In the case of manufactured goods, textiles, for example, controls start at the manufacturing level, with priority rationing of raw materials to the manufacturers, so it might be supposed that unrestricted dealings would find little scope. Not so. Fabricators manage to stretch their priorities to secure raw materials over and above their legitimate manufacturing needs; the surplus materials are sold for cash at high prices. This practice is said to be resorted to particularly in cases where the plant's regular manufacturing operations already have placed it in the high surtax brackets, making further legitimate activity relatively unattractive.

In some cases—liquor, for instance—the dealer who would stock good rye or scotch is forced to make a tie-in purchase of inferior rum or gin as well. He may, in addition, be requested to pay an amount equal to the ceiling price by cheque, with an extra bonus on the side in cash. The same practices have been reported in cigarettes at both the wholesale and retail level. The apartment-seeker who would cover his head with a roof sometimes finds that extra-legal currency will do what legal tender will not; and the renter sometimes finds that services nominally provided by the lease come only with cash or recourse to law. Porters, railroad clerks, and so-called "reservation bureaus" are reported doing a flourishing business in railroad reservations at exorbitant prices, because more persons want to go more places more times than ever before.

A booming black market exists in secondhand furniture and office equipment. The ceiling on resale of used furniture is 75 per cent of original cost if it is in good condition, and progressively less if it is in poor condition. These regulations are easily evaded, since no two pieces are exactly alike. An urgent demand presses against a scarce supply, since practically no office equipment has been manufactured for several years. Even at ceiling prices, the purchasing departments of some institutions are showing a record of net credits instead of normal working expenditures as a result of the disposal of obsolete surplus equipment. The active market which exists in this field is demonstrated by the experience of one institution which recently disposed of a group of 1918 adding machines at 75 per cent of their original cost. With reconditioning expenditures added, these were obviously resold above the ceiling. The same firm received \$19 for ancient roll-top desks for which, prior to the war, cartage fees would have been paid to the junkman to remove them. The purchasers of these items frequently bid, unasked, for other scarce items owned by the

As there is now a long waiting list for *The Economist*, subscribers who wish to renew their subscription are advised to do so before the date of expiry. If they fail to do so, their subscriptions will be automatically cancelled as soon as that date is passed, and this may mean a gap of many months before the despatch of copies can be resumed.

seller. These prices indicate that in this field the price is two to three hundred per cent above pre-war and ceiling prices.

Auction sales have been an important loophole for evasion of ceiling prices. An interesting sidelight on black market intricacies is the report that government bureaux themselves have been forced to resort to buying office equipment at auction sales at more than ceiling prices.

Demand and Supply

In contrast to the situation reported from Europe, the mainspring behind the black market in the United States appears to lie relatively more in the large increase in national income and the shift in income distribution in favour of the working-class than in any absolute scarcity on the supply side of the market for most items. High taxes and resulting tax evasion are major factors. Still another is the failure of some people to understand the complexities of rationing, thereby becoming more or less unwitting accessories.

Whatever the basis, the end result is inequitable distribution of supplies, resulting in hindrance to the war effort which, in a country lacking the supplies of the United States, would be serious indeed.

Probably the fraction of the record-breaking (both total and per capita) consumption of goods and services going through the black market is small, but until proof to the contrary is adduced many people will believe that its aggregate puts it in the "big business" category.

American Notes

Chosen Instrument or Competition

Discussions on civil aviation policy continue. While a sub-committee of the Senate Foreign Relations Committee is considering the agreements concluded at the Chicago Conference, a sub-committee of the Commerce Committee has started public hearings on the McCarran Bill, which seeks to establish a single "All-American Flag Line Company" as the "chosen instrument" in international operations by US air lines. Among other provisions of the Bill the company would be permitted to negotiate with foreign interests.

Rarely has there been such unanimity among government departments and agencies in opposition to a Bill. Among those on record are the State Department, the War and Navy Departments, the Maritime Commission, the Departments of Commerce and Justice, and the Civil Aeronautics Board; all favour a system of regulated competition. None recognise the menace Senator McCarran sees in the British White Paper. Seventeen of the smaller airlines have lined up in a bloc with these opponents and the larger American Export Air Lines and Trans-Continental and Western Air Lines have said they want no part of any "All-American Flag Line."

The chief advocate of the "chosen instrument" is the rather splendid Mr Juan Trippe, pioneering president of Pan American Airways. No one underestimates Mr Trippe, who has usually had things his own way. This time, however, he has only a single ally, United Air Lines, one of the largest of the domestic lines. Thus far Mr Trippe has oversimplified; he pictures a state of competitive confusion, with at least 14 domestic airlines scrambling for the mere 18 per cent of all traffic that is overseas, as the chaotic and only alternative to a calm, shiny future, with at least 60 per cent of all transatlantic passengers going by air for \$100 a head. To this latter state of affairs he is perfectly willing to sacrifice the identity of his great company, knowing full well that the sheer weight of his equipment and the enormous technical skills and knowledge under his roof, would inevitably mean that the "All-American Flag Line" would shape itself around Panamerican.

The comparison between the United States and those countries which have adopted the "chosen instrument" policy is not a very close one. The State Department divides these countries into three categories: those in which all industry is state-controlled, those which need to connect colonial possessions scattered over the globe with a mother country and small nations whose financial resources do not permit the support of more than one enterprise. The United States, not fitting into any of these divisions, is still free to base its aviation policy on the effects it will have on the aircraft industry and air commerce, and the view is emphatically held that competition is best.

A Giant Expires

As the Maritime Commission's shipbuilding programme prepares to wind up by the end of this year, the United States is having a look at the first big industry to reach completion of its war job. The look industry and labour are giving this gigantic liquidation is a progressively more interested one, for a series of recent events and pronouncements clearly indicate that shipbuilding will not for long be alone. First there was the Byrnes Report, with its unexpected emphasis on reconversion. Then 1,000 employees were dropped at the Ford Willow Run Plant, where B24 Liberator production is scheduled to end by August. The War Production Board has ordered \$50 million worth of new tools for civilian production, and, to cap all this, the Secretary of Labour announced that the country has already entered the transition period from war to peace construction.

Employment in the shipyards has been drifting downwards since the peak month of November, 1943, when over a million and a-half men and women were at work. By January, 1945, the number had declined to something over one million. True, manpower was better utilised; in 1943 each employee completed an average of 10.1 tons, while in 1944 the figure had increased to 11.5 tons, an improvement of 13 per cent.

With the completion of the 12 million tons now scheduled for 1945, half a million workers will be displaced in shipbuilding alone. Actually, the expiration of the Maritime Commission's contracts reaches far back into the whole fabric of war production and reconversion. The War Production Board has pointed out how essential it is that these workers be located where they are needed, and not be lost to war production. In an attempt to prevent a mass exodus from the yards every time a rumour of contract expiration circulates, the Maritime Commission has promised to give advance notice of terminations and expirations. Then the War Manpower Commission will move agents into the yards, and present the workers with a list of opportunities and needs in war work. Too much cannot be expected from this procedure, since present and prospective vacancies in industries with high labour priorities have pay scales much lower than the displaced ship workers have been receiving. A welder, for example, who has been upgraded to \$1.20 an hour, will not leap eagerly at a chance to work for 50 cents an hour in the lumber industry.

In any event, the treatment of these half million displaced men—some of whom, it is true, will be absorbed immediately into ship-repair work—will be an interesting test of whether it is possible to transfer labour in such large numbers in accordance with a plan based on the best good of the war effort, and of the gradually revitalised civilian economy.

Hollywood Wants the Air

Hollywood, hitherto always hostile to television, has finally decided that it cannot be made to go away. So, in characteristic grand manner, the moving-picture industry is making preparations to take control. The result may be that one day American cinema-goers will be served up, along with the second feature and a game of bingo, with a televised programme of news and variety beamed from Hollywood.

Whether the broadcasting companies, without Hollywood's help, could produce appetising enough programmes to keep the people at home, is still a question. In a recent survey 86 per cent of the American people have said they want television sets in their own homes. The radio industry has invested \$25 million in research and development of television. If receivers were available now, present television broadcasting would be within reach of 25 million people. Certainly radio can have no intention of yielding quietly to the Hollywood princes. Radio may wish it had exercised more inventiveness in the use of the air waves instead of falling into the tempting and easy rut of capitalising on the popularity of Hollywood personalities. True, the profits have been enormous. But the ether was thus opened to Hollywood programming, and now most of the variety programmes and most of the plays are dominated by the cinema city. The latter hopes, of course, to keep it that way.

Anything in the nature of a television network depends upon the technical possibilities of transmitting television signals by cable from city to city. A relay link from New York to Philadelphia has already been established, but the distance is less than 100 miles. A Paramount subsidiary has applied to the Federal Communications Commission for two

nation-wide experimental relay networks on which it hopes to test a relay service which would bring major news and special events as they occur to cinema audiences. It is difficult to see how the feature film could be made to synchronise with these plans.

Metro-Goldwyn-Mayer has filed application for "television" stations in Los Angeles, Chicago, Washington and New York. RKO is preparing to come out a winner no matter who wins. For regular commercial television programmes put out by the radio broadcasters, it will produce and distribute sponsored films. But if the broadcasting industry grows too menacing it will be prepared with a theatre television service. Both Twentieth Century-Fox Film Corporation and Paramount have more than an academic interest in Scopony Corporation of America, which is developing patents covering the projection of large-sized television images on theatre screens.

The contrast with the British picture could hardly be more complete. Instead of a single monopoly, there is to be competition not only between two industries, but within each of them. The American public will certainly, as a result, get more television than the British, and the quality of the programmes will also probably be better.

Catholics on the Peace

A statement on international organisation recently issued by the American Catholic hierarchy is of some importance because the Catholic population of over 22 million people is fairly closely organised and has many times demonstrated its ability to put pressure on Congress and the Administration. The Catholic Church in America, as a whole, has hardly been in the forefront of those who called for an active foreign policy, and though it would be an exaggeration to call its earlier attitude isolationist, it has had closer contacts with that side of the great argument than with the other.

The present statement represents the views of a wide section of opinion, outside the church as well as in it, which has been somewhat reluctantly converted from isolationism and has now taken refuge in perfectionism. Thus, while the bishops say they do not believe that a sound world organisation is a Utopian dream, they offer no means of reconciling what they call "Marxian totalitarianism" and

"Christian-based democracy." Faced with the manifest fact that the only form of world organisation that can be brought into existence at present must include both America and Britain on the one hand and Soviet Russia on the other, the bishops condemn all the steps that have been taken, either at Dumbarton Oaks or at Yalta, to bridge the unquestionable differences that exist between them. Thus the Yalta compromise on voting procedure is condemned because it gives "a preferred status not only to the powerful aggressor, but even to any aggressor with a powerful patron," and they look forward to a time when the Security Council will become merely the executive committee of the assembly.

Like the ex-isolationist press, the Catholics show a great anxiety about the existence of provision for altering, in accordance with international justice, the terms of any treaties or settlements concluded in the course of the war—the obvious reference being to the Russian treaties with Poland and Yugoslavia—and there is an open allusion to the "enslavement" of Lithuania, Latvia and Estonia.

These are arguments that carry great weight with wide sections of American opinion. If the present attempt to bring the United States into a world organisation fails, the fatal attack, as last time, will come from the perfectionists rather than the avowed isolationists.

Senator in the Cabinet

President Truman, in an unprecedented action, has invited Senator Kenneth D. McKellar, President *pro tempore* of the Senate, to attend Cabinet meetings. The 75-year-old Senator from Tennessee will thus be the first Senator ever to attend these high councils. He will sit in the Vice-President's seat. This is a very concrete way for Mr Truman to demonstrate that he intends to increase the participation of Congress in framing major government policy. Senator McKellar's invitation is, in virtue of his office rather than of his views, but it is not perhaps wholly without significance that he is best known for his bitter and persistent enmity toward TVA as an autonomous organisation. Year after year he has fought to make TVA come to Congress for appropriations, thus opening it to the necessity of making political appointments to its staff.

THE WORLD OVERSEAS

The ILO and South-East Asia

(By a Correspondent)

BY one of the decisions taken at Philadelphia, the ILO is charged with an increased burden of regional activities, among them the duty of summoning as early as possible an Advisory Conference of the countries of South-East Asia. There has for long been a feeling among the more important Asiatic countries that their special social and economic problems do not receive adequate consideration at the general conferences of the ILO with their predominantly Western background. The earlier demands for summoning an Asiatic regional conference of the ILO, however, evoked but little response from the countries most concerned. The developments that have since taken place in Asia have once again brought the question to the fore, and it is now proposed to hold two conferences, one of the countries of the Middle East, and the other of the countries of South-East Asia. The South-East Asia conference is to consist of the usual tripartite delegations from India, Ceylon, Burma, Malaya, the Netherlands Indies, Thailand, the Philippines, Indo-China and China.

The general theme of such a conference, it has been stated, would be the implications for Asia of the United Nations' pledge of freedom from want. As a result of the last war, the past two decades have witnessed considerable industrial development in Eastern countries like Japan and India. In India, the number of factories has increased from under 3,000 in 1914 to close on 10,000 in 1939, of which 1,700 are described as "large industrial undertakings." The

number of factory employees has similarly risen from 950,973 to 1,751,137. This total represents less than 1 per cent of the population, but recent developments have nevertheless placed India among the first eight industrial producers of the world, a fact which has greatly perturbed the Western nations which already had well-established commercial connections with the East. Even in China, in 1938-40, industrial production was estimated to be increasing, in real terms, at the rate of 10 per cent annually. To the older manufacturing countries, therefore, the industrialisation of the East appeared primarily as a question of trade competition, and not much effort was made to understand or to sympathise with the imperious economic necessities which had impelled the East to take to industrialisation.

In every one of these countries industrialisation is regarded as the primary method of maintaining and raising standards of living. All are still predominantly agricultural—the last available figures show 100 million Indian workers out of a total of 148 million gainfully employed working in agriculture—and everywhere the pressure of population on economic resources falls most heavily on rural areas. In consequence, poverty, under-nourishment and ill-health have become almost endemic. The average Indian expectation of life in 1931 was only 27 years, compared with the 50 years of the American negro. Infant mortality

in Burma in 1939 was as high as 204 per 1,000, compared with 53 per thousand in the United Kingdom.

Social developments of this kind are now being approached from a new angle; it is now recognised that "poverty anywhere constitutes a danger to prosperity everywhere," and that it is only by providing full employment and by the raising of standards of living everywhere that the harmonious prosperity of the world as a whole could be assured. The application of these general doctrines to economically backward territories would involve, in the first place, a strengthening of their agricultural economy so that primary production may be increased, and, secondly, the establishment of suitable industries to provide occupation for those who may be drawn off the land and to satisfy the popular belief in industrialisation as the key to a higher standard of living.

Taken by itself, the addition to the world's stock of goods and services which would result from efforts of this kind would be a clear economic benefit to the whole world at large, though the first beneficiaries will be, as is only natural, the local populations. There are, however, many who consider that all attempts at economic and social improvements in the East are foredoomed to failure because of the excessive rate of population-growth and its pressure on resources; to this Malthusian prognosis the only answer is that in other parts of the world increased material prosperity based on industrialisation has in the long run resulted in slowing down the increase of population. The closest geographical parallel—that of Japan—shows a marked fall in the net reproduction rate which sooner or later must have its effect on the total population.

The ILO Conference on South-East Asia would be rendering a service if it could shed clear light on the problems involved in increasing production and raising standards of living in the East and on their repercussions on the older industrialised areas. It is obvious that the vast and comprehensive schemes that are needed for the economic regeneration of Asia could not be carried out without enormous borrowings of capital and technical skill from the more advanced countries of the West, and more particularly from those with historic connections with the East. By helping in the economic development of South-East Asia, these countries will also be serving their own self-interest. In India and China alone there are about 900 million human beings. Should international help be forthcoming, it would enable this vast population to promote the world's trade more effectively by producing more and consuming more, with results that in the end would be profitable to all alike.

Western Help

The post-war years will afford remarkable openings for this kind of international economic collaboration. These new demands for capital goods and technical assistance will enable the older industrial countries not only to negotiate successfully the difficult problems of transition by spreading it over a longer period, but also to maintain production and employment at higher levels than would otherwise be possible. Immediately after the last war, Dr Sun Yat-Sen addressed an energetic plea to Europe and America for assistance in the economic rehabilitation of China. He pointed out that the war industries of these continents could easily, with but slight adjustments, produce the goods which China needed: he emphasised that such an arrangement would be to the mutual benefit of China and the countries co-operating with it, for the latter would be obtaining a new market and gaining much good-will in the process of helping China to stand on her feet. The remarks of the great Chinese leader are apposite and topical at the present juncture, when the dangers of sudden reconversions and large backlogs of war products might be partially offset by export to the under-capitalised countries of the Far East.

The alternative to international co-operation is a refusal—open or disguised—to help in the economic development of the East. Prompted by fears of future competition it might slow the tempo of Eastern industrialisation, but would be powerless to stop its ultimate completion. An incidental result would be to strengthen the chauvinistic elements in Asiatic countries which, encouraged by widespread suspicions of Western motives, stand out openly for economic self-sufficiency.

It is, of course, clear that industrialisation would create in the East the same problems as in the West. Questions such as hours of work and wages, unemployment and social insurance, factory inspection, protection against accidents,

and the safeguarding of women and children are already arising in the East. With its Western experience, the main work of the ILO will be to extend the scope of its conventions in Eastern countries. In addition, there are the problems of poverty, disease and illiteracy in a large and rapidly-growing population. Any additional wealth that is created will have to be directly used to achieve better nutrition, education, housing and public health, which are now sadly neglected. With the increased efficiency that would follow the adoption of such a programme, we may reasonably expect better wages for the worker and better prices for the primary producer, and it is only in this way that the economic gap between the older and the newer industrial countries can be closed, and the foundations laid for orderly and harmonious world progress. This is the major contribution that the ILO can make to economic development in the East. If its Asiatic conference succeeds in enabling the vague and confused social aspirations of the East to gain clarity and definition, and in directing those aspirations to their fulfilment in higher living standards for Eastern peoples, one of the most potent causes of international friction in the future would have been effectively removed at the same time.

The Opposition in Brazil

[FROM A CORRESPONDENT IN MONTEVIDEO]

A SURPRISINGLY strong opposition has lately emerged in Brazilian politics. President Vargas' authoritarian regime, known as the *Estado Novo*, since it was given a constitution some eight years ago, was purged of its democratic elements last year, the purge culminating in August with the suppression of the Association of Friends of America and the resignation of Oswaldo Aranha from the Ministry of Foreign Affairs. His departure put an end to any hopes of making the regime more Liberal, and as a result its opponents combined to form, last autumn, the *União Democrática Nacional*.

In its first manifesto, the UDN proclaimed itself a political organisation which proposes "to co-ordinate all democratic currents in order to re-establish legality and democracy . . . and to fight neo-fascism, which is staging a come-back in Latin America." It then went on to demand the abolition of the press censorship and the restoration of the political parties, whatever their social and economic tenets. Resistance groups were formed which were particularly active in São Paulo, Rio de Janeiro and Minas Geraes. By the time Mr Stettinius appeared in Rio de Janeiro after the Yalta Conference, the opposition had already been organised on a national basis.

Mr Stettinius's Brazilian journey was held to mean, first, that the Brazilian Government's authoritarian domestic policy would have to fall more in line with its anti-Axis foreign policy if Brazil was to play its part at the San Francisco Conference, and, secondly, that the recognition of Russia was necessary if Brazil was to become eligible to represent Latin America in the Council of the United Nations. This amounted to the incompatibility of the *Estado Novo* with the Brazilian aim of becoming a Great Power. It was also of enormous encouragement to the opposition, which thereupon came out into the open; it judged, correctly, that the Government would hardly be able to take repressive measures on the eve of the Mexico City Conference.

The upshot seems to have surprised the administration. Twelve of the 17 important daily newspapers turned against the Government. Moreover, this offensive by the opposition was followed by a campaign to make Brigadier-General Eduardo Gomes a candidate for the presidency. The selection of Brigadier Gomes aimed at uniting the different groups of the opposition. He is a Catholic and enjoys a great reputation in the army, which is the outstanding factor in Brazilian politics. In the 1930 revolution he backed President Vargas, and took sides against the revolutionaries of the National Liberation Alliance in 1935—indeed, he was even wounded by them. But after the coup of November 10, 1937, he became increasingly critical of the regime, particularly during the period of *rapprochement* with the pro-Nazi *integralistas*. To him was credited the reorganisation of the Brazilian Air Force; he was also able to co-operate smoothly with the North Americans. His stainless personal record inspired the trust of the politically more advanced sectors of the Brazilian opposition; at the same time he was moderate enough not to

scare away the conservative opponents of the *Estado Novo*. For these reasons, his candidacy could be supported by sections of public opinion ranging from Conservatives and Catholics, São Paulo "constitucionalistas" and Republicans to Liberals, former adherents of the *Estado Novo*, the democratic group of the army, and even the extreme Left.

Difficulties Ahead

Such strong and broad political forces are represented in the opposition that under normal circumstances they would have every reason to look forward with confidence to the electoral contest. Nevertheless, the political barometer is unsteady. Eight years of the *Estado Novo* have created many vested interests which will be unwilling to surrender their prerogatives. The *status quo* is still supported by big industrialists and a small but powerful group of civilian and military officials who control most of the key positions. Their determination to remain in power has led several leading spokesmen of the opposition to make scarcely veiled references to the possibility of civil war. The appointment of Agamenon Magalhães, who was believed to be one of the architects of the opposition, to be Minister of Justice and the Interior did not reassure the opposition. Moreover, the fact that General Dutra, the War Minister, was put forward as a presidential candidate was regarded by the opposition as an attempt to split the army and make it swing away from the support of Gomes.

Big political changes in Brazil are not expected before the San Francisco Conference. From it the present administration is likely to emerge with increased international prestige, which it may be expected to exploit to the utmost for internal purposes. The opposition will have its work cut out to maintain its precarious legality after the Conference. The Government has refused to abolish the DIP (the censorship) or the National Security Tribunal; nor has it agreed to an amnesty for political prisoners. The opposition in Brazil is, therefore, not over-optimistic. It is aware that only the first battle has been won.

Swiss Burdens

GERMANY'S disintegration has presented Switzerland with a new problem. Great numbers of foreign workers are reported to have been entering Switzerland especially since the French advance into southern Germany. It is hardly possible for the Swiss Government to harbour all these foreigners for a long time. During the war, the number of foreign refugees who have been maintained in Switzerland has reached a total of about 100,000. In addition, about 30,000 foreign children have been housed, fed and clothed by the Swiss. The total number of children has hardly changed each year, but each child has only been allowed to stay for three months. The burden on the Swiss administration and particularly on food supplies can be appreciated if it is borne in mind that the total population of Switzerland numbers roughly 4½ millions.

Considerable food supplies for Switzerland have been accumulating in Spanish ports mainly carried by the Swiss fleet of freighters with a total tonnage of 60,000. In addition the Government had chartered 72,000 tons of Greek shipping. During the recent trade negotiations with the Allies, an understanding was reached on the grant of facilities for goods in transit, and France is to place Toulon at Switzerland's disposal. There is, however, no prospect of a substantial increase in imports and exports before the new harvest. Last December and January, imports and exports fell to a fraction of the average monthly imports of 1938. The stocks of rice, tea and coffee have become inadequate. The daily bread ration has been reduced from 8.8 ounces to 7.9 ounces and reductions have had to be made in fat and meat rations. Since 1942 the number of cattle has been kept fairly steady, but the shortage of imported feeding-stuffs has led to a considerable reduction in the number of pigs. Switzerland seems to have reached the limit of agricultural expansion, and the resumption of adequate food imports is, therefore, a major concern of the Swiss Government.

The Fuel Shortage

Trade with Germany has now come to a standstill. Until last July, imports of coal from Germany were fairly regular at roughly 150,000 tons per month, but for some time no coal has been received from anywhere. Gas, both for

domestic and industrial use, has been severely rationed. Electric power cannot replace coal altogether, and a gradual decline in industrial activity is inevitable. The lack of industrial raw materials and the virtual cessation of exports of manufactured articles have been felt more severely recently. The home market cannot absorb the products of the Swiss exporting industries, and the iron and steel, machine tools, watches and electrical industries show a marked reduction in output. The aluminium industry is suffering from a shortage of bauxite. So far increasing numbers of workers have been employed on public construction works and in agriculture. But the lack of coal will automatically reduce the manufacture of cement, which in its turn will reduce activities in the building industry. An increase in unemployment can hardly be avoided if foreign trade is not resumed in the near future.

During the summer and autumn of last year, many Swiss industries maintained almost full production in the hope that hostilities would soon come to an end. Some industries began to renew their plant and buildings and thus absorbed a small part of the machinery which could no longer be exported. On the other hand, the consumption of civilian commodities, especially clothing and shoes, declined, for consumers hoped that an early end of the war would enable production to return to peacetime standards of quality. The public has recently resumed its purchases, but the textile and shoe industries are suffering from extreme shortages of raw materials.

During 1944 and in January of this year Swiss railway traffic reflected the growing industrial difficulties by a marked decrease in the transport of goods, but a considerable increase in passenger traffic, owing partly to a greater home tourist traffic. The number of foreign visitors is still extremely small. But Swiss hotels, which were formerly an important part of the national economy, are being prepared for the resumption of their peace-time activities, and the Government has arranged to give financial help in modernising and renovating hotels wherever necessary.

The Financial Position

As a result of the agreement between the Allies and Switzerland, most foreign funds, including German funds, are now frozen. The Federal Council has also decided on a complete prohibition of imports and exports of foreign bank-notes. At the same time, transactions in foreign bank-notes among Swiss citizens inside Switzerland were prohibited. The quotation of the rate of exchange for sterling, dollar and French franc bank-notes had already been suspended.

During the second part of 1944 Switzerland again mobilised its army to full strength in preparation for the last phase of the war. This is one of the reasons for the increase in the note circulation during 1944. The maintenance of the army and the construction of fortifications, in short the cost of the war, has been relatively large. Total expenditure on the war since 1939 is estimated at 1,800 million francs, and the national debt will rise to 6,500 million francs during 1945. This is a heavy financial burden for the post-war years, and considerable concern is felt about the inevitability of high taxation after the end of the war. Switzerland seems to be acutely conscious of the difficulties which will arise in the reconstruction of the devastated Continent. The last phase of the war has added new burdens, and there is no prospect that the actual end of the war will bring immediate relief.

THE BUSINESS WORLD

Europe's Coal Famine

THE havoc caused by the war on the European Continent cannot yet be assessed; its magnitude will only be revealed after the fighting. One of the most serious problems during the next twelve months is the threat of a coal famine which will not merely hamper the resumption of industrial activity, but may leave the inhabitants of many of the big towns without adequate amounts of fuel for heating next winter. The facts about the shortage should be made fully known as soon as possible, if only as a means of speeding up such preparations as can be made to avoid the worst consequences of a famine.

Before the war, Continental Europe as a whole was not self-sufficient in coal, though, in volume, its overall deficit was not big. The deficit, met by this country, varied from year to year; in 1935—the year chosen by the League of Nations for an analysis of Europe's trade—there was a net import into Continental Europe of 21½ million tons, equivalent to about 7 per cent of the estimated consumption of some 300 million tons. Within the Continent, Germany and Poland were the only two countries with a substantial export surplus; in 1937 Germany exported some 40 million tons and Poland 11 million.

Belgium and Holland had an export trade of more than 4 million tons each, but this was more than offset by imports; the trade of both countries consisted largely in an exchange of qualities. Among the countries dependent on imports, France alone was also a substantial producer, with an output of some 45 million tons; but even that country had to import an amount equivalent to about two-fifths of its needs.

The facts about the present position of productive capacity are not yet known in full detail, though enough is known to suggest that the prospect for this year is bleak.

*

In any survey of the present position, a distinction may usefully be made between the European territories likely to come directly within the Russian sphere of influence or control, and the rest of Europe. In the former territories, the coal mines of Silesia—most of these are now in the hands of Russia—are reported to have been found in working order by the Russian armies. Production in the whole of Silesia, including the mines of Poland, Czechoslovakia and the former German Upper Silesia, is reported to have reached the annual rate of 100 million tons in 1944. But even on an optimistic view of production in those mines during the next twelve months, their export surpluses are not likely to equal the loss of production suffered by Russia as a result of the flooding and wanton destruction of the Donbas mines. In other words, Russia may well need a

good part of the coal it can get from the Silesian mines, though, to begin with, the amount that can be moved east will be limited by the capacity of transport. There may be little Silesian coal available for other countries.

The absence of Polish coal in Scandinavia, Western and Southern Europe would not be a matter for serious concern if their other sources of supply were unimpaired. Unfortunately they are not. France is not expected to produce more than 30 million tons this year, that is, two-thirds of its output in 1937; Belgium is producing with difficulty at half the pre-war rate of 30 million tons a year; and in Holland the annual rate of output is down to a third of the 1937 level of some 14 million tons.

The majority of the coal mines of France have been recovered intact; those of Belgium and Holland, too, have not been seriously impaired (the Dutch mines are in territory already liberated). The most serious difficulty in all three countries is the shortage of labour; next, in order of importance, come equipment and, especially in Holland, transport. Transport, it should be remembered, is needed not only to move the coal away, but also to bring stores, and especially pit props, to the mines. The production difficulties of France, though less serious than those of Belgium and Holland, are grave. The labour force has declined from 245,000 at the end of 1938 to 205,000 at the beginning of last February. Most of the decline took place last summer during and after the liberation of the country, when large numbers of miners left their jobs to join the Maquis, or the armed forces, or to seek work elsewhere. In Belgium and Holland the decline has been even more serious. Again, there has been a marked fall in output per manshift since 1938, amounting in France to one-fifth; the rate of absenteeism has also tended to increase. Malnutrition is stated to be one of the main reasons for the fall in productivity.

Preliminary reports from the mining districts of Western Germany—with a combined pre-war output of more than 160 million tons, including the hard coal equivalent of lignite—suggest that destruction has not been as serious as might have been expected. The Saar mines have been recovered almost intact—some of the equipment has been damaged and stores have been looted; but the greater part of the miners have vanished. At present the annual rate of production is reported to be barely a million tons, against more than 16 million tons during the year ended March, 1944, and 14 million in 1938. Further north, to the west of the Rhine, the position seems to be very similar. In the Ruhr district itself—with a former annual output approaching the rate of 130 million tons a year—destruction

is reported to have been more marked, but, at any rate in the mines already recovered, there has been nothing like the systematic destruction carried out in Russia. Apart from physical destruction, which includes much damage to miners' dwellings, there has been a wholesale exodus of miners, especially of prisoners and of imported slave labour. Investigations on the spot have not yet been completed, but it would be optimistic to hope for an output in Western Germany of more than one-tenth of the pre-war level in the immediate future or of more than about one-quarter of the same level by next winter—say a total for the next twelve months of some 30 million tons, including the output of the area between Aachen and Cologne, which was 20 million tons of coal and lignite (in hard coal equivalent) before the war. Much of this may be required by the Allied armies of occupation, though they will have at their disposal the lignite mines of central Germany, said to be capable of an annual output of some 35 million tons in terms of coal. Quite apart from transport difficulties, there may be little German coal available for other parts of Europe this year.

*

Europe's balance-sheet in coal for the next twelve months, therefore, is likely to be a grim one. Russia will be able to make good from Silesia a part, but by no means the whole, of its own losses. Scandinavia, Western and Southern Europe may have to go without the 11 million tons from Poland, and they will receive nothing like the 40 million tons formerly exported by Germany, mainly from the Ruhr. Moreover, in view of the continued fall of production in Great Britain, the Continent cannot expect anything approaching the 20-odd million tons that this country was sending before the war. Without imports, France will have barely two-fifths of its pre-war supplies; if transport and essential public services are to be maintained, there will be little left for industry—that is, not much more than a quarter of its pre-war consumption—and almost nothing for heating the towns in winter. This would not only involve a serious delay in economic recovery, but it might also have serious political consequences. Other countries, such as Belgium, Holland, Switzerland and Sweden, would be faced with similarly difficult problems.

The prospect of this year looks desperate; drastic action will be needed, though a temporary famine can now hardly be avoided. Remedial measures might take three forms. First, France, Belgium and Holland should concentrate on speeding up their output. This is largely, but not entirely, a matter of man-power. France, for example, needs more than 30,000 miners to raise output to the level of 42 million tons achieved in 1943. The shortage of miners is not merely a Continental problem; it is a problem in almost every coal-mining country. Voluntary recruitment could possibly be speeded up by financial incentives and by the provision of more amenities, though any improvement in housing, for example, would take time. If need be, recruitment may therefore have to be supplemented—at least temporarily—by the employment of prisoners. In so far as there are shortages of equipment and stores, assist-

ance might possibly be provided by Britain and, in a larger measure, by the United States.

Next, an Allied Coal Council should be formed, to ensure the expansion of output in the mines of Western Germany. As it will be impossible to retain the prisoners and deportees in the mines of Germany, their places will have to be filled by German miners, many of whom must by now be in prison camps. Physical damage must be repaired as quickly as possible, and this will have to include the provision of accommodation for miners. Coal supplies available in Western Germany might be pooled and distributed according to need, with priority for the armies and for the liberated allied countries.

Thirdly, since efforts to raise production on the Continent are unlikely to prevent a grave shortage during this year, they should be supplemented by imports. Although this country may not be able to spare much coal for export, the shortage on the Continent is such that even relatively small quantities will be welcome. It would be a pity if Britain could do nothing to help the countries that were formerly its best customers. South Africa, which is now the second largest exporter of coal, might also furnish some supplies, but the United States could no doubt make the largest contribution. During the fuel year ended March 31st, the United States produced no less than 620 million tons of bituminous coal, some two-fifths more than in 1938. True, all this coal was needed to sustain the tremendous volume of production, and, indeed, stocks had to be drawn on to the extent of 14 million tons. Moreover, output has tended to decline this year, largely because of the shortage of man-power; during the first quarter of this year production was 11 million tons smaller than last year. Mr Harold L. Ickes, Solid Fuel Administrator, pointed out on April 9th that the United States was facing a shortage this year and that the cessation of hostilities in Europe "would not solve the coal problem." On a superficial view, the prospect of assistance from the United States would not appear to be very promising. But it might be possible that, with economies in consumption, some coal—and perhaps some fuel oil—might be spared for the Continent; some 18 million tons, equivalent to a mere 3 per cent of American production, would provide the margin that is necessary to prevent continued economic paralysis and to provide a minimum of fuel for heating next winter.

If the coal-producing countries of Western Europe take such steps as they can to raise their output of coal, and if the problem of speeding-up production in the Ruhr and the Saar districts is tackled energetically, supplies in 1946, though still short, should be sufficient at least for minimum needs. The task will be a hard one, especially in view of the difficulty of recruiting labour for coal-mining, a phenomenon that is by no means confined to this country. On a longer view, the coal deposits of Europe are, of course, ample to meet European requirements for many generations; there is no justification for anxiety. Indeed, the danger to this country is that it may lose its markets on the Continent, for, if British coal cannot be had in large quantities within a reasonable time, Ruhr coal may well take its place.

The Income Tax Bill

THE Income Tax Bill, which reaches the Committee stage in the House of Commons on Friday of this week, gives effect to the changes in the taxation of industry after the war that were announced by the Chancellor of the Exchequer, in his Budget Speech last year. Broadly, Sir John Anderson's proposals are designed to remove some of the financial obstacles in the way of the modernisation of British industry. By relieving from taxation all expenditure on research—from fundamental research to the full-scale development of the product—he intends to give a fillip to technical progress; by granting additional relief from taxation in respect of plant and equipment, he intends to assist industry to accumulate funds for speedier replacement and modernisation; and, finally, by granting the tax-free obsolescence allowance unconditionally to a "continuing business," he hopes to facilitate the change-over from obsolete to new processes of manufacture requiring different equipment.

Although the Bill conforms to the Chancellor's intentions, and, therefore, is a step in the right direction, it can be criticised under three headings. First, while it ensures in general that the taxpayer can accumulate, free of tax, a sum

equal to the original cost of plant and machinery, it does not differentiate between profits set aside for the replacement of plant by more efficient and more costly plant and profits paid out as dividends; in other words, it does nothing to encourage the process of capital accumulation that is the precondition of rising productivity. Moreover, by fixing depreciation allowances in terms of the original, rather than the replacement cost of plant and machinery, it does nothing to protect industrialists from the effects of rising prices.

The second criticism concerns the discrimination in the matter of depreciation allowances between industrial buildings and other buildings. The new depreciation allowances are confined to "productive industry"; dwelling-houses, retail shops, showrooms, hotels and offices are specifically excluded. Sir John Anderson has thus declared himself an adherent of the old Physiocratic school of thought, which draws a crude distinction between productive and unproductive activities, a fallacy that is exploded in every elementary textbook on economics. Thirdly, the Bill has drawn criticism because the new system of allowances leaves some concerns worse off than they were under the old

system. This criticism relates to inventors, to owners of existing industrial buildings, and to the sale of second-hand plant and machinery. It is with this third series of objections to the Bill that the remainder of this article is chiefly concerned.

Hitherto inventors who sold patents on the basis of the payment of a royalty have been liable to income tax on the royalty, while purchasers have enjoyed the full allowance in respect of the cost to them of the royalty. But inventors who sold patents for a lump sum, that is, a single royalty, have escaped the payment of taxation, for the lump sum has been treated as a capital gain; in this case, the burden of taxation has fallen upon the purchasing trader. The Bill brings the treatment of single payments into line with that of royalties, that is to say, the inventor will in future have to pay income tax on the lump sum, while the trader will get his depreciation allowance. In order to avoid hardship, the inventor can spread the payment of tax over a period, subject to a maximum of six years. The inventor can therefore no longer escape taxation by selling patents for a lump sum. This change has attracted criticism on the ground that it will discourage inventions. It is, of course, quite true that the inventor will be worse off than before, and that any steps that might discourage him are to be strongly deprecated. But it is very doubtful whether the taxation of lump sum payments will act as a deterrent. Nowadays the majority of inventions are the result of organised research within the business, and expenditure on such research is no longer to be taxed. Moreover, despite the advantages hitherto attaching to the sale of patents in payment of a lump sum instead of royalties, many patents have hitherto been sold on a royalty basis.

The second criticism, relating to the new allowances in respect of industrial buildings, is a more serious one. Since 1919, industrial buildings have been subject to an annual depreciation allowance—the Mills and Factories Allowances—based on the net Schedule A assessment on buildings, inclusive of any fixed plant and machinery they housed. Although the basis of the allowance was slightly altered by the Finance Act of 1937, it has amounted to about one-sixth of the annual value of the buildings and plant. The allowance has been generally equivalent to about 1 per cent on the cost of erection, but sometimes, that is, where the buildings contained expensive rateable plant and machinery, it was appreciably higher. Buildings in existence since 1919, and subject to an annual allowance of 1 per cent have thus been granted a total depreciation allowance of 25 per cent. Where the allowance amounted to more than 1 per cent, the total allowance so far granted has been correspondingly greater.

The new system of allowances is quite different. There is to be an initial tax-free allowance of 10 per cent granted in respect of new buildings, but not for existing buildings. In addition, there is to be an annual allowance of 2 per cent for both new and existing buildings. The allowances will make it possible to write off the cost of new buildings during a period of 45 years, but, in the case of existing buildings, the annual allowance is to be confined to a life of 50 years. For example, a building that is 25 years old when the new system comes into force will thus be eligible for the 2 per cent annual allowance for a further period of 25 years. Exceptionally, if a building is 50 years old at the time of the change-over to the new system, and its owner is in receipt of the Mills and Factories Allowance, he can claim the existing allowance for a further period of five years.

The proposed system of allowances, in fact, discriminates between old and new buildings; new buildings will get full depreciation, but existing buildings only partial depreciation, varying with their age (and with the amount of the existing allowance) at the date of the change-over. For example, a building that is 40 years old at the appointed day will be

allowed 2 per cent per annum during the next ten years of its life, which, added to the 25 per cent already received (assuming the old allowance to have been equivalent to 1 per cent of the original cost), will give a total depreciation allowance of about 45 per cent. A building that is 30 years old at the date of the change-over would, on the same assumption, be given a total allowance of about 65 per cent. The effect of these provisions on cotton spinning mills has been assessed by the Federation of Master Cotton Spinners' Associations. The calculations reveal that almost 60 per cent of the existing mills will be allowed only 30 per cent of their cost; 15.3 per cent will receive between 30 and 45 per cent; 21.3 per cent will receive between 45 and 65 per cent; and only 4 per cent will receive upwards of 65 per cent. There may be a case for more lenient treatment, to assist traders to accumulate funds for replacement. But there is no justification for granting full depreciation on all existing buildings; this might retard rather than speed up replacement.

The third criticism is, perhaps, the most substantial one. Hitherto traders have been granted depreciation allowances in respect of plant and machinery, and, if it was sold second-hand on replacement, the price obtained by sale has been deducted from the final allowance. There was no provision that enabled the Government to reclaim the depreciation allowances already granted if the second-hand or scrap value of the plant exceeded the amount of the final allowance based on the original cost.

The new scheme retains the principle of the final, or balancing, allowance on replacement. But it also introduces its counterpart, that is, a balancing charge; that is to say, where the proceeds of sale exceed the expenditure still unallowed, a balancing charge is to be made in respect of the excess of the price over the written-down value, though the amount of this charge is not to exceed the allowances previously given. The effect of this may be serious. If prices have risen during the life of a machine, not only is the owner not allowed to accumulate, free of tax, more than the original cost, but he is also now to be deprived of any capital profit he may make in selling his own machine second-hand. Traders who replace their equipment after the war will be worse off under the new scheme than they were under the old.

This treatment of capital profits arises from the fact that depreciation allowances are based on original rather than replacement cost. During a period of falling prices, that is, when the cost of replacement is lower than the original cost, the trader gains; but when, as a result of inflation, the value of equipment rises, he loses. And since the present period is one of rising prices, traders will be deprived of the rise in the value of second-hand equipment they may wish to sell, although they will have to pay the inflated price for new machinery. The price that will have to be paid for new plant after the war may often be double that of the original cost of the existing plant; in other words, tax-free profits set aside for replacement will cover only about half the cost of new plant. This is a serious matter that raises the whole issue of protecting industry from the effect of rising prices. The Chancellor of the Exchequer might argue that there is no justification, in equity, for discriminating in favour of industry during a period of inflation. But it might be replied that, in order to encourage a rise in productivity through modernisation, industry does deserve special treatment—the more so since major inflation of prices is usually the result of state action, while deflation is associated with depression, when industry needs every encouragement it can get. Other countries have found it advisable to give protection from the effects of inflation; in France, for example, the Government decided in 1939 to grant special allowances for the rise in prices, over and above the ordinary depreciation allowances. In view of the rise in prices since 1939, and the prospect of a further increase, the arguments in favour of some form of protection deserve careful examination.

These criticisms do not detract from some of the solid benefits that the Bill confers on industry. But they are enough to show that, even within the limits set for it, not all its provisions are favourable. And the limits set for it are the narrow ones of orthodox financial accountancy rather than of the more elastic conceptions of economic policy that have been in evidence in other parts of the Budgetary process in recent years. The Chancellor of the Exchequer shows a tendency to speak of the Income Tax Bill as if it were a major contribution to industrial policy. It is nothing of the sort. It is a useful, but quite minor, measure—and even so it has some bad provisions which ought to be altered. The major task of re-examining the structure of taxation so as to minimise the impediments to economic progress still remains.

SCHUBERT: *Symphony No 8 in B. Minor*

Brilliantly played by the National Symphony Orchestra under the conductorship of Anatole Fistoulari, this suite of three Decca records will recreate in your own home the superb melody, harmony and instrumentation that make this composition one of Schubert's finest orchestral works. It is a poignant, affecting masterpiece recorded with care and understanding, as thrillingly alive as an actual concert hall rendering: memorable recordings of what is probably Schubert's most popular composition.

Business Notes

The Budget and the Market

Despite all the talk of a fall in equities being due, the last few days before the Budget saw a further advance in prices. There are two daily indices of industrial equities, and both have now established new high levels. It is true that the figure of *The Financial News* (July 1, 1935 = 100), which now stands at 118.0 against last year's peak of 116.9, owes something to the large movements in the shares of Callender's Cable; it is also a fact that the new high is due to larger dividends rather than to a conviction on the part of the investor that he must accept lower yields. Nonetheless, new levels have been established by the more sensitive indices, and it only remains to be seen what the more comprehensive figures of *The Actuaries' Investment Index* will show.

Very little had been expected from the Budget in the way of changes in taxation, and in the event it appears to have been taken as a bull point by the market, which was rather more active and buoyant after it than before. There are two justifications for this. One is the relief from double taxation, and the other is the virtual certainty that the Budget is to be considered only as an interim statement. It is being confidently predicted in some quarters that there will be considerable reliefs before April next, and this has influenced the jobbers if not the investing public.

It is, however, doubtful whether there is anything in the immediate outlook to justify the rise of 0.7 in the index of *The Financial News* which occurred on Wednesday. The rise appears to have been based on a moderate amount of buying and a good deal of marking up by jobbers who have for weeks past been trying to keep their books level. There is little doubt that some of the buying in the past few days has been by those who hope for a quick profit, and it cannot be said that, so far, there is a clear indication that a new rise of major importance is impending.

Double Taxation Relief

From the standpoint of trade and industry, Sir John Anderson's second Budget is far from barren, for it was the occasion of making public the Treaty with the USA on the avoidance of double taxation and the prevention of evasion. The Treaty, which is the result of conversations lasting many months, covers all taxes on income, and there is a second Treaty covering death duties. There is an important provision, Article XX, for exchange of information, but nothing given in confidence may be disclosed to anyone whatever outside the taxing authorities of the two countries. The effect of the Treaty is to abolish double taxation, making the total tax payable that appropriate to the recipient under the laws of the country of residence. This is done, in most cases, either by crediting tax payments in the country of origin of the income against tax due in the country of receipt, or by complete reciprocal exemption from tax. The Treaty covers income receipts of every sort.

While the effect on the trader and the industrialist is easily stated, the provisions regulating whether the relief is financed by the UK or the US Treasury are complex and take up two White Papers (Cmds. 6624 and 6625). Broadly speaking, it seems that the US authorities have been not ungenerous, even when it is remembered that relief to their own nationals is of long standing. Under the provisions it will make a substantial difference to the British Treasury whether such business as buying and selling in the USA is done through an American firm or through a branch of the British firm established in the USA. It is to be hoped that this will not mean any discouragement to the setting up of American branches.

Great as are the direct advantages of the Treaty, they by no means limit its possible effects. It has long been confidently expected that an Anglo-American agreement would lead to similar arrangements with other countries. Sir John Anderson indicated that there was hope of conversations with the Dominions this summer, and it is known that more than one of the Western European countries is anxious to open negotiations. Dominion tax relief is not at present fully operative, since net payments far in

excess of 10s. in the £ have to be made in some cases, notably Australia, even after the British Treasury has granted the full relief permitted.

There is one anomaly in connection with double taxation relief which it would be as well to clear up. At present, where Dominion tax relief has the effect of reducing the rate of British income-tax payable by a company, tax is deducted from preference dividends, as well as from ordinary dividends, at the reduced rate. The tax paid overseas appears in the accounts as a reduction of net profits and is therefore paid by the ordinary shareholder, but he has to share the corresponding relief with the preference shareholder. This is quite illogical and unjust, and since the amounts involved may in future be large, the opportunity should be taken to change the present law. Tax should always be deducted from preference shares at the full standard rate, and double taxation relief should accrue entirely to the equity holders. There are some phrases in the Treaty that suggest that this is the intention.

Industrial Alcohol

The report of the Industrial Alcohol Committee, appointed by Sir Kingsley Wood in January, 1943, with Lord May as chairman, has brought to light some curious and little-known anomalies. Broadly, there are two kinds of distilleries, that is those producing whisky and other potable spirit from malted or unmalted grain, and those producing alcohol for non-potable (that is, mainly industrial) purposes from molasses. In both sections of the industry the Distillers Company holds a dominating position.

To prevent the evasion of duty and to facilitate revenue control, the Spirits Act of 1880 subjects distilleries of both categories to certain restrictions on operations that tend to raise costs of production above the level that would obtain if there were no restrictions. In order to compensate distillers for the artificially inflated cost of production, an allowance was given by the Government in respect of whisky exports. In 1902 this allowance was fixed at 3d. a proof gallon. In 1906 the allowance was extended to all industrial alcohol, and in 1921—this time as a protection, that is "for the purpose of equalising the conditions as against the spirits of foreign manufacture"—it was raised to 5d. a proof gallon. Since then, the demand for industrial alcohol has risen by leaps and bounds; the amount on

which the allowance was payable increased from 4.6 million proof gallons during the financial year 1920-21 to 43.6 million in 1938-39 and 50.1 million three years later; and the amount of the allowance exceeded £1,000,000 a year during 1939-41. During the same period the profits of the Distillers Company showed a marked improvement. The Committee says quite bluntly,

it is evident that the Distillers Company was before the war in a position to dictate, and in fact did dictate unchallenged, the prices of Plain British Spirit to the users whom it supplied direct and to the methylating concerns whose charges for methylated spirits it controlled also. Obviously it could, if it chose to do so, obtain directly or indirectly for itself some part, if not the whole, of the allowance by means of the prices it charged. Effective competition there was none; the only restraint was that imposed by considerations of business expediency.

The Committee "was disposed to think" that the company could have supplied its consumers (of industrial alcohol) at "lower prices than were actually operative and still obtained reasonably satisfactory results from this part of its operations." It expresses the view that, if the cost-raising Excise restrictions on operations are permanently relaxed (they have been relaxed during the war), even the nominal justification for compensation would disappear. It is hardly surprising, therefore, that the Committee recommended the withdrawal of what amounted, in effect, to a subsidy of 5d. a gallon, and that the Chancellor of the Exchequer promptly adopted the suggestion in his Budget Speech on Tuesday. But it is surprising that an anomaly of this sort was not "discovered" and removed long ago, especially if, as the Committee believes, its removal is not likely to affect adversely the production or consumption of industrial alcohol, and if its existence tended to discourage research and the development of other methods of production.

More Treasury Bills

The tender issue of Treasury Bills will be increased next week from £110 million to £120 million. Apart from a temporary rise to £120 million for four weeks last October and early November—designed to give the money market an excess of bill maturities over the new issue during the heavy tax payment period at the end of January—the tender issue has been maintained at £110 million for very nearly a year. The new increase will almost certainly be permanent. Indeed, it will be surprising if there is not a further increase to £130 million or £140 million in the near future.

The yield from taxes is at a nadir during the first quarter of the financial year necessitating, during war-time particularly, heavy borrowing to meet Government expenditure.

STAGGERED WORKING HOURS SHORTEN QUEUES

... they go even further than that. Experience has shown that staggered hours mean better timekeeping, less crowding on trains, buses and trams, less weariness and more comfort. The thought may have already occurred to you... but have you done anything about it? London Transport's Commercial Manager will be pleased to explain how your firm can help. Write him at 55, Broadway, S.W.1.

ture. An expansion of the tender issue of Bills is one method of floating debt borrowing which has been used for the last two years at about this time. In April, 1943, the weekly tender was raised, in steps, by £15 million to £90 million, and in April, 1944, by £20 million to £110 million. This year the absence, so far, of a summer savings campaign will presumably mean even greater reliance on floating debt borrowing to meet the current deficit, and a rise of as much as £30 million in the issue would not now appear excessive. A £20 million increase would take the total tender issue outstanding up to the record of £1,690 million, compared with the present level of £1,430 million.

Treasury Bills and Deposit Receipts

An expansion in the tender issue of Treasury Bills is in any case desired from other considerations, particularly by the banks. During the three years to the end of last month, the clearing banks' holdings of TDRs have risen from 15.7 per cent to 37.7 per cent of their deposits. During the same period their money market assets—bills, and money at call mainly lent against bills—have declined from 9.7 per cent to 7.4 per cent of their deposits. The clearing banks' holdings of bills alone show an absolute decline from £163 million to £149 million during this period, despite the big expansion of credit.

In part this has been due to the fact that previous expansions in the tender issue have largely found their way to "special customers" at the weekly tender comprising, in the main, overseas central banks with accumulating sterling balances. One at least of these institutions will shortly have heavy payments to make on the conversion-repayment operations with regard to Australian loans. This may enable the clearing banks to increase their bill portfolios more easily. There is certainly a strong desire on the part of the banks to provide a greater part of the additional credit required in the form of bills, and less in the way of TDRs. It may be surmised, however, that the authorities have a preference for the longer-dated TDR. The increase in the bill issue may indeed prove the signal for raising the limit for TDR calls above the £150 million which has previously been the highest level for a week's new TDRs.

Engineering Wage Award

The National Arbitration Tribunal, working with unprecedented speed, has awarded an increase of 4s. 6d. for a 47-hour week on the basic rate of all adult male time and piece workers in the engineering industry. The claim put forward by the National Joint Trades Movement of the industry, which had been turned down by the employers and referred to arbitration, was for an unspecified "substantial" increase in basic rates.

The award does not apply to women, unless they are already receiving the "rate for the job" on men's work. It will bring the basic rate for skilled time workers up to 70s. 6d., excluding the national bonus of 25s. 6d., which remains unchanged by the award. The basic rate of skilled piece workers will likewise become 70s. 6d., plus their national bonus of 17s. 6d.; but for these workers, it means that, as provided in Award No. 326 of 1943, a worker of average ability will have to earn at least 27½ per cent over the new basic rate, instead of over the old one. The award does not affect time workers' lieu rates, individual merit rates, compensatory or other bonuses. It stipulates that the new rates are minima, and shall not be operated to reduce the rates of workers who are already receiving higher rates.

It is too early yet to estimate the industry's reactions or to see whether Award No. 718 will give rise to the same kind of difficulties as its predecessor No. 326. The increase will probably not go far to compensate for the loss of earnings caused by the reduction of overtime, Sundays and holiday workings, which will disappear with the end of the war. Moreover, piece workers who were earning well above 27½ per cent on the old rate will not be affected, and may well express dissatisfaction when they find that their pay packets are not automatically increased by 4s. 6d. next week, when the award comes into force. On the other hand, the award represents an advance on the basic rate, and not, as often previously, only on the national bonus.

It is difficult to estimate its cost to the industry, but

BARBADOS

IN the year 1605 the English ship "Olive Blossom" touched at the Island. Later, Barbados became the first British Colony in which the sugar cane was planted and remains to this day primarily a sugar producer.

The Elected House of Assembly of Barbados dates from 1639. For more than 300 years representative institutions have flourished in this Caribbean outpost, which is about equal in area to the Isle of Wight. This island has a population of 200,000, and the Bank has been established at Bridgetown since 1837.

The average annual value of its external trade for the years 1935-39 was approximately £4,000,000. Those concerned with trade in the West Indies, Africa, or the Mediterranean are invited to communicate with:—

EVERY THIRD HOUSE

One house in three in England and Wales is owner-occupied. When the war is over many other people will desire to purchase new houses for occupation. It should be an aim of public policy to ensure that this demand is satisfied as soon as practicable after the war. The Abbey National, in common with other building societies, will be ready and willing to help those concerned.

ABBAY NATIONAL BUILDING SOCIETY

on the assumption that engineering continues to employ about two million workers, the cost could hardly be less than £20 million a year, at a time when the expansion in exports will be a high priority and when the Chancellor has issued a warning about the need for maintaining the relation between wages and prices. The important thing now is to ensure that the industry will take every possible measure to improve its efficiency, so that higher wages can be matched by increased productivity. At the same time, it would be desirable if the employers and unions would agree to the long overdue simplification and standardisation of the industry's wage structure.

Hard Work

At the annual meeting of the Rugby Portland Cement Company the chairman, Mr Halford W. L. Reddish, emphasised the dependence of the prosperity of the cement industry upon that of the country as a whole. He said, for example:

I am an optimist, and I have great faith in the inherent commonsense of our people . . . if the facts are put clearly before them. But I refuse to subscribe to the facile optimism of those false prophets who paint roseate pictures of Utopia round the corner, but fail to point out that there is one way, and one way only, to the achievement of anything worth having in this world, and that is by what it is too often, alas, unpopular in these days to describe as hard work. . . . Production per man-hour in all industries must be increased, partly by the ruthless scrapping of obsolete machinery and the installation of the most efficient plant in its place, partly by the enthusiastic co-operation and a growing pride in the job on the part of the operatives themselves.

The words spoken by Mr Reddish reveal an acute perception of the conditions of Britain's prosperity after the war. They also reflect a legitimate concern in the prosperity of his industry; obviously, the greater the prosperity of the country as a whole, the bigger is likely to be the sale of cement. What is true of cement is also true of a whole range of other industries. Does Mr Reddish's blunt speaking herald the conversion of British industry to a policy of expansionism?

During the next few years the closely organised cement industry will be in an exceptionally strong position. Its capital costs are high, and since the price of equipment has risen appreciably since 1939—it has nearly doubled—new entrants into the industry would have a tough time, so long as selling prices are not fixed too high. But the advantageous position of the industry carries a special responsibility to the consumer. It remains for the industry to live up to its responsibility—and to the exhortations addressed to the community at large by one of its spokesmen by contributing its share to the prosperity of the country as a whole.

Prospectuses for Placings

The new regulations for "placings" concluded between the Treasury and the Council of the Stock Exchange, have

been considered in detail by the legal advisers of the latter who have expressed the opinion that this new type of placing constitutes an offer for sale to the public under Section 38 of the Companies Act 1939. In so far as this argument is valid, it is a welcome outcome of the negotiations, since it means that brokers responsible for placings will have to provide information corresponding to that required under the Act in a prospectus. It would seem that everybody who is invited to take up stock under a placing must be provided with a copy of this information.

So far so good, but there is nothing in the new market regulation announcing this requirement which touches on the question of providing information to the public. If, after the lapse of the six months prescribed under the arrangement, permission to deal is sought, it is quite clear that the information provided for the original applicants ought to be made available to all investors and brought up to date. This is so, not only because any other practice gives an unfair advantage to one investor over another, but also because only by the widest advertisement can the best terms be secured. It is true that the benefit will enure to the original holders of the stock, but this fact will affect the terms which they will accept from would-be raisers of capital in the future.

It is on this point that the present policy of the Treasury is in conflict with the best of pre-war practice and, it is contended, with the national interest. The greatest benefit from a fall in the rate of interest arises, not from the cheapness of Government borrowing, but from a general fall in the cost of obtaining capital. The smaller the Government's share in total national expenditure, the more important it is to have efficient machinery for new issues.

Stock Exchange and the Public

Some encouragement is given to the hope that information, available to the Stock Exchange, will be more widely disseminated in the future by a statement made by Mr Uring Clark at the meeting of proprietors on Tuesday. Touching on relations with the public, he said that:

the Council had appointed an influential Committee of Information and that it was hoped that through the co-operation of the press the real value of the services rendered by the Stock Exchange to the public would become more widely known and be better appreciated.

In fact, on the larger issues, members and officers have for some time past worked hard to see that misunderstandings were avoided, and with some success. There remain, however, many matters of daily routine on which information might be more widely disseminated and explanations more readily obtainable. With the change in outlook on the need for public enlightenment, all that remains is to provide an adequate channel of information and to see that everything of interest flows through that channel. With this object in view, it is understood that an existing officer of the Exchange is to be charged with the duties of Public Relations Officer, in which he will have the backing of the Committee of Information and the assistance of experts.

The development of the PRO is probably still in its infancy. In individual cases, success has almost always been greatest when his duty was that of giving and elucidating news, rather than pushing a line of policy. Without suggesting that the Stock Exchange can hope to avoid falling into some errors in this matter, an acquaintance with those who are backing the movement suggests strongly that they believe familiarity with the facts is all that is required to establish the value of the services which they render.

Scottish Banker's Death

The death of Sir William Whyte, director and until a year ago general manager of the Royal Bank of Scotland, removes one who, apart from other claims to distinction, is associated with the outstanding development of Scottish banking during this century, namely, the peaceful penetration of a considerable area south of the border. His passing will be regretted in both London and Edinburgh, but it is possible that his name will be associated with these developments long after his friends have ceased from their labours. After the early struggles between the English and Scottish bankers had ended in a compromise on the basis of the latter

restricting their operations in England, with one or two minor exceptions, to the opening of offices in London without right of note issue, there were few further developments until 1918. Between then and December, 1923, the capital of four of the eight Scottish banks was purchased by members of the London Big Five. In the following month the Royal Bank reversed the direction of the invasion by buying outright the business of Drummond's, the London bankers.

It was at that moment that William Whyte, for some time joint manager in Lombard Street, became sole manager there. It is difficult to say how much he may have been concerned in the taking over some six years later of Williams Deacon's, with the Burlington Gardens branch of the Bank of England thrown in as a douceur. Relations between the Bank and the "Royal" have always been close; in 1930 it was still thought undesirable to add to the hold of the Big Five, and there were reasons why neither of the other Lancashire banks should take in their competitor.

Whatever the actual reasons for the Williams Deacon's purchase, the acquisition of Glyn Mills in 1939 was clearly a triumph for Sir William, then general manager. The principal reason for a fusion was the pressure of taxation and especially death duties. There was at least one other Scottish bank which was, or should have been, in the running, but the "Royal" retained its monopoly of participation in the English banking system. It is difficult to envisage any great further development on these lines, but it is symptomatic of the difference in national temperaments that, while the Scottish banks have invaded the West End of London, it is hard to believe that any English bank would have the temerity to open a branch in Edinburgh or Glasgow.

Oil Tankers

The United States Maritime Commission's cancelling last week—at the direction of the Office of War Mobilisation and Reconversion—of existing contracts for the construction of 30 of the 126 oil tankers scheduled for completion in the US is an indication that oil tanker needs are, for the time being, considered adequate. During the past four years the world's tanker fleet has known metamorphosis. Immediately before the outbreak of war, Lloyds Register showed 1,731 vessels, of 11,436,850 gross tons, of which 435, comprising 2,919,566 gross tons, were British-owned; 421, of 2,800,780 gross tons, American owned; and 272, of 2,117,381 gross tons, Norwegian. In spite of the severity of British and Norwegian wartime losses, it is probable that the present world tanker fleet still equals the pre-war fleet in tonnage, whilst greatly exceeding it in carrying capacity.

The oil tanker supply position, at one time extremely critical, may now be considered well secured. In the period from January, 1940, to December, 1944 inclusive, the US built some 600 oil tankers, of 9.5 million deadweight tons, the equivalent of between 6 and 7 million tons gross; a considerable number was built also in Britain and Canada. Most of the American-built tankers have been of the standardised T2 and T3 types, with a deadweight of over 16,000 tons, carrying capacity of around 140,000 barrels, and a speed of 14 to 15 knots per hour. Each may be held to equal in performance two pre-war tankers of about 11,000 tons deadweight, with 100,000 barrels carrying capacity, and a speed of 9 to 11 knots. It can safely be assumed that the new British-built tankers are by no means inferior in quality to the American. The distribution of oil has been further improved by the use of pipelines between geographical points formerly serviced by tankers; and also through the re-opening of the majority of the direct oil sea-routes.

Post-war conditions of oil transport, aided by war-built pipelines, may indeed show a world surplus of tanker tonnage, along with maldistribution among the nations of the available tanker resources. Recognising this impending problem, the United States has already transferred some tankers to Allied flags. Britain and Norway, in particular, will look for American co-operation in their endeavour to raise their post-war tanker tonnage to at least the 1939 level.

Valuation for Fusions

Two fusions of some interest are at the moment before the investors concerned. In one, that of British Insulated Cables and Callender's, the preliminary statement implies that the terms of the fusion are based on the recommenda-

tions of a committee consisting of a member of each of the firms of auditors to the two companies and of two outside auditors. In the case of the other, the offer of Transport Services to take over McNamara and Company (which has now lapsed owing to an inadequate number of acceptances), the chairman of the latter, Sir Maxwell Hicks, has just stated that no outside opinion was sought because the opinion of anyone not familiar with the particular circumstances of the undertaking would not have been advantageous and might have been misleading.

This suggests that an independent auditor would not have found the terms offered reasonable unless he had been given information which one or other of the parties to the offer either could not or would not disclose even in confidence. It is of course always the case that there will be refinements which it is impossible to convey to those with no intimate knowledge of a business. But is that necessary to arrive at a working idea of the relative worth of two concerns? A study of detailed accounts over a period of years will provide a great deal of the material to foretell the future, so far as that is possible. New factors are also susceptible of estimation, if not of measurement, and it is difficult to believe that the opinion of an expert is of less value in this field than in many others into which the unpredictability of human behaviour enters. In any case it is likely to remain the fact that schemes backed by independent opinions will be more readily accepted than those which are not.

Reinstatement in Industry

The Industrial Welfare Society, in devoting the current number of its *Journal* to a review of reinstatement problems, has performed a valuable service to industry. It does in effect for the "user" of labour what the Ministry of Labour's recent handbook does for the serviceman and approaches the issue from an industrial angle. The smoothness of the demobilisation process will depend largely on the extent to which industry can satisfactorily absorb the men and women released from the Forces, and it is therefore essential that employers as well as employees should know where they stand.

POWER SUPERSEDES HUMAN EFFORT

WE live by bread. But from time immemorial corn was cut and gathered by manual labour. So man's ability to feed himself was limited by the small scope of his two hands. Symbolic of our more enlightened age are those mechanical devices which help agriculture and BRUSH ELECTRICAL

EQUIPMENT plays an ever-increasing part in their production. In this, as in most other departments of human activity where electrical power has replaced manual labour, BRUSH is a name respected for its integrity and reputation for sound workmanship.

The Reinstatement Act provides that an employer shall reinstate a former employee in his old occupation on terms and conditions not less favourable than he would have enjoyed had he not been called up. This raises a number of difficult questions—is the old occupation still in existence? How can it be determined what position a young man would have reached with the firm if he had not been called up?

Problems such as these, and the questions of training, ranging from refresher courses to completely new occupational training, are dealt with in the IWS brochure, which stresses the importance of enlisting the co-operation, not only of foremen and departmental heads, but of all the employees in the firm. The reinstatement problems may not arise in acute form for some months, for there may be a considerable time-lag between the end of hostilities and demobilisation, but to be forewarned is to be forearmed, and firms might well study the schemes and their implications well in advance.

Higher Wages for Cotton Operatives

Some 200,000 Lancashire operatives in both the spinning and weaving branches have been awarded flat-rate increases in wages of 7s. a week for adults and 4s. a week for juveniles. The trade unions originally applied for 11s. for adults and 5s. for juveniles. After extended negotiations, the matter was submitted to the Conciliation Committee. Since the two sides could not agree, Sir Charles Doughty, the chairman, was asked to make an award. The increased wages will come into operation on the pay-day in the week beginning June 11th on earnings in the previous week.

Since the beginning of the war wage rates have been raised by an addition of 35 per cent to list rates and by an addition to flat rates of 10s. a week for adults and 9s. for juveniles. Earnings will now be approximately double those of September, 1939. It is estimated that the latest rise will mean an increase in labour costs of about £3,000,000 a year. It is understood that Sir Frank Platt, the Cotton Controller, is considering the revision of controlled prices for yarn and cloth in view of the prospective rise in labour costs, and that the revised margins will be announced early in June.

The cotton industry is suffering from an acute shortage of labour, which threatens serious difficulties in supplies of all cotton goods. It is reported that Mr Ernest Bevin has suggested that the employers should be prepared to establish a guaranteed wage of £4 a week for men and £2 15s. a week for women. This proposal is now being considered.

Bacon and Eggs

The welcome announcement has been made that farmers are to receive larger rations for pigs and poultry. The allocations are to be increased by stages, beginning on June 1st, until in May, 1946, rations will be calculated on the basis of one-third of pre-war numbers. In addition, the acreage deduction from rations will be discontinued on June 1st for pigs and on September 1st for poultry, and the chick ration is to be restored on June 1st.

These measures will have no immediate effect on output. They are by way of being preparatory to increases it is hoped to obtain from the early part of next year. The immediate task is the revision of pig and poultry breeding programmes to absorb the larger rations.

The decision to increase domestic production of pig-meat and eggs has been taken partly because of the prospective world meat shortage. Thus there is no guarantee that the consumer will benefit from it. On the other hand, it is hoped that the allocation of eggs to ordinary consumers will be better this year than last, since larger imports are expected from Canada.

Agricultural Machinery

One of the reasons for the increased agricultural output during the war has been the more intensive use of machinery by pooling and other arrangements, and the increase in the number of machines in use. The Ministry of Agriculture has just published returns of the numbers of certain types of machinery owned in Great Britain in 1942 and 1944. The

more important machines are shown in the accompanying table. The figures are the estimated numbers owned by farmers, agricultural contractors, and county war agricultural executive committees. Unfortunately, it is not possible

AGRICULTURAL MACHINERY IN GREAT BRITAIN			
Machine or Implement :—			
	1942	1944	
Tractors.....	116,825	172,770	
Ploughs.....	465,425	466,815	
Disc harrows.....	33,850	58,845	
Cultivators and grabbers.....	161,690	191,355	
Combined corn and fertiliser drills.....	8,200	12,695	
Fertiliser distributors (over 5 ft. wide).....	60,380	68,730	
Potato splinters.....	37,030	53,440	
Binders.....	131,665	143,880	
Combined harvester-threshers.....	1,000	2,500	
Milking machines.....	29,505	37,770	

to compare the detailed figures with the pre-war position, but the number of tractors in use in 1939 is estimated at 55,000.

There is room for considerably greater mechanisation in British agriculture. The Ministry of Agriculture is sending a mission to the United States and Canada to obtain the latest information about agricultural machinery development work, and to study the general trend and state of mechanisation. The party will visit research centres and colleges, and manufacturers and farmers during their three months' stay in North America. They should return with valuable information, although the different size of the average farm in Britain and America means that, short of a reform of lay-out, some machines can only be of limited use here.

New Crittall Finance

When dealing some weeks ago with the projected installation of an important new light rolling mill by Darlington and Simpson Rolling Mills, it was pointed out that this group was an associate of Crittall Manufacturing. It is, therefore, not surprising to find that the latter company is now making an offer of new capital to its shareholders in order to provide a part at least of the necessary finance. The operation is to be combined with the repayment of some £800,000 odd of 4½ per cent first mortgage debenture stock, which is repayable at 107½ and will call for £854,967.

To provide the money, holders of existing ordinary shares are offered one new share of 5s. for every share now held at 22s. 6d. per share. As the current price is about 38s., it can hardly be maintained that there is no element of bonus in the terms, but Treasury consent has been obtained. The issue will raise £1,406,250 gross, leaving, after repayment of the debentures, some £550,000 in cash. It is stated that the relief from the debenture service will provide savings equivalent to 20 per cent on the nominal value of the new ordinary capital to be issued—£312,500—and, as 20 per cent has been the ordinary dividend for each of the past three years, it should be possible at least to maintain the rate on the increased capital.

A Non-Ferrous Metal Federation

The tendency of the members of individual industries to group themselves into associations and federations has been given a strong fillip during this, as during the last war. It still continues. The latest addition to the species is the British Non-Ferrous Metals Federation, formed this week by over 150 firms in the industry.

The inauguration of the new Federation was accompanied, as usual, with a statement of good intentions. Its primary object is to assist in the reorganisation of British industry by the creation of

a fully organised industry to which Government direction can be applied as a whole and not to a collection of competitive firms, big and small, each fighting the other for its very existence.

What does all this mean? Does the new Federation really invite Government direction or is its real object the control of prices—it is to ensure "fair trading" within the industry—and the elimination of competition? In other words, is its object to be "enterprise," with "freedom" to fix prices to the consumer?

True, the statement issued by the Federation also mentions what should be the real objectives of trade associations.

THE PRESIDENT'S ADDRESS

The past year was marked not only by the brilliant military exploits of the Allies, but also by a series of international meetings, of which the Middle East Financial Conference in Cairo, the International Labour Conference at Philadelphia, the Monetary Conference at Bretton Woods and the Security Conference at Dumbarton Oaks deserve special emphasis.

These conferences bear witness to the increasing interdependence of political, economic and financial problems, which assume greater importance as hostilities draw to their close, and one can but hope that they have helped to establish among nations a spirit of solidarity, with which they were not always imbued in the years between the two wars, and to open at last the way towards frank co-operation in the universal interest.

Much has been written on the question of the balances which have been accumulated in sterling during the war, giving rise to considerable misunderstanding. The dimensions of the subject are such that I can

hardly deal with them on this occasion, but I should, nevertheless, like to stress in the first place that our creditor position is one of strength, and, secondly, that the process of its liquidation is not dependent on skilful financial adjustments.

I, therefore, think it prudent to confine ourselves to-day to the declarations of the responsible authorities in Great Britain and Egypt, who have let it be understood that the question is viewed by both countries in a spirit of mutual understanding and friendship which safeguards the interests of Egypt.

COTTON CROP AND PRICES

Last year's cotton crop is estimated at 4,483,000 cantars, including Scarto, that is some 914,000 more than the 1943 crop. The yield per feddan was 5.15 cantars, against only 4.90 in 1943. On the other hand, the average grade of the crop was slightly lower than the average of previous seasons.

Official buying prices were 20 per cent. above those of 1943, and private transactions reached even higher levels. Stocks, as you know, are considerable, and at the end of February were estimated at 11,413,000 cantars, or 1,109,000 larger than at the end of February, 1944.

Last year's rice and maize crop, compared with those of 1943, were superior both in quantity and yield. This was especially so in the case of maize, with an outturn of 11,000,000 ardebs, against 9,800,000 the year before, and an average yield of nearly six ardebs per feddan, against five ardebs in 1943. On the other hand, the millet harvest was not quite so favourable. The official prices of those foodstuffs were 8.25 per cent. above those of 1943, and nearly three times higher than those of 1940.

Favoured by the continued abnormal conditions due to the war, the country's industrial production has been well maintained and the deficiency in manufactured goods of foreign origin has thereby to some extent been met. Certain of our industries have accumulated considerable financial reserves with a view to pursuing their activities after the war with renewed equipment. Industrial circles are accordingly already preoccupied with the possible effects of an eventual lowering of Customs duties throughout the world. Yet it is difficult to foresee to what extent this tendency will materialise in view of the complexity of the problems of every kind that it involves in each country.

BANK'S BALANCE SHEET

The balance sheet which we have the honour to submit to you to-day shows marked expansion in our figures. Deposits by the public have reached the record figure of £E.91,000,000, while the Government balance now totals £E.66,500,000. These figures, which provide further evidence of the continued increase in the monetary resources of this country and at the same time bear eloquent testimony to the confidence enjoyed by the bank, impose upon us the responsibility of maintaining a position of such liquidity that even in the most adverse circumstances no difficulty would be experienced.

You will observe that our money at call and funds with other banks amounted to no less than £E.33,000,000 at the end of the year, and I would again remind you that our securities include a very substantial holding of three months' British Treasury bills and other early maturities, the interest yield on which is, of course, comparatively low. Our advances, on which we earn a higher rate of interest, are now relatively small, but we have obtained a fair share of the total business offering, although suitable opportunities for the employment of our funds have again been very limited.

CLERICAL, MEDICAL AND GENERAL LIFE ASSURANCE SOCIETY

SIR FRANCIS E. J. SMITH'S ADDRESS

The annual meeting of this society was held in London on the 25th instant.

The following address was submitted by the chairman, Sir Francis E. J. Smith: The net new life business, and the life premium income were virtually maintained at the 1943 level; surrenders occurred, only upon a very low scale; expenses of management showed a further small reduction, and the life assurance fund rose, by about £120,000, to £16,121,606.

Claims by death, from normal causes, produced a satisfactory mortality profit, but this margin was considerably more than offset by the loss which resulted from further claims, amounting to just over £125,000, in respect of war service deaths and civilian casualties. The weight of these claims reflected the intensity and scope of the year's war operations, and arose, in the main, from contracts issued upon an unconditional basis prior to the outbreak of hostilities. They raised the total of war claims paid, in the years 1940-44 inclusive, to a figure of over £550,000.

I would like to draw special attention to the welcome improvement which occurred during 1944 in the gross and net interest income. The average gross rate of interest earned upon the society's assurance funds rose by 3s. to £4 9s. 7d. per cent., whilst the corresponding net rate increased by 2s. to £3 5s. 11d. per cent. The main sources of the increase in interest income were our property investments, including owned properties, mortgages and property company debentures.

THE FORTHCOMING BONUS

I should like, next, to refer to the prospects of the bonus to be declared one year hence. On the occasion of the last division of profits, which dealt with the five-year period 1936-40, a bonus was declared in respect of the three years 1936-38, but no distribution was made in respect of the two years 1939 and 1940, so that, a year hence, we shall have to deal with the accrued bonus rights of a seven-year period. Each year, since 1940, the financial position of the society has, in the opinion of the directors, justified the continuance of payment of intermediate bonuses, upon policies terminating by death, maturity or surrender and such bonuses, upon the level of the last-declared scale, have been, and are now being, paid. All I can say at this stage, is that the directors have every hope that, a year hence, they will be able to announce the declaration of a satisfactory bonus, in respect of the seven years 1939-45 inclusive.

THE VALUE OF LIFE ASSURANCE

Year by year, at these meetings, I have laid stress upon the unique merits of life assurance and, to its undoubted peacetime attractions there may be added, under war conditions, not only the virtue, but the necessity, of personal saving. Moreover, it would appear obvious that this necessity of saving must persist, and we look forward to being able to devise and offer, when the present emergency is ended, new and revised forms of policy, adapted to the changed conditions, and designed not only to attract new entrants but also to convince our existing policyholders of the wisdom of increasing their stake in the society.

In the meantime, to those of us who believe in the value of life assurance, it is most gratifying to find the flow of new business maintained so steadily in times when the number of our branches and of our outdoor staff is, of necessity, reduced to proportions which make it quite impossible for us to offer to our agents and connections the degree of attention and service to which we and they had become accustomed. I can assure them that their continued loyalty and support is warmly appreciated.

THE RUGBY PORTLAND CEMENT COMPANY, LIMITED

ENTERPRISE AND THE OUTLOOK A PROSPECTUS FOR PEACE MR HALFORD REDDISH'S SPEECH

The annual general meeting of The Rugby Portland Cement Company, Limited, was held on the 26th April.

In the course of his speech the chairman and managing director, Mr Halford W. L. Reddish, after dealing with the accounts, said:—

Although I am confident that the company is well equipped for a prosperous future in the post-war years, I must again sound a warning note as to the prospects for the current year. I cannot see any great expansion in the demand for cement until at least a year after the defeat of Germany. During 1944 there was a further substantial rise in production costs, due mainly to the increases in the price of coal. Under the authority of the Ministry of Works some adjustment of cement prices has now been made, and this will help us to a certain extent in 1945.

CONVERSION SUCCESS

Just before the end of the year we gave notice to repay on June 30, 1945, the whole of the £419,911 4s per cent. first mortgage debenture stock outstanding at December 31, 1944, at the same time offering to the stockholders the right to convert into a new 4 per cent. first mortgage debenture stock at 100 per cent. No less than 93.3 per cent. of the old stock was converted, which I am told is a record success for this type of issue. The authorised amount of the new stock is £500,000, with the right to increase in certain circumstances to £750,000. We shall therefore have, as far as can be foreseen, adequate amounts of debenture stock, preference shares, and ordinary shares available for issue to finance extensions in the immediate post-war period.

Since the date of the balance-sheet we have acquired a substantial portion of the share capital of Charles Nelson and Company Limited, cement and lime manufacturers, whose properties are adjacent to our own Southam Works in Warwickshire, issuing in exchange 25,000 preference shares of £1 each and £100,000 ordinary shares of 5s. each credited as fully paid.

PLANT EXTENSIONS

We may be fairly confident that this year will see the beginning of the real turn-round of industry from war to peace, and you will, therefore, no doubt expect me to give you some account of the factors likely to influence the future of our company.

Our plans for the extension of certain of our works are completed and only await the word "go." In this respect we are fortunate in that most of our present plant was installed only a year or two before the war, and is therefore modern both in construction and lay-out. The two completely new works which we built then were designed to accommodate the extensions which will be put in as soon as we are able to get ahead.

In this connection I think it only right to point out that for many years before the war it was the policy of the organised cement industry always to keep productive capacity ahead of demand, and to plan for the future accordingly. The building of new works and extensions of existing works has of course been suspended during the war years, and this leeway will have to be made up in the immediate post-war period, when the capital cost of new plant will be so much higher. Notwithstanding this, the cement industry hopes to achieve substantial reductions in the price of cement to the consumer when the post-war demand develops, because it is in a position to average the cost of new works and new extensions with the written-down values of obsolete plant with an annual

capacity of less than 125,000 tons was scrapped, while efficient modern plant was installed with an annual capacity of 2,250,000 tons. Had this not been done, the cement industry would not have been able to supply the cement needed for the war effort, nor would it be in a position to visualise reductions in price to the consumer when the post-war demand again enables it to reduce costs of production.

COAL AND TRANSPORT

But on the question of costs, I must draw attention to two factors outside our control which are bound to have a pronounced and cumulative effect on the future trend of costs and selling prices. In the first place comes coal, the biggest individual item in the cost of production. In one form or another, it takes something like 8 cwt. of coal to make a ton of cement. In the last ten years the price of kiln fuel delivered to our works has been multiplied by three: it has doubled since 1939. And there has been a considerable deterioration in quality. Further, I need scarcely point out that the price of coal also enters largely into the price of all our steel supplies and machinery.

Secondly comes the question of transport, which also affects the cost to us of all coal, steel, and other supplies entering the works, and is a very big item in the distribution of cement. It may not be generally realised that on average throughout the country about 20 per cent. of the cost of cement to the consumer is accounted for by the cost of transport from works to site. The cement industry is therefore profoundly interested in the future trend of transport costs.

As far as the home market is concerned, the emphasis will quite rightly be on housing for the next year or two, and until that period has passed and other forms of constructional work can be undertaken it is unlikely that the demand for cement in this country will reach the pre-war figures.

NEED FOR CLEAR THINKING

But the future of our company and of the industry to which it belongs is, of course, completely bound up with the future of our country, and that may well be shaped by our actions in the coming months. It is a time for clear thinking and stout hearts. I am an optimist, and I have great faith in the inherent common sense of our peoples, nourished, as it has been, by centuries of development and tradition, if the facts are put clearly before them. But I refuse to subscribe to the facile optimism of those false prophets who paint roseate pictures of Utopia round the corner, but fail to point out that there is one way, and one way only, to the achievement of anything worth having in this world, and that is by what it is too often, alas, unpopular in these days to describe as hard work.

We have won the struggle for the right to survive as a nation. We have now to win the struggle for existence in a world which will expect us to pay for our essential imports. The richer and fuller standards of life to which we aspire can come only from our own worthy endeavours. We shall have in this country in the years to come an unparalleled opportunity for achievement, but we must be bold and enterprising. To substitute security for opportunity in the life of the individual, as we are tending to do, is no creed for an Englishman with blood in his veins and breath in his body. Indeed, without the opportunity and the incentive to individual effort, "security" will itself prove to be but a mirage.

OPPORTUNITY FOR ALL

It is the business of Government to govern—to see that conditions exist in which the flower of opportunity for all can flourish; in which initiative and enterprise and hard work, whether of brain or brawn, will bring their due reward; in which every man, whatever his station in

life, is encouraged to rise by the merit of his own endeavours. It is as true to-day as ever it was that "whoever can make two blades of grass to grow where only one grew before deserves better of mankind and does more essential service to his country than the whole race of politicians put together."

Let no one delude himself into thinking that an easy time lies ahead. We shall pass from the period of blood and tears, but the stark necessity for unremitting toil will be with us for a long time to come. With a great part of our foreign investments gone, and therefore much of the invisible exports upon which we relied for our food in the past no longer available, we shall be dependent after this war almost entirely on our export trade for the means to pay for our necessary imports of food and of raw materials.

HARD WORK AHEAD

If, therefore, we are to maintain a reasonable standard of living, we must produce more and produce cheaply—and that means hard work. Production per man-hour in all industries must be increased, partly by the ruthless scrapping of obsolete machinery and the installation of the most efficient plant in its place, partly by the enthusiastic co-operation and a growing pride in the job on the part of the operatives themselves. It cannot be too often emphasised that what really matters is not the amount of currency in the weekly pay envelope, or the £ s. d. appearing on the monthly pay cheque, or the amount of the dividend, but what in cold fact can be purchased therefor. It must be realised too, that the State as such has no funds apart from those it collects in one form or another by direct or indirect taxation from us all, and that lavish expenditure by the Government simply means that you and I and every wage-earner are going to foot the bill between us, thus depreciating the real value of all incomes. Some alleviation as soon as is possible of the burden of taxation is an essential incentive to the revival of peace-time industry. The excess profits tax, which is admitted on all sides to have been imposed for political reasons, and which is bad in principle and uneconomic in effect, must be removed.

We have been forced to dissipate the accumulated wealth of centuries as the price of survival. We can replace that wealth, on which our standards of life depend, only by sheer hard work. Let us turn a deaf ear to the pseudo-intellectuals who chatter glibly of "full employment" and shorter working hours in the same breath. Work begets work; sloth, apart from its inherent dishonesty, can lead only to higher costs all round and a further depression of the standard of life.

UNITY AND STABILITY

Let us, then, demonstrate our conviction when we shape our economic destiny in the post-war world, that recognition of the dignity and freedom of the individual is the essential requisite for success in the difficult days which lie ahead; that anything which seeks to crush that individuality is despotism, whatever may be its fashionable name at the moment; and that we must shake off the icy grip of bureaucracy as soon as possible.

There is nothing in all this which need lead us in this proud island to fear the future. A nation and empire which entered the war at the call of duty before it was itself attacked and later faced alone the forces of evil for a whole year when all seemed lost need not be daunted by the magnitude of the task which confronts it now. Above all else we need a continuance of unity and stability at home, so that we may go confidently forward to meet the future with

"United thoughts and counsels, equal hope

"And hazard in the glorious enter-

TELEPHONE AND GENERAL TRUST, LIMITED

ROLE OF THE CAPITALIST TAXPAYER BENEFIT TO THE STATE

SIR ALEXANDER ROGER'S VIEW

The ordinary general meeting of Telephone and General Trust, Limited, will be held on the 2nd proximo in London.

The following is the statement by Sir Alexander Roger, K.C.I.E., the chairman, circulated with the report and accounts:

Profit at £120,463 has increased by £4,994. After charging £59,000 for income-tax, and providing for the usual preference and ordinary dividends, £77,175 is carried forward—an increase of £3,467. General investments have increased by £64,767, and investments in and loans to subsidiary companies by £10,820. There is an increase of £141,390 in cash. These reflect mainly the increase of £189,228 in loans at call from subsidiary companies, which amounted to £381,560.

Valuation of securities.—The valuation shows an appreciation of 15.74 per cent., compared with 9.15 per cent.; 81.4 per cent. of the investments are in the British Empire, with 18.6 per cent. in foreign countries, comprising mainly our interests in foreign telephone operating companies. Government stocks, debentures and loans account for 14.0 per cent., preference stocks (including subsidiaries) 16.8 per cent., ordinary 40.9 per cent. and subsidiary ordinary 28.3 per cent.

TELEPHONE OPERATING COMPANIES

Portugal.—Considering present-day difficulties, the standard of service rendered by the Anglo-Portuguese Telephone Company to its 64,000 stations has been well maintained. The Anglo-Portuguese Telephone Company, with which the trust has been associated for many years, continues to derive much benefit from the specialised knowledge and experience of the trust's personnel and its connections in all branches of the telephone business. Given suitable and stable conditions there is abundant evidence of the prospects for expansion and development.

Venezuela.—The Nacional Company of Venezuela, in which the trust has a substantial interest, both direct and through Telephone Properties, Limited, continues its steady progress, and had nearly 39,000 stations at December 31st last. The shortage of material remains a difficulty, but some exchange equipment is in process of manufacture, which will help to relieve the position, and it is hoped that this will prove to be the forerunner of further additions as the war situation eases.

West Indies.—In spite of maintenance difficulties, which have seriously increased after over five years of "make do and mend," efficient management under the guidance of our able consulting engineers has avoided any breakdown in the service of the various operating companies. The systems in Trinidad, Barbados and Jamaica, which give service to some 19,300 stations, are still seriously overloaded, and it is hoped that with the improvement in the war situation a speedy release of essential equipment and supplies required for the relief and extension of the systems will be permitted by the supply authorities.

JAMAICA TELEPHONE SYSTEM

The negotiations for the purchase of the Jamaica Government telephone system, which I referred last year, have not yet been finally concluded, but a draft agree-

ment of sale and new licence are now approaching their final stages, and, if agreed, will be presented for ratification to the new House of Representatives which was recently elected under the new constitution of Jamaica.

I am more than ever convinced that the establishment of comprehensive and efficient telecommunications throughout the West Indies is essential for the full social and economic development of the various communities; and I think it will be to the everlasting credit of the United Kingdom that, on top of the tremendous efforts and sacrifices made for the prosecution of the war, great sums have been allocated for Colonial development.

I am sure our friends in the West Indies realise just what a strain this imposes on the British taxpayer, and will recognise the necessity for Britain to regain and expand her business—home, Colonial and international—in post-war years. It is only thus that the British taxpayer—the man who provides the money—will be able to meet his obligations.

General.—The management of the trust, in spite of the difficulties occasioned by over five years of war, remains keenly alive to the acquisition of new business, and we continue to investigate all reasonable possibilities.

CAPITALISM—SAVINGS AND TAXATION

For two successive years I have shown, within the confines of a company address, that, whether we like it or not, we have become, through hard-earned savings, a nation of capitalists to a degree never hitherto reached or even dreamed of. The movement goes steadily on, in spite of the tremendous figures already achieved, with over £700,000,000 saved by the small investor alone in the past twelve months, while the total of small savings since 1939 has reached the astounding figure of £3,440,000,000.

These savings relate to deposits with the Post Office and Trustee Savings Banks, Savings Certificates and Defence Bonds. The Post Office depositors alone number about 19,000,000, while some 17,500,000 of the public hold Savings Certificates. In addition, vast increases have occurred in Government borrowing, and total National Debt has risen from £8,301,000,000 in 1939 to £22,416,000,000 to-day. All this has been found possible under the British system of private enterprise.

Capitalism is not confined to investors in Government stocks. One out of every three house occupiers in England and Wales owns his house. Even larger numbers own their own furniture, and in normal times, if not now, a bicycle, a motor-car, an insurance policy, an investment in a garage, a shop, and a thousand other things acquired out of savings.

A NATION OF CAPITALISTS

Not long ago capitalists were small in number; but to-day they embrace the entire nation; a nation which at the same time has become a nation of taxpayers, each citizen contributing according to his means. It can be said, without fear of contradiction, that no man, woman or child now escapes taxation in one form or another,

either by direct taxation on his income, on earnings, on savings and investments, or by indirect taxation wrapped up in the purchase and consumption of goods.

I have been looking at the returns of Government ordinary revenue and expenditure for the year to March 31st last, and I devoutly wish that every capitalist and taxpayer in the country would study and understand them. Ordinary revenue amounted to £3,238 millions and expenditure to £6,058 millions. The deficit of £2,820 millions was covered by borrowing.

Of the total revenue of £3,238 millions, £1,900 millions was raised by way of income-tax, surtax, and excess profits tax, while £1,076 millions came from customs and excise duties. Estate duties and motor vehicle duties accounted for £140 millions, stamps and wireless licences £22 millions, while miscellaneous receipts were £99 millions. Almost all of it came directly or indirectly from the capitalist-taxpayer—from the entire nation—and practically none of it arose from income on assets owned by the State.

It is significant that surtax produced only £74,000,000, which represents less than 2½ per cent. of the total revenue raised and is the smallest amount produced during the past three years. The ordinary income-tax payer has jumped from 3,800,000 in 1938-39 to at least 11,000,000, while he contributed £1,316,000,000, against £335,901,000 in the year to March 1, 1939. These are tremendous facts and they put beyond any shadow of doubt or argument that the State and its purse, the Treasury, have practically no funds wherewith to meet expenditure from any other source than the capitalist-taxpayer.

DEMOCRATISATION OF WEALTH

The democratisation of wealth has come to stay, but it must carry with it a universal sense of responsibility of ownership and of obligation to put the best we know into our jobs. It must not be supposed that with the extension of social services the need for the continuation of personal saving vanishes. The necessity for saving—the bread and butter necessity—for working, earning and saving to replenish capital used in the war remains, and it must never be forgotten that you and I—the taxpayer-capitalists—are the only source from which it can come.

If the true position were thoroughly grasped it would lead to the question whether the new world promised recklessly by the planners was going to result in Parliament demanding still more from the taxpayer or whether his burden of taxes will be lessened. This is a question that every elector should have clearly and categorically answered by his member of Parliament or the candidate who aspires to that very responsible and onerous position. It is your money, your possessions, and your way of life that the planner is planning to deal with.

Following the resignation of Mr L. D. Bennett, we were very pleased to invite Mr C. E. Bailey to join the board. He has for many years been associated with the trust as managing director of its associated company, the Nacional Telephone Company of Venezuela, and his wide experience of telephone operations and his great abilities will be invaluable to us.

Once again I would like you to join me in a special tribute to our staffs at home and overseas for their loyal and unswerving efforts. The burden upon those at home remains particularly heavy, but is being cheerfully borne, and our sincere thanks are due to everyone concerned.

UNITED KINGDOM PROVIDENT INSTITUTION

POSITION OF EXCEPTIONAL STRENGTH

COMPOUND BONUS FOR SIX YEARS

SIR ERNEST BENN'S STATEMENT

The annual general meeting of this company was held, on the 25th instant, in London.

The following is a summary of the statement by the Chairman, Sir Ernest J. P. Benn, Bt., circulated with the report and accounts:—

Since the last general meeting of members the Board has been strengthened by the election of Major T. E. Baring, whose appointment is now submitted for confirmation.

The balance-sheet, life assurance account, and the actuary's valuation all disclose a position of quite exceptional strength, on which the directors have felt justified in declaring a compound bonus of 25s. per cent. for the six years ended 31st December, 1944, and an interim bonus at the same rate for the current year. The bonus, taken in conjunction with our premium rates, puts a United Kingdom policy in the very forefront of reliable investments, whether considered from the viewpoint of cost or return. The mortality experience of the two triennial periods has enabled the actuary to recommend an additional 2s. to the rate of bonus payable to certain members of the temperance section.

HOME AND OVERSEAS INVESTMENTS

The rates of interest announced in the directors' report are calculated on the book value of your property and investments, would be appreciably lower if these were written up by current market prices, and are much above the rates now obtainable on new money.

Our overseas investments form just over 10 per cent. of our fund, as compared with nearly one-quarter in pre-1914 days. There is scope here for prudent investment in securities where the yield is commensurate with the risk. Our investment of nearly £7,000,000 in British Government and Government guaranteed securities reflects the not inconsiderable part we have played in aiding the war effort, but we cannot pretend that this investment gives us the yield we need. It is interesting to recall how one of my predecessors, Sir Thomas Whittaker, always emphasised the absence of British Government securities from our portfolio, until the start of the first world war. Our holding of ordinary shares accounts for approximately one-seventh of our assets and ensures to us an appropriate share in the prosperity of the country.

NEED FOR ECONOMY

The vastly swollen National Debt now amounts to 45 per cent. of the total value of private property in this country, and more than a third of it is callable within a year. This cannot be considered a healthy condition, and emphasises the urgency of a halt in the orgy of spending and the piling up of public commitments. The unrivalled stability of Britain has always depended upon the successful balancing of the Budget, and that dependence will be of even greater importance in the days to come.

As new-fangled theories, one after another, prove to be unworkable, the City of London is steadily regaining its pre-eminence as the historic repository of wisdom and experience in monetary matters.

THE SAVING HABIT

A post-war aim of first importance will be to perpetuate the saving habit developed with such gratifying success in the

last few years. Saving is essential in war-time, but to refrain from or defer spending and consumption must always be an essential part of the process of progress. It will be necessary to find new savers to replace any who from force of circumstances are obliged to encash Savings Certificates and other Government obligations, and, in addition, to rebuild capital assets of all descriptions lost or damaged by war. In this connection life assurance has a great part to play and may be regarded not only as a personal necessity but also as a national service.

There is a great deal to be said for cheap money—meaning thereby good money at a low rate of interest—but there is also much that needs saying on the other side of the argument. Thrift, as a social service, is entitled to a just reward. Too much attention can be given to large public financial transactions and too little thought to the millions of individuals and the hundreds of thousands of small traders whose need is for money with good purchasing power. The sum of the business of all the little people transcends in amount and importance the large-scale schemes which tend to monopolise public attention. We can never thrive on "cheap and nasty" money and should take care that reckless expenditure is not encouraged by facilities for borrowing on artificial terms.

NEW BUSINESS

The numbers and amounts of new policies issued during 1944 show a satisfactory advance, especially when the care with which proposals are examined is remembered. As will be seen from the directors' report, no less than £260,000 of such proposals made to us were declined, postponed, or for other reasons not completed, indicating to some extent the safeguarding of existing members by the skilful caution of our officials.

For reasons beyond our control it became necessary to move the head office of the institution, and we are now quite near to London Bridge, where we were so happily located for the latter half of the nineteenth century. We were unable to escape a degree of dislocation and delay, but thanks to magnificent staff work inconvenience to members was reduced to small proportions. We were fortunate in possessing a fine modern city building at 33, Gracechurch-street, and are already deriving some benefit from its well-planned working facilities.

FINANCE FOR INDUSTRY AND HOUSING

Like other offices, we are taking our due place in the plans announced by the Bank of England to provide finance for industrial reconstruction. In addition we are proceeding with our own debenture-cum-policy scheme, which, started before the war, has already proved its worth to medium-sized manufacturing concerns.

I am happy to report that we have resumed business under our popular house purchase scheme, and stand ready to take our full share of the post-war housing problems.

Fire and general business.—Our subsidiary, the United Kingdom Fire and Accident Insurance Company, Limited, continues to give us satisfaction, and, as our members avail themselves of the facilities offered, is an ever-growing source of profit to them in a double way. They benefit from the services supplied by the company and also from the profits accruing to the mutual funds of the institution.

THE LONDON ASSURANCE FURTHER PROGRESS

The annual general court of The London Assurance will be held, on the 9th proximo, in London.

The following is an extract from the statement by the Governor, Mr R. Olaf Hambro, circulated with the accounts:—

I will refer first to the life department. The volume of net new business, that is, sums assured net of re-assurances, for the year 1944 amounted to £2,034,830, being an increase over the previous year of £282,121. The annual premium income at £893,794 shows a slight decrease of £114 compared with 1943.

The year 1945 is the last year of another quinquennial period, and customary practice will be followed. In the early part of next year we will be issuing the usual valuation, and there is nothing at this moment which would lead me to believe other than that we will then declare a bonus compatible with existing conditions. Further than this it would probably be injudicious for me to go. For the present we are continuing the payment of interim bonus, and the usual intimations have appeared in the Press and elsewhere indicating what we are doing.

FIRE, ACCIDENT AND MARINE DEPARTMENTS

The Fire Department has once again exhibited a great deal of strength, and shows at £2,796,999, an increase in premium income during the year of £198,441. Claims paid and outstanding during the year are 45.9 per cent. compared with 46.4 per cent. The one difficult territory which has been a non-contributor to our profit position in the year of account is the United States of America.

The Accident Department, with a premium income of £1,381,860, shows an increase over the previous year of £61,652. Claims paid and outstanding at £661,737 show a decrease of 2.1 per cent., the figure this year being 47.9 per cent. compared with 50 per cent. in the previous year.

The Marine Account shows a decrease in premium income of £510,915, the comparative figures being: 1943, £2,249,585; 1944, £1,738,670. Claims paid, after deduction of reinsurances and salvages, total £1,001,084, which is a decrease over the previous year of £104,258. Expenses of management and overseas taxation, represent 10.9 per cent. of the premium income, compared with 6.4 per cent. in the previous year.

The profit and loss account opening balance is £1,215,649. To this have to be added interest, dividends and rents, less income tax, £205,578 and the transfers from fire account £122,726, marine account £500,000 and accident account £242,652. There is also a small amount on account of transfer fees of £123. These figures show a total of £2,286,728. There is a provision for taxation of £750,000 which is an equal amount to that which we reserved in the previous year's accounts. After taking all debits into consideration, the profit and loss account closes with a balance of £1,290,937, being an increase on the amount brought in of £75,288.

£9,000,000 IN GOVERNMENT SECURITIES

In the balance-sheet the most notable change during the year is an increase of £844,698 in our holding in British Government Securities, which for the general fund alone now amounts to £5,287,501, a figure equivalent to 47.4 per cent. of the total investments of the fund. Taking the two funds together, our total holding of Government securities amounts to nearly £9,000,000. The total premium income for the year 1944, including the life department, is £6,829,933 and our total assets exceed £28,000,000. The year 1944, similarly with all its war-time predecessors, has had difficulties associated with war conditions, and it is my confident hope that the year 1945 shall be freed, in part at least, of the difficulties in that we will see the cessation of European hostilities.

JOSEPH NATHAN AND COMPANY, LIMITED

PROJECTED POST-WAR EXPANSION

MR. ALEC NATHAN'S STATEMENT

The forty-fifth annual general meeting of Joseph Nathan and Co., Limited, was held, on the 25th instant, in London.

Mr Alec Nathan, chairman of the company, presided, and the following is his statement circulated with the report and accounts:—

As long as excess profits tax is 100 per cent. the profit and loss account can show but little change from that of the preceding war years. The net profit is £77,563, which, when added to the amount brought forward—£32,985—leaves an amount available for distribution of £110,548. After making provision for dividends and placing £20,000 to general reserve, there remains £39,548 to be carried forward. The only change in the balance-sheet which calls for explanation is due to the sale of the Greenford property to our subsidiary company, Glaxo Laboratories, Limited, which has resulted in a reduction of £270,000 under the heading of freehold land and buildings, with a corresponding increase in investments in subsidiary companies.

The sinking fund policies, which were taken out to provide a nucleus of funds for replacing these buildings at the end of their useful life, were at the same time sold to Glaxo Laboratories, Limited; this accounts for most of the decrease in the value of sundry investments. A small increase in income, less slightly lower expenses other than tax, results in an increased profit, before tax, of £3,540. The increase in the provision for taxation is partly due to the payment last year of the ordinary dividend on a free tax basis.

GLAXO LABORATORIES, LIMITED

Glaxo Laboratories, Limited, have experienced another year when demand for the foods, the medical products, and the pharmaceutical preparations has far exceeded the company's capacity to supply. The utilisation of labour and other resources upon work of national priority, including the manufacture of penicillin, has acted as a brake upon the development of several projects, important in the interests of the company. Moreover, it has caused a reduction in the quantity of goods issued for sale through retail and other channels to the general public.

The company's goodwill with doctors and pharmacists remains high. Anyone distant from the complex problems of running a manufacturing and distributing business during war-time must find it difficult to realise that their particular demands cannot always be met: and yet they remain, with very few exceptions, tolerant. The forbearance of our customers, particularly of the general public, is very greatly appreciated.

TWENTY-FIRST ANNIVERSARY OF VITAMIN D

Let me refer now to the 21st anniversary of an occasion which was of very special importance to the company. It is close on 21 years ago since vitamin D was first prepared in a form suitable for use in medical practice, and introduced under the name of "Ostein." Glaxo Laboratories were pioneers of vitamin D. It should give you particular pleasure to recall the debt owed to those engaged in the early work, which was of such significance to the country, as well as to your company. It took some time for the nutritional importance of vitamin D to be fully realised. To-day, however, not only is the addition of vitamin D to margarine compulsory, but various official schemes ensure the ready availability of the vitamin, particularly to young babies and expectant mothers.

Produce Businesses.—The produce businesses, by reason of control and fixation of prices, together with the fact that there has been a continuous suction of demand for more goods than are available, and lastly because they are economically and efficiently managed and directed, have had a satisfactory and profitable year.

New Zealand.—The war has made trading increasingly difficult, with its necessary controls both in regard to imports and exports; nevertheless, our staff have, much to their credit, surmounted all difficulties, and the profit from the business is a little better than in the previous year.

FUTURE POLICY

Until the termination of the war it is not possible to interpret future plans into positive action, nor is it possible to do much future planning until the Government defines and declares its policy. While the excess profits tax is a necessary war measure, its incidence at its present high rate is a deterrent to enterprise and initiative. That tax should either be substantially reduced or eliminated as soon as possible—such an action would materially stimulate the growth and development of the export trade.

Our post-war policy and plans call for a further extension of the activities of Glaxo Laboratories, Limited, both at home and overseas. We have already undertaken considerable responsibility for the production of penicillin and the further development both of our food and pharmaceutical trade will necessitate extensive building operations and renewal of plant and machinery which will make considerable calls upon our capital resources.

Our long-standing policy of conservation and concentration of these resources, which, as you are well aware, has been operating for many years, will, we are satisfied, enable us to meet our immediate requirements under these headings. The development of this policy to its fullest extent, as and when circumstances permit, will provide the means by which we shall be able to carry out our post-war plans on a sound financial basis.

THANKS TO THE STAFF

Our thanks are due to the staff both at home and abroad. In face of almost insuperable difficulties, not the least of which is the perpetual strain of five years of war, they have played the vital part in making it possible to show continuously satisfactory results. In relation to this matter, it should be stressed that our export business is of primary importance, and all of us are indebted to those overseas who, separated from the home office all these years, have managed to keep the business alive and ready to expand when we have a measure of freedom.

We hope that in this coming year we shall have the pleasure and privilege of welcoming back the many hundreds of those members of the staff who are serving in the Forces in all parts of the world.

The insurance against the future is in the fact of the past control and direction of the business. Having safely guided the business through the manifold difficulties and obstacles during the greatest war in history it should give our stockholders assurance that when peace comes their business will have increased its reputation, with enhanced goodwill and prestige, as a servant of the community.

The report and accounts were adopted.

MANGANESE, BRONZE AND BRASS COMPANY, LIMITED

MR. J. C. COLQUHOUN'S STATEMENT

The forty-sixth ordinary annual general meeting of the Manganese Bronze and Brass Co., Ltd., was held, on the 20th instant, at Aldwych House, Aldwych, London, W.C., Mr J. C. Colquhoun (chairman and managing director) presiding.

The following is the statement by the chairman, which has been circulated with the report and accounts: At the end of the year under review Mr E. A. Mearns relinquished his appointment as joint managing director, and has since resigned from the board. He had held that appointment since 1932, and I would like here to put on record our appreciation of the service which he rendered to the company during his period of office. Mr A. T. Thorn, B.Sc., M.I.C.E., M.I.N.A., who joined the board on January 1st this year and comes up for re-election at the meeting, has been appointed joint managing director of the company.

THE YEAR'S RESULTS

The profit for the year before providing for taxation is £151,161, against £230,405 for 1943, the decrease being due to changes in the armament production programme during the year. The provision for taxation is £104,000, against £172,500. The full estimated provision for taxation on all profits to date has been made, but the provision shown in the appropriation account is somewhat more than the amount truly applicable to 1944 profits owing to adjustments on prior years. For this reason the surplus remaining after providing for dividends is only £5,519, against £16,263. The final dividends proposed are set out in the directors' report and make 25 per cent. for the year on the Ordinary shares after paying the 7½ per cent. Preference dividends. These are the same as in the previous year.

In the balance sheet it will be noticed that the surplus of current assets now stands at £130,531, an increase of £16,003 in the year. Fixed assets, after writing off £20,678 for the year, are valued at £187,696, against £198,180 a year ago, capital expenditure for the year being below average. Trade investments remain the same and total net assets are increased by the surplus for the year to £330,388.

TRANSFER OF PROPELLER WORKS

Shareholders will no doubt be interested to learn, now that censorship regulations have been relaxed, that the marine propeller works was transferred to Birkenhead in the winter of 1940-41 as a result of bomb damage to the old London works. Preparation had been made beforehand in case such an emergency should arise, and no ship was kept waiting for a propeller throughout this critical period. The new site, where the factory will now remain, is more spacious and has room for further expansion if necessary. I need hardly say that this section of your business has played an important rôle during the war. The wrought side also—extruding, rolling and forging—as well as the "Oilite" self-lubricating bearing and powder metallurgy business, have made valuable contributions. In this connection it is a pleasure to have this opportunity of expressing our appreciation of the work of the staff and of thanking all servants of the company for so willingly working at high pressure for so long.

In the current year some further reduction in output for war requirements must be expected. Any reliable forecast of results during the transition period is impossible, but the change from war production to peace-time production involves no major changes in plant and equipment or processes, and we are in a position to supply our products immediately to returning markets.

The report and accounts were unanimously adopted and the dividends recommended were approved.

THE ALLIANCE TRUST COMPANY, LIMITED

SUCCESSFUL RESULTS

FINANCING INDUSTRY IN POST-WAR PERIOD

MR. JAMES PRAIN'S STATEMENT

The fifty-seventh annual general meeting of The Alliance Trust Company, Limited, was held on the 27th instant, at the Company's Office, Meadow House, 64, Reform Street, Dundee, Mr. James Prain, LL.D. the chairman) presiding.

The chairman's statement, which had been circulated with the report and accounts, was taken as read and was as follows.

You will observe from the annual report that your directors have invited Mr. T. H. H. Walker to join the board. The company is fortunate in securing Mr. Walker's services and I am confident that his wide experience will be of great value to us.

YEAR'S RESULTS AND DIVIDEND

The accounts for the past year show a further improvement in gross revenue, which at £699,700 is higher by some £32,000 than the amount collected in the previous year. Against this the amount we have set aside to meet future taxation is greater by some £40,000, with the result that net revenue is somewhat below that of a year ago. On this question of taxation I might explain that owing to our remaining interests in mortgages and land, apart from investments in stocks and shares, the basis on which this company is assessed for tax is one which brings into account items of a capital nature. This has afforded the Company certain benefits in the past, but in the current year it is not anticipated that any relief from this source will be forthcoming. The result then is that after making full provision under this head and for the prior claims of the debenture and preference stockholders, there is available out of the revenue of the year an amount equivalent to 35 per cent on the ordinary stock, which shows the proposed dividend of 25 per cent to be amply covered by earnings.

VALUE OF SECURITIES

Market values of securities have again risen substantially during the year and are now at a level comparable with the boom period of 1928/1929. There is no doubt, therefore, that a valuation of the company's investments at 31st January would show a very large surplus over the book value. I must repeat what I have remarked on earlier occasions that this appreciation, impressive though it might be on paper, does not have any great significance for us as it does not offer any promise of increasing returns.

QUESTION OF CAPITAL FOR POST-WAR INDUSTRY

In all probability industry as a whole will be in the transition stage to peace-time conditions in the near future. Whether the country emerges from that stage successfully will depend on the degree of realism we bring to bear on our problems. It will be admitted that for a highly industrialised country such as this, dependent for our existence on our export trade, the maintenance of productive efficiency is of the first importance; it follows that if industry is to succeed in producing wealth sufficient to maintain the present or a higher standard of living, capital must be forthcoming to provide the most modern equipment. Too little attention is paid to this aspect, I think, in our post-war planning which so far has been concerned more with unproductive expenditure, surely a matter of secondary importance. The necessity for a constant flow of capital into industry has been made much more clearly by those who are likely to be our principal competitors.

ALLOWANCES FOR DEPRECIATION

The higher production per man-hour which obtains for example in American industries in general is the result, to some extent, of a larger expenditure on and more intelligent employment of modern labour-saving machinery. In this country the effect of legislation has been to starve industry of the funds it should have retained for its maintenance and development and to discourage capital investment. Recently, it is true, there has been some recognition of the inadequacy of the existing allowances for depreciation but such recognition is both tardy and insufficient. Something much more far-reaching and constructive is called for. As a first step I would wish to see a more equitable and less crippling form of taxation in place of the present Excess Profits Tax, which bears so unfairly on those industries without the allowance of a reasonable standard of profits in the years arbitrarily fixed on for that purpose and whose equipment has been exhausted in Government service and other necessary work. This tax may have been thought expedient six years ago in time of crisis, but now I feel expediency should give way to something much more equitable.

CORPORATION FOR FINANCING INDUSTRY

I might mention one recent development which has for its object the provision of finance for industry—the formation of a corporation for that purpose. It is proposed that the funds be subscribed by financial institutions including the Investment Trusts. It is, as I have remarked, of the first importance that capital should be available for industry and on that ground it is right that this company should support such an undertaking. That it should be thought necessary—and I believe it is necessary—to form this corporation, must bring it home to us how serious this question of the industrial equipment of this country which is more concerned with dividing the golden eggs than with keeping the goose alive.

With these uncertainties in mind one cannot make any forecast, but I am hopeful that in our next annual report the results will compare not unfavourably with those of the past year.

The report and accounts were unanimously accepted.

CAMP BIRD, LIMITED

The forty-third ordinary general meeting of Camp Bird, Limited, was held, on the 25th instant, in London, Mr F. W. Baker (the chairman) presiding.

The following is an extract from the chairman's review circulated with the accounts: The profits for the year amounted to £21,824. The break-up value of the company's shares at December 31st last was 11s. 9d. per share.

West Witwatersrand Areas, Limited, announces that a mining lease has been granted, and a new company, West Driefontein Gold Mining Company, Limited, has been registered in South Africa. The operating subsidiary of Lake George Mining Corporation, Limited, reported a successful year to June 30, 1944. During the year the Fresnillo Company paid two dividends, and Mexican Corporation, Limited, in turn, paid one dividend of 1s. per share. The Yukon Consolidated Gold Corporation, Limited, reports that the resumption of dividend payments depends entirely on the date at which the scale of operations can be increased.

INTERNATIONAL NICKEL COMPANY, OF CANADA, LIMITED

EFFECT OF LABOUR SHORTAGE

The annual general meeting of this company was held, on the 25th instant, at Toronto.

Mr Robert C. Stanley (chairman and president), in the course of his address, said: During 1944 we produced 284,701,556 lbs. of nickel in all forms from all sources, which compares with 296,438,177 lbs. in 1943. The decrease from 1943 was due entirely to lack of manpower in Canada, which amounted at times to approximately 2,000 men or about 13 per cent. of the requisite force.

COPPER OUTPUT

Copper produced in 1944 in all forms and from all sources was 310,468,465 lbs. comparable with 318,598,596 lbs. in 1943, and now that the war with Germany is closing, the revival of commercial business with the United Kingdom and Continental Europe, must be actively pushed. It is indeed unfortunate that except for war-time arrangements, Canada's copper is barred from the United States, our adjacent and economic market, by a duty of 4 cents per pound. It is in Canada's interest that the Government at Ottawa should endeavour to bring about a removal of this trade barrier.

At the close of 1944, current assets totalled £132,861,790, and after deducting therefrom current liabilities of £26,151,119, working capital was £106,710,671, compared with working capital of £96,935,202 on 31st Dec., 1943, an increase of £9,775,469. Of this increase £6,861,423 is represented by higher holdings of cash, short-term securities and Government securities which aggregated £70,947,443 on 31st Dec., 1944, compared with £64,086,020 at the end of 1943.

Capital expenditures in 1944 were £4,652,127, as compared with \$5,445,248 in 1943 and with \$12,009,497 in 1942. The amount required for 1945 will approximate \$6,000,000. Of the 1944 expenditure, approximating \$3,000,000 was applied in the War Expansion Programme of the Canadian plants. In order to complete this entire work there remains to be expended approximately \$4,000,000, principally required for mine development and mine equipment. In this connection it will be recalled that by agreement with the Government of the Dominion of Canada we are amortising \$25,000,000 of these expenditures over a five-year period. Of this amount \$20,000,000 had been applied by the end of 1944.

VENEZUELAN EXPLORATION

As I have previously reported to you, nickel is one of the most widely disseminated elements in the earth's crust, but compared with other metals the workable concentrations are limited. It is essential that the uses which research has created for nickel throughout the world be assured of stable and adequate sources of supply for many years to come. In the circumstances, this company is constantly on the alert to detect nickel ore deposits of sufficient importance to justify commercial development.

During the year one of the deposits inspected by the company's geologists gave evidence of justifying exploration. We have secured the exclusive exploration and mining rights and are making the necessary investigations by core drilling and trenching to determine whether the deposit, which is located in Venezuela, South America, is suitable for commercial development.

In conclusion, I am able to say that we face the future with confidence and that we believe the "trend of sales growth in the nickel industry" will continue, and with proper research, advertising and selling activities will assure satisfactory consumption of our many products in a world at peace.

SELFREDGE (HOLDINGS), LIMITED

MR H. A. HOLMES'S STATEMENT

The annual general meeting of Selfridge (Holdings) Limited was held, on the 27th instant, at the company's offices, Oxford Street, London, W., Mr H. A. Holmes (chairman of the company) presiding.

The following is an extract from the chairman's statement, circulated with the report and accounts, which was taken as read:—

The trading profit of Selfridges Limited, as shown in the attached accounts, after making provision for depreciation of leaseholds, fixtures and plant and £25,000 for deferred repairs, is £400,766 as compared with £426,611, and in the circumstances this result should not be considered unsatisfactory. The deductions for interest and sinking funds for the redemption of Debenture stocks of £53,409 and £35,268 respectively are about the same as previously and leave a net profit (subject to taxation) of £312,089—a decrease of £26,585 for the year.

Provision for income tax and National Defence Contribution amounting to £215,000 represents the estimated tax liability on the profits for the year under review. No further charge against profits in respect of future income tax has been made as it is estimated that the reserves are now sufficient to meet all such liabilities. The sum of £10,000 has been applied to staff benevolent account and a dividend of 12½ per cent, less tax, the same as in the two previous years, amounting to £62,500, has been declared and paid to Selfridge (Holdings) Limited. The balance of profit for the year of £24,589 has increased the amount carried forward to £46,744.

INCREASED RESERVES

On referring to the balance sheet it will be noticed that the reserves have increased during the year by £100,000. Under the heading current assets, cash and tax reserve certificates appear at £1,245,046 against £988,938. Investments have increased from £37,874 to £86,261. On the other hand the figure for stock-in-trade has fallen from £496,441 to £457,675, a feature to be regretted but a quite unavoidable position in this sixth year of the war.

The very strong liquid position disclosed by the accounts should enable the company to take every advantage of the many opportunities which in due course should come along when labour and materials become available following the relaxation and, we hope, abandonment of too many forms of control. Considerable expenditure will be necessary for the modernisation of the interior of our premises—a programme which is likely to take longer than we had hoped owing to the more pressing claims there will be for the very urgent needs of housing, which must have priority. In addition considerable war damage will have to be made good, and it will be noted from the accounts that no adjustment has been made in respect of the damage sustained. Stocks will have to be built up as opportunities offer, but I am afraid this can only be achieved very gradually.

STAFF SHORTAGE A MAJOR PROBLEM

Staff shortage during the year has, of course, been a problem of major importance. Much praise is due to those of our members who have, as a consequence, been carrying increased responsibilities, and I would like particularly to refer to their devotion during conditions amounting to real hardship immediately following the last bomb damage. We look forward to the return of many hundreds of our young men and women from the forces and various war-time activities. In this connection it is interesting to note that in response to a questionnaire sent to these members last summer 97 per cent. of the replies indicated in no uncertain manner their desire to return to us.

I now turn to the accounts of Selfridge (Holdings) Limited in which you are

directly interested. These show the same dividend of £62,500 received on the shares in Selfridges Limited and a reduction of £7,356 in rents receivable, which a year ago benefited by the sum of £7,119 in respect of earlier years. After crediting certain income tax refunds amounting to £8,784, the total receipts amount to £96,065, or an increase of £1,989. After deducting outgoings the net profit is £65,702 against £63,040. Of this balance there has been appropriated £25,881 for redemption of "A" secured income redemption stock, £7,764 for redemption of "B" secured income redemption stock, and £12,046 towards reduction of mortgages, leaving, with the amount of £49,743 brought forward from last year, a balance of £69,154.

REDUCTION OF INCOME DEBENTURE STOCK

It is perhaps pertinent here to note that after the £25,881 referred to has been applied to the reduction of the "A" secured income redemption stock the balance of this stock outstanding will be £31,596, an amount which we hope to be able to take care of within a measurable period. The effect of this will be that once the "A" stock is out of the way the proportion of income available under the scheme of arrangement for the stockholders will be considerably increased. With this prospect in view and having regard to the balance of profit carried forward, which for the present it would seem imprudent to distribute by way of dividend, the Board considers that the time has come when the capital structure of the company and the position as to the large accumulation of arrears of dividends should be examined. I feel some reference should now be made to this matter, although in view of the numerous interests involved, some time must elapse before it will be possible to submit definite proposals to the stockholders.

The report and accounts were adopted.

TELEGRAPH CONSTRUCTION AND MAINTENANCE COMPANY, LIMITED

STRONG FINANCIAL POSITION

The eighty-first ordinary general meeting of this company was held, on the 24th instant, in London, Mr Colin F. Campbell, the chairman, presiding.

The following is an extract from the chairman's statement, which was circulated with the report and accounts, and was taken as read: The liability for taxation, which is now so large a figure, amounts to the sum of £322,591. This amount includes the necessary provision for income-tax on profits earned to date.

The value of the company's investments, £325,416, is an increase of £32,799 over last year, and we also hold tax reserve certificates amounting to £175,000 towards provision for subsequent tax payments. The market value of the investments, it will be noted, is £11,232 in excess of the book value.

The balance of the trading account is £304,952, which compares with £375,115 last year. The difference in this balance was principally due to reduction of prices on Government contracts. The board now recommend a final dividend of 5 per cent., making a total of 10 per cent. for the year, the same as for 1943, leaving £42,296 17s. 8d. to be carried forward.

While our efforts are still confined 100 per cent. to the war effort, post-war problems and technical development are being closely studied, and I feel confident that when peace returns and we regain our liberty of action, we shall not be unprepared to cope with these problems.

Despite the present burden of taxation, a strong financial position has been maintained, which will be of inestimable value when we are called upon to satisfy the peace-time demands of the home and export markets.

The report and accounts were unanimously adopted.

CRAVEN BROTHERS (MANCHESTER) LIMITED

A FULL ORDER BOOK

The annual general meeting of this company was held, on 25th instant, at Stockport, Mr J. R. Greenwood (chairman and managing director) presiding.

In the course of his speech the Chairman said: The reduction in profit on operations from £163,160 to £104,567, or £58,593, is due in the main to changing conditions which are inevitable as the war in Europe approaches its final stage. They are (1) part cancellation of the contracts for two types of special machine tools which we were producing in quantity at the Government's request; (2) continued increase in manufacturing costs; and (3) during the period of the war we have suffered a steady reduction in our labour force, both skilled and unskilled. After making all necessary reserves, the net profit for the year is £70,366 as against £69,235 in 1943, an increase of £1,131, and, after providing for a final dividend of 15 per cent., making 20 per cent. for the year (the same as last year), we carry forward £166,191 as against £157,025 last year, an increase in the carry forward of £9,166. In arriving at these figures I wish to emphasise the fact that full provision has been made for all taxation in respect of profits earned to the end of the year under review.

DEMAND MAINTAINED

Some time ago we held the view that, having regard to the enormous quantity of standard machine tools which have been produced in this country and the large quantity which have been imported from the U.S.A., the machine tool industry might find it difficult after the war to obtain a sufficient volume of business to continue normal working capacity and, although our position is somewhat unique in that we manufacture so few standard machine tools, we thought the demand for our own product might be curtailed. Our fears in this respect have proved completely unjustified.

Our present most urgent requirement is additional labour—skilled and unskilled—and in these days, when we hear so much about redundancy and when we realise, as I suggest we must, that with the end of the war there must inevitably be a redistribution of labour from the enormous production of war equipment to peace-time requirements at home and the production of necessities for the reconstruction and rebuilding of devastated Europe, the greatest difficulty your company is facing is shortage of manpower, and we can take into our service upwards of 600 additional workpeople as soon as they become available, and we know that we can offer full employment for some years.

EXPANSION OF BUSINESS INDICATED

We are again fortunate that we have no necessity to make changes in our organisation to deal with post-war production, so that we can get right on with our normal work. Most of the business on our books at present is for home customers, which is gratifying to us because it indicates that important companies are preparing to play a big part in the reconstruction of the world and in our export trade after the war. We have also received indications of an unprecedented demand for our products from overseas, practically all over the world, so that some expansion of the business is indicated, and it is a matter for regret that high taxation and E.P.T. have deprived industry of the opportunity of building up some reserves which could have been used for re-equipment, replacement of obsolescence, and for normal expansion.

The plant and machinery of the company have been maintained in first-class condition. We have a full order book, and your Board looks to the future with every confidence.

The report was unanimously adopted.

(Continued from page 560)

The Federation is to promote scientific and research and the "rationalisation and modernisation of plant and production." It will have to be judged by its acts.

Diamond Position

The continuation of the wartime boom in diamonds has compelled the mining companies, which have been for several years living largely on their stocks, to resume mining operations on a larger scale. In 1943, diamonds to the total value of some £20 million were sold, of which it is estimated that only £7 million worth were produced. Comparative figures for 1944 are not available, but it is likely that both total production and the proportion currently mined were substantially larger. The full accounts for 1944 of De Beers show a great increase in mining expenditure from £417,513 to £1,008,918. Operations at the company's Bultfontein mine have been resumed. Similarly, Consolidated Diamond Mines of South-West Africa announce a substantial increase in operations, which were facilitated by a rise in the native labour complement and the acquisition of extra petrol-driven lorries.

The cost of resuming normal mining operations must bring down profits from their inflated wartime levels, although the very need to replace stocks should ensure to the industry a period of prosperity. The 1944 diamond receipts of De Beers, again including the sale of a portion of the company's quota, is actually slightly higher at £4,627,000, and the fall of £400,000 in net profit is much more than accounted for by the rise in mining expenditure. The dividend on deferred shares is reduced from 70 to 60 per cent. Nevertheless, the company's net liquid assets

have been heavily strengthened from £404,000 to £760,000. General reserve has received a book profit of £3 million, arising from the sale of the company's interest in African Explosives and Chemical Industries in exchange for the whole of the £4 million issued ordinary capital of the new company, De Beers Industrial Corporation.

The demand for industrial diamonds has at least trebled during wartime, but the "pegging" of their prices at pre-war levels means that the major part of profits is still derived from the sale of gem stones. Demand for gem stones fluctuates widely, but has maintained an upward trend throughout the war and at the moment seems to be approaching a new high level. The coming series of London "sights" is likely to find many more buyers than sellers. The reopening of the Antwerp diamond market, which has already re-absorbed a quarter of its pre-war labour force, should greatly help the selling syndicate in meeting this year's world demand for gem stones. The immediate outlook is thus excellent, but the more distant one remains obscure.

Shorter Note

The 1944 consolidated trading profits of United Molasses show a very large rise of some £125,000, and total £960,163 against £834,781, although it is not revealed how much profit from past years is included. Taxation, not unexpectedly, requires more, but depreciation actually takes less, so that net profit is still higher by £100,000. The company is increasing its final dividend by 2½ per cent, making a total distribution for the year of 22½ per cent against 20 per cent; in addition, a tax-free bonus of 2½ per cent is again to be paid out of capital reserve.

GOVERNMENT RETURNS

For the week ended April 21, 1945, total ordinary revenue was £51,063,000, against ordinary expenditure of £112,103,000 and issues to sinking funds of £255,000. Thus, including sinking fund allocations of £361,993, the deficit accrued since April 1st is £161,487,000 against £201,886,000 for the corresponding period a year ago.

Total	335,026	299,661	109,354	114,253

A change has been made in the method of showing an excess of Post Office Expenditure over the Post Office Revenue. Such excess is now included as ordinary expenditure under "Total Supply Services" instead of being shown, as up to July 24, 1943, inclusive, as a deduction from ordinary revenue.

After increasing Exchequer balances by £238,337 to £2,893,024, the other operations for the week (no longer shown separately) increased the gross National Debt by £62,687,492 to £22,563 million after allowing for £16 million of sinking funds in 1944-45.

FINANCE AND BANKING

THE MONEY MARKET.—The discount market this week was mainly concerned with the monthly making up operations of the banks. Though the net TDR call from the banks, after allowing for prior encashments, was reduced by about £35 millions to just over £20 millions, the displacement of credit for "window-dressing" purposes resulted in a marked shortage of credit on Tuesday. Though additional balances came through at the end of the session, the Bank's agent had to intervene with special buying on a small to fair scale before the books of the discount houses could be balanced. Later in the week, however, money became more plentiful and, by Thursday, there was a marked widening in the banks' purchases of bills. The discount market's quota of Treasury Bills for the week remained at 24 per cent with the results of the tender showing singularly little change from the previous week. The raising of the tender issue of Treasury Bills next week is discussed on page 556.

The Bank Return shows Bankers' Deposits as high as £229.6 millions on Wednesday reflecting the easing of conditions after Tuesday's special assistance and the return of making-up balances to the market. The rise on the week amounted to £38.4 millions. The special assistance probably accounts, too, for part of the rise of £26.1 millions to a total of £256.3 millions in Government Securities but Ways and Means advances seem likely to have been chiefly responsible for this expansion.

MONEY RATES, LONDON.—The following rates remained unchanged between April 19th and April 26th:—
Bank rate, 3% (changed from 3% October 26, 1939). Discount rates: Bank Bills 60 days, 1½%; 3 months, 1½%; 4 months, 1½-1½%; 6 months, 1½-1½%. Treasury Bills: 3 months, 1½%; 3 months, 1½%. Day-to-day

Gangsters' End

MUSSOLINI is dead. So, according to general belief, is Hitler, though the world has not yet been given the spectacle of his corpse being kicked around the streets as proof of death. Whether he has really cheated justice, or is merely trying to escape it; whether he met a soldier's death or the gibbering dissolution of a lunatic; whether he died of natural causes, or by his own hand or shot by some other member of the gang—all these are questions that for a few more days will have to go without answers. There are mysteries also about the appointment of Admiral Doenitz as the second, and last, Führer of the Nazi Reich. Was he really appointed by Hitler or did he seize the pathetic tatters of power? And what does his promotion mean, a desire to find a head of the state whose surrender will be accepted, or an attempt to use the last Nazi assets—the U-boats and the garrison of Norway—in fighting on to the final inescapable slaughter? What game was Himmler playing? And Goebbels? And Keitel? These questions, too, will find their answers very soon.

One thing, however, is certain. The Third Reich is dead. The end has been an indescribably sordid welter of blood and betrayal. Total in all things, the Nazis have brought upon their countrymen a defeat as complete as it is

possible to conceive. Even the final unconditional surrender, when it comes, will be little more than a formality, for there is very little left to surrender. In the North, Field Marshal Montgomery has reached the Baltic and occupied both Bremen and Hamburg. Berlin has fallen. The Americans and Russians are lining up on both banks of the Elbe. Bavaria has been overrun. Northern Italy and most of Austria have been surrendered. The garrisons in Norway, in Denmark, in Holland are left without a homeland. By the end of the week there will be hardly an acre of German soil unoccupied. It is not the Nazi Reich that will last for a thousand years, but the awful echo of its fall.

The slow asymptotic approach of the end during these last few months, always nearer but never quite reached, will make the hour of acknowledged victory, when it arrives, something of an anti-climax. This will be no grand climactic like November 11, 1918, but one more stage reached and overcome in a world crisis that has been raging for thirty years and still has many storms ahead. The moment of rejoicing will be brief, and the rejoicing itself will be restrained by the knowledge of efforts and sacrifices still to come. But a moment there will be, and though verdicts must be left to history, this, the hour of

surrenders and capitulations, of liberation and victory, is the time for tributes.

The story has been often told that Marshal Stalin once distinguished the contributions of the three great Allies; Russia, he said, had given blood, and America material wealth, while Britain had contributed time. It is a true saying and a compliment, for though the world will endlessly dispute who won the war, there can be no doubt who prevented it from being lost, irrevocably and absolutely, without hope of reversal or revenge. That palm goes to two people. One is Winston Churchill, who, more fully than his great ancestor, has been the Captain-General of England. The other is the ordinary British citizen, of both sexes and all ages, in and out of uniform. Nor were these two ever quite without support, for the record of these years cannot be surveyed by even the most sceptical mind without the hand of Providence being visible in many of its miraculous turns of fate.

It is a providence, however, that has granted opportunities rather than ready-made victories, and the best tribute that can be paid to the managers of Britain's war is that

they have not let slip any of the opportunities that the enemy's many mistakes have given them. The war has been fought with skill as well as with courage. Just as in its personal aspects, the sordid end of the gangsters caught like rats in a trap, is one of History's morose vindications of the moralities, so in its political the end of the war is an irrefutable proof of the value of liberty. Once again, demonstration has been given of the immense moral and physical resources upon which a free and tolerant and honest society can call. The British people have fought this war longer than most, more continuously, harder than many. They have fought it, field and at home, at sea and in the air, with technical and physical courage and great human qualities of imagination. Hitler called them military imbeciles; and why once again they have made magnificent soldiers.

When Stonewall Jackson lay dying on the victor's field of Chancellorsville, on another May 3rd, eight years ago, he was approached by an unknown private in his army. "General," said the soldier, "to-night, when you meet Caesar, tell him we still know how to make war."

A New Risorgimento

THE unconditional surrender of the German South West Command has given the Allies complete control in Northern Italy and in large areas of Austria. The surrender crowns a long and arduous campaign, and it is appropriate that Field Marshal Alexander and the men fighting under him should end so sensationally a struggle which has not always commanded its share of public attention. It would, however, be unfortunate if the speed of the final collapse were to mask the hard fighting that preceded it. In particular, it should not be forgotten that the prime factor in the freeing of Northern Italy was not the German surrender but the successful using of the partisans. Long before the Germans ceased fighting and long before the Allied armies reached the great cities—Milan, Turin, Genoa, Piacenza—the partisan armies and their political leaders were in full control.

In spite of the crowds who hissed and booed round the exposed bodies of Mussolini, his mistress and his party bosses, discipline, not anarchy and violence, is the most striking feature of the movement of liberation. Field-Marshal Alexander and General Clark have both praised the partisans for the skill and efficiency with which they followed the instructions of the General Staff and worked out their own tactical plans. In almost every town in the North they managed to prevent the destruction of power stations, reservoirs, public utilities and railways. In the factories, they knew exactly when to strike and did so in the most effective way of occupying, not deserting, the factories. In each community, a Committee of Liberation was already in being, ready to take over the civil administration until the arrival of the Allied armies.

The Central National Committee of Liberation for North Italy is based on a coalition of the principal political parties. It appears at present to include two Communists, two members of the Action Party, two Christian Democrats, two members of the Italian Liberation Party and two Socialists. It is impossible to say what is the balance of power between the different groups. The three strongest are undoubtedly the Communists, whose numbers have grown very considerably in recent months, the Socialists and the Christian Democrats. They are all of them committed to radical reforms in Italian society—a large measure of socialisation and the establishment of a Republic. Their prestige as the liberators and rulers of the richest, most populous and most highly developed areas in Italy will enormously reinforce the power of their parties throughout the country. The Bonomi Government has already agreed that the National Liberation Committees of Rome and of the North shall meet and there is talk of summoning a conference of all the provincial committees. The Committees will undoubtedly demand a reshuffle of the Government with an active resister as Prime Minister. The question mark over Italy's future is whether this

new government, representing a strong coalition of the Left, can guide the Italian people towards the free and progressive society which a great mass of them undoubtedly desire. As a result of liberation, there have been "spring-times of the people" in other countries, particularly in France. But in each case the ensuing months have seen the weakening and disillusionment of the popular forces and the resurgence of old, compromised groups and interests. In Italy, there is perhaps a greater chance of successful political evolution. The resistance movement is not a heterogeneous medley of groups united by loyalty to one man. The parties which compose it have proved themselves capable of mass action on a scale achieved nowhere else—only in Northern Italy have strikes been used effectively as a weapon of resistance. They appear to be united on the major issues of national reconstruction. On the vexed question of public ownership, the fact that Mussolini's Fascist Republic nationalised the whole industrial system in North Italy may make the achievement of public control elsewhere and its maintenance in the North less difficult. Above all, the Liberation Movement, thanks to its great part in the actual fighting, must now enjoy that supremely important political asset—self-confidence.

It would, however, be very misleading to underestimate the potential opposition. The Fascists are defeated but not wiped out. It is not so long ago that the escape of General Roatta deeply disturbed the people of Rome by the evidence it gave of a quite widespread Fascist underground movement. The Monarchists are far more active and vocal in Southern and Central Italy than they were a year ago. Industry is predominantly in private hands and there are reports in the Swiss press of the close contact maintained by such industrial leaders as Count Volpi with British circles in Switzerland. The basis for the usual coalition of frightened and compromised people exists in Italy as in any other liberated country. Accusations and disputes among the progressive parties may yet undo the first enthusiasm of freedom and sap the political initiative and drive necessary to carry through a really radical programme.

It is too early to forecast the strength of the opposing groups. But it is not too soon to see clearly how influ-

A special Section on

THE NATIONAL FINANCES,

which appears on pages 589 to 599 of this issue, covering the great majority of the statistical tables in the recent Budget White Paper, together with a commentary on the figures and a collection of tables on the Revenue and Expenditure.

ential must be the policy of the Allies in Italy. It is entirely in their interests that a radical and democratic Italy should emerge from this war. The voice of the people in North Italy is raised today in favour of peaceful relations with their neighbours, and of union between the states of Europe; in short, the new Italy denounces everything that made Fascist Italy an endless disturber of the peace. An Italy based on a coalition of the anti-progressive parties might be tempted to return in foreign policy to the fractious, grabbing, war-mongering mood of Mussolini's regime. There is at the moment a very good chance that a peace-loving and progressive Italy will be the result of liberation; but it is also true that a wrongly conceived policy could frustrate the Italians' proper development.

First of all it is surely time to recognise the Italians' part in their own liberation by bringing democratic Italy back into the comity of nations. It is surely ludicrous that Argentina should sit at San Francisco while the men who liberated Northern Italy are unrepresented. If, when the new government is formed, it were to receive a formal invitation to attend the Conference, its prestige would be enormously enhanced and that fact alone would strengthen it against an opposition in which extremist nationalists are bound to play an active part.

It is equally important that Allied supervision and control should be reduced to a minimum. It has already been stated that the period of AMG in the North will be short. At the first moment possible, the relative freedom of action restored to central and southern Italy should be extended to the politically far more mature north. It is very likely that the use of the new government will make of its powers will not be altogether acceptable to conservative circles either in Italy or this country. The question of the monarchy's future is an obvious example. The British Government has acquired in Europe—not without some justification—the reputation of intervening only in favour of the Right. It would be disastrous if the new political situation in Italy were, during the next crucial months, to be influenced or manipulated by the occupying Powers.

Some of the gravest problems awaiting the united Italian government lie in the economic field. There is a hope that most of this year's harvest will be gathered in, but there are some hungry months ahead. Coal was one of Italy's chief imports. Very little will be available from abroad for some time to come. Anything that the Control Commission can do to relieve the desperate economic situation will contribute directly to political stability. Even if the straitened supply position and a heavy list of priorities make large-scale deliveries impossible, the Allies could take a load off the minds of the people by lightening the economic clauses of the armistice. The partisans, by saving thousands of lives and millions of dollars worth of equipment, have at least earned this.

Finally, the Allies can probably make or mar the democratic future of Italy by the policies they permit on the part of Italy's neighbours. Nothing so weakens the pres-

tige of a government as to sit by helplessly while undisputed national territory is unjustly given away. Nothing could give a better entry point for nationalist and fascist propaganda. Nothing would so confuse and divide the progressive parties themselves. Marshal Tito has demanded the Italian town of Trieste. His troops are in its outskirts. No Italian government could consent to the transfer of an Italian town to Croat control. Most Italians are ready for a very drastic redrawing of the Italo-Yugoslav frontier in order to transfer as many Slavs as possible to Slav rule. They would also admit that the hinterland of Trieste is largely Slav. The compromise which probably offers most hope of a solution is the creation of a Free City of Trieste, under Italian administration, but acting as a port and depot for Yugoslav, Italian and Austrian trade. The Slav areas behind the city could then be transferred without endangering the rights of the Italian community and without condemning Trieste to share the economic decline of Fiume.

This question already threatens to divide the unity of the Italian liberation movement. Moscow has given its blessing to Marshal Tito's plan of annexation. Thus the Italian Communists cannot openly oppose it. The Christian Democrats and Socialists have already spoken firmly against the proposal. If the Communists are forced to take an unpopular line, it is of course the right wing, nationalist opposition that would stand to gain from their discomfiture.

There is a possibility of conflict on Italy's western frontiers as well. French forces have crossed the Italian frontier and appear to be marching on Turin. It seems that they have already advanced beyond the line of occupation fixed for them by the Supreme Command. The purpose of this advance is difficult to understand. The Italian partisans certainly regard it with alarm and suspicion, and if the French were to enter Turin, an armed clash might be the result. One of the most encouraging features in the last nine months has been General de Gaulle's readiness to see in liberated Italy a regime as different from that of Mussolini as is his own from that of Pétain. It would be disastrous if now, for no reason at all, Franco-Italian relations were to drift back into the bickering animosity of the twenties and thirties.

The Allies' Italian policy presents them with a very grave responsibility. There are in Italy today fairer hopes of a genuine revival of freedom and social progress than anywhere else in Central Europe. The movement of liberation faces difficult months. It has enough economic and political problems to daunt the most self-confident leadership. Its task will become impossible if, over and above the difficulties inherent in the situation, the Allies by indifference, clumsiness, stupidity or self-interest, weaken in any way the new regime. On the other hand, a successful experiment in co-operation might lead not only to a new creative relationship between Italy and the Allies but to a genuine renewal of freedom and responsibility throughout the Latin world.

Education and Business

A COMMITTEE, under Sir Arnold McNair's chairmanship, representing the Universities on the one hand and the Accountancy profession on the other, has prepared a scheme by which accountants can accomplish some of their professional training in the Universities. A candidate who graduates after pursuing a stated course of study, will be excused the Intermediate professional examination and will be able to gain both a degree and a professional qualification in a period of 5½ years from start to finish. It is wisely provided that the periods of serving articles in an office and those of studying at the University shall alternate rather than overlap, so that no excessive strain should be involved. The special course is to consist of two main subjects—economics and accountancy—and three minor subjects—law, a modern language (or some other recognised degree subject), and a course in "the study of Government." The purpose of the scheme is to attract into the profession "men and women of the highest character and intellectual attainments."

This initiative deserves to be warmly welcomed. Accountancy has hitherto tended to be one of those professions—banking, insurance and the solicitor's branch of the law are other examples—which have, by the force of circumstances and their own professional requirements, held themselves somewhat aloof from the main stream of the nation's intellectual life. There has, of course, been in no sense a ban on university graduates in the profession, but the graduate, so far from being given any credit for his higher education, has been put under the severe handicap of age if he wished to enter the profession. Not all these handicaps are now removed. The process of acquiring the double qualification is still to be a long one. Moreover, the boy who is going to enter the profession by the academic door now opened cannot start his 5½ years much before his eighteenth birthday, or finish them until he is nearly 24, while the boy who serves his articles in the normal way will probably continue to leave school at 16 and be qualified by the time he is 21.

It would be wrong to criticise too severely what is doubtless only a first step. But there is evidence in the document that the Committee has drawn up of a certain ambiguity about the purposes that the scheme is intended to serve. It is an ambiguity that has, in recent years, been obscuring a number of walks of the national life; it is the confusion between education and vocational training, and matters of far greater moment than the welfare of the accountancy profession depend upon its being clarified. What is good in the present scheme is its recognition that a university education is of value to a man or woman entering even a technical profession. This is a great advance, both in the particular context and in the general. Accountants have, in recent decades, been working themselves into a more and more commanding position in all sections of the business world, and it is clearly imperative, as was said in another connection, that we should educate our masters. And in general, this move back towards the virtues of a broad education and a catholic competence are a refreshing change from the contrary tendency so frequently exemplified in recent years, to set up ever more watertight compartments, each jealously guarded by a set of exclusive "professional" qualifications. This protectionist tendency was most recently illustrated by the Royal Statistical Society's proposal to grant Diplomas in Statistics and thus to make a start with professionalising a calling that has hitherto been open to general ability and common sense.

What is less reassuring is that the accountancy profession is not prepared—at least not yet—to grant facilities of entry to their ranks to the university graduate in general. Of the prescribed course, one part is to be in accountancy itself—not hitherto generally regarded as a university subject—and the other major part is to be in the general subject that is most akin to accountancy. This, no doubt, is the concession that had to be made to the

section of the profession which still holds that the best training for an accountant is accountancy. But it invites the retort that, on the contrary, the best preliminary training for any profession is to learn how to think, which is not to be learned exclusively—if indeed it is to be learned at all—from any particular combination of vocational and semi-vocational studies.

It may be that the traditional English education of the last century leaned far too heavily in the direction of the general and the abstract and neglected too completely the technical and the scientific, that it produced far too many highly literate amateurs. This may be true—though the considerable fame that the English have won for themselves in the world, out of all proportion to their numbers, would not suggest that there was anything very basically wrong with their methods of bringing up their young. But however this may be, the pendulum is now swinging far too violently in the other direction and, with the impending up-grading of "technical" and "modern" secondary schools, it will probably swing still further. The clamour now is to treat the educational system as a means of acquiring "useful knowledge." But knowledge is not the proper end of education, least of all the memorising of technical facts. The only thing to do about facts is to look them up. The proper end of education is the ability to use knowledge, and the most "useful" subject—that is, the subject that leads most quickly to a well-paid job—is usually, for this purpose, in the long run the most useless.

There is another related clamour, which found expression in the debates on the Education Bill, for compulsory instruction in any number of subjects, ranging from sex hygiene to patriotism, about which the educated citizen "ought to know something." No doubt it would be an excellent thing if the citizen, once he was educated, had a passing acquaintance with some of these subjects. But if the all too short educational years are more and more encroached upon for these adventitious purposes, to the exclusion of education itself, the citizen will grow up without any ability to use any of his knowledge, or any will to retain it. Indeed, some would hold that the damage already goes further and that there is an alarming decline, among those who are regarded as well educated, in the essential elements of basic literacy, the ability to write or speak the language, to distinguish truth from falsehood, to see the present in the perspective of the past and to follow a straight line of logic. The educators have been crying alarm for years; but the pressure of opinion is often too strong for them. The Joint Advisory Committee on Agricultural Education was roundly abused the other day for suggesting that even future agricultural workers should be given an opportunity to lift their eyes from the soil and to regard their brains as something other than the untilled seed-bed of the hair. The pressure of parents, as every schoolmaster can confirm, is very heavily towards the "useful" and away from the "theoretical." Yet Sir William Goodenough's Committee on Medical Schools was unquestionably right in holding that "the ideal educational background to the training in medicine is undoubtedly a course of study for a university degree in another faculty." And if the medical profession can build safely, and for preference, on the basis of a sound general education, other less exacting professions can surely do likewise.

So the argument comes back to the accountants. It would be ridiculous to carry it so far as to say that any university graduate, no matter what the faculty in which his degree has been gained, or the class of honours he has attained, should be accepted without further ado as proficient in any profession. The tricks of the trade have to be acquired, and time must be allowed for the purpose, though perhaps not nearly so much time as the professional bodies insist upon. Nor should the university graduate grumble if he is late in reaching the stage of earning his living, for he reaches it with greater treasures in his keeping.

But it is of some importance that the distinction between education and vocational training, and between their different purposes, should be clearly seen. If the process of drawing the universities and the professional bodies closer together merely results in accountancy being taught in a quadrangle rather than in an office, then it is unlikely that either the universities or the profession will gain very much. Followed a few steps further, this process leads to the doctrine that everybody should stay for many more years in an educational establishment, but that the teaching he gets there should be more and more vocational. This, very largely, is what has happened in America, and though there are many excellences in the American educational system, the Americans themselves are at present in a mood of deep disappointment over its intellectual results. The dangers that such a system runs are that the professional training is delayed and diluted, while the basic educational process, the stretching of the mental muscles, is ignored. It may be true that the traditional English system produced too many literate amateurs. But that is better than to produce skilled illiterates—better, at any rate, for a social system which finally relies on the wisdom of the common man.

The British community has recently committed itself to a very large increase in its expenditure on education. But it has devoted remarkably little thought to the purposes, other than the employment of teachers, for which this public money is to be spent. It is very necessary to insist that it should be spent on education—that is, on producing a generation who know how to use their brains—and not as a subsidy to industry and the professions in aid of their vocational training. There is no unanimity about the methods by which education can best serve this end. In particular, there is controversy about the extent to which the "new" subjects can stretch and exercise the mind as successfully as the old standbys of classics and

Elections in France

ON Sunday, April 29th, some 23 million French electors—men and women—had the opportunity of choosing 600,000 Municipal Councillors for France's 30,000 Communes. French journalists have described these elections as the most confused in French history. Different methods of voting were used—proportional representation for Paris, the old double ballot elsewhere. The electoral lists were confusing. Some were presented by the old parties, some by resistance groups, some were *listes uniques*, including both groups and parties. The political programmes on which the elections were supposedly fought were themselves confused. As *Combat* put it:

Political groups are no longer differentiated by ideals and to-day it would be impossible even to distinguish one from the other by the class or social group from which it claims to draw its support, for they appeal to all.

With the exception of the *Fédération Républicaine*, all parties and movements have gone to the country on a generally radical programme, "Who does not claim to be a bit of a Socialist these days, and who does not profess to be anti-capitalist?" Such distinctions as remain must certainly have been overshadowed in many communes by the personality of the candidate or by entirely local issues. Several of the parties also showed a tendency in the weeks before the elections to play up secondary issues, for instance the question of the religious schools.

Yet in spite of these elements of confusion and in spite of the fact that the returns are still far from complete, the first results of the municipal elections are being generally described in the British press as "a great swing to the Left." In the towns, the Radicals have lost ground to the Communists. In Paris, the Communists have secured their most striking success, winning at least 25 per cent of the

votes and 27 out of the 90 seats on the municipal council. Another six have gone to the *Front National* groups, which are very close to the Communists. It is true that the results from the countryside will certainly be much more conservative, yet when all allowance is made for these divergences, the evidence suggests strongly that the people are more to the Left than at any previous election.

Is this, however, a fair index of France's present political mood? The comparison with the last election, in 1936, can be misleading. The electorate is different. Few prisoners and deportees have voted this year; about two million men were thus excluded from the ballot. Women voted for the first time and made up perhaps 60 per cent of the electorate. The comparison with 1936 is also irrelevant. To gauge the real change in public opinion in France it is useless to go back to 1936, before the war, before the occupation, before resistance and liberation. The comparison should be not with May 1936 but with August and September 1944. If this is the standard of comparison, it is not so easy to assert that the municipal elections represent a "swing to the Left." It can be argued with some force that in spite of the heavy Communist vote, in spite of the general appearance of radicalism, they represent a resurgence of the Right.

In the first weeks of liberation, France undoubtedly passed through a short revolutionary phase. The collapse of the authority both of Vichy and of the Germans created a political vacuum which could at that time have been filled by a Left-wing government possessing sufficient authority to carry through those "changes in the structure of society" for which most of the Left-wing groups have been pressing ever since. On the basis of the local Committees of Liberation, a genuinely new regime could have been established, and revolutionary changes carried

through. These changes were foreshadowed in the programme of the Council of National Resistance—the nationalisation of banking and insurance, public ownership of heavy industry, power and transport, and the expropriation of collaborators.

The revolutionary phase passed and no fundamental changes were achieved. The chief reason was, of course, the policy of General de Gaulle himself, who while accepting the national and patriotic content of the Resistance, has given little evidence of accepting its economic and social aspirations. He based his carefully balanced Cabinet upon all resistance groups, but his closest associates were mainly drawn from the right of the Resistance, the right wing Christian Democrats. He has consistently set his face against all radical economic change on the grounds that it must await the sanction of a constituent assembly.

The General's relative conservatism was reinforced by two elements within the Resistance itself. The Communists had discipline and organisation enough to make an effective political force; but they were committed from the first to backing the leader recognised by Moscow, and since the signing of the Franco-Soviet Pact, they have studiously avoided such "controversial" issues as the nationalisation of key industries or the taking of drastic financial measures to check inflation and the Black Market. On the other hand, the genuine radicals in the Resistance—sections of the Socialist Party, the members of the *Mouvement de Libération Nationale* without party affiliations, *Ceux de la Résistance* and many other smaller groupings—lacked a clear political programme and had little sense of political strategy. They were easily isolated, either returning disconsolately to the old parties or sinking into critical apathy. Against this background of political stalemate, France has passed through nine uneasy months. The economic situation has been and is still deplorable. At the root of it is the lack of supplies. The Allies have not yet been able to release enough shipping to satisfy even a small proportion of French civilian requirements. In France itself, industry still works at about a fifth of its pre-war capacity, for even where some raw materials are available the lack of coal is so severe that it may be necessary when present stocks are exhausted to reduce supplies to industry still further. Yet so long as only a dribble of goods appears upon the market, it is impossible, short of revolutionary methods, to check either inflation or the Black Market. In the long-drawn-out duel between the Minister of Finance, M. Plevin, and the Minister of National Economy, M. Mendès-France, the latter proposed sterner measures for dealing with the economic crisis—the blocking of currency, a measure of nationalisation and the expropriation of war profits. M. Plevin is also taking steps to secure a more effective control over the nation's finances. For instance, shares are to be registered and all treasury bills held by financial institutions must be deposited with the Bank of France. It may be doubted whether M. Mendès-France's proposals would have had the desired

effect; nevertheless his policy, coupled with the resignation of M. Mendès-France, is regarded as concessions to the wealthy classes, a *politique de confiance* to reassure the timid bourgeoisie and coax them into co-operation.

The supply position is complicated further by the French Army's absolute priority. A very large percentage of everything produced in France—lorries, for example, or footwear—goes to the Army. Most Frenchmen accept this. Indeed, the need for a very large, very powerful, highly modernised army has no keener advocates than the Communists. Yet some observers are already uneasy about the possible future conflict between the needs of civilian reconstruction and the economic demands which the upkeep of a large modern army must represent. There are also signs of uneasiness over the composition of the armed forces and over the rôle in France's national life to which they are apparently assigned. It is disconcerting for radical opinion, eager for collective security and in particular for a closer integration of Western Europe, to find official French newspapers such as *Le Monde* claiming that France's chief security must be its own military strength and a frontier on the Rhine. The reiteration of French greatness is beginning to pall a little. The average Frenchman does not want it to be thought that he "protests too much." The note of militarism and nationalism evokes unfortunate analogies—Mussolini after the last war, Boulanger after the war of 1870. Just at a time when, after five years of waiting and fighting, General de Gaulle's superb faith in the strength of the democratic alliance is bearing fruit in victory, many Frenchmen find it disconcerting to hear in official propaganda more than an echo of Pétain's *France Seule*.

It is not the only sign of Pétainism. The return of the aged Marshal has brought many submerged fears to the surface. In the administration, part of the Vichy structure remains. In the countryside, the peasants are voting for men who voted for Pétain in 1940. Above all, in the army, which is to so great an extent the centre of General de Gaulle's interest, men who served Pétain hold high rank and a great majority of the officer corps were loyal to Vichy at least until the German occupation of 1942 destroyed the last remnant of Pétain's independence. In the nine months since the fall of Paris, the Vichy state, which was totally submerged in the flood of liberation, has begun to emerge a little, not as a state, not even as an administrative structure, but still as an attitude of mind, as a political tendency, as a potential centre of resistance or power.

The elections of last Sunday are to a very great extent a protest against the last nine months. The townspeople are voting against desperate economic conditions, against bread queues, short rations and the ubiquitous black market. The resisters are voting against the unpurged collaborators, the suspected supporters of Pétain's *Etat Français*, the effective conservatism of the bourgeoisie. It is wrong to call this a "swing to the Left." It is a protest from the Left because they fear that the pendulum has begun to swing the other way. Equally, the country voting is a protest—against the supposed predominance of the Left—but nine months ago in the first weeks of liberation the countryside was in the mood to respect and not resent the radicalism of the cities.

How effective will be this protest from the Left? It is weakened by the atmosphere of confusion in which the elections have taken place, but the chief obstacle is the lack of coherence and unity among the groups which are most critical of General de Gaulle's caution and ambiguity. They neither can nor wish to form an alternative administration. The most likely result is therefore a broadening of the present Cabinet to include more representations of the Left, probably of the Communists. General de Gaulle may make some concessions in the sphere of economic policy—another experiment in nationalisation, perhaps, or new measures against war fortunes; but any concession is likely to be balanced by reassurances to the conservative elements so as to maintain the present equilibrium. It does not seem, therefore, that the elections will influence decisively the present evolution of France. They register a fear and a protest. But since both are equivocal, they are not likely to have any immediate effect.

NOTES OF THE WEEK

San Francisco

A few weeks ago it was still fairly widely assumed that the controversy between Great Powers and small nations would provide the chief dramatic element at the San Francisco Conference. The problem of the voting procedure on the Security Council, which secures an extensive right of veto to the Great Powers, was expected to become the storm centre of the debates. A terrifying picture of the four powerful policemen, whom nobody would dare to police and who would in perfect harmony bully the timid public at San Francisco, struck fear into the heart of many a critic.

How very different has been the actual picture of the Conference so far. The four "policemen" have shown all too few signs of solidarity. On the contrary, ever since the Conference started the Foreign Secretaries of the Big Three have been engaged in almost constant jockeying and skirmishing. The clients of the Great Powers, far from being afraid of the four policemen's truncheons, have been able every now and then to intervene with a certain freedom in their diplomatic duels.

The bad temper to which some of the leading Allied diplomats have at times given vent can hardly have been caused by the issues discussed at the Conference. Taken by themselves, some of these issues even appear almost irrelevant. The debate over the chairmanship of the Conference generated far more heat than the importance of the issue would justify—there are really no great principles involved in the choice between having the American "host," Mr Stettinius, as permanent chairman and the setting up of a system of chairmanship by rotation. That the dispute over this should have been able to create the first "crisis" of the Conference was, nevertheless, a disturbing sign of insufficient confidence and co-ordination among the Big Three.

It was to be expected that Mr Molotov's relentless demands for the admission of the Lublin Administration would trouble the atmosphere at San Francisco. It is difficult to see what he hoped to achieve by raising the demand over and over again. Was it his intention to appeal from the British and American verdict against Lublin to world public opinion? Any such intention would by itself be a striking—and let us hope premature—confession that in the Big Three cannot hope to speak a common language. In addition, Mr Molotov's appeal to world opinion has been utterly ineffective. However, this setback to Russian diplomacy was to some extent offset by the ready admission of the Ukraine and of White Russia to the Assembly and the Conference.

Argentina and Poland

The "policemen's" disagreement became even deeper when the proposal for the admission of Argentina was made. Mr Molotov countered this by the renewal of his demand for the admission of Lublin. It would be futile to deny that at this stage Mr Molotov's opposition to the British and American viewpoint became much more convincing and effective. If the representative character of a Government and its participation in the war against the Axis are genuinely held to be the conditions entitling a nation to admission, it is really inconsistent to sponsor Argentina and to reject Lublin. Both governments are unrepresentative; and Argentina's adherence to the United Nations has been very recent indeed. Mr Molotov was able to quote extensively President Roosevelt's and Mr Hull's castigations of the Buenos Aires Government and to remark ironically:

Perhaps since last September Argentina has changed from a Fascist to a democratic government. We should be happy to receive information on this. At any rate, when the documentation is received on Argentina's policies to-day, the Soviet Union will be able to take suitable steps.

Argentina has been admitted, nevertheless. But the ambiguity of the case has caused some of the delegations—the French and the Chinese—to abstain from voting. And the Russians—and perhaps not only the Russians—must have received the impression that the democratic objections to the admission of Lublin were, after all, less genuine than they were supposed to be.

Mr Molotov is about to leave San Francisco; and Mr Eden, too, is expected to cross the Atlantic soon. This need not be taken to mean that the Conference is meeting with failure—it will probably go on with the participation of all the United Nations. But the attempt to set up the world organisation will undoubtedly fail if there is no real agreement between the Great Allied Powers on the crucial issues of the peace.

The Electorate

Chelmsford was the first constituency in England to vote on an up-to-date register. Unlike the other three constituencies that have used the new register, it was a Conservative seat and a perfectly ordinary constituency. The result was all the more startling. In a heavy poll (69 per cent), a Conservative majority of 16,624 was turned into a Common Wealth majority of 6,431. Part of this startling reversal may be due to the personality of the winner, a young bomber pilot—though the Conservative candidate is also an officer in the RAF. Part may also be due to the Conservative tactics of deploring the necessity to fight the election. But these special explanations are not enough to explain so large a turnover. Unquestionably, Chelmsford quite deliberately and definitely voted against the Tories.

On the other hand, the application of this fact to the General Election can be overstated. It has long been apparent that there are two trends in public opinion to-day, a strong anti-Tory trend and a strong pro-Churchill trend. The Chelmsford result shows that the former is even stronger than was believed. But the second is not properly at issue in any by-election, which cannot affect who is Prime Minister. Which of the tendencies will be stronger at the General Election it is still very difficult to guess.

An Invitation
THE
PRIME MINISTER
has said:
"We must make exertions to
restore our export trade."

The Midland Bank invites all who are making plans for business with other countries to take advantage now of the Bank's co-operation.

The Overseas Branch of the Bank in London and the Foreign Branches in various provincial centres have a vast fund of information and experience, and through many thousands of banking agents in all parts of the world facilities are available for handling every type of transaction.

The Manager of any of the Bank's 1,800 branches will welcome the opportunity of discussing problems related to foreign trade.

MIDLAND BANK
LIMITED

There is much wisdom in the American saying that you can't beat somebody with nobody, and there can rarely have been a ease when the somebody was more of a somebody and the nobody more of a nobody. The odds, probably, are still on Mr Churchill. But they are not long odds.

In the other by-election of the week, a Liberal candidate, Mr D. R. Seaborne Davies, accomplished the feat of increasing both Lloyd George's poll and his majority at Caernarvon Boroughs.

Variations on a Theme

The week-end's political speeches brought a number of variations on the theme of public versus private enterprise, which seems, by general consent, to be regarded as the main issue at the coming election. The co-appearance of Mr Herbert Morrison and Sir Stafford Cripps at Bristol on Saturday is a sign that Sir Stafford has been promoted from the wilderness to become one of Labour's chief spokesmen in the election campaign.

Mr Morrison, elaborating the Labour party's views on public ownership, explained that they were not advocating nationalisation for its own sake, but as a means for improving efficiency in industries such as coal, where the case for transfer to public ownership had been established, and that each case would be judged by its merits. Industrial efficiency was also Sir Stafford's theme at a meeting in Kingswood. Speaking of efficiency in the engineering industry, of which he has considerable experience as Minister of Aircraft Production, he outlined four essential conditions for efficient production—up-to-date machinery and methods; improved status and standards of management; co-operation of the workers in the planning and organisation of production; and improved factory buildings and welfare facilities. Both Mr Morrison's and Sir Stafford's speeches contained constructive suggestions. Indeed, if other Labour speakers would follow their example and spend more time in thinking about industrial efficiency and less time in sloganising, they might gain considerable support from circles outside the Labour party.

The most refreshing speech, however, was that of Mr Amery to Birmingham Conservatives, which at least had the merit of courage. He is reported as saying that the Conservative party's last two triumphs had really been disasters. After winning the 1924 election on the Zinoviev letter, they threw overboard all positive economic policy, and were helpless in the face of mounting unemployment, while in 1935 they went to the country on sanctions, while disavowing any intention of rearming to face the consequences of driving Mussolini into Hitler's arms. Like Lord Baldwin, Mr Amery, it appears, believes in admitting his party's election tactics, only he has done so before and not after the election. There is room, in all parties, for honesty like Mr Amery's.

The Food Problem

A preliminary statement about the Washington conference on world food supplies recently held between representatives of Great Britain, Canada and the United States was issued early this week. It is the most authoritative statement yet made, and it is far from being an optimistic

one. It states quite clearly that "the problem of food is one of the most urgent now facing the United Nations." For the rest of this year, and for part of next, requirements will be greater than ever, and they must be met, unfortunately, out of reduced supplies. The larger commitments arise, of course, from military needs—for the feeding of prisoners, liberated peoples, and displaced persons. Supplies are smaller because of reduced agricultural manpower, shortage of fertilisers, the devastation of agricultural land in battle areas, and poor harvests. The problem is further aggravated by transport difficulties.

The three countries agree that liberated areas must be fed until they can re-establish their own agriculture; and to do this they will require transport, fuel, fertilisers, feeding-stuffs, and machinery.

The most important task now facing the western Allies is to find some immediate solution to the critical transport problem. So complete is the chaos and dislocation left behind by the defeated enemy that ordinary traffic lines will take years to reconstruct. Even a framework of reconstruction cannot be achieved in time to save large areas of liberated Europe from destitution. In this dilemma all the resources of improvisation should be pressed into service without delay. Holland is being kept alive by ministering bombers. Much more is possible.

New Regime in Austria

The birth of the "second Austrian republic" was announced from Moscow last Sunday with the news of the formation of an Austrian Government under Dr Karl Renner. Dr Renner was the first Chancellor of the first Austrian republic and represented his country at the Peace Conference of Versailles. The old leader of the Social Democrats thus represents the living link between the two republics. On the whole, the composition of his Government is also calculated to emphasise the continuity of Austria's independence. Of its fourteen members, five are Social Democrats, four Christian Socialists, three Communists and two non-party men. The parties that played a leading rôle in Austrian politics before the rise of the authoritarian movement have reappeared on the stage under their old leaders. The only newcomers are the Communists who played a negligible part in the first Republic but whose influence has grown rapidly in recent years.

Whether it has become strong enough to justify the appointment of Herr Franz Honner, the Communist leader, to the Ministry of the Interior is, at least, open to doubt. This appointment is certainly inspired by Russian "considerations of security." Provided that those considerations are not interpreted in such a way that they reduce the Governmental coalition to a deceptive façade of virtual one-party rule, even this feature of the new Government can be defended. Apart from this reservation, which is, admittedly, a weighty one, it would be difficult to find any fault with Dr Renner's administration.

What has given cause for objections both in Washington and London is the fact that the Austrian Government has been set up without any prior consultation between Russia and the western Allies. The creation of the Government was attributed by Russian sources to the initiative of the Austrians themselves; but this story can hardly be accepted at its face value. The Russians have hardly any excuse for unilateral action in Austria—joint occupation and joint responsibility for the country's political outlook have been accepted by the Big Three. The State Department has therefore bluntly refused to recognise Dr Renner's Administration, while the British Government has voiced its objections in a more discreet way. It would be disastrous if Austria now became a new bone of contention between the Allies. It should be possible to reach agreement, especially in view of the moderate and all-inclusive character of Dr Renner's Government.

The Budget Debate

The debate on the Budget produced very little criticism of it, probably, as the Chancellor himself said, because there was so very little in it. Members used the occasion for a general debate on the country's economic and financial position rather than the fiscal policy outlined in the Budget speech.

Sir John Anderson's reply was equally unremarkable, save in two respects. He gave some additional information on the

cost of food subsidies, discussed in an article in *The Economist* of April 21st (page 503). Of the total of £225,000,000, £65,000,000 is in respect of imported food, £15,500,000 is attributable to the National Milk Scheme, and £5,500,000 to the milk-in-schools scheme. The remaining £139,000,000 is paid in respect of home-produced food—but whether this should be regarded as a subsidy to the farmer or an aid to the consumer could not be determined in present circumstances when food was being produced on marginal land. In an accounting sense, it is possible to distinguish between the sums paid through the Ministry of Agriculture and those paid through the Ministry of Food, but the distinction of channel is not necessarily a distinction of purpose.

More important were the Chancellor's remarks on the future of the income tax. In his Budget speech he claimed that pay-as-you-earn was a success. In his reply to the Budget debate, he stated the cost—so long as PAYE was in force, he doubted if it would be possible to introduce changes in the rates and structure of income tax to come into force immediately. If this is so, then the cost of the present version of PAYE must be judged too high. So long is it since there was any change at all in the standard rate—and it is eleven years since the change was downwards—that the far-reaching effects of a change tend to be forgotten. If a Chancellor wishes to stimulate consumption, he has no easier and more effective weapon to hand than a reduction in the standard rate, but in future, it appears, its effects will be delayed for a full year. The psychological effect, both of rises and falls, will be similarly lost. Whether income tax is regarded, in Mr Gladstone's words, as a "colossal engine of finance," or, in Mr Benson's words in last week's debate, as "a fundamental interference with the life of the people," to the extent to which the British people are indebted to it for their freedom from the constant financial difficulties that beset other nations cannot be over-estimated. If PAYE is obstructing its elasticity, then PAYE will have to be amended.

Dearer Coal

The Minister of Fuel's decision to raise the price of coal by 3s. 6d. a ton, as from May 1st, appears to have come as a surprise to many Members of Parliament, who appealed for delay in effecting the increase until the House had had an opportunity to discuss it. But there is surely very little ground for surprise. The recent White Paper on the Coal Charges Account showed that the industry was in debt to the Treasury to the tune of £25,750,000 and that during last year, the Exchequer had made advances to the Account amounting to 1s. 5d. per ton. The decision to increase the price to the consumer marks the Government's determination to discontinue the policy of indefinite subvention and of allowing the Treasury to become a widow's cruse to the coal industry.

It may be a hard decision for the consumer, who was already paying so much for his coal supplies. The White Paper showed that national increases in price from the beginning of the war to the end of 1944 amounted to 15s. 11d. a ton, and, with certain adjustments and variations, the average increase should be estimated at 18s. a ton, to which must now be added a further 3s. 6d. The increase will inevitably be reflected in higher prices for manufactures, especially in the iron and steel industry, which is already labouring under the burden of dear fuel. But it is better that the consumer should have the facts brought home to him in this very direct manner, than that they should be obscured by the provision of unlimited subsidies to a single industry, which can only have a damaging effect on the national economy.

There is only one answer to the problem, and it is so obvious that it hardly needs repeating. The ultimate solution is to improve the productivity of the industry by achieving the thorough technical reorganisation recommended by the Reid committee and by securing a full week's work from the industry's labour force. The fundamental cause for the present state of affairs is declining production, and it can only be remedied by tackling the problem at the production end. Not only have progressive wage increases (wages have increased by 126 per cent over 1939, compared with 73 per cent for other costs) failed to produce the hoped-for increases in output, but higher wages have resulted in lower production, whatever the causes and whoever is to blame. Reorganisation and reconstruction are admittedly part of the long-term policy, but that is no reason for further postponing measures which should have been taken at the beginning of the war.

Labour and San Francisco

Sir Walter Citrine has voiced a rather odd grievance against the British Government, the Deputy Prime Minister and other Ministers. In a statement issued at the World Labour Conference at Oakland he said:

The Government is deliberately excluding the organised workers. We cannot accept this position. We regret very much that Mr Attlee and other Labour Ministers who are members of the British delegation assent to the Government's attitude. We do not believe this attitude represents the desires of the millions of organised workers, and we feel this necessitates raising this matter at the forthcoming Labour Party Conference.

Does Sir Walter suggest in all earnestness that the Labour ministers do not represent "millions of organised workers"? His grievance, based on the non-admission of the TUC to the San Francisco Conference, is very unconvincing. The Conference has been called by Governments and not by social institutions.

What Sir Walter unknowingly demands is a root-and-branch revision of the Yalta scheme. It may well be that he looks with some envy at M. Kuznetsov, his Russian opposite number, who has been included in the Soviet delegation to San Francisco. But then the Soviet Trade Unions, as a whole, have been "included" in Russia's governmental machinery. Would Sir Walter like the TUC, too, to enjoy a similar privilege? Or he is perhaps only looking for a topic with which to enliven the pre-election conference of the Labour Party?

Revolt in Argentina

All the Latin American republics supported the United States' request that Argentina should be admitted to San Francisco. Three of them, Brazil, Mexico and Chile, are represented on the Executive Committee of UNCIO, and the original request for an Argentine place at San Francisco came from St. Padilla of Mexico, who claimed to speak for all the other republics. Peace within the hemisphere and the hope of a seat on the Security Council for a representative of "the inter-American region" may both be

Making the most of the NATION'S MILK

IN winter the supply of fresh milk falls, but in summer there is a surplus. This surplus can be conserved in a number of ways, one of which is to make Milk Chocolate.

Cadburys Milk Chocolate retains the valuable milk solids (fat, protein and lactose). Only the water which comprises roughly 87 per cent. of the milk bulk is eliminated.

Milk Chocolate is a compact and highly concentrated food, easily kept and transported and requiring no elaborate packaging. It retains the full food value of the milk almost indefinitely without special storage or canning.

held, in the Latin American view, to have gained strength from Argentina's presence at San Francisco.

How much this Latin American view has misjudged the wider issues was seen in Mr Molotov's trenchant arguments for Argentina's exclusion, at least for the time being, from San Francisco. These arguments are not likely to pass unheeded by Argentina's neighbours. It is Argentina's internal regime, not its failure to declare war, that has caused them most anxiety. At Mexico City, their fears of Argentine aggression within the hemisphere were somewhat allayed by Argentina's signature of a non-aggression pact. But for the democratic opposition in Argentina, as elsewhere, a change of heart could only come with a change of Government. President Farrell's nationalist regime, at the price of a long withheld declaration of war against Germany and Japan, had secured a place in regional counsels and recognition by many of the United Nations. Last week, on the eve of its entry to San Francisco, it was forced to meet what may have been a very real attempt to overthrow it in favour of a representative and democratic regime. In a wave of arrests the former less nationalistic Presidents, General Rawson and Ramirez, were detained presumably because of their Army influence, which has not entirely shifted to the present rulers. More important, arrests of "extremists" (Communists and other Left-wing leaders) and "reactionaries" (Conservatives, including those who have forsaken or disappointed the Farrell-Peron Cabinet) indicate that the broad political front, in which these elements have been knit under the control of exiles in Montevideo, had decided to act.

The activities of this "underground movement" are described in detail on page 587. It is doubtful whether they will be given much chance to influence the political development of Argentina in the immediate future. Vice-President Peron has said that the country is in a state of "pre-electoral reorganisation," and has, more recently, disclaimed any intention of being a candidate for the Presidency. But last week's political arrests point away from the freedom of speech and press that has prefaced the electoral campaign in Brazil.

Elections in Brazil

In Brazil the stage is set for presidential elections to take place before the end of the month. Relaxation of the press censorship has shown wide support for General Gomes, who opposes the principles of President Vargas's authoritarian *Estado Novo* and is the principal opposition candidate. He is being opposed by General Gaspar Dutra, Minister of War in the present regime and a Vargas nominee. General Gomes was until a few months ago the head of the Brazilian Air Force, and General Gaspar Dutra's nomination is said to be an attempt to split his support from this influential quarter. The Communists, however, represent another important faction whose allegiance is by no means clearly defined. Although in his *Estado Novo* President Vargas suppressed them, his recent amnesty for political prisoners followed a Leftist manifesto pledging support to his regime in return for concessions which were to include the release of the jailed Communist leader, Luiz Carlos Prestes.

Although General Gomes promises a return to democratic government and is reported to be without political ambitions, he is a Conservative. This fact, together with Vargas's war record, his establishment of diplomatic relations with Russia, and his release of political prisoners, may split Left-wing support between the two leading candidates who are simply fighting on pro-Vargas and anti-Vargas platforms. In the event, the influence of President Vargas himself, who is not a candidate at this stage, but who still controls the machinery of government, will certainly play a decisive part in shaping the result of the polls.

The BBC and the Orchestras

The long-standing dispute between the BBC and the National Association of Symphony Orchestras over the fee payable for the relay of outside concerts has not yet been settled. It now threatens to deprive the listening public of the music of such orchestras as the Hallé, the London Symphony and the Liverpool Philharmonic.

The financial side of the dispute is relatively unimportant. For each concert relay the BBC is willing to pay £120 and claims that this sum affords about £45 profit—an increase of 66 per cent over the pre-war figure—to the promoters. The promoters maintain that their profit, part of which goes

to the conductor and the soloist, is quite inadequate. It is altogether surprising that the BBC, which is known to remunerate its so-called "comics" very generously, should quibble about an additional £30 for a symphony concert—especially since the Corporation's past record in the encouragement of good music is so praiseworthy. The hint of obtuseness in the Corporation's handling of this dispute will be taken as another sign of the deadening influence of its monopoly control.

Sooner or later a problem of this nature was bound to arise. The BBC, with a monopoly of broadcasting in Great Britain, is a law unto itself so far as fees are concerned. Its rates could be effectively disputed only by combinations or associations of performers equally monopolistic. But in the world of entertainment such organisations are hardly practical, for the BBC is itself a purveyor of entertainment, with its own team of performers. The BBC is thus in a privileged and protected position however the matter is regarded. And it is a position that is not at all to the public advantage. The only solution, short of the abrogation of the Corporation's charter and the experimental introduction of a system of limited competition in broadcasting, is that such disputes shall be decided by arbitration. Since the present dispute is unlikely to be the last of its kind the setting up of a permanent arbitration authority might be justified—as a safeguard against the abuse of monopoly powers.

The Port of Cardiff

During the war the western ports have been active. Many of them have acquired a new importance as naval stations; others have been called upon to handle the bulk of the nation's overseas trade. This reorientation of trade was dictated primarily by strategic considerations, but the development of armament industries in the west would, in any case, have provided a powerful argument for it. Now, very naturally, the ports are wondering how much of this new activity can be made permanent. Will the economic advantage be lost when conditions of peace return? Or will it be preserved as the mainspring of successful reconstruction?

Before the war Cardiff ranked thirteenth, by the value of its trade, in the ports of the United Kingdom. It was pre-eminently a coal port, dependent upon world demand for the steam coal of Rhondda. It had only a small share of the export trade in manufactured goods and its imports of food and raw materials were largely for local consumption. The trouble with Cardiff was that its hinterland—its effective inland trading area—was severely limited; and this geographic disadvantage was exaggerated by the inadequacy of the port's communications. In a report, published on Monday, the city's Chamber of Commerce stresses the need for a more equitable distribution of general cargo tonnage than obtained before the war and suggests that part of the traffic of London and Liverpool should be diverted to the Bristol Channel ports. To this end it recommends that the port facilities should be improved and that railway and shipping companies should offer an incentive of specially favourable freight and storage rates to importers and exporters.

This would be all very well for Cardiff. But if the diversion of traffic was not to be artificial and economically damaging, it would have to be justified by real economies in handling and inland transport costs. In the short period geographic and economic disadvantages can be neutralised by preferential traffic rates. But they could only be abolished by an extension and enrichment of the port's trading orbit; and special rates could be justified only if they contributed to this development. The report argues that for the Midlands Cardiff is a more economical port of entry for meat supplies than London, and it strongly urges the retention of the Ministry of Food's 10,000 ton cold storage plant as a substantial first move in the establishment of an imported meat trade.

Winding Up Civil Defence

The air-raid warning system has ceased to exist; London evacuees are to be given facilities for returning home—to begin in a month's time; and the "appointed day" for the end of the civil defence general services was Wednesday of this week. The first revocation of a defence regulation giving the Government powers over the persons and services of British citizens has taken place. There is now no legal obligation on anyone to perform part-time civil defence duties, and all part-time members of the service, except for those

who volunteer to assist in the winding-up, will be released. Wholtime members are being given a month's notice. Many of these are volunteers, some from the leisured classes and some with their own businesses to return to, who will not need assistance in resettlement. But some were conscripts under the National Service Act of 1941, and the Ministry of Labour will be supplied with particulars of all members under notice so that they can be assisted to find suitable employment.

The Royal Observer Corps is being stood down simultaneously with the civil defence service. Cuts in the whole-time strength of the National Fire Service are also taking place, and its part-time members are no longer liable for compulsory service.

No decision has been taken on whether there will be a peacetime civil defence service. But those released will be asked whether they would volunteer for such a service if it were established. It is difficult to say whether any useful purpose would be served by retaining the cadres of civil defence. If some form of compulsory national service is imposed on all citizens after the war, there are certain branches of civil defence which might fit in with such a policy—for instance, the fire and ambulance services. But as a precaution against the next war's air-raids, a skeleton civil defence service does not at this stage seem worth while. Rockets rendered precautionary measures ineffective, and if a refinement of this form of air attack is to be the civilians' fate in the next war, the civil defence service will have to be considerably adapted. It might be more effective to retain, instead of the local authority staffs, the regional machinery which had to be evolved in the course of the war for dealing with the longer-term problems of air-raids.

Vital Statistics for 1944

Last year's vital statistics continued the favourable trend of most of the war years. The infant mortality rate was 46 per 1,000 live births, a new low record, compared with 49 per 1,000 in 1943, the previous lowest rate. The stillbirth rate, at 28 per 1,000 total births, compared with 30 in 1943

and established another low record. The death rate was 11.9 per 1,000 of the population; this was 0.2 below the rate in 1943 but 0.3 higher than that in 1942. There were 302,046 marriages, which was 6,632 more than in 1943 when the total was the lowest recorded since 1926.

The most important figure, for considering the future population, is the net reproduction rate. What the Registrar-General calls the effective reproduction rate is provisionally estimated at 0.990—1 per cent below the full replacement level. This is not what demographers call the net reproduction rate, but is the Registrar-General's own fancy variant of it, which leads him to take a favourable view of the future infant mortality rate and to ignore possible unfavourable factors such as wars or 1918 influenza epidemics. In any case, as he himself points out, it is too early to rejoice. The birthrate last year may well have been influenced by the Second Front, which grew more and more imminent from the spring of 1943 onwards. Similarly, it is likely to show another bump upwards next year and perhaps in 1947 as a result of demobilisation. But it is the years after that that will count.

Shorter Notes

A note in the current issue of the *Economic Journal* records the fact that Lord Keynes, after 34 years, has resigned the editorship and secretaryship of the Royal Economic Society. Mr Austin Robinson, who has in recent years been joint editor, is to be the new secretary, while Mr R. F. Harrod becomes the second joint editor. It is the intention of the Council of the Society to nominate Lord Keynes as president, and certainly no man was ever more clearly singled out to preside over his profession.

Information about the rocket attacks on Southern England was released last week-end. The total number of rockets that reached this country was 1,050, and total casualties were 2,754 killed and 6,523 seriously injured.

AMERICAN SURVEY

Producers' Country and the Tariff

(From a Correspondent in Colorado)

THE architects of a brave new post-war world, including those in Washington, might be well advised to take more seriously than they seem so far to have done, the more serious dissent that is mounting among farmers and other producers of raw materials, and particularly in the interior two-thirds of the United States. The people there desire peace as genuinely as do any. They, and most of their representatives in the Senate, favour international co-operation on the political side, to a degree that would have been unthinkable only a few years ago.

But they are not, as yet, persuaded of the need to accompany such political co-operation with economic co-operation that would promote trading between nations, and more specifically would permit large-scale imports into the United States to accompany exports—unless it can be demonstrated that such a policy will be at someone else's expense, or at least not at theirs.

There has been no such clear-cut line of argument and education on this economic front as there has been in behalf of political co-operation. Instead, the reverse is true. Political isolationism, accepting at least temporary defeat, has gone into disguise as economic nationalism. And it has succeeded in persuading many people who genuinely favour political co-operation for the sake of lasting peace that in the interests of their very livelihood they must oppose any further lowering of trade barriers, but must work instead for even higher tariffs, if anything, than those reached in the Hawley-Smoot Tariff Act. Most Senators and representatives from producers' country will work against any further lowering of trade barriers. The simple reason is that, politically, they dare not go back home and face the wrath of producers of raw materials who may feel that their immediate interest, livelihood and profits have been be-

trayed in behalf of "foreigners," with the excuse only of what will seem to them, at best, a vague assurance that they will in the long run be better off.

It would take a page just to list the producers' associations, local, state and regional, which in the past year have gone on record in favour of international peace and accord—some of them in favour of international trade—but always with the proviso tucked in somewhere, that such a policy shall not cancel present tariff protection for their members. Wool growers want an import quota—and ask for it largely because they are pretty sure they cannot get the 50 per cent tariff increase they really want. Sugar people want protection against a thriving Far Eastern sugar-growing industry. Non-ferrous miners want import barriers to enable them to build the suggested post-war stockpile of strategic metals at comfortable profits entirely from low-grade American ores. Gold and silver mine operators inveigh against the agenda of Bretton Woods as meaning a "managed currency" and the definite and final demotion of gold and silver to a commodity status. Cattlemen favour international accord, but simultaneously demand a continued tariff system to protect "all American producers," and a continuance of the embargo against Argentine raw beef.

Three years ago the director of one of these big producers' associations said to the writer that the end of this war, like that of the last, would be followed by a wave of internationalism against which American producers would be forced to unite in their mutual self-defence. That is exactly what is happening now. National organisations follow the same trend. For example, the National Grange, at its recent convention, called for international peace—but at the same time for a two-price system by which American farmers would be paid high prices for enough of their products

to supply the home market—plus anything they could get from the world, outside the American tariff barrier, for the surplus, dumped on the rest of the world.

The influential *Country Gentleman* recently printed an article, complete with charts and elaborate data, providing an ideological or mystic basis for the preachings of economic nationalism. This article has been reprinted by thousands, and sown through producers' country along with similar articles, and many, many speeches. Briefly, it argues that agricultural income is always one-seventh or thereabouts of gross national income, the two going up and down together. The only way to ensure permanent, automatic, self-protective prosperity for the United States is simply to keep on raising farmers' prices, and protecting their domestic market by whatever means available, whereupon the entire national income will automatically go up, in the proportion of seven to one—that is to say, an increase of a billion dollars yearly in farm income will automatically result in a seven billion dollar increase in gross national income. Naturally, this calls for the complete protection of the home market for the farmer, by means of "parity tariffs," whatever they may be. The other half of the argument is that the importation of a billion dollars' worth of agricultural products—whether they can be produced here or not—will reduce the American gross national income by seven billion dollars.

A variant of this argument to enlist mining operators of the West is that the proportion of the income of all raw material producers to gross national income is one to five, therefore for national prosperity all producers of raw materials must likewise be protected against imports by a "parity" tariff. Wherever this word appears, it apparently means, to those who utter it, a tariff high enough to serve as a virtual embargo. The March issue of the *Engineering and Mining Journal* suggests of the post-war tariff question that producers of raw materials should "form a defensive alliance to prevent their being sacrificed to manufacturing interests, whose viewpoints dominate Washington thinking." In the same issue—only two pages away, in fact—is a double-page editorial in which the president of the McGraw-Hill Corporation, publisher of this and some 25 other business and trade magazines, calls for acceptance of an era of co-operation in international trade.

Of course, economists shoot this theory full of holes, but their explanations fall on deaf ears. It "sounds good"; it puts "foreigners" in their place, a political advantage in most of the American producers' country; and it gives producers the joyous feeling that in serving themselves they are, after all, serving the best interests of the country. And owing to the make-up of the American Senate—where two senators from Nevada, with a population of 110,000, have exactly the same voting strength as two from New York, with its population of 13,479,000, or Pennsylvania with its 9,600,000—producers of raw material have a political strength far beyond their numbers. If there is a Senator from those regions who has contradicted this theory, the writer has not heard of him. Whatever its merits or lack of them, this theory and its variants—including a considerable residue of political isolationism—present the most formidable obstacle to-day to American participation in international trade on any large give-and-take postwar basis which would require the sacrifice of any degree of tariff protection, on the part of any considerable group of American producers.

The overt currents of American opinion perhaps justify *The Economist's* recent ironic comment on the "acceptance of the principles of free trade by the more articulate (American) public." The undertow is setting in a far different direction, and for the future of international trade and concord may have far more meaning.

The conflict may not wait until the end of the war. Even while the San Francisco conference is debating political ways to world peace, Congress is debating the renewal of the Reciprocal Trade Agreement Act, which expires in June. The Administration, in the interests of post-war trade accord, wishes to increase the President's powers to permit tariff reductions upon proclamation by as much as 75 per cent, as against the present 50 per cent. Senators and representatives from producers' country are overwhelmingly against renewal of the Act, unless on some such terms as that one-third the House and one-third the Senate may, by veto, kill any specific reciprocal agreement. This would, for all practical purposes, put veto power in the hands of those representing the producers' interests most directly affected. The observer who wishes to chart the true trend of American post-war action would do well to watch the outcome of this contest in Washington as well as San Francisco.

American Notes

A Guaranteed Annual Wage

There was much speculation over President Roosevelt's motives when, shortly before his death, he called for a study of the practicability of an annual wage plan—that is, of guaranteeing annual wages—but to most of labour the President's motives were irrelevant. If, as some thought, the President wanted the inquiry to be made now to divert labour from its increasingly vigorous campaign to raise hourly rates, it still was most important to labour that the inquiry should be made.

The original impetus came from the National War Labour Board, which only last year found "unworkable" the United Steelworkers' demand that 86 steel companies grant a guaranteed annual wage to 400,000 steel workers. The members of the Board decided unanimously, however, that the whole question of guaranteed wage plans and the part they could play in helping to stabilise employment and regularise production, should now be studied on a national scale. This they recommended to the President.

President Roosevelt, because he saw the problem as "closely connected with the problems of reconversion and the transition from war economy to a peace economy," handed it to the advisory board of the Office of War Mobilisation and Reconversion. An annual guaranteed wage has been a major post-war goal of the CIO. So far the American Federation of Labour has displayed little interest in guaranteed annual wages and, in the past, Mr John L. Lewis has disapprovingly referred to such plans as "socialistic."

No comprehensive study has ever been made of the 50 or 60 individual plans now in existence and of their effects on employment, production and profits. A recent survey of wage and hour contracts completed by the Department of Labour shows that out of 8,000,000 wage earners only 42,500 have any form of wage guarantee. And according to the WLB, no plans have ever been tried in a durable goods industry like steel, where demand fluctuates widely and is dependent on the changing needs of other industries.

The critics say that such planning is impractical for any consumer industry and that such adjustments, being none of the government's business in any case, should not be crammed down the throats of labour and management as law. Labour is quite willing to have "such adjustments" crammed down its throat and is zealously at work mobilising the public support and pressure needed before Congress would pass legislation. Meanwhile, Senator Kilgore, of West Virginia, probably the CIO's best friend in the Senate, is reported to be planning to ask for a Congressional study of guaranteed annual wages to supplement the executive project.

Another Axis

A barometer of American earnestness about the San Francisco Conference is the mail that the State Department is receiving from the public, which has jumped from its usual average of 400 letters a day to an average of 6,000. In general, the press has given the public fair and soberly critical news of the Conference, although it is difficult to see why there should be so much surprise over inevitable differences in method, tactics and points of view between the Western Powers and the Soviet Union. An interesting point is made by Mr Walter Lippmann, who sees Soviet suspicions of the United States and Great Britain growing out of a concern that the two Western Powers really are interested in setting up an organisation to police the Soviet Union. This, he points out, would inevitably involve restoring Germany "first as a buffer and then as a spearhead." A wide section of the press takes a similar view, stressing that too much time, patience and goodwill cannot be used to overcome Russia's deeply rooted doubts and suspicions. The fact that she is as desperately in need of peace as Britain and the United States is seen as hopeful.

It is the attitude of the "diehard" section of the press, however, that has caused many good people in America concern. These are the isolationists to the end, the publishers who cannot be convinced by mechanical bombs or Buchenwald that what they insistently call the "American way of life" has any context in the world outside America's physical boundaries. The most unpalatable comment is concentrated in the group of papers that

President Roosevelt once called an "Axis," in which one of the leading figures is the widely read Mr John O'Donnell, who writes something of a gossip column on political themes for the *New York Daily News*. "Bed-fuddled experts who are master-minding the confusion circus known as UNCIO," Mr O'Donnell says, "are trying to figure out a way of winding it up as swiftly as possible before the big boys start saying in public some of the dirty cracks they are circulating in private, before they start World War Three right here." In another column he predicts that the "United States, backed by Britain, is in for a showdown fight—diplomatically as yet—with Russia." He says Britain, faced with a Communist Europe, is asking Americans in San Francisco, "as big-shot bank-rollers of Pal Joey, to cool off the Russian heat."

These are not isolated examples; they are examples of many thousands of words that are being written, and it is a tribute to the good sense of the American people that, although they read the words, they continue seriously to seek an alternative to violence as a means of settling international disputes.

Universal Military Training

The very delicate question of post-war universal compulsory military training is by no means dead or even sleeping. It has merely been allowed to rest while the various wartime manpower bills were thrashed out. Very shortly now, the House and Senate Military Affairs Committees are expected to air this controversy again, probably using as a springboard the May-Gurney Bill, which provides that every male in the age range of 18 to 21 should serve in the armed forces for one year. The hard issue has often been obscured in the past by a public opinion which took refuge in the objection that the discussions were "premature." But the future is now rapidly approaching.

Before the war there was some support for conscription from the super-nationalist section of opinion, from those with imperialistic dreams and, more simply, from those who loved a parade. The great majority, however, was opposed. Now the issue cannot be so easily decided. The huge task of re-employing millions of demobilised men can very easily affect the answer. And certainly it is complicated by how a military training plan would be interpreted by friendly nations. Would they see in it a sign that America is prepared to back up peace agreements with force, or a sign that she is not placing much faith in such agreements?

Quite naturally, the most clear-cut stand is taken by army and navy officials, who, in general, are supported by the civilian members of the Administration. Mr Forrestal, the Secretary of the Navy, has said, "It no more means that we are looking for war than getting vaccinated means a man is looking for smallpox." Early this year President Roosevelt, in a message to Congress, said "We must have universal military training after this war" as an essential factor in the maintenance of peace in the future.

Church groups, both Catholic and Protestant, have either opposed such legislation or would postpone it. Educators are divided and apparently determined to remain so. All polls of public opinion indicate that the American people favour universal military conscription. The trend is well revealed by a Gallup poll taken last November, which showed that 67 per cent of men approve and 60 per cent of women approve (in 1939 only 37 per cent of men and women approved). War Department surveys of servicemen show that between 65 and 70 per cent favour universal training. This is natural in wartime, but perhaps it will be far less natural in time of peace.

One of the best and most thoughtful cases for conscription was recently put by Mr Charles Guy Bolte, chairman of the new American Veterans Committee, who is impatient with all the elevated social, moral, character-building, health and educational arguments that becloud the real issue which must be squarely faced. In a world where one of the most important elements in the shaping of foreign policy is the fact of rocket or stratospheric bombs and troop-carrying aircraft, will or will not universal military training contribute to the future security of the United States? Although it is difficult to determine any alignment of forces at present, if the issue can be so clearly cut and squarely faced the answer will probably be "yes."

Away From Normalcy

President Truman made two significant appointments last week. The recipient of both was Mr Henry Wallace the Secretary of Commerce. The President transferred to Mr Wallace and the Department of Commerce the constantly growing surplus property disposal activities of the Treasury Department. Mr Wallace's views on surplus property disposal are no secret and at least some of his ideas on how such disposal could aid small business were developed in his testimony before the Senate Committee during hearings on his nomination for the office he now holds. The other job was an authorisation by the President to conduct an investigation into alleged monopolistic practices under existing patent laws. Mr Wallace has been extremely vocal in his view that patent laws have been used to strengthen cartels, restrict competition, suppress new inventions and weaken the country's security. Mr Truman made similar charges during his campaign and now apparently is giving Mr Wallace a chance to prove their case.

These are interesting appointments in that they are almost the first positive steps Mr Truman has taken completely on his own, with no course clearly marked out by President Roosevelt. For the first time the new President has made himself vulnerable to criticism, for in no sense can these appointments be interpreted as trends in the direction of the "normalcy" for which the opposition yearns.

The Department of Commerce, in taking over the Treasury's disposal functions, will be one of seven agencies through which the vast accumulation of government-owned surpluses will funnel. It will be the agent for all categories of consumer goods, in prodigious quantities: automobiles, textiles, wearing apparel, machinery, furniture, hardware, medicine, paper and office supplies, photographic equipment, livestock, electrical supplies, etc. About \$15 billion worth of stocks that civilians can use are involved, and probably \$6 billion are ready now for the domestic market.

The job of investigating the uses to which patent laws are being put is not unconnected with the surplus property assignment. After the last war, German patents were included in the mass of surplus materials that were turned over to private interests and were the basis of a whole new chemical industry.

The Russian Budget

LAST week the Soviet Commissar of Finance, M. Zverev, made his Budget speech to the Supreme Soviet. This was his second wartime report on the Budget—none was made in 1942 or 1943. The financial figures for 1944 and 1945 are by no means complete, but they do seem to offer a guide to some of the economic processes in Russia in the last year of the European war. The gaps in the picture are due to several factors. Not all the figures of revenue and expenditure are available. It is, further, impossible to relate the figures in roubles to the real values which they represent, because no price indices have been published in Russia for at least twelve years. It is, in particular, impossible to say to what extent prices (especially in industry) have changed in the course of the war. It is certain that increases in revenue and expenditure do not represent corresponding increases in the volume of real goods at the disposal of the Government. And—last but not least—it is never quite certain how far the Russian financial accounts are real, how far their publication is a mere legal formality, or how far it is calculated to serve special political purposes. It is in the light of all these, perhaps somewhat over-sceptical, reservations that the table below ought to be analysed. The table compares the chief items in this year's estimates with the Budgets of the two preceding years, as well as with the last two Budgets which were planned in peace-time (1940 and 1941):—

(In billions of roubles)					
	1940	1941*	1943	1944†	1945
Revenue	180.2	216.8	210.0	268.0	305.3
Turnover tax.....	105.8	124.5	71.1	116.0	137.7
Levies on profits.....	§	§	§	§	§
Expenditure	174.3	216.0	210.0	263.0	305.3
Defence.....	56.0	78.9	124.0	137.0	137.9
National economy.....	57.1	73.2	31.1	49.0	64.6
Social and cultural development.....	43.0	47.9	37.2	51.1	66.1

* The figures for 1941 are taken from the estimates for that year.
† Preliminary figures for last year's actual revenue and expenditure.
§ Not available.

The first striking feature is that the estimates for the current year provide for a higher Budget than in all previous years. A casual comparison between the estimates for 1945 and those for 1941 shows that up to a point this must be a purely inflationary increase. This year's global figures are 43 per cent higher than those of 1941. In any other economy in which the Budget is merely a fraction of the national income a similar or even a much higher increase in the Budget is quite normal. The Russian Budget, however, represents the bulk of the national income. A very large increase in the former presupposes a correspondingly large increase in the latter. As it is impossible to assume that Russia's national income—after all the devastation caused by the war—will be higher this year by 40 or even by 30 per cent than her planned income for 1941, the conclusion must be drawn that the rise in the budgets over the years of the war reflects an indefinable element of price inflation; and that that inflation has developed even in the most rigidly controlled sectors of the Soviet economy, where the Government's price-fixing machinery is, in theory, supposed to work perfectly and smoothly, meeting no economic resistance.

This, however, does not mean that the increase in the budgetary figures for 1945 over those of 1944 necessarily have an inflationary character. There are some indications that the inflationary trend came to something like a standstill last year. If the price-fixing machinery is now able definitely to reassert itself, then the increased volume of revenue and expenditure will reflect real economic expansion. The new material basis for that expansion has been created by the liberation of all Soviet territories from German occupation.

The most striking political feature of the 1945 estimates is that the expenditure on defence has been maintained on the high level of the previous year. Commissar Zverev called for a "further intensification of the war effort." Unlike his British counterpart, he gave no hint of an "interim budget."

The decision not to cut defence expenditure may well have been made as a political gesture. Though the Budget year in Russia starts in January, and the cost of the war in the first half of the year is certain to be heavy, there has certainly been scope for a substantial reduction in defence expenditure. The meaning of the political gesture can only be guessed at; it may spell a warning to Japan; it may reflect the Russian Government's uneasiness about the general prospects of stable peace; and it may also be calculated to prevent a sudden slackening of morale at home.

Finance for Industry

The other striking feature is the increase in the budgetary allocation for "national economy," which has risen from 49 to 64.6 billion roubles, and is thus nominally higher than the corresponding allocation for 1940, though lower than that for 1941. Grants for national economy indicate the rhythm of industrial expansion, including expansion in armament industries. Thus, in 1944, 22 out of the 49 billion roubles spent on national economy were invested in new capital construction. The total investment in new plant was 29 billion roubles, which means that three-quarters of the cost of the building of new industrial enterprises was covered from the state budget, and only one-quarter was covered directly from the reserves of industry itself. The table below shows in greater detail how the grants for national economy are distributed between various branches:

(In billions of roubles)		
	1944	1945
TOTAL.....	49.0	64.6
Industry.....	27.3	35.9
Agriculture.....	7.0	9.2
Transport and communications.....	7.7	9.8
Trade and stocks.....	1.2	1.7
Municipal services and housing.....	1.8	2.9

Investment in heavy industry is still being given first priority. It is striking that budgetary grants for housing are unexpectedly low, though the lack of housing throughout the former occupied provinces is reliably reported to be appalling. Undoubtedly, the republican budgets of the Ukraine and Byelorussia will also provide some grants for housing. But, on the whole, the tendency seems to be to make the inhabitants of the liberated provinces build houses from their private resources. The Government's building programme provides, on the other hand, for large-scale construction of public buildings, schools, clubs, etc. The following table gives the detailed items of expenditure on "social and cultural development":

(In billions of roubles)		
	1944	1945
Education.....	20.440	28.591
Health and physical culture.....	10.210	13.194
Social insurance.....	3.800	5.200
Large family grants.....	0.872	1.407
Social welfare.....	15.600	17.700

On the revenue side, the turnover tax and taxes on industrial profits provide jointly the largest single item. It is, however, not yet known what was the actual yield of the turnover tax alone in 1944, or what is the estimated yield for 1945. The turnover tax—the indirect tax on consumers' goods—used to provide more than a half and at times even two-thirds of the total revenue. The decrease in the yield of the tax throughout the years of the war reflected shrinking consumption. The Commissar of Finance has now foreshadowed an increase of revenue from this source, which indicates that a substantial expansion in consumers' industries is planned for the current year. The yield from the turnover tax and from levies on industrial profits is expected to cover "nearly half of this year's expenditure." The yield from the turnover tax alone is, however, not likely to exceed 30-35 per cent of the expenditure. It may be of the order of 110 billion roubles. A very steep rise in consumption is thus expected, compared with the volume of consumption

in 1943, when the yield of the turnover tax did not exceed 71 billion roubles. This year's yield may be on a par with or even higher than that of 1940. But this would not imply that consumption, too, has reached the same level, because both the prices of consumers' goods and the rates of the tax have gone up in the meantime.

No attempt has been made to compare the Russian war expenditure with Lend-Lease deliveries, and to show the proportionate rôle which Lend-Lease supplies have played in the total defence expenditure. Similarly, on the revenue side the yield of reparations from the satellite countries has been altogether omitted. Yet reparations as well as requisitions made on enemy territory are certain to create quite important budgetary surpluses. In the absence of any extraordinary political and military complications, the estimates of defence expenditure will, in addition, prove to be very much higher than the actual expenditure. From Commissar Zverev's Report it would therefore appear that by overstating expenditure and understating revenue he has greatly over-budgeted this year, probably in order to create a large reserve for next year's work of reconstruction.

The Argentine Emigration

[FROM A CORRESPONDENT IN MONTEVIDEO]

LAST year Montevideo became the assembly point of Argentina's outstanding political exiles, including the leaders of both resistance movements—the *Asociación de Mayo* and the *Patria Libre*. The former is the civilian wing of an essentially military group rather than the nucleus of any mass movement. It pinned its hopes on an insurrection among allegedly disaffected sections of the army. Exclusive in its outlook, it refused to associate with the Communists, although the latter had the best underground organisation and were influential in the "Unified Labour Command," which rallied the sections of labour that were in open opposition to the régime. The chief representatives of *Asociación de Mayo* in Montevideo are a former Socialist senator, Alfredo L. Palacios; two former Socialist deputies, Nicolás Repetto and Guillermo Korn; a former governor of Santa Fé province, Dr Luciano F. Molinas, who belonged to the Progressive Democrat Party; and José Gabriel, a journalist.

The *Patria Libre* is a more popular resistance movement both in outlook and organisation. It has its own underground press. Its chief representatives in Montevideo, who form its "Foreign Council," are a former governor of Buenos Aires province, Rodolfo Moreno, a Conservative; another Conservative in José Aguirre Cámara, a former president of the Finance Committee of the Chamber of Deputies; a former Socialist deputy, Julio González Iramain; a former Radical deputy, Silvano Santander; and the Communist publisher of the emigré fortnightly *Pueblo Argentino*, Rodolfo Ghioldi.

When the Latin American Labour Confederation, whose chairman is Lombardo Toledano, held its last meeting, in Colombia, in December, 1944, the *Patria Libre* sent a special delegate. Afterwards he undertook a continental tour, visiting Cuba, Mexico and the United States, during which he played the part of unofficial ambassador of the underground. On his return he was able to assure the Argentine democratic opposition that its efforts were noted with sympathy by the democratic forces of the continent. Shortly afterwards the Latin American Committee of the Congress of Industrial Organisations in a memorandum to the State Department suggested that "the Argentine resistance movement be regarded in the same way as the European underground and . . . be rendered all necessary aid."

About the middle of February the two resistance groups in Uruguay achieved some measure of unity. In a joint statement they pledged to work together for a return to normal constitutional processes; to carry out international obligations and to co-operate with the United Nations; to fight totalitarianism; and to expose the real situation in Argentina. This programme was endorsed by Nicolás Repetto and Guillermo Korn, of the *Asociación de Mayo* (but not by Palacios or Molinas) and by all the supporters of *Patria Libre*. It was hoped that a similar rapprochement would take place within Argentina. Mr Stettinius's much publicised statement about "the military Fascist gang in control of power in Argentina" indicated that an agreement between the United States and the present Argentine

Government was impossible and was considered to be an encouragement to the opposition.

Blow to the Opposition

Thus the "Argentine resolution" of the Mexico City Conference came as a complete shock to the opposition forces, and was held to be inconsistent with the former attitude of the United States. Moreover, the fear at once arose that the Argentine Government would seize the opportunity to obtain recognition by taking a few minimum steps without changing any of its essential characteristics.

In a statement addressed to the Pan-American Council for Democracy the Foreign Council of *Patria Libre* described the resolution as "a dangerous concession" to the forces of appeasement. In an editorial Rodolfo Ghioldi expressed as follows the general opinion of most of the exiles:

It is not for the first time that US diplomacy has let us down. This occurred in Paraguay, where a military-Nazi group controls all key positions. In Bolivia, owing to the Warren report [the report of a US committee of investigation which led to recognition of the Bolivian revolutionary régime], the pro-Nazi Victor Paz Estenssoro [Minister of Finance in the present government] was retained, although his personal background is only too well known by the State Department. And now a completely wrong policy will be applied to Colonel Perón, who must be appeased just as Hitler was appeased.

Ghioldi, the Communist, was joined by Aguirre Cámara, Conservative, who in *Voz Argentina*, a radio programme of the Argentine exiles, voiced his anxiety about the effects of a recognition of the Argentine Government:

The dictatorship does a right-about turn in order to disarm and weaken the internal opposition. This is the moment for the resistance movement to rise to its climax. It must remain firm, because the slightest weakness might have sorry results. We prefer genuine illegality to faked legality subject to military control.

Two facts were not in doubt: first, that a recognition of the present Argentine Government would tend to consolidate its position and thus be a momentary setback to the resistance movement; secondly, that the sudden switch of US diplomacy weakened the confidence of the very currents

BALKAN SOBRANIE CIGARETTES & TOBACCO

RECIPE FOR INACTION...

For so long so many have been doing so much. But the time is at hand when duty can be given leave, when orders can be ruled out-of-order, when the right to do nothing some of the time can be one of the Freedoms free men slave for all the time.

But there's so much to be done, say the planners. So much to be done that there's only one thing to be done about it—light up a Balkan Sobranie and enjoy not doing anything about anything.

Its flavour puts you on top of the world without making you a dictator, its aroma persuades you to surrender without preaching defeatism, its counsel when all about you is feverish botheadedness is always cool, mature and wise.

SOBRANIE LTD LONDON E.C.1.

in Latin America on which it must mainly rely for the maintenance of the Good Neighbour policy. These currents are overwhelmingly opposed to the Argentine régime, and consider that US diplomacy "let them down" in exchange for the dubious friendship of the Argentine Colonels.

In Argentina itself the international problem was complicated by the Government's knowledge that, should it decide to declare war on Germany, the United Nations would not fail to stake out their claims to German funds.

Eire's Building Programme

[FROM OUR DUBLIN CORRESPONDENT]

THE building industry in Eire has been gravely handicapped by the war. Many essential building materials have to be imported and serious shortages were experienced quite early in the war. Large arrears of housing and other essential building work have accumulated, and it is clear that abnormal demands will be made on the industry in the immediate post-war period. To prepare for this contingency the Department of Industry and Commerce established a special branch last year to undertake a survey of the country's probable requirements for a period up to five years from the conclusion of the war, and to ensure that the social, economic and cultural value of the work proposed is taken into account before building resources are utilised. The new organisation has assembled all available information about building and constructional projects contemplated by Government Departments, local authorities, public bodies and private businesses. Larger undertakings were asked to estimate their expenditure during five years and important public bodies have co-operated by planning to spread their expenditure over a period of years. The results of these investigations have been published in a White Paper entitled *The Post-War Building Programme*.

The total estimated cost, at current prices, of the building projects notified to the Department is £73,166,888 and of constructional projects involving the use of building materials £26,400,715. The major items among the building projects are as follows:—Housing by Government Depart-

ments and local authorities £26,913,300; housing by private enterprise £14,292,330; hospitals £9,388,000; factories £4,797,780; and churches and convents £4,323,413. The major constructional works are: roads £13,722,500; water and sewerage £3,361,695; electricity £2,807,000; and aviation £2,799,850. The sum proposed to be spent on housing amounts to no less than 56.3 per cent of all building activities. An estimate of the local distribution of the projects shows that 56.1 per cent of the total expenditure will be incurred in Dublin. This emphasises the centralising tendency that has marked the Irish economic system since the Treaty. It is noteworthy that no expenditure seems to be contemplated on capital works relating to agriculture. Doubtless agricultural exports will be indirectly helped by some of the projected works and the tourist industry will be encouraged by the improved roads and hotels, but, generally speaking, the buildings and constructions in contemplation will do little to increase exports. The necessary expansion of imports can, however, be paid for out of the large sterling balances accumulated during the war, provided that supplies are available in exporting countries.

It is estimated that, when due allowance is made for increased building costs, the annual volume of post-war work will be at least two-thirds greater than that carried out in a normal pre-war year. In the period immediately after the war the building industry will be completely unable to meet the demands made on it unless a rigid scheme of priorities is established. Imports of timber and other essential materials will be scarce. The supply of labour will depend upon the rate at which skilled craftsmen who have emigrated to Great Britain will return. The great demand for labour in Great Britain during the war has gravely depleted the supply of skilled labour in Eire, and there is every reason to believe that the post-war period will also witness considerable building activity. British wages and social services may tempt many Irish workers not to return to Eire and the training of new labour may be necessary. The expansion of the building industry is desirable, not only because of the shortage of houses, but because of the amount of well-paid employment that it affords.

Priorities

The function of the Government in directing the building programme is, to a large extent, negative. The Government can prohibit the erection of buildings but, apart from works by public authorities, cannot order them to be erected. Moreover, it is exceedingly difficult to decide upon what principle the social desirability of competing projects should be determined. In an individualist society the ultimate arbiter of desirable activity is the satisfaction of consumer demand, and, except in the abnormal conditions of war, preventing the public from satisfying their legitimate wants can hardly be justified. The Department accepts this view and states, therefore, that any necessary restriction should apply proportionately to every class of project. In other words, it is the rate and not the direction of the building programme that needs to be regulated. Certain principles are laid down to determine the allocation of priorities. Promoters who are ready to proceed should be facilitated; preference should be given to private enterprise; work requiring much labour and little timber should be preferred to work requiring much timber and little labour; work should be encouraged in areas where labour is plentiful; and some publicly financed schemes should be held in reserve for periods of depression.

On the basis of these principles, a provisional plan has been prepared. The plan assigns work in the following amounts in the post-war years: first year, £7,834,890; second year, £10,575,340; third year, £13,016,210; fourth year, £13,616,640; fifth year, £12,728,475; sixth, seventh and eighth years, a total of £15,395,333. The sum of £7,834,890 to be spent in the first year includes £2,500,000 for housing by local authorities, £1,500,000 for housing by private enterprise, £600,000 for factories, £562,000 for schools, and £530,000 for hospitals. In later years a good deal of elasticity must be allowed in determining the priorities of particular projects. The various Government Departments directly concerned will have to make these decisions in the light of the supplies of labour and materials available. Obviously, building which does not comply with the Government's programme will have to be prevented, and it is proposed that no building exceeding a specified cost should be undertaken except under licence. To aid in the execution of the post-war building programme, five special advisory committees have been set up representative of employers and labour in the building and allied industries, and a committee has been established to deal with research in the building industry with particular reference to the use of the country's natural resources in building materials.

THE NATIONAL FINANCES

The purpose of this special section is to provide a conspectus of the statistical material that is available on the national finances. It is divided into three parts:—

1. The National Economy.—A summary of the figures contained in the Budget White Paper ("An Analysis of the Sources of War Finance and Estimates of the National Income and Expenditure in the years 1938 to 1944"; Cmd. 6623; 1s. net) and a commentary upon the results. This section contains the majority of the tables from the White Paper (other than the main tables reprinted in full in Section 2). But it also contains a number of independent estimates by THE ECONOMIST. The official tables are printed at the foot of each page and are numbered as they appear in the White Paper (where two tables are summarised in one, the numbers of both are given). THE ECONOMIST's own estimates appear in the text and, as a further safeguard, any figure containing an element of private estimation is given in brackets.

2. The National Income.—The four main tables from the White Paper reprinted in full.

3. The Budget.—A collection of tables relating to the revenue and expenditure of the Exchequer and to the National Debt. This replaces the Budget Supplement that has been published for many years. All the figures are derived from official sources.

All figures (other than percentages) are in £ millions, unless otherwise stated.

I The National Economy

The Budget White Paper is divided into five chapters. Of these the fifth consists of the main tables, reprinted in full on pages 595-6, and the fourth is a comparison of this year's estimates with those of last year's Budget White Paper, which is mainly of technical interest. The discussion below summarises and comments upon the first three chapters. Between the second and third, however, there is interposed a discussion on "The Cost of the War," based largely on estimates by THE ECONOMIST.

I—INTRODUCTION

THE introduction is mainly concerned with defining the terms used in national income studies, illustrating them from the figures of the single year 1938. The discussion starts with the familiar concept of incomes received by individuals and their disposal in the three main categories of consumption, taxes and saving. These figures are shown in Table 1, and Table 2 adds figures for other income which, while it is private, does not accrue to individuals; this consists mainly of the undivided profits of companies. The total of these two tables is Private Income. Table 3 sets out both the Private Income and the Outlay resulting from it in a different way. The income is differentiated according as it arises from economic activity—that is, as payment for some contribution to the economic process—or from transfers from public authorities which are made without regard to any economic activity. Pensions and social security payments generally are clearly "transfer payments," while interest on the national debt is customarily so included. The third category of personal income is remittances from abroad. In this table also, the outlay of personal incomes on consumption is sub-divided according to the economic nature of the different payments. Out of every £1 of private income in 1938 2s. 2d. went in direct taxes and 1s. 5d. was saved, leaving 16s. 5d. to be spent on consumption. Of this 16s. 5d., a further 2s. 2½d. went in indirect taxes (making a total of 4s. 4½d. for taxes), 10s. 6d. went to pay wages, salaries, rent, interest and profit to British persons and companies, 1s. 0½d. was set aside to meet the costs of replacing the capital equipment used in producing the consumption goods, and 2s. 8d. went in payment for imports and in remittances overseas.

The foregoing tables exclude both the income and the outlay of the central government and local authorities, which is shown in Table 4. The major items in income are naturally the taxation levied on private income; but there is also income from public trading and from taxes

levied by one public authority on another. Expenditure is divided under heads similar to those in Table 3.

Items of saving and of depreciation and maintenance appear among the expenditure items both of Table 3 and Table 4. Together these amount to the gross saving of the community, its expenditure on the maintenance, replacement and increase of its capital. These sums also were, in the main, expended on goods and services (i.e., new capital equipment and labour for maintenance and repair), and they too can therefore be divided up according as they were spent on salaries, wages, rent, interest and profits; on depreciation (i.e., the maintenance and replacement of the capital used to make capital goods); on indirect taxes; or on imports. These figures are given in Table 5, which also includes an item for the net increase or reduction in the total of British claims on other countries. This item is the net resultant of a large number of transactions between the United Kingdom and the rest of the world, usually known as the balance of payments, and shown in Table 6.

The figures of private income given up to this point have included transfer payments—that is, payments such as pensions which are made to persons for reasons other than in payment for economic activity. For some purposes—for example, discussions of taxable capacity—it is right that these payments should be included. But in the main, national income figures are used as measures of economic activity, and for these purposes transfer payments are best excluded. A nation that went in for gigantic social security schemes and greatly increased its national debt would thereby increase the total of its private incomes. But, as a community, it would not be any richer, and for the measurement of real wealth it is therefore necessary to have figures from which these items are omitted.

There are three main national income concepts in general use: net national income at factor cost, net national income at market price, and gross national income at market price (usually called gross national product). The

difference between net and gross consists of depreciation and maintenance expenditures. For some purposes, such as ascertaining the total resources available for use in wartime, it is the whole flow of output of the community that has to be measured, irrespective of whether some of it ought to be devoted to replacing the capital used up in producing it. For a number of years the community can neglect its capital equipment and consume, either for private or for governmental purposes, the whole of its output. But for determining longer-term issues, which require the maintenance of capital as a first charge on output, it is the net income that is relevant. Hitherto, discussion in this country has mainly concentrated on the net figures, chiefly because no others were available. It is one of the advances recorded in this year's White Paper that a figure for depreciation and maintenance allowances is now shown for every year, so that a continuous series of gross figures can be given. The difference between "factor cost" and "market price" depends upon whether the goods and services of which the national income is composed are valued at their market price, which includes indirect taxes, or at the payments made to the various factors of production that went into them. Shall each packet of 20 cigarettes be counted at 2s. 4d. (market price) or at 7d. (the wages, salaries, rent, interest, profits and import costs that went into it)? The more correct way, of course, is "factor cost," since the imposition of indirect taxes does not in any real sense increase the productivity of the community and should not therefore inflate the estimates of national income. But it is not always possible to separate out the indirect tax portion of different items of expenditure, and it is then necessary to use "market price" figures.

Table 10 gives, for each of the last seven years, figures for personal income, for total private income, and for the three versions of national income. It also shows the relation between these various figures.

II—CENTRAL GOVERNMENT EXPENDITURE AND THE NATIONAL ECONOMY

In wartime a very large proportion of the total output of the community has to be pre-empted by the Government. Table 11 is an attempt to show how much. The total expenditure of public authorities on goods and services, reduced to a "factor cost" basis, is compared with the net national income at factor cost, and the proportion of the former to the latter is seen to rise from 20 per cent in 1938 to 61 per cent in 1943, with a slight fall to 59 per cent in 1944. The figures in this table are the first time that war expenditure has been distinguished from other public expenditure. It will be noticed that the distinction is not carried down to the final percentages, but if it can be assumed that indirect taxes amount to the same proportion of war expenditure as of other public expenditure, then the proportion of war expenditure to net national income would work out at 7½ per cent in 1938, 55 per cent in 1943 and 53½ per cent in 1944.

This is the comparison with *net* national income. But it is not certain that this is the most realistic comparison. Net national income is a purely accounting concept. It is not the value of the total national output, nor even the value of the total national output less those goods and services that *actually* are set aside to maintain and replace capital, but the value of the total national output less those goods and services that *would have to be* set aside if the national capital were to be fully maintained—which it is not in wartime. If the comparison is made with the *gross* national income at factor cost, then the proportion borne by total public expenditure is 18 per cent in 1938, 57½ per cent in 1943, and 56 per cent in 1944.

There are three ways in which resources have been provided in such large volume for the Government's use. The first is through a rise in the total output of the community. The total number of men employed in the country (including the Armed Forces and whole-time Civil

Defence) rose from 13.2 million in 1938 to 15.1 million in 1942, and has since fallen only to 14.9 million. The total for women rose from 4.6 million in 1938 to 7.2 million in 1943 and 7.1 million in 1944 (counting each part-timer as a half). At the same time average hours worked per week rose from 46½ in October, 1938, to 50 in July, 1943, and have since fallen back only slightly. On the vexed question of output per man-hour, the White Paper says that "some rise has taken place" but that "the main sources of increased output per man-hour are to be found in the shift of employment from industries with a relatively low to those with a relatively high output per head and in the economies that have arisen through the greatly increased scale of war industries."

The second way in which goods and services have been provided for the war is through a contraction in consumption. Figures bearing on this are given in Table 14. The physical volume of consumption, as can be seen from the last line, was reduced by 22 per cent in 1943, with a slight relaxation in 1944. The Chancellor of the Exchequer explained in his Budget speech that this increase in consumption was almost wholly explained by the incidence of clothes rationing periods.

The third method of mobilising resources has been by drafts on capital at home and overseas—the expression including, in the latter case, not only the realisation of assets but the incurring of debts. The figures are given in Table 15, but it should be realised that these figures include no allowance for loss or damage due to enemy action on the one hand or for any capital assets, on the

other, of permanent value arising from Government expenditure for war purposes.

This is a description of the economic processes involved in mobilisation for war. But, cloaking and facilitating the economic processes, there are also the financial processes. The Government does not take goods or services without paying for them, and it must raise the money to do so. The figures of Government expenditure hitherto quoted are not those for which the Chancellor of the Exchequer has to make provision. On the one hand, they have been limited to Government expenditure on goods and services—that is, they have excluded expenditure on social services and the national debt. On the other hand, they have included expenditure by public authorities other than the central government. The double adjustment is made in Tables 16 and 17.

The means of collecting revenue are familiar. But the borrowing process can be analysed in two ways. Table 19 shows the economic origin of the funds available to be borrowed—that is, whether they derive from saving or from the encashment of capital assets at home or overseas. Table 20 shows the form of securities by which the borrowing has been done.

The fact that these two tables add up to the amount of the Government's borrowing does not prove that there is no inflation. As the White Paper says

There can be no heading in any of them called "inflationary" sources because accounting knows nothing of such matters. A very high figure of personal saving may arise because consumers have foregone a

great deal of consumption, because by increased effort they have raised their total income or because a general increase in prices has resulted in a rise in saving and everything else expressed in terms of money. . . . A better test, perhaps, is the extent to which the pressure on resources has driven up prices, rates of remuneration and incomes and in this way provided the source of the higher money saving.

Judged by this test, the position is not unsatisfactory. There has been a considerable fall in the value of money during the war years, but the greater part of it occurred in the earlier years and was probably due in the main to the fall in the exchange value of the pound sterling. The continued fall in the value of money, or rise in prices, in the later years has been small in relation to the enormous pressures at work. Unquestionably, there has been some inflation, but it has been commendably small in extent.

III—THE COST OF THE WAR

One serious defect of figures stated in money terms is that it is difficult to distinguish how much of the change in them is due to change in the real physical magnitude and how much is merely a reflection of shifts in the value of money. Thus the Gross National Product was £5,682 million in 1938 and £10,069 million in 1944, a growth of 78 per cent. How much of this growth is a real increase in the gross output of goods and services and how much mere price inflation? Before an accurate picture of the effect of the war on the national economy can be obtained, it is necessary to eliminate the effects of price changes.

The White Paper does this for consumption expendi-

tures (see Tables 14 and 22). But no figures of price changes are given that can be applied either to Government expenditure or to the capital items. The reason for this is presumably the great statistical difficulty of doing so. War expenditure goes very largely on things that did not exist a few years ago; how can a correction for price changes be made in such circumstances? The capital items are partly composed of purely financial entries; there is no "physical volume" to measure. These difficulties are quite enough to deter any statistician whose figures would carry an official stamp. But the advantages of having a series of figures from which the effect of price changes has been eliminated is so great that, as in previous years, *The Economist* has made its own estimates. No exactness is claimed for these, but they are believed to be of the right order of magnitude.

These estimates are based on the figures of the Gross National Product, or gross national income at market price. The consumption figures can be deflated by an index of market prices, calculated from Table 14. For the capital items, it seems best to use an index number of the factor cost of consumption goods, which can also be calculated from figures given in the official tables; it is unlikely that capital goods have been greatly affected by the war-time increases in indirect taxes or in subsidies, and for the purely financial items the only possible analogy is with capital goods. It seems probable that the price level of goods and services bought by the Government has risen less than the factor cost of consumption goods, since it is in the munition industries that the greatest gains in productivity have been recorded. Accordingly, an arbitrary series of index numbers has been used for the Govern-

9. Services not included above	567	563	492	450	423	403	403
10. Other goods	280	282	261	225	196	198	205

23.—PERSONAL EXPENDITURE ON CONSUMERS' GOODS AND SERVICES AT CURRENT PRICES ADJUSTED FOR INDIRECT TAXES AND SUBSIDIES

	1938	1939	1940	1941	1942	1943	1944
1. Food:—	1,138	1,172	1,209	1,261	1,328	1,317	1,398
2. Alcoholic beverages:—							
(a) Beer, etc.	110	115	119	150	161	167	168
(b) Other	48	49	52	62	62	68	66
3. Tobacco:—							
(a) Cigarettes	86	92	96	109	118	121	118
(b) Other	...	...	...	...	...	...	...
4. Rent, rates and water charges	335	345	348	344	342	344	347
5. Fuel and light	186	190	212	224	228	227	241
6. Durable household goods:—							
(a) Furniture and furnishings	145	139	133	103	89	65	55
(b) Hardware	78	74	69	57	47	44	45
7. Clothing:—							
(a) Footwear	70	75	87	79	85	80	84
(b) All other clothing	353	361	386	307	335	307	373
8. Travel, including the purchase of privately-owned vehicles and their running expenses	245	228	160	176	194	204	207
9. Services not included above:—							
(a) Entertainment	58	54	52	66	81	88	92
(b) All other	483	485	484	470	452	446	462
10. Other goods	263	270	278	269	258	264	277
11. Income in kind of the armed forces	16	28	77	131	143	185	200

ment sphere; it is here that the greatest margin of error lies. The index numbers used for deflation are as follows:

	1938	1939	1940	1941	1942	1943	1944
Government expenditure	100	(100)	(115)	(125)	(130)	(135)	(137½)
Consumption expenditure (market price)	100	102	119	135	142	148	151
Capital items (factor cost)	100	102	118	131	137½	141	145

With the official estimates corrected in this way, the following table can be constructed:—

GROSS NATIONAL EXPENDITURE
(millions of 1938 pounds)

	1938	1939	1940	1941	1942	1943	1944†
Government expenditure:—							
1. War purposes	358	(795)	(2,400)	(2,960)	(3,130)	(3,440)	(3,400)
2. Other*	496	(471)	(418)	(413)	(410)	(398)	(396)
3. Private expenditure on consumption	4,153	(4,180)	(3,710)	(3,480)	(3,450)	(3,370)	(3,450)
Expenditure on maintenance, replacement and increase of capital:—							
4. At home	785	(810)	(460)	(300)	(289)	(250)	(198)
5. Abroad	70	(246)	(-672)	(-608)	(-485)	(-486)	(-454)
6. Gross Nat. Product	5,682	(6,010)	(6,316)	(6,545)	(6,796)	(6,972)	(6,990)

* Excluding net capital formation of a non-war character, included in item 4.
† This column incorporates certain rearrangements and revisions of the figures given on page 534 of *The Economist*, of April 28, 1945.
‡ This line differs from the corresponding line of Table 14 because it is given at market price; it also differs from the total of Table 22 because it incorporates certain adjustments.

From this table it is possible to show the real cost of the war, and the relative real magnitudes of the sources from which it has been derived. Government expenditure on war purposes in 1944 was (£3,042 million) higher than in 1938. This figure can be regarded as the cost of the war in 1944. (There was, of course, a large rearmament element in the 1938 figure, but it is not possible to eliminate this.) It is also clear how the £3,042 million

24.—TAXATION ON PRIVATE INCOME

	1938	1939	1940	1941	1942	1943	1944
1. Private income	5,063	5,411	6,359	7,355	8,050	8,664	9,018
2. Direct taxes, etc., met out of private income	545	597	787	1,231	1,522	1,912	2,104
3. Indirect taxes, rates and war risks insurance premiums less subsidies met out of private income	565	613	690	856	959	1,036	1,016
4. Excess of tax liabilities over payments	23	117	284	327	343	147	102
5. Total of 2, 3 and 4	1,133	1,327	1,761	2,414	2,824	3,095	3,222
6. (5) as a percentage of (1)	22	25	28	33	35	36	36

25.—NUMBERS IN DIFFERENT RANGES OF NET INCOME

Range of income after tax	1938-39	1942-43
150-250	4,500,000	7,000,000
250-500	1,820,000	5,300,000
500-1,000	450,000	550,000
1,000-2,000	155,000	117,000
2,000-4,000	56,000	31,750
4,000-6,000	12,000	1,170
6,000 and over	7,000	80
Total of above	7,000,000	13,000,000

28.—PRIVATE SAVING

	1938	1939	1940	1941	1942	1943	1944
Gross personal saving	273	371	797	1,100	1,374	1,625	1,597
less Death duties, etc.	-90	-87	-85	-94	-100	-104	-113
Balance	183	284	712	1,006	1,274	1,521	1,484
Private non-personal gross saving	182	266	437	485	345	244	214
Total gross private saving	365	550	1,149	1,491	1,619	1,765	1,698
less Increase in allowance to meet accrued taxation	-23	-117	-284	-327	-343	-147	-102
Net private saving	342	433	865	1,164	1,276	1,618	1,596

was provided. To begin with, the total gross national product increased by (£1,308 million). Private consumption expenditure was reduced by (£703 million) and Government non-war expenditure by (£60 million). A reduction in the gross provision for domestic capital contributed (£587 million) and increased drafts on overseas capital (£384 million). A similar sum can be done for each of the years from 1939 to 1944, and the following table shows the results for the last two years and for the six years together:—

	1943		1944		1939-44	
	Millions of 1938 pounds	%	Millions of 1938 pounds	%	Millions of 1938 pounds	%
Cost of war (inc. in item 1)	(3,082)	(100)	(3,042)	(100)	(13,977)	(100)
Derived from:—						
Larger output (inc. in 6)	(1,290)	(42)	(1,308)	(43)	(5,537)	(39½)
Smaller consumption (red. in 3)	(783)	(25)	(703)	(23)	(3,278)	(23½)
Smaller Govt. non-war expenditure (red. in 2)	(58)	(2)	(60)	(2)	(230)	(1½)
Reduced provision for domestic capital (red. in 4)	(535)	(17½)	(587)	(19)	(2,403)	(17)
Larger drafts on overseas capital (inc. in negative figure in 5)	(416)	(13½)	(384)	(13)	(2,529)	(18)

The cost of the war has been equivalent to the whole gross output of the nation, at the 1938 standard, for 2½ years, and this cost has been met, in the rough proportion of 4:2½:3½ from greater productive effort; from economies in consumption and normal government expenditure; and from drafts on capital.

The American official figures permit a comparison to be made in this respect between the economic cost of the war in the United Kingdom and the United States. The following table gives the percentage distribution of the cost of the war in the peak year in each country (1943 in the United Kingdom, 1944 in the United States)

25.—DISTRIBUTION OF PRIVATE INCOME BY RANGES OF INCOME SHOWING THE EFFECT OF CHANGES IN INCOME TAX AND SURTAX United Kingdom, 1938

Range of income before tax	Number of incomes	Aggregate income before tax 1938	Aggregate income after income tax and surtax at		Proportion of income before tax retained after deduction of taxes at	
			1938-39 rates	1942-43 rates	1938-39 rates	1942-43 rates
£	000's	£m	£m	£m	%	%
Private income at the disposal of individuals which can be allocated to different ranges:—						
Under 250.....	...	2,706	2,701	2,641	99.8	97.6
250-500.....	1,745	595	578	499	97.1	83.9

2,000-10,000...	97	360	256	170	71.1	47.2
10,000 and over	8	170	84	35	49.4	20.6
Unallocated private income.....	...	612†	506	...	82.7	...
Total private income	...	5,063	4,660	...	92.0	...

United Kingdom, 1942

Range of income before tax	Number of incomes	Aggregate income before tax 1942	Aggregate income after income tax and surtax at		Proportion of income before tax retained after deduction of taxes at	
			1938-39 rates	1942-43 rates	1938-39 rates	1942-43 rates
£	000's	£m	£m	£m	%	%
Private income at the disposal of individuals:—						
Under 250		3,347	3,339	3,245	99·8	97·0
250-500	5,500	1,854	1,803	1,584	97·3	85·4
500-1,000	1,110	740	664	533	89·7	72·0
1,000-2,000	295	413	343	253	83·1	61·3
2,000-10,000	102	366	263	176	71·9	48·1
10,000 and over	8	170	84	35	49·4	20·6
Unallocated private income	...	1,160†	...	508	...	43·8
Total private income	...	8,050	...	6,334	...	78·7

with the peacetime year five years earlier, thus giving an identical period of mobilisation in the two countries:—

	United Kingdom	United States
Cost of war	100	100
Derived from:—		
Larger output	(39½)	(100)
Smaller consumption	(23½)	(-17)
Smaller Govt. non-war expenditures ..	(1½)	(3)
Reduced provision for, and drafts on, capital	(35)	(14)

The contrast is very striking. The whole real cost of the war to the United States has been met out of increased production. Economies in other Government expenditure and in provision for capital have been necessary only to meet the increased consumption—amounting to about one-fifth—brought about by the impact of high wartime earnings on an economy that is still substantially unrationed.

IV.—CHANGES IN THE COMPOSITION OF PRIVATE OUTLAY.

The chapter of the White Paper with this heading deals with the effect of the war on the incomes and expenditures of individuals. Private outlay comprises consumption, taxation and saving, and each of these components is treated separately.

(A) Consumers' Expenditure

Table 21 shows, in greater detail than has hitherto been available, the composition of personal expenditure,

	Increase or Decrease in 1944 compared with 1938	Proportion of Market Price in 1944 represented by net indirect taxation
Food	-17½	4
Alcoholic beverages	+7½	60
Tobacco	+15½	77
Rent, rates and water	+1	32
Fuel and light	-4½	1
Durable household goods	-75	19
Clothing	-38	7½
Travel	-34	7
Entertainments	-29	34
Other services	-29	2½
Other goods	-26½	15

* Net Subsidy.

at market prices. The adjustment in item 13 is to remove from the figures the expenditure of tourists or troops

27.—DIRECT TAXATION PAID IN EACH YEAR IN RESPECT OF THE POSSESSION OF DIFFERENT TYPES OF INCOME OR THE OWNERSHIP OF DIFFERENT TYPES OF PROPERTY

	1938	1939	1940	1941	1942	1943	1944
1. Arising out of the possession of income:—							
(a) Rent of land and buildings:—							
(i) Income tax	58	65	83	105	120	125	125
(ii) Surtax	7	7	8	8	8	8	8
(b) Interest and profits:—							
(i) Income tax	205	222	302	401	399*	537	595
(ii) Surtax	43	48	58	57	53	54	54
(iii) N.D.C., E.P.T., etc.	15	28	68	231	348	483	519
(c) Salaries:—							
(i) Income tax	43	54	79	130	219	267	310
(ii) Surtax	9	10	12	12	11	12	12
(iii) Employers' contributions ..	4	4	5	7	7	7	7
(d) Wages:—

(ii) Surtax	51	53	56	61	65	64	64
(iii) Employers' contributions ..	...	...	...	...	...	...	...
2. Arising out of the ownership of property or claims thereto:—							
(a) Land and buildings:—							
(i) Estate duties (estate legacy and succession duties), corporation duty and land tax	10	10	10	11	11	12	13
(ii) War Damage Act contributions (Part I)	...	...	...	32	40	40	40
(b) Interest bearing securities, viz.:—							
Government and municipal stocks, bonds, mortgages, debentures:—							
Estate duties and corporation duty	22	22	23	27	29	30	35
(c) Stocks, shares, etc. (excluding debentures, mortgages, etc.) in all forms of productive, commercial, financial, etc., enterprise:—							
Estate duties and corporation duty	37	37	37	40	43	43	47
(d) Other forms of property:—							
Estate duties	9	9	9	10	11	11	12
3. Incapable of being allocated between the above headings:—							
(i) Other direct taxes, etc., paid to the central government	30	25	32	28	20	20	19
(ii) Direct taxes paid to extra-budgetary funds not specified above	...	...	...	43	26	14	9
4. Total direct taxes	545	597	787	1,231	1,522	1,912	2,104

* The introduction of Tax Reserve Certificates absorbed payments previously made in advance.

from overseas and to add in consumption expenditure abroad out of British personal income. Out of the total increase of £1,063 million, £649 million is attributable to expenditure on alcoholic beverages and tobacco. Table 22 shows the same items, in summarised form, at constant prices. Comparison of the last column with the first shows the variation in physical volume of the various items. Table 23 gives figures for expenditure on consumption goods with the effect both of indirect taxes and of subsidies removed. A comparison of Table 23 with Table 21 shows what proportion of the market price of the different categories is represented by indirect taxation less subsidies. These two comparisons are shown in the attached table.

(B) Taxation in Relation to Income

Table 24 shows the proportion of private income that is taken in taxation. Of the final percentage of 36 for 1944, the Chancellor of the Exchequer stated in his Budget speech that 3 per cent represents Excess Profits Tax.

Table 25 brings up-to-date figures given in previous years of the distribution of total private income between incomes of different sizes. These figures, in so far as they relate to *personal* income (i.e. excluding unallocated private income), can be summarised as follows:—

Range of Income before tax	1938			1942		
	Total No. of Incomes	Total Income before Tax	Total Income after Tax	Total No. of Incomes	Total Income before Tax	Total Income after Tax
Under 250. £	...	...	...	...	...	...
250—500	(89)	65	65	(72)	48½	56
500—1,000	(7½)	13	14	(21½)	27	27
1,000—2,000	(2)	8	7½	(4½)	10½	9
2,000—10,000	(0.8)	6	5½	(1.2)	6	4½
10,000 and over	(0.4)	8	6	(0.4)	5½	3
	(0.03)	4	2	(0.03)	2½	1½

A further illustration of the same social transformation shown by these figures is given in Table 26, which shows the number of net incomes of different sizes. (This Table is confined to persons assessed to income tax.) In Tables 25 and 26 each married couple is treated as having only one income.

Table 27 shows how direct taxation falls on the different economic categories of income.

Table 28 (reprinted here in summarised form) shows the composition of private savings.

2 The National Income

I.—ESTIMATES OF NET NATIONAL INCOME (OR PRODUCT) AND EXPENDITURE, 1938-1944 (£ million)

	1938	1939	1940	1941	1942	1943	1944		1938	1939	1940	1941	1942	1943	1944
1. Rent of land and buildings ..	380	388	388	385	384	384	384	7. Personal expenditure on consumers' goods and services including sums involved in the acquisition and transfer of property and life assurance at market prices	4,153	4,264	4,423	4,633	4,909	4,987	5,216

revenue and borrowing in meeting wartime expenditure:— It will be noted that the difference, amounting to £14,153 million, between ordinary revenue on the one hand, and total expenditure (including sinking funds and debt repayments) on the other, was met as to £4,632 million by borrowing from the money market (i.e., by additions to the floating debt); £1,783 million by small savings (3 per cent defence bonds and national savings certificates); £7,671 million by other borrowing; and £67 million by miscellaneous receipts, in which is included contributions received under the War Damage Act. The items shown as net are given after allowing for repayments and receipts.

* Interest on National Savings Certificates paid in excess of provision in Permanent Debt Charge. † Met out of Vote of Credit.
‡ Included in Civil Expenditure until 1938-39. § Including excess of Post Office expenditure over revenue.

This table gives estimates of purely civil expenditure for 1944-45 and 1945-46, compared with the amounts actually spent in the two previous years. It will be noted that the estimates contain a new item in the Ministry of National Insurance which has taken over certain functions from the Ministries of Health and Labour. The pensions items continue to increase, particularly the estimate for supplementary pensions. Another noteworthy increase is shown by the estimate for education mainly as a result of last year's Education Act.

THE COST OF SOCIAL SERVICES.

The latest available figure for expenditure on public social services by central and local authorities appeared in *Hansard* of December 14, 1944, from which the following table has been compiled. The expenditure figures include payments out of taxes and rates, and also contributions by the persons benefiting in the case of the contributory schemes. Many persons shown in the last two columns as receiving benefits do so under two or more of the Acts mentioned in the first column, and are, therefore, accounted for more than once.

Service	Great Britain		Total Number of Persons directly benefiting from the Expenditure	
	1941-42	1942-43	1941-42	1942-43
Unemployment Insurance and Assistance Acts:—	£000	£000

BACKGROUND TO ACHIEVEMENT

Power

FOR more than forty years BTH has been pre-eminent in the design and manufacture of power station equipment. Not only does the Company provide generators, switchgear, transformers and rectifiers for very many electricity supply undertakings throughout the British Empire, but in many cases has also been responsible for the design and installation of the complete systems. The first successful steam turbine for utilising extra high temperature steam was manufactured by BTH for an electric power company in the U.S.A., this experience ultimately enabling BTH to make the propulsion unit for Air Commodore Whittle's jet-propelled plane.

THE BUSINESS WORLD

Double Taxation

THE existence of double taxation arises from the fact that few countries are prepared to confine the purview of their taxation either to income arising within their territory, whatever the residence of its owner, or, alternatively, to income received by their residents regardless of its source. Since most states levy taxes both on the full income of their residents and on all income arising within their borders, double taxation arises therefore whenever income is earned in one country and paid to a resident in another. In the years when the return to be obtained by overseas investment was much greater than that to be earned at home and when direct taxation in the overseas countries was slight, the existence of double taxation was, perhaps, no more than a moderate hindrance to the development of overseas enterprise. This was the more true since the category of overseas investment in which the return was moderate, as in loans to foreign Governments, was commonly exempt from taxation in the paying country.

The injustice of double taxation was already beginning to make itself felt before the war of 1914-18, both because tax rates were rising—although low by present standards—and because rising competition was forcing down the rates of return on overseas investment. The rise in tax rates during the last war brought matters to a head. The subject was considered by the Royal Commission on the Income Tax in 1920, while in 1923 the League of Nations requested Professors Bruins, Einaudi and Seligman and Sir Josiah Stamp to examine it. Throughout the '20s there were several expert reports and the whole question, including the best methods of giving relief, was thoroughly thrashed out. As a result of these deliberations upwards of fifty agreements were concluded between 1921 and 1938 limiting the full rigours of double taxation. The United Kingdom was a party to none of these arrangements. Its activities were limited to Dominion income tax relief and a number of arrangements concerning the profits derived from shipping, air transport and certain types of agency.

Dominion income tax relief is a unilateral concession by the United Kingdom made after discussion with the Dominions. This country gives a set off against the British income tax of a UK resident amounting either to the Dominion rate of tax or to half the UK rate, whichever is the less. If any further relief is required to reduce the net rate paid to the higher of the two it must come from the Dominion, but the Dominions gave no undertaking to provide this relief. Even when DIT relief has been adopted, new taxes have been imposed by the Dominions which they held were not eligible for relief. In consequence, very high rates of tax are now being paid by UK investors and businesses within the Empire, especially in Australia and New Zealand. Only in one case, that of Eire, has DIT relief been extended into complete reciprocal exemption.

The reason for the failure of this country to take part in the movement for relief from double taxation appears to have been a complete misconception of the economic arguments in favour of relief. The possibility that DIT relief could benefit the Empire as a whole was envisaged, but the authorities in this country never seem to have supposed that the United Kingdom, regarded by itself, could reap a benefit from the extension of the principle—presumably on a reciprocal basis—to countries outside the Empire. As recently as July, 1937, the then Financial Secretary to the Treasury stated, in rejecting an application for general relief from double taxation:

there is no reason for us to believe that foreign countries would accept the system of double taxation relief which applies within the British Commonwealth, even if we were prepared to extend it to them.

He went on to imply that DIT terms were the best anyone could hope for from the United Kingdom.

Throughout the period between the two wars the attitude of the United Kingdom appears to have been based on the immediate effect of relief arrangements on the revenue of the British Exchequer. Since, in those years, the United Kingdom was a creditor country, it had a very strong preference for taxing income on the basis of the residence of the owner and was prepared to make concessions, if at all, on taxation at source. In practice, any plan for the relief of double taxation consists in sharing taxation between the country of origin and that of residence. Most of the arrangements between the countries of continental Europe and between them and the United States and Canada classify incomes according to their nature—on a basis broadly economic—and leave some to be taxed in the country of origin and others only in the country of residence.

*

The treaty signed three weeks ago between the United Kingdom and the United States is also a compromise between the two methods. The interest of the United Kingdom in the residence principle has presumably been weakened by transition from creditor to debtor status, but by the same token the American interest in the same principle is growing. So far as can be seen from the terms of the agreement, the balance between the two principles has been kept fairly even. If the principle of taxing by residence were to be applied exclusively, there would be a complete exemption from tax of all income going to non-residents. If the principle of taxing by source were to be applied exclusively, neither country would tax any income yet coming to its residents from overseas. The arrangements actually made adopt a little of both methods. Non-residents are to be exempted from some taxes, and other taxes are reduced in their favour, and for the remainder they are to get a credit against their home tax liability.

The list of exemptions from American tax of income accruing to British residents includes income from profits on trading in the United States when the trader has no place of business there, income from all profits earned in the United States by shipping and aircraft registered under the British flag, all interest payments—other than those paid by a subsidiary to a parent company—royalties on patents and copyrights and film rentals, profits on the sale of capital assets, dividends paid in the United States by a British company to persons neither resident in nor citizens of the United States, and certain salaries, pensions and annuities. There is a reciprocal exemption from British taxation of income due to American residents under all these heads, other than capital gains which are not taxed here.

In the case of other varieties of income, the country of origin is still to levy some tax on the income earned there and the country where the owner resides is to set off these payments against his liability to its own taxes. There are three main classes of income so taxed: profits of the branches of United Kingdom companies in the United States; mineral royalties and rentals from real estate; and dividends from United States companies paid to residents in the United Kingdom—and vice versa in each case. On the first of these, American taxes remain unchanged. On the other two, the American "withholding" tax is reduced from the present level of 30 per cent to 15 per cent or, where the dividend is that of an American subsidiary paid to a British parent company, to 5 per cent. (To secure this latter benefit the parent must control, directly or indirectly, at least 95 per cent of the entire voting power of the subsidiary and not more than 25 per cent of the subsidiary's gross income may come from interest or dividends, other than those paid by its own subsidiaries.) In return, the United Kingdom agrees that dividends earned in this country and due to a person who is resident in the United States, who is subject to American taxation and who is not engaged in trade or busi-

ness in the United Kingdom, shall not be subject to British surtax. A similar arrangement is to apply to mineral royalties and real estate rentals.

For all these taxes which are still to be paid in the country of source, a set-off against home tax liability in the country of residence will be given. In the case of ordinary dividends paid by an American company to a British resident the set-off credited against British taxation will include an allowance for the American corporation tax, which is levied on the corporation before dividends are paid, and where the dividend is on a participating preference share the corporation tax will be taken into account in so far as the dividend exceeds the fixed rate. There are further arrangements, with safeguards against evasion, to provide that the taxable profits of an American branch of a British company shall be only those earned within the United States, the tax assessment not being influenced by the earnings of the business as a whole.

The treaty also provides for a settlement, on terms which amount to total discharge on payment of sums roughly equivalent to interest only, of old tax debts to the United States Treasury from the days before 1936. There is a very important provision for the exchange of information between the two taxing authorities. No new powers to extract information are being taken in either country and the information given will not be passed on to other departments by the taxing authorities.

The convention covering death duties follows similar lines. It lays down rules as to where different types of property are to be taxed and if, despite these rules, double taxation cannot be avoided, provides for set-off against home duties of those paid overseas.

Each party to the treaty can nominate its dependencies and mandated territories to its benefits, but the Dominions must, of course, negotiate their own arrangements. The treaty has to be ratified and the UK set-offs will require legislation.

An attempt to estimate whether the loss of revenue resulting from this treaty will be greater for the American or the British Treasury would require a very detailed knowledge of the affairs of the two countries. In the first category—income where complete exemption is granted to non-residents—the largest items are likely to be British shipping earnings and American film royalties. But in both these cases there is exemption at the moment, and the treaty simply guarantees its continuance. Compared with the present position, therefore, there will be very little change in this category, though it might be argued that the British undertaking to continue the exemption to American film royalties is the abandonment of a potential source both of revenue and of economy in foreign exchange. In the second category, dividends are the most important item. The American Treasury has to meet the cost of reducing the withholding tax on dividends going to British residents and also the cost of giving relief from American taxation to American residents in respect of the British income tax, which is to continue to be deducted from their British dividends. The British Exchequer loses surtax on dividends paid to American residents (which must be a small item) and also has to meet the cost of set-offs against the reduced American withholding tax and the American

corporation tax. The American corporation tax is at present 40 per cent, and the new withholding tax on the remainder is 15 per cent, so that if, for simplicity's sake, the American dividend can be assumed to be exactly equal to the profits out of which it is paid, the combined total of the two taxes is 49 per cent (or 43 per cent in the case of a subsidiary), compared with the present rate of British income-tax of 50 per cent. If the volume of gross dividends moving were the same in each direction, the bargain would seem to be slightly favourable to the British Government (43 to 49 per cent on the in-payments plus surtax on the out-payments as against the cost to the American Treasury of 50 per cent on the in-payments plus 15 to 25 per cent on the out-payments.) Before the war, the volume of dividends moving from America to Britain was much larger than in the reverse direction, and the application of these terms (with the present rates of taxation in both countries) would have made the bargain an expensive one for this country. Today, it is doubtful whether there is very much difference between the two sides.

★

The reception accorded to the treaty by those who have been most vocal in seeking relief appears very favourable and it can reasonably be said that the signing of so complex and far-reaching an arrangement constitutes a complete and very welcome break with the past by the Inland Revenue and the British Government. It is widely felt that the way is now open for a very general adoption of similar arrangements with other countries.

Sir John Anderson has already indicated that DIT is due for an overhaul this summer and it is to be hoped that no Dominion will wish to forgo the advantages which are likely to flow from the free access of capital to areas in need of development. The United States has similar treaties with Canada, South Africa and France, among others. France, Belgium and Holland had each a number of treaties covering direct taxation before the war and, it is believed, are anxious to conclude agreements with this country. There was also a network of arrangements, more or less complete, between Germany, Italy, Sweden, Poland, and the Succession States of the Austro-Hungarian Empire.

Of the major powers only Britain and parts of the Empire held back before the war, and it is to be hoped that, having broken the ice, they will now play their part to the full. Strangely enough, the change has come at a moment when this country is less able than at any time for 150 years past to find funds for overseas enterprise. The opening of the frontiers to a free flow of capital—subject of course to exigencies of exchange control—will not change the general pattern. For some time the really heavy demands for capital can only be met by the United States and the treaty will make the investment of capital here more attractive to American enterprise. But an extension of the reliefs to include all the principal countries would mean that such British capital as can be spared for export would have an equal chance with domestic capital. That is at least one step away from economic individualism, if a small one.

Electrical Engineering

THE electrical engineering industry has grown rapidly in size during the past twenty-five years; during the eleven years from 1924 to 1935 (the year of the most recent census of production) its output rose from £69 million to £107 million in value, and by 80 per cent. in volume. Technologically it is one of the most progressive industries, and the rate of progress was never faster than it has been since 1939. The industry is one that will continue to grow rapidly after the war, and it should be able to contribute materially to the expansion in exports. In sum, the electrical engineering industry will play an important role in British industry; but if it is to justify high hopes it must be as efficient as possible in production, well ahead in the matter of technical progress, and free from restrictive practices.

It is impossible, within the limits of a short article, to give anything like an adequate description of an industry that consists of as many sections and sub-sections as the manufacture of electrical equipment; nor is it possible to submit each of the various sections to the kind of tests that would reveal the degree of its relative efficiency. There are, nevertheless, certain features common to the main branches of

the industry which, even at the risk of over-simplification, may be singled out for brief comment.

Broadly, the industry may be divided into a heavy and a light section. The heavy branch includes machinery, cables and wires, and the light one the multitude of appliances and apparatus from lamps and wireless sets to heating and cooking appliances. Output in the heavy section has been relatively stable (apart from short-term fluctuations); it was £36 million in both 1924 and 1935. The light section, now the more important in point of value, has gone ahead rapidly; its output rose from £33 million to £71 million between the two census years. As it is organised to-day, the industry consists of three sections. There is, first, a number of giant concerns, such as the General Electric Company, manufacturing the whole range of electrical products, both heavy and light. Around these firms are grouped, secondly, the specialists, often large concerns, concentrating on the production of heavy machinery, such as the English Electric Company, or on the manufacture of wireless apparatus, lamps, or some other kind of electrical product. Thirdly, there is a multitude of smallish concerns, engaged

mainly in the production of small components, such as lamp-holders or fittings; the fact that even small components are usually patented makes for variety of design and small-scale production. In the year of the latest census of production, in 1935, the overall productivity of this great new industry was little higher than that of British industry as a whole; the output per person employed was £230, against an average of £222 for all industries. It may be that the technical characteristics of the industry have precluded a more rapid improvement in productivity; but it may also be that the industry, or, at any rate, some of its branches, has not made the best of its opportunities.

In the main sections of the industry, technical or marketing conditions, or both, would seem to favour the large-scale undertaking; the record of amalgamations—that between Callender's Cable and Construction Company and British Insulated Cables, Ltd., is the latest—is a testimony to this tendency. The manufacture of heavy machinery requires large capital investments, and expensive research and development. The light sections, too, often need expensive equipment. Filament lamp production, for example, requires the employment of special diamond dies for wire drawing, in which accurately tapered holes have to be drilled to produce a filament wire appreciably thinner than a human hair. Costly automatic machinery is needed for fixing the wire to its supports, so as to ensure the correct position of the filaments, for expelling the air to obtain the requisite low pressure inside the bulb, and for the controlled introduction of gases. Even before the war the demand for certain light products, such as lamps and wireless sets, was big enough to favour large-scale production units, capable of reaping the benefits of mass production. In spite of this tendency to large-scale units, however, the concentration of ownership has not yet led to the emergence of monopolies, such as Imperial Chemical Industries, in chemicals. This was brought out in the paper on the "Structure of British Industry," read to the Royal Statistical Society on February 20th by Mr H. Leak and Mr A. Maizels, of the Board of Trade. The following table, taken from their paper, shows the number of companies employing 500 persons or more in each of the main branches of the industry in 1935, their aggregate net output, and the net output per person employed, together with their share in the total net output of each section:—

Business	Units employing 500 Persons or more	Total Net Output £'000	Percentage of all Firms	Net Output per Person Employed £
Electrical machinery	27	8,846	48	221
Electrical wires and cables	15	4,793	53	285
Telegraph and telephone apparatus	8	4,176	80	260
Wireless apparatus	13	2,656	39	204
Wireless valves and electric lamps	5	1,865	66	264
Batteries and accumulators	4	2,606	82	294
Lighting accessories and fittings	7	358	33	168
Heating and cooking apparatus	6	769	53	196

These figures show that the industry is by no means completely in the hands of large-scale enterprise, and that in each of the major sections there are still several large business units.

★

But this does not mean that the industry is free from monopolistic practices. In fact, the high overheads of the industry, and the ease with which combinations in restraint of trade can be practised in this country, have driven some of the sections of the industry to seek protection from the full blast of competition by agreements of various kinds. The British Electrical and Allied Manufacturers' Association, founded in 1911, is the senior organisation of the industry, which, among other things, has attempted to establish conditions of contract and sale. A number of branches are tightly organised. In cables, batteries, valves and lamps, for example, separate associations have been formed which fix minimum selling prices with ranges of discount. The lamp cartel, for example, is a branch of the international lamp cartel which, before the war, parcelled out the world's markets among member firms by quotas, with penalties for over-selling and prohibitions of manufacturers from supplying certain reserved areas. In this country the market is largely in the hands of the Electric Lamp Manufacturers' Association; its policy has been to discriminate against wholesalers who refuse to deal exclusively

with its own members. Again, the Electrical Lighting Fittings Association appears to aim at fixing minimum prices for lighting fittings. Sections in which standardisation has hitherto made little progress, as in other fittings, cookers, wireless sets and refrigerators, have formed associations concerned with the determination of agreed fair-trading policies, with standard conditions of sale and ranges of discounts; the introduction of standardisation during the war, as in hot plates and ARP fittings, was followed by price-fixing.

The electrical engineering industry, in fact, is riddled with monopolistic practices of a varying degree of efficacy. The damage done by these practices cannot be assessed with precision, but it can hardly be ignored. It would be interesting to know, for example, why electric lamps are appreciably cheaper in the United States than they are in this country. But a criticism of equal, if not of greater, importance as a price-raising factor is the slow progress that has been made in the matter of standardisation; responsibility for this lies with the electricity supply industry, as well as with manufacturers of equipment.

The most important obstacle to standardisation on the part of the supply industry is the difference in the systems and pressures of supply, which vary from 100 to 260 volts either alternating or direct current. Owing to the need for minute accuracy, a great variety of apparatus is necessary, each specially designed for a narrow range of supply voltages with consequent heavy increase in fixed costs, as many components are highly specific. Wire of different strength and thickness is needed for windings and lamps, and these in turn necessitate different types of support. These variations render impossible the adoption of bulk production methods in the case of non-standard voltages, which are only called for in small and decreasing quantities, and reduce the utilisation of the plant designed for the standard pressure of 230 volts. Another consequence of the variety of voltages is the need for storing at manufacturers', wholesalers' and retailers' large stocks of equipment, thus reducing turnover and necessitating higher charges. This is another cause of the higher prices of electrical equipment, and even the most modest reorganisation proposals for electrical supply provide for compulsory standardisation of voltages.

The industry, in turn, is responsible for the absence of standardisation in the design and dimensions of many acces-

LOOKING AHEAD

THE Post-War World will need business initiative, foresight and courage. The services of Westminster Bank are at the disposal of all those who are, or will be, engaged in the great task of reconstruction and expansion both at home and overseas.

CREDIT facilities will be readily available to meet the requirements of all classes of trustworthy borrowers.

WESTMINSTER BANK LIMITED

HEAD OFFICE

41 LOTHBURY, E.C.2

sories and components, although the individual predilections and fancies of supply engineers have still further complicated the issue. Electric plugs and sockets are well-known examples. Although for civilian use the advantages of interchangeability are not so marked as in the case of the fighting services, where complete standardisation has proved necessary, it is obvious that standardisation would make possible the continuous production of a limited range of articles with consequent spreading of overheads over a larger turnover, saving of time, and improvement of quality, all leading to a reduction in costs. Again, there has been too little standardisation of appliances, such as cookers, refrigerators and so on; as a result many of them have remained the privilege of the few. The net output per person employed in the lighting accessories and heating apparatus sections of the industry was well below the national average in 1935. The British Standards Institute has done much to bring about standardisation, but generally it has only fixed limits of performance. Specifications giving limits of dimensions or other factors necessary for securing interchangeability are rare; the most notable example is that for filament lamps.

Business Notes

Politics Once More

The wave of buying which immediately followed the Budget has been rather short-lived. The stock market is still reasonably active, but, after reaching a peak of 118.5 on Monday, against 100 for July 1, 1935, the equity index of *The Financial News* has fallen back to 118.0. It will be seen from a table of *The Actuaries' Investment Index* on page 616 that on Tuesday of last week this indicator had reached a new high for recent years. It is, however, worth noting that the yield is still higher than in August last, which suggests that confidence in the industrial outlook has not increased since then. The Stock Exchange, like everyone else, rejoices over the approaching end of the war. But peace will bring a general election and the results of recent by-elections, especially that at Chelmsford, suggest that a general election might possibly bring a change of government and an economic policy that might have little solicitude for industrial profits. So it is not so surprising that the good news from the Continent should have led to some hesitation in the market. It is, however, not improbable that the pressure of money will prevent any really substantial fall in equities unless there is some new adverse development. The comparison of yields of industrial groups with those ruling some years ago is interesting.

Industrial equities are not the only section to weaken, for the decline in prices was started by gilt-edged. These stocks have improved considerably lately, and the yield on 2½ per cent Consols is under 3 per cent against 3.18 a year ago. Some reaction would, therefore, not be surprising in any circumstances. Actually, the prospect of a Labour Government is likely to react adversely on fixed interest securities, and it is also the fact that the moment is approaching rapidly when some sales of gilt-edged to finance reconstruction are inevitable. It is, however, improbable that such sales will assume in the near future, proportions which will offer a serious threat to the level of gilt-edged. In yet another field, that of foreign bonds, politics are playing a part. On more than one day recently, when the general tone in that market has been firm, there have been falls in the stocks of those areas, like Austria, Poland and Danzig, which are under Russian influence. More recently French funds have fallen on the success of the Communists in the municipal elections. It is evident that the problems of political and economic reconstruction will give the investor, like everyone else intimately concerned, a great deal to think about.

NORANDA MINES LIMITED

DIVIDEND NOTICE

Notice is hereby given that an interim dividend of One Dollar (\$1.00) per share, payable in Canadian funds, has been declared by the Directors of Noranda Mines Limited, payable June 15, 1945, to shareholders of record at the close of business, May 15, 1945.

By Order of the Board,
Toronto, J. R. BRADFIELD, Secretary.
April 27, 1945.

To monopolistic practices and lack of standardisation and mass production must be added the high distribution costs of some sections of the industry, such as lamps, where they are sometimes equivalent to as much as 40 per cent of the price paid by the consumer. The cost of products is also inflated by heavy advertising expenditure.

The electrical engineering industry has the reputation of being one of the most efficient British industries. It has undoubtedly many solid achievements to its credit, especially since 1939. Nevertheless, there are many indications that it is not as efficient as it might be. This is not the occasion for suggesting a detailed programme of action. The electricity supply authorities could, by co-operation, speed up the standardisation of equipment and fittings, and curb monopolistic practices; the Ministry of Works is using its opportunity for pressing for standardisation. The industry itself has prepared plans for the mass production of household appliances. One thing is certain; if the industry is to remain in the forefront in the world's electrical engineering industry, it cannot afford to neglect any means making for greater efficiency.

Better Export Credit Guarantees

There is still no sign of the comprehensive Government plan that will be needed for the reshaping of the national economy for the much larger part which exports must play in it than they did before the war. Against this background, the recent extensions and improvements of the Export Credits Guarantees system are of only limited significance as a contribution to the main problem, but they are none the less welcome. As had been foreshadowed in the recent debates on the Export Guarantees Act (which raises the limit upon the commitments of the Export Credits Guarantee Department from £75 million to £200 million—an increase, allowing for the altered price-level, of roughly one-third), the Department has now introduced a new and improved guarantee policy. This policy, known as the ECGD (Contracts) Policy and superseding the War Emergency Policy, is available from May 1st for exports on short credit of consumer goods and straightforward sales of capital goods, as distinct from sales on special credit terms abroad.

Its main lines follow closely those of the war policy. It thus extends into the post-war phase the substantial additional protection afforded to assist the export drive in the early period of the war. Before the war, the Department guaranteed only 75 per cent of the contract price, and covered only those losses arising after delivery of the goods to the buyer. During the war, the guarantees have been raised to 85 per cent for losses due to insolvency or default and 90 per cent for other guaranteed losses, and, more important still, have been extended to losses arising from the date of the placing of the contract—except losses within the buyer's or the exporter's own control or arising from events within the United Kingdom. A comprehensive premium has been charged, and transfer risks have not been covered as a separate item, as they were before the war. These extensions are all retained in the new policy, but an exporter can, if he wishes, forgo the transfer cover and insure for "insolvency" risks alone. He cannot, however, secure transfer cover without also insuring for insolvency.

There are also two entirely new facilities. In the past, an exporter could not secure payment from the Department for "insolvency" losses unless and until the "insolvency" of the buyer—as defined, with reasonable elasticity, by the Department—had been established. This provision has at times been a source of irritation to the exporter. In future, he will not only have the same "insolvency" cover as in the past, but will be paid by the Department if the buyer, whether "insolvent" or not, has not paid the contract price within 12 months of its due date—provided only, for the purpose of this added cover, that the goods had been duly delivered and accepted. This positive assurance of eventual payment should be of real value to the exporter, especially when seeking finance from his bank.

"First Loss" Principle Abandoned

The second innovation is the dropping of the "first loss" principle that has characterised all earlier contracts.

Previously, a guarantee of 85 per cent of the contract price has meant that the Department met losses only in excess of the first 15 per cent, and that any eventual receipts from the debtor were applied first to reimburse the Department and did not benefit the exporter until its claim had been discharged. Now the Department and the exporter will share proportionately in all losses and receipts. For exporters working on narrow profit margins, this is a very notable advance. It will be especially helpful in those cases in which goods held abroad under a frustrated contract have to be resold by the exporter at less than the original contract price.

On one matter that has always bulked large in trade criticism of the ECGD system, there is no formal change. This is the principle that, if an exporter contracts with the Department at all, he should contract for the whole of his export turnover. Exporters would naturally like to keep the good risks themselves and unload the bad ones on to the Department. In the absence of a radical change in export policy as a whole, and so long as the Department has no responsibility for the geographical direction of exports but works on an insurance principle, its rule is the only possible rule. There must be a reasonable "spread" of risks. The Government has, however, admitted that that need not in all cases oblige an exporter to cover his entire turnover. During the debate on the new Act, the late Mr Harcourt Johnstone agreed that, in future, traders could exclude some markets from cover provided that the business they did offer to the Department did afford the requisite spread. Obviously, restriction of the field for which cover is sought may tend to increase the rates of premium charged. But in one sense this is actually desirable: in the new circumstances of the post-war it would be folly to stimulate exports in directions which do not offer reasonable chances of eventual, and in most cases prompt, payment. Certainly, these improvements in facilities for export credit guarantees must not be taken as implying that Britain can afford any substantial volume of exports on credit. For some years, at least, the emphasis must be overwhelmingly upon cash transactions. In general, exports on more than the shortest of customary credit terms will be justifiable only where they are plainly necessary to enable British goods to re-establish themselves in markets that may be expected to become good cash customers in the early future, or where credit exports of particular goods appear likely to generate an early demand for other British goods for cash.

Women in Engineering

The interesting and surprising conclusion that the majority of women who have entered engineering during the war wish to remain in the industry in peace-time is drawn from an inquiry conducted by the Amalgamated Engineering Union, which was reported to the AEU Women's Conference at Blackpool on Tuesday. The inquiry, which covered a cross-section of women workers, was addressed to about 2,000 women in 228 factories in London, Glasgow, Manchester, Birmingham and Coventry. Two-thirds of the women questioned replied that they wanted to stay in the industry, and only 20 per cent had worked in engineering before the war, the majority having been in domestic service. It is particularly significant that 79 per cent of the married women who had not been in paid employment previously, wanted to continue in industry.

This survey should not necessarily be regarded as conclusive, since it covers only a small proportion of the women directed to war work, but it is an interesting indication of a trend, which would seem to contradict the popular belief that women war workers are eagerly waiting for an opportunity to leave industry. The reasons given are, surprisingly enough, not monetary, for 35 per cent of the women were in the lowest-paid group and were earning less than 1s. 6d. an hour. Presumably the sense of independence gained by factory work and the dislike of "domestic duties unpaid" are important factors.

If these results can be taken as typical of the general attitude of women in engineering, they raise far-reaching economic and social problems for the industry—whether there will be sufficient employment for the women who wish to remain as well as for the men now employed and for those returning from the Forces, and whether the continued employment of women might not tend to depress the standard of male workers. Women's rates are 30-40 per cent below the men's rates, and only a small proportion of the women in the industry can be earning the "rate for the

job." If considerable numbers of women wish to remain in industry, the question of equal pay for equal work will assume even greater importance. The extent to which married women will in fact be able to work in industry depends not only on the availability of jobs, but on the provision of labour-saving houses, nursery schools and other means of lightening domestic responsibilities.

For some years after the war, there should be enough work to keep the engineering industry fully employed meeting pent-up civilian demands and producing for export. It is a question of adjustment and absorption. Already there are disturbing reports of mounting "redundancy," especially in the Midlands, but with the end of the war there should be no delay in effecting the change-over to peacetime production programmes.

Export of Aircraft

The British aircraft manufacturing industry, raised to the status of the biggest industry (in terms of employment) during the war, will soon be faced with the need for severe contraction. The extent to which it will have to be deflated has been variously estimated; the Minister of Aircraft Production, Sir Stafford Cripps, has mentioned a proportion as low as a tenth.

It is not surprising, therefore, that the industry has decided to make a bid for exports. The Council of the Society of British Aircraft Constructors—the industry's trade association—has decided to create a special export sections, with headquarters in London and branch offices in the chief potential markets overseas. It will be the task of the "trade ambassadors" to promote the interests of the British aircraft industry as a whole, to establish contacts with aircraft operators overseas, and to keep the industry in this country informed about marketing conditions. The new organisation will not supersede the system of overseas representation by individual companies. It is designed to assist the agents and salesmen of individual manufacturers.

The scope for exports should be considerable, though, to begin with, the British aircraft industry which has concentrated almost exclusively on the manufacture of military

OVERSEAS TRADE

Exports are vital to our post-war national prosperity, and the Bank will, as in the past, provide the requisite finance for their production and distribution. Technical information for overseas traders will also be available regarding Exchange, market conditions and commercial requirements abroad.

types, will not be as favourably placed as the American, which has been manufacturing transports on a large scale throughout the war. The extent to which British aircraft manufacturers will be able to make use of their opportunities will depend largely on their ability to design efficient commercial aircraft as speedily as possible, and to market them at competitive prices.

Nuffield Organisation in Australia

An indication of the changing trend in British exports is provided by the activities of the Nuffield organisation. Their intention to manufacture Morris cars in India was recently announced, and it now transpires that a new company with a capital of £1,000,000, entitled Nuffield Australia Proprietary, has been formed to operate in the Dominion. In the first place, the intention is to manufacture only bodies in Australia, and to assemble there engines and equipment imported from this country. Lord Nuffield has, however, undertaken gradually to build up works capable of all stages of car production.

It is evident that, as against the possibility of Australia taking a corresponding number of cars manufactured here, this arrangement would involve a loss of exports. But there is no escape from this tendency. When virtually the whole car is built overseas, this country will still export the skill involved in the design and the experience in making the cars. In addition, Britain may send jigs and some of the most recent additions to equipment, as well as having provided some at least of the capital.

So far as the more industrially developed countries are concerned, it is along these lines that British exporters must think. We may still be able to increase exports of staple goods to some areas, but this country is able less and less to rely on its own raw materials, and more and more must trust to special skills to hold its own in the world's markets. The aeroplane still calls for special skills at almost every point, the family car much less so, and the new Nuffield enterprises are in the line of development which yields most hope of success in the changed conditions of the post-war world.

The Supply of Bills

The expansion of the offer of Treasury bills at last week's tender is being followed, as foreshadowed in these Notes, by a further £10 million increase, to £130 million, this week. This should permit a welcome replenishment of discount market portfolios, and hence an improvement in the supply of bills to the banks. In the absence of these periodic expansions of the tender offer, the accumulation of overseas funds in London would, despite the availability of tap bills for certain central banks, make progressive inroads into the volume of bills available to the market. Two years ago, after the tender offer was first raised from the basic figure of £75 million which obtained for so long, the market's intake of bills ran for many weeks at levels appreciably higher than those of the past few months, although the total weekly offering was then £20 millions less. In June, 1943, indeed, the average weekly allotment to the market almost touched £40 million, a level that was not surpassed until last May, with a record average of nearly £44 million. Since then the trend has been downwards, despite the temporary increase in offerings (to £120 million) in the autumn. It is true that in the first quarter of this year the intake was still running appreciably above the corresponding 1944

figures—the quarter's weekly average was £35 million, compared with £25 million. Last month's average, however, would have been easily the lowest for more than a year, had it not been for a bumper quota last week—thanks to a full allotment of the shorter-dated Monday bills. As it is, the average for April tenders comes out at just over £30 million, which is £4,000,000 less than in March and £3,000,000 less than a year ago.

On the basis of past experience, therefore, it may be unwise to assume that the expansion which now seems in prospect will, except in the short run, do much more than make good the inroads that have already occurred—unless, of course, the inflow of overseas funds should slacken or unless the facilities for the issue of tap bills were to be extended. Meanwhile, clearing bank portfolios, which are the principal concern in this context, have for three months been maintained somewhat above their corresponding levels of the previous year. But they have probably not yet felt the full impact of the recent decline in market intake, and in any case are already extremely low in relation to the huge volume of deposits.

Income Tax Bill

Some of the shortcomings of the Income Tax Bill—which formed the subject of an article in *The Economist* of April 28th—were discussed in Committee in the House of Commons on April 27th. (The Bill is designed to give effect to the changes in the taxation of industry foreshadowed by the Chancellor of the Exchequer in his Budget Speech last year.)

Several members of Parliament criticised the present system of depreciation allowances because the allowances are based on the original and not on the replacement cost of equipment. The criticism of the present system arose from the fact that the new Bill will enable the Government to reclaim part or the whole of the depreciation allowances already granted if, at the time of replacement, the second-hand value of plant exceeds the amount of the final depreciation allowance based on the original cost of the equipment. True, this position conforms to the established principle of taxation. But the principle itself is a questionable one during a period of rising prices, when the cost of new equipment may be double that of the original equipment. Sir John Anderson merely pointed out that the law takes no account of the change in the value of money. But the matter can hardly be left at that; other countries have found it advisable to introduce a special system of allowances over and above the normal depreciation allowances, designed to protect industry from capital consumption caused by inflation.

Productive and Unproductive Industries

The Bill also drew criticism because the new depreciation allowances for buildings are confined to "productive industry"; retail shops, hotels, showrooms and offices are not eligible for these allowances. The Financial Secretary to the Treasury, Mr Peake, gave the two reasons that prompted the Chancellor of the Exchequer to draw this distinction. The first line of defence was, as so often, that the universal application of the new allowances would give rise to "extremely formidable" administrative difficulties. The second explanation he gave was that of the Physiocrats:—

Productive or creative industry is the foundation of national prosperity. It is the production and export of things, not the retail distribution at home, that is the real life-blood of the country.

This explanation is hardly a valid one.

On the other hand, the Chancellor was in a more accommodating mood in the matter of discrimination between new and old buildings. The Bill will grant an initial depreciation allowance of ten per cent in respect of new buildings and an annual allowance of two per cent for both new and old buildings. The new system is to supersede the Mills and Factories Allowances granted since 1919. For existing buildings, the annual allowance is to be confined to a period of 50 years; exceptionally, where a building is 50 years old or more at the time of the change-over to the new system, its owner can claim the existing allowance for a period of five years. This limitation will often leave owners of existing buildings worse off than they are under the present system. To meet their case, Sir John Anderson said that if the period of five years should prove inadequate, an extension would be justified.

You do a man a favour
when you
sell him
something!

But does your prospective customer realize it? He does not know what experience, what scientific knowledge, what care in manufacture, goes into the making of that thing you sell. He may be allergic to sales talk, advertisements and to letters. Perhaps he simply will not read. An educational film about your product, the research behind it, its manufacture or its use can create that confidence essential to successful business at home and abroad. Seeing is believing. To make such a film you must have the advice and assistance of creative people, experienced in the art of successful film propaganda, backed by the best technical resources.

Food controls to continue?

The political controversy about governmental controls becomes ever more lively. On only one aspect of the question is there general agreement: we must continue to exercise some control of the Nation's food, or suffer for it.

Even housewives, who are longing for the time when the ration book will no longer be a necessary adjunct to the shopping basket, would not want all Government food measures to disappear overnight. For then where, for example, would be the extra supplements of vitamins for expectant mothers and babies, or the priority allowances of milk and eggs, or the allocation of vitamins to all children under five?

These are the sort of controls that might well be worth preserving, even in the days of plenty, when the health of the nation will continue to be a major responsibility for everyone.

So much is agreed on every hand. Yet it is perhaps not generally realized how great a part was played by the discovery of vitamins in revolutionizing the science of dietetics, which has made the feeding of our people so much more efficient in World War II than in 1914-18.

Today, this extension of knowledge in the nutritional field has led to the production of vitamins in synthesized form on a very large scale. In the Roche plants in Great Britain, Vitamins B₁ and C are being produced so economically that they are now within the reach of even the most moderate purse. Already, the distribution of synthesized vitamins to the children of Paris has prevented the worst effects of vitamin deficiency. Indeed, these synthesized vitamins are materially helping in the task of feeding

This Greek boy, aged 12, is suffering from the effects of prolonged malnutrition. Consignments of food, including supplies of synthesized vitamins, have materially helped in combating the terrors of starvation and disease.

Europe and in the building of a post-war world where disease and want will become increasingly rare.

Tin Prospects

The Japanese seizure of the Pacific tin-mining areas has had, until now, no serious effect upon the war effort of the United Nations, since Allied tin reserves were supplemented during 1942 and 1943 by increased exports from Bolivia, Nigeria, the Belgian Congo and other tin-producing areas. Shortage of developed ore reserves, and scarcity of manpower and materials, have now, however, greatly reduced the output of these mines. At the beginning of 1945 it was reported that the American Government's tin reserve—accumulated during the eighteen months prior to Pearl Harbour, and drawn upon as required—stood at around 113,000 short tons, enough to meet current Anglo-American requirements for more than a full year. Recent withdrawals, however, have been on a rising scale, and it is now stated that this reserve has reached a dangerously low level. Although upon examination this view may appear pessimistic, it is clear that measures must be taken to prevent a serious tin shortage in the near future.

By a recent official report of the United States Foreign Economic Administration, some 7,000 short tons of Chinese tin—twice the 1943 total—were imported during 1944, travelling by air to Calcutta, and thence by sea to the United States. The re-opening of land communications between China and India may raise the figure in 1945, but the production of Chinese tin is limited; nor is the re-occupation of Burma likely to add much to Allied tin supplies.

There remain Malaya, the Dutch East Indies and Thailand, all of which may soon become theatres of military operations. The resumption of tin mining in these zones immediately upon their liberation—for which plans have already been made—should go far to remove the threat of a tin shortage for the most essential needs. Mining activity may, however, be seriously hampered by the destruction of plant, including dredges, and also by lack of labour (never, in any case, efficiently organised in Malaya). Tin is the scarcest of the major metals, and a plentiful supply is essential to the health of the food and other vital industries. During 1944 considerable attention was given to preparations in the fields of organisation and technology for the intensive effort that will be necessary to secure enough tin for world rehabilitation, but of late this matter appears to have been allowed to slip into the background. The end of the European war should set free industrial resources sufficient to resume regular production of tin-mining equipment, including dredges, so that the effects of war damage may be repaired without delay.

Diamond Optimism

Speaking at the annual meeting of the Anglo American Investment Trust, Sir Ernest Oppenheimer confirmed the impression, noted in these columns last week, that not only was 1944 an excellent year for the diamond industry, but that 1945 had opened equally successfully. He said that stocks were at a minimum level, except for the types of small rough stones normally cut at Antwerp, so that the reopen-

ing of the Antwerp market will usefully absorb the only surplus stocks available.

More generally, Sir Ernest was optimistic about the future of the industry. In practice, its prospects will be affected by two important considerations. It may be taken, as Sir Ernest claims, that industrial diamonds have now proved their worth in engineering technique, but their future price level is far less certain. The anti-trust suit now being taken by the US Government against the diamond companies is associated with the belief that the current prices of industrial diamonds, although they have not been raised during wartime, are too high. If price reductions could be secured—a difficult task unless tackled by joint international action—then the sale of industrial diamonds, which even during wartime does not represent more than a third or a quarter of the total value of diamond sales, would become much less important as a stabilising factor in demand. In any event, the steadiness of the demand for industrial diamonds, while it will certainly help to offset fluctuations in the demand for gem stones, may also give rise to production problems owing to the fact that the two sorts of diamond are mined together.

The second and more important consideration affecting the industry's future is, in fact, the demand for gem stones—and it is also much harder to estimate. Gem stones are in strong demand during wartime for a wide variety of reasons, many of which may disappear; and the replacement of stocks, while it will ensure a period of activity, can offer no lasting contribution to the industry's prosperity. The contention that the price of industrial diamonds is too high could probably be brought with more weight against the price of gem stones, although action against the selling syndicate's monopoly would be in this case still more difficult.

Reduced Rayon Prices

The Rayon Producers' Committee has announced its decision, approved by the Board of Trade, to reduce rayon yarn prices. As a result, they were marked down by 2½d. per lb. on May 1st, making the price of 150 denier 3s. 9d. per lb., compared with 2s. 6½d. before the war. The reason given for the reduction is that the special arrangements made in July, 1940, for the export trade are no longer necessary. Since that time, when the export drive was at its height, the home market has in a sense been subsidising exports, since prices were 3d. per lb. above those of exports. This had become an anachronism.

A more deep-seated reason for the reduction is probably the rayon producers' optimism that production can, through the lifting of many wartime restrictions, be considerably increased in the not too distant future. The rayon industry has always been quick to reduce prices when it could, and the latest decision is typical of it. The smaller producers may not find it so easy to work to the lower prices as the larger firms, although the rayon trade has, on the whole, done reasonably well during the war. It has had the advantage of being inherently economical in its use of shipping and manpower, and has thus gained considerably over the older textiles.

Whether the consumer will benefit from the reduction is another matter. Wages, in common with those in the cotton industry, are due to go up in June, and coal prices rose on May 1st. These increases may well absorb the 2½d. per lb. If so, prices of rayon goods may well be unchanged until economies of large-scale production can begin to make themselves felt. The rayon industry is clearly looking forward to being able to reduce costs by scientific and technical developments, but these and the lifting of restrictions will take time.

One means of stimulating production is to enlarge the market. A British Rayon Federation delegation, led by Sir Percy Ashley, is to visit Australia and New Zealand to investigate the probable post-war conditions and prospects of trade in rayon goods with the two countries. The delegation will survey, among other matters, the size and nature of the demand, and the possibility of United Kingdom interests participating in the promotion of secondary industries in Australia and New Zealand. The delegation has the blessing of the Board of Trade and is being cordially welcomed by the Australian and New Zealand Governments. Perhaps it is only the first of a number of similar delegations to other parts of the Empire and the world.

London Dock Inquiry

The report of the committee of inquiry set up to investigate the causes of the recent London dock strike, shows

that there is room for improvement in both the methods of administering dock labour and the machinery for industrial negotiation in the London area. The committee unanimously found that the strike was wholly unwarranted and condemned the men for their failure to use the established negotiating machinery, a failure due in part, they believed, to the influence of a small subversive political section among the dockers. The workers will no doubt claim that their strike action was justified in that it drew attention to defects which would not have been brought to light by the use of normal and less spectacular methods. But the strike nonetheless was condemned by the unions.

The Committee concluded that the main purpose of the Dock Labour scheme—the maintenance of the minimum labour force required to secure the quick turn-round of ships—would only be ensured by the use of control points and calling-on stands, and that its success equally depended upon the preservation of discipline and the reduction of absenteeism. But while it found that, on the whole, the officials of the National Dock Labour Corporation performed their duties “with patience, consideration and good humour,” the Committee admitted the need for a review of some of the disciplinary arrangements.

The report recommends, for instance, that the onus for application for leave of absence should not rest entirely with the individual docker, but that there should be some machinery entitling him to leave, subject to labour requirements, on the completion of a particularly long or arduous job. Then, instead of the Port Manager being solely responsible for judging breaches of discipline, he should consult with the man or his union representative or with a special advisory committee, in the case of workers in the Reserve Pool, or with the appropriate industrial committee, in the case of men in actual employment. The committee further suggested that Appeals Tribunals should have a wider composition and that disciplinary measures should apply to employers as well as to employees. In connection with the wider question of administration, they recommended greater decentralisation of the Corporation's London organisation, in order to give area managers more authority, and measures to secure a more careful allocation of labour.

The question of the future of dock labour schemes, which were set up to deal with wartime emergencies, is bound to arise with the end of the war. It would be valuable to have reviews of other port schemes, on the lines of the London inquiry, and the modification, if necessary, of any of the more irksome features of the administration, so that the real benefits conferred on the dockers by decentralisation will not be obscured by any lesser irritants or grievances.

Texas Land Offer

After all, the last has not been heard of the Texas Land affair. Last week produced an offer by an undisclosed buyer of £8 per share which is subject only to its being accepted by holders of at least 50 per cent of the shares. The price offered, although well below the valuation of the assets before meeting the tax payable on liquidation, is some four or five shillings above what a liquidation would yield at current values. Further, some of the net yield of liquidation would not be available for some appreciable time. In the circumstances the new directors, that is the Lowson interest, are accepting the offer, and it seems extremely probable that all their associates will follow their example. That alone should ensure that the deal is completed.

Evidently the buyer agrees with the old board rather than with Mr Lowson about the real value of the assets, and it seems clear that he intends to keep the company in being for some time. Beyond that the situation is obscure. The circular advertising the offer gives as an advantage that the dissident minority will now be able to retain their holdings. But will they consider this a reasonable course? When the Lowson interest obtained control they knew who would be in charge, and they were dissatisfied because they did not know what he would do. In this case they do not even know who will be in control, and doubtless the buyer counts on this argument to obtain something substantially in excess of the minimum 50 per cent upon which he insists.

Dissident holders who sell now may reckon that they are well out of a situation which at one time must have held rather gloomy prospects for them. Those who sold, almost two years ago, will have had great difficulty in finding investments which have yielded them the profit they would have obtained had they held and sold now. That profit has gone to Mr Lowson and his friends. If there is a moral to

this story it is that directors should give, and shareholders should insist upon receiving, the fullest information about their property. This is even more necessary when, as in this case, there is a heavy uncalled liability.

Maypole Dairy Results

There has been no change in the underlying conditions of supply which affect adversely a specialist company like Maypole Dairy which had in peace a special organisation for securing just the qualities of goods suited to its customers. The company has, however, been able to increase its turnover of non-rationed and “points” goods, while the subsidiaries, which are less highly specialised, have increased both turnover and profits. Maypole Dairy has suffered a reduction in earnings as the expansion in business has been insufficient to offset the rise in wages in March, 1944, which will cost the company £21,000 in a full year. The results of the group and the company for the past three years are summarised on page 615. It will be seen that liquid resources continue to increase and are very large. The only change in the appropriation of profits is to substitute for the modest provision for deferred repairs an allocation of £25,000 for modernisation of premises.

It must be especially irksome to a firm whose business was built in part on special channels of supply to have to submit to the present system of distribution and Sir George Schuster, the chairman, repeats the comments he made a year ago as to the need for the Government to indicate its policy with regard to supplies of food and, in particular, to say what is to be produced at home and what to be imported. Sir George is, naturally enough, a protagonist of “a proper nutritional diet” and maintains that to achieve that the country could absorb the output of British agriculture

beneficially employed at full stretch and still buy from . . . Canada, Australia, New Zealand and . . . countries like Denmark and Holland food products on a scale which will provide adequate outlets for their own production.

Against the background of the present situation on the Continent, this reads a little oddly, but Sir George is presumably taking a long term view. As to the immediate

in 4,250,000 Ordinary Shares of 10s. each and 25,000 Deferred Shares of £1 each.

DIRECTORS.
SIR GEORGE W. ALBU, (Chairman). C. S. McLEAN.
DR. HANS FIROW. T. SHEARER. C. S. GOLDMAN.
M. W. RICHARDS. S. C. BLACK. ERROLL G. HAY.

EXTRACT OF ANNUAL REPORT TO DECEMBER 31, 1944.
Tons crushed 2,449,000
Yield (3,750 dwt. per ton) fine oz. 459,180

Working revenue (31.50s. per ton) £3,857,110
Working costs (18.99s. per ton) 2,325,281
Working profit (12.51s. per ton) £1,531,829
Sundry Revenue 102,775

Less Interest on Fixed Loan from General Mining & Finance Corporation Ltd. £13,839
Exchange 1,413
Special Benefits to European Employees 3,178
Directors' Fees 2,000

20,428
Credit Balance brought forward from 1943 £1,614,176
37,624

Total Available Profit £1,651,800

Appropriated as follows:—
Capital Expenditure £4,912
For year 100,000
Repayment on account of Fixed Loan £104,912

Miners' Phtisis—Provision on account of outstanding Liability 23,268
Taxation 1,009,594

Ordinary Dividends Nos. 26 and 27, totalling 17½% £371,875
Deferred Dividends Nos. 17 and 18, totalling £4 18s. 2d. per share 123,958

495,833
Unappropriated profit carried forward 17,795

£1,651,800

ORE RESERVE.—The fully developed ore reserve, as recalculated at December 31, 1944, amounted to 8,840,000 tons of an average value of 4.2 dwt. over 47 inches. (1943 9,149,000 tons at 4.2 dwt. over 47 inches.)

Copies of the full Report and Accounts have been despatched to British shareholders direct from the Head Office in Johannesburg.

ROYAL EXCHANGE ASSURANCE

225th ANNUAL REPORT

LIFE FUND EXCEEDS £17,000,000

LORD BICESTER ON THE YEAR'S PROGRESS

The two hundred and twenty-fifth annual general court of the Royal Exchange Assurance was held, on the 2nd instant, at the Royal Exchange, London, E.C., the Rt. Hon. Lord Bicester, the governor, presiding.

The governor, in the course of his speech, said: In the life department we issued 3,121 new policies, assuring an amount of £2,096,244. The premium income of £1,453,944 is some £20,000 in excess of that received in 1943. The life figures in general show little variation from those of the previous year, for which reason they do not call for any particular comment. But in making a general observation it is certainly satisfactory to see that, in spite of the vast upheavals that have taken place during the last five years, the great merits of life assurance appear to retain their appeal in the mind of the general public. It is also, I think, a tribute to the management of life business that through such a time the security and protection afforded to the assured remains unquestioned. Probably it is true to say that the average life fund—and it is certainly true of our own—has never been in a stronger position than it is now; it now exceeds 17 million pounds.

EXCELLENT FIRE RESULTS

Dealing next with the results of our fire business, I am happy to say we have again experienced an excellent year's trading, resulting in an underwriting profit that has only once been exceeded by the department. The total premium income of our fire business is £1,942,000, an increase of nearly £130,000 on the premiums received in 1943. It must, of course, be appreciated that in comparing figures relating to premium income with those of former years increased values are playing their part, so that while our business is, I feel, definitely expanding, a fall in the general world price level would not be without its influence. Meanwhile, it is undoubtedly sound for all those who are responsible for maintaining property adequately covered, to consider carefully this question of rising values. The corporation has devoted a good deal of time in both explaining and bringing this important fact to the notice of its insured.

WORLD-WIDE CONNECTIONS

As you are aware, our fire business connections are world-wide, and in spite of the territories that are still closed to us through the war, it is encouraging to see that abroad also the volume of our fire premium is increasing. I very much hope that by the time the next annual general court is held I shall be able to state that we have re-established our former connections in many European countries from which, during the war years, we have been or still are cut off.

After taking credit for net interest, amounting to £40,300, there is available a sum of £259,647, which has been transferred to general profit and loss account. It is a most satisfactory result and one that reflects great credit upon all those whose efforts led to its attainment.

MARINE DEPARTMENT

Last year, in reporting to you on the work of the marine department, I mentioned that with the great diminution in the number of our shipping casualties which was then taking place, and which gave cause for satisfaction and thankfulness, it was probable that our premium income from marine underwriting would also decrease. This turned out to be so, and the

net premium income for 1944 at £513,000 is less by some £86,000 than in 1943, but we have no reason to be critical of this, and I am happy to report that both the results of our own activities in the marine market and the conditions prevailing in the market itself are satisfactory.

In proof of this, your court has this year again decided to transfer a sum of £75,000 to the general profit and loss account, this being a like amount to the sum transferred for the previous twelve months. I should mention that the marine fund now stands at the satisfactory figure of £1,240,000, representing 242 per cent. of the premium income.

I think, however, it may not be inappropriate at the present time to sound a note of caution. While throughout the war the marine market has remained a competitive one, there has been more co-operation between its two component parts—that is the companies and Lloyds underwriters—than for a long time past. While that co-operation continues there is a reasonable prospect that results will also continue to be satisfactory. But if intensive competition reappear, and as a result, for any reason, the Joint Hull understanding be discontinued, then unfavourable results may well be anticipated. It is to be hoped that every effort will be made to maintain the agreement, and also the smooth working of the more recently established Joint Cargo Agreement. To me this seems to be of especial importance during the years immediately following the cessation of hostilities.

ACCIDENT FIGURES AGAIN GOOD

The results of our accident department are again good. The net premiums received for the year at £1,148,625 show an increase of practically £100,000 on those of the year before. We have, I feel, every reason for satisfaction in this increase, not only because it has been achieved in spite of the numerous adverse factors, to which I have referred in previous years, but also because it has been obtained—and to this I attach the greatest importance—without sacrificing the quality of the business.

In reviewing the individual sections which make up our accident account, I might say that motor-car insurances have participated in the increased volume, and this is an indication that we are securing our share of policies on the cars that are slowly coming back to the roads. There is nothing new to report in regard to employers' liability business, as there has been no change in the situation since I last addressed you.

I might also mention one other branch of our accident business, that which deals with burglary risks. During the war years, for a variety of reasons, of which war damage has been prominent, it has been extremely difficult to protect adequately either business or private premises. The corporation has nevertheless done its utmost to help its policyholders, and when they themselves have taken all reasonable steps to safeguard the property insured, we have, wherever possible, continued to give cover.

Our business overseas very naturally continues to confront us with many problems, and although some of these individual accounts are difficult, I am pleased to say that the department has made a profit on balance in this section. The net result of the accident department trading for the year, including interest, is the transfer of £154,858 to the profit and loss account.

PROFIT AND LOSS ACCOUNT

I now come to the general profit and loss account itself. In dealing first with the

income side of the account, you will see that "interest not carried to other accounts," less tax, amounts to £69,886. This item in our general account now increases very slowly. The same factors relating to the Government's cheap money policy naturally exert themselves in the results of investing our general funds as those to which I have previously made reference in dealing with our life fund. Each fund has supported the financing of the war with almost its total available cash, but the return in net interest has been very small indeed. The figures of the individual departmental transfers I have already given. Added to those is the sum of £30,229, being one-fifth of the proprietors' valuation surplus on the years 1936-40. Transfer fees of £63 and an item of somewhat larger proportion than usual of £2,020 in conscience money make up the total amount on the income side of the account.

On the expenditure side there are three items which I should mention. Provision for United Kingdom taxation, including income-tax for 1945-6, absorbs £202,000. You will see, also, that this year we have made further transfers of £100,000 in each case to our fire insurance fund and our accident insurance fund, bringing them up to one million and half a million pounds respectively. When you set the figures given in the balance-sheet, namely, £1,776,928 for the fire fund, and £1,465,566 for the accident fund against the premium income of these respective departments, you will, I think, agree that the position in both cases is an extremely strong one, and is a satisfactory reflection on the manner in which both our fire and accident business has been managed through a difficult and somewhat hazardous period. After giving effect to these various expense and transfer items, the balance, which as you know constitutes our general reserve fund, stands at £1,226,923.

Your directors have already passed a recommendation to pay a final dividend of 19 per cent. for the year. This dividend, together with an interim dividend of 11 per cent. paid on November 6th last, will make a total amount of 30 per cent., less tax, on the capital stock of the corporation for the year 1944.

As a whole, the progress made by our associated companies can be viewed with every satisfaction.

INSURANCE INDUSTRY'S GREAT PART

The insurance industry, and in it this corporation, has played a great and important part in the country's struggle for existence. It has lent every possible assistance to the Government's plans to meet many emergencies. It has been of the greatest value in helping in the general strengthening of public confidence, through shouldering the many and diverse risks that confronted both business and the private citizen. Last, but by no means least, by the great financial contribution, both by loans to the Government and by taxation, the insurance companies have borne a great and heavy burden.

Our staff which has carried this burden has been considerably reduced in numbers. It has provided from its ranks many men and women for the fighting services. Unhappily, some of these are among the killed and wounded, and to their relatives and friends we offer our profound sympathy. Of those who have remained at home, in addition to their duties in the corporation's service, they have given much of their spare time to war work in its various phases. They will be able to look back upon a great record, and you will wish me to convey to them your most grateful appreciation.

Before concluding this address, you will also wish me to extend on your behalf sincere thanks to our general manager and the management and staff of this corporation, coupled with our appreciation also of the help given us by our local directors, representatives, and those of our agency organisations both at home and abroad, who have all, in their various ways, helped us in this difficult time.

The report and accounts was adopted.

ANGLO-PALESTINE BANK, LIMITED

FIGURES SHOW CONSIDERABLE EXPANSION

FINANCIAL AND ECONOMIC POSITION

The forty-third annual ordinary general meeting of the Anglo-Palestine Bank, Limited, was held at the bank's London offices, Stafford House, 30 King William Street, London, E.C., on the 30th ultimo.

The following is the address of the chairman (Mr L. Braudo) circulated with the report and accounts:

I have much pleasure in presenting the Anglo-Palestine Bank's report and accounts for the year 1944.

Some observations on the financial and economic situation in Palestine and on the affairs of the bank will, I take it, be welcome to the shareholders.

The present high price level to which I drew attention in my last statement is, one must emphasise again and again, mainly a product of the abnormal supply position. A return to more normal conditions will affect this level to a degree which, although difficult yet to estimate, is bound to be considerable. At the same time some change in the price level prevailing in the United Kingdom is certainly within the bounds of possibility. It would seem, therefore, that currency and exchange discussions, based mainly on the present temporary and artificial difference in the respective price levels, are not quite realistic.

NATIONAL FINANCES

In various announcements on behalf of the Government of Palestine it has been explained to the public that the financial year which has just come to a close is expected to show a deficit in the neighbourhood of £3,500,000 in spite of the fact that revenue from local sources during the year has risen by not less than approximately £2,500,000. The outstanding item of expenditure on which public attention is focussed is that of about £5,000,000 subsidies mainly on cereals and flour and on meat. It is felt that Palestine has been particularly unfortunate in that, under the Middle East supply system—in which its Government has no say—it had no choice but to import the bulk of its essential foodstuffs at greatly inflated prices from countries which, unlike itself, have hardly made any serious attempt at stemming the tide of inflation. It is hoped that with the turn which the war in Europe is now taking, this state of affairs will in not too long a time come to an end. The Government deems some further increase of taxation unavoidable, and if a very moderate amount of borrowing proves necessary, it will be pertinent to observe that the country has so far managed to balance its annually increasing budget during the whole war period (1939-40, £6,000,000; 1944-45, £18,400,000) without any borrowing at all for budget purposes, and that it will enter the post-war period, as far as public finance is concerned, in a strong and sound position. Such borrowing as will at the present time be required can be taken care of in the country.

ECONOMIC POSITION

On the economic position generally only little need be said. Industry has adjusted itself with comparative smoothness to the gradual falling off of army orders and the necessity of reorientating itself towards the needs of the local market. All manufacturers of some importance are looking forward to the moment when they will be able to place orders for the renewal and extension of their plants. The transition to more normal post-war conditions is, however, certain to raise its own problems.

The citrus industry is still suffering, as there was hardly any export during the last season. However, hopes are high that the next season will be better; there is every reason to expect that in the course of a few years it will be possible to bring back most of the plantations to a normal condition. The required measure of thorough cultivation, at a time when crops will as yet be insufficient to cover the outlay of the season, will call for additional investment. This raises a problem of finance which comes on top of the other problem of easing the burden on the growers of the debt to the Government incurred during five consecutive seasons, when cultivation would have been impossible without Government guaranteed advances on the part of the leading banks. I am afraid that at the present moment I can say little more than that the matter is under consideration.

EXPANSION OF BUSINESS

The bank's balance-sheet figures show a further considerable expansion. Current, deposit and other accounts now show a balance of £37,276,000, as against £25,446,000 last year. Some demand for additional accommodation has made itself felt during the year, and the aggregate items of loans and advances and bills discounted now stand at £3,914,000, an increase of £742,000 over last year's total.

It is only natural that the accounts should continue to show a very high degree of liquidity. Cash in hand and at bankers and moneys on call show a total of about £13,725,000, being 37 per cent. of deposits, and British Government securities (all relatively short-dated) stand at £19,323,000, a further 52 per cent. The bank is, therefore, well equipped to meet all demands for accommodation which the post-war period may bring.

FINANCE FOR INDUSTRY

In line with the trend in the United Kingdom the directors have given a great deal of thought to the problem of financing deserving industrial enterprises. They have, therefore, formed a subsidiary company with a capital of £200,000, in which the bank participates to the extent of £150,000, the special purposes of which will be to provide medium and long-term credits for the re-equipment and extension of promising industrial undertakings.

Another subsidiary with a capital of £100,000 (in which the bank participates to the extent of £66,700) has been formed with the intention of providing the nucleus of an agricultural credit corporation.

DIVIDEND NOW TAX FREE

The profit for the year was satisfactory, as shareholders will have perceived from the accounts. I went to some length last year in explaining the workings of Dominion income-tax relief, which under the Finance Act, 1920, the bank is bound to pass on to its shareholders. The matter is not without its intricacies, and in order to put the position before shareholders in the simplest possible form the directors have deemed it best to return to the system of declaring a dividend "free of tax." Dominion income-tax relief continues, of course, to be passed on to the shareholders and all the relevant particulars are set out in the dividend vouchers. The tax-free dividend of 5 per cent. on the ordinary shares and "A" ordinary shares now proposed represents the net cash payment which shareholders will receive, including Dominion tax relief. Last year's dividend

expressed as "free of tax," would have amounted to 4.35 per cent.

While appropriating to the contingencies reserve an amount similar to that of the previous year—namely, £50,000—the directors have also been able to transfer an amount of £31,356 10s. to the reserve fund, which now stands at £250,000.

E.N.V. ENGINEERING COMPANY, LIMITED

CONTRIBUTION TO WAR EFFORT

MR. C. G. TWALLIN'S ADDRESS

The annual general meeting of the E.N.V. Engineering Company, Limited, was held, on the 30th ultimo, at Winchester House, Old Broad Street, London, E.C.

Mr C. G. Twallin, C.B.E. (chairman of the company) who presided, said: This is our seventeenth annual general meeting. The accounts have been circulated, and with your permission we will take them as read. (Agreed.)

To deal with the accounts, our debtors are up by £15,020; our cash at £312,968 is up by £118,124; our investments and tax reserve certificates are reduced by £125,000, and our stock figure is lower by £19,903. Our machinery and plant is now standing in our books at £30,819. During the year we have expended £5,129 in additions; the depreciation figure provided for is £7,754 less than last year, due to the reduction in the capital figure on which depreciation is calculated, consequent upon the liberal policy of depreciation we have always adopted.

Freehold land and buildings.—We have spent £4,796 on buildings, and ample depreciation to the extent of £14,119 has been provided.

On the liabilities side our creditors, including provision for taxation, are down by £55,632; our reserve account in the balance-sheet is increased by £10,000.

RESULT OF YEAR'S WORKING

The surplus on profit and loss account of £97,512 is £3,598 larger than that available last year, notwithstanding the fact that the trading profit for the year after provision for taxation is £7,197 less, two contributory reasons being a larger carry forward from the previous year, and a smaller allocation to depreciation.

We propose to deal with this credit balance as follows: Proportion of dividend on preference shares up to December 31, 1944, less income-tax £625, in payment of a final dividend of 10 per cent., and a bonus of 8½ per cent. on the ordinary shares, both less income-tax, absorbing altogether £46,875, in transferring to reserve account £15,000, which will bring this figure up to £200,000, and to carry forward to next year's account £35,012.

For some years for security reasons I have been unable to give you information as regards our activities, but now that the veil is lifted slightly I am able to tell you that we have been fully occupied in the manufacture of reduction and other gears for aero engines and propellers, transmission gears for tanks and high-speed motor-boats, rear axle gears and assemblies for vehicles for the Services, gears for machine tools, and much other work of a similar nature.

In November we were honoured with a visit by Sir Stafford Cripps, H.M. Minister of Aircraft Production, who when addressing the assembled staff indicated that the switch-over from war to peace work would in all probability cause some dislocation and consequent inconvenience to the individual, but this should be viewed as part of our contribution to the war effort.

FUTURE OUTLOOK

I was heartened by the remarks of Mr Brendan Bracken, H.M. Minister of Information, when, addressing the members of the Royal Empire Society in London in February, he stated: "If research, risk-taking and enterprise were not discouraged there was no reason for pessimism about

the future of British industry." As far as this company is concerned, if inquiries are an indication we shall be in for a busy time, provided a reasonable proportion of these inquiries mature.

I should like to take this opportunity of expressing our appreciation of the courtesy and help we have received from various Government Departments with which we have worked during the war period, but we welcome the day when controls will be lifted.

On your behalf I am sure you would like me to express our thanks to my co-directors, shop foremen, charge hands and employees for their co-operation.

The report and accounts were unanimously adopted.

THE ROYAL LONDON MUTUAL INSURANCE SOCIETY, LIMITED

TOTAL ASSETS EXCEED
£63,000,000

The eighty-fourth annual general meeting of this society was held, on the 24th ultimo, in London.

Mr J. K. Wiseman, chairman and joint managing director, presided, and in the course of his speech, said:

The market value of Stock Exchange securities substantially exceeds the book value, and the investment reserve and contingency funds remain intact. British Government securities now represent more than one-half of the total Stock Exchange investments.

The total income for the year amounted to £11,201,000, an increase of £411,000 over the previous year. The combined premium income amounted to £8,844,000, an increase of £290,000 over the previous year.

The total claims and surrenders paid during the year amounted to £4,272,000. This, however, only partially represents the amount applied for the benefit of policyholders, as a proportion of the premiums being paid now are set aside to provide for sums assured which emerge for payment in the future. In this way, in addition to the £4,272,000 paid to policyholders during the year, the sum of £4,050,000 has been added to the funds as provision for future payments to policyholders, these two items together making a total of £8,322,000.

The premium income in the ordinary branch (including consideration for annuities granted) amounted to £2,286,000, an increase of £84,000 over the previous year. The new sums assured amounted to £3,313,000, which is slightly above the amount written the previous year.

In the industrial branch the premium income for the year amounted to £6,557,000, an increase of £205,000 over the previous year. Claims and surrenders amounted to £2,822,000. The amount added to the fund during the year was £2,942,000, which includes £1,595,000 interest on investments. This addition to the fund is money put aside as a provision for future payments to policyholders. Adding this item to the actual disbursements to policyholders during the year the total is £5,764,000. Thus the actual amount paid to policyholders, plus the amount added to the fund, which provides for future payments to policyholders, together make up a sum equal to 87.9 per cent. of the premiums received.

The balance-sheet shows that the assets total £63,755,000, an increase of £4,069,000 over the previous year. Stock Exchange securities represent 82.1 per cent. of the total, the remainder consisting mainly of mortgages, loans on public rates, freehold and leasehold properties and ground rents.

Our holding of British Government securities now amounts to more than £39,500,000, and represents 46.3 per cent. of the total assets.

The report and accounts were unanimously adopted.

THE "BANK-INSURANCE" GROUP OF TRUSTS

MR J. H. BATTY ON B.O.T. REQUIREMENTS

The tenth annual general meeting of Trust of Insurance Shares Limited, managers of the "Bank-Insurance" Group of Trusts, was held at 30, Cornhill, London, E.C.3. Mr J. H. Batty, chairman of the company, presided. Mr Batty said:

This year the Unit accounts are presented to you in a new manner to conform to the Board of Trade requirements. These requirements are to be welcomed because they give official recognition to unit trusts, because they will lead to uniformity in unit trust practices and accounts, and because they will make clear one of the most important features of the unit trust movement—namely, the degree of economy in management.

We are, however, not in complete agreement with the requirements of the Board of Trade whose task, in our opinion, was unusually complicated because the powers granted them in the Schedule to the Prevention of Fraud (Investments) Act, 1939, were inadequate and ill defined. For example, it is to be regretted that the following matters were not dealt with:

- The regulation of the bid price of units.
- The conversion of units into cash by the managers by selling securities in the fund and so reducing the total number of units in issue.
- The amortisation of the initial management charge for the purpose of ensuring that an investor who buys a unit in a trust with, say, five years to run pays less than he would in one with a remaining life of, say, twenty years.

Holders of units in the "Bank-Insurance" Group are already fully protected on all three points. The first two are covered by our undertaking, which was emphasised in our report last year, to buy back any quantity of units, large or small, at a price not less than their realised value or their realisable value as certified by the Trusts' official stockbrokers and auditors. This applies to all our trusts except the specialised Cornhill Trust where other suitable provisions exist. The third point—the gradual reduction in the management charge—has always been observed by us.

The items in the requirements which in my view should be modified include:

- Disclosure of the "actual" amount of each security held in the trust.
- Calculation of yield.
- Certain details in the accounts.

DISCLOSURE OF "ACTUAL" FIGURES

We, in common with, we believe, all other unit trust managers, disapprove of the publication of "actual" (as opposed to percentage) figures where this will result in disclosing the amount invested in each security held by a trust. "Actual" figures will give dealers on the Stock Exchange information which can be used to their own advantage and may handicap managers in buying and selling securities for the trusts, to the detriment of unitholders. Rigidly fixed trusts are liable to be chiefly affected, but even managed trusts like ours, with powers to continue or convert the trusts at the end of a given number of years, will have to take care that their current buying and selling policy does not become known in advance to the market.

CALCULATION OF YIELD ON UNITS

The basis of calculating yields laid down by the Board of Trade differs in three main respects from that adopted generally by the Stock Exchange and by responsible financial writers, viz., treatment of accrued divi-

dends, commissions, and Dominion income tax relief. As a result unit trusts are required to advertise a lower gross yield, after allowing for service charges, than would customarily be quoted in other quarters for the investment of an equivalent sum in securities identical with those comprising the unit trust. The difference may amount to as much as a half of one per cent. This may cause confusion in the minds both of investment advisers and investors, who compare the yields given by a group of securities with that of a unit trust composed of the same securities, to the disadvantage of the trust. In effect, the gross yield, as we are required to advertise it, is misleading.

Fortunately the Board of Trade do not consider their requirements, as originally published, to be immutable, and they have already modified them in some respects, particularly in regard to certain details in the accounts.

I take this opportunity to express our appreciation of the courtesy shown us by officials of the Board of Trade, with whom we have had numerous discussions during the past three years. We shall, of course, continue to make representations to the Board whenever we consider these to be in the interests of unitholders.

THE 1944 CONSOLIDATED ACCOUNTS

Copies of the directors' report on the consolidated balance sheet and the consolidated statement of profit and loss of the management company and on the Unit accounts of the Trusts are in your possession and are being sent to all unitholders.

The aggregate invested funds in all our trusts exceed £16,000,000. The investment reserve account has been increased by the addition of £7,000 to £38,000. Our profit (before tax) for the year amounted to £18,023, or 7.8 per cent. gross on our capital, and reserves of £231,000. Approximately half of this profit was derived from income and profit on our own investments; the balance in my view represents a very modest—perhaps too modest—return for the heavy and responsible work involved in managing and servicing our large trust funds.

The value of unit sales increased by 22.7 per cent. during the year; all our units appreciated in value by an average of about 5 per cent., except the Cornhill Debentures and "geared" Cornhill Deferred Units, the latter of which rose by over 16 per cent. These tendencies have continued during the first half of our current financial year.

The gross balances, excluding "holding" items, remaining to the Managers from dealing in and liquidating units of our five unit trusts, excluding the "geared" Cornhill Trust, amounted to £9,190; the amounts are expressed in the directors' report in the form of percentages of the sales of repurchased units and also of the proceeds of liquidated units of each trust, and will, I venture to say, appear reasonable to you.

The net balance carried to the consolidated profit and loss account, again excluding the Cornhill Trust, after deducting expenses and crediting the semi-annual remuneration, amounted to £1,643.

The Treasury ban on the issue of new units is still in force, but with the approach of the end of the war in Europe we have every hope that the Treasury will see its way to remove this restriction.

FREE MARKET IN UNITS

As in previous years we have readily bought back any number of units offered to

us, and in the case of our four largest trusts we have for several years been willing to buy or to sell up to 5,000 units, or even more, at a time at quoted prices. This is an adequate answer to those who in the early days of unit trusts expressed doubts as to their marketability.

CHANGE IN NAME OF MANAGERS

Immediately following this meeting an extraordinary general meeting will be held at which it will be proposed that the name of the management company, "Trust of Insurance Shares Limited," be changed to "Bank Insurance Trust Corporation Limited," which more accurately describes the scope of our business.

The report and accounts were adopted, and the proposed change in the name of the management company was approved.

LACRINOID PRODUCTS LIMITED

MR T. L. HORABIN'S STATEMENT

The eighth annual general meeting of this company was held on the 30th ultimo, in London, Mr T. L. Horabin, M.P. (the chairman), presiding.

The following is the statement of the chairman circulated with the report and accounts.

In deference to the wishes expressed at the last annual general meeting of the company, the profit and loss account for the year under review shows the net trading profit before providing for taxation and consequently discloses the amount required for such charge. It will be appreciated that, as in former years, the incidence of excess profits tax does not allow much variation in the amount of net profit available for dividend and for retention in the business. It will also be observed from a comparison with the corresponding amounts of the previous year, that the trading results show only a slight reduction, and that the net profit is practically unchanged at £5,522, as compared with £5,559 for the previous year.

Adequate provision for depreciation of the company's plant, fixtures and buildings has been taken into account.

Having regard to the conditions under which the work has been carried on, and in particular the increasingly difficult labour situation, your directors consider the year's results satisfactory.

In the period under review a subsidiary organisation to deal with the distribution of certain of the company's products was set up. The loss referred to in the company's accounts during this initial trading period has since been largely recovered.

POST-WAR PROSPECTS

As was the case in the previous year, practically the whole of the output of the company has been directed to supplying Government requirements. This will not, however, hamper our future development, and when peace comes we will be in a position to maintain our output. Already orders in quantity for civilian needs, both at home and abroad, are on our books. These orders must of course be deferred for the present because of the greater urgency of Government demands.

The plans of the management for the production of building and furnishing accessories have been pushed steadily forward. As a result your company is in a position when the war is ended to play its part, not only in the re-clothing of the people, but also in rehousing.

Both the management and the workers are to be congratulated on the way in which they have carried on day and night during the summer months at the peak of enemy activities against "Southern England."

The report and accounts were adopted.

RICHARD COSTAIN LIMITED

CONSTRUCTION OF MULBERRY HARBOURS

MR R. R. COSTAIN ON POST-WAR HOUSES

Mr R. R. Costain, the managing director, presiding at the annual meeting of Richard Costain, Limited, in London, in moving the adoption of the report and accounts, apologised for the absence of the chairman, Mr R. Arthur Costain, owing to indisposition. He said that he felt sure the meeting would wish to express to him their expression of sympathy and hopes for his speedy recovery. (Hear, hear.)

The managing director, continuing, said: You have had the accounts of the company as at the end of the year 1944, and will have noticed that apart from one or two figures the change is so slight that it hardly calls for an explanation. The figures to which I wish specially to draw your attention are, firstly, the balance from the trading account, which shows an increase of rather more than £42,000.

We add to contingency reserve a sum of £15,000, and the bank loans show a reduction of approximately £55,000. Trading and sundry creditors are considerably reduced by the sum of £160,000. This leaves a balance to be carried to the balance-sheet from the profit and loss account of £67,988, which is an increase of approximately £27,500. On this account your directors recommend for the year ended December 31st last an increase in the dividend to 8 per cent., less income-tax.

WAR EFFORT

Our company has carried its share of the burden imposed on the building and civil engineering industry during the war period. This culminated in what is probably the major contribution of civil engineers towards winning the war in Europe—namely, the construction, in record time, of one of the largest allocations towards equipment for the assault in Normandy, the Mulberry Harbours, both of the Whale and Phoenix sections. The company, too, has made a substantial contribution to the part taken by civil engineering contractors in meeting the fuel shortage by taking contracts to win opencast coal.

I feel it necessary to put on record that in the reconstruction of the country after the first World War, the private company, from which our company developed, did effective pioneering work in that they were the first contractors to carry out contracts for at least eight municipalities and local authorities, and our company is now anxious and able to make an even greater contribution by providing homes for the people, the greatest task facing the industry to-day.

HOUSING POLICY—GOVERNMENT PRONOUNCEMENT NEEDED

It is difficult to forecast the future prospects of our company, but it is hoped that, as well as normal building and civil engineering work at home and abroad, we will contribute considerably to the housing programme. It is essential, however, that the Government should make a more detailed pronouncement about their housing policy at an early date. The Ministry of Health has already stated that the Government look to private builders in conjunction with the building societies to meet, as they did before the war, a large part of our big housing needs, and that, subject to conditions, a subsidy will be available to private enterprise. The Minister has also said that he hopes that private enterprise will be able to build some houses even during the first two years after the end of the war with Germany. This is encouraging, but it is not enough. If your company are to begin, as they should, to build houses shortly, they and other private enterprise companies must, like local authorities, be able to plan now.

We must therefore know at once from the Government what sort of houses are to be built during the transitional period, what subsidy will be available and subject to what conditions, and which of the present controls will continue and for how long. We must also have an early decision on the report of the Rent Restriction Committee and an early report by the recently set up Committee on the Selling Price of Houses. You will, I am sure, agree that wrong decisions on either of these two problems might well retard house-building for many years.

PLENTY OF BRICKS AND CEMENT AVAILABLE

What sort of permanent houses are to be built in the earlier years after the end of the war with Germany? If a prefabricated house is to be produced which can be erected more quickly and by the use of less man-hours than a house built by traditional methods, and if it can be ready in time—the war with Germany might be over in a matter of weeks—the Government should tell us about it now. Your company is only too anxious to assist. If such a house is still only in the experimental stage, let us be told to get on with traditional houses. It is sometimes forgotten that the skin of a house takes only about 25 per cent. of the total man-hours needed to provide the whole house. We have plenty of bricks and cement in this country, and we do not need to build new factories for them, as we might have to do in connection with prefabricated houses. I feel that there is great scope—and I suggest sufficient scope—for prefabrication, in the manufacture of the components providing the equipment required for the inside of a house.

It seems that the local authorities will be building houses before the amount of the subsidy and the conditions attached to it are settled, and that these will operate retrospectively. You will, I am sure, wish your directors to join with others, in pressing the Government to announce the conditions for free enterprise now, and to say that all houses built privately, which conform to those conditions, will get the same subsidy retrospectively. Let the Government authorise both local authorities and free enterprise to begin new building at once in a small way with immobile labour. We shall not only be building new houses, we shall be acquiring the full information on costs, which is so vitally necessary, and we shall also be training the craftsmen of the future.

THE LONG-TERM VIEW

I have been dealing with the transitional period, as there are bound to be some controls during that period, and costs are bound to be higher than they will be later on. As regards the long-term problem, you will all, I am sure, agree entirely with one of the main conclusions of the Government Committee on Private Enterprise Housing, and I think that that conclusion is worth quoting. It reads as follows:—"Given favourable conditions, the housing needs of a large section of the people of this country can be met without assistance from public funds. The conditions required include cheap money, a plentiful supply of labour and materials, building costs in close correspondence with the cost of living, and stability of values."

With regard to the type of construction permitted, while your original company constructed several thousand timber and concrete houses immediately following the last war, it was found that, as soon as the industry became stabilised, the traditional methods were the most economic and

efficient. It is felt that this will make the greatest contribution to solving the post-war housing problem, and, while your company is anxious to assist in the interim period, it is hoped that we shall be permitted at an early date to build the traditional houses, of which your company was one of the largest producers in pre-war years.

CONSOLIDATED BALANCE-SHEET

It is becoming the general policy of

MAYPOLE DAIRY COMPANY, LIMITED

INCREASED TURNOVER: GROUP PROFITS MAINTAINED

SIR GEORGE SCHUSTER ON POST-WAR POLICY

The forty-seventh annual general meeting of the Maypole Dairy Company, Limited, will be held, on the 11th instant, in London.

The following annual review by the chairman (Sir George Schuster, KCSI, KCMG, CBE, MC, MP) has been circulated with the report and accounts:

GENERAL TRADING RESULTS

The year 1944 has again been a difficult one for the company, and may best be described as a period of "holding on" so far as concerns rationed goods and of constantly striving to increase sales of such non-rationed goods as are available to us under present-day restrictions.

The factors which, as explained in previous statements, adversely affect our position in war-time have continued to affect our registrations for rationed goods. The results of this have, however, been more than offset by the success of our efforts to increase turnover in non-rationed and "points" goods. As a result, a net increase in turnover has been achieved, but as against this there has been a slight reduction in gross profit margins. At the same time there has been a substantial rise in costs owing to wage increases. A scale increase was agreed in March, 1944, which for a full year will cost the Maypole Company £21,000.

While the Maypole Company has increased its turnover, but shown a slight decline in net profits, its subsidiary companies have been able to increase both their turnover and profits. The business of these subsidiaries is of a more general nature, and this contrast in results is another clear illustration of the fact referred to in previous statements—namely, that war trading conditions have created quite exceptional difficulties for a specialist company like the Maypole.

In the final result it will be seen from the report that the total profits of the group at £341,002 are only £250 less than for 1943. From this figure it is proposed to set aside £25,000 as a reserve for modernisation of premises in lieu of the provision for deferred repairs, which has been made in previous years. The provision which it is thought necessary to make for income-tax and NDC is £8,000 less than last year. The final result, allowing for smaller appropriations by subsidiaries, is that the net profit available for distribution is £103,112, about £12,000 less than last year.

STAFF

As usual, I must pay a warm tribute to the way in which the company's staff, both at headquarters and branches, has continued to cope with the difficulties of war conditions.

We have continued to pay war allowances throughout the year to dependants of Servicemen with families. Our total disbursements for war allowances and pension fund contributions, together with allocations from the provident fund for pensions and special grants have, for 1944, amounted to £47,379.

companies to produce to their shareholders a consolidated balance-sheet. Your directors are anxious to give you the fullest information, and have, therefore, decided to prepare next year such type of balance-sheet, in addition to the usual accounts.

I should like to express our appreciation to the staff and employees for the help and support given us during this difficult period, and our greetings to those serving in the Forces with the wish that they may have a safe and speedy return.

The report and accounts were adopted.

DEMobilISATION AND RESETTLEMENT

As I mentioned in my remarks last year, we are giving active attention to the question of the resettlement in civil life of our employees on demobilisation. We recognise that we shall have difficult problems to deal with. The men who come back to us after this long separation from their homes and work may have changed their outlook in many ways. From such letters as we receive, however, it seems quite clear that most of our "Maypoleons" are looking forward to coming back again to us and are anxious to get down as quickly as they can to normal civil life and a regular job. We can assure them that they will be welcomed as old friends, and that they will come back to a close fellowship which is bound together by many ties. We contemplate that a number of those who are returning may benefit from a period of retraining. Accordingly, we attach great importance to certain steps which we have taken during the past year in the way of preparing training facilities for our men returning from the Forces. We have for this purpose acquired a country house near the company's war-time headquarters at Worcester, which we propose to use as a residential centre for training courses not only for our ex-Servicemen, but for juniors coming fresh to the business. It is our intention, as necessity arises, to extend our activities in this direction as part of our post-war policy. Our plans for starting the Worcester centre are now fairly well advanced, and it is hoped to hold the first course early in June. One of our branch managers, who has completed a course of training as an instructor, is being put in charge, and we propose to give tutorial experience to other members of our staff.

FUTURE POLICY

There is little to add to what I said in my statement of last year. We still take the same view, and we are still without any definite information from the Government as to post-war conditions and British policy. In these circumstances I think it may be worth while to repeat certain remarks which I made last year.

Post-war conditions cannot be predicted with certainty, nor do we know how far Government controls of trading will be continued, or what will be the policy of the Government in regard to the production in this country and the import from overseas of the commodities in which we mainly deal. I think the time has come when the Government could safely be more informative on the last two points. All those who are responsible for the conduct of important forms of economic activity would be greatly helped by having some knowledge of the shape of things to come in matters which depend on Government policy. It ought, for example, to be possible for the Government with their present knowledge to indicate what is to be the target for home agricultural production, and broadly what is to be the quantity, nature and source of supply of our food imports from overseas.

"Personally, I believe that a factual appreciation will show that, if we are going to give all the people of this country a proper nutritional diet, we can keep our own agriculture beneficially employed at full stretch and still buy from our good friends abroad, Canada, Australia, New Zealand, and I would add countries like Denmark and Holland, food products on a scale which will provide adequate outlets for their own production. It would then be only a question of these countries making it possible for us to pay them by taking goods from us. If I am right in this belief then the sooner the British Government make the position clear the better, since our relations with so many countries are affected."

DIVIDEND PROPOSALS

The net profit available for distribution amounts to £103,112. We have again recommended that a dividend at the rate of 3 per cent, less tax, should be paid on the deferred ordinary shares, which will, after providing for the dividends on the preference and preferred ordinary shares and the usual allocations to reserve and staff provident fund, necessitate drawing on our carry-forward to the extent of £3,013, leaving this at £300,518.

The formal resolution embodying the board's recommendations will be duly submitted at the annual general meeting.

FUTURE PROSPECTS

It will be seen that the liquid financial position of the company has been still further strengthened. Taking account of this and of the general spirit of our staff, I feel that we can look forward to the future with confidence as soon as war-time restrictions and controls can be relaxed.

NORTH BRITISH AND MERCANTILE INSURANCE COMPANY, LIMITED

THE HON. ARTHUR O. CRICHTON'S REVIEW.

The annual general meeting of North British and Mercantile Insurance Company, Limited, will be held, on the 10th instant, in Edinburgh.

The following are extracts from the statement by the chairman (The Hon. Arthur O. Crichton) circulated with the report: The life new business figures for the year show an increase of approximately 15 per cent. on those of the previous year. The total war claims at £142,798 show a substantial increase on the corresponding figure for 1943, but our mortality experience has notwithstanding been more favourable than expected.

The end of the year under review synchronised with the end of a quinquennial period. The surplus permits of the payment of a compound reversionary bonus of £1 per cent. per annum for each of the valuation years and leaves a moderate carry-forward.

The satisfactory position revealed by the results of the valuation justifies us in deciding in the case of policies becoming claims, either by death or maturity, before the next valuation is made, to pay an interim bonus at the same rate as that now declared.

In the fire department premiums for 1944 were £4,062,228 compared with £3,744,618 in 1943. The underwriting profit, after providing 40 per cent. for unexpired risks, was £133,624, or 3.29 per cent., which compares with £330,451, or 8.82 per cent., for 1943.

After reporting the results of the Casualty, Marine and Fine Art and General Insurance business, the chairman continued:

The combined underwriting profits, fire, casualty and marine, were £452,775 against £677,794 in 1943. The directors again recommend a dividend of 6s. 3d. per share, less income-tax.

(Continued from page 609)

future, it is likely to be very like the recent past, except that the group will, presumably, get back a section of its pre-war staff. With this development in view, it has plans well advanced for a residential training centre where courses will be given both to ex-service men and to juniors entering the business.

The difference between Maypole Dairies and other members of the Home and Colonial group is stressed by the fact that the parent company and both Meadow Dairy and Lipton all disclose increased earnings both before and after tax for 1944. Dividends are unchanged, that on the 4s. ordinary shares of the parent at 3 per cent. As these stand over 8s. the yield is under 1½ per cent less tax, an indication of the extent of the recovery expected.

Insurance in America

A compilation made by *Best's Bulletin Service* shows the operating results of American casualty and fire insurance companies in 1944. Premiums written by stock casualty companies rose nearly 8 per cent to reach an estimated \$1,220 million, the highest in the history of the business and 40 per cent above the 1929 level, despite decreasing rates for almost all classes of risk. Underwriting profits, although below the ratio for the previous year, were excellent at 8.4 per cent of premiums. In fire insurance, premiums of stock fire companies—which include marine insurance business—increased by 9 per cent to the "all-time high" of \$1,135 million. During the past five years premiums on pure fire insurances have risen by some 45 per cent, but they are still below the pre-depression level; the volume of insurance in force, however, is much greater, the reduced premiums being due to lower average rates. Companies experienced in the aggregate a loss of 1.9 per cent, against a profit of 4.3 per cent in 1943.

The immediate outlook is not promising in either department. Adverse fire experience—in the United States as in this country and elsewhere—is the result of rising prices and higher costs, coupled with increased claims frequently due to lessened maintenance and care of property and plant, speed of production and rapid turn-over of labour; at the same time, there has been downward pressure on rates. These influences are likely to be maintained for some time. Casualty results have been exceptionally good during the past three years, but are not expected to remain so. Automobile insurance will tend to deteriorate when traffic on the roads returns to normal proportions, and it is thought likely that workmen's compensation also will become unprofitable when wages decline and employees no longer have the present strong incentive to remain at work; there will be more claims for minor injuries and many delayed and re-opened cases. No doubt rates will be adjusted in course of time to the worsened experience, but the time-lag which has favoured casualty companies during recent years will for some time operate to their detriment.

Shorter Notes

The first issue to be announced under the new temporary regulations of the Stock Exchange, and the first gilt-edged placing of the war period, is an offer of £500,000 London Corporation 3 per cent. stock at 99½. The Corporation has decided to redeem at the first optional date, August 1, 1945, the whole of the £3,395,807 5 per cent stock, 1945-65, now outstanding. It has funds in hand to repay all but £500,000, which is to be raised by the placing. It may be recalled that under the new rule there can be no dealings in the stock until the lapse of six months or until permission to deal is granted. Under existing circumstances, permission will not be granted in less than six months. It is perhaps an indication that the need to avoid procrastination in considering applications for new issues is realised that the staff of the Capital Issues Committee is now to return to London.

The creation of the Non-Ferrous Metals Federation last week has been followed by the setting up of another trade association, the Joint Iron Council. The new Council groups in one association two existing ones—the Council of Iron Producers and the Council of Ironfoundry Associations. The one represents producers of pig iron for purposes other than steel-making, and the other the numerous ironfounders' associations. These two sections have not been covered by the bigger British Iron and Steel Federation.

* Highest level reached during 1932-37 recovery.

Trade Disputes.—The number of working days lost in March as a result of trade disputes was 398,000, compared with 60,000 in February and 1,601,000 in March, 1944. There were 194 stoppages compared with 171 in February and 333 the year before. The number of workpeople involved was 73,600 in March, 27,400 in February and 313,300 in March, 1944. Coal mining disputes in March, 1945, accounted for 84 stoppages, 214,000 days lost and involved 32,000 workers.

"The Economist" Sensitive Index.—A slight change in the price of wheat on April 23rd caused the crops component of the sensitive price index (1935=100) to move from 140.3 to

140.4. There was no change in the index in the week ending May 1st. The raw materials component was 185.5, and the complete index stood at 161.4.

FINANCE AND BANKING

THE MONEY MARKET.—The Bill market tender for the larger offer last week was divided between the 91 and 92-day bills, and although the quota for the latter was unchanged at 24 per cent, a full allotment of the former raised the overall proportion to roughly 39 per cent. The market thus had some £20 million more bills to pay for. New money required of the banks on TDR's was £50 million, compared with some £20 million in the previous week. It might have been expected that these demands would have been sharply felt in the short loan market; but although the ease that developed towards the end of last week, with the conclusion of the monthly making-up, quickly disappeared, the position has remained comfortable. The banks have been moderate buyers of end-May and June maturities, despite their heavy TDR take-up, and on Wednesday it was suggested that the market probably sold as many bills as it paid for. Over the week as a whole, however, portfolios must have expanded.

The market benefited on Tuesday by the release of £3.5 million in interest on 4 per cent Funding Loan, while the Treasury return shows that £8.5 million of Ways and Means were outstanding on April 28th. This last figure, however, seems to be a mere residuum of earlier heavy borrowings—necessitated by last week's postponement of TDR payments until the end of the making-up—for the current Bank Return shows a fall of £33 million in Government Securities, which are now almost back to their level of three weeks ago. The note circulation, too, after three successive declines, has resumed its rise. Hence bankers' balances have fallen by as much as £37 million, but one still above the level maintained in the first half of last month.

Net issues of TDR's in April, as shown by the Exchequer statement, amounted to £136.5 million, easily the largest monthly increase yet recorded. It is suggested that the appreciable decline in outstanding tap bills may reflect preparations for the Australian debt repayment associated with the recent conversion operation. However that may be, discount houses are not expecting any violent disturbance of the large Australian balances now employed in the short loan market.

MONEY RATES, LONDON.—The following rates unchanged remained between April 26th and May 3rd:—
Bank rate, 2% (changed from 3% October 26, 1939). Discount rates: Bank Bills 60 days, 1½%; 3 months, 1½%; 4 months, 1½%; 6 months, 1½%; 12 months, 1½%; Treasury Bills: 3 months, 1½%; 6 months, 1½%; 12 months, 1½%; Short Loans, 1½%; Bank deposit rates, 1½%. Discount deposit at call, 1½% at notice, 1½%.

Exchange Rates.—The following rates fixed by the Bank of England remained unchanged between April 26th and May 3rd. (Figures in brackets are per cent of exchange)
United States: \$ (4.86) 4.024-034; mail transfers 4.024-034; Canada: Cdn. \$ (1.36) 4.43-47; mail transfers 4.43-47; Switzerland: Swiss franc (16.66) 17.30-40; French Empire: France 1931-2004; Syria, p. 8.81-85; Krona (18.18) 17.16-85-95; Dutch West Indies: Florin (12.11) 12.11-04; Escudos (110) 99.80-100.20; mail transfers 99.80-100.30; Portugal: Escudos (110) 99.80-100.20; mail transfers 99.80-100.30; Brazil: 7.6597 p. GOVERNMENT RETURNS

For the week ended April 28, 1945, total ordinary revenue was £67,624,000, against ordinary expenditure of £103,838,000 and issues to sinking funds of £95,000. Thus, including sinking fund allocations of £56,993, the deficit accrued since April 1st is £197,796,000 against £264,133,000 in the corresponding period a year ago.

Total	670,628	461,971	406,749	126,945	107,088

A change has been made in the method of showing excess of Post Office Expenditure over the Post Office Revenue. Such excess is now included as ordinary expenditure under "Total Supply Service" instead of shown, as up to July 24, 1943, inclusive, as a deduction from ordinary revenue.

After reducing Exchequer balances by £5,266 to £2,737,758, the other operations of the week (no longer shown separately) increased the gross National Debt by £331,816 to £22,599 million after allowing for £16 million of sinking funds in 1945.

London Office: 8, OLD JEWRY, E.C.2.

Also at AUSTRALIA HOUSE, LONDON, W.C.2.

EXECUTIVE required, by large nationally-known firm of
Choclate Manufacturers in Southern England, to fill an im-
portant position demanding managerial and imaginative qualities
of the highest order. He must be competent to direct and co-
ordinate the work of both technical and sales staffs in expanding
the sale of the Company's existing products and in creating
a sound working knowledge of economics, advertising, sales pro-
motion and marketing in all its phases. The appointment carries
a high salary and unlimited prospects. Write, giving full details
of experience and salary expected, to Box 67, The Economist,
Brettenham House, Lancaster Place, London, W.C.2.

OFFICE Woman-linguist (Russ., Germ., Fr., Span.)
needed for post in indus., comm., or scient. org. Wide exp.
in sec. transp., translator, econ., statistical and library
work; short-h./typ. some bk-kpg. Write, Box 66, The Economist,
Brettenham House, Lancaster Place, London, W.C.2.

WANTED. Copies of The Economist, January, 1940, to April,
1945 inclusive.—Belgian Ministry of Economic Affairs, 82,
Eaton Place, London, S.W.1.

MANAGEMENT CONSULTANTS require immediately Man
about 35-45, with first or good Second-class British Univer-
sity Honours Degree (preferably engineering), and consultancy
experience to take overall control of Specialists in Production
Engineering and Routines, Costing, Incentive Bonus and Labour
Relations. He should have thorough knowledge of the economics
of production and practical experience of Production Planning
and Control. Salary £1,500 to £2,000 according to previous posts
and qualifications. Ex. Offered.—Write to The Wallace
Attwood, 10, Park Lane, London, W.1, stating when
available. Full details should be given of age, education and
previous posts (with salaries).

PERSONA

THESE DAYS of mod

Ancient Sacrifice

SO the end has come. After the two great capitulations
to Field-Marshal Alexander in Italy and to Field-
Marshal Montgomery in the North-West, there was little
of Germany or the German power left to surrender. Only
against the Russians was there any fighting for several
days before the final end, and only against the Russians
was there still in the highest German quarters any trace
left of the will to resist. It took some time for this last
obstacle to be overcome, and it was not until the early
hours of Monday, May 7th, that the all-embracing sur-
render was signed. On Tuesday the firing ceased, and
Europe, though a long way yet from peace, was no longer
at war. The victory is complete and crushing. Germany
is totally occupied. Apart from the Doenitz-Krosigk
phantom, there is no German Government. The German
people, in General Jodl's anguished words, are for better
or worse delivered into the victors' hands. In the middle
of Europe, where so recently there stood the most power-
ful and resourceful military tyranny the world has ever
seen, there is now nothing but the emptiness of sorrow and
silence.

So it has ended, twelve years since the Nazis seized
power, seven years since their first overt aggression, five-
and-a-half years since the first shots were fired, five years
since the sudden, awful, brilliant campaigns that brought
the evil flood lapping up against the last fortress wall in

Europe, two-and-a-half years since, at El Alamein, at
Stalingrad, in the waters about Guadalcanal, the tide
began to turn. It has been a long time, a hard time, a bitter
time, and the marks of it, on the face of the earth and on
the mind of the human race, will last for many ages yet
to come.

These are days of many emotions. Uppermost; quite
naturally, is that of thankfulness that the long ordeal, for
half the world at least, is over, and that the sins of blind-
ness and indolence and complacency that encouraged the
aggressor—sins from whose taint none is free—are purged
at last. It is right that there should be a brief pause of
rejoicing. "Speak ye comfortably to Jerusalem and cry
unto her that her warfare is accomplished and that her
iniquity is pardoned."

The second thought—the deeper and more lasting—is
for those who will not come back, for those who will not
grow old, as we that are left grow old. For this country
(though not for others) they are mercifully fewer than in
the last war. But human life is not to be computed statis-
tically, and of all war's wounds an empty heart is the only
one that time does not heal. To the gallant dead, many
memorials will be established and consecrated with a
sincere and universal resolution to see their task finally
accomplished. But, just as Lincoln said of the soil of
Gettysburg, it is not for us to dedicate memorials, it

is rather for us, the living, to be here dedicated to the great task remaining before us, and to find in its accomplishment the only lasting proof that they neither lived in vain nor died forgotten.

After the dead, the living. Many thousands will come back torn and crippled and must be cared for. But for every one thus visibly maimed there will be ten whose lives have been twisted and distorted. Taken from the threshold of a normal life, they have, for five years, been serving an apprenticeship to the trade of death, and they have now to find their way back to a very strange world which will seem to them to have little demand for the crafts they have acquired, such as courage and endurance and the mastery of men. It has become fashionable to say that, in this war, the civilian and the soldier have been on a parity of sacrifice. The contrast, it is true, has been less sharp than it was between the trenches and the unbombed homes of the last war. But there has still been an enormous gulf fixed between the two, and those who

have slept at least half the nights of the war in their own beds have a personal duty to help the returning men and women of the Forces in making the very difficult transition back to where they might have been. If they are allowed to become an army of unemployed or of misfits—the living ghosts of a lost generation—then the fault will not be theirs, but that of a society that refuses to go out of its way to receive its saviours.

The period of physical courage and physical sacrifice is nearing its end. The need will now be for moral courage and mental sacrifice, if the opportunity so dearly purchased is to be taken. The quieter virtues are no less difficult, especially for a generous, tolerant, easygoing people who are slow either to anger or to forethought and quick both to forgive and to forget. But if the tasks of peace can be approached with the same majestic compound of unity in freedom and responsibility that has brought the British people so triumphantly through the perils of these dreadful years, then nothing will be beyond their powers.

The Russian Attitude

IT is tragic that the victory which crowns the joint military effort of the three Great Powers should be overshadowed by the gravest political dissension that has yet divided them. The news that the fifteen Polish leaders, some of whose names were communicated to the Russians by the British Government, have been arrested and await trial in Moscow has for the time being shattered all hopes of a compromise solution of the Polish problem.

This crisis, coming at the end of a long series of crises over the Polish issue, raises a very serious question. Can co-operation between the Great Powers be carried on any further on the present basis? If the whole principle of joint agreement and joint policy announced at Yalta is to be abandoned, what are the alternatives? Already voices are raised in this country and in the United States, arguing that the attempt to maintain an alliance or even friendly relations with the Russians is impossible. Let the Western Democracies, they argue, face the fact that Russia is using the same diplomacy as did Nazi Germany and that the only effective policy which remains open to the West is preparedness for war. These extremists are suspect. Many of them were ready enough to appease Hitler so long as he posed as an anti-Bolshevik crusader. Their fear is based on an ancient hatred of the Soviet Union as a revolutionary power. But it is useless to pretend that only a lunatic fringe in this country is perturbed over the Polish issue. Only the equally lunatic fringe of fanatical Soviet worshippers can swallow with any ease the latest twist in Russian policy. There is a widespread feeling that the Anglo-American approach to the problem of co-operation with Russia must have been mistaken if its fruits have been so small and so sour, and that the time has come to adopt new methods.

The issue of friendship and co-operation with Russia is not in doubt. The most passionate desire of the peoples of Europe is that war may be avoided, and they see clearly that only a firm understanding between Russia and the West can give any hope for peace. This realisation is reinforced in many people by a deep admiration for the Russian experiment, which, though it may be troubled by the brutalities of Russian foreign policy or the antics of local Communists, nevertheless, gives enormous emotional reinforcement to the desire for peace with Russia. Quite apart from these general factors, the pressing military need in Britain and the United States is to finish the Pacific war as soon as possible. How could they, with this heavy struggle still on their hands, renounce the friendship of a Power whose influence might be decisive in the Far Eastern zone of war? No British Government, probably no American Government, can renounce the aim of friendship with Russia. They cannot afford to do so. In the short run and in the long, co-operation with Russia—or at least the avoidance of conflict—must be one of the cardinal points of British policy.

Yet in the light of the Polish crisis—and many other disputes of lesser magnitude—it is difficult to maintain that the policy pursued hitherto by Great Britain and the United States has in fact achieved very much in the way of the strengthening of ties and the deepening of cordial relations. It is not the objects of the policy that are open to question, but its methods and degree of success. There must be something radically wrong with a policy which after four years' constant effort produces the Polish deadlock, the Austrian difficulty and the friction that has been generated by the talk of eastern and western blocs. The policy has been in the main one of concession and compromise, the compromise amounting to little more than a substantial acceptance of the Russian proposal after a slight time lag and with the addition of a couple of face-saving formulæ. On the whole, the British Government has not evolved policies of its own. It has only struggled to modify the more unacceptable elements in the policy put forward by the Soviets. It has mediated between Russia and America. It has played the honest broker. It has avoided raising "controversial" issues on its own account—for instance, the project of closer association in the West.

*

It is this policy of conciliation and compromise that has brought the British Government slowly and unwillingly, to the tragedy of Poland, in which they now find themselves not only helpless to assist the ally for whom the war was begun but directly implicated in the handing over to their jailers of democratic Polish leaders. The policy pursued has done great injury to the moral standing of British policy and to the British claim to stand for the rights of small nations. These sacrifices have been made in the hope of eliciting friendly co-operation from Soviet Russia, but if anything of the sort has been secured it is not visible from this distance. To all appearance, the sacrifices have been made in vain, the concessions have been made without purpose. If the object of the policy was closer understanding, it has failed.

When a policy is faced with such a blank record as this, common prudence demands that it be reviewed. The aim of any policy towards Russia must be friendship and collaboration, but perhaps there are other ways of attaining the aim that will prove more effective than constant concession. The Soviet leaders, after all, have the same aim as the Americans and British—or so their speeches constantly proclaim—but their desire for friendly co-operation does not prevent them from using their every bargaining advantage to the full, from playing every card for all that it is worth. Perhaps this is what they expect from this side. Perhaps they are genuinely unable to distinguish a willingness to compromise in the interests of

wider agreement from mere weakness and inability to stand firm. Perhaps the best way to win their respect and their friendship is to drive as hard bargains as they do themselves.

There will be the greatest reluctance, both in London and in Washington, to come to such a conclusion. Hard bargaining with a friend is not customary among the English-speaking peoples. But it would be idle to deny that those who have the responsibility of managing the foreign policies of the Western allies are being compelled to ask themselves whether they will not have to change their tactics in this direction. And it is the policy of the Russians themselves that is the compelling factor.

For Poland it is now, probably and tragically, too late to do anything but protest. But other and still larger matters are on the agenda, in which the same question of the tactics to be pursued with the Russians will inevitably arise. One is the war against Japan. Another is the government of Germany, for which, since Wednesday morning, the Allies have been solely responsible. It is clearly desirable—so desirable as to be almost imperative—that they should have a joint policy of administration, even if it is separately pursued by each occupying power in its own zone. To have, for example, a Government of liberated Germans in one zone and a purely military administration in another would lead to endless complications. But a joint policy means securing Russian agreement, not only in principle but in detail, not on one formal occasion but day by day. How can this best be done? The Western Allies are by no means without bargaining counters. They command food supplies and transport—limited in both cases, but probably much more than is available in Eastern Europe. The incidence of surrender has put four or five million German prisoners of war and many more millions of civilians in the hands of America and Britain. These men are now the greater part of the able-bodied German population. Through fear of the Russians, the eastern zone has been denuded, and until at least the workers return the administration of

Russian-occupied territory will be crippled. Now which procedure will most effectively lead to agreement on joint policies—the handing over of these trump cards as a preliminary concession in the hope of creating a friendly atmosphere, or their use as one of the bargaining counters in the agreement? Which policy would the Russians pursue if they were in their western Allies' shoes? All British instincts would be in favour of the former course. But does recent experience really support it?

A policy of hard bargaining has the danger that it might be mistaken for a policy of hostility, and this would be a strong argument against it if the alternative policy of concession had in fact achieved any relaxation of suspicion. Do the Russians wish it to be believed that the choice is between painful concessions and suspicion on the one hand and merely suspicion on the other?

Nor would a policy of firmness be without difficulty, for one of its obvious requirements is that the Americans and the British should know what they are going to be firm about. Do they know clearly what they want in Germany? What type of administration do they seek—local only or central? Do they wish to base it on Generals and Admirals, or is a resurrection of the democratic parties and groups part of their plan? What is their attitude towards reparations? Do they approve of forced labour and deportations? If so, have they laid down conditions for the treatment of workers? Do they intend to permit or assist the reconstruction of German industry, or to change the basis of the German economy? Are they for partition or for federation or for a centralised Reich? The British Government appears to have lived so long hand-to-mouth in its conduct of foreign policy that it may well be impossible to formulate a German policy in time to make it effective. After years of brokerage, it will not be easy to act as a principal. But the alternative is pure drift, securing neither sound and effective policies nor Russian respect and friendship. It is just possible that a policy of hard thought and moral courage could still secure both.

Back to Civilian Life

There are, however, a number of factors which should make the task of demobilisation smoother than it was after the last war. Mobilisation has been better ordered, and the Ministry of Labour has exercised far-reaching powers of control over the movements of labour. Though the controls over labour will be relaxed progressively, the Ministry still possesses in the Essential Work Orders and the Control of Engagement Order the necessary instruments for regulating and allocating the supply of labour. Moreover, the civilian population, after six years, have become accustomed to restrictions and controls which they will accept provided they are convinced of their necessity. So long as Japan remains undefeated and the production of munitions for the Far Eastern war still has overriding priority over other forms of production, a general control over labour will have to be retained. Parallel with demobilisation, the call-up will still continue, and younger men from 18 to 27 will be liable for military service. There will be no abrupt transition from war to peace, even if the Japanese war should end sooner than had originally been anticipated. The average soldier, sailor or airman of 1939-45 is better equipped, mentally and physically, for the return to civilian occupation than his predecessor in 1914-18. He has throughout been kept in touch with the home front, and the Forces' education schemes have been specially designed to bridge the gap between army and civil life, and to minimise the difficulties which men and women who have spent a large slice of their adult life in uniform are bound to encounter when they return home.

The authorities, it seems, are determined to profit from experience and to avoid the mistakes which were made after the last war. There was certainly no dearth of demobilisation plans in 1918, but the Government, acting on somewhat rule-of-thumb methods, aimed at releasing

With the Armistice and the prospect of early peace, a new industrial situation has arisen. The rapid and effective transference of manpower from non-productive to productive enterprise will be the acid test of the nation's capacity for the peace tasks that industry is to face immediately. The transference must be rapid . . . it must be effective, because the breakdown in the process of reabsorption with the unemployment that would inevitably result may have serious and even calamitous social consequences.

THESE words of warning, taken from *The Economist* of December 21st, 1918, might equally well be applied to the situation on May 12th, 1945. The ending of the European war brings the nation to its most critical moment. The brief period of rest and rejoicing must be followed by the maximum effort to restore and resume peacetime industrial activities. In many ways, Great Britain is far better prepared to meet the situation and to bring about a rapid and effective transference to peace than it was at the end of the last war, although the scale of operations is much greater. This war has lasted for nearly six years, compared with the 4½ years of the last war, and the nation has been more fully geared for total war than it was in 1914-18, as the figures given in the White Paper on the war effort showed. This mobilisation of manpower, without parallel in history, may have been reached slowly, but it has been complete, and the process of demobilising and "unwinding" the nation's manpower will be correspondingly more arduous. It is little wonder that Sir Godfrey Ince, former Director of Manpower at the Ministry of Labour, recently remarked:

Mobilisation has been difficult enough, but demobilisation is going to be infinitely more difficult. Not only shall we require the wisdom of Solomon and the patience of Job, but we shall need the help and co-operation of the whole nation.

the key men first, with the perfectly logical and legitimate intention of restarting the wheels of industry before the large-scale return of men from the Forces. In practice, this system broke down. Men who had slogged through four years of Flanders mud found themselves by-passed by recent arrivals who were regarded as more important to industry. They expressed their resentment in the only way open to them, and began to demobilise themselves. They "voted with their feet." This time, the Ministry of Labour has discarded theoretical considerations in favour of a simple rule of fairness. With the few exceptions of Class B men, who are needed for urgent priority reconstruction, such as building, the criterion of age plus length of service will apply universally. The Ministry has also rejected any more elaborate scheme of weighting demobilisation by points. The scheme has been criticised for not giving preference to married men (though married women will have priority of release) or to men with long overseas service. There is also some concern among the Forces, particularly in Burma lest the phrase "urgent military necessity" might interfere with their release when their proper group is reached. But, by and large, the scheme has been generally accepted as fair, and the Ministry of Labour has taken steps to ensure that service men and women know where they stand. The admirable booklet "Release and Resettlement" has been issued widely in the Services, and there should certainly be no excuse for ignorance.

It has been suggested that there will be a rush of applications for release under Class B. The Ministry of Labour, however, is determined not to permit any pressure either from the men themselves or from employers to take advantage of this provision. Moreover, men who elect to come out under Class B will not receive as many benefits as those in Class A. These disadvantages, together with the Ministry's declared policy of limiting the number of releases in this category, mean that the proportion of men released out of turn is likely to be very small. This fact will not, it is hoped, impede the rate at which building can proceed or the process of industrial reconversion. It would be a pity if the Government, in its anxiety to avoid the mistakes of the last war, went to the other extreme. The best procedure, unquestionably, is to stick to the policy laid down, but to speed it up as much as possible. It is at this stage impossible to tell either when demobilisation will start or how long it will take. There will inevitably be some time-lag owing to the need for reorganisation and readjustment, while the speed with which demobilisation can be completed obviously depends upon the speed of industrial absorption. But any delay in beginning is dangerous and every question of doubt should be settled in favour of speed.

★

The authorities are doing their utmost to smooth the return to civilian life. The Ministry of Labour is setting up about 400 Resettlement Advice Offices in order to assist demobilised serving people in the many problems that the return to civilian life will bring, and to act as the Forces' equivalent of the Citizens' Advice Bureau. Their success will depend largely on the way in which they are staffed and conducted. It is also essential that these Resettlement Officers should co-operate closely with the many voluntary organisations which also deal with servicemen's problems, in order to prevent any overlapping.

The greatest difficulties in the course of demobilisation are likely to arise in connection with the interpretation and administration of the Reinstatement in Civil Employment Act. This Act provides that all men and women who have entered the Armed Forces since May 5th, 1939, shall be entitled to reinstatement in their old occupation, on terms and conditions not less favourable than they would have had if they had not joined the Forces. This provision may be extremely difficult to operate in practice. How is an employer to determine what position a man of 25, who was with the firm for perhaps two years when he was 17, would now have reached, had he not been called up? Or what is to be done when three or four men, each called up in turn, has held the same job? The

Act, it is true, provides that if it is not "reasonable or practicable" to reinstate a man, then the employer must offer the best alternative. Mr Bevin has said that the operation of the Act will depend more than anything on the "spirit" of employers and employees, and he hopes that questions will be settled by mutual agreement, though failing agreement, they can be referred to reinstatement committees with the ultimate right of appeal to an umpire. Up to the end of last year only 62 cases have been heard by committees, but as more and more men return from the services and claim reinstatement rights, the work of the committees may extend. It is, of course, not improbable that a literal interpretation of the Act will break down on such snags as these, but so long as there are alternative jobs available this would not be a serious matter.

All the schemes for resettlement lay great emphasis on the importance of education and training for industry. Every effort is being made to train disabled workers and schemes for training able-bodied men are being prepared by industry. Under the Interrupted Apprenticeship Scheme, men who broke off their apprenticeships, whether they were indentured or not, will be able to resume their training either with their previous employer or with another employer in the same trade. The number of men who want to resume their apprenticeships, however, is comparatively small. The great majority of men and women in the Services have probably never had any industrial experience at all. All three Services have organised special education and training schemes, which will operate between the end of the German war and their release. These courses are general rather than vocational and include such subjects as citizenship and current affairs. Army Education in its present form really started in order to relieve boredom in 1941 and 1942. The present schemes may serve an incidental purpose in preventing men being "browned off" while they are waiting to be released. The Ministry of Labour's schemes, which are purely vocational, have been prepared in co-operation with employers and trade unions in about 50 industries. Free training will be given in Government training centres, technical colleges or approved factory schools. For men and women who want to take up professional or business careers, the Ministry of Labour will provide financial assistance towards further education, and resettlement grants up to £150 for men who want to restart their businesses.

On paper the Ministry of Labour's plans for demobilisation and resettlement are admirable, and it will not be for lack of foresight or planning if the schemes do not work out as well as they might. There are three fundamental conditions for their success in operation. The first is the way in which they are administered. In this connection, it would be regrettable, though probably not fatal, if Mr Bevin, who was responsible for the mobilisation of manpower, were unable to supervise its demobilisation. The second condition for success is the maximum co-operation on the part of employers, employees and the men and women in the Forces themselves. The third and obviously the most important condition is the availability of work to absorb not only returning servicemen and women, but the industrial workers whose work in war factories will come to an end now that the European war is over. Here the responsibility rests with the whole Government, machinery and the Board of Trade are primarily involved. It has now become platitudinous to say that physical reconstruction, housing, the restarting of export trades and the relief of consumer goods shortages will involve as great a demand for labour as the needs of war production. Full employment, in the sense that there are more jobs than workers, should continue for some considerable time to come, and unemployment should be purely temporary and transitory. This at any rate is the state of affairs which in theory should exist in the immediate postwar period. Whether it will be so in fact, whether a large and complex transition will be made without large-scale dislocation, experience alone will show, just as experience alone will show whether the carefully laid programme for demobilisation will proceed according to plan.

The Other War

IN the middle of all the rejoicing for the end of the European war, it should not be forgotten that for thousands of fighting men and their families, the war is not over but carries on, as hardly and as grimly as separation, distance, climate and enemy resistance can make it. It is impossible to be entirely whole-hearted in relief and thankfulness when for so many a long and hard struggle may still lie ahead.

But how hard and how long? The military evidence of the recent fighting in inconclusive. On the one hand is the astonishing feat of the Fourteenth Army and of the other Allied forces in Burma in advancing in a few days from Meiktila to Rangoon, capturing the city and cutting off all the Japanese forces fighting to the west. This spectacular drive defeated both the Japanese and the monsoon, and although the weather may now hold up a further advance by land to Singapore, it may be possible to advance across the Shan States towards Siam, thence to cut off the Japanese in Malaya from their bases in Indo-China. In any case, the capture of the port of Rangoon intact revolutionises the military situation, for hitherto the Allied armies have had to be supplied almost completely by air.

From the further end of the great arc running from Malaya to New Guinea, the news is also good. The Australians are completing the occupation of Tarakan. Possession of the island's airfield, just off the coast of Borneo, will be a step forward towards Java and Sumatra.

On the other hand, the root and basis of Japanese aggression lies in the Japanese homeland. The reconquest of Malaya and the Netherlands Indies is an end in itself. It does not directly contribute to the immediate defeat of Japan. The battles in the inner ring of the Japanese defences have not so far proved as decisive as the more distant fighting. The effects of heavy air bombardment are always difficult to assess and no one can say precisely what is their contribution to the destruction of the enemy's war industries and civilian morale. Yet the air raids on the Japanese mainland already constitute a major offensive. Tokyo has been bombed day after day, week after week, fire bombs have been used very effectively, and much of the capital is in ruins. Industrial targets, ports and airfields have also been pounded, and this offensive is steadily growing in intensity as the British bomber force joins in and more and more airpower can be transferred from the European zone of operations. Japanese officials put the figure of casualties—killed, wounded and homeless—at three million, a sufficiently disturbing figure, yet they are only the first.

Fighting has already started on islands which are

administratively part of Japan. After a very hard struggle, the Americans captured Iwojima on March 15th; the next target drew one of their larger task forces almost to the doorstep of Kyushu, Japan's most southerly island, Okinawa is one of the Ryukyu islands, only 400 miles from the mainland. The American forces had little difficulty in landing there on April 1st. Since then, however, the fighting has been exceptionally bitter. The northern

half of the island is occupied, but the southern part has so far proved impregnable. The Japanese, always fanatical fighters, have outdone their own record in suicidal attack and defence. The Japanese High Command have thrown in thousands of planes, and some of the Grand Fleet has been—unsuccessfully—hazarded in action. If Okinawa

CAPITAL ANNUITIES

Extract from the Chairman's speech, March 22nd, 1945:—

"... The scheme was only introduced in June but by the end of the year Considerations amounted to £247,000 and by now they exceed £400,000. Your Society is thus maintaining its reputation as a specialist in annuity business."

EQUITY & LAW LIFE ASSURANCE SOCIETY
LINCOLN'S INN FIELDS

Temporarily transferred to
163-164, STRAND, LONDON, W.C.2

is typical of the kind of defence the Japanese will offer, there are tough and difficult and long drawn out battles ahead. Taken altogether, the evidence given by the present military situation is not uniform. It is very good in patches, but not so universally good that one can base on it alone a reliable judgment on the length and bitterness of the Japanese war; but obviously military factors are only one determinant of policy. The Japanese have also to assess their political opportunities.

In many ways, the political outlook could hardly be more gloomy. Japan has been deserted by its one ally, and the Japanese press's indignation at this defection reflects their uneasiness. Germany's downfall is an impressive warning to any nation bent on fighting until ten minutes past twelve. Moreover, the end of the European war frees the Russians for political and military action in the Far East. Their first move was the denunciation of the Soviet-Japanese Pact of Neutrality. Is the next step open or undeclared war? If so, might not Japan, surrounded by enemies, prefer to offer unconditional surrender, hoping by shortening the war to secure better terms?

The difficulty here is that Russia's Far Eastern policy is still unpredictable, and that the Japanese Government has some reason to hope that profound disagreements between the Allies may render their fighting less effective and create a diplomatic situation in which Japan can manoeuvre and bargain its way towards concessions. Even

if the Japanese were considerably more hard pressed militarily than they are now, they would hardly think of seeking a settlement so long as their worst fear, an effective fighting coalition of the Three Great Powers against them, has not been realised. The manner in which the European war has ended—in disagreement over Poland and confusion over policy towards Germany—is not wholly discouraging from the Japanese standpoint. Their new Government contains elements who can appease and bargain with both Russians and Anglo-Saxons. This undoubtedly they will try to do so long as any hope remains—and the war will drag on.

The Allies are presumably attempting to put an end to the uncertainties and divisions which hold them apart. General Hurley, the United States Ambassador to China, announced recently on his return from Moscow that the Three Great Powers had reached agreement on their Far Eastern policy. So far, there is little evidence to support his statement, and sufficient hints of disagreement—over the rival authorities in China, over the future of Manchuria—to encourage the Japanese Government to continued resistance. Allied disunity is, in fact, as disastrous an obstacle to a speedy peace in the Pacific as it is to a stable peace in Europe. There need be no collision of policies and interests. But until both are clarified, the possibility of conflict remains—a prospect from which no one can draw any comfort, except the Japanese.

NOTES OF THE WEEK

Formal Surrender

When the German collapse finally came, it came quickly. There was only a week between the first mass surrender in Italy on May 2nd and the final surrender to all the Allies signed in Rheims in the early morning of May 7th.

It may be that Admiral Doenitz hoped in forming a non-Nazi government—only one Nazi was associated with it, Albert Speer, the Minister for War Production—to persuade the Allies to make terms and concessions. The collapse of the German armies and the apathy of the people defeated his purpose. Yet in spite of the completeness of the final surrender, the Nazis seem to have been able even in their final dissolution to cause some grave political difficulties. The Nazi leaders and the generals in the field did their utmost to surrender to the Western Allies only. When their overtures were rejected, they proceeded to a *de facto* surrender to the West. Units fought their way back from the Russian front to surrender to the Americans on the Elbe and in every area it was the Russian forces who had to bear the full brunt of the fighting during the last days of the war.

This fact had very small military consequences. It is unhappily not so easy to say whether the political consequences have been equally small. At the moment, thanks in part to the German strategy of surrender, Britain and America control a large majority of the prisoners of war—a circumstance for which they are not responsible but which appears to have aroused misgiving in Moscow. The end of the fighting has seen a sudden intensification of distrust. The Polish arrests, the Vienna government, the Russian attack on the British and American treatment of Russian prisoners of war, are all symptoms of disunity and disquiet. The Russians even postponed VE day by 24 hours as a gesture of reproof. This mood may well have been excited in part by the German surrenders and a quite unjustified suspicion of Allied connivance.

Divisions at San Francisco

Writing of the international conferences which took place after the last war, Mr Churchill once expressed his view that

This [the new League] would have been admirable if a preliminary understanding had been reached on the main issues between the leading men, and if they had known where they stood with one another in essentials and had not felt that very serious conflicts impended. But now it seemed that the Conference was to dive into interminable academic discussions upon a new Constitution for mankind while all the

practical and clamant issues had to drum their heels outside the door.

At San Francisco, however, the heels are being drummed so loudly that the noise has penetrated to the conference halls. The news of the arrest of the Polish leaders damped the optimism which had been widely felt on the prospects both of securing a more representative Polish Government and of securing a really agreed framework for the new League. The sudden deterioration in the Polish situation, which left the British and American delegates perturbed and anxious and the Russians even more inscrutable than ever, re-aroused fears of a fundamental split between the Great Powers, with the smaller states dutifully grouping themselves round their protectors.

This growing division into blocs was noticeable in the Argentina debate, where the United States, impelled by the insistence of the Latin American states, felt it necessary to insist somewhat brusquely on the admission of Argentina. The American votes, with most of the British, gained a clear majority over the bitter opposition of the Soviet Union and its dependent Europeans. The Russians have since proposed a two-thirds majority on all questions save those concerning the procedure of the conference. This proposal will probably be accepted, since the American bloc is large enough to prevent a two-thirds majority voting against it.

Another point of conflict between the American and Russian delegation is the problem of whether to give the World Organisation the power to revise existing treaties, Senator Vandenberg pressing for it (with one eye on Poland?), the Russians opposing it as a means of German recovery. Latest reports suggest that the Russians may be prepared to accept a compromise.

The question arises, since blocs and regionalism have obviously come to stay in international life, whether they can be tamed and civilised by external supervision. In other words, shall the Security Council have an over-riding authority over them? The answer given by the Powers is very much what the cynic might expect. Before he left San Francisco to report to his Government, Mr Molotov declared that Pan-American regionalism should be controlled by the new League, but denied that Russia's security pacts with its Western neighbours had anything to do with the League, since they were directed against enemy countries. On the other hand, the Latin-American States wish the Act of Chapultepec, establishing regional security in the Western hemisphere, to be outside the jurisdiction of the Council. The mood is thus: "My regional pacts are good

and need no supervision. Your regional pacts are suspect and must be carefully watched."

The United States Government is, however, restraining the eagerness of its Latin neighbours. With Britain, it still represents the universalist approach.

Trusteeship Disputed

Commentators agree that there appear to be fewer signs of Britain emerging as the leader of a third bloc. In the Argentina debate, New Zealand voted with Russia. So did Belgium and France. Neither in the Empire nor the western fringe is Britain a "bloc leader." On the contrary, Mr Eden has put in excellent work bringing together the policies and proposals of his Russian and American allies. On one issue, however, the British are taking a decided line. The question of colonial trusteeship has been under discussion for a week now. The British are prepared to continue the old Mandate system and to extend it to any colony transferred from enemy sovereignty. The Americans wish to tighten up the Mandate system for all existing Mandates, extending international control and supervision and vesting responsibility in the international organisation. They wish, however, to exclude from this system the Pacific islands which will be taken from Japan. Under pressure from the Navy Department and from a group of visiting Senators the American delegation is trying to find means of distinguishing their control in the Pacific from the general principle of trusteeship. They urge that these islands are "strategic" and as such should be the concern of the Security Council alone. The British argue that however small the population the treatment should be the same for all. So far no agreement has been reached.

The Last to be Free

The liberation of Holland, Denmark and Norway has come as the automatic result of Germany's unconditional surrender. The people of Holland, terribly reduced already by starvation and disease, have at least been spared new horrors of land fighting. But their wounds have been deep and grievous. Much of their land has been flooded. In their difficult work of reconstruction the Dutch are entitled to expect that their more fortunate Allies will give them quick and effective assistance. The Allied bombers which in the last days of the war dropped food, instead of bombs, over Dutch territory were, let us hope, the harbingers of a new age in which technique, skill, inventiveness, and material wealth will be used to heal the wounds of war, not to inflict them.

Norway and Denmark have suffered less than Holland; but their contribution to the Allied cause will not be forgotten in the hour of victory. Throughout the war in both countries the Nazis' attempts to cajole and flatter the people were answered by contemptuous and persistent passive resistance, in which workers, clergymen, teachers and university professors had an equal share. To both countries, victory offers the opportunity of resuming their quiet and civilized way of life. The need for these bases of peace and good government is a hundred times greater in war torn Europe today than ever it was before.

The Liberation of Prague

Prague, the first non-German capital to be invaded by Hitler's armies, has been the last to be freed from them. The rising which broke out last Saturday met with a ferocious riposte, on the part of the SS detachments garrisoned in the city. Though the knell of National Socialism could already be heard all over Europe, the Nazis in Prague were still bent on wreaking atrocious revenge on the insurgents and on the civilian Czech population.

The Wehrmacht in Czechoslovakia adopted more consistently than anywhere else Admiral Doenitz's original instructions. Its soldiers willingly surrendered to the Americans, who entered Pilsen almost unopposed, while they were still fighting one of their most stubborn battles against the Russians around Olomouc. However, the cease fire was soon sounded on the Russian front, too; and the earlier German surrenders to the Americans saved from destruction the rich industrial areas in Western Czechoslovakia, of which the Skoda works are the hub.

President Benesh and the Czechoslovak Government will now return from Kosice to Prague. The liberation of Prague will entail a new reshuffling in the Government

which would bring in the representatives of the resistance in Bohemia and Moravia. The verdict of Munich has now been finally reversed; and Czechoslovakia is confronted with the difficult task of reuniting its nationalities in the Republic and of finding its internal balance under predominant Russian influence.

Politics after Victory

The European victory has given rise to a fresh crop of rumours about an early General Election, and the view that it will come in July is widely held. Presumably the parties hope to benefit by the public mood of exultation, and to forestall the danger that it might turn to disillusionment.

Technically, there may be no obstacles to an election this summer. Theoretically there may be no good reason for prolonging the life of the coalition now that the tasks for which it was formed have been accomplished, and it might be appropriate to announce its end on the fifth anniversary of its formation. All the same, there are very good arguments against precipitating the dissolution. It will be some months before serving men and women can return to exercise their full rights of citizenship, and a proxy vote is a poor substitute to the man who wants to take part in electioneering. The new register, as was found at Chelmsford, is far from perfect, and needs to be improved. Moreover, there is much unfinished legislation for the present Government to complete, much of it of a non-party and non-controversial character.

It is doubtful to whose advantage a snap election would be. The Chelmsford results showed the electorate to be in an anti-Tory mood, though if it had been asked to vote for or against Mr Churchill, as it inevitably would be at a General Election, the results might have been very different. None of the parties is believed to have finished its election preparations, and its panels of candidates have still to be completed. The Conservatives are understood to be busy reducing the average age of their candidates, as well as brightening their publicity. The coming Labour party conference will perhaps show the state of Labour's

Getting down to fundamentals

Fundamentals must come first . . . primary requirements of a civil aircraft such as inherent reliability, operational economy, minimum maintenance—each in turn contributing to safe and inexpensive air travel—are all-important factors governing design . . . factors which distinguish the "Bristol" Freighter as the logical aircraft answer to immediate civil air transport needs. The Bristol Aeroplane Company Ltd.

preparations, though the election plans are to be discussed in private session. For Labour, the real issue, tacitly understood though never openly referred to, is who is to lead the party at the election.

The Liberal party, which has published a brief seven-point election programme, makes it clear that it is following the banner of Sir William Beveridge, who is chairman of its election campaign committee. Apart from free trade and proportional representation, the Liberal aims of international security, "freedom from want," full employment, a healthy agriculture and homes for the people, are very similar in outline to those of Labour. In all probability, the Conservatives, who have not yet issued their election manifesto, will put forward exactly the same points. This makes it all the more probable that the electors will vote for personalities rather than for policies.

Future Income Tax

Further reflection serves only to deepen the alarm with which Sir John Anderson's remarks on the future inelasticity of income tax should be regarded. What the Chancellor actually said was as follows:

Under the new system which we have devised for pay-as-you-earn for income tax, there is a very elaborate machinery indeed to ensure collection of the tax at the proper rates. I doubt whether it would ever be possible in the future, so long as that system continues, to do what we have always been in the habit of doing in the past—that is to introduce changes in income tax, in the rates or the structure of the income tax, to come into effect immediately.

In the passage that contains these words the Chancellor was discussing the possibility of a Supplementary Budget later in the present year. He went on:

Therefore, if it appeared towards the end of the year that it would be possible to make an adjustment in the structure of income tax, there would, from that point of view . . . be a case for asking the House to address itself to that question, even though the actual changes might not take effect until the normal date, the beginning of the next financial year.

It may be, that is to say, that a reduction in the standard rate, or an increase in the allowances, will be announced in the autumn to take effect on April 6, 1946.

This device may serve for the present year. But it can hardly be repeated in a normal year, when the Chancellor can scarcely be expected to make up his Budget for the next financial year when the previous year is only half over. On the other hand, to accept the position that a whole year's notice must be given of any change in income tax would be to introduce an intolerable rigidity into the British fiscal system. Something will clearly have to be done to make PAYE more quickly alterable. Even with the present system it is not very easy to see why the rate of tax could not be altered on Budget Day, when the fiscal year is only a week or two old; such a procedure might involve a small amount of refunding of tax overpaid (if the change is a reduction) or of heavier deduction to catch up with the few weeks of deduction at the lower rate (if the change is an increase). But this is precisely the sort of adjustment that the cumulative system is well adapted to make, and if the tables were printed in advance, the change would be smooth. Changes in allowances would, admittedly, be more difficult, since they would involve the alteration of millions of individual codings. But the rate is the more important, since it alone affects the other schedules.

The one thing that should be clear is that rigidity cannot be accepted, since it would by itself more than offset any other contribution to full employment that fiscal policy can make. The ideal way out of the dilemma would be to invent a much simpler system of PAYE, which would not be difficult once the payment of allowances were separated from the collection of tax.

Adriatic Melting Pot

In recent weeks Trieste has passed through a period of tension and bloodshed. The city became for a short time the focus of all the accumulated antagonisms and political passions of the Adriatic coast. In the last days of April Marshal Tito's men captured part of the town; and they made no bones about their intention of incorporating it in Yugoslavia before any internationally valid decision about the future of Trieste could be taken. The Yugoslav threat of a coup on the Adriatic caused a political storm in Italy, where public opinion was mobilised in defence of

Trieste. Inside the city, and around it, there gathered the most unusual motley of partisans and military formations of all political complexions. The Croat Ustashe fought against Tito's men. Neo-Fascist bands were still holding out in one of their last strongpoints against Italian anti-Fascists. And finally General Mikhailovitch's Chetniks suddenly concentrated in the area between Trieste and Gorizia—their number was given as 20,000 to 30,000 men. Under these conditions, the clashes and skirmishes threatened to deteriorate into a mad fight of all against all.

The appearance of New Zealand troops at Trieste—"without Marshal Tito's permission," as a Yugoslav communiqué stated—may have angered the partisans, but there can be no doubt that the discreet intervention of the New Zealanders came just in time to arrest an ugly drift of events which might have ended in senseless slaughter. At present the tension around Trieste seems to have eased. Much political sense and tact will still be needed to control the tempers on the spot, to administer punishment to the real war criminals and to keep the quarrelling members of the various political parties and sects from leaping at each other's throats.

The Ghosts Go West?

The opening of the Nazi concentration camps has freed a varied group of statesmen and leaders whose return to active politics is likely to be of great importance for their countries. The reappearance on the French political stage of MM. Herriot, Daladier, Blum and Reynaud is certain to infuse new strength into their parties, which have so far lived in the shadow of General de Gaulle's political authority. The return of General Weygand is bound to affect the situation in the French Army. His record has certainly been less tainted than that of Marshal Pétain—after all, he is returning home as a prisoner of war. Will he accept General de Gaulle, or will he side with the Pétainist elements and defend his former chief, who is now committed for trial? Or will he perhaps become the link between Gaullism and Pétainism, and try to reconcile the two?

The freeing of Dr Schuschnigg may well complicate the inter-Allied controversy over the Austrian Government. Dr Schuschnigg was the last Chancellor of independent Austria. He was bullied and treacherously deprived of office by Hitler. From a rigidly legitimist viewpoint he might still be regarded as the Chancellor of Austria, prevented from exercising his prerogatives by force majeure. He is therefore a potential rival of Dr Karl Renner, whose Government has so far received support only from the Russians. It is, however, fairly clear that the return of Dr Schuschnigg would not be well received by most Austrians, who have not forgiven him the suppression of Austrian democracy in the civil war of February, 1934, and his suicidal coalition with Seyss-Inquart before the Anschluss.

Another prominent figure released from the concentration camps is Dr Schacht. He is now free to contemplate the ruins of the Third Reich, which his financial skill helped to build at an earlier stage. And there is, finally, General Bor Komorowski, the Commander of the Polish rising in Warsaw, who will perhaps be able to shed some light upon the military background of Warsaw's tragedy.

War Injuries

The recent case of *Kemp v. Minister of Pensions* raised an interesting and rather disquieting point in connection with pensions for "war injuries," particularly so far as merchant seamen are concerned. The facts are simple. The claimant was the widow of a merchant seaman who was knocked down and killed by an Army truck in Alexandria late at night in December, 1941. His ship was in dock in that port, and he was permitted off shore on ship's business and allowed to stay on his own. It was when he was returning to his ship that the accident took place. The widow's application for a pension was refused, and that refusal was upheld by the High Court.

The trouble arises because the expression "war injury" appears in two Acts, the Act which gives pensions to men in the Forces and in the Merchant Navy, and the Act that takes away from civilians their normal common law right of suing for damages where the injury was technically a war injury. "War injury" is defined in the Acts, but that definition is affected by the construction put upon it subsequently by the High Court, which very naturally has tended to give it the most limited meaning possible, since,

under one Act, it takes away rights at common law as well as, in another, conferring rights to pensions. The result is that the circumstances of the death of this seaman do not make it the result of a war injury. The position in which the widow finds herself is admirably summed up by the Pension Appeals Tribunal itself. If the deceased had been in the Navy, the Army or the Air Force she would have received a pension, for a member of the Armed Forces is always on duty. But at law a merchant seaman is still a civilian. A claim under the Workmen's Compensation Act would fail, as the deceased had stayed on shore on his own affairs when the ship's business was finished. And, finally, his widow has no hopes of sustaining an action for damages for negligence against the soldier driving the truck, since she has no means at all now of finding out what actually did occur in that blacked-out street in Alexandria over three years ago.

The facts disclose an unfortunate loophole in the Pension Acts. It is no answer to say that there can be very few merchant seamen who are killed in circumstances which give rise to no pension for their dependants. There is no evidence that that is so, and, in any case, it is a scandal if one case of failure to pay a deserved pension can arise under the statutes. An injustice does not cease to be an injustice simply because the number of people who suffer from it is small. One answer would be to alter the status of merchant seamen. Another would be to give the Minister of Pensions, or a small special committee, power to pay pensions in cases like these, where the pension is morally due but an unusual set of facts removes the case from the strict letter of the law.

World Trade Union Relations

At this moment of strained diplomatic relations among the United Nations, it is encouraging to hear that complete agreement has been reached between the leaders of the trade union movements about the constitution of their new international organisation. The draft constitution, which has just been adopted by the representatives of the trade unions at their meeting at Oakland, California, will be submitted to the various organisations which attended the London conference in February, and will be finally approved when the recalled world conference meets in Paris in September.

The proposed constitution, it is reported, provides for a World Trade Union Congress, which will meet every two years; an elected General Council representing all affiliated members; and an elected committee of seventeen members elected from the Congress. On this executive committee, Russia is to have three seats, Britain, the United States, France and Latin America two each, there will be three seats for all other European countries and one each for China, Africa and the Pacific. This arrangement has presumably been reached on the basis of numerical strength, for hitherto America, Britain and France have had equal representation on conference bodies with the USSR. The constitution also defines the basis for voting in the Congress, and the financial arrangements for membership.

It appears that agreement was not reached without a great deal of discussion and compromise; in particular, the question of the autonomy of individual trade union movements seems to have given rise to controversy, and to have been settled in accordance with the British attitude. Many other problems will arise before the new organisation can take effect. The question of Polish representation and of the trade unions in Communist-controlled China is likely to be raised by the Russians, while the position regarding the American Federation of Labour is extremely unsatisfactory. But if there is readiness to compromise and to concentrate on the common ground of agreement, there is no reason why such obstacles should prove insuperable. The establishment of satisfactory inter-union understanding may be an important factor in future international relations.

Verdict on the Land Bill

The Requisitioned Land and War Works Bill is at last through its Committee stage in the Commons, and will soon become law. The Bill was complicated originally, and it has been elaborately amended, but its aim is simple and reasonable enough—to recoup some of the taxpayers' money spent on temporarily requisitioned land, and to acquire such land where it is permanently needed for national use. The Government's repeated assurances that the greater part of requisitioned land will be automatically returned to its owners has not convinced Parliament that the land at stake

is unimportant. The Bill's central proposal—the creation of a Commission which will settle the terms of compensation or purchase between the requisitioning Ministries and private owners—is obviously sensible. But Parliament has been anxious to secure that the Commission shall be both strong and independent, and that the number of cases in which the Commission can be ignored or overruled shall be strictly limited. The main effect of the amendments is that the powers of the Commission are stronger and those of the requisitioning Ministries weaker than was originally intended.

One weakness in the Bill which remains is that each requisitioning Ministry will decide the desirability of purchasing or reselling land entirely on its own. Amendments have secured that the views of other interested departments and of planning authorities can be heard by the Commission. But it is odd, to say the least, that Parliament should need to spend time in backing up the rights of planning departments against those of requisitioning departments, and that in the end the independent Commission may be called on to balance their different claims. The Bill's drafters still seem unaware of any need of co-ordinating land use—even where all the land in question is to be publicly owned.

Parliament refused to give even the Commission a free hand where requisitioned commons and open spaces are concerned. After much debate, final concessions have been wrung from the Government which compel it either to provide an equivalent area of substitute land or, when this is not done, to submit its proposals to Parliament. The question of what constitutes substitute land will be decided by the Ministries concerned with open spaces, although what constitutes a common has not been satisfactorily defined. The degree of protection with which the Commons have defended public amenities is all to the good; but surely it should have been foreseen.

Emergency Powers

The emergency powers given to the Government in August, 1939, for the prosecution of the war can be divided roughly into two groups—those concerned with the defence of the realm and those enabling the full mobilisation of the

NYASALAND

THE territory, now known as Nyasaland, consists of a long narrow strip of country lying between Lake Nyasa and Northern Rhodesia, with Portuguese territory forming its southern border. It has a land area of over 37,000 square miles and in 1891 was constituted a British Protectorate. Since the construction of the great bridge over the Zambesi River in 1933, the country has had a direct rail link to the sea at Beira.

The population of about 1,700,000 is mainly engaged in agriculture. The fine quality of the tobacco, which is largely grown by the natives of Nyasaland, is well known. Tea has been grown on an increasing scale in recent years. Sisal, coffee and cotton are also exported in considerable quantities.

The average annual value of the external trade of Nyasaland for the years 1935/39 was approximately £1,600,000.

The Bank has branches at Blantyre and Limbe. Those concerned with trade in Africa, the Mediterranean or the West Indies are invited to communicate with:—

country's resources in materials and manpower. The second group are still essential because of the Pacific War, and Mr Bevin has given a reminder that industrial conscription, with all that it implies in the way of Essential Work Orders and control of engagement, is still in force.

The DORA powers, however, or at least a great many of them, are now unnecessary, and the Government took the only sensible course in revoking a great many of the regulations this week. Regulation 39BA, which made it an offence to spread "alarm and despondency," has gone. So have 2C, concerned with the publication of matter prejudicial to the war effort, and the obnoxious 2D, which allows the Home Secretary to suppress, without warning and without allowing an appeal, any newspaper printing such matter. The weather news has come back in its full glory; but at the time of writing it is not known what other topics are still censorable.

More important than the regulations giving power to suppress opinion, which have been very sparingly used—the *Daily Worker* and the *Week* were suppressed and the *Daily Mirror* warned—are the regulations affecting the liberties of British subjects. The war zone courts, which could be set up under the second Emergency Powers (Defence) Act of 1940, were not necessary, but the powers to use them are still there. But the fifty persons still detained without trial under Regulation 18B were released this week. This regulation has, rightly, raised stronger objections than any other regulation made during the war, but the Home Secretary could always defend it, and its administration, by the plea of military necessity. His promptness in releasing the remaining internees and in revoking 18B fully justifies those who gave him their support, however reluctantly, whenever his administration of his powers was attacked.

Holiday Resorts

Victory in Europe has come early enough in the year to set everyone thinking in terms of a summer holiday by the sea—a tonic that the country as a whole both needs and deserves. Unfortunately, the resorts—particularly those in the south and south-east—are in no condition to welcome the crowds that may descend upon them. Some are still encumbered by defence works; some have suffered badly from bombing and shelling; all are in need of repairs and renewals.

The work of rehabilitation is hampered by the acute shortage of labour and materials and by the impoverished finances of the seaside authorities. For four years these areas have been deprived of their chief means of livelihood as pleasure and health resorts and they are already heavily in debt. Moreover, there has been little progress so far in the derequisitioning of schools, hotels and camps.

In their extremity the resorts are appealing for more Government assistance. Some of the worst-hit authorities can already obtain loans from the Ministry of Health for local reallocation—in sums of up to £150 repayable over 5 years—among small traders and proprietors. And seaside caterers resuming business are being granted retail trade licences. How much more can be done to relieve the position in the next few months must depend on the supply of men and materials and the progress achieved in the housing programme, which has clearly first priority.

Even if they are not "at home" summer holidays, 1945, will certainly be makeshift. But the Government could greatly improve the prospects by releasing as many requisitioned premises as possible with all speed. At the moment derequisitioning is a fortuitous by-product of inter-departmental deliberations. It should be the special and urgent objective of a single department.

Forestry Needs

The clearest point which emerged from last week's debate in the Commons on the Forestry Bill was the need for a steady and continuous programme of tree-planting which will not be upset at any point by short-term financial considerations or by pressure from competing interests. Forestry can only be undertaken successfully on a long-term basis, which yields little in the way of quick returns. Too little attention to this elementary fact handicapped forestry policy between the wars, so that losses of woodland during the last war had not been made good by 1939. Shortage of timber has caused even more deforestation during this war, so that Britain's woodland has now shrunk to a million acres, of which most, as Mr Hudson remarked, are "either immature or second-rate woods or woods very thinly stocked."

This sorry and strategically dangerous situation has led the Forestry Commission to propose a minimum planting by the state during the next fifty years of 3 million acres, of which half would be planted in Scotland. Through no fault of its own, the semi-independent status of the Forestry Commission proved too weak for it to handle altogether successfully its much more modest inter-war task. Energy and continuity in forestry policy are now called for, which can only be obtained by placing the work of the Commission, as the Bill does, under direct ministerial control. The argument that the Minister of Agriculture should not be given the job is ill-founded. It is true that agriculture and forestry to some extent represent competing claims on limited land, but it would be hard to find a more suitable person than the Minister of Agriculture to balance their claims.

labour, thousands of men, and millions of pounds to build them; of great trading ships, laden with food for hungry men and women, sunk in thousands by the same device; of men taken from their homes and carried six hundred leagues over seas infested with these submarines, to fight in unknown jungles and uncharted deserts; of the million men and women carried into slavery by one of these great princes in the space of three or four years; of how they starved and toiled under the whips of their taskmasters; and how, when the prince who had enslaved them was conquered, they were turned loose without food or money or compass to find their way to the distant homes from which they had been rapt. I told him of how all the great cities of a country which had sixty million citizens might in two years be destroyed and brought to a heap of rubble and brickdust, in which the common people sheltered as best they could from weapons falling from the air; with no hope of ever having again a home to live in, a place to work in, or any food to fill their bellies, except what might be spared them by the charity of their conquerors. Their towns, I was careful to explain, are not now sacked as in former times, but—in the words of the prince who ruled them—smudged out.

When I had completed this part of my discourse my master interrupted me angrily. My tale, he said, was impossible, and I was surely trying to deceive him. This warfare of which I spoke must be so dreadful that no men rational enough to invent these weapons would consent to be drawn into it; and if the prince ordered his people to engage in it they would certainly refuse.

I was at first confused by this objection of my master's but, as bravely as I could, I answered him that it was due to his ignorance of humans, who might, as I allowed, to one unacquainted with them, be difficult to comprehend. I explained that, when a prince either by inheritance or by seizure of power controlled a nation, it was easy for him also to control their opinions of his subjects. Learning had increased among humans so greatly that every man, woman and child is able to read; and a prince could so arrange matters that they should not have an opportunity of reading any opinions except those that he desired them to hold. In this way, and helped by verbal messages which he can, with the help of his scientists, pass direct into their homes, he can persuade his people that though others will be destroyed by war, they will be safe. To some he will say that war will bring them great glory and profit; to others that there will be no war; to others, again, that they have only to trust him and they will swim in prosperity; to all he will at the last declare that their country is in danger, and their neighbours on the point of attacking them.

Though these things cannot all be true, almost every man will believe at least one of the prince's arguments, and so be reconciled to the dangers of his warlike policy.

Again my master interrupted me. If humans, he said, are as rational as you claim, why do they not join together and oppose such a prince as this? Have you no such things as alliances or treaties of mutual defence?

I exclaimed at once that alliances and treaties of friendship are very well known to us, and are in daily use. They are, above all things, popular with a powerful prince in the preparations of his plans for war; and there is no moment in the life of a small nation so dangerous as the day on which such a prince invites it to sign a treaty of eternal friendship. It is almost always an omen and a sign that the small country will next be invaded by the other party to the treaty. It is the shadow of the executioner's axe; and whenever it is known that a weaker nation has had to accept a treaty of friendship with a stronger neighbour, the wise statesmen of other countries will, for fear of being swallowed in the inevitable catastrophe, have as little business with it as possible, much as friends and neighbours shun the house of an acquaintance who is known to have contracted the plague.

But, said my master, how can these things continue? That the disaster may happen once if humans are fools and madmen, I can comprehend. But have they no memory? Do they not recall their sufferings and determine to avoid them in future? Can they not once they have suffered so arrange their affairs that warfare may hereafter be banned out of their lives?

I tried to explain to my master that the thought of war is seldom out of the minds of humans, telling him that while they are engaged in a great war, the two subjects which are most often debated by them are the date on which the present war will end, and the date on which the next will begin. They spend much time and labour and thought on devising councils and assemblies which may make the outbreak of war impossible, but as each man has his own favourite belief on how these matters should be ordered, much heart-burning is engendered by them; and it will often be found that such important business as who shall be invited to the assembly and who shall sit in this place at the table, and who at that, may, before the first discourse is delivered, have brought the men gathered together to establish perpetual peace to the point of blows and violence one against the other.

My master sighed and raised himself on his haunches—a sign of my dismissal. For your sake, he said, I hope your peacemakers may succeed. For my own, I am thankful to have been born a horse.—Yours faithfully,

LEADENHALL

Letter to the Editor

Gulliver, 1945

SIR,—Two hundred and forty years ago a ship's surgeon named Gulliver was cast away on an unknown island, which he found to be possessed and governed by an intelligent and virtuous race of horses; and there, being taken into the household of a leading horse, he was at pains, after learning the language, to inform his master of the life lived by humans in other parts of the globe. His master was astonished at everything, but most of all at his narration of the causes and results of war. Indeed, with the poor material at his disposal, Gulliver's description was well enough; and we who have behind us a long period of human progress which Gulliver missed must not despise his account of the intrigues of statesmen and the destruction of battle. We should remember that, when he spoke of war, he had in mind such local affairs as the Thirty Years War and the campaigns of Marlborough, fought by small armies without the benefit of big guns, machine-gun nests, bombers, tanks, rockets, submarines, flame-throwers, and propaganda. If Gulliver's generation had had the scientific and cultural advantages we enjoy, how much more effective would his conversation with the horse have been.

In obedience to my master's commands, so Gulliver's report of the conversation might have run, I told him of the

marvellous devices which our civilisation has put at the command of a great prince when he determines to go to war with any one of his neighbours; and how a prince of true foresight will in peace no less than in war encourage with rewards and honours every man of science to invent new weapons and perfect old ones. I told with pride of the great advance of learning under this encouragement, and of the inventions which the men of science have contributed to the better conduct of warfare. As well as I could I described the skill which these scientists have acquired in the working of metals and in the art of combustion. He must know, I said, that when once war has been begun between two nations, the citizens of either of them may at any moment be blown in pieces by the enemy even though they be three hundred miles away from the nearest battle; and if the improvement of human knowledge continues, they will soon suffer immediate and violent death as they sit in their homes three thousand miles away from the enemy. For example, a man might then leave his home in New York in the morning, and returning at night, find his wife and children dead from a weapon shot into the air at mid-day in Berlin—and that without his ever knowing that the war had begun.

I told my master of submarine ships which will destroy in a few minutes great ships of war that require years of

THE WORLD OVERSEAS

Poland's Managed Revolution

LAST Saturday, Mr Molotov informed Mr Eden and Mr Stettinius that sixteen Polish leaders had been arrested by the Soviet authorities and charged with "preparations for diversionary activities against the Red Army." Among the arrested are Mr Jankowski, the Vice-Premier representing in Poland the Polish Government in London, and three other underground ministers, as well as the Commander of the Polish military underground, General Okulicki. In addition, the Soviet authorities have arrested the representatives of the four political parties—the Nationalists, the Christian Democrats, the Peasants and the Socialists—some of whom had been recommended by the British and the American Governments as possible candidates for a new Polish Government, which was to be created on the basis of the Yalta agreement.

The wider political significance of this sudden Russian move and its implications in international policy are discussed elsewhere in this issue. What does the arrest of the Polish leaders mean in the context of Polish politics? How will it affect the outlook inside Poland? Almost simultaneously with the announcement of the arrest of the

Polish leaders, a plenary session of Lublin's quasi-Parliament, the so-called Home National Council, came to an end in Warsaw. The Ministers of the Lublin Government reported to the Council on their activities in the last few months; and those reports have thrown some light on the present social and political conditions inside Poland.

There can be no doubt that at the present time Poland is undergoing a process of virtual Sovietisation. In part, the upheaval seems to have sprung from internal Polish conditions. In part it is certain to have been caused by the inclusion of Poland in the "Russian zone." In many essentials the Sovietisation of Poland differs from the Russian prototype of 1917; in others, it resembles it fairly closely. The present state of affairs, as described by the Lublin ministers, can perhaps be defined as the Polish NEP. The New Economic Policy was the name given to the Soviet economic structure in the early twenties, which was a combination of predominant state ownership in industry, small private ownership in agriculture, and of mixed public and private trading.

The Lublin Minister of Industry and Commerce, Mr

Mine, stressed in his report that large-scale industry is being reorganised on the basis of complete public ownership. Private enterprise, he stated, will be allowed only in small industry. Paradoxical as this may seem to those accustomed to think of pre-war Poland as a normal "capitalist" country, no radical reforms have been needed to bring about this socialisation. Ever since its re-emergence as an independent state in 1918, Poland has suffered from an atrophy of private capital, and state enterprise has played an increasingly dominant role in its economy. Before the war the transport system was almost entirely state-owned, as was 70 per cent of the iron production, 50 per cent of metal manufacturing, nearly a 100 per cent of some chemical industries, and a very high proportion of the timber, coal and oil industries, quite apart from the large state monopolies of alcohol, tobacco, matches, salt, etc. Private ownership in large-scale industry was represented chiefly by foreign capital—the share of foreign capital was about 40 per cent of the total capital of all joint stock companies. It was nearly 50 per cent in mining and metal industries, 85 per cent in oil extraction, 60 per cent in chemical industries, and 85 per cent in electrical works. Polish private capital was pathetically squeezed in between the mill stones of public and foreign enterprise.

In the thirties, the public sector of industry was steadily expanded in connection with the building of armament industries and with the official drive against foreign capital. Under the German occupation, most of the Polish entrepreneurs were expropriated in favour of German companies and colonisers. The economic consequence of the extermination of the Jews, who had held a preponderant position in trade, was the utter disruption of any established private trade, too. Thus, a long succession of "organic" economic trends and of acts of dispossession and violence has very effectively paved the way for complete state control. True, there remains the problem of foreign investments in Polish industry. The members of the Lublin Government have so far made somewhat contradictory statements about their proposals for foreign holdings. Some time ago they stated that foreign investments in Poland would be welcome. Last week the Minister of Commerce intimated that "no private capital would be tolerated in large-scale industry." But no matter how the problem of foreign capital is eventually solved, the nationalisation of industry can be accomplished without the massive expropriation of a native class of capitalists carried out by the Bolsheviks in Russia.

The Land Reforms

In agriculture, the situation was very different. Here a root and branch reform has taken place. Under the land reforms, nearly 7,000 land-owning families, possessing more than 10 million acres, are being expropriated in the area to the west of the Curzon line alone—far more land than had belonged to the Polish aristocracy in eastern Poland was shared out among the peasants in 1939 to 1941. Of the 10 million acres only half will be distributed to landless peasants or owners of tiny plots—the rest has been taken over by the state. The fund of land available for distribution is far too small to still the hunger for land in the countryside. Even after the completion of the reform some millions of land-hungry peasants will remain, and the new small holdings—their standard size is 12½ acres—can hardly prosper, deprived as they have been of agricultural implements and cattle. As in Russia during the NEP, agriculture will need state credit, state guidance, and state-produced industrial goods. Some form of collectivisation or co-operation can be expected to take place sooner or later; and the technical conditions of agriculture—the need to replace animals by tractors—will demand it perhaps even more strongly than the collectivist bias of the régime. But even the reorganisation of agriculture on a collective or co-operative basis will not do away with rural over-population. The Lublin Government, therefore, treats the annexation of East Prussia and all the other German lands east of the Oder and the Neisse as part of its schemes for land reform. The annexed lands are to be used for the mass colonisation of the landless peasantry.

In the political field, the Lublin revolution has led to the formation of a completely new state apparatus. The old police, which was highly unpopular as a tool of the pre-war dictatorship, and whose record under the Nazi occupation was not very shining, has been disbanded and replaced by a Militia. The Militia is controlled by the Communists, and organised more or less on the model of the Soviet police. The Russian security police is active in

the background. Similarly, the new army is officered by new men drawn from the working classes, though it has also absorbed some of the elements of the old officers' corps, from which has come its Commander General, General Rola Zymierski, now promoted to Marshal. While the training of the new officers' cadres is still taking place, great numbers of Russian officers have been detailed as instructors to the Polish army. A similarly radical change in personnel is being carried out in most branches of the administration, which is based on the Committees of Liberation, the new version of the Councils of Workers and Peasants or Soviets.

It would probably be a mistake to attribute this upheaval entirely to Russian making. The years of the war and of Nazi occupation have brought a strong tide of Left wing radicalism all over Europe, and especially in Eastern Europe. If one can judge from the results of the recent elections in France and in Finland, two countries with a much more solid democratic tradition than Poland has ever had, Communism must have grown very strong in Poland too. Even before the war Polish Communism was never negligible. It had its ups and downs; and was at times, in spite of ruthless persecution, a very strong popular movement. The social unsettlement of recent years, and the attraction of victorious Russia, have undoubtedly imparted to it a new and great momentum. The entry of the Soviet army was followed by a quasi-spontaneous establishment of some sort of a workers' control over factories. The rising tide of radicalism has caused a crisis and internal split in the ranks of the Socialist Party, some groups of which have joined the Lublin Government. Even so, it is fairly certain that had it not been for Russian backing, the Communists and the factions attracted by them would not have been able to assert themselves against the combined forces of the old parties.

Prefabricated Revolution

The peculiar trait of the "revolution" that has been taking place in Poland has been its apparent lack of popular élan and its monotonously imitative character. No great battle of ideas and programmes has accompanied the upheaval. Poland is receiving the Soviet system in a ready-made authoritarian or totalitarian form, which has in Russia itself been the end-product of a long, painful and yet "organic" evolution. The prefabricated elements of that end-product are simply being transplanted to Poland together with all the fashions prevailing in Moscow to-day. Thus, the workers' control over production is now being suppressed in favour of the "authority of the employers," which presumably means the authority of the state organs. Strikes are prohibited and the Stakhanov system of premiums and widely differentiated wages is being started in Poland, together with the fight against the "reactionary demands for the equalisation of wages." The rehabilitation of the Orthodox Church in Russia has its counterpart in Lublin's rather ostentatious coquetterie with Roman Catholicism. Russian Communism pays tribute to Peter the Great, Ivan the Terrible, and to the legendary warriors of Russia's remote past. Polish Communists, too, link up the threads of a remote nationalist tradition which leads back to Poland's first dynasty, the Piasts, whose kingdom had spread westwards to the Oder. And, last but not least, there is the absolute, tedious and unnatural unanimity in all votes, decisions and resolutions. The picture of this managed revolution is completed by the fact that the Committees of National Liberation, the National Councils, and all the other institutions that form the fabric of the new régime, have been called into existence by appointments from above, not by popular election. The Polish "Soviets" are an imitation of the Russian models of 1945 rather than those of 1917 to 1920.

The position of the old parties is extremely difficult. The Lublin Government has rather stolen their thunder. Public ownership of industry was a plank in the Socialist programme, and land reform of the Peasants'. The Lublin Government poses as almost more Catholic than the Christian Democrats, and as more nationalist than the Nationalists themselves. What is still effective in the programme of the old parties is their struggle for national independence, which has lost little of its meaning—though the Lublin Government has succeeded in persuading quite an important section of the educated classes that it, too, stands for Poland's independence. The old parties also struggle for the survival of the party system against the single party régime which is already striking roots. The arrest of the sixteen Polish leaders is an ominous sign that Poland's *Gleichschaltung* to a single party system is proceeding apace.

Denmark Looks Back

DENMARK was for five years and a month an important sector of Germany's totalitarian war economy; but at this moment of economic chaos in Central Europe, it can resume at least a measure of independent economic activity. Fundamentally, Denmark's economy comes out of the war largely intact. There has, however, been some change in the relative importance of the different branches of economic life, and a period of readjustment will be necessary.

During the five years of occupation, Denmark's economy went through several distinct phases. The first phase, which ended roughly in the middle of 1942, was marked by the gradual exhaustion of the stocks of agricultural and industrial raw materials imported from overseas. During this phase direct German interference was slight, although Danish exports were monopolised by Germany. From June, 1940, to June, 1942, the total number of pigs decreased from 3,218,000 to 1,141,000, that is by 65 per cent. The reduction of poultry was even greater, and it seemed at that time that Denmark's most important export industry would be completely ruined. But the cattle herds, which numbered over three millions at the beginning of the occupation, suffered only small losses. Before the war Denmark's large livestock industry needed, on an average, annual net imports of more than 600,000 tons of cereals, and roughly 800,000 tons of oilcake.

During this phase of wholesale slaughter of pigs and poultry, Danish farmers, organised in highly efficient co-operatives, were forced to expand the area under cereals and oilseeds, while the area under root crops, particularly potatoes and sugar beet, was maintained at the pre-occupation level. From 1942 to 1944, that is, the phase of expanding arable land, cereal harvests increased, and the prospects for the 1945 harvest are reported at the moment to be good. This is a considerable success for the highly efficient Danish agriculture. It cannot, however, be doubted that the land has been worked to the utmost, and, especially during the 1944-45 season, without adequate supplies of fertilisers, which could no longer be imported from Germany. But the actual production of fodder was sufficient for a considerable increase in the number of pigs during 1943, and at the end of 1944 the number of pigs had reached roughly two million, or double the number in June, 1942.

At the end of 1944, there were signs that the farmers' efforts could not prevent a general deterioration in economic conditions. German demands for foodstuffs increased, the shortage of fodder became acute, and this time a heavy slaughter of cattle could not be avoided. This is how Danish agriculture stands at the moment of liberation. If the harvest of cereals and root crops yields an output equal to that of 1943 and 1944, food supplies for the Danish population will be secured, and will be the highest on the whole continent. The rations were comparatively high in the last five years. The bread ration was higher than in Germany, the sugar ration was twice as high as in Britain, and the fat ration was 40 per cent higher than the British ration. As soon as shipping tonnage is available for imports of fodder and fertilisers, Denmark could in a very short time resume exports of bacon, butter and eggs on a large scale. There is no doubt that Denmark could then play an important part in preventing starvation in other parts of the Continent.

Industrial Difficulties

This, however, is only one side of Denmark's economic situation after five years of occupation. A return to full agricultural production demands that industrial activities should be brought back to the pre-war level. But industrial problems are more difficult. Since January of this year Denmark has received no coal from Germany. Before the war the average annual imports of coal and coke amounted to about 6 million tons. During the last three years of the war Germany supplied annually some 3 million tons of coal and coke. The balance was covered by peat and brown coal. The output of peat increased from 400,000 tons before the war to roughly 6 millions in 1944, and the production of brown coal reached some 2½ million tons against 20,000 tons in 1938. The cutting of peat and the mining of brown coal absorbed a relatively large number of workers, and can hardly be maintained for a long time. Coal and other fuel are badly needed in agriculture, especially if the large acreages are to be maintained. At present

fuel, gas and electricity are severely rationed, and without imports of coal and coke industrial activity cannot be increased, while railway transport will have to be reduced. Moreover, the Danish resistance movement concentrated on attacking the railway system—it is said that 753 attacks were made on railways during the war. Motor transport has also been considerably reduced. Out of a total number of motor vehicles of 190,000, not more than 20,000, mostly lorries, were still on the roads when the occupation ended, and these were driven by generator gas. Before the war annual imports of petrol, kerosene, and fuel oil amounted to roughly 900,000 tons. Without adequate coal and oil supplies transport, industry and agriculture cannot resume full activity.

Manufacturing Changes

During the occupation 50 per cent of fuel consumed was covered by domestic supplies, whose production was largely responsible for the high index of industrial activity; but it was an extremely wasteful use of labour. The Danish manufacturing industry, which was largely employed on German orders, shows even more profound changes. The famous Danish silverware industry changed over to the manufacture of steel and metal goods. The shipping industry was engaged more and more on the construction of wooden ships for Germany. The bicycle industry, on the other hand, came practically to a standstill, and all civilian industries were severely restricted either under German pressure or because of a lack of raw materials. The supply of home-produced wool and artificial fibres amounted to a small fraction of pre-war supplies of cotton and wool from overseas. New processing and manufacturing methods for using inferior hides and fish skins demanded more labour. Engineering capacity and raw materials were diverted to the manufacture of generators, which were used not only for motor-vehicles, but also for stationary engines in agriculture. Lastly, growing numbers of workers and much valuable material were diverted to the construction of fortifications. More and more, the available supplies of manpower, materials and industrial capacity fell short of the demands. Sabotage wrecked a number of important industrial buildings and factories; and, above all, industrial plant, factories and railways have been stretched to their full capacity without undergoing repairs and renewals. The new steel works, with an annual capacity of 40,000 tons, will come to a standstill without fuel. The overall picture is, in fact, of an industrial capacity, largely intact and unimpaired by bombing, but badly in need of reconstruction.

The most serious loss sustained by Denmark's economy is the reduction in the shipping tonnage. The actual loss appears to be about half the pre-war tonnage, which means that without foreign assistance imports must remain small for some time, even if coal, oil, cereals and oilseeds are available in the countries of production.

Although the material damage is slight, the actual loss of productive capital is proportionately high. For years, exports have exceeded imports, whereas before the war there was an import surplus. Revenue from shipping services has fallen, and the costs of occupation have had to be paid either in material or in labour. The accumulated clearing credit and the various enforced contributions to Germany's war economy are large, and may have risen to about Kr. 8,000 millions at the end of the occupation, which is slightly more than the present nominal national income. This debt is at the moment a dead loss. Nevertheless, the fact that its economy is largely intact gives Denmark a unique position in the economic reconstruction of the Continent.

THE BUSINESS WORLD

Liquidation of War Contracts

ONE of the most difficult of the many tasks that now clamour for Government attention on the economic front is the working out of plans for the orderly liquidation of war contracts and the establishment of flexible machinery to ensure that such plans can be carried through with the minimum of friction and red tape. The formulation of even the initial arrangements is bound to take some time, and their eventual form must certainly be governed by actual experience of negotiations with contractors. Meanwhile, it is of prime importance that Supply departments should not plunge into wholesale cancellations or, indeed, take any major steps to curtail war production until their policies can be adequately co-ordinated with those of the departments responsible for planning the rebuilding of civilian industry. The attention that has been given in the past year or so to problems of postwar employment ought, on first principles, to provide a substantial assurance against precipitate action. But experience of the working of the Government machine at times of major change and great pressure suggests that policies evolved and recognised in general terms at the highest levels are not necessarily a sure guide to detailed action at the periphery—not, that is, until they have been reduced to practical workaday plans for the guidance of officials in all departments and at all levels.

A more reliable assurance against undue haste comes from the continuance of the Far Eastern war. The Chancellor's Budget estimates indicated that the end of the war in Europe was not likely to lead immediately to any really spectacular reduction in Government demands. The effective reduction may, however, be more substantial than he had in mind, especially in that part of the expenditure which directly affects the home market. The cease fire has apparently come somewhat sooner than the date—"some time in the early summer"—assumed for the purpose of budgeting; the Chancellor's estimates, even on that assumption, were admittedly conservative; and it seems reasonable to suppose that the underlying Service department programmes were even more so. Those departments, however complete their forward planning, may now be expected to take stock of the position afresh. But until the stocktaking is complete, the departments responsible for supply are likely to adopt a cautious attitude, at least in those directions in which it is not already clear that there will be large surpluses of productive capacity on any hypothesis of military requirements.

In some directions, indeed, the real danger in this second phase of war may be, not that the Supply departments will act too hastily, but that their tactics will be both too timid and too rigid. Subject only to the need for dovetailing the curtailment of war industry with the re-expansion of civil industry, it is clearly desirable that the curtailment should proceed as rapidly as military requirements permit. That is so obvious a fact that it might easily become the basis of popular clamour, or of action by pressure groups, for release of war capacity or curtailment of war expenditure without sufficient regard for either orderliness in transition or military needs. There is no doubt that official propaganda will be directed towards ensuring that this does not happen. But it is greatly to be hoped that fears of this kind will not force the war production departments into a defensive role. It may well be thought that the major task of such departments is done, or shortly will be. But the truth is that, if they manage well and wisely, they can play much more than a negative part during their liquidation phase. They are the departments of Government which have been in intimate contact with industry for the past five years and more; they know the extent to which its structure has been distorted by war; and they are in a position to appreciate—perhaps better than the "post-war" departments, and certainly better on matters of practical detail—its reconversion needs. So far as the war industries are concerned, the key to smoothness in transi-

tion is in the hands of the Supply departments, no matter where the constitutional responsibility may lie.

In the pursuit of their primary task, these departments will have the support of the Government directive, long since both public and unequivocal, that until the final V-Day the Far East war will have first claim on the national resources. But it is of first importance that this directive—which in VE-Week has found unqualified and universal approval—shall not be narrowly used simply to maintain the paramountcy of war production and of the departments responsible for it. The task now is to meet all Service and other war requirements, not only with speed and efficiency, but subject to those overriding needs with minimum obstruction of the transition to peacetime production.

This principle is the only proper basis for Government policy in the termination of war contracts. It postulates a highly flexible and discriminating policy, and will require of the production departments not only an accommodating attitude towards the pleas of the "postwar" departments, but a positive initiative of their own. The attitude of different industries, and of individual firms within them, towards cessation or curtailment of war orders will vary widely. Four main categories will perhaps be distinguishable. There will be some firms that will expect to be able to resume peacetime production at an early date. There will be some who know that their suppliers or customers will be otherwise occupied for some time ahead, or who have reason to think that their normal production will rank low on the Government scale for release of scarce materials, and who, accordingly, will be anxious to keep their wartime orders. A third group will be undecided, and will want maximum flexibility in their Government contracts; while a fourth group will welcome some curtailment, but would deplore a complete or sudden withdrawal. As their requirements contract, the Supply departments will have a greater choice of capacity than they have ever had before. If their choice is made simply by reference to their own convenience, it is certain that their policies will cut right across these differing needs of industry. An indiscriminating technique might, from the point of view of employment, be hardly less disastrous than precipitate cancellations would be. Firms might be released who had no prospect of early resumption of civil work, and firms retained who could not only have changed over rapidly, but whose re-establishment was a condition precedent to the re-establishment of others.

To operate a fully discriminating policy will, admittedly, be no easy task. The needs of individual firms, even of individual industries, are in themselves of only secondary importance; they are of prime significance only if they conform to the Government's master plan—which has yet to emerge—for postwar priorities. Each individual claim will need to be vetted and tested by reference to this plan. Moreover, it is clear that the departments will be subjected to a babel of conflicting pleas from all sides. It will be impossible to satisfy everyone. In particular cases, military requirements or peculiar conditions of production may leave little scope for choice, and may compel departments to override even important reconstruction objectives. In other cases it may be necessary to curtail orders rapidly even though no civil work is in sight for the capacity thus released. The detailed administrative task will be one of huge complexity, and may tax to the utmost the resources of the officials directly involved. Departments will inevitably be pre-occupied with these and similar difficulties in the coming months; what is important is that their consciousness of them should not be allowed to stampede them into abandonment of rational principles simply because they know that the theoretical ideal will not in practice be wholly attainable.

Second only in importance to the orderly planning of production curtailment is the question of the adequacy and

flexibility of the actual termination conditions in the contracts themselves. The notice that must be given on termination varies according to the type of supplies involved, but the norm is generally understood to be three months or slightly less. Subject to this major variation, the bulk of direct contracts are governed by a standardised "break" clause—from which, at certain points only, the Admiralty deviates for shipbuilding contracts and the Ministry of Aircraft Production for certain aircraft and engine contracts. The general clause requires contractors to impose parallel "break" conditions upon all substantial subcontractors, so that in theory virtually the whole of war production is governed by the same basic structure of termination provisions; but it is not certain how far this requirement has in fact been implemented by contractors and subcontractors.

To analyse the implications of what are necessarily somewhat involved conditions lies beyond the scope of a first survey of the liquidation problem as a whole. But it can be said at once that the smooth application of the clause will depend very largely upon the understanding and flexibility with which it is construed by the departments themselves. On such vital but debatable matters as the extent of the liability of the contracting authority to indemnify a contractor against "commitments, liabilities or

expenditure reasonably and properly chargeable" to the contract, there is clearly room for discretion, since the contractor must "satisfy" the authority that these would otherwise represent an "unavoidable loss." Moreover, this indemnity provision, together with that for "hardship" pleas—which is wholly a matter for departmental discretion—is placed outside the arbitration clause. The whole question evidently bristles with opportunities for prolonged and intricate discussions. In the generality of cases, these must be avoided at all costs. But the danger to be guarded against is that the need for speed and relief from administrative pressure may lead to the use of rule-of-thumb formulae in cases in which discretion can and should be exercised. One means of minimising these difficulties may be to distribute the curtailment of production in such a way as to allow contracts to run their course wherever possible, and thus reduce recourse to the complicated "break" provisions. Fortunately, the extended use of the liberal progress payments system in the past makes it improbable that delays in settlement will, in the majority of instances, seriously aggravate the problem of financing industrial reconversion. But this is a matter that will need to be closely watched, both by the Government and the banks. If real trouble arises, there may be need for joint action to devise special financial facilities.

US War Loan Drive

(From Our New York Correspondent)

THE Seventh War Loan Drive marks a new phase in war finance, with an attempt to restrain undesirable practices which have grown up in the past. The drive opened on April 9th with the offer of the non-marketable issues that are designed to tap workers' pay-packets at the source; the active general campaign will follow from May 14th to June 30th, and all securities paid for by July 7th will count towards the goal of \$14 billion. The emphasis in this new drive is upon personal subscriptions, as distinct from institutional; the target for the former is \$7 billion, compared with the \$5 billion at which the Sixth Drive originally aimed, but actually exceeded by \$900 million. Steps have been taken which, it is hoped, will substantially curtail the practices known as "free-riding," which was especially marked by non-banking corporations, and "high" interest borrowing.

The practices now deemed undesirable have, indeed, arisen from what, until now, have been two fundamental features of the system of war finance. The first is the rigidity of the interest-rate structure adopted by the authorities at the outbreak of war as the basis on which borrowing would be done at least for the duration. The interest scale starts with rates of $\frac{1}{8}$ per cent for 3-month Treasury bills and rises in steps to $2\frac{1}{2}$ per cent for 22-27 year issues; the three-month rate is officially pegged, and the others are maintained within a narrow range by official market intervention when necessary. The second feature has been the incompleteness of the rules designed to minimise the recourse to bank credit creation. New Treasury issues (except bills and refunding issues) have been offered only to others than the commercial banks; but subscribers to all but the long-dated issues have been free to resell to anyone, including the commercial banks, after a short period. Moreover, the banks have been kept supplied with excess reserves so that they could and would take up any surplus issues.

The practical result of this system has been that non-banking corporations and individuals who subscribed for new securities could, if they held them for a short time until the maturity shortened, and the price consequently rose (as, in market jargon, the issues "rolled down the curve") then sell them to the banks at a useful profit. If the subscription was financed by borrowed money, an interest differential could often be obtained, between the coupon on the issue and the rate charged by the bank, and this differential, with the profit on re-sale, gave a handsome return on the equity stake put up by the subscriber. Even without the leverage of borrowed money, a return of something like 3 per cent per annum, or even more, could be made by buying the 2 per cent issues, holding them a few months, and then selling them at half a point premium; with two Drives a year this made possible two operations with the 3 per cent return—and sometimes the return

was better than that. This could be done even while the highest rate paid by the Treasury was $2\frac{1}{2}$ per cent on the longest maturities, and could be done with "investments" with a maturity of 10 years or less. Even on shorter-term issues than the 2 per cent's, the coupon return could be somewhat increased. The authorities did, however, try hard to prevent the more flagrant abuses by "policing" the subscriptions, and met with considerable success.

"Why I read The Yorkshire Post"

"My first need is for information. But it must be accurate, well balanced and unbiased information, giving all the facts, clearly and concisely, and holding nothing back. That is why I read 'The Yorkshire Post.' It tells me things essential for me to know about the teeming, industrial North, where life, and people, are a little different from those in the part of the country where

I myself live. I am especially interested in the North's political life; and in 'The Yorkshire Post' I find that political comment is scrupulously just and fair, even to those 'on the other side of the fence.' I find I get an all-round vital, well balanced and unprejudiced picture of the North as a whole and that is what I need. "It seems to me so important what one reads nowadays."

The Yorkshire Post

Voice of the North

This practice of "riding down the interest curve" was even enlisted by organisers of the loan Drives themselves. A regional organiser who found difficulty in placing his quota of securities could entice a few wealthier individuals or corporations to "take a ride" and thus get the quota met. In the shorter term issues this quota "riding" was, indeed, frequently on a pure "accommodation" basis, designed simply to meet the regional target, but without any profit to the operator.

But these operations, whether for profit or accommodation, had the same eventual result: securities recently offered, or offered earlier and now showing marked appreciation, presently appeared in considerable volume among bank assets. And the banks' appetite was maintained, not only by the availability of ample excess reserves, but also by official assurances both that the interest curve would be maintained (which was, in effect, a guarantee that they would not suffer market depreciation even by taking maturities formerly considered outside their proper range) and that they would be free from examiners' criticism for holding government issues.

The results of this situation were that, whilst the Treasury was ostensibly selling virtually all its securities outside the banking system, bank holdings were in fact rising by an amount equal to about one half of the new financing. Moreover, a high proportion of the issues going to the banks were 2 per cent issues. And bank earnings were (and are) rising at a rate and reaching levels which evoke considerable criticism.

To restrict these market practices, the Treasury in this Seventh Drive is offering only the non-marketable securities (E, F, G and Savings Notes); long term 2½ and 2½ per cents, which cannot be bought by the banks for a number of years; 1½ per cents which (with minor exceptions) can be subscribed only by individuals; and ¾ per cent certificates. Fiduciary institutions have been officially requested not to sell present holdings in order to buy new issues. Thus, except for the certificates and a probably small portion of 1½ per cents, there is nothing that can move into the banks. And if previously acquired issues are, in fact, sold to increase the subscriptions in this Drive, and for the appreciation now shown on such holdings, it will be the last time that this can be done. As already noted, the quota for individuals has been substantially increased, and that for non-banking institutions sharply reduced; whilst the period for individual subscription to the non-marketable issues has been greatly lengthened.

The new policy has already had repercussions in the market. Ever since the turn of the year there had been

rumours of some such measures, with suggestions that the highest coupon issue to be offered would be 2½ per cent. The result was a bull market in outstanding unrestricted issues and in the 2½ per cents. With the announcement that a 2½ per cent issue would be available after all, these fell back somewhat, though they still command a substantial premium, for it is now suggested that the new 2½ per cent issue will be the last issue of its kind. The 2 per cents sold in the Sixth loan at the end of last year are approaching a 3-point premium and other free issues are strong.

Strength in Government securities has spread to the market for corporate issues. New issues of long-dated public utility bonds—30 years and over—are being sold to yield 2.65 per cent to 2.70 per cent, and some outstanding issues have risen to yield 2½ per cent or less—which is parity with the Government yields. The high-grade preferred stock market is at or near a 3½ per cent level. These trends are expected to stimulate the refunding of a large amount of corporate issues now outstanding, and to produce a change in the yield basis of mortgages, and perhaps of common stocks, too.

If the new level now being established is maintained, it will naturally involve a reduction in the income of insurance companies and saving banks, the universities, and other groups to which investment income is significant, with a consequent increase in cost of their services. It would also involve, eventually, a readjustment of capital values in general, and may already be a factor in the rising trend of land prices. The gentle rain of lower interest rates falls on all alike.

While it may solve some problems, the new policy raises others. The rise in capital values has already so concerned Mr Eccles, the chairman of the Federal Reserve Board, that he has proposed a special tax to try to restrain it. Some are disturbed, too, about the implications of the restriction of negotiability of government issues which is implicit in the request to fiduciaries not to sell their holdings.

And, just at this point of development with the many questions which it raises for the future, another major uncertainty has come into being. What does the death of Mr Roosevelt mean to those who have been responsible for the formulation and operation of monetary policy in war finance thus far, especially Mr Morgenthau, who was an intimate of the late President? The theory has long been prevalent that the forces and arguments for easy money are so powerful that the policy would certainly be continued regardless of personality—and also regardless of the end of the war. We shall presently see whether this theory is to be validated by events.

Business Notes

Fall in Equities

Monday was a bad day for the "bulls." The news of the arrest of the Polish representatives from London; the Russian announcement of a new Austrian Government, without prior consultation with the Allies; the talk of a General Election in June or July; and, last but not perhaps not least, the probability of a two days' holiday, caused jobbers to mark down most prices sharply. Partly, no doubt, because of this marking down there was a steady trickle of small selling orders until fairly late in the session, when a firmer tone developed. The net result is a fall of a point in the industry share index of *The Financial News* to 116.0, as compared with 118.5 a week before, the highest since 1936, and with 100 for July 1, 1935. Actually this attracted less attention than a drop of ½ to ¾ points in the whole range of Government stocks. Almost every section was definitely weak with the exceptions of some Kaffirs and virtually all Far Eastern securities.

The only new element in the situation was the further evidence of differences between the Anglo-American Allies and Russia, and it was to this that the new weakness was attributed. Insofar as this element in the complex of causes determining prices is concerned, it is probable that the fall in quotations will be short lived. For the rest, it seems not improbable that there is at present a tendency to over-emphasise both the political risk, so far as most companies are concerned, and the general effects of such movement towards increased liquidity as may occur. When the markets re-opened on Thursday, there was a widespread feeling that little serious attention would be

given to investment business until Monday at earliest. There was some buying of "Internationals" and of some gold-mining shares, but prices in other sections tended to sag.

British Meet French Industrialists

Business contacts between Britain and France are gradually being re-established. The trade unions of the two countries resumed relations soon after the liberation of France; an exchange of views between employers' organisations has been delayed by the dissolution of the Confederation of French Employers in the summer of last year. For some time French industry was without a central organisation; the need for some body able to represent industry in discussions with the Government about prices, wages and working conditions has led to the creation of a new central organisation, the *Commission d'Aide aux Entreprises*, composed of paid executives rather than of owners. In addition to this body, another new organisation has been set up to represent the employers of small and medium-sized firms. A delegation of these new organisations has been in London this week at the invitation of the Federation of British Industries.

The discussions held between British and French industrialists were mainly in the nature of an exchange of views; more could hardly have been expected at a first meeting. Nevertheless, the resumption of contacts was not without significance. It was recognised in discussions that, fundamentally, British and French industries have many problems in common (such as the need for exports and for an increase in productivity), that their interests are

largely identical, and that, in consequence, closer co-operation is likely to be of advantage to both countries. Both sides felt that the possibilities of co-operation should be examined jointly in detail as a first step towards the closer integration of the economies of the two countries. Although the scope for co-operation will inevitably be conditioned by the policies of the governments of the two countries, much will depend on the ability of British and French industrialists to appreciate the advantage of a division of labour and on their willingness to accept its implications. Those are questions that remain to be answered.

BIS Swan Song?

The fourteenth report of the Bank for International Settlements, which has just been published, may well be the last, or at least the penultimate, of the familiar annual surveys by the bank. The Bretton Woods plans, including that for the International Reconstruction Bank, naturally envisaged the winding-up of the BIS. That the high hopes which some were disposed to build upon its formation fifteen years ago have not been realised is certainly no fault of the bank. As it is, it has had in some spheres a useful, if unspectacular, career. Indeed, were it not for the virtual certainty that the new institutions will be equally assiduous recorders of the trends of international finance, the passing of the BIS, when it occurs, would be a matter for real regret.

The latest survey has all the thoroughness of its predecessors. Despite the extensive black-out on the statistical front, it brings together a great mass of data on international finance and trade for the period 1943-44. In view of the difficulty of collating diffuse material in these days, the value of the BIS compilations is hardly diminished by the fact that, in detail, the statistics they present are in most cases already available separately elsewhere. This is not always true, however, of the data on enemy countries: the tables showing the accumulation of indebtedness on German clearing accounts, and payments to Germany by the former occupied countries, are especially valuable. This analysis of German external finance is part of a survey of the course of the three main international capital streams during the war—the other two being British disinvestment, and mutual aid and lend-lease. The related tabulation of Latin American trade balances shows how it has happened that record US exports have been associated with the first "cash" import surpluses (i.e., excluding lend-lease) since 1893 and with a progressive decline in US gold holdings.

In the chapter on foreign exchanges there is a useful account of the exchange and currency arrangements made last year by the Allied forces, or repatriated Governments, in liberated territories. Other noteworthy material includes tables of relative birth-rates; price movements; bank deposits and note circulations (with secondary analyses of their relationship to national incomes); and surveys of gold production, gold prices and the growth of internal governmental indebtedness.

Women in Engineering

Details can now be given of the survey conducted by the Amalgamated Engineering Union (referred to in *The Economist* last week) which indicated that the majority of women who had entered the engineering industry during the war wished to remain in it in peacetime. The questionnaire was actually sent to 26,000 women members of the union, but only about 7 per cent replied. The results of the survey therefore cannot be taken as representative of the attitude of women in the industry in general; nevertheless the 2,000 who replied represented a broad cross-section and their replies indicate a significant trend.

An analysis of the survey shows that two-thirds of these women said they wished to remain in the industry after the war, and that the desire was greater among older than younger women, and in the Midlands area than in London or the North. Of the 21-26 age group, 57 per cent wished to stay on, compared with 66 per cent between 26 and 35, and 81 per cent of the women between 41 and 50. The percentages were highest in Coventry and Birmingham, with 77 and 76 respectively, compared with 63 per cent average for London, 63 per cent for Manchester and only 50 per cent for Glasgow.

Only 19 per cent of the women who replied had been in

engineering before the war. A high proportion had been in domestic service, and it is significant that as many as 78 per cent of these ex-domestic workers wished to stay in engineering, whereas the proportion was only 38 per cent among former blackcoated workers. A third of the women who replied were married women, and as many as 79 per cent of the married women who had no paid occupation before the war expressed a desire to continue in industry.

Two interesting facts were revealed incidentally by the inquiry. One is that the earnings of women directed into industry tend to be higher than those of women who had been in it before the war, 31 per cent of the former were earning less than 1s. 6d. an hour, compared with 48 per cent of the latter. Another is that long hours were being worked at the beginning of this year, when the inquiry was conducted. The average was about 50 hours per week, though a number of women worked 60 hours and over.

The AEU is to be congratulated on its initiative in undertaking this inquiry, which obviously has a very direct bearing on postwar employment problems. It is a pity that it did not cover a larger number of women and it would be extremely interesting to know the results of a similar survey which the Ministry of Labour is said to be conducting on a much larger scale.

One of the most urgent problems raised by the desire of women to remain in industry is that of the relation between men's and women's wages. Many of the women questioned by the AEU prefaced their remarks by saying . . . "provided they were not used as 'cheap labour.'" An interesting sidelight on the question of "equal pay" in engineering is thrown by another unofficial survey, conducted by the National Shop Stewards' Council. This body surveyed the earnings of 30,643 women in 58 factories, and found that 6,010 women were replacing men and 6,475 women were on the same work as men, yet only 2,050 were receiving the full men's rate.

There are clearly a great many anomalies in the position and it seems difficult to determine the "rate for the job," whether it is performed by men or by women. It is to be hoped that the Royal Commission on Equal Pay will lay down certain criteria to guide employers and the unions.

Bank Window-dressing

Whether or not the Cohen Committee makes any specific recommendations on the form of published bank accounts, it is greatly to be hoped that the banks will conform to the trend towards greater clarity and frankness in company accounting in general. The very least that might be expected, when present depleted staffs are replenished, is that all clearing banks should adopt the "Cunliffe" model balance-sheet that has been the basis of the accounts of several of them for a number of years. That would afford useful additional information on the banks which at present employ the less extended statement, and would be a first step towards standardisation. It would, perhaps, be naive to suppose that any possible post-war improvements are likely to include the adoption of a suggestion made in these columns some time ago—that the banks should include in their monthly statements a marginal note of their daily average or "undressed" cash ratio. When that suggestion was made, it evoked an unofficial comment that *The Economist* was crying for the moon, that what it was really asking for was an abandonment of the whole practice of window-dressing, since it was absurd to dress the window and then reveal to the public the undressed window as well. Certainly, the suggestion was that window-dressing should be abandoned, and it was hoped that marginal publication of "true" cash ratios would eventually have that effect. But the window-dresser's retort about absurdity does not really dispose of the suggestion, since the absurdity already exists. Ever since the Macmillan Report and the subsequent public issue each month of the Bank's Statistical Summary, including figures for clearing banks' till money, it has been possible to estimate, with tolerable accuracy, the undressed volume of bank cash. *The Economist* has published such estimates at regular intervals since 1942. It will continue to do so, in the hope that the availability of the two figures, the dressed and the undressed, will eventually have its effect on the practice itself.

The latest estimates, based on the Bank of England

"Summary" for March, cover the first three months of this year. They are shown below, with comparative figures for the similar period of 1944:

	Clearing Banks' Cash (£ million)		Published Ratio	True Ratio	Window- dressing Index*
	Making-up Days	Wednesdays			
1944					
January . . .	416	332	10.5	8.4	20.0
February . . .	414	315	10.6	8.1	23.6
March	423	323	10.6	8.1	23.6
1945					
January . . .	460	368	10.3	8.3	19.4
February . . .	455	331	10.3	7.5	27.2
March	464	346	10.4	7.8	25.0

* Difference between true and published ratio expressed as percentage of the latter.

The volume of window-dressing here indicated has in each of the last three months been less than in the last quarter of 1944. It is premature to assume, however, that this represents the beginning of a return towards the much lower figures that ruled before the war, when the "index" normally stood below 10 per cent. Not only were the figures abnormally high in the last quarter of 1944—the index ranged from 27.9 to 30.0 per cent—but there is normally some recession in the first quarter of each year. The latest evidence points rather to a continuation of the upward trend.

US Manufacturers on Cartels

At a meeting on April 30th, the Board of Directors of the American Association of Manufacturers passed this resolution against cartels and international economic controls:—

The National Association of Manufacturers stands squarely against cartels of every description, both private and governmental. . . . It has opposed and will continue to oppose every attempt to restrict freedom of opportunity and freedom of competition in our domestic economy. . . . The United States Government should take the lead and seek to promote voluntary agreements with other nations to prevent the formation or operation of international cartels and should seek the abrogation of those already established.

There is nothing in the cabled reports of the resolution to suggest that the Association has recommended a reduction in American import duties which would contribute generally to an expansion in world trade. But it specifically asked that, pending the abrogation of cartel agreements, United States traders should be "encouraged by the Government to operate in other countries in accordance with the internal laws and business practices of such countries, without harassment from their government." Is it possible that the Association is taking a somewhat pessimistic view of the likelihood of the abrogation of monopolistic practices in other countries?

Canadian Pacific Prospects

Mr Coleman, the chairman, at the annual meeting of Canadian Pacific Railway, made out a plausible case for some increase in Canadian railway charges. He pointed out that, while during the war charges have "in general remained stationary" under Government control, labour costs have risen by 25 per cent, coal costs by 35 per cent, and other costs by varying amounts. Altogether, operating expenses in 1944 are estimated to have been \$43 million higher than pre-war. The increase in costs has been more than offset to date by the great expansion of traffic, but it is evident that this expansion has now passed its peak. Further, there is likely to be a decline in the proportion of high rate goods traffic and a reduction in the average haul, both of which may be semi-permanent. Although gross earnings in 1944 reached the record total of \$319 million, net earnings were actually down by \$6 million. Mr Coleman indicated that 1945 net earnings cannot be expected to show any improvement on 1944, even although the 1944 accounts included \$4 million provision for retro-active wage rates. The anticipated decline in railway traffic is not indeed likely to be considerable. It may not extend to agricultural products, which form a large part of the freight handled by Canadian Pacific, while the prospects for passenger traffic for the rest of the year are said to be "very favourable."

The payment of an ordinary dividend for 1944 of 5 per

cent, against 2 per cent, was in the nature of a special bonus made possible by the satisfactory accumulation of reserves in previous war years, and by a temporary reduction in fixed charges which is unlikely to be repeated. Average costs are unlikely to fall in the immediate future, so that it is reasonable to suppose that only the authorisation of some increase in railway charges can prevent a gradual fall in profits. Mr Coleman can plead in support of his case that freight charges in Canada are lower than in the other Dominions and the US, although operating conditions in Canada are, generally, less favourable. In several respects, CPR has perhaps a rather stronger case than the British railways, who may shortly be putting forward rather similar arguments for further increases in their fares.

Dissentient Shareholders' Rights

It has frequently been maintained that the law as it exists to-day provides insufficient protection for those shareholders who are not prepared to accept the majority view on the terms offered in reconstructions and amalgamations. The decision of the Court in a recent case under Section 155 of the Companies Act, 1929, seems to support this contention. Evertite Locknuts entered into an arrangement to transfer its share capital to another concern, RD and Company, and the transfer was accepted by holders of more than nine-tenths of the shares concerned. In consequence, under Section 155, those who had not accepted could be compelled to sell unless they were prepared to make an application to the Court and could convince it that it should order otherwise.

In this case the application was made and the ground advanced for not accepting the offer was that the holder (of shares in Evertite Nuts) had been unable to obtain any information about a company in which that concern had a substantial interest and that, in consequence, he could reach no conclusion whether the price offered him was fair or not. The Judge maintained that on the basis of a previous decision the applicant could only succeed if he could show that the offer was unfair, and he held that, although the applicant might have some grievance against the company he had been unable to produce any evidence that the offer was unfair and that the application must be dismissed.

There is no reason to doubt the correctness of this decision in law, but its effects would seem to be the reverse of desirable. While the obligations laid upon directors of companies concerning disclosure remain what they are, no shareholder who has not special sources of information is able to reach a reasoned conclusion as to the value of his holding. Consequently it is in the nature of the case that he is not in a position to produce the proof which the Courts require. It is no answer to say that over nine-tenths of the shareholders have accepted. If the information had been available, perhaps none would have done so. That is the whole question; and until fuller information has to be given, Section 155 will afford no protection except in the very improbable event of the dissentient having inside information of real importance.

Unit Trust Accounts

The publication by the Trust of Insurance Shares of their first accounts under the regulations, made by the Board of Trade last summer, is the occasion of a critical review of the requirements by Mr J. H. Batty, chairman of the management company. He raises three main points, namely, the failure of the Board of Trade to deal with (i) the bid price of units, (ii) the conversion of units into cash by the managers selling securities and so reducing the number of units in issue, and (iii) the question of amortising the management charge in such a way that the sub-unit holder who acquires sub-units when the trust has lived, say, half its life shall only pay his fair share. It need hardly be said that this group has found its own solution to all these points, but that does not reduce the need for regulation.

Two further points emerge which are also criticisms of the regulations as they exist. One is that there is no obligation to publish the accounts of the managers. Again, the group does this, and *The Economist* has always maintained that such publication is likely to be both useful to the investor and beneficial to the management. Against this,

the managers consider that the publication of actual figures for individual trusts, but not necessarily for the management company, is harmful. There is some substance in this, for it gives information about the size of the trust, at least in retrospect.

With the explanations which accompany the accounts, it is possible for the investor to obtain a very fair idea of what he pays for the services which have been rendered. It remains to be seen, however, whether the prescribed form of accounts will satisfy this criterion when permission to create new units is given. That is perhaps, a matter which must be left to experience, but it is quite clear that the points raised by Mr Batty, which correspond very closely with criticisms of the regulations made in various quarters at the time of their issue, ought to receive immediate attention.

Industrial Reconversion

Speaking to the Paint Manufacturers' Research Association last week, Mr Dalton held out hopes that the Government would soon make labour and materials available for the switch-over from war to peace production. The announcement of peace will undoubtedly hasten the process, which had been delayed until at any rate the European victory was complete. There has been considerable criticism among manufacturers at the delays and the slow working of Whitehall's machinery, and it will be interesting to see whether the Government departments concerned, and especially their regional machinery, are sufficiently prepared to cope with the applications for materials and labour which are bound to increase every day.

The latest figures of the number of applications for permission to manufacture prototypes or to undertake experimental work, given by the Board of Trade, are as follows: Out of 1,545 applications between August, 1914, and the present time, 1,388 have been granted, 145 are under consideration, and 13 have been refused. Permission is only withheld where the firm is behind with its war contracts and the list of refusals is constantly being reviewed. Nearly all the applications come from engineering firms, and the majority are for experimental work in household appliances, textile machinery or machine tools. The engineering industry more than any other manufacturing industry will be most affected by reconversion, for it has been the most fully concentrated on war production. To assist its Regional Controllers on engineering problems, the Board of Trade has appointed technical specialists in each area.

Planning Civilian Supplies

Although complaints of shortages have been made periodically, the Board of Trade has achieved a measure of success in its wartime task of ensuring the largest possible supplies of essential civilian goods and of distributing them fairly. In the issue of the *Board of Trade Journal* for May 5th, an article describes the role of statistics in wartime.

Whether articles of civilian consumption have been rationed or not, an attempt has had to be made to steer limited labour and materials into the production of the most essential goods. Perhaps in the case of rationed goods this has been more important, since deficiencies would be more obvious. Rationing has however to some extent made the Board's problems easier to solve. For rationed goods the information required by the Board falls into two classes: the information concerning the manufacture and supply of articles, and information concerning consumer demand. The former enables the ration to be fixed, and the latter enables production to be steered, if necessary, to the types of goods most wanted by consumers.

The information required in planning non-rationed goods is broadly the same as that for rationed goods, although the planning cannot be quite as successful. There is naturally a tendency for the demand for non-rationed goods to be larger, in relation to peacetime demand, than that for rationed goods, which is largely controlled demand. Thus the most serious complaints of shortages have been made in non-rationed goods, and particularly in those which are most essential. Of all articles of household linen, for example, there was a time when towels were the most difficult to get. When they were included in the clothes ration, it was almost at once possible to buy them—on the surrender of coupons. The conclusion might be drawn that more rationing would have meant less shopping difficulty

for those in real need, but the Board's answer to suggestions of extended or total rationing has always been the administrative problems of rationing a large number of miscellaneous articles.

There have been cases where production fell so far short of what the civilian population considered to be their minimum and indispensable requirements, that drastic action had to be taken. An outstanding example was domestic pottery. The shortage was mitigated and, indeed, largely overcome by limiting the industry's production to a few, undecorated articles. Standardisation was adopted, and output increased sufficiently to provide a reasonable output so that supply and demand were more or less balanced without recourse to rationing.

Another system used in cases of acute shortage has been the priority system. This has been done by two methods. One was by empowering shopkeepers to sell certain goods only to certain classes of customer. For example, sieves at one time were sold only to holders of children's ration books, and vacuum flasks only to certain workers, such as those in Civil Defence and agriculture. The other way was to give priority consumers dockets entitling them to certain goods.

Up to now the Board's main problem has been to distribute equitably a volume of goods which has on the whole been contracting. For the future, it can look forward to a gradually expanding volume of supplies. This expanding volume will need to be steered and guided no less than the contracting one did until it is large enough to meet the total demand. Perhaps the case for guidance in the next year or so will be even stronger, because the end of the war in Europe will release pent-up demand and the pressure on supplies will be considerably greater. The Board's task will still be to see that the main effort is put into producing essential goods and to ensure that the goods reach those who need them most.

Building Costs

In reply to a question in the House of Commons on May 2nd, the Minister of Works, Mr Duncan Sandys, gave an analysis of the pre-war cost of a house of about 800 square feet, exclusive of land and estate development costs, overheads and profits. His analysis, in other words, refers to the cost of the type of house built by local authorities. Total costs ranged from £335 to £405; materials absorbed £230-£280 and labour £105-£125. The distribution of the costs of materials is shown below:—

COST OF MATERIALS PER HOUSE
(Average 1935-38)

Bricks	40-50
Timber (joists, rafters, flooring, etc.)	30-35
Metal castings	18-25
Cement	18-20
Roofing tiles or slates	14-17
Sand and ballast	10-16
Windows (metal)	11-12
Plaster and plasterboard	10-12
Doors and staircase	11-15
Paint and distemper	7-12
Flooring tiles	4-5
Other materials	56-65

Mr Sandys pointed out that the overall cost of a similar type of house is at present 70-100 per cent higher than before the war. Unfortunately, however, he did not give an itemised analysis of present costs. His estimates emphasise the need for a determined effort to bring costs down, by increasing the efficiency of traditional methods of construction (between 30 and 40 per cent of the total labour cost of a small house is absorbed by bricklayers and labourers) and by the use of new ones. True, the immediate task is to make good the deficiency in houses at "all costs"; but, in view of the shortage of labour (to be alleviated by the employment of prisoners of war), "all costs" must mean the most economical methods.

Oil Production Trends

The end of the war in Europe has not reduced the pressure on oil supplies. At the end of last year the United States Petroleum Administration for War announced that demand for the Pacific much exceeded the 1942 estimates

of the maximum for all fighting zones. Since the beginning of this year, Far Eastern war requirements have increased substantially and the next few months will undoubtedly witness a further expansion. It is only natural, therefore, that all possible steps should be taken to increase production to new maxima.

In the United States, the daily production goal for May has been set at 5,198,480 barrels (seven barrels roughly equal one ton), an increase of 41,520 barrels on the previous maximum—for April, 1945—and an expansion of 332,000 barrels on the average for 1944. After the heavy increases in recent years, this new expansion requires an unusually great effort at all stages of the US oil industry.

Despite considerable increases in the United States oil output, however, the bulk of this year's additional world supplies will, for the first time since 1939, come from the extra-United States producing regions. While the United States oil output had advanced from 1,260 million barrels in 1939 to about 1,700 million barrels in 1944, the combined extra-United States output had, until early last year, remained well below its 1939 rate of 820 million barrels. Since then oil production outside the United States has expanded and, despite the destruction of wells and refineries in the Pacific region, Burma and Europe, it is now above the rate of 850 million barrels a year. Within the next few months a new and marked intensification of production in the Caribbean area and the Middle East will take place since development programmes are now approaching completion, including the Saudi-Arabian refinery of Ras Tanura which will yield the first oil from Arabia.

It is more than likely that this year's production outside the United States will reach a record of more than 900 million barrels. The marked expansion in international oil production during the war will undoubtedly lead to major changes in supply conditions on the international oil market. Until the end of the Pacific war, however, there is not much prospect of a de-restriction of civilian supplies, although there is at least a chance that owing to the heavy strategic accumulations of oil and petrol here and in Europe, which will no longer be needed for military purposes, a small basic ration for civilians may be restored before long.

Hydro-Electric Development

The development of the water power resources of the Highlands requires a very large capital outlay, and it is open to question how fast development should proceed during the period of shortage of men and materials. But the eventual balance of advantage which development will confer not only on the Highlands but on the whole nation is becoming increasingly apparent with the elaboration of the Hydro-Electric Board's policy. The export of electric power to the South can be undertaken at prices that are certainly not higher than those required by steam generation, while yielding a profit which will enable the Highlands to enjoy the benefit of cheap electric supplies.

As regards the more remote areas, electricity, as the Board points out in its first annual report, can only be provided at considerable loss, and its sole but sufficient justification is the improvement of local amenities. The Electricity Commissioners have stipulated that un-economic schemes of this character cannot be undertaken until the Board has made some profit from the export of power to the South. The Board can draw on the State's credit for its borrowing, but it is obliged to pay its way. For this reason, and because of the urgent need of increased supplies in industrial Scotland—at the moment Scotland is actually importing electricity from England—the Board's first two constructional schemes have been mainly directed to providing electricity for export.

There are, however, other and more accessible areas in the Highlands which are capable of industrial development. In some areas, such as that around Inverness, which is served by the Grampian Supply Company, there is already an unsatisfied demand. The Board's third constructional scheme, recently published, which provides for a new generating station near Cromarty Firth, is partly designed to supply the Grampian Company's needs in this area, and should help to dispel accusations that the Board is neglecting its duty to existing supply companies. The Board is also planning to commence the construction of an inter-linking grid for the North of Scotland which will facilitate industrial development.

Industrialising the Highlands

The value of cheap electric power to the Highlands depends largely upon the degree to which it is used to develop the industrial and agricultural resources of the region. New industries would be more important than the Board's constructional schemes in providing employment and creating prosperity. An interesting survey of the possibilities of such development has been carried out by a committee of the Association of Scientific Workers.* The Highlands contain considerable quantities of limestone and dolomite, which it is suggested should be utilised for the manufacture of two main products for which world demand is rising, carbide and magnesium. The manufacturing processes involved require large quantities of electric energy—in fact, it is urged that a fifth of the total power to be generated under all the Board's schemes could profitably be used in the production of carbide alone. Carbide is also an important source for the manufacture of synthetic rubber and plastics, which could be developed as subsidiary industries. Highland agriculture would gain greatly from the demand for milk and vegetables which would arise from the creation of industrial centres, although the direct advantage to it of rural electrification might be more limited. The committee also suggests the desirability of electrifying Highland railways.

It is clear from this and other surveys that the Highlands, notably the areas around either end of the Caledonian canal, are well suited for the creation of electro-metallurgical industries. The most suitable form of development is probably the creation of several compact medium-sized towns containing a number of associated industries; but it is only too likely that, unless strict control is exercised, it might take the form of numerous straggling industrial villages, dependent on one or two factories. The creation of any such villages, with their lack of amenities and liability to unemployment, would be a sad mockery of Highland prosperity. Sprawling or unsightly building can, in addition, do far more to spoil the amenities of the Highlands than any of the carefully designed hydro-electric schemes. The Hydro Electric Board's powers are limited to the provision of electricity. It is not a Tennessee Valley Authority, and although analogies with this American model often tend to be misleading, it may be wondered whether some authority should be established in the Highlands to see that full benefits are derived from the public provision of cheap power and that they are passed on to the right quarters.

Currency for Celebration

Currency requirements for the week's celebrations tend to confirm the general impression that the attitude of the public has been, on the whole, one of restraint. The outflow of notes has, indeed, been heavy, but it represents only a fraction of the amount that normally goes into circulation in the pre-Christmas period or for the August holiday. Last week the banks took the precaution of increasing their till money reserves, and the total circulation rose by £5.5 million. This week—the Bank return was made up on V-plus-One—a further £9.4 million has gone into circulation. This last demand was only fractionally less than the available reserve, and in consequence a sudden increase in the fiduciary issue—which otherwise had not been expected for a week or so—was necessary. The increase, as on most occasions in the past, is one of £50 million, raising the total fiduciary issue to £1,300 million. This is the fifteenth expansion since the outbreak of war and the fourteenth for purely currency purposes—the first increase was for the purpose of releasing the Bank's gold to the Exchange Account. Excluding that transaction, the aggregate of the increases is £720 million.

The enlarged currency demands were reflected in the Money Market in a somewhat sharp pressure for funds immediately after the holiday. The banks, which at the end of last week had shown a better appetite for bills than for some while past, were no longer buying, and there was some substantial calling-in of balances. The banks and the money market opened in the morning both of V-Day and of V-plus-One, so that there was no interference with the maturity dates of bills; but business was naturally confined to the barest essentials.

COMPANY MEETINGS

ROYAL INSURANCE COMPANY LIMITED

ANOTHER SUCCESSFUL YEAR

MR. P. R. ENGLAND'S SURVEY

In a statement circulated with the annual report of the Royal Insurance Company, Limited, the chairman, Mr P. R. England, said that total fire, accident and marine premiums, at £17,225,000, were higher by £825,000 over 1943. Total underwriting profit was £1,607,000 compared with £1,356,000 in the preceding year, and, with the exception of 1942, was the highest figure ever recorded by the company. New life net sums assured, at £3,770,000, represented an advance of more than £1,000,000 over the 1943 figure.

1945—CENTENARY YEAR

The chairman referred to the fact that the "Royal" was founded one hundred years ago on May 31, 1845. He wondered if the founders could have visualised a time when the company would be covering risks in 100 different categories, transacting business in 100 different countries, and settling losses in fifty different foreign currencies. Could they have contemplated that by 1945, the "Royal" with its 38 associated companies (after absorbing other insurance companies), would constitute the world's largest fire, accident and marine insurance group, with a world-wide staff of 10,000? The history of the "Royal" closely reflected the development of the nation and of the countries in which it works. It progressed with the rise in the standard of living.

INTERNATIONAL NEED FOR INSURANCE

In the building up of a new economy between nations, insurance had an important part to play. International commerce and industry could not thrive without the protection given by insurance companies on land, at sea, and in the air. The widespread organisation, long experience, and financial strength of British insurance was a primary factor in a world of changing values. The British offices' network of overseas branches, agencies, and associated companies would contribute greatly to the full restoration of the delicate fabric of international trade, commerce and finance.

Insurance had played an essential rôle in the success of the war effort, in the days to come it could serve efficiently and economically the peace-time needs of all nations. The chairman hoped that in the plans for peace, Russia might open the way for a wider interchange of insurance of its nationals with those of other countries.

CIVIL AVIATION

The war had provided a world laboratory for the development of the aeroplane and the years immediately ahead held prospects of great expansion in civil aviation. It might well be that the latter would provide the greatest single channel for the extension of insurance since the introduction of the motor car. The "Royal" was equipped to meet the insurance needs required in this direction.

ROAD ACCIDENTS

Unfortunately, the fall in the number of road accidents in the past year or two received sharp check in 1944, a serious aspect being the incidence of loss of child life. There seemed justification for the view that the increase was influenced by the vehicles concentrated for the invasion of Europe, for an improvement, noted later, was continuing. It might be hoped that, following the interim report of the Road Safety Committee, active measures would be taken to resolve this urgent problem.

QUINQUENNIAL LIFE VALUATION

For the quinquennial valuation—at December 31, 1944—of the company's life and annuity business, the stringency of reserves was increased by reducing the rate of interest used in valuing life assurance contracts from 2½ per cent. to 2¼ per cent., the rate used in valuing annuity contracts remaining unchanged at 2½ per cent. This change in the basis of valuation strengthened the reserves by £670,000.

As a result of the valuation, it was found that the assets of the life and annuity fund, taken at their balance-sheet values, exceeded the liabilities on the strengthened reserve basis by £4,022,929. It was decided to declare a bonus of 25s. and a special centenary bonus of 5s., making a total reversionary bonus of 30s. per cent. per annum on the sum assured for the five years ending December 31st last.

A sum of £200,000 was allocated to shareholders and an unappropriated sum of £2,037,418 was carried forward.

Since its foundation, the Royal had, without interruption, declared reversionary bonuses of at least 30 per cent. per annum, and the present declaration at this rate, after the stringency of the valuation basis had again been increased, worthily upheld this striking record in the centenary year. With an unappropriated carry forward of over £2,000,000 and an exceptionally strong reserve basis, the life assurance and annuity funds of the company were in a stronger position than ever.

For the new quinquennium, the rate of interim bonus would, as usual, be reviewed each year, and for 1945 would be 25s. per cent.

PROFIT AND LOSS ACCOUNT

Provision had been made for British taxation on the profits of the year under review and profit and loss account was charged with an amount of £850,000.

The directors recommend, to mark the centenary of the company, that part of the undivided net profits should be capitalised and applied in discharge of the 7s. 6d. per share remaining uncalled on the issued shares. For this purpose an amount of £2,099,974 had been transferred to the uncalled capital fund, and a formal resolution will be placed before the extraordinary general meeting following the annual general meeting.

The balance carried forward after making the above-mentioned transfer amounted to £1,068,141.

THE LIVERPOOL AND LONDON AND GLOBE INSURANCE COMPANY, LIMITED

109th ANNUAL REPORT

In a statement circulated with the annual report of The Liverpool and London and Globe Insurance Company, Limited, the chairman, Mr P. R. England, says that in the company's 108th year, and after more than five years of war, the directors are able to report a position of outstanding stability and vitality in the 1944 accounts.

Total Fire, Accident and Marine premiums at £10,577,894 showed an increase of £333,636 over 1943. Underwriting Profit was £730,639 against £732,666.

New Life business at £1,807,657 was nearly half a million pounds higher.

Fire premiums at £4,045,636 compared favourably with £3,905,437 in 1943, due in part to higher values at risk.

Accident Department trading was again satisfactory, premiums at £5,390,257 comparing with £5,018,075.

The Marine 1943 Account closed with a record profit of £236,105.

Net Interest was £343,637 against £303,942.

The directors recommend a final dividend of 13s. 6d., making 27s. per share, less tax, for 1944.

INCORPORATED ACCOUNTANTS

MR. RICHARD WITTY'S ADDRESS

Mr Richard A. Witty, president of the Society of Incorporated Accountants, took the chair at the society's annual meeting on the 9th instant in London, and in the course of his speech said: In normal circumstances the society might have been inclined to celebrate its diamond jubilee, but under war conditions any such celebration would be out of place.

I mentioned last year that we had had conversations with the committee of vice-chancellors and principals of the universities with a view to evolving a scheme by which accountant students of the future should be more readily able to link a university education with their professional qualification. Details have now been published. We believe this to be a step of the utmost importance and we trust that every practising member of the society will encourage his articled clerks and by-law candidates to take advantage of the opportunities offered.

IMPORTANCE OF COSTING

Industrial accountancy has been greatly developed during the war, and this reminds one, naturally, of the subject of costing. It is nearly 25 years since the Society of Incorporated Accountants, realising the importance of costing, amended the syllabus to include special papers on cost accounts, economics, and statistics. There has undoubtedly been a recognition of the absolute necessity for costing records on the part of large commercial units but the war years and the period of Government contracts have shown the need for a still further recognition, particularly in manufacturing and contracting businesses of medium size. It is unfortunate that the various Government departments have insisted on the use of different formulas in arriving at basic costs and overheads for the purpose of cost-plus and other contracts. But that difference of view only serves to emphasise the vital importance of costing, and I want to suggest to our members, particularly those who are in public practice, that they should continue to impress upon their clients the importance of this subject. The reply usually given by the manufacturer has been to inquire whether cost accounts would provide him with additional profit.

That attitude was, I think, perfectly natural, and we must be careful not to over-elaborate the technique of costing by insistence upon forms with adjustments and apportionments which could only be comprehended by a few. There is room for action by all qualified accountants in the matter of popularising costing, and by so doing we shall be helping the future commercial prosperity of the country. It is not a matter which is dependent upon Government contracts only or upon Government control. I think that now is the time to engage in this form of missionary work.

The negotiations towards co-ordination in the accountancy profession have continued during the past twelve months. Some of the difficulties have been solved and today there is a greater degree of unanimity than at any previous date.

It has been agreed that members of the society returning from the Forces shall be welcomed at special courses on the lines of those held by the society in peace days at Cambridge and Oxford.

RESETTLEMENT ADVICE SERVICE

A panel of accountants is being compiled who are ready in an honorary capacity to advise ex-Service men who contemplate the purchase of small businesses. The panel will work in conjunction with the Ministry of Labour and their resettlement advisory officers. A substantial list has already been compiled of those incorporated accountants who are willing to help.

"Design of Accounts" was well received by the profession and the commercial world generally. The first edition was sold immediately on publication, and a second extended edition will be published when the necessary paper can be obtained.

The report and accounts were adopted.

CALEDONIAN INSURANCE COMPANY

SATISFACTORY FIGURES

The one hundred and fortieth annual general meeting of the Caledonian Insurance Company was held within the company's office, Edinburgh, on the 10th instant.

The chairman, Mr William Blair, W.S., in the course of his speech, said: In the Life Department the net new assurances issued during 1944 amounted to £1,292,873, the premiums thereon being £56,345, of which £11,791 were single premiums.

In view of the changed war conditions, the Directors decided to investigate the position of the Life Department as at December 31st last. Our last valuation was as at December 31, 1941, when, as you will recall, no general distribution of profits was made.

Having regard to the fall in interest rates during the intervening years (the average net rate for the last three years being £3 3s. 5d. per cent.) and acting upon the advice of our Actuary and Hon. Consulting Actuary, we have strengthened our valuation. Formerly our liabilities were based on the latest Tables of Mortality in general use with interest at 2½ per cent. for assurances and 3 per cent. for annuities, whereas now we have valued our liabilities, using the same Tables of Mortality, but with interest at 2½ per cent. both for Assurances and Annuities. The strengthening process has required a sum of about £200,000.

At the annual meeting following the 1941 valuation, the chairman indicated that it was our intention to take into consideration at the next division of surplus the fact that no profits, excepting Interim Bonus, had been allotted to Policyholders in respect of premiums due and paid in the quinquennium ended December 31, 1941.

Not only have we declared bonuses under participating policies in respect of each year's premium due and paid for the years 1937 to 1944, but we have also decided to re-open claims by death and maturity under participating policies which arose in the years 1941 to 1944.

I think you will agree that the results are highly satisfactory considering the difficulties with which in recent years insurance companies have had to contend.

FIRE, ACCIDENT AND MARINE ACCOUNTS

The premium income in the Fire Department for 1944 was £1,061,555, as compared with £910,493 for the previous year, and exceeds one million pounds for the first time in the history of the company. The year under review was not a favourable one for fire underwriting in the United States of America. This experience, which we believe to be transitory, resulted directly from war conditions, and has affected adversely all insurance companies doing business there. This accounts for our profit from the department being only £3,348, compared with £57,081 in 1943.

The premium income of the Accident Department for 1944 was £579,541, as compared with £485,478 for the previous year. The profit was £41,920, compared with £48,235. In the Marine Department, on account of the satisfactory condition of the accumulated Marine Fund, a sum of £50,000 has been transferred to the Profit and Loss account, leaving the fund at £682,328 (222 per cent. of the year's premium income) as compared with £628,001 (162 per cent. of the 1943 premium income).

If the recommendations of the directors be approved the balance to be carried forward in the account, after payment of a dividend of 15s. a share and the allocation of £20,000 to the Staff Pension Fund, will be £107,422, against £72,523 a year ago.

The report was adopted.

ARMY AND NAVY STORES, LIMITED

STOCK POSITION AND OUTLOOK

The 73rd annual general meeting of the Army and Navy Stores, Limited, was held on the 9th instant in London.

Major-General Guy Dawnay, C.B., C.M.G., D.S.O., M.V.O. (the chairman), after expressing regret at the death of Mr W. W. Workman, who had been a director for 25 years, proceeded to deal at length with the items in the accounts, in the course of which he said that the net profit for the year at £337,459 would appear to be £13,046 higher than that of the previous year, but was actually £15,446 down, having been arrived at before deduction of Schedule "A" tax, which was now included in "Provision for Income Tax, etc." They recommended a dividend of 10 per cent., the same distribution as last year; £2,000 had been placed to the Indian Good Service Fund. The various appropriations disposed of all but £94, which they proposed to add to the balance brought in from the previous year, leaving £105,959 to be carried forward.

THE FUTURE

Continuing, he said: I should like to say a few words about the future. The turnover, so far as we have gone this year, is slightly in excess of that for the corresponding period of last year, but whether we shall be able to maintain it at that level depends entirely on our ability to replace stocks as they are sold, and that depends, in turn, on the Government's policy in regard to releasing raw materials and manpower to manufacture the necessary merchandise. Our stock-in-trade is down from £579,000 to £466,000, and the tendency is for it to fall. However, sooner or later, stocks must be made available to industry if the large number of men and women in the Services and on other work of national importance are to be re-absorbed into their former employment, and that remark applies to the retail trade as well as to factories.

If nothing untoward occurs in the meantime, and we are able to replace our sold stock at about the same rate as last year, we hope to maintain our dividend at 10 per cent., but I think it may be desirable to give a word of warning to any of you who may think that one of our particular aims in the post-war world will be to pay higher dividends.

OBJECT OF THE COMPANY

The object of the company is to supply its clients with the best articles of domestic consumption and general use at the lowest remunerative prices. Our object has been, and most certainly will continue to be, to enable our customers for a given expenditure, to buy better goods at the stores than elsewhere, or to buy more cheaply at the stores than elsewhere goods of equal quality.

The real element of risk in this particular type of business lies in the competency of the management to judge correctly what the public wants to buy, how to obtain those goods, what stocks to carry, and to sell them at prices satisfactory to our customers, after taking a reasonable remuneration for the service.

What does "reasonably remunerated" mean? The right goods having been bought and sold at the right prices, and the various attendant services having been provided and paid for, the shareholders are entitled to a fair and reasonable return on their capital. This return is now 10 per cent. of the nominal value of the shares. Then, in the interests of the shareholders themselves, it is necessary to build up certain reserves out of the undistributed profits, to enable us to maintain and, as necessary, develop the scope and efficiency of the business.

The report and accounts were adopted.

DAVIS AND TIMMINS, LIMITED

IMPROVED TRADING RESULTS

The forty-sixth annual general meeting of Davis and Timmins, Limited, was held, on the 2nd instant, in London.

Mr F. Le Neve Foster (chairman and managing director) said that the net profit for the year, after making provision for taxation and other items, was £52,202, as against £50,733 for the previous year. Trading profits, before taxation, were £81,780, as against £72,072 for the previous year, which was a substantial increase of £9,700, but that increase was not attributable to better trading conditions, but rather to the fact that this year they had not found it necessary to make certain provisions which they had found it advisable to make out of the 1943 profits. The provision for taxation amounted to £23,105, as against £14,707, and that increase had largely offset the improved trading results.

The consolidated account showed a thoroughly sound and strong financial position. The amount of general reserves and undivided profits, after a deduction of the provision for final dividends, totalled over £200,000.

During the period of reconstruction, with its tremendous rehousing programme, which would call for great quantities of fittings and equipment, the demand for the company's products was likely to be high. On the other hand, automatic machine capacity had been greatly increased during the war, and for that reason conditions would be highly competitive. He had every confidence, however, that with the benefit of its long experience in the trade and of its goodwill in the name of Davis and Timmins, which was renowned in its sphere for quality and service, the company would give a good account of itself. The report was adopted.

CONSOLIDATED AFRICAN SELECTION TRUST, LIMITED

A STRONG POSITION

The adjourned twentieth annual general meeting of this company will be held in London on the 31st instant.

The following is an extract from the report of the directors which embodies the annual statement of Mr A. Chester Beatty, the chairman.

The net profit for the year ended June 30, 1944, was £812,899, compared with £912,230 for the preceding year. The consolidated profit statement shows a total provision for taxation, including excess profits tax, of £1,002,811. The two dividends for the year total 1s., free of tax, which is the same as for the previous year.

The directors continue their policy of maintaining the company in a strong financial position as a protection against uncertainties in the diamond market which may arise during the post-war period. Operations at the mines continued satisfactorily notwithstanding war conditions, but development and other work has fallen behind owing to shortage of staff.

The total diamond sales of this company and its subsidiary, Sierra Leone Selection Trust, Limited, reached a high peak in the year ended June 30, 1943, and the sales for the year to June 30, 1944, although lower, were nevertheless at a very high level. These resulted from abnormal deliveries which were made possible owing to stocks accumulated in London as the result of a decision taken early in the war to mine out some very rich portions of ground as a measure of security. The need for this emergency measure fortunately disappeared some time ago, and production is proceeding on the basis of working to the average grade of our reserves. In consequence, there will be a further reduction in deliveries to the market for the current financial year ending in June, 1945, but this is unlikely to result in any marked decrease in the net balance of distributable profits.

E. POLLARD AND COMPANY, LIMITED

FIFTY YEARS' PROGRESS

Mr. H. Edward Pollard, the chairman and managing director, presiding at the thirty-third annual general meeting of E. Pollard and Co., Limited, held at 159 St. John-street, Clerkenwell, London, on the 8th instant said: This is the thirty-third annual general meeting of the company, and this year marks the fiftieth anniversary of the business founded by my father, Mr. Edward Pollard, in 1895. Over ten years of those fifty have been devoted entirely to war work. Our second span, starting as it does with the coming of peace in Europe, surely offers a more unbroken prospect for our shopfitting and engineering work.

If you will turn to the printed accounts you will see that the trading profit for the year ended December 31, 1944, after deducting excess profits tax, was £112,246, which compares with £112,866 of the previous year. Against this we have to deduct the usual charges of depreciation, amortisation, etc., and a slightly larger amount of interest payable, which is due to the higher bank overdraft necessary to finance the great amount of Government contracts we have in hand.

These deductions leave a balance of profit of £83,518, and when the 1943 carry-forward of £35,827 is added we have £119,345 for taxation, reserves, and dividends. Income tax takes away £47,778 and war damage and Debenture redemption reserve a further £3,274. Then we have placed £10,000 to the general reserve and paid the Preference dividend of 7 per cent. It is proposed to pay a dividend of 7½ per cent. on the ordinary shares and this will leave us a carry-forward to 1945 of £37,396.

Coming to the balance-sheet you will see that the issued capital is unchanged at £718,044, including the Debentures for which we now have a reserve of £10,407. Our general reserve with the £10,000 added from the 1944 profits is £41,000.

There is an increase in the bank overdraft at £289,447, which is due as I mentioned before to Government orders. The creditors and provisions for accrued expenses has also increased slightly to £180,548. On the asset side there are few changes. The properties, the plant and machinery, and the goodwill and the investments in subsidiary companies are more or less as in 1943. The stock has decreased a little for obvious reasons and the debtors account has increased to £889,335 as the outstanding Government matters accumulate.

The notable figure is the work in progress, which is the highest on record for the company—namely, £972,967—and is an indication of the importance of our contribution to the war supplying Ministries. The excess profits tax very effectively prevents us from showing a profit in any way commensurate with the effort we have put into the business during 1944, but I feel that our accounts show a satisfactory state of affairs.

We have been concerned with a wide range of supplies from Bailey Bridge complete with pontoons to fuselages, wings and parts for fighter and bomber aircraft. We have erected some thousands of special type bungalows in camps all over England for civilian war workers and played our part in the rush supply of components for the Mulberry Harbours. Gun mountings, tank trainers, bomb throwers, and a host of similar items have been turned out in large numbers for Ministries of Supply and Aircraft Production and also a number of special items for the Admiralty.

During all these war years we have not forgotten the demands that will be made upon us after the war. Shops and buildings are our business and many thousands have been destroyed or damaged. To deal with the vast amount of work that is coming we are lucky to have been

able to retain many of our pre-war staff, while others who have joined the Services, and with whom we have kept in constant touch, will be welcomed back as soon as they are released.

Our plant, machinery, and other facilities are right up to date and ready for the change over to peace production. We want our fair share of materials released at the very earliest date so that we can build up steadily and consistently to a high rate of production and efficiency which I believe will continue for many years to come. It is very encouraging to see that the enthusiasm of our executive staff during the greatly changed conditions of war is now being directed more and more to the preparation for the flood of work we anticipate.

The report and accounts were unanimously adopted.

PINCHIN JOHNSON AND COMPANY, LIMITED

RECORD SALES IN 1944

MR EDWARD ROBSON RETIRING IN JUNE

The annual general meeting of Pinchin Johnson and Company, Limited, was held at Tigbourne Court, Witley, Surrey on the 11th instant. Mr. Edward Robson (the chairman) presided.

The directors' report stated that trading during the year continued under the difficulties of control of essential raw materials and labour, but despite such difficulties the total sales represented a record in the history of the company.

All foreign and overseas units, with the exception of those in enemy-occupied territories, continued to operate successfully.

The chairman's statement was as follows:—

65 YEARS IN PAINT BUSINESS

It is with great regret I have to inform you that after 65 years spent in the paint business, of which approximately 50 years represents my active association with Pinchin Johnson and Company, Limited, the time has now come when the responsibility must fall upon younger shoulders. Consequently I am retiring from the company's service on June 30th next.

The immediate post-war problems and competition confronting your company during that period will call for very strenuous efforts, which can only be rendered successfully by a younger man.

This occasion, therefore, will be the last time that I shall have the pleasure of presiding at the company's annual meeting, a function at which I have presided for the past 30 years. It is, of course, hardly necessary for me to say that, although I am retiring, my interest in the company will definitely continue unabated, for I hope I may claim to have done my share in building your small business of 50 years ago to its present pre-eminent position in the trade to-day.

I feel very confident that your company will continue to grow and prosper under the management which I shall leave behind me.

WAR-TIME ACTIVITIES

The shareholders will naturally be interested in hearing of the company's war-time activities, which they must have assumed to have been on a very large scale and to have been carried out under extreme difficulties. I hope it will be possible in the near future to present a short statement for circulation to shareholders which will briefly cover these points.

In conclusion, I wish to thank my co-directors and staff for their loyal support and excellent work during the past year, and, for that matter, during my whole period of service with the company.

The report and accounts for the year 1944 were adopted, and a final dividend of 7½ per cent., less tax, was declared on the ordinary shares, making 10 per cent., less tax, for the year. The retiring directors were re-elected and the auditors reappointed.

G. BEATON AND SON, LIMITED

COMPANY'S WAR ACTIVITIES

The annual general meeting of G. Beaton and Son, Limited, was held on the 8th instant, in London, Mr S. C. Goodwin, J.P. (chairman of the company) presiding.

The following is the Chairman's statement circulated with the report and accounts:—

Consequent upon the great improvement in the war situation I am happy to be in a position to refer in greater detail to the company's activities during recent years. On the outbreak of war the demand for motor car accessories, for which your company is well known, practically disappeared and, although a small output of such products has been maintained for the use of the Fighting Forces during the war years, the energies of your directors, staff and workpeople have been directed to securing the utmost possible output of aircraft components, for the production of which a department was set up in 1936. The demand for the company's products was only limited by its capacity to produce and, by stages three additional factories have been put into commission and operated under arrangements which cover the period of the national emergency.

POST-WAR PROSPECTS

Your directors continue to give constant consideration to the post-war position when it is anticipated that the company's normal business will provide the bulk of its output.

The joint venture in which the company held an interest was terminated during the year. The assets were acquired by the respective parties and the business is now being carried on by your company.

The net profit of £12,629 is arrived at after providing for all taxation and does not show any material change from last year. Reserves have again been strengthened to the extent of £5,000, and the liquid position remains strong.

To our employees who are serving in the Forces I extend our best wishes for a speedy return and to those who are still with us I offer our thanks for their services.

The report and accounts were unanimously adopted.

AMALGAMATED METAL CORPORATION, LIMITED

MR W. GARDNER'S STATEMENT

The sixteenth ordinary general meeting of the Amalgamated Metal Corporation, Ltd., will be held in London on May 9.

The following is the statement of Mr. Walter Gardner, the chairman, which was circulated with the report:—

Following the now customary procedure, to save paper and unnecessary travel, I am including with the annual report of the directors the few remarks I have to make. Once more they are brief as the report of the directors is comprehensive.

The principal change in the investment holdings, to which reference is made in the directors' report, is that during the year under review we reduced our holding in C. Tennant Sons and Co., of New York, from a majority to a minority interest.

War conditions continue to restrict severely the opportunities for earning revenue and it is unfortunately evident that a return to anything like normal trading conditions must be slow and difficult.

Meantime it is our privilege to render service to the best of our ability and I have again pleasure in thanking all associated with our joint concerns for their wholehearted co-operation.

RECORDS and STATISTICS

GOVERNMENT RETURNS

For the week ended May 5, 1945, total ordinary revenue was £52,845,000, against ordinary expenditure of £97,492,000 and issues to sinking funds of £400,000. Thus, including sinking fund allocations of £856,993, the deficit accrued since April 1st is £242,845,000 against £337,799,000 for the corresponding period a year ago.

Total	567,931	591,761	505,942	129,790	99,193

A change has been made in the method of showing an excess of Post Office Expenditure over the Post Office Revenue. Such excess is now included as ordinary expenditure under "Total Supply Services" instead of being shown, as up to July 24, 1943, inclusive, as a deduction from ordinary revenue.

After increasing Exchequer balances by £260,463 to £2,988,221, the other operations for the week (no longer shown separately)

increased the gross National Debt by £45,043,951 to £32,644 million after allowing for £16 million of sinking funds in 1944-45.

On May 4, applications at £99 14s. 11d. for bills to be paid for on Monday, Tuesday, Wednesday, Thursday and Friday of the following week, were accepted at about 30 per cent. of the amount applied for, and applications at higher prices were accepted in full. Applications at £99 15s. for bills to be paid for on Saturday were accepted in full. £130 millions of Treasury Bills are being offered for May 11. For the week ended May 12 the banks will be asked for all Treasury deposits at a maximum amount of £75 millions.

GOLD AND SILVER

The Bank of England's official buying price for gold remained at 168s. 0d. per fine ounce throughout the week. In the London silver market prices per fine ounce have been 25d. for cash and for two months. The New York market price of fine silver remained at 44½ cents per ounce throughout the week. Bombay bullion prices were as follows:—

Defence Policy

Prime Minister's Victory broadcast was, in the end, a retrospect of pride, as it had every right to be. The history of this island has no finer record of perils met by valour and wisdom and no clearer example of one man being entitled to speak for all. But to content ourselves with the bestowing of laurels—meet though that is—would be to miss the point of history. There are lessons to be learned from the years, and now, before their urgency fades, is the moment to learn them. Even now, in these expansive days, it comes with a new shock to remember how very narrow, how desperately close, was the margin that lay between disaster and disaster. Indeed, had the enemy made a few mistakes, not all the bravery and devotion of the British people could have saved this island from being a part of Hitler's slave empire. Had the German General which foresaw everything else, foreseen the necessity of crossing the Channel, had they begun the Battle of Britain earlier or continued it longer, had they concentrated their air-raids on the ports instead of on London the list of these might-have-beens is long, and each one contains a lesson. It would be unwise to rely on our enemies always making so many blunders.

The whole nature of war has changed in these last few decades. Not only is it more total and more horrible while

it is going on, it has also changed profoundly in the obligations that it imposes on a peaceful state in time of peace. In all of recorded history, until the present century, the period within which a country could win a war and the period within which a country could organise itself for defence were broadly similar—if anything, the advantage was on the side of the defence. But once the industrial revolution was fully applied to the business of war, the picture changed very radically. The last war demonstrated the change—but the Battle of the Marne obscured the demonstration, which was fully comprehended only by the Germans. This war has made it clear for all to see. It is possible to win a war, and a major war at that, in three weeks. But it takes at least three years to mobilise for defence. It is of the very nature of mechanised war that it shortens the first period as it lengthens the second. Where our present situation differs from that of 1919—or at least from what that of 1919 was thought to be—is not that the risk of war in the near future is any greater but that, so long as there is any risk of war at all, the minimum defensive precautions are so much more elaborate.

It would be foolish, however, to run from one extreme to the other and to embark upon a policy of making this island fully secure at all times against every imaginable peril. For one thing, given the geographical position of

the British Isles, complete security, even within an alliance, is not possible. For another, the temper of the people has always been hostile to a standing army and it would certainly not tolerate the burdens that complete security would impose. Moreover, such a policy would certainly defeat itself. In modern history, it has usually been the civilians who have won wars and the militarists who have lost them. If, which God forbid, the people of Britain could ever be induced to saddle themselves with a policy of militarism, they would certainly lose that flair for ardent improvisation which wins the last battle. If the only lesson that was learned from these last thirty years was that safety lies in military regimentation, then it would indeed be true that the only lesson to be learned from history is that no one ever learns from history.

There must, in short, be a rule of reason in these, as in all other matters. No country ever completely failed to take any precautions at all against the possibility of war, and no country can ever make itself completely secure. Somewhere between the two extremes lies the reasonable course and the duty that the country owes to itself is, in the light of the evidence of the new nature of war, to review its precautions and decide which of them are reasonable.

★

Emotionally first on the agenda of any such inquiry is the question of conscription. And already it is clearly arousing emotion. On balance, the weight of arguments, not all of them strategic, will probably seem to the majority of people to favour a policy of conscribing young men for a short period of national service. But it would be a mistake to expect too much from this. The number of boys born in the United Kingdom twenty years ago was only some 430,000 a year, and in the five years before the outbreak of war the number of boys born—who would be the conscripts of 1954-58—was only 370,000 a year. Unless it be believed that Parliament would vote more than twelve months' conscription (and that would take some hardihood), the number of conscripts in uniform at any one time could hardly be more than 320,000, falling to 280,000, for all three services together. It is true that the military value of conscription does not lie in the numbers under arms at any one moment so much as in the number of trained men in reserve. But it is clear that not even with conscription can Britain maintain a large military establishment.

All the more important is it that the emphasis should be laid on the quality of what there is. It would be monstrously ungrateful for any civilian pen to write slightly, at this moment, of the quality of the armed forces of the Crown. The individual qualities are certainly the equal, if not the superior, of those of any other nation. But what is excellent can always be improved, and the story of 1940 does suggest that the British regular forces, though they had all the valour of their forefathers, also had their forefathers' habit of preparing for the last war. The armed forces have never been in this country what they have been in Germany, in France and (it would seem) in Soviet Russia, active competitors for the services of the intellectually gifted. In part, this is a matter of social framework and political preconceptions, and no one would have it very sharply altered if it involved any of the taint of militarism. But in part also it is due to the much humbler matter of pay. There is a point beyond which the able man cannot be expected to ignore the attractions of civilian employment. One of the first steps in any defence policy should be to make the career of officer one that holds out attractions instead of imposing crushing handicaps. And a second most practical step would be to insist on the standard of research into all matters of military technique and equipment, and of development of the results of research, being kept up to the highest attainable level. Money spent in these two ways will be the truest economy.

But trained manpower is not the narrowest bottleneck, either in its quantity or in its quality. The greatest perils, both in this war and in the last, have arisen on the material side. In the earlier phases of both wars, there has been a lamentable lack of equipment to put in the hands of eager defenders, with the result that the aggressor's

first onslaught nearly—more nearly in 1940 than in 1914—won him the war. And in both wars the major threat to Britain's ability to sustain the long attrition, by which alone the victims of aggression can ever win wars, has been the threat to her sea communications. Production and imports are more important chapters of a defence policy than even manpower.

★

The production target should be to ensure that men called to the colours, whether they be returning reservists or raw recruits (the difference disappears in a few months), shall never again have to drill with broomsticks or pikes, or go into battle without air cover. This does not mean, of course, that a full war establishment of equipment must be maintained all the time—that would be incredibly wasteful. But it does mean that something above a peace establishment, as hitherto understood, should be kept. The aim should be a "Battle of Britain" standard. That is to say, there should be enough equipment on hand to meet the minimum defensive needs of holding a potential enemy at bay until more can be produced. What that standard should be is a matter for technical decision, and it might reasonably vary from time to time. But there should always be clarity about the aim—to have enough in hand to ward off the worst that can reasonably be expected to happen in the next x years, x being the period within which production can be expanded to the mass level.

This will inevitably be an expensive policy and will involve considerable waste, the more so since it is essential that the equipment should be up-to-date, and therefore frequently scrapped. But clearly it will be the less expensive the smaller x is—that is, the more rapid the expansion of production that can be relied upon. This is almost entirely a matter of how widely spread in general industry is the "know-how" of munitions production. One of the great discoveries of recent years is the shadow factory principle, and some modification of it should form part of the permanent policy of the country. All sorts of industrial hands in at munitions production, in small quantities, but sufficiently to preserve the "know-how." This is a policy that will be most distasteful to the Service departments, tractors; but the inconvenience and the extra cost of spreading orders wide are part of the price that will have to be paid.

There are some sorts of "know-how" which may not exist in this country at all, or in quite inadequate volume, unless special steps are taken to secure them. The manufacture of machine tools, for example, was before the war on a scale too small for a country that may have to turn itself into an arsenal. There is even now no production on a commercial scale of synthetic rubber or the other important derivatives of petroleum chemistry, such as high-octane fuel. This is a field in which it would be worth paying some price to have indigenous "know-how." Light metals and alloy steels are other examples of materials in which there is a strong defence interest. It should be unnecessary, at this time of day, to add that more protection of private interests is not by itself likely to be a satisfactory remedy. The public interest extends even more to the efficiency and modernity of these industries' practices than it does to the volume of their operations.

★

Against the perils of blockade the most effective and the cheapest antidotes are ships, aircraft and stocks. The maintenance of the Royal Navy—particularly its numbers of destroyers and other escort vessels—and of a strong Coastal Command of the RAF and the first line of defence for the ship lanes. Fighter Command and Anti-Aircraft Command for the ports. But these protective measures cannot be perfect, and it should be one of the objects of shipping policy to ensure that there is at all times a reserve of carrying capacity revolving fund of merchant shipping, amounting to as much as, say, a year's sinkings at the highest rate recorded

during the war. This could be achieved by the Government chartering ships for short periods to be laid up. Or it could also be achieved by the policy, which has been advocated on far wider considerations in these columns, of a Government-owned, though privately-operated, merchant fleet.

Another precaution against blockade that is frequently advocated (most recently by Mr Lyttelton last week) is the stimulation of a larger domestic agriculture. But if by larger is meant an agriculture employing more men, that would be a definite weakness in war. One of the great strengths of this island, which has enabled it in this war to put into fighting and munition-making a higher proportion of its total population than any other belligerent, is precisely the fact that it does not have to devote more than a single million of its labour force to growing food. To be able to obtain food from abroad, more particularly if it can be obtained without current payment in exports, is an enormous reinforcement to the nation's manpower, the scarcest of all commodities in wartime. (Since misunderstanding on this subject is so easy, it should be added that this is not the whole case for or against a larger agriculture; still less is it the whole case for or against the policy of making a limited agricultural industry more prosperous.) A much more economical way of ensuring food supplies is to build up stocks of staple imported foodstuffs. Sir Arthur Salter suggested before the war that the target should be the equivalent of one year's wheat imports—though it should not, of course, be held entirely in wheat. This policy of storage should be extended to certain essential raw materials and, as Lord Keynes has frequently argued, the holding of stocks in this country could be made to serve the economic purpose of stabilising prices as well as that of ensuring safety.

New Priorities for Europe

REPORTS on the material condition of Europe are confused and incomplete, but there is quite enough evidence to show that the chaos is appalling and will grow worse. Even countries as relatively intact as France and Belgium are living on the shortest commons and their industrial recovery is retarded by the shortage of raw materials, particularly of coal. The Dutch crisis is such that it has thrown out all calculations based on the predictable needs of Western Europe and the emergency supplies sent to Holland have unbalanced the programmes of neighbouring states. The situation is worst of all in Germany itself. The major towns are flattened. The transport system has broken down—not one of the old Rhine bridges remains standing. Agriculture is being disrupted by the mass exodus of foreign labourers. The able-bodied manpower of Germany sits in the prisoners' cages, and although President Truman has promised a speedy settlement of the reparations problem, it is not known yet how many of these men will be sent to work abroad.

All this is familiar. It is even difficult to grasp the magnitude of the problem, so accustomed are we to ruin and devastation. Yet what a challenge it presents. To restore a functioning system in these lands ravaged by battle and distorted by years of Hitler's war economy is a more formidable task than the actual waging of the war. Not only is the problem itself more complex, but the machinery is lacking to accomplish it properly. The war in Europe has been simply directed from Shaeff. It has been jointly provisioned by the Combined Boards in Washington. It has been governed by the simple principle that military needs enjoy an absolute priority. In the field, all military needs are under a single clearly defined authority. Their powers and responsibilities have been clearly laid down. Even with all this relatively straightforward machinery, the procedure it has been difficult enough to avoid over-lapping, confusion and waste.

The structure of authority and administration for peace is much more complex. There is, first of all—and for the time being—the direct military power represented by Shaeff and, concerned primarily, it must be presumed, with

To this list of items for a permanent defence policy there are doubtless many additions. Nothing, for example, has been said here about the new development of rocket warfare, which, when it is further studied, may have considerable implications for the life of a crowded and exposed island. But what is necessary is that there should be some systematic thought about the requirements of defence policy instead of the flight from thought on the subject that took place after the last war, and that the thinking should be begun while the public mind is still comparatively clear on the subject. To tackle it on the lines here projected would, admittedly, be an expensive undertaking. The figure of £500 million a year for defence expenditure, at pre-war values, has obtained currency; the cost would certainly not be less and might well be more, and figures in pre-war values have to be considerably inflated before they can be applied to the post-war world. If the figure could be kept down to 750 million post-war pounds, that would probably be nearly ten per cent of the national income, against the two to three per cent that was customary in the 1920s and the early 1930s. The question whether this can be afforded cannot be lightly answered, unless it be by the reflection that the cost of not having a defence policy has, in the last six years, proved to be well over £20,000 million. It is always sound policy, in a matter of insurance, to pay a high premium and get effective cover than a low premium and face disaster. How many hundreds of millions a year the nation can afford for defence precautions is a matter for debate. What is quite certain is that the country cannot face another 1940 without being overwhelmed, or another six years of total war without being ruined.

liquidating the war. It controls the vast armies which are still in the field, it is responsible for the prisoners of war, it has first call on all transport even in Allied countries; in short, for the time being it is supreme and autonomous. It is, however, already changing its character. It will shortly assume the role of military government—AMG—and there will then be two distinct Army authorities—the military proper and AMG—both responsible to the Supreme Commander acting either through Shaeff or through the Allied Control Commission which is to be set up at some unspecified time. Shaeff will presumably wither away once the Commission is functioning. Meanwhile, the division of authority and work between the Army proper and the AMG officers has not been entirely smooth.

The American plans for AMG recently announced by Mr Stimson make it clear that the Americans in their zone will fulfil all the functions of government. British plans will probably be very similar. What is not certain is how soon the transfer of authority from Shaeff to the Control Commission can be made.

It is obvious that the role of such civilian bodies as Unrra will be strictly subordinate. The Director-General has announced changes in the direction and staff of Unrra so that it can be ready to engage in "intensive field operations." It appears to have been decided long ago that Unrra's activities in Western Europe and Germany should be confined to the care of displaced persons, but even in this restricted field the military authorities appear to be performing, and to be preparing to go on performing, all the tasks originally allotted to Unrra. One class of civilian authority has, however, already asserted its independence of the military. The Allied Governments in Western Europe have complete responsibility for a section of their supplies—their National Civil Imports—and control all transport, industrial capacity and local supplies not required by the military authorities. Their powers have been steadily extended since the time of liberation, and it is the policy of Shaeff to leave them full responsibility for their own administration, except where overriding necessity demands a measure of military control. Hitherto

it has been easy to determine what could be classed as "overriding necessities." They were needs dictated by the war. Now that the war is over the position is less clear.

Thus in place of the unified direction of Shaeff over the whole battle area, there will shortly be a divided military authority and, except in Germany, different national civilian authorities. This is not an ideal administrative structure for a time of extreme scarcity. It allows obviously for overlapping and collision. It can be improved by a settlement of all disputed questions between AMG and the Army proper. Even then the relationship between AMG and the civilian authorities—local in Germany, national in the rest of Western Europe—will be difficult. It is, however, useless to envisage anything else. For some time to come the military authorities will be the only officials able to administer the reconstruction of Europe. They are on the spot. They include every kind of technician and expert. No other cadres could be built up—Unrra is proof of this—on a comparable basis of efficiency.

The difficulty in adapting this military administration to the needs of Europe lies in the fact that hitherto its job from the first planning to the last execution has been a straightforward one, based on a very simple objective—to win the war. As a result, the priorities have been simple—military needs first. And this in turn has simplified administration. Now the objective is very complex—to restore a shattered continent. The priorities are correspondingly complex. And behind all the complexities, a primary decision has to be taken which military authorities will naturally find it very difficult to take. Civilian, not military, needs must now come first. For example, in the present state of transport, the movement of agricultural workers to their own countries and the establishment of German workers on their own—or other people's—farms has a higher priority than the bringing back to Britain or America of millions of soldiers. The American authorities are already talking of withdrawing some 3,000,000 soldiers. The priority of such a vast flitting must be established if it is not to act as a fatal disruption to civilian transport. Again, when soldiers are no longer fighting, do they need rations so greatly in excess of what is available for civilians? But could the military authorities be expected to reverse absolutely the thought and practice of years and to fix such priorities at their proper level?

The answer is not in doubt. A military administration will almost automatically continue to give first attention to military needs, and if the military administration of liberated Europe—which is inevitable—is not to act as a brake on reconstruction there must be from the outset a reassertion of civilian control at the highest level. The task is to use the military administration for civilian purposes—not, indeed, to submit soldiers to detailed interference by ignorant civilians, but to ensure that the programme of priorities to which the army works is determined, in the ultimate resort, by a body that has a far wider reference than any army can have. There has been talk

of establishing a Supreme European Council for Reconstruction. The fate of the European Advisory Commission, or indeed of Unrra itself, suggests that the mere creation of representative bodies, however high-sounding their titles, may accomplish little. Whether the proposal of a Supreme Reconstruction Council is a good one or a bad one depends entirely on its real nature. The only civilian authority powerful enough to control the military administration would be that of the President and the Prime Minister, acting through deputies who enjoy their complete backing and confidence. To them it would be necessary to add a direct representative of General de Gaulle, since France is also an armed and occupying Power. But any further dilution would probably lower the effectiveness of the machinery. Ideally, the American, British and French armed forces ought no doubt to be willing to take guidance from an international civilian body. In fact, they would not, and since the needs are urgent it would be as well to stick close to the most practical method. A triumvirate, a Commission representing in the most immediate way the supreme civil authority in the three States, would alone have power and prestige enough to impose a civilian stamp on the military administrations in Western Europe. If Soviet Russia would effectively co-operate, so that the purview could be extended to Eastern Europe, so much the better; but this is another matter which appears to be out of practical reach.

There is no obvious obstacle to the creation of such a Commission in the traditions and practices of Great Britain. The military authorities are accustomed to taking their highest directives from civilian ministers. It might be more difficult in France, where General de Gaulle, himself a soldier, has given his first attention and the nation's chief resources to the building up of a military machine. In the United States, too, the tradition of military independence is strong, and Mr Stimson recently remarked that the aim of AMG would be to put military needs first. A considerable assertion of the Presidential authority would be essential to override the military.

Yet the civilian supply authorities—the Combined Boards—are still in being. The Governments of Britain, the United States and France are civilian Governments. Their statesmen do not ignore Europe's desperate need for physical reconstruction and recovery. It would be failure indeed not to create the civilian control necessary to see that these needs are now put in their proper perspective.

The existence of an effective civilian authority for reconstruction matters would not solve all problems. Relations with the national Governments would still be delicate. The division of very scarce supplies between sharply competing needs will grow worse, not better, as the winter approaches, but the fact that a body existed to which governments, civil authorities such as Unrra and the military could all turn—none of them being judge in its own cause—would give some guarantee that the right priorities would emerge and that reconstruction would be pursued with at least some of the vigour and efficiency hitherto devoted to war.

The Redistribution of Labour

MR BEVIN'S eagerly awaited statement on manpower release and resettlement in the House of Commons on Wednesday did not exactly signal the green light to industry. Rather, it sounded a note of caution. The Minister of Labour reminded the House that there can be no general demobilisation until after the end of the Japanese war and that the present stage is one of re-allocation of resources between war and peace purposes. The call-up is to continue and the present age-limit of 30 is to be retained, not reduced, as originally intended, to 27, while production of munitions for the Far East will necessarily take precedence over other forms of production. But in the sector of industry which can be turned over to civilian production, and which, as Mr Lyttelton has indicated, will be a substantial proportion of the total resources, stringency of labour may prove a delaying factor

in reconversion. This may sound strange, in view of the reports of mounting "redundancy" in aircraft and munitions factories, and in view of the impending large-scale return of men and women from the Forces. Nevertheless, if an overall view be taken, it is clear that the demand for labour will exceed the supply for several years to come, and that any unemployment that arises should be purely frictional or transitory. What matters is that the process of re-allocation and reabsorption should be as rapid as possible. It would be deplorable if the unwinding of industrial resources were to be as slow and fraught with bottlenecks as the initial mobilisation in 1939-40.

A welcome sign that the process will in fact be speeded up is shown in the decision to advance the date of demobilisation by six weeks. It had originally been planned to enforce a standstill of three months from the

end of the European war. Now there is to be only a six weeks' gap, and the first releases from the Forces will start on June 18th and will apply to all theatres of war, including Burma. The releases of the first eleven groups in Class A should be completed by the end of August, and by the end of the year something like 750,000 men, mainly from the Army, may have returned to civilian life. As the first to be released will be the older men with industrial experience, there should not be a long delay in effecting their reabsorption at the end of their eight weeks' leave, or even sooner, for men are being encouraged to take up jobs as soon as possible after their release. The questions which have been causing concern to industry are first, how many and which key workers will be released under the Class B procedure, and secondly, how soon their industrial capacity can be diverted to peacetime production. Mr Bevin has given the general target of 60,000 "B" men within a year. The majority will be building operatives, but 50 per cent of the remainder will be directed to underground mining, in order to maintain the coal industry's labour force. The balance, which can only be very small, will presumably be made up of specialists. It is, however, anticipated that a considerable proportion of the craftsmen needed by industry will be automatically included in the early groups released in Class A.

It is still extremely difficult to make any estimate about the speed of reconversion. It will obviously vary from industry to industry, and from factory to factory, according to the extent to which it has been engaged on war production and on the degree of re-tooling and re-equipment needed to bring about the change of product. The labour situation will be more difficult for some industries than for others. Numbers of workers may take advantage of the relaxations which have just been announced to retire from industry. No obstacles will be placed in the way of the withdrawal of men over 65, women over 60, women with domestic responsibilities and married women who want to join their husbands. Women over 50 will be allowed to leave industry unless their firms need them for urgent production reasons, and women over 40 will not be regarded as "mobile." Workers who have been away from their homes for three years or more will be allowed to transfer to work nearer their homes. But unless a large number of those who are now entitled to withdraw their labour in fact decide to remain in industry, it is feared that the programme of replenishment and reconstruction may be delayed. The shortage will be particularly felt in certain sections of the engineering industry producing for household needs, in the clothing and textile industries. Indeed unless the cotton industry can expand its labour force, there is a danger that the clothing coupon will not be honoured. The Ministry of Labour is therefore appealing to employers not to get rid of their older workers, and to the workers not to rush from the factories, even if they qualify for release, until there has been a general demobilisation.

A few figures from the White Paper on the war effort will serve as a reminder of the extent to which the labour force of some of the consumer goods industries has been allowed to run down. From 1939 to 1944, the textile industries' manpower declined from 1,002,000 to 626,000; the clothing trades' from 587,000 to 349,000; and the number of distributive workers from 2,887,000 to 1,928,000. In all, the Group III, or less essential, industries lost one-third of their labour force and provided more than half the numbers required for the Armed Forces and a considerable proportion of the men and women required for the munitions industries. These facts indicate the scale of reallocation of manpower as between munitions and civilian production which will be necessary if anything approaching pre-war standards is to be aimed at.

Mr Bevin emphasised the need for continued control over the national economy during the transition period. The prosecution of the war against Japan, involving the conscription of younger men, and the need for orderly re-allocation of scarce resources so as to satisfy the essential needs of the community, are arguments which only the dithard anti-controllers would contest. It is in fact not now a question of control or no control, but of how much control and what control.

The Trades Union Congress is insisting on the retention of the maximum control over materials, prices, industrial location, trade and finance, but apparently wants the minimum control over the movements of labour. It has all along declared its opposition to the continuance of compulsory direction to work after the end of the European war, and is also pressing for the abolition of controls which carry with them penal sanctions. They contend, with some justification, that penalties have been enforced one-sidedly against the workers, while the employers have been relatively lightly treated. Instead, they advocate that an unemployed man who unreasonably refuses to accept a job should forfeit his unemployment benefit. This sanction might be of considerable importance in encouraging labour mobility in the normal year, but so long as labour is in a seller's market, it would be largely ineffective. Mr Bevin who himself has often expressed the view that the advantages of continued direction to work would outweigh its disadvantages has compromised, and the present proposals represent a measure of relaxation of the rigid controls which have of necessity been imposed upon the working population during the war. Obviously, to continue these controls in full would be politically inexpedient, however theoretically desirable it might be, and the Minister of Labour hopes that he will have a sufficiently effective and flexible instrument for the reallocation of labour in his new Control of Engagement Order.

This Order will largely supersede Regulation 58A, which gives the Ministry of Labour power of direction and which, without being cancelled, will eventually be kept in the background and only used if there is a serious emergency. The new Control of Engagement Order, which will be intro-

My Trustee

There is an intimacy and confidence expressed in this phrase. Can a corporate body create the same atmosphere? The answer is that it does and with the added advantage that it concentrates on every duty a specialised experience and that it ensures continuity of management from beginning to end.

The Royal Exchange Assurance will be pleased to act as the Executor and Trustee of your will, either alone or under a joint appointment with your personal Trustee. Your own solicitor can be retained. The fees are moderate and full particulars can be obtained from the Manager of the Trustee Department.

ROYAL EXCHANGE ASSURANCE,
Royal Exchange, London, E.C.3.

duced in a few days' time, means that men from 18 to 50 and women from 18 to 40 can only be taken on through Employment Exchanges. It is particularly designed to ensure that no employer will take more than a fair share of skilled labour, and would seem in effect to represent a check on the employer's freedom to choose his workers, rather than on the worker's to choose his employer.

The Essential Work Orders, which have been such a necessary part of the war economy, will be retained during the transition period, though they may not be applied to the same industries as at present. Indeed, the industries which have been of secondary or tertiary importance from the point of view of war production and were consequently drained of their labour, may need to be rebuilt through the EWO mechanism. The Orders now apply to over 8,000,000 workers, and their purpose, officially described as being "to prevent loss of production owing to unnecessary turnover of labour, absenteeism or indiscipline," would seem as applicable in the transition period as it was at the height of the war. The Orders have been criticised on the ground that they undermine labour discipline and managerial authority, but on the whole they have worked remarkably well. They contain, moreover, a number of elements which the unions would like to incorporate in their permanent agreements, such as the guaranteed working week, the right of appeal against discharges and the "fair wages and conditions" clause.

One wartime labour regulation, whose appearance excited a storm but whose disappearance has passed almost unnoticed and certainly unlamented, is Defence Regulation 1AA, aimed at the instigators of strikes. The argument originally raised against this regulation—that it was an unnecessary addition to existing powers—seems to have been justified by events. There has not been a single

prosecution under this regulation since it was introduced in April, 1944.

Another piece of wartime legislation which will probably disappear, though not before the end of the Japanese war, is the Conditions of Employment and National Arbitration Order, which prohibits strikes and lock-outs and provides for the reference of industrial disputes to the National Arbitration Tribunal. The unions have already declared their opposition to compulsory arbitration. The right to strike is the time-honoured method of enforcing demands and its abandonment in wartime (imperfect though it may have been) is regarded as one of labour's major sacrifices. The Wages Councils Act, which aims at strengthening industry's voluntary conciliation machinery, may have a restraining effect in the transition period. But whether arbitration is compulsory or voluntary, there will be some obligation on labour to refrain from exploiting the strike weapon in the transition period.

From every point of view the next six to twelve months will be a testing time for industry, and the test will be its ability to effect the readjustment speedily and smoothly, and to engage the men and women from the Forces and from war industries in productive employment. The return to party politics may have its counterpart in the industrial sphere, but continued cooperation between both sides of industry will be necessary in the immediate future as it has been in the immediate past. Industry too will have to turn its attention to the urgent task of raising its technical efficiency and show the initiative and enterprise of which it has so frequently boasted. For the Government, the duty is to keep a firm hand on the reins, but to guide and facilitate the path back to peacetime production and to make sure that a timid or cautious approach does not impede the process of reconstruction.

Russia 1815 and 1945

IT is almost a truism that the most severe test for any coalition of belligerents comes on the morrow of their victory over a common enemy, when the military links of their alliance weaken and old or new rivalries awaken. This is especially true after a war in which the downfall of the enemy thoroughly upsets an old balance of forces and creates a political vacuum, which each victor is inevitably tempted to try to fill to its own satisfaction. A historian writing on the aftermath of the Napoleonic wars described the diplomatic outlook in the years 1815-1818 in the following words:

... almost everywhere in Europe during these three years, their (i.e., Britain's and Russia's) policies apparently conflicted. The Czar, or at least some of his servants, engaged in multifarious activities which were in almost all cases hostile to Britain. There was a kind of diplomatic duel between the two countries which extended over a large area. At Paris they appeared to be rivals for the favour of Louis XVIII, at Madrid there was a fierce contest on which large issues hung, in Italy and Germany Britain supported Austrian influence against Russian, at Constantinople there were almost openly confessed divergences of view; the contest extended into Asia; and the struggle over Persia had already begun. It must be remembered that this was an entirely new part for Russia to play. Before the French Revolution she had appeared as a half-barbarous Power who had no relations with Western Europe. ... Now her influence was supreme and apparently increasing at half the Courts of Europe, and her agents were engaged in stirring up strife all over the West. No wonder, therefore, that many men accused the Czar himself of hypocrisy and trickery. His professions of Christian principles were thought to be merely designed to cover his far-reaching schemes of European domination.

To apply this entire description to the present relations between this country and Russia would probably be pushing the analogy too far. But the recent crises over Poland, Trieste, Austria and some of the other still brewing inter-Allied controversies inevitably recall the tense atmosphere in which Napoleon's victors quarrelled in the days of the Congress of Vienna. Even the words "hypocrisy and

trickery" have now and then been flung at Marshal Stalin; and here and there his professions of democratic, if not exactly of Christian, principles are being thought "to be merely designed to cover his far-reaching schemes of European domination." Yet the Congress of Vienna was followed by a very long period of peace between Britain and Russia. In spite of many tensions and conflicts between the two countries, only one minor and rather pointless war—the Crimean War—was waged between them for a century after 1815. Can it be hoped that the present controversies, too, will dissolve into a long, though perhaps not age-long peace?

After the defeat of the *Grande Armée* it was the expansive policies of Russia, then the greatest single military Power on the Continent, that bred the fear of Russia all over the Continent. Russian expansion was to be achieved at the expense of her own and Britain's Allies—Prussia and Austria, whose Polish lands Alexander I wanted to unite to his Kingdom of Poland. The secretiveness of the Czar's diplomacy, his tactics of taking his Allies by surprise, and his alternation of conciliatory attitudes and rude power politics caused confusion and embarrassment among his Allies. It is really striking how these traditional patterns have reasserted themselves in contemporary Russian diplomacy. On the Polish issue, for instance, Mr Eden might now well repeat the words spoken by Castlereagh:

The Emperor insinuated that the question could only end in one way, as he was in possession. I observed that it was very true, His Imperial Majesty was in possession, and he must know that no one was less disposed than myself hostilely to dispute that possession; but I was sure His Imperial Majesty would not be satisfied to rest his pretensions on a title of conquest in opposition to the general sentiments of Europe.

There are, however, essential differences between 1815 and 1945. In 1815 the Russians stood in Paris; at present their zone of occupation ends much further to the east—on the Elbe. A modern military occupation, on the other hand, involves incomparably more direct and comprehensive political control than any occupation did at the begin-

ning of the nineteenth century. Politically, if not territorially, the Russian expansion now tends to be less limited and less temporary. Its motives, too, are partly different. Czar Alexander was eager to uphold Russian prestige and national pride; he wished to be fêted as the chief victor in Paris. These same motives, undoubtedly, impelled Marshal Stalin to order General Zhukov to accept unconditional surrender from Keitel in Berlin. Besides prestige and national pride there was the Czar's anxiety to secure strategic benefits for Russia in Poland and in the Balkans. But here and there he had to contend with the strong resistance of the Austrian Empire, of Prussia and of the Ottoman Empire. Europe then was not quite the military vacuum which it is today if left to itself. And—finally—Alexander's policy of territorial acquisitions was, on the whole, not put forward as compensation to Russia for her own losses in the war.

In this last respect the present Russian policy is very different. This time there is a popular economic motive behind the Russian expansion. In order to understand the popular Russian mood behind Marshal Stalin's policy one ought, perhaps, to imagine what would have been the mood in this country if vast portions of it had been invaded by the enemy; if Britain had lost something like 8 to 10 per cent of its population in killed soldiers and murdered or starved civilians; if most of its coal-pits had been flooded and some of its most prosperous areas laid waste; if a very high proportion of its people—a fourth or perhaps a third—had been compelled to live in caves and earth huts; and if after all this the British people had succeeded in driving the enemy out of the country and in beating him down in his own land. Who can say with certainty that, after such sufferings and tribulations, even the British people, with their moderate temper and sober outlook, would raise no clamour for tangible compensation and would not fall a prey to some sort of irrational expansive dynamism?

★

This is not meant either to excuse or to blame Russian policies; it is merely an attempt to understand them. Russian foreign policy has evolved throughout the war under the potent pressure of economic motives. Marshal Stalin's stubborn endeavour to widen the sphere of Russian influence is, apart from its strategic objectives, designed to enlarge the material basis for Russia's post-war reconstruction. This would, of course, imply that the countries now lying within the purely military sphere of Russia are to be associated with the Russian planned economy. The sphere of influence thus tends to become a sphere of economic and social upheaval in which the economic structures of the outlying lands have to become adjusted to the Russian system. To take one instance, the industrial area of Greater Upper Silesia with its rich coal mines and great metal-manufacturing capacity may well be regarded as a substitute for the destroyed Donbas; its productive reserves may speed up the reconstruction of the Ukraine. Hence Russia supports the claim for the incorporation of Upper Silesia into a "friendly" Poland on the basis of the "adjustment" of Poland itself to the Russian planned economy. This would undoubtedly constitute some departure from "Socialism in one country," the doctrine associated with Marshal Stalin's name, and its gradual replacement by "Socialism in the Russian zone." On the other hand, such a policy would seem to indicate that the hope for Allied credits and Allied co-operation in Russia's reconstruction is now no longer very seriously entertained in Moscow; and also that not very great hopes are set on the contribution which reparations from Germany can make towards reconstruction. Implicitly, the emphasis in Russian economic policy seems to be back on self-sufficiency and isolation, but on self-sufficiency and "isolation" within an area considerably wider than that of pre-war Russia.

The strategic motives and fears with which Russian policy seems to be riddled coincide with the economic aspirations. The whole effort of Soviet diplomacy is now concentrated on the creation of a vast defensive *glacis*, stretching from the eastern and central Baltic to the Adriatic sea. Stettin is to serve as the westernmost bastion

in the north, and Trieste in the south. Every territorial claim that may strengthen and widen the defensive *glacis* is sponsored and encouraged, no matter how justified or unjustified the claim seems to be by ethnic or political standards. The nationalisms of the small nations are stirred and kindled to the utmost. The Yugoslavs are encouraged to insist on the incorporation of Trieste and Carinthia. Austrian nationalism, too, must have its reward, and so the demand is raised that Austria should regain the whole of the Tyrol from Italy. Poland, pushed back beyond the Bug in the east, is to reach out for the Oder and the Neisse in the west, while Königsberg is to become purely Russian.

Against whom are these strategic bastions being erected? Germany, beaten and prostrate, can by itself hardly constitute any danger to Russia for many decades to come. The fear that seems to dominate all Russian policy is the fear of an anti-Russian coalition of which Germany might be the spearhead. One of two policies must spring from this fear. Russia must either attempt to destroy all German military potential so radically that even in a coalition with the West the German potential would be a negligible quantity, by modern technical standards. This conception underlay the Russian demand for a Carthaginian peace. Since the achievement of this purpose does not seem to be feasible—the reduction of the strongest industrial Power on the Continent to complete industrial impotence is, for physical and economic if not for political reasons, an almost impossible policy—the logical alternative to it is a policy designed to bring about, sooner or later, a link-up between Russia and Germany. No sober observer of the Russian policy towards Germany can fail to realise that Moscow has been exploring the possibilities of a switch over from the one policy to the other. Though such a switch-over may be dictated by the logic of Russian foreign policy, its practical execution undoubtedly presents very great difficulties. A policy of some reconciliation with defeated Germany would have to bridge over a terribly wide gulf between the two countries, a gulf created by the unspeakable horrors of the war in eastern Europe. The events of the last days of hostilities, when guilt-conscious and fear-stricken masses of Germans surrendered to the western allies, but not to the Russians, threw a glaring light on that gulf. To start an effective policy of reconciliation the Soviet Government would now have to overcome a strong psychological resistance in Russia itself; and it could hardly dispel the deeply rooted German fear of Russia otherwise than by a rather over-generous treatment of the defeated foe.

The final choice of policy has probably not yet been made. The more determined and unrelenting has been the Russian effort to organise the absolute Russian hegemony in all the countries of the "middle zone" between Russia and Germany. That this effort is being made in more or less open disregard of the policies of the western Allies and of the sentiments prevailing in their countries, and even in disregard of ordinary politeness, is quite obvious. The style of Russian policy is marked not only by fear, but also by something of that "dizziness from success" for which Marshal Stalin has sometimes blamed his closest associates and followers. The two moods—fear and dizziness from success—are not likely to be the best advisers to the makers of Soviet foreign policy.

Inter-Allied diplomacy is now opening a new chapter which will undoubtedly be filled with the political conflicts, the pressures and the counter-pressures which inevitably accompany the creation of any new world-wide political balance. Never before have the statesmen and diplomats of any coalition been confronted with a task so prodigiously difficult as the one with which the Allied leaders have to cope now. The sources of tension and the potential storm centres are scattered all over Europe. Clarity of thought and a careful choice of ends and means are now as urgently needed in the field of diplomacy as they were needed in military strategy when the defeat of Germany was being planned and prepared. Coping with a similar task in 1815, Castlereagh used to say that "the climate of Russia is often the more serene after a good squall." We are quite obviously in for a few "good squalls." Let us hope that, after that, the climate of Russia will become "the more serene."

NOTES OF THE WEEK

Big Three Again ?

There are hints and rumours of a Big Three meeting. Little resulted from the Yalta Conference, and it is not easy to say whether a new Conference at this stage would have a more positive outcome. Yet the three Great Powers have so obviously drifted into a crisis of confidence that possibly a meeting of their heads of state might persuade Stalin that his friends are not preparing a stab in the back and the Western Allies that Russia is not planning to fill Hitler's vacuum with its own New Order.

All the crises of recent weeks—Poland, Trieste, Carinthia, Ruthenia—bear the marks of fear. Distrust on each side is breeding more distrust, and the outcome of distrust is "protective" action, which can look dangerously close to provocative action. The virtual incorporation of Europe east of a line drawn from Stettin to Trieste into the Soviet system is a function of the Russian Government's waning confidence in Western co-operation. But this whole strategy makes it more certain that the Western Powers will draw still further away from Russia.

Can anything be done to arrest this fatal drift? The question of a German Administration is still unsolved, and the possibility of two rival German Governments—one Russian-sponsored, the other backed by the Western Allies—could split the alliance wide open. For this reason alone, a new meeting of the Big Three is essential. It will, however, achieve a real success only if the British and American leaders have a firm policy of their own.

No Darlan for Germany

For a long time now it has been obvious that trouble would brew for the Grand Alliance if they allowed a "Lublin" situation to arise in Germany, with two rival governments. It can be disputed whether at first any central administrator ought to be appointed, difficult as it would be to carry on military government without a German civil authority. But if there is to be a central administration obviously it must fulfil two conditions. It must be acceptable to all the occupying Powers; and it must be entirely non-Nazi and non-military.

It is therefore good news that the self-styled Fuehrer, Admiral Doenitz, is being held both as a prisoner of war and a war criminal and that the British and the Americans have at no time recognised his government, which contained confirmed Nazis such as Speer, Backe and Seldte, and represented a coalition of Nazis and high military officials. The team was so obviously unacceptable that one may well ask why its pretensions were not immediately denounced.

It is, of course, possible that in the general confusion of surrender, the German generals and their Nazi allies were able to attempt a peculiar and grotesque *coup d'état*, seizing a non-existent state with the aid of a non-existent army. If so, the problem still remains why an immediate denunciation did not come from Shaeff. General Eisenhower was quick to prohibit fraternisation between his own officers and captured German generals; but the Doenitz issue was far graver and should have been more promptly denounced. The sudden visit of General Eisenhower and Field-Marshal Montgomery to London suggests that new political directives had to be issued at the highest level.

The whole incident throws a disturbing light on the political advisers now attached to Shaeff. The responsibility for tendering advice on non-military matters rests with Mr Ivone Kirkpatrick and Mr Robert Murphy. It is only a presumption that they did not immediately warn General Eisenhower of the very grave dangers inherent in any leniency towards Doenitz's claims. Yet Mr Murphy's connection with the Darlan episode is not altogether irrelevant. The excuse made in London for the failure of the British and American Governments to denounce Doenitz was that by appearing to accept his authority, they would be able more quickly to secure the surrender of the remaining German U boats. This very much resembles the basic argument of Darlanism—that a temporary military advantage is worth a disastrous long-term political risk. Such an approach betrays a disturbing failure to grasp the under-

lying ideological issues of the war. To accept ex-Nazis and war criminals in any official capacity is to take the heart out of the non-Nazis, to disquiet all the Allies and even to encourage the Russians to launch an experiment with a Paulus or a Seydlitz of their own. Only a really stupendous military advantage would be worth such a risk. Today, no such advantages remain.

Mr Churchill on Ireland

Almost the only passage of Mr Churchill's broadcast that could be regarded as at all controversial was the passage relating to Eire, and people have naturally been asking what can be happening behind the scenes to justify it. The probability is that nothing is happening behind the scenes, and that the Prime Minister was merely giving expression to the universal sense of outrage at Mr De Valera's egregious act in offering formal condolences on Hitler's death.

Mr Churchill's approach to the Irish matter (it is no longer an Irish problem) was that of the great majority. The high indignation of 1940-41 had somewhat died down under the double influence of the gallantry of individual Irishmen and of the element of benevolence in the official Irish policy of neutrality which grew larger as it became more evident which side was going to win. But any softening produced in this way has been wholly cancelled out by a single act of ceremonial foolishness. What is left is a feeling of relief that it was not ever quite necessary to lay hands on Eire, a hope that it never will be, and a profound thankfulness that Northern Ireland remained part of the United Kingdom. This last feeling, it should be noted, is shared by the great majority of former Home Rulers, and it has nothing at all to do either with admiration for the Orangemen or liking for their party dictatorship.

By their official behaviour in these last few years, the Southern Irish have thrown away any chance they had of enlisting English support for putting an end to Partition. In fact, they have probably thrown away the power to stir any English interest in their affairs. If ever a country wanted complete moral isolation, none can ever have been so successful in achieving it. And since that is what Mr De Valera has always said he wanted, everybody ought to be happy. The lifting of the censorship in Eire will give the Irish people an opportunity to find out whether they really like their position in the world.

Issues Before Labour

Contrary to general expectation, Mr Churchill did not drop any hint about the date of the General Election in his broadcast speech on Sunday. He may not have wanted to drag controversy into his review of the war, or it may be that no decision has yet been reached. But the parties are still left very much in mid-air, and it would certainly be awkward for the Labour Party if it met in conference on Monday without knowing if it has four weeks or four months in which to complete its election preparations. This, indeed, may be part of the Tory calculation, and by no means unfair, as the Labour Ministers have it within their power to postpone the election by staging a stay-in strike and simply remaining in office.

Whether the election is held in July or October, however, this year's Whitsun conference will certainly be the last party conference before the election, and the discussions will inevitably be concerned mainly with election policy and plans. It seems doubtful if the question of electoral agreements with other parties against the Conservatives will even be raised at Blackpool, for, under the three-year rule, this issue, which was apparently settled at the December conference, can be ruled out of order. But certain events in recent weeks will strengthen the hand of the advocates of "Left unity." There was the success of the Common Wealth candidate at Chelmsford, a seat which will undoubtedly revert to the Conservatives, if, as is now threatened, Labour, Liberal and Common Wealth candidates all stand. Then there was the resolution carried by the Distributive Workers' union, which has a high proportion of membership affiliated to the Labour party, in favour of electoral

agreements, and the results of a Gallup Poll, showing a large majority in support of a Popular Front. Lastly, the decision of the Labour candidate at Bridgwater not to oppose Mr Vernon Bartlett because of his progressive views, has just been made known. But there is no real reason to suppose that the adamant refusal of the Labour Party machine to contemplate anything of the sort has been in any way weakened. The party has always put purity above success in the past, and still does so to-day.

The Labour Party conference agenda itself seems dull and gives very little indication about what the main issues at Blackpool will be. Partly because of the slow working of democratic procedure, many of the resolutions on the agenda have already been out-dated by the European victory. But, apart from the election, which will be the main issue, two matters, not on the agenda, should provide copy for the journalists. One is conscription. Labour Party and trade union leaders discussed what their attitude to conscription should be after the end of the Japanese war at a special meeting last week and, according to reports, there is by no means unanimous support for Mr Churchill's announcement that conscription will continue. The other matter, rather more personal than political, is Sir Walter Citrine's outburst against Mr Attlee at San Francisco. This is regarded by many Labour people as a gaffe and an unfortunate indication of cleavage so near to the election. But Sir Walter, however egregious he may be, is rather too eminent in the movement to be publicly rebuked.

Party Programmes

The Conservative Party machine is also getting into condition. It has already produced 480 prospective candidates, and hopes to find 120 more before the election. The Conservative Party's programme, on the other hand, is still lamentably vague. Its latest exponent, Mr Oliver Lyttelton, speaking at Exeter on Friday of last week, produced a draft plan of campaign that had no more cohesion than an old-time music-hall poster. The starred item was Mr Churchill. He was supported on the bill by Private Enterprise with Minimum Control, Healthy Agriculture—"it eases from day to day the burdens which the need to import food imposes on us"—Vigorous Export Policy, Social Insurance, Financial Stability and a chorus of protest against the theme of Nationalisation.

All this repetition of general aims and objects—many of which might have been lifted from Socialist declarations, though different methods are proposed—is disappointing. Perhaps the Conservatives intend to remain unstudiously vague about their policy and to rely entirely on the superior attractions of their leader. If so they may be underestimating the intelligence and temper of the electorate. There have been abundant signs in recent months that Socialism—even of the visionary brand—is much more palatable to a war-weary public than tentative Conservatism. So is it too much to hope that the Conservative Party will produce a really workable plan of campaign before the election?

In his capacity as Minister of Production, Mr Lyttelton was more revealing. He said that some peace production could begin immediately not because the defeat of Germany brought British commitments to an end, but because it is physically impossible to bring the full power of the 5,000,000 munition workers mobilised for D-Day to bear on the Japanese. The very distance of the Japanese theatre of war makes total war mobilisation in Britain both unnecessary and impracticable; and here, as in America, redundant labour can be set free immediately to tackle the first of the manifold problems of reconstruction.

Trieste and the Powers

The question of Trieste is one more instance of the tension between the Great Allies. Locally, it is a dispute between Italy and Yugoslavia. Internationally, it represents a cleavage in Great Power policy, the Russians encouraging Marshal Tito to attempt a unilateral solution by force, the British and the Americans supporting Signor Bonomi in his temperate appeal that the question should be solved at a Peace Conference after the election of free Governments in both Italy and Yugoslavia.

There can be no question that in this instance the Italian, British and American Governments represent the way of sanity and moderation. Responsible opinion in Italy admits

that changes must be made in favour of the Yugoslavs along the frontiers of Venezia Giulia. Many Italians would accept an autonomous status for Trieste, resembling the settlement of the Danzig question. What is inadmissible to all save the Italian Communists—who are badly out of step with Italian opinion—is that Marshal Tito, by marching his Yugoslavs into Trieste and bringing into the city Croats and Slovenes from the surrounding countryside, should seek to annexe Trieste and to put 140,000 Italians under 40,000 Slovenes without reference to Italy or the Great Powers.

At present the situation is frankly unsatisfactory. The Yugoslavs control and administer the town of Trieste and have forced the Italians into quiescence and even hiding. British troops fully control only the harbour. It is imperative that the Allied armies—with Yugoslav representation if necessary—should at once extend their control to the whole area.

Friction in Austria

Carinthia has the same social and ethnic structure as many other Central and East European lands, and presents a similar problem. The dominant race—Poles in East Poland, Italians in Venezia Giulia, Austrians in Carinthia—form the landlord class and the great majority of the urban population. In the countryside dwell the Slav peasants—Ukrainians and Slovenes. It is this sharp social and ethnic division that makes so difficult the clear drawing of national frontiers or the sorting out of racial claims and counter-claims. The final solution tends to represent the relative balance of forces in Europe at the end of any particular struggle; to forecast accurately the settlement in any disputed area, it is necessary to know not only local conditions, but how deeply the interests of the Great Powers are implicated, and to what extent they are ready to force the issue.

In Trieste, the line between Russian and Western pressure and Yugoslav and Italian policy is easy to determine. In

The Greatest Good is Prudence; a more precious thing than Philosophy. From it spring all the other virtues. Epictetus.

If the function of modern banking could be described in one sentence it could not be better summarised than as the centre of activity in the exercise of this great virtue by the people, for the benefit of themselves individually and of the whole nation.

Prudence does not of course, mean hoarding or mere defensive saving. As a Lord Halifax of three centuries ago said: "Wise venturing is the most commendable part of human prudence."

Your banker is backing wise venturing from hour to hour and will take a leading part in the recovery of peace with plenty.

MARTINS BANK

LIMITED

LIVERPOOL, LONDON and Branches

Carinthia the position is much more confused, for Austria as a whole is at present an area of pressure and counter-pressure between the Great Powers. The Allies still do not recognise the Renner Government, and there are disquieting rumours that they are playing with the idea of an alternative administration under Schuschnigg, the former right wing Chancellor of Austria. In Graz, in the British zone, a "pro-British" Government was set up before occupation, with local Socialist and Catholic backing. Then the Russians occupied the city, and no more was heard of the new administration. Finally, in Carinthia, Marshal Tito, who seems to be acting rather as the Russians' agent, is claiming the whole area, on account of its Slovene peasantry, and has put troops into Klagenfurt alongside the British occupying forces.

These dangerous complications cannot be solved locally. The proper solution is the formula proposed for Trieste—settlement at a peace conference, after free elections in both countries. A plebiscite successfully settled the frontier issue in Carinthia after the last war, when 60 per cent of the people in the most Slovene areas of Carinthia voted to remain in Austria, and against inclusion in the new Yugoslav state. The relative attractions of the two countries may have slightly shifted since then; but local plebiscites will occur only as a result of Great Power agreement. The first necessity is then to redetermine the zones of occupation, and then to arrange for an impartial control until a plebiscite or some other method of final demarcation can be fairly arranged. The alternative is perpetual friction, and even the outbreak of local war.

Coal Questions

Victory celebrations, European politics and demobilisation have tended to obscure the fact that the nation is once more faced with a serious coal crisis. It is now plain that there cannot be a debate on coal until after the Whitsun recess—and not before it, as had originally been intended. Whatever the reasons the delay is deplorable, because the speed of reconstruction both at home and in Europe depends largely on the measures which can be taken immediately to restore British coal production. It is now nearly two months since the Reid report was issued, and the House of Commons has not yet had an opportunity to discuss it. It is true that the report is concerned with long-term rather than with short-term solutions. But a start must be made, and the longer the delay, the less likelihood is there that a coal shortage can be avoided this winter.

It seems that the sub-committee of owners and miners, which was set up last winter, jointly to investigate the causes of falling output, has fallen into abeyance. The committee met at Christmas, and then purely formally, though a second meeting is now planned. It may be that things have gone too far for this kind of approach to be of any value—in any case, the chances of successful co-operation would seem to be slight—and that nothing short of drastic Governmental action will produce any results.

Some indication has, however, been given about the manpower situation. The Bevin ballot has now been suspended, and youths will no longer be directed to the mines instead of the Forces, though they will still be allowed to opt. Few tears will be shed at the passing of the Bevin boy scheme, which has not been one of the most successful episodes of the war, though it is claimed that the 20,000 Bevin boys in the industry have enabled 11,000 men to be upgraded to the coal-face. Bevin boys already at work will be treated like other boys in military service, and will be released with their age and service group. The Government has decided to direct a number of miners under Class B to underground mining, and it is also probable that a considerable proportion of miners, who joined up in 1940 and are likely to be in the older age groups, will be included in the first Class A groups to be released. To maintain, or even to increase, the number of men in the industry is, however, only one side of the problem. It is equally essential to increase the output of each man. Until the thorough technical and organisational reform advocated by the Reid Committee is put into operation, the coal problem will be as far from solution as ever.

Training Building Labour

Details of the Government's scheme for training adult able-bodied men, for the building industry, on their release from the Services, have now been announced. After six months' training at a Government centre, during which

maintenance allowances will be given, there will be fourteen months' practical training, on actual building work, during which wages slightly below the normal skilled craftsman's rate will be paid. After these twenty months, trainees will be accepted by both sides of the industry as skilled craftsmen.

The Government's aim is eventually to train 40,000 craftsmen a year under this scheme, though there is some likelihood that the rate of training will be slowed down because of a shortage of instructors. The Ministry of Labour is therefore appealing for qualified teachers to give instruction at the Government centres in the seven main building crafts.

This special, short-period training is entirely separate from the ordinary long-term apprenticeship scheme, under which it is proposed to train 25,000 apprentices each year, in order to offset the wastage among building craftsmen, and to maintain a proper proportion between labourers and craftsmen. This scheme, too, may suffer from a shortage of instructors, and special arrangements for increasing the number of teachers both for junior and senior courses are now being worked out between the Ministry of Works' Building and Apprenticeship Training Council and the education authorities.

If the intended rate of recruitment and training under these two schemes is achieved, it would mean a net addition of 65,000 craftsmen annually. The Government's aim is to expand to 1,250,000 men the permanent size of the building labour force, which is now down to about one-third of its pre-war size. There is obviously a danger that an inflation of the recruitment rate to accord with this target, and to meet the pressing needs of the industry, might be succeeded by an equally drastic deflation, with consequent unemployment. In this process, the ex-Service men, who entered the industry by the special channels, and not under the apprenticeship schemes, would probably be the first to suffer. It might, therefore, be wiser, even at this late hour, to scale down the programme of recruitment to more manageable proportions, so as to ensure that those who do enter the industry can look forward to some stability and continuity of employment.

The exceptional plans to use prisoners of war on non-constructional work, such as road-making, sewerage and site clearance, do not, of course, affect the issue, since they will not represent any permanent addition to the building labour force. Nor is there any question of German prisoners being used as cheap labour. They will be paid trade union rates; the money will go to the War Office, which will deduct the cost of feeding and billeting, leaving the prisoners with 1s. for an eight-hour day for skilled and 6d. for unskilled workers, as laid down in the Geneva Convention.

Ordeal by Water

Britain is plentifully endowed with natural resources of water, both above and below ground, yet its urban dwellers have several times in the past few years been threatened with the danger of drought, while at least a seventh of all rural dwellers lack any proper supply at all. A start has at last been made towards improving this deplorable situation. The Rural Water Supplies Act of last year provided £21 million of public money for the extension of piped supplies to villages and hamlets. The more ambitious Water Bill, which has now completed an unspectacular course through the Commons, will set in motion an elaborate and exhaustive survey of the nation's water resources of all kinds. Both money and research are clearly important; but the reorganisation of distribution, which the Water Bill is also concerned, is far more important and has been handled far less satisfactorily.

The basic problem here is the excessive number of supply undertakings and their lack of co-ordination. As long ago as 1908 a Royal Commission saw complete centralisation of distribution as the only workable solution. The Water Bill goes so far as to enable the Minister of Health to amalgamate supply undertakings, to force one undertaker to sell bulk supplies to another, and in the last resort to deprive of its powers any undertaking which does not furnish a satisfactory supply. But experience has shown that powers of this type are always sparingly used; and in this case the number of statutory undertakings is so great—there are over 1,000—that a few piecemeal changes, however useful, can do little to energise the system. It should not be assumed that private water companies are the main stumbling-block. In most cases local government areas are quite different from, and smaller than, the natural catchment

area; yet only about 50 joint boards have been formed, while over 700 local authorities continue to organise their supply independently. Such a situation leads to overlapping and misuse of available resources, and stands in the way of the development of a national water grid. The Water Bill will enable the nation's resources to be ascertained and to be protected from pollution; but it will go only a little way towards seeing that they are fairly and efficiently distributed.

My Brother's Keeper?

The Foreign Secretaries of the Four Great Powers have left San Francisco. They have achieved a measure of agreement on a number of points—for instance, the representation on the Council of the Middle Powers—but two important issues are still unsettled—the relation of regional pacts to the general security organisation and the problem of trusteeship.

Unfortunately the handling of these two topics does not bode well for the spirit in which the Powers are to work their international system. That each should fight to defend its own interests is understandable and was to be expected. What is really alarming is the anxiety of each to counter and thwart the interests of others. In the discussions on regional pacts it soon became clear that while the Latin American republics were anxious to exclude the Act of Chapultepec almost entirely from world supervision, they were strongly in favour of close supervision of alliances and regional blocs elsewhere. Similarly, the Russians attacked Chapultepec while defending their security pacts in Eastern Europe. Will the result be a system devised to supervise all regional arrangements closely, save those worked out by the Americas and the Soviets—in other words, to supervise the British Empire and Western Europe?

On the question of trusteeship, the United States is in essence endeavouring to tighten up very much the international supervision of mandates, and at the same time to exclude from supervision any mandates it may secure for islands in the Pacific. The Americans' desire for a free hand is understandable, but why should they try at the same time to tie both hands of the older mandatory Powers?

From the reports available, it is not easy to make a clear picture of the British attitude, but it seems that on the question of trusteeship the British delegation has very largely accepted the Americans' proposals and thus completely failed to make clear to them how inconsistent and illogical their position is. Mr Eden has earned praise for his work as negotiator and oil-pourer. But is honest brokerage always enough?

France Looks for Trouble

It is right that the British and the American governments should be concerned at the Yugoslav attempt to impose a unilateral settlement on Trieste. It would, however, reassure public opinion at home—and possibly a watchful Russian Foreign Office—if they were equally emphatic in checking what begins to look like an unworthy manoeuvre on the part of the French. On the frontiers of Northern Italy, in an area already completely freed of Germans, largely by the Italian partisans themselves, the French have set up an AMG—in the valley of Susa and Aosta—which is apparently being used as a cloak for straight annexation. Similar happenings are reported from the Riviera. The inhabitants are being asked to state the preference for French or Italian nationality, and the issue of a ration book is dependent on the right choice. Italian officials are being dismissed, French currency introduced and there are even reports that the large electricity stations in Val d'Aosta are being modified to switch the current from Italy to France.

The French explain their peculiar activities by saying that they are not bent on annexations, but that they were not signatories of the Italian armistice, do not feel bound by it and, while deferring frontier questions to the peace conference, must take precautions "against an Italian attack."

Such explanations ring singularly hollow after twelve years of Nazi diplomacy. It is tragic, indeed, that General de Gaulle should feel compelled to re-assert the greatness of France by methods which can only undermine it.

Emergency and Transitional Powers

The Order-in-Council revoking certain defence regulations, which had not been published when *The Economist*

went to press last week, is now available (SR and O 1945 No. 504). Altogether 84 of the Defence (General) Regulations 1939 have been wholly revoked, and 28 more partially revoked. Among the more important ones not mentioned in last week's Note (page 629), are Regulation 1 AA, making it illegal to incite workers in essential services to strike, which was severely criticised when it was made in April, 1944; 18 AA, giving power to control and wind up organisations subject to foreign influence or control or whose controllers are associated or in sympathy with a hostile government; 29 A, giving the Ministers concerned power to coordinate and control certain civil defence functions of local authorities; 38 A, imposing the death penalty for looting; 94 B, giving power for the seizure of printing presses used by newspapers publishing matter prejudicial to the war effort; and the regulations enabling very wide powers to be given to Regional Commissioners. In addition, several of the special sets of defence regulations have been revoked in whole or in part. These include the Defence (Fire Guard) Regulations of 1943 and the Defence (War Zone Courts) Regulations of 1940.

The Emergency Powers (Defence) Acts, under which these regulations were made, and could be re-made if necessary, are still in force. So, too, are the vast majority of the regulations made under them "for maintaining supplies and services essential to the life of the community." In particular, these include the regulations giving the Government virtually complete powers over industry (54 C and 55) and over the services of every man, woman and child in the country. To what extent, and for how long, such economic controls will be necessary after the end of both wars is not known, but a Bill introduced in the House of Commons last week—the Supplies and Services (Transitional Powers) Bill—enables any of the regulations imposing such controls to be used, not only for the prosecution of the Pacific war, but also for the equitable distribution of supplies and services at fair prices, for facilitating the readjustment of industry and commerce to peacetime requirements, and to assist the rehabilitation of Empire and foreign countries that "are in grave distress as the result of war."

No new defence regulations can be made under the new Bill, which is to remain in force for two years in the first

Conserving THE FOOD VALUE of our Milk

FRESH DAIRY MILK consists of two elements—water, which averages 87½%, and 'MILK SOLIDS' (fat, protein and milk sugar). As the chart shows, Cadbury's Milk Chocolate retains all the MILK SOLIDS of all the milk used, and only the water is eliminated. It is easily kept and transported and requires no elaborate packaging. It retains the full food value of the milk almost indefinitely without special storage or canning.

Cadbury means Quality

place and will then be renewable for a year at a time; but existing regulations can be adapted for the new purposes. It is further provided that Parliament may have forty days in which to annul a regulation, instead of the twenty-eight allowed under the Emergency Powers Acts, and that in future every subordinate Order made under all defence regulations shall be placed before Parliament and be subject to annulment.

★

The second reading of the Bill should give Mr Morrison an opportunity to indicate which of the defence regulations it is intended to retain. The position of the Defence (Finance) Regulations, which are apparently not included in the powers given by the new Bill, also needs clearing up. Another dubious matter is the position of civil servants. Sir John Anderson announced this week that a new regulation—58 AAA—will prohibit any whole-time civil servant under the age of 60 from leaving his employment except with the consent of his, or her, Department or of a National Service officer. This, he said, will have the effect of bringing the non-industrial civil service into line with undertakings scheduled under Essential Work Orders. Does this mean that, in accordance with one of the provisions of those Orders, the persons coming under them must be paid the rate for the job—in other words, that temporary civil servants will henceforward be able to claim the same salaries as their permanent colleagues?

★ ★ ★

Colonial Minerals

It is regrettable that more publicity should be given to the somewhat theoretical questions of trusteeship and mandates at present being raised at the San Francisco Conference than to the far-reaching question of colonial minerals debated in the House of Lords on Tuesday. The debate turned largely on the ownership of mineral rights, and three out of the four speakers urged that in all the colonies they should be vested in the state. This is not a matter of political theory. The colonies are poor; their minerals are one of their few rich assets—in Northern Rhodesia, in 1938, mineral exports accounted for 99 per cent of total exports. Yet only a small proportion of this rich but wasting asset accrues to the colonies in the form of wages or taxation. If the mineral rights are vested in the state, at least it will be able to collect royalties on concessions worked—in Northern Rhodesia, royalties are paid to the British South Africa Company, which owns the mineral rights, and amounted sometimes before the war to a sum equal to the wages paid to the Africans employed on the mines.

It is true that there would be no financial gain where existing mineral rights are bought by the state, which would have to pay compensation. But there might well be other less calculable gains. How, for instance, can a government develop its territory if it has no say in what minerals are to be exploited? There are instances of unworked bauxite deposits in the colonies, and it could be made a condition of the grant of a concession that the concessionaire should show good cause why the concessions were not being developed. The new Nigerian mining ordinance vests the ownership of all minerals in the Government and provides that a lease cannot be granted for more than 21 years. A similar ordinance might well be made throughout the colonial empire, at least in respect of future mineral rights, and the advantages and disadvantages of buying out existing owners of rights should be thoroughly investigated. It is no answer for the Colonial Office to claim that local governments now supervise labour conditions in the mines or for the mineowners to claim that the welfare of their labourers is properly provided for. The point is that mining operations, particularly in Africa, have very far-reaching consequences on the economy and social conditions of a colony, and colonial governments ought to have some control over them from the beginning.

Food Cuts

The end of the European fighting had given rise to the irrational hope in some quarters that food rations in this country would somehow be increased. Perhaps the almost immediate announcement of the restoration of the basic petrol ration was fuel to this hope. Now, once again, it has been denied that any increase can be expected; and more, Colonel Llewellyn's statement last Tuesday makes it plain that there will be even less food than before. The facts are

simple enough: the United Nations, now that the war in Europe is over, have more mouths to feed and the last year of war has produced poorer harvests almost everywhere.

This country has been well enough fed during the war to maintain its health unimpaired. During the last eighteen months or so it has been possible even to increase the variety of its diet. In view of this, it is scarcely too much to expect that as a thank offering some further sacrifice should be made to help feed the unfortunate peoples of Europe. The greatest shortages are in meat, fats, dairy produce and sugar. Of these foods a reduction in fats would probably be the greatest hardship in Great Britain, but if there are others receiving even less than the 8 oz. ration current here, a more equitable balance must be found. The time has come—indeed, is overdue—when there should be laid down a minimum standard of diet below which no dweller in a liberated country should be expected to fall.

At the same time, the best hope for the adequate feeding of the world is to increase food production. Demobilisation and repatriation will help. In addition, machinery, fertilisers and other agricultural equipment must be sent as speedily as possible to those parts of Europe which can make best use of them.

★ ★ ★

Petrol

The promised restoration of the basic petrol allowance, described by Mr Churchill as this "modest indulgence," has given unmitigated satisfaction to a public long inured to the irksomeness of war transport. This consolation is more important as a foretaste of the comforts of peace than as a mere relaxation of control. The return of the civilian car will greatly ease the daily burdens of fetching and carrying, and journeys by train and bus will become less of a scrimmage. But the return of the tradesman's van will do most to please the long-suffering housewife. During the war Shanks's pony has done yeoman service. It has suffered under every scheme to "rationalise" retail distribution. Now it is to be afforded a measure of relief.

Before the trickle of petrol becomes a flow there will be many repairs and renewals to be effected. For a long time the breakdown gangs will be busy. But this may be a blessing in disguise. It would be courting disaster on the roads to allow transport to switch over suddenly to the conditions of 1939. In five years the nation's road sense, never conspicuously good, must have suffered serious deterioration.

Shorter Notes

During the committee stage of the Family Allowances Bill last week an amendment was passed making the allowance payable to the mother.

★

The Government order for the purchase of 50,000 temporary aluminium houses will enable large quantities of "secondary" and scrap material left over from war production to be usefully employed. Orders may be placed eventually for permanent aluminium houses.

★

A Note in *The Economist* last week (page 628) discussed the case of *Kemp v. Minister of Pensions*. It was announced in the House of Commons on May 10th that Mrs Kemp, widow of a merchant seaman, who was killed in circumstances that did not entitle her to a war pension, has been paid by the shipowners the full amount that would have been paid under the Workmen's Compensation Acts if her case had fallen under these Acts. This gratuitous payment does not invalidate the statement in the Note that the facts disclosed an unfortunate loophole in the Pension Acts. But it is satisfactory to know that in this particular hard case justice has been tempered by generosity.

As there is now a long waiting list for *The Economist*, subscribers who wish to renew their subscription are advised to do so before the date of expiry. If they fail to do so, their subscriptions will be automatically cancelled as soon as that date is passed, and this may mean a gap of many months before the despatch of copies can be resumed.

AMERICAN SURVEY

The New President

(From Our Washington Correspondent)

WITH the passing of the first shock of that mid-April week-end when Franklin Roosevelt died, it was as if on the screen of American public life a newsreel, done in black and white, had succeeded a feature done in technicolor. The audience is still mostly interested in identifying people. The cast of the feature were well-known stars. The newsreel does not even have the same clarity of focus on the central figure. And there is no indication at all as to who are those men on his right and on his left.

What is going on? The drawing of past parallels has, of course, been busily undertaken. Johnson and Coolidge are the two Vice-Presidents-become-Presidents on whom most interest has centred—the former as successor to the only other President to die in wartime—also in mid-April—with a reconstruction period ahead; the latter as another rural townsman whom fate suddenly touched.

Neither parallel is very compelling. The hatreds that descended with Lincoln's office do not seem to be part of Mr Truman's inheritance. Part of the strength that he brought to the Vice-presidential nomination last summer was the Truman Committee's critique of the administration—by taking him in, the ticket came as near as the American system permits to including the opposition in the government. Moreover, Roosevelt as a war leader commanded wide respect across the country; during the war years the New Deal had very largely withered away, and upon occasion been thinned out; and Roosevelt's post-war programme, unlike Lincoln's, had not been sufficiently defined, particularly in its domestic aspects, to become the centre of controversy.

The Coolidge comparison is closer; both men share the background of small town life in a not-too-prosperous agricultural setting. Both came up, politically, the regular way; neither, before entering the Presidency, had very broad acquaintance with the other main features of the national life, nor with the world abroad. Yet the slogan "Keep Cool with Coolidge" seems unlikely to be revived in some such phrase as "Be True with Truman." Political non-participation in the economic process is generally agreed to be impossible at home; and to foreign correspondents who were recalling Coolidge's famous monosyllables about the World War I debts, Mr Truman's endorsement of the Bretton Woods idea at his first press conference came as something of a correction.

For the international documents that are currently in the works—Bretton Woods, Civil Aviation, Food and Agriculture, Dumbarton Oaks—there could probably have been no more favourable development than Mr Truman's taking office just at this time. However much the distance from Capitol Hill to the White House may lengthen as time goes on, for the present it will be only five minutes by taxi, and no one will have forgotten in which direction the first trip was made. The fact that the new President's immediate friends are politicians—and they come from both sides of the aisle that divides the parties—gives new content to the words "advice and consent"; more than for a long time, the advice is likely to be sought, and the consent to be given.

In this connection, the name of Jimmy Byrnes has been the subject of almost as much talk as that of Mr Truman himself. It is highly likely that Mr Byrnes, the ex-Senator, the ex-Supreme Court Justice, the ex-Director of the Office of Economic Mobilisation, the ex-Assistant President, is by no means at the exit of his career as a politician. As one of the chief American repositories of the Yalta conversations—he took shorthand notes—he has a short-term value to the new President comparable to that of Mr Harry Hopkins. But he was hardly a member of the inner circle of the Roosevelt intimates, as was shown by his resignation shortly before the late President died; and unlike them, he will probably not pass from the scene as soon as President Truman has been briefed. If, after the fruits of San Francisco have been gathered and presented to Congress, Mr Byrnes should become Secretary of State, he would achieve, in the line of constitutional succession,

the Vice-Presidency that he thought was to be his when he went to Chicago to the Democratic Convention last summer—and he would have achieved it in a position where he could exercise concurrent power.

Over the longer term, comparable interest may well attach to the relations between the new President and the other contender for the Vice-Presidency last summer, now Secretary of Commerce, Henry Wallace, or if not to the relations between the two men, at least to the relations between the President and Mr Wallace's following, whose representation in the Congress is not proportionate to its strength in the country. The Democratic Party cannot win in 1948 without labour support.

Mr Truman's labour record is all right—it was, in fact, what made him "available" for the Vice-Presidency last summer, bridging the gap between active forces of the labour unions and the position of the politically vocal South—what has been called the Second Missouri Compromise. In many cases the findings of the Truman Committee (under the able direction of its counsel, Hugh Fulton, who, if he does not actually join the President's official family, is at least likely to occupy the unofficially powerful place that Tommy Corcoran filled in Roosevelt's kitchen cabinet) shed a light on dubious business practices that were grist to labour's mill.

★

Mr Truman's political regularity is well known. His advancement from office to office has been accomplished with the nod of the party organisation, and his nomination at Chicago could not have been secured if the full weight of the party organisation—personified by Mr Robert Hannegan, who will be to the Truman Administration what Mr Farley was to the New Deal—had not been thrown against Mr Wallace. There is every reason to suppose that the new President's regularity will continue.

But the determination of what is political regularity can hardly fail to pile problems on the Party—and eventually the executive—desk. If the new President has not too clearly inherited either the friends or the enemies of his predecessor, he will certainly not be denied opportunity to make plenty of his own when—not too many months from now—the announcement of post-war economic programmes becomes necessary.

During the new administration, how much success will pressure groups have in diffusing the exercise of economic power? With how much success will the new President, so clearly aware of the necessity of "going along" with Congress and its individual members, fill the post of representative of the national interest as over against special interests that constitutional practice attaches to the Chief Executive? The formation of policy on international trade (beginning with the extension of the reciprocal trade agreements Act on which hearings opened the week he took office), will bring pressures on him in one form. The specifics of domestic reconversion, beginning with VE day, will bring them in another. With how much imagination, and how much force, can he approach the stabilisation of the American economy at a high level—the job that will have as much effect on world welfare as all American foreign policies rolled together?

If the possible diffusion of economic decisions under the new administration is causing some searchings of heart, a parallel decentralisation of political capacity may be of considerable advantage in 1948. The stature of the late President, from the time the country rallied to his first inaugural speech, tended to overshadow other men. As the years went on, and the original New Deal crusaders got tired or were discarded, the men in public life tended to be the men who grouped themselves congenially around the central figure. In such circumstances, succession tends to come by designation rather than by competition.

With the better part of four years to go, there is a chance for a plurality of leadership and a correspondingly

healthy rivalry in the Democratic party to manifest itself. There will be time for the Truman administration's record to be established and judged. Two Vice-President-become-Presidents have subsequently been chosen Presidents at the polls. But Mr Truman will be 64 in 1948.

The good words for the new man that are being said in private in rather exceptionally varied quarters can be interpreted in different ways. They can be attributed to a desire for normalcy, gratified, this time, even before hostilities are over. They can be due to belief that work can now be begun on a substructure of political life that was in need of replacement. They can be due to a feeling that life is accurately reflected in newsreels—at any rate, it seems likely that from now on there will be more occurrences, fewer events.

American Notes

Truman Progress Reports

Political observers are still weighing each appointment Mr Truman makes, each political move he takes, still trying to evaluate him, his strength, and the nature of the opposition he will face. In nominating Mr David Lilienthal to head the Tennessee Valley Authority for another nine years, the President has demonstrated that his invitation to Senator McKellar, of Tennessee, President *pro tempore* of the Senate, to attend Cabinet meetings, does not mean agreement with his views, for the Senator has spent a good part of the last decade bitterly opposing the TVA as an autonomous project, and trying to get rid of Mr Lilienthal. Year after year he has tried to bring TVA under the scope of patronage, and when appropriations time comes along this year, Congressmen will watch for the usual McKellar rider requiring Senate ratification for all Federal employees earning \$5,000 a year. He will try again to make TVA responsible to Congress for its operating expenses.

A Bill passed by Congress to defer farm workers from conscription, backed by most Republicans, many Democrats and all of the powerful farm organisations, placed Mr Truman in conflict with Congress for the first time since he took office. He vetoed the Bill because, he said, special privileges to any group violated the basic principle of selective service. The House sustained the President's veto by a narrow margin of eight votes. Interestingly enough, a breakdown of the votes shows that the all-too-familiar Republican-Southern Democrat bloc was not, in this case, working.

On price controls the President has taken a strong stand. In a message to Congress asking for the continuation for another year of the Office of Price Administration, he called the price control and stabilisation programme carried out by that much-maligned agency "one of the most remarkable achievements of this war."

There was no question about the fitness of Supreme Court Justice Robert H. Jackson for his new appointment as chief US counsel for the prosecution of Axis war criminals in the European theatre of operations. And the appointment of Democratic Committee Chairman Hannegan as Postmaster General did not worry anyone, for it is traditionally the job that goes to the committee head of the party in power.

Head of the American delegation to the Reparations Committee in Moscow, however, seems a strange post for a political appointee, and that, without doubt, is what Mr Edwin W. Pauley, Treasurer of the Democratic Party, is to be considered, although the California businessman has in the past worked in Moscow, on matters relating to the oil industry, with Mr Maisky, who will be his Russian opposite on the Reparations Committee. It is assumed that Mr Isador Lubin, appointed by President Roosevelt to the post now to be occupied by Mr Pauley, will, as Mr Pauley's assistant and executive head of the Committee, furnish most of the qualifications.

answers he tells the people in simple terms the military and industrial effort still required to defeat Japan, the amount and rate of reconversion, the commitments for relief and rehabilitation of devastated foreign countries, the Army's plans for redeployment and partial demobilisation. It is a remarkable report in that Mr Vinson asked and answered exactly the questions that are troubling people. And his answers have about them so great an air of frankness and competence that public confidence in the Government's planning, and in its methods is bound to respond.

The report is based on the assumption that Japan can be expected to surrender her home islands unconditionally without a successful invasion by Allied troops. It is stated that although the Army's demobilisation of men who can be spared will be carried out with the greatest dispatch, shipping limitations will spread this first stage of demobilisation over at least a year. A cut in war production of from 10 to 15 per cent within six months will probably increase unemployment from the present 1,000,000 to about 2,500,000 in twelve months. But most of the unemployed will be idle only for temporary periods, between jobs. Although the manpower situation will not be acute on a national scale, severe local shortages will exist in areas where war production remains at a peak. In such areas, strict manpower controls must continue.

Restrictions upon industry to protect war and essential civilian production are to be relaxed only where it is possible to relax them without damage to the war effort. High taxes will continue, and additional money will be raised through war bond drives. Reconversion will proceed vigorously, with a quickening pace as war needs permit. No early general improvement in the civilian food supply was promised, and the public was reminded that military requirements would not decrease, and that relief needs would be even greater. The most extreme shortages were expected in meats, sugar, fats and oil.

The battle against inflation and rising prices will continue, with price controls and rationing demanding wholehearted public co-operation. Wage stabilisation must be maintained during Phase Two to prevent inflationary price increases, and to avoid a post-war deflationary trend that would threaten wage standards.

Storm Over AP

The recent storm over the violation by a correspondent of the Associated Press of a security ban on the German unconditional surrender at Rheims, has resulted in his discreditation by Shaeff and an order for his return to the United States. The Director of Public Relations at Shaeff insists that Allied lives might have been involved and that such an indefensible breach of faith might prove a source of embarrassment in inter-allied relations. The correspondent still insists that the holding up of the surrender story was "purely political censorship" to which he could not submit, although responsible correspondents have learned in this war how inseparable the political can often be from the military.

The story of the surrender at Rheims was given to sixteen correspondents under pledge of secrecy. General Eisenhower said the utmost secrecy was essential "because of the great difficulty, due to distance, of exactly co-ordinating action of this kind with the Russian Army." Using unauthorised channels, Mr Kennedy got the story out to the United States, from where it was relayed to Paris. Associated Press called the story "one of the greatest news beats in newspaper history," while the 15 correspondents who observed the pledge condemned the violation as "one of the most disgraceful, deliberate and unethical double-crosses in the history of journalism." The *New York Times* has called upon the newspaper members of the Associated Press to "make it clear for all time that they would prefer not to receive a story than have a 'news beat' even of such transcending importance, obtained in such a manner." AP's profound regrets cannot wipe out the fact that the climate of an organisation plays a large part in shaping the journalist's attitude toward news.

One of the more amusing aspects of the matter is that the United Press, AP's chief American rival, now enjoys a complete revenge for the discomfiture it suffered over Mr Roy Howard's famous "false Armistice" of 1918. Indeed, the revenge is double, for the AP has slipped twice. It reported a false armistice three weeks ago when it broadcast Senator Connally's indiscretion and gave the Himmler story

to the world. And now it has improperly reported the true armistice. Perhaps there will be a little less self-righteousness in future in discussions of the "freedom of the press."

Various editorial groups, supported by Mr Kent Cooper, President of the AP, Mr Archibald MacLeish and others, are urging the delegates at San Francisco to build into the structure of the international body the guarantee of universal free interchange of news. Such an interchange must, however, depend upon the treatment of vital political and diplomatic news as something more than merchandise for sale.

The Foremen Organise

The National Labour Relations Board, reversing a previous decision, has recently ruled that unions of supervisors are entitled to the protection of the Wagner Act. The Foremen's Association of America, organised in Detroit three years ago, has been a source of keen embarrassment to NLRB, and it was a bold decision for the Board to take, for powerful industrial groups are expected to mobilise opposition in Congress and the Courts, resisting this upheaval in the traditional management pyramid.

The employers' arguments against the decision were rejected one by one: lower output and quality; division of loyalty; antagonism against management; the fact that foremen were heard on promotions, discharges, transfers;

Letters to the Editor

BETRO

SIR,—Allow me to refer to the newly founded British Export Organisation (BETRO) and to pour a jet of cold water on the boiling enthusiasm.

Whenever a serious national problem crops up an "institute," "association" or "organisation" follows promptly in its wake. When at the beginning of the war the signal was given for exports, we were blessed with almost 300 export groups. When the slogan was "industrial research" a number of research associations were founded. Now, when the need for export research is being emphasised, the BETRO has come into existence. If organisations could do it there would be little ground for concern about our economic future.

If it were not for fear of adding to our already advanced stage of that mental disease "institutitis," I would propose the formation of a British Institute for Individual Effort (BIFIE), which would, no doubt, be more useful than popular.

There are two types of research which must precede an attempt at export to any country, namely: (1) *General Research* and (2) *Individual Research*. The former comprises import statistics, Customs tariffs, local production, import restrictions, exchange, etc. This information is available through the Department of Overseas Trade.

The latter comprises investigations of all factors relating to the export article of the individual manufacturer, such as quality, fashion, price, competition, advertising, credit, etc., and there is nobody but the manufacturer himself, through persons with an intimate knowledge of his product, manufacturing facilities, cost and scope, who can effect this research so that any intelligent policy can be adopted. To gather this information through "flying squads" of a foreign body would merely add to the heap of export failures.

However unpleasant it may be, the truth is that in successful export there is not and will never be an "ersatz" for individual effort.—Yours faithfully,

O. J. BRUUN
Slough, Bucks

Education and Business

SIR,—I know nothing of accountancy, beyond such knowledge as may be acquired by a holder of the London University Commerce degree and that collected by a banker of thirty years' experience. I only write because in the second paragraph of your article you refer to banking, a trade in which I have passed the greater part of my life.

Now there is no doubt that the staff departments of banks are not prepared to give preferential treatment to university

that they are comparatively well paid. The decision has aroused great indignation in the industry. General Motors has run a large and costly series of display advertisements under the caption, "Should Management be Unionised?" But it is a fact that the foreman's status in mass production industry has changed. His rôle in management is now negligible; he has ceased to be a policy-making official, and, according to NLRB, he has become a production "traffic cop."

The *Harvard Business Review* points out that foremen actually are in an intolerable position, expected to transfer literal instructions from top management and technologists, with whom they have no contact, to the workmen from whom they are separated, and who often view them with distrust. If management wishes to thwart the trend toward unionisation, it is unlikely that pressure on public opinion, resort to litigation, and complaints that labour is entering into union combinations in restraint of management, will produce results. The rôle of the foreman in modern industry needs to be adjusted to new conditions, and a completely new type of training given him to make him more than "a mere cog in the industrial machine."

The NLRB decision does not define the kind of union to which a foreman can belong, or whether it can be allied with rank and file trade unions. The CIO and AFL, always alert for signs of an overabundance of company influence, can be expected to watch with wariness the creation of completely independent foremen's unions.

graduates, but that attitude is not based on stupid prejudice but on experience. The clearing banks believe that a young man learns something in a bank between the ages of seventeen and twenty-three that he can learn at no other age and in no other way, and that that learning is of abiding value in his trade. From this essential experience a university graduate is necessarily barred.

This, however, does not mean that the general management of banks frown upon or disregard sound learning. I could wish that they regarded it with a more discriminating eye, but I know that the educational acquirements of new entrants to the trade are carefully examined and that subsequent examination successes are not overlooked—even when the aspirants achieve university degrees.

Yet much of your article deserves the consideration of bank managements. From a long experience of young clerks I am certain that a pass, even with distinctions, at School Certificate level tells little about the examinee's brain. On the other hand, I am sure that a satisfactory Higher Schools Certificate is as good an index of intelligence as we can at present ask, particularly (and this is important) where the candidate has offered classics.

If we are moving into an era when the average examination standard of the secondary school leaver will be higher than in the past, the banks will no doubt react in the manner laid down by the classical economists; but commissions of inquiry will be disappointed if they expect their advocacy of university graduates to receive sympathetic consideration, and the banks will also be disappointed if they, in their turn, ignore the supreme value of sixth-form classical work.—Yours faithfully,

Oxted

W. J. THORNE

SIR,—In your interesting article of May 5th you rightly stress the danger of confusing education and vocational training but regret that "The accountancy profession is not prepared . . . to grant facilities of entry to their ranks to the university graduate in general." Both the chartered and the incorporated accountants do in fact excuse the university graduate two years of his articles; and so, whatever his subject, he can become qualified in much the same time as the new scheme requires. He is not excused his Intermediate examination but this, which involves only a more elementary knowledge of the subjects required for the final examination, does not divert and need not retard the process of technical training.

It is difficult to see how a single profession in which technical proficiency is essential can do much more than this to encourage a non-vocational university training. You suggest that the time for learning the tricks of the trade might steadily be reduced. Practical experience is of fun-

On With the War

If the American public is confused about just how much of a war is still going on, they can find all the answers in a report issued by Mr Vinson, Director of the Office of War Mobilisation and Reconversion. The report was formally addressed to the President, but it was clearly meant for the public. Mr Vinson called his report "The War: Phase Two." In a series of non-technical questions and

damental importance in the work of an accountant and I think that most graduates in the profession would agree that the three years now required is all too short a time in which to gain this experience. Admittedly, one goes on learning throughout one's career and especially during the first few years after qualifying; but at present membership of one of the three principal bodies of accountants does, from the first, impose a certain technical standard which it would surely be undesirable to relax, even to attract better trained brains to the profession.

I think that the best hope lies in university education becoming more widespread, as it may then be considered a normal training for the person with ability. The present encouragement offered by the accountants should prove efficient.—Yours faithfully,
Oxford

VENETIA BURNEY

PAYE

SIR,—In commenting on Paye you suggest that a change in rate could be put through quite smoothly early in the fiscal year. In the case of an increase it certainly would need to be very early in the year, because the sudden deduction in one week of the arrears from x weeks paid at a lower rate

would be not insignificant to the small wage-earner. In the ingenious machinery of tax deduction there is little sign that the experts appreciate the importance of shillings to the lower-paid workers.

The Guide sold to the public in 1944 says blandly, "... if your wages go up and down from week to week the tax deducted goes up and down with the wages." True, it does not say "in proportion to the wages," but that is the implication, whereas, in fact, the deductions from week to week are in certain circumstances wildly disproportionate. As one familiar with the wages records of a large factory, I have come across numerous cases of this kind, and it will be remembered that last year there were several references in the press to workers who objected to overtime because of the resultant increase in tax. These anomalies are capable of explanation mathematically, of course, but that does not appease the taxpayer, indignant at an apparent departure from what he understands by the Pay As You Earn principle.

It is claimed that the scheme has been a success, which from the point of view of collection, it has. It is open to doubt whether, in its present form, it can be considered a success from the point of view of the citizen taxpayer.—Yours faithfully,
Epping

THE WORLD OVERSEAS

The Czechoslovak Army

(By a Correspondent)

THE Czechoslovak Army is returning home. The section that has been fighting with the Russian Army first reached Slovakia at the Dukla Pass on its most eastern fringe on October 9th, 1943. Now the section that trained in Britain is reported as having crossed the Czech frontier on May 1st. For some of the men in that army the journey back to their own country has taken six years.

In 1938 the Czechoslovak Army was considered to be a powerful fighting force. When fully mobilised, as it was in the summer of 1938, it consisted of 44 divisions, four of them motorised. The standing army had a strength of 14 divisions and consisted of a core of professional officers, warrant officers and sergeants coupled with the annual intake of men undergoing their period of compulsory military service. That lasted two years and began at the age of 20. The professional army was also supplemented by a reserve of officers.

This army had, in the 1938 frontiers of Czechoslovakia, an admirable defensive position and possessed some of the best armament factories in Europe. It was broken by the Munich Agreement of September, 1938, and was finally dissolved in March, 1939, when Hitler marched into Prague. Czechoslovakia seemed to be at an end, its independence gone and the fringes of its territories filched by Germany, Hungary and Poland. Yet, in less than six months, the Czechoslovak Army had been reborn. On October 2nd, 1939, the French Government recognised the Czech National

Committee, under Dr Benes, and permitted them to form a national army in France.

It is not an exaggeration to say that every man in the present Czechoslovak Army could write a novel based on his own life in the last five years. They have reached the forces that fought Germany in countless different ways, but, in general, there were several distinct groups that can still be identified.

The first comprises those men who left their country between September, 1938, and September, 1939. The majority crossed into Poland. Some were able to obtain visas to travel on, but the majority remained there. At first, the Polish Government did not permit them to form any military organisation, but, after March, 1939, when the prospect of German aggression became only too clear, the Polish Government authorised the setting up of an informal Czechoslovak Legion. On September 1st, 1939, this Legion had no uniforms and about one rifle per 100 men and it could take no active part in the fighting. It withdrew eastwards and the greater number were in that part of Poland occupied by the Russians and so were interned. The remainder escaped into Roumania.

The next group consists of those men from Poland who reached Roumania and of those who, after September, 1939, managed to cross the frontier, usually without passports, and make their way through Hungary to Yugoslavia. In Hungary they were in danger of imprisonment, but the Yugoslav Government permitted them to enlist, nominally, in the French Foreign Legion. They then travelled on to Syria, and from Syria they were brought by sea to Marseilles and thus into the new army in France. But the bulk of the Army in France was made up of Czechoslovak subjects living in France (a number worked in mines and factories in Northern France), who were conscribed, with the consent of the French authorities.

This army fought in France in 1940, on the Marne, on the Seine, and on the Loire. In May, 1940, it had reached a strength of 11,000 men. It lost some 2,500 killed and captured in the Battle of France. On the fall of France the survivors, then concentrated near Carcassonne, were given the option by the French of either accepting demobilisation with the French army or of getting out of France as best they could. A great many of the conscripts agreed to demobilisation. The volunteers did not. The British Government managed to find ships for their transport, and late

in June some 4,000 landed at Liverpool. They are the nucleus of the western Czech army.

The next group are those who left their country after the fall of France and before Germany's attack on Russia. Their objective was Palestine, and, as the Mediterranean was then closed to shipping, they were trained there and fought with the British Middle East forces, notably at the first siege of Tobruk. They were withdrawn from the Middle East in 1943, and joined the western section in Britain.

Germany's attack on Russia immediately altered the status of the men interned there from Poland. The Russians at once formed a separate Czechoslovak formation, and that force has since been joined not only by individuals who escaped, but also by a whole division of the Slovak army, formed under German auspices by the Slovak state, and sent to the Russian front. The eastern army is now of Army Corps strength, and has fought from Kiev onwards to the liberation of Slovakia and Moravia from the east.

The western Army, organised as an armoured formation, landed in Normandy late in August last year, saw some fighting at Falaise, and, from October to late in April, formed the major section of the force that contained the Germans in Dunkirk. Their comparative inaction there was very galling, especially after the Rhine crossings. Not that the Dunkirk front was entirely inactive. The Czechoslovaks themselves staged two minor actions, the first, and most successful, on October 28, 1944, that being Czechoslovakia's National Independence Day, when they destroyed a German battalion in the line to the east of the perimeter for the loss of 12 men killed and one tank. But for the most part it was only routine patrol work, in the winter mud and cold, in a partially flooded area of Flanders.

Since the landing in France this section has received as recruits men who had deserted from the German armies. The greatest single number came from the Protectorate Militia, formed by the puppet government for home duties. The Germans moved some of it to Northern Italy, for garrison duties, and many promptly joined the Italian partisans. When France was liberated, some of these men made their way across the Alps and so reached their own army by that route. Others had deserted from the *Wehrmacht* or the Todt organisation in every possible circumstance. One man had volunteered for Rommel's Afrika Corps in order that he might the more quickly reach the British.

Problems of Re-education

These men from the German armies have raised a problem that will meet the army when it returns home. Most of them are young, and their education has been only such as the Germans allowed in the Protectorate. It was very little. All the universities and high schools were closed in 1939 for, since the Czechs were to be perpetual serfs to the German Reich, it was considered better if their education stopped at the age of thirteen. The resulting standard of education, particularly general knowledge, is desperately low, and as a substitute they have been filled with Nazi propaganda. The Czechs have, therefore, been studying for some nine months the problem of re-educating a German-educated youth.

Their conclusions are not pessimistic. Even the rigid discipline of the *Wehrmacht* has its uses for, if the men are told to think about a problem for themselves and then to discuss it, they make a real attempt simply because it is an order. They still have their inquisitiveness. They learn best from association with men from the former regime, but they respond to lectures, ask questions, and are gradually beginning to think and talk freely. It seems to be important not to attack their Nazi ideas directly. That is an attack on themselves, and they are put on the defensive. Their existing illusions can only be undermined and cleared away by indirect methods.

But the greatest advantage possessed by the Czechoslovak army is that it has escaped the fate of the Polish army—the gulf between the section in the east and the section in the west. For one thing, the Czechoslovaks have no traditional mistrust of Russia. On the contrary, the majority seem to have a feeling of mutual sympathy and trust. The Russians do not seem, any more than we have, to have attempted anything more than operational control. Furthermore, there has been a considerable interchange of officers, as well as of information, between the army in Britain and the army in Russia. The British section had a surplus of officers, the Russian was short. So the army has never become divided. It feels and acts as one.

Perhaps that may prove to be the most valuable experi-

ence it has gained during the war. It now contains men who know both Russia and Britain intimately, and who appreciate the virtues and defects of each. The Czechoslovaks themselves, Eastern European in temperament and Western European in mind, do, in fact, occupy a halfway house between East and West that is not only geographical. Their contribution to post-war understanding in Europe can be of very great importance to Europe as a whole, provided only that they are allowed to make it.

A People's Victory

[FROM AN ITALIAN CORRESPONDENT]

THE liberation of Northern Italy by the "Volunteers of Freedom" has been authoritatively described as one of the greatest feats ever achieved by a people in arms. Everywhere the rising was general, and the carefully prepared plans were smoothly carried out. Nazi demolition squads were overcome, shot or captured. All vital plant and all industries which had escaped destruction were kept intact. The fighting was particularly ferocious in Turin, where, on March 9th, 1943, the national movement of insurrection had first come into the open with the great strike which spread to Lombardy and later to all over the North.

The unity of the movement and the co-operation of all parties and classes were, after the military and political leadership and organisation, the most remarkable features of the movement. This unity was also stressed by General Cadorna, military commander of the movement, in the parade held in Milan on May 6th.

What will be the influence of these events on Allied policy? It cannot be denied that there is some anxiety not only among Italians but also in certain Allied circles. It might have been thought that as the most optimistic expectations had been surpassed in the rising, difficult problems would not arise. As an AMG officer put it, Northern Italy is "a going concern." Trains, trams, power stations and a good many industries are working. The food situation, even in the big towns, is by no means wonderful, but nevertheless tolerable, and the people have shown an unexpected capacity for self-government and administration after twenty years of dictatorship. It would hardly be tactful, to put it mildly, to superimpose on that well-working machinery the AMG or Civil Affairs administration, which in Modena, for instance, started by closing down the postal service and seems likely to persist in a front-line mentality even where there is no front left. Supply and transport for the Allied troops do not need such an attitude, and as for the famous though still unknown armistice terms, the Allied control which they anticipated was obviously meant mainly to suppress Fascism. In that respect, the Liberation Committee, which acted and is still acting as a Government authority, proved far more efficient than the mixed administration in the south, where Civil Affairs is still predominant. Even the speedy executions of Fascists were on the whole carried out in an orderly manner and have now given place to the courts of justice.

It hardly seems necessary to refer to the moral aspect. Undoubtedly recent events call for a different policy towards Italy than that pursued since the armistice and to which the United States adhered only reluctantly. Most of the competent British representatives here feel that as strongly as do the people of Milan. They feel it to be a British interest and fail to understand what Britain can gain by keeping Italy in its present hybrid position, which incidentally is very different from that granted by Russia to ex-enemies.

A change in the moral status of Italy is the Italians' first wish. On the material side the supply of raw materials and some means of transport, fuel and machinery are more urgent than food and other consumer goods. To make Italy a living body of 46 million people, sincere and thankful friends of Britain, would be of greater value to Britain and to all Europe than a prostrate discontented country.

Well over 50,000 armed partisans and countless thousands of Milanese civilians greeted the Allies on the parade day with great courtesy, but as co-belligerents. There was warm enthusiasm when General Cadorna expressed Italy's thanks to all the liberating armies but in particular to those Allied officers who joined the partisans by parachute and shared their dangers and victories. Between them, between all the hundred thousands of men of both nations who fought side by side in the front line, links have been forged which will not be forgotten on either side.

3 out of 5 aircraft

During a critical period of the war, no fewer than 3 out of every 5 home-based aircraft going into action had been repaired by the Civilian Repair Organisation built up and administered through the Nuffield Organisation in collaboration with the R.A.F. The Organisation has salvaged the metal from 12,500 aircraft crashed beyond repair. It has repaired and put back into action more than 75,000 aircraft.

THE BUSINESS WORLD

The Prospect for Exports

THE need for an expansion in British exports is now widely recognised. Even the global target has been fixed. The end of the war in Europe should be the signal for passing from discussion to action. The restrictions upon exports imposed by the terms of Lend-Lease have been largely removed. The markets are wide open. Admittedly, there are still limits to expansion set by the exigencies of the war with Japan; men, materials and ships will be needed to smash the gangster regime set up in the Pacific. Essential civilian requirements at home must be met, for stocks have been severely reduced since 1939; homes, pots and pans, and clothing must be provided in greater volume. In spite of these very real limitations, it should be possible to ensure a steadily growing flow of exports from now onwards. The flow should be stimulated, not merely by the clearance of obstructions, but by a policy designed to encourage exporters to do business abroad. And the time has come to assess, at least in broad terms, what products and how much of each Britain will be able to send abroad during the next twelve months.

Both the exporter and the Government will have important parts to play in the resumption and speeding of exports. If confusion is to be avoided, it is essential that the function of both should be defined and delimited. The actual business of getting orders and of fulfilling them, clearly, must be the concern of traders. As a correspondent points out in a letter on page 659 "there is not and will never be an *Ersatz* for individual effort." For 5½ years industrialists have worked to Government orders; their efforts have been limited to the business of production. But it would be sheer delusion to think that the Government can act as a salesman for British industry in overseas markets.

The task of the Government is different, though no less important. It will have to ensure the speedy expansion of production for the civilian markets at home and abroad. This is not merely a matter of allocating manpower and materials, but of avoiding unnecessary friction during reconversion. There are many industrial plants that cannot produce both war materials and civilian supplies, but, owing to their technical lay-out, have to concentrate on the one or the other. A gradual scaling down of war contracts spread over the different firms in the motor industry, for example, would seem to be both logical and just. But such a procedure would be impractical and wasteful. In the interests of a speedy resumption of civilian production, expediency would seem to dictate the concentration of war production on some plants and the complete release of others. This, it may be said, would involve discrimination; but it may be answered that the symmetrical approach is as impracticable in reconversion as it was in mobilisation.

Next, the Government cannot escape the task of earmarking definite proportions of the manpower and materials available for civilian production for home consumption and for export. Further, in allocating resources for export, it may have to take account of marketing possibilities and of overseas needs. A strictly proportionate increase in the allocation of resources to different industries may be desirable; but in practice this is hardly feasible. Within these limits each industry should have an export target; but the Government should ensure that these targets are not fixed too low. Some industries, or individual concerns in given industries, might be disposed to neglect exports because they foresee no difficulties in selling their output at home. Practices of this sort can hardly be condoned. For example, if the Government felt that the motor industry could reasonably be expected to export 50 per cent of its output but if it did not in fact do so, the Government should apply all the sanctions at its command, that is, it should promptly reduce the manpower and raw material allocations of the firms that deliberately neglect their responsibilities. The need for the application of this sanction might be avoided by a clear statement of the Government's policy.

The size of the global export target—an increase of 50 per cent in volume over exports in 1938—is a large one. In 1938, total British exports were valued at £470 million. At 1938 prices this 50 per cent increase would mean exports to the value of £705 million; at 1944 prices—they were then 78 per cent higher than in 1938—the target would be £1,255 million. The real comparison, however, is not with 1938, but with 1944. In that year the volume of exports was only a third of what it was in 1938. The need, therefore, is to multiply them by five. The task of achieving the aim looks equally formidable by comparison with the experience after the last war. Unfortunately, the Board of Trade has not calculated volume indices for 1914-18. The value of exports rose from £501 million in 1918 to £799 million in 1919, but a substantial proportion of the increase of 60 per cent must have been the result of higher prices. In 1919, the volume of exports was 45 per cent less than in 1913; in 1920 it was still 29 per cent below the pre-war level and, during the subsequent two years, it suffered a fall. If the global target is to be achieved, a much greater effort will be required after this war. Obviously, it will take some years to achieve it, even in the most favourable conditions; but this merely underlines the need for immediate concentration on the task. An attempt should

	EXPORTS IN 1938 AND 1944			
	1938 Value	1944 Value	1944 Volume	1944 Average Price
	£ million	£ million (1938=100)	(1938=100)	(1938=100)
Coal	37.4	4.5	7	178
Pottery, glass	9.6	9.5	55	180

Chemicals	22.1	28.1	80	160
Vehicles	44.6	11.7	13	194
Total	470.8	258.1	31	178

be made to raise the average volume of exports during the next twelve months from 31 per cent of the 1938 volume—the average for 1944—to at least 50 per cent. What are the prospects?

It is easy enough to fix an export target for the next 12 months; a brief examination of the list of the chief products exported before the war shows how difficult it will be to achieve it, especially if the war with Japan is not concluded within a few months.

The accompanying table lists the principal exports in 1938 and shows how far they have since fallen in volume. The blackest spot in the picture is coal. Exports of coal and coke amounted to £40½ million in 1938; in 1944 they were down in volume to 7 per cent, and in value to less than £6 million. In view of the downward trend in production, a revival in coal exports seems to be out of the question. In pottery the prospect is better; there is a good chance that exports will rise again to the pre-war volume within a year. In steel, too, it should be possible to achieve a substantial expansion. In spite of heavy home demands the industry should be able to export about an eighth of its output, exclusive of sheets and tinplate; this rate of exports would not compare unfavourably with 1938 shipments. Steel makers have already booked heavy overseas orders. Exports of machinery would seem to offer good prospects, though heavy home orders and the shortage of skilled engineers—many of these are still engaged on war production—are limiting factors. The overseas demand for machinery is so heavy that there should be no difficulty in selling substantial quantities of second-hand tools surplus to home requirements. Since the volume of exports of machinery was still at the rate of two-fifths of 1938 exports

in 1944, shipments during the next 12 months should exceed the global minimum target of 50 per cent of pre-war exports. Similarly, it should be possible to raise exports of electrical equipment and apparatus to something like three-quarters of the pre-war level. Shipments of chemicals have been maintained at a high level throughout the war; in 1944 they amounted to four-fifths of the 1938 volume and actually exceeded pre-war exports in value. Immediate expansion may be difficult in some types, such as pharmaceutical and certain heavy products; but there is scope in other sections and it may be possible for this industry to raise its exports to something like the pre-war total.

In textiles and clothing—responsible before the war for more than a fifth of total exports (by value)—the general and immediate prospect is less encouraging. The cotton and wool textile trades are short of labour and the decline in clothing stocks for sale during the past year suggests that the volume of production has been below the severely restricted home demand—plus, of course, the military requirements. The chief problem of these trades is to raise production to the level of home demand, and this postulates a substantial influx of labour. Moreover, the depletion of the public's stocks of clothing is likely to lead to pressure for an increase in the ration. This does not mean that an expansion in the volume of exports during the next twelve months is impossible—rayon should make further headway;

Electric Supply Companies

IF there is one industry above all others whose future skin will be a mixture of industrial and political threads, it is the electricity industry. For all industries whose ownership may be a party matter at the next election, or the next but one—the utilities, transport, coal-mining and the rest—Victory Day symbolises the end of the period of planning for some uncertain future period called "after the war," and a definite entry into the arena, with its dust and heat. In the case of the electricity supply industry, however, there is no straight issue between public and private ownership. Already, the industry is a mixture of both, in proportions which vary widely between the out-and-out "private enterprise" companies with perpetual franchises, at one end of the scale to, say, the London and Home Counties Joint Electricity Authority at the other. There are enterprises of every type, falling short of complete Government ownership. On the "private" side, there are concerns whose rights fall in, like leases, at a range of future dates. There are concerns like the "London" companies, whose properties are due to be taken over in 1971. There are the Joint Electricity Authorities, which in some ways resemble pieces which hardly seem to fit into the jigsaw at all. There are the extremely important municipally-owned enterprises, very numerous and ranging in size from the suppliers of some of the largest cities down to small local authorities. The Central Electricity Board, of course, comes prominently into the picture, as a species of Public Corporation run with businesslike and forward-looking efficiency as a merchant and wholesaler of electricity on the grand scale, without enjoying any Government financial facilities or favours beyond the rather doubtful one of official advice on the timing and placing of its capital requirements. Whatever ownership policy may be deemed expedient for the electricity industry, those who are called on to put it into practice will have all their work cut out to make a consistent and coherent whole (or wholes) out of all these several parts.

Holders of electricity company shares, probably, will be content to leave the issue, for the moment, on the lap of the gods, and meanwhile, as one step towards understanding the *apologia pro vitis suis* of the companies in which they are interested, to examine their wartime record in the light of the figures which have just been published after a black-out of five years under the Defence Regulations. It may be recalled that in the case of companies in the gas industry, whose wartime experience was described in *The Economist* of April 7th, page 449, the general picture was one of moderate though appreciable expansion to meet enlarged demand from industry, except in the London area, where physical difficulties, including the effects of enemy bombing, in some instances severely curtailed operations. With the electricity companies, the same broad conditions have applied, with a broadly similar geographical demarcation. But, physically, electricity, as might be expected of a "newer" industry, has shown what on the face of it appears to be considerably greater elasticity. The table opposite,

but it is likely to be somewhat limited. Among other consumer goods, motor cars would seem to offer an excellent opportunity for an export drive. Overseas demand is likely to exceed the production capacity of the exporting countries; home demand, though also heavy, could be restricted to essential needs for another year without hardship. The industry deserves high priority in the allocation of resources, but only on condition that it exports at least 50 per cent of its output. The production of pre-war models could be resumed and stepped up rapidly.

There are two conclusions that may reasonably be drawn from these brief comments. The first and obvious one is that both industry and the Government will have to make an immediate and strenuous effort to increase exports. This will involve a reorientation of policy; industry will again have to "go out" and get orders, and the Board of Trade will have to substitute a policy of expansion for the policy of restriction it had to pursue during the past 5½ years. Secondly, while the global export target of 50 per cent above the 1938 volume can only be reached over a period of years, a sizeable contribution can, in fact, be made during the next twelve months. It is impossible at this stage to calculate the size of the adverse balance of payments during the next 12 months. This will depend on a complex of factors, such as import policy, military expenditure overseas and the future of mutual aid.

compiled mainly from data revealed in recent chairmen's speeches, gives by no means a comparable picture as between different companies, but affords a rough measure of achievement in 1944, as compared with 1939, in the case of each separate concern.

The main features of the companies' wartime experience are brought out fairly clearly. Output figures, where given, reveal a wartime expansion in units produced of something like two-thirds in the case of the large companies serving active provincial industrial areas, and a varying but smaller

TABLE A

	Expenses (£'000) (e).....	540	1,343

(a) 2,566 millions in 1943. (b) From sales of current and rentals. (c) Generation, purchase of current and distribution. (d) Pre-war figures are for 1938. (e) Generating and distributing. (f) Power receipts and services to customers, etc.

rise (ranging, perhaps, from 10 per cent to 50 per cent) even in the London area. Unfortunately, however, the data here are scanty—the County of London Electricity Supply Company itself is a "dual" organisation with one set of interests well outside the London area proper. It is known, however, that the industry's experience under enemy action has been much more favourable, even in the heavily bombed areas, than was feared in the early days of the war.

Operating revenue has increased by anything from 50 to 100 per cent, but expenses have risen even more steeply. This is particularly significant, because it runs directly con-

trary to the experience of the two pre-war decades, when a rapid upward trend in electricity consumption, whose pace bore comparison even with that of the last five war years, was accompanied by progressive reductions in charges to consumers, financed out of the economies of large-scale production. Actually, during the war, charges have had to be increased in numerous instances, though not as a rule by more than a moderate percentage. The chief difficulty has been what the chairman of the County Company describes as the "alarming increase" in the cost of fuel—i.e., coal, accompanied by a great falling off in quality. Within the past month there has been a further rise in coal prices, and electricity is only one of the industries which has felt, in a disturbing way, the backwash of the muddle into which the affairs of the coal-mining industry have been allowed to drift.

The financial results of the operations of the companies

(a) 1944 figure shown after charging £185,000 in taxation. (b) £276,000 charged for income-tax in 1944. (c) After charging £300,000 for depreciation and reserve fund in 1939 and £350,000 in 1944, and £75,000 for contingencies reserve in 1944.

mentioned above, in the pre-war year and in 1944, are summarised in the table above.

Net revenue in every case shows an increase, apart from the effects of higher taxation. Special appropriations, however (including ARP, contingencies and provision for deferred items), have also increased. In the final result, the provincial companies have maintained their pre-war rates of dividend, usually (though not invariably) with a slightly higher earnings cover, while the London companies, prudently, have reduced their dividends, though earnings have made by no means an unsatisfactory showing.

Undoubtedly, the industry can congratulate itself on its performance during the war. Its contribution to the war effort has been invaluable, and its financial experience anything but unsatisfactory. The shares of the leading companies, deservedly, maintain their high reputation, even with the most conservative of investors. At present market prices, the yield on electricity shares is, on the average, as much as 1 per cent lower than that on representative shares of companies in the gas industry, whose figures were set out in the earlier article. That fact does not necessarily suggest that investors are backing electricity against gas under a post-war

resumption of competitive relations between the two industries. The yield differential was a long-standing feature—though not quite on the present scale—under the pre-war regime, in deference to electricity's wider "development" possibilities as the newer industry. But electricity share yields ranging from 3½ per cent to under 4 per cent, against an average of 4.10 per cent on the mixed bag of industrial shares in *The Actuaries' Index*, do go a long way to show that investors generally are satisfied with the industry's financial ability to catch up with arrears of renewals and replacements and to make necessary plant extensions. They take for granted, in short, the industry's ability to carry on its tradition of uninterrupted growth in output, as soon as it can obtain the material and labour. (Under neither head is the industry satisfied with the "priorities" which the authorities have allowed it during the war.)

The rate of new capital expenditure has been definitely slowed down under wartime conditions. In the case of the Lancashire company, for example, such expenditure for the last five years has averaged only a little over £101,000 per annum, compared with £486,000 per annum for the preceding five years. But plant, generally, is intact and efficient, and the higher working expenses which the war has bequeathed can be set against the savings in unit costs, resulting from a fresh expansion in output, which the industry will certainly achieve. In other words, the adverse consequences of the war will find their reflection, not in a further increase in charges or a contraction in total earnings, but rather in a slowing down of the rate of reduction in prices to the consumer, judged by pre-war standards. There may also be a period of re-adjustment of charges between different classes of consumer. The presence of "coal clauses" in many contracts for the supply of industrial power, considered with the Government's desire to keep the cost of living down, has led to a greater proportionate rise in charges to the industrial than to the domestic consumer, which may have to be corrected. As was suggested in the earlier article, the result of resumed post-war competition between gas and electricity is less likely to be the putting of either service out of business than an increasing differentiation of function, under which effort will be concentrated mainly on the satisfaction of particular forms of demand for which each is specially fitted to cater.

All in all, therefore, it may be said that the effect of the war on the electricity industry has been not to arrest its development (though it has shifted its centre of gravity towards "industrial" rather than "lighting" demand) or to leave the industry with any really serious legacy of physical or financial problems. From the investor's viewpoint, the question is mainly how far structural changes, particularly those acknowledged to be overdue on the distributional side, can be effected while leaving the industry in its present hands. Will there be a closer drawing together of interests, as some suppose, by the formation of new large holding companies? Or is it (in the cautious phraseology used by the chairman of a large electrical engineering company at its meeting this month) "the intention in general terms of the Government to take over in some form or another the electricity distribution undertakings of the country"? The answer, perhaps, may be clearer after the coming General Election. But present holders of electricity company shares, to judge by the figures adduced in this article, do not seem to be inordinately worried over the prospect, either way.

Business Notes

Funds and Kaffirs

The past few days have brought a rather steadier tone to the general body of stock exchange quotations, and some recovery in the volume of business, insofar as this can be gauged by the number of bargains received. The expansion in business has, however, been restricted to one class of investment, gold mines, and among them almost entirely to Kaffirs. The only other point of real interest to emerge so far is a partial recovery in the Funds from the fairly sharp falls which followed the conclusion of hostilities in Europe. This recovery is associated in the market with talk of official support and of preparations for a fresh issue of tap bonds. The earlier fall in the Funds was supposed to have been caused by fears of a scramble for liquidity, presumably on the part of industrialists, and it has always

been very doubtful whether there was much justification at present for expecting any really large-scale selling on that account. The recovery is, perhaps, due mainly to a realisation that the fall was overdone. There is, however, some justification for supposing that the Treasury will not continue to issue 1½ per cent Exchequer bond much longer, as the reduction in the maximum life is considerable and they may well believe that they can obtain better terms.

A rise in Kaffirs was due as soon as there was any real indication that the supply of labour and materials would make possible an increase in output. That alone would justify some rise in quotations, but there still remain the questions of how far a permanent rise in costs has occurred and how far it can be offset. It must be remembered that, while there is an assured market for the output of the

mines, it is a market at the pre-war price unless and until the sterling-dollar parity is changed. The rise has been stimulated by two developments, the granting of permission for a limited issue of shares in this country by New Driefontein and the favourable nature of the April returns from the Rand. They show both an increase over the output of a year ago and a larger expansion in the native labour supply than has been usual. It is reasonable to assume that conditions will continue to improve, but the outlook must be conditioned by the question of costs and, for the British holder, may be influenced by the discussions on Dominion Tax Relief which are to be initiated shortly.

* * *

Relaxation of Restrictions

Few industrialists could have expected any wholesale relaxations in industrial control and restrictions immediately after the German surrender, but nonetheless, during the last fortnight, relief in some directions has been given or announced as commencing shortly. Coupled with the announcement of the restoration of the basic petrol ration for private use was the news that petrol will be more freely available for business purposes. Public transport and delivery services, including retail delivery, will benefit. Probably the large stocks of petrol accumulated in this country have led to the making of this decision—it is discussed on page 656, but rubber and tyres are still in short supply. Control has been relaxed over a number of raw materials. These include copper and zinc. Since May 11th, applications to acquire them have been considered without restriction on the type of article to be manufactured. This applies to home uses of the metals; certain restrictions on the release of copper and zinc for export will continue. Two orders dealing with the acquisition and use of certain plastics were revoked on May 15th.

Removal of restrictions affecting the population as a whole will also have been welcomed in industry. One is the complete lifting of black-out regulations, which, apart from economies, will bring with it daylight in factories, greater ease on railways and other means of transport. Even the weather news, particularly the weather forecast, will help industry to some extent, although agriculture will derive the most benefit from it. There are also a number of relaxations of the control over labour, the effects of which on industry are discussed in an article on page 648. The cessation of hostilities in Europe is also reflected in the fact that no more war damage insurance policies will be issued. Current policies, however, remain operative until they expire. As early as May 12th a list of shortened war risk scales for cargoes was announced.

*

Another sign of the times is the return of the Stock Transfer Office of the Bank of England from Whitechurch to London on May 25th. The office is to go, not to the main building, but to its home after the last war in Finsbury Circus. For the time being, all transfers will continue to be dealt with through the post, and it is inevitable that there will be some additional delay until the department has settled into its new premises. It is hoped, however, that the additional delay will not be substantial or of long duration, and against this there will be a saving of time in transmission, since the existing system of collection by Bank officials from the Stock Exchange will be continued.

* * *

Anglo-Turkish Payments Agreement

The Anglo-Turkish Trade and Payments Agreement, which comes into force next week, follows a different pattern from that of any of the other monetary or financial agreements concluded in the past few months. This difference, it may be surmised, reflects not only Britain's experience of pre-war trade with Turkey, but the fact that the disintegration of German economy, to which a large part of Turkey's foreign trade was formerly geared, will involve a complete reorientation of her international trade relationships. It seems probable, moreover, that the re-shaping process will synchronise with heavy import requirements for capital re-equipment. Finally, the sharp inflation that has occurred during the war, in consequence mainly of heavy pre-emption purchases at high prices by both belligerents, will eventually require a re-alignment of the exchange parity. In these circumstances an agreement like say, that with Sweden, under which the overseas central bank sells local currency to the Bank of England against sterling, and the Bank of England acts reciprocally, would

obviously have been inappropriate. Instead, the Turkish agreement follows closely the model of the wartime "special account" system, which not only effectively canalises the proceeds of sterling area exports to the country in question for the purpose of financing sterling area purchases, but also compels that country to keep its own purchases within the limits of its export proceeds and, if there is a surplus, to hold it in sterling.

Thus the Turkish Agreement provides that all payments due from the sterling area to Turkey shall be made only to approved "Turkish Accounts," in sterling, and that all payments due by Turkey to the sterling area shall be made only from such accounts. As in the Swedish and Belgian agreements, there is a clause about making this sterling available for "third" country payments "as opportunity offers." But the clause appears in a tighter form. The Bank of England undertakes merely to "endeavour to arrange" such releases, and their total is limited to 20 per cent of the proceeds of exports of Turkish-origin goods to the UK, excluding export proceeds reserved under the pre-war Guarantee Agreement.

*

From the point of view of British trade, the most important effect should be to enable exporters to know more surely the dates and terms upon which they will be paid. The Anglo-Turkish Clearing, though which payments have been made in the past—with unpredictable delays—is to be wound up; the Turkish Central Bank will now publish, not only its buying and selling rates for sterling, but also the premium rate that has been allowed or charged for the purpose of subsidising exports or constricting imports; and the Turkish Government will "do its best" to ensure that authorised imports from the UK can be paid for in accordance with the terms agreed between buyer and seller—which is presumably a virtual undertaking to make sterling available, at the published rates, for all permitted purchases. There is also a somewhat meagre provision for the relief of the UK owners of blocked balances in Turkey. Such balances, if duly registered within the next three months, may be used to buy mohair and valonea for export to the UK, where the sterling proceeds will be left freely at the seller's disposal!

One final point is of general, and perhaps of ominous, significance. The British Government, in the event of "quantitative limitations" being imposed on UK imports, agrees to treat Turkish produce equitably; and, furthermore, in the event of its deciding to regulate the quantity of imports of Turkish *agricultural* produce, "will not make allocation between countries of the total permitted imports" without first giving Turkey a chance to discuss the matter. Is this the first official hint that a system of agricultural quotas is on the way?

* * *

Combined Raw Materials Board

The third annual report of the Combined Raw Materials Board, published as a White Paper this week, brings the record of its work up to January 26, 1945. The aim of the Board is to bring the overall supply and requirements of the United Nations into equilibrium. It is not an executive body, but its recommendations are generally accepted by the governments concerned. These cover allocations or other distributive arrangements to ensure a steady flow of supplies to consuming countries in proportion to their essential needs and in the light of transport capacity; the maintenance or expansion of production; the achievement of economies in use in the light of the different production techniques of the consuming countries; and, lastly, the conclusion of stable buying arrangements.

The broad picture of the Board's report is mainly one of steadily easing supplies. This has enabled it to recommend the relaxation of restrictions on the free flow of a number of commodities, including tungsten, molybdenum, cobalt, mercury, shellac and certain grades of asbestos, tantalite, balata, balsa wood, and certain grades of mica. Complete suspension of controls would have been unwise, for some materials that were in adequate supply during some periods were short in others. Antimony and zinc, in free supply towards the end of 1944, suddenly became stringent early in 1945 because of unforeseen changes in the supply and demand position; close supervision, therefore, had to be restored.

A number of important materials, however, remained in short supply. These are natural rubber, hides and leather, timber and pulp and paper, and—after a period of easement

in 1943—lead. For these materials the Board had to recommend a policy of careful allocation and economies in use. Thanks to the foresight and good management of the Board, the raw materials available to the United Nations have been distributed broadly according to needs, and, even where shortages were acute, war production programmes were never seriously held up.

* * *

Tasks Ahead

The work of the Board is by no means done. The requirements of liberated Europe during the current year will represent an additional call on raw materials; since supplies of many materials cannot be readily increased, "the legitimate needs of Europe will curtail the quantity available for others." The claims of Europe may thus cause new shortages in the volume of raw materials available for civilian use in the United States, the United Kingdom, and elsewhere. Wisely, the liberated countries (and Unrra) have decided to secure their needs of materials in short supply—natural rubber, leather, timber and paper—in collaboration with the Board. The scope of the Board has thus been appreciably extended.

The Board is essentially a wartime organisation. In the absence of a new decision on the part of the British and American Governments it will be wound up after the defeat of Japan. This would be a pity, for a number of raw materials will remain in short supply for some time after the end of the war in the Pacific. The Board is well qualified to smooth over the period of transition. In a technical sense its work would remain unchanged, though its objective would be different; instead of facilitating a steady flow of materials to war factories it could do much to ensure a fair distribution of scarce supplies among the various countries of the world.

More ambitiously, it has been suggested that the Board might become the nucleus of a permanent world organisation, designed to smooth out the disastrous ups and downs in prices caused by fluctuations in demand and, in the case of shops, in supplies. But this is an entirely different matter. The issue here is not whether the Board should or should not be kept in being after the period of transition, but whether the market in raw materials should be free or controlled.

* * *

Bank Deposits and Savings

Credit expansion in April, reversing the previous month's trend, was substantially larger than in the corresponding period of 1944. Clearing bank deposits rose by £65.4 million to £4,524.8 million, and the figure for "net" deposits—computed by deducting items in course of collection, but not the inter-branch "transit" items, because only one bank now shows these separately—is raised to £4,390.2 million, which is actually £21.5 million above the year-end peak. The faster expansion last month—approximately twice that which occurred in April, 1944—is, of course, a consequence of the delay this year in the launching of the customary savings drive: at this time last year the growth of deposits was being retarded by the "Salute the Soldier" campaign. The natural desire of the authorities to hold their fire until they could come forth with a post-VE slogan has not, however, yet involved any unduly large credit creation. Despite the more rapid growth in April, the increase in "net" deposits in the first four months of the year is no more than £22 million, which is only half what it was in 1944.

It is to be hoped, however, that the campaign now in preparation will not be much longer delayed, for the influences that have so far held the situation in check have not been wholly desirable ones. The smaller flow of savings, among other factors, has compelled the authorities to lean very heavily upon floating debt borrowings through the banking system. In the five months since last November the banks have had to take up no less than £273 million of additional TDRs, or nearly £150 million more than in the similar period of 1943-44. That these heavy demands have not produced a roughly equivalent increase in deposits is due, of course, to a reduction in other assets. Last month, indeed, TDRs were the only earning asset which did not fall, and this is also true of the five-month comparison, if a fractional rise in advances is excluded. Between November and April last year, money market assets ran down by £26 million, and at the same time the banks financed an additional £30 million of advances. This year, although the

run-down is no less than £114 million—which carries the bill portfolio to its lowest level, at least since the resumption of monthly statements after the last war, and brings the bill ratio to an exiguous 2.6 per cent—and although, too, there has been only a negligible net increase in advances, the banks have made appreciable sales of investments. After a further reduction of £13 million last month, the investment portfolio now stands fully £52 million below the peak figure of £1,192 million touched last November.

* * *

Brakes on Credit Expansion

It is easy to assume, as some in the market seem to have done, that these sales of investments result simply from the policy of the banks themselves—that they reflect profit-taking on the one hand, or the beginning of a clearing of the decks for post-war industrial refinancing, on the other. Such suggestions do, indeed, seem to have been a minor cause of the softer tone of gilt-edged securities last week, for the market is well aware that, if post-war refinancing were to be attempted by such means, even a tight rein on the controls of real resources might not suffice to protect the cheap money structure. Fortunately, speculation on these lines, if not wholly groundless, is at least premature. The significant fact is that the banks' cash ratio, so far from rising, has lately been running somewhat below its wartime norm, which plainly shows that the brakes on credit expansion have not been put on voluntarily by the banks themselves, *pour mieux sauter*, but have come into play as a necessary protection of the conventional cash position, against the full effects of floating debt financing.

What the authorities seem to have been doing, by a tight hold on the credit base, is to keep the whole credit structure screwed up taut while the flow of funds into savings securities remains subnormal. That is certainly a better technique than the opposite one pursued on comparable occasions in the last war, when the market was flooded with credit in the months preceding the launching of a new funding issue. So long as the gilt-edged market remains resilient, it may even be a means of draining away part of the savings accumulating in liquid form. But it is not a policy that can be pushed too far, and the practical limit may not be far off now.

Owing to the great change in the assets structure of the banks, the technical limits to such manoeuvres as these are certainly more circumscribed than they were before the war. Recent suggestions that the refinancing of industry may be hampered because the banks are so heavily committed to TDRs, as distinct from bills, have no fundamental significance. The demands of industry cannot in any case be met without inflation unless they are financed by genuine new savings, which in practice means a flow of money into funding securities to redeem TDRs, or public purchases of gilt-edged from the banks. But the concentration of floating debt upon TDRs has one important consequence. It involves a severe constriction of the escape valve through which the banks can, in effect, draw additional cash if new demands for finance, whether from Government or industry, begin to press upon their investment portfolios. With money market assets at present low levels, the banks cannot, except purely temporarily, compel a creation of new cash by the authorities by allowing these assets to run down. More than ever is the initiative kept firmly in the hands of the authorities, which is, perhaps, precisely the reason for their recent technique. But a somewhat more elastic policy will surely be needed in the future.

ICI Earnings

The full accounts of Imperial Chemical Industries, summarised on page 670, add little to the story of profits of the parent company told in the preliminary statement of a month ago. They show, however, a further fall in the revenue of the whole group to £18,194,047, the lowest figure since 1939. The net figure is the highest since that year and the explanation lies in over-provision for taxes in the earlier years. At least the directors' report states that the existing provision, whose amount is not disclosed, should suffice to cover all liability on profits up to the end of 1944 when the numerous outstanding questions are finally settled, while the tax provisions have fallen more sharply than total revenue.

The reserves and provisions disclosed by the parent company show no change on the year, other than that the central obsolescence and depreciation reserve is increased by £2,502,000. In detail £3,500,000 has been added from current profits and £27,000 from the liquidation of a company, while £1,025,000 has been written off subsidiaries and "operating divisions." It is to be noted that, of the total provision from current earnings, £1,000,000 is provided by the parent as additional depreciation. This special addition is made because an overhaul of the position suggests that the total, permissible under tax law, is rather higher than had been supposed and that the whole of this sum will, in fact, need to be used. The total provisions of the five years 1940-44 under this head and miscellaneous writings down is almost £19,750,000. The surplus in the consolidated balance sheet shows an increase of £105,000.

The directors report for 1944 contains all the information which was last year given as a statement by Lord McGowan, so it is to be presumed that he will give a more extended review at the annual meeting. Meanwhile, one remaining point of interest in the report is a dissection of the gross manufacturing and trading proceeds for 1943. This figure was £113½ million for that year and £105 million for 1942. In each year the company's investment, property and miscellaneous income amounted to £1,500,000. The way in which these receipts were spent is set out below:—

(Millions of pounds)

	Factory, Sales and Administration*	Obsolescence and Depreciation	Wages, Salaries and Pensions	Taxes	Net Dividends	To Reserves
1942.....	56	3½	30½	12½	3	1
1943.....	65	3½	33½	9	3	1

* Other than personnel.

Despite the heavy demands of the services, the export business of the group has been maintained and, in some cases, increased, and by the end of the year the delay in shipments, caused by D day, had been made good. Expansion of export business is one of the group's principal preoccupations and there are new goods, evolved in wartime, which should make their contribution. But, like all other large concerns, much of the skilled staff is still in Government departments. Until some at least of these are released and until shipping, materials and labour are available expansion of business must be slow.

Complex Accounts

Much satisfaction has been caused by the announcement of the chairman of Stewart and Lloyds, Sir Alan Macdiarmid, that a consolidated balance-sheet and profit and loss account will be published next year. The main difficulty in the way to date, which has now been removed, appears to have been the taxation loss which would have resulted in changing the accounting date of an important subsidiary. In the meantime, the changes shown in the 1944 accounts, which are analysed in full on page 670, make difficult reading. A figure is given at the moment for the group's consolidated profit, but it needs to be qualified by cumbrous adjustments. Disregarding these for the moment, it appears that the profits of both the group and the parent company have increased by about £200,000, or roughly 20 per cent, after allowing for depreciation and taxation. If the dividend received from a subsidiary during 1943, but actually included in the 1942 accounts, is excluded from this comparison, the rise in consolidated profits amounts to nearly £350,000; for some reason, too, the sum retained by subsidiaries in 1944 is down by £50,000. Thus, the increase in the parent company's profit for 1944

would have amounted to as much as £400,000, were it not for another complicating factor, namely the bringing in to the 1943 profits of £200,000 from taxation reserve no longer required.

However, little importance should be attached to this apparent rise in profits, although this hardly excuses the attempt which was made in the company's preliminary statement to obscure it altogether. Sir Alan Macdiarmid points out that wartime arrangements made by the Government within the iron and steel industry make the figure shown as trading profit "largely arbitrary and artificial." One element in this arbitrariness is no doubt yearly adjustments in taxation provision, which is not revealed at all in the present accounts. It is to be hoped that the consolidated figures, when they appear, will show this item. In any case, Stewarts and Lloyds' wartime profits seem to have been entirely determined by its EPT standard, which is claimed to be highly unfavourable. Sir Alan goes so far as to say that, had 1938 been allowed to rank as a standard year, the company would now be £1¼ million richer.

Good Tubemaking Prospects

Although Stewarts and Lloyds' main products—tubes, pipes and castings—are as vital to peace as to war, the extensive development and research of the last five years is of little use for peacetime processes. The British tube-making industry has thus considerable technical leeway to make up in comparison with many foreign competitors. Nevertheless, the long suspension of normal activity enables Sir Alan Macdiarmid to state that

So far as we can see at the moment, the future is likely to be a period of almost unlimited demand both for home consumption and for export.

Developments in both oil and housing will also lead to special demands, such as the production of tubular roofs for temporary houses now being undertaken on a large scale. It is clear that the company must shortly spend large sums on capital expenditure, and schemes which the Government has already sanctioned include the modernisation of tube plants in Scotland, the building of an additional tube mill at Corby, and appropriate additions to steel plants. The money will be raised for the time being by borrowing without any new issue of shares.

One of the company's chief embarrassments is the rising price of coal and coke, which is said to affect it even more heavily than other British steelmakers, owing to the relatively large quantities used in the Bessemer steelmaking process and in the utilisation of low-grade local ores. This problem, serious as it is from the national viewpoint, is unlikely to prevent the company from earning good profits during the next decade, especially in view of the protection likely to be afforded by the reconstituted Iron and Steel Federation and by the possible revival of international agreements.

Future of Cotton Labour

The Federation of Master Cotton Spinners' Association has realised that one of the gravest problems it has to face is the attraction of more workers. It has been estimated that some 30,000 additional workers are needed in the spinning section and up to 20,000 in other sections. In the past, wages and conditions in the cotton industry have lagged behind those in many other industries. In a statement issued last week, the Federation said that it was their policy to bring cotton wages more into line with the general wages level. To make this possible, they hope for co-operation from the trade unions in modifying existing agreements, practices and methods of calculation. New systems for the more efficient staffing of machines will have to be evolved, and great hopes are placed on the outcome of experiments now being carried out at Wye Mill and elsewhere under Cotton Board auspices.

In its desire to attract new recruits to spinning, the Federation suggests that men should be paid £4 and women £2 15s. a week during training under officially approved schemes, and that on completion of training the same rates should be paid for three months or for a shorter time if the worker can earn more under piece-rate calculations.

This week's conference of the United Textile Factory Workers' Association was also largely concerned with the improvement of wages and conditions in order to attract

new entrants to the industry. Already there are many munition workers who are being urged to return to cotton, but who are deterred by the relatively low wages and unsatisfactory conditions in textile mills and prefer to hang on in engineering. The problem, therefore, is to raise wages without impeding the efforts to restore the export trade and to meet competition from low-wage countries.

But perhaps the most significant and encouraging feature of the conference was the indication that the unions are preparing to "face up" to the issue of double-shift working without which there can be no improvement of efficiency. The Association has traditionally opposed any form of shift working and there still seems to be a large body of hostile opinion in its ranks. But the union leaders, Mr Naesmith (Weavers) and Mr Roberts (Cardroom Operatives), who were members of the Platt Mission to the USA, seem to be determined to bring the majority round to their view of the Association's legislative council, which is that unless the unions accept the shift system, which is operated in every important textile producing country, they can neither press for the forty-hour week nor could they expect the modernisation and re-equipment of the Lancashire mills that is essential to an increase in productivity.

The unions' proposal for the formation of a separate Ministry of Textiles, on the ground that the Board of Trade is overworked, is in line with the growing tendency nowadays to suggest a new Ministry as the panacea for every problem. The call for a separate Ministry of Housing was an example of this trend. It is doubtful whether the problems of the cotton industry, which are mainly technical, would be relieved by a new Government department, even if its headquarters were to be situated in Deansgate and not Whitehall. Indeed, experience has shown that such Ministries, like trade associations, tend to become the guardians of the special rather than the national interest.

British Wartime Merchant Shipping

In his address to the Institution of Naval Architects, on April 17th, Sir Amos Ayre, chairman of the Shipbuilding Conference, gave an account of Britain's merchant shipbuilding in wartime. (Sir Amos Ayre was director of Merchant Shipbuilding at the Admiralty until recently). A record of the number and tonnage of ships constructed is given in the accompanying table. The tonnage of merchant shipping launched from September, 1939, to the end of 1944 totalled 5,723,000 gross; the number of vessels of 100 gross tons and over built during this period was 1,240. In 1942 the tonnage launched reached a wartime peak of 1,250,000 tons gross compared with the previous record of 2,050,000 tons in 1920. During 1942 the number of workers employed in British shipyards totalled 175,000 (the wartime peak exceeded 180,000 in 1943), compared with 300,000 in 1920.

U.K. MERCHANT SHIPBUILDING OUTPUT,
SEPTEMBER, 1939—DECEMBER, 1940
(Vessels of 100 tons gross and over)

	1939		1940		1941	
	No.	Tons ('000)	No.	Tons ('000)	No.	Tons ('000)
Scotland and Northern Ireland	28	150	83	450	102	494
North-East England	23	87	76	341	96	601
Other Districts	9	3.6	23	18	36	63
Total for the U.K.	60	240	182	809	234	1,157

	1942		1943		1944		Total	
	No.	Tons ('000)	No.	Tons ('000)	No.	Tons ('000)	No.	Tons ('000)
Scotland and N. Ireland	108	540	102	563	92	472	515	2,670
N.E. England	114	719	92	582	96	494	497	2,824
Other Districts	37	43	42	56	81	46	228	229
Total for the U.K.	259	1,302	236	1,202	269	1,013	1,240	5,723

Of the total number of workers employed in 1942, nearly 75,000 were engaged on repair work (naval and merchant

vessels), 60,000 upon new construction, and only 40,000 in merchant shipbuilding. Sir Amos Ayre stated that there was an increase of from 50 to 75 per cent in the average output per employee in 1942-43, compared with 1917-18, due largely to technical progress—that is, prefabrication, welding, simplification of structure, additional plant, and so on. This is a substantial increase. No doubt, there is scope for further improvement in the productivity of the British shipbuilding industry. The industry can only regain its former supremacy in the world if it is willing and able to make the fullest possible use of the most efficient methods of construction.

Driefontein Issue Sanctioned

There will be general satisfaction that the British Treasury has decided to permit the issue in this country of a section of the original working capital of West Driefontein Gold Mining Company. This concern is an affiliate of West Witwatersrand Areas and the amount of shares which may be taken up here is limited to the rights, under the terms of issue, on those "West Wit" shares on the London register. Thus, the Treasury adheres to past practice to the extent that there is technically no issue to the public. What is new is that the concern raising the money is domiciled outside the United Kingdom—but still within the Empire—and that the issue has no direct connection with the war effort. The latter characteristic is shared by the recent issue of Crittall Manufacturing, which marked a welcome recognition of the needs of reconstruction at home. The Driefontein issue is the first step towards rebuilding Britain's greatly reduced overseas holdings, and it is particularly important because a number of similar extensions to gold mining in South Africa are known to be in contemplation. Too much should not be made of it, however. The money is to go to a concern within the Empire and within the sterling bloc. Further, gold is readily exchangeable for any currency. It is very probable that the opportunities for investment outside this country will for long remain very restricted, but possibly the Chancellor of the Exchequer will have something to say on this aspect when he makes his statement on the general policy of control of capital issues which he promised the House on Tuesday.

"Slubbers" Costs

The accounts of The British Cotton and Wool Dyers' Association for the year to March 31st show a modest expansion in both trading and net profit and an increase in the dividend from 5 to 6½ per cent, the best paid since 1939-40. The fact is less interesting than the explanation of it advanced by Mr Peter Caldwell, the chairman of the group. Difficulties increased during the year and there was little or no relief from the shortage of labour. But the association dealt with an increased amount of material because virtually all its orders were for the services or for Utility cloths, small dyeing lots being almost completely eliminated. Mr Caldwell continues:—

Before the war, the yarn dyeing industry was clogged and stifled by an excess of small dyeing quantities, brought about by the endless variety of shades in use, with the result that labour expenditure was exceedingly high, and the outlay in coal, dye-stuffs and chemicals proportionately much higher than when dyeing greater weights.

Having stressed the difference between those conditions and the present experience, he goes on to say that

a continuation or extension in the post-war period of production on the lines of the Utility Scheme would do much to solve one of our most difficult problems, that of the supply of labour.

It is a pity that Mr Caldwell does not give a numerical example of the difference in cost and does not say whether he advocates the continuance of utility goods as a permanent or a temporary feature. The shortage of labour may be relieved by the exceptional measures being taken by the Government and the industry itself. But so long as shortages of labour and materials last, a substantial restriction in the number of shades may be desirable, if it does in fact produce a substantial increase in the amount of goods available. To continue what is in fact a compulsory limitation upon freedom of choice beyond that point seems of doubtful benefit.

There is little doubt that the total number of shades available in pre-war days exceeded what was "reasonable"

and it is to be hoped that during the transition period conditions will so develop that a price difference between what may perhaps be called a "standard" shade and a "fancy" one will be so impressed upon the public that they will in many cases prefer the former. In a completely free economy there is nothing to prevent concentration upon standard shades, or any other standard attribute. Whether it is desirable to do so will be determined by demand.

United Molasses Outlook

The preliminary statement of United Molasses for last year had already shown an increase in profit of the group from £834,781 to £960,163, the highest figure since 1940, and an increase in the dividend. The directors' report and chairman's statement add something to the information as to the position of the group. In the first place, contributions from the profits of prior years are not yet exhausted and are likely to continue, although presumably, at a reduced rate, for some years. They arise from uncertainty as to the interpretation of Government contracts, and it is evident that the officials of the company have been careful to err on the side of conservatism in making their estimates. Again, the fall in the provision for depreciation from £208,394 to £153,875 is to be read as a sign that many assets are written down to scrap values, and the report states that, until new assets are acquired, less and less will be required under this head. Finally, contributions to pensions funds were suspended in respect of last year, and will not be required until the whole position can be reviewed after the return of the company's employees now serving in the forces.

These are all pointers to an increase in distributable profits, but the position is not without its dark spots. Mr F. K. Kielberg, the chairman, discloses that the group has suffered heavily at sea, having lost some of its largest and most efficient tankers. So far some of the oil tankers have been replaced by the purchase from the Ministry of War Transport of two tankers of 12,000 tons each for delivery six months after the end of the war, but no steps have so far been taken to replace molasses tankers lost. It is not easy to deduce from the consolidated accounts of the company just what losses it has suffered, but they appear to have been moderate in the early years of the war and heaviest in 1942. The recent position can be seen from the summarised results of the past three years given on this page. The group has over £6 million of net liquid resources invested in gilt-edged stocks, so there can be no question of its having adequate funds for the replacement of the fleet when the appropriate moment arrives.

Colonial Development

The work of the Imperial Institute deserves to be better known. Its report for 1944 contains a fascinating account of varied activities. Its exhibition galleries, films and lantern slides are better known than its scientific work. A good deal of the work of the Scientific Department done for the Government has necessarily been of a confidential nature, but during last year increasing attention has been paid to post-war development.

The Institute provides an intelligence service for commercial firms as well as for Government departments on plant and animal products, mineral resources and rubber. It has had what it calls "an unusual number of inquiries" about rare and lesser-known metals with such attractive names as selenium, lithium and rhenium. Much of the Institute's research reveals prospects for the establishment of new industries in the colonies. These include bookbinding to use locally tanned leather in Basutoland, the production of fruit juices in New Guinea and Nigeria, silkworm production in Malta, sponge fishing on Tanganyikan shores, linen flax production in St Helena, and the use of local grasses for paper-making in Nigeria and Southern Rhodesia. The last might help to increase the supply of newsprint, which is likely to fall far short of demand in this country even when the war is completely over.

Geological surveys of some colonies have been made, and these are to be intensified in the future. They will be of the utmost value as a preliminary to development. Social aspects are not forgotten, and the Institute is preparing statements on colonial building materials of mineral origin for the Colonial Housing Research Group at the Colonial Office. One on the West Indies has already been submitted, and another for West African colonies is nearly complete.

In addition to the ordinary dividend, there was a tax-free distribution of 2½ per cent., paid out of capital reserve, in 1943 and 1944. Allowing for this, the units of ordinary stock, standing at 42s. 3d. ex dividend, yield £4 6s. 10d. per cent.

COMPANY MEETINGS

THE UNION BANK OF SCOTLAND, LIMITED

RECORD BALANCE SHEET FIGURES

SIR A. STEVEN BILSLAND'S REVIEW

The annual meeting of shareholders of The Union Bank of Scotland, Limited, was held, on the 9th instant, Sir A. Steven Bilsland, Bt., M.C., D.L., chairman of the bank, in the chair.

The chairman, in submitting the directors' report, mentioned that the balance-sheet presented that day, in the total figure and in the amount of deposits, constituted a record for the fifth consecutive year. The balance-sheet total of £65,703,000 compared with £63,786,000 for last year, and deposits at £54,668,000 showed an increase of £3,113,000. Cash, money at call and short notice, Treasury deposit receipts and bills—largely Treasury bills—amounted to £21,268,000 and represented 35 per cent. of the bank's liability for deposits and notes in circulation. The bank's investments of £33,651,000 showed an increase of over £2,650,000 compared with last year, £30,500,000 being British Government securities, a considerable proportion of which were short-dated. The actual market values of these investments were in the aggregate very considerably in excess of the figures appearing in the balance-sheet. From what has been said they would appreciate that the bank was in a very liquid position and that ample resources were available to make advances when the demand arose. The circumstances of the war had greatly reduced the demand for bank credits but the total of loans and advances at just over £9,000,000 showed an increase of £359,000 over last year. A fair proportion of the advances, which were well spread, represented assistance to firms engaged in the war effort.

PROFITS AND DIVIDENDS

The larger funds at their disposal during the year had resulted in an increase of over £10,000 in the profits which amounted to £323,776. This figure was arrived at after making ample reserves for taxation, which, in the case of banks as with other business undertakings, was a very serious item. An allocation of £50,000 had been made to reserve, raising that item to £2,050,000 against their paid-up capital of £1,200,000. For the second year in succession £20,000 had been placed to a reserve for repairs and renewals. On approval of the board's recommendation that a dividend of 18 per cent., absorbing, with tax, £216,000, be paid for the twenty-third successive year and that £35,000 be transferred to pensions and allowances fund, the balance to be carried forward would amount to £151,372, an increase of almost £3,000. The position of the bank was one of very great strength.

POST-WAR PROBLEMS

With the end of the war in Europe many problems would have to be faced. There was now a much greater realisation in this country than existed even a year or two ago of our position with regard to international trade. The Chancellor of the Exchequer had pointed out that in order to obtain essential imports to feed our people and to provide raw materials for industry, this country must incur further foreign indebtedness. Ultimately these debts, which by the end of 1945 might amount to 4,000 million pounds, must be paid: that could only be done by the export of goods, together with the rendering of services, such as shipping, insurance, banking, etc.

It was clear, therefore, that the expansion of their export trade was of vital importance if they were to maintain a satisfactory standard of life in this country. That meant that in peace no less than in war the country must maintain a united effort. Further, it meant the necessity for a high

standard of efficiency—in good management, modern plant, full value in output for wages paid and good salesmanship. They must sell overseas what their customers wanted at prices these customers were willing to pay, and it was clear that the further industrialisation in the new world would require a greater degree of specialisation on the part of this country. They must lay sound plans for the development of their export trade and not be deluded by the sellers' market that would exist for some years after the war: a sellers' market was never a sound market.

It was satisfactory that the Chancellor of the Exchequer had been able to announce the conclusion of a treaty with the United States on the difficult but very important question of double taxation, thus removing one of the handicaps to the exporter. It was also encouraging that the export credits guarantee department had recently announced improved guarantee policies which met many of the criticisms made against former restrictive conditions.

TRIBUTE TO MR NORMAN L. HIRD

After paying a tribute to the management and staffs at head office and in London, he also expressed their particular indebtedness to the general manager, Mr Norman L. Hird, and the assistant general manager, Mr John A. Morrison, for their valuable services during the past year.

With that annual meeting Mr Hird had completed 25 years as general manager of the bank—a record of service as chief executive officer seldom equalled in banking. These 25 years had covered a period of extraordinary complexity. Mr Hird had stood the test with great credit to himself and, as their figures showed, with great benefit to the bank. That day they expressed to him their cordial congratulations and their heartfelt thanks.

The report was unanimously adopted and a dividend at the rate of 18 per cent. per annum declared.

UNITED MOLASSES COMPANY, LIMITED

The nineteenth annual general meeting of this company will be held, on the 29th instant, at Brook House, Park Lane, London, W.

The following is an extract from the statement of Mr F. K. Kielberg, chairman and joint managing director, which was circulated with the report and accounts: The trading profits for the year, amounting to £960,000, include "Profits from prior years now available." A similar notation has appeared in the reports for the last three to four years and is likely to continue for some years to come. Had we not adopted this method of dealing with the accounts, but waited until all outstanding claims were finally settled and rates of hire agreed with the Ministry of War Transport, the publication of the accounts would have been delayed for years.

Having regard to the company's free reserves and strong liquid position, combined with the satisfactory earnings record of the last ten years, your directors feel that a slightly higher distribution is justified and recommend the payment of a final dividend of 15 per cent.

Trading during the first four months of the current year has been satisfactory and the immediate prospects indicate no change in this respect. The comparative stability of combined earnings during recent years is, to a large extent, due to the success of the board's policy of widening the basis of your company's activities, pursued since the middle thirties.

THE DISTILLERS COMPANY

The extraordinary general meeting of the company convened by notice dated April 24, 1945, was held in the North British Station Hotel on the 17th instant, with Lord Forteviot presiding.

The resolution extending the objects clause of the company's memorandum of association was passed.

ASHANTI GOLDFIELDS CORPORATION LIMITED

MR J. H. BATTY RETIRING

SIR EDWARD SPEARS NEW CHAIRMAN

The forty-eighth ordinary general meeting of Ashanti Goldfields Corporation, Limited, was held, on the 10th instant, in London. The following is the statement by Mr J. H. Batty (chairman) circulated with the report and accounts:—

I have come to the conclusion that the time has arrived when I should free myself from a great deal of the detail work involved in my present position as chairman, and after some discussion with my colleagues, the board have adopted my recommendation to appoint Major General Sir Edward L. Spears to be my successor. I have, however, agreed to continue to occupy my present position until the termination of hostilities in Europe and the transfer of the head office back to Old Jewry.

I have been a director of your company since 1921, and chairman for the past 15 years. My colleagues have invited me to assume the title of president of the corporation, and I have informed them that I shall be prepared to accept this suggestion provided the post does not carry any emoluments nor create a new function and new duties, and provided also that the proposal is acceptable to you. If this proves to be the case, I shall continue to act as a director, occupying the position of deputy chairman. This, in my view, is the best means of placing my past experience at the disposal of Sir Edward Spears. My position as president would be a purely advisory one, and your chairman will be invested with full powers, presiding at all board and other meetings of the corporation.

Sir Edward Spears has considerable business ability and I would remind you that he has recently held the important position of British Minister in Syria and the Lebanon. I am sure he will always study the interests and welfare of the Corporation and I wish him every success.

It is the intention of Sir Edward Spears to pay a visit to the Corporation's property at Obuasi in the autumn.

THE ACCOUNTS

Dealing with the balance sheet, it will be seen that the issued capital and share premium account remain the same.

Reserves amount to £331,682, an increase of about £7,000, and provision for taxation £398,353. Sundry creditors at £152,424 are higher by some £18,000. On the other side of the balance sheet the items of plant and machinery and main shafts again show reductions by depreciation. The large increase in sundry debtors is accounted for by the inclusion of £146,000 in respect of the claim for loss of profits owing to the fire in Ashanti Mine (since paid), and refund in respect of E.P.T., both of which matters I shall refer to later.

Investments in British Government Securities remain at about the same figure, viz.:—£240,540, and shares in other companies taken at cost or under market value, whichever was the lower, stand at £447,870. I may add that the market value of these shares on September 30th last was £1,336,558.

Tax reserve certificates and cash amount together to £393,091.

The profit for the year after allowing for our proportion of care and maintenance expenditure of the closed down mines £69,579, and taking into account the amount recoverable for E.P.T. for the year £15,010, and claim for loss of profit resulting from the fire £146,000, amounted to £820,225. It will be noted from the appropriation account that the estimated refund due in respect of E.P.T. claims for previous years, amounts to £16,747, which, added to

the profit for the year, and including £412,637 brought forward from last year, gives a total of £1,394,609. Of that sum, the interim and final dividends for the year will absorb (after deducting tax at 6s. in the £) £498,175, equal to the net amount distributed last year. Provision for income tax (including Gold Coast tax) amounts to £525,624. Of this amount £112,155 has been paid in advance. After allowing for the proposed transfer of £10,000 to the pension fund, there is a balance to be carried forward of £360,810.

It will be realised that the distribution this year has only been maintained by using the amount recovered in respect of E.P.T. for previous years, and by taking from the amount brought forward the sum of £51,827. There will be no further opportunity to recover E.P.T. for the current year, and therefore future distributions will depend upon the actual profits made.

EFFECT OF FIRE

As you are aware, our monthly returns were affected by the fire which necessitated sealing off the main shaft section for over four months. I am sure you will wish to join the board in expressing appreciation of the excellent work done by the manager and all concerned in coping with this serious danger. Every help and encouragement was forthcoming from the chief inspector of mines and his staff. We are glad to take this opportunity of expressing our appreciation of the valuable assistance they gave us. The board would also like to record their appreciation for the prompt manner in which our claim for insurance was dealt with, which is in keeping with the best tradition of the British insurance companies.

Fortunately, as the manager points out, very little material damage was done underground. Naturally, however, the fire caused a good deal of disorganisation in our plans. For one thing, owing to the main shaft section being closed, development had to be confined to less important sections of the mine, so that no addition to ore reserve was possible.

At 1,829,176 tons of 21.8 dwt. ore the reserve is still equal to about 10 years' supply at 15,000 tons per month. With the resumption of normal development, further and valuable additions can be confidently looked for.

As the London consultant indicates in his comments, we have authorised the sinking of a large ventilation shaft. This is part of a long term development policy to provide for the future working of the mine at much greater depth, and on a larger scale than we have at present reached. We expect to spend some £120,000 on this project, spread over the next five years.

Our underground workings are very extensive, stretching some 2 miles from Obuasi to Ayeinm. The existing shafts were planned—quite rightly on the evidence available forty years ago—for much smaller operations than we have to budget for today. As already indicated when I addressed you in February, 1939, it will be necessary for us to sink a new shaft to the north of our present main shaft. The war has hampered development to explore for the correct site for this shaft, but we hope to be in a position to come to a decision after we have resumed our normal development programme on the lower levels. This new shaft will involve a heavy expenditure, but, as in the case of the ventilation shaft, it will probably take 5 to 7 years to complete, and the cost will be spread over that period. Later it may also prove desirable to either enlarge the existing Ayeinm shaft or sink a new one.

The question of resuming our normal output, or of increasing it, must wait until the position with regard to European staff and essential supplies improves.

Meantime, it is impossible to maintain the plant at the same pre-war high standard of efficiency, and you will understand that even when the present stringency eases, there will be a time lag before we can bring the plant back to full capacity.

BIBIANI (1927) LIMITED

VERY STRONG RESERVES

NEW CHAIRMAN TAKES OFFICE

The eighteenth annual general meeting of Bibiani (1927) Ltd., was held on the 10th instant, in London. The following is the statement by Mr. J. H. Batty (Chairman) circulated with the report and accounts:

Those of you who are also members of the Ashanti Goldfields Corporation will have seen that I propose resigning the chairmanship of that Corporation directly hostilities in Europe are ended and the Head Office returns to Old Jewry. It is my wish to simultaneously take the same step in the case of this company.

I have been your chairman since 1930 and, with the able assistance of Mr. G. W. E. Turner, the London Consultant in all technical matters, and with the close association of the Ashanti Goldfields Corporation, our operations have achieved considerable success. The ore body met with at Bibiani is a remarkable one, and at times has given us some anxiety, but Mr. Turner's clear insight and decision with regard to the programme of work underground, have brought us to our present satisfactory position. He is deserving of the greatest credit and thanks from us all.

It gives me pleasure to record that we have been immensely helped by the interchange of staff and the combined experience pooled with the Ashanti Goldfields Corporation, and the cordial support which I have received from my colleagues during my tenure of office.

SIR EDWARD SPEARS

Major General Sir Edward L. Spears, whom I recommend to be my successor, has the unanimous support of the Board and I am pleased to be able to advise you that he has accepted our invitation.

There is a desire that I should remain associated with the Company, and I have accepted the invitation to remain on the Board as deputy chairman. I shall be pleased to do whatever is within my power to give the greatest help and support to your new chairman.

Sir Edward Spears has had considerable business experience, and his Parliamentary career has been outstanding. I have every confidence that he will bring his great ability and experience to bear in fostering and developing your interests.

Referring to the balance sheet, it will be seen that there is no change in the capital or share premium accounts. Provision for income tax (after allowing for £22,732 Gold Coast tax paid in advance) is £79,967. Plant and Machinery at £552,233 is again lower by depreciation written off. The same remark applies to main shafts standing at £18,602. Mine development after writing off £16,733 to profit and loss account in respect of tonnage treated during the year, stands at £127,622, which is equal to 1s. 2.9d. per ton on the ore reserve of 2,053,979 tons.

Investments in government securities, tax reserve certificates, and cash, amount to £294,500.

Referring to the profit and loss account, after making provision for our proportion of care and maintenance expenditure of the closed down mines £21,035, and for E.P.T. £15,000, the profit for the year amounts to £153,647.

In the appropriation account it will be noted that E.P.T. recovered (less taxation adjustments) in respect of the past years, is £90,896, which, added to the above profit, and including the balance brought forward from last year, £72,512, makes a total of £317,055.

In respect of the twelve months, an interim dividend of 5 per cent. has been paid, and it is proposed to pay a final dividend of 15 per cent both less tax at 5/- in the £. These dividends (less tax) amount to £75,000, as against the £68,750 distributed last year. After making provision for income tax (including Gold Coast

tax), and transferring £5,000 to Staff Bonus Account, there is a balance to be carried forward of £149,035, being an increase of £76,523 compared with last year's figure.

OUTLOOK FOR THE FUTURE

In view of the uncertainty of the duration of the war, and the increased difficulties with regard to staff and supplies, which, of course, have an important bearing on our being able to maintain present output, it is most necessary that we should be conservative in our distributions until conditions become more normal.

Directly we return to normal conditions, when Staff and material can be brought up to full standard, we are ready to go ahead, and I look forward with confidence to the future.

The technical side has been dealt with in the London Consultant's comments on the manager's report. This report can be seen at the Company's office by arrangement with the secretary.

Development results at the end of the year did not call for any special comment, only medium to low grade ore having been found at No. 11 Level at that time. It is satisfactory, however, to be able to record that since then better results have been obtained there, No. 9 crosscut having exposed 20 ft. of reef of an average value of 9.3 dwt.

Even more encouraging are the results of crosscutting at the North end of No. 10 Level, where East of the Main drive No. 27 crosscut N. has given so far 15 ft. of reef of an average value of 35.2 dwt.

As soon as circumstances permit, further work will be done in this area to explore what may prove to be a new pay shoot.

The programme of shaft sinking and development to open up a new main haulage level, mentioned by Mr. Turner, will be put in hand as soon as circumstances permit.

The ore reserves are in a very strong position. It is satisfactory to find that our estimates of tonnage have been on the conservative side, so that last year stopping Blocks yielded 75,000 tons more than anticipated.

With regard to future output we are hopeful of maintaining our present rate of production, but in addition to the difficulties of labour and supplies already mentioned, costs are rising owing to war conditions, and this, naturally, is likely to have some bearing on future profits.

Continued attention has been given to promoting the welfare of the African and European staff. African labour has been adequate and contented. You will, I am sure, agree that the manager and his staff, many of whom, owing to transport difficulties, have had to serve unduly long tours of duty, are to be congratulated on the excellent work accomplished during the year.

WILLIAM BEARDMORE AND COMPANY, LIMITED

The ordinary general meeting of William Beardmore and Company, Limited, was held, on the 11th instant, at the offices of the company in Glasgow. Sir James Lithgow, Bt., G.B.E., M.C., chairman of the company, presiding.

The secretary, Mr D. M. Cameron, C.A., read the notice convening the meeting, and the report of the auditors was read by Mr H. MacRobert, C.A.

Resolutions adopting the report and accounts for the year ended December 31, 1944, authorising the payment of the dividend on the ordinary stock, and confirming the placing of a further £100,000 to war contingencies reserve, were carried unanimously.

The retiring directors, Captain Q. H. Paterson, D.S.C., R.N., and Mr T. M. Service, were re-elected, and the auditors, Messrs J. Wyllie Guild and Ballantine, re-appointed.

The proceedings concluded with a vote of thanks to the chairman.

SCOTTISH UNION AND NATIONAL INSURANCE COMPANY

TOTAL ASSETS EXCEED £19,478,000

MR. JAMES L. MOUNSEY'S SPEECH

The annual general meeting of the Scottish Union and National Insurance Company was held, on the 9th instant, in Edinburgh.

Mr James L. Mounsey, W.S., chairman of the company, in the course of his speech, said: New business written in the life department in 1944 showed a satisfactory increase over the previous year, both as regards sums assured and annual premiums. In dealing with children's policies and other contracts carrying an option, it is our practice to take credit for only the basic sum payable in the published new business figures; we do not take into account the increase in the sum assured which may accrue when the option date is reached. The average rate of premium for new business was maintained at well over 5 per cent. in respect of the proposals accepted in 1944, and the business generally was of a substantial nature. The total annual premiums show an increase on the previous year, and considerations for new annuities were substantially larger than in 1943. The net rate of interest earned on the fund was £3 2s. 11d. per cent. last year.

On the other side of the account, mortality experience continued to be favourable, and though claims by death at £357,043 were higher by approximately £60,000 than the very low total in 1943, they were well within the estimated figure, despite the incidence of claims caused by hostilities. It is interesting to observe that, with the exception of last year, we have to go back to 1912, i.e., the year before the "City of Glasgow" life funds were included in our accounts, to find a year when the mortality claims were less and, at that time, the business on our books amounted to only about one-third of the present total.

FIRE DEPARTMENT

The main feature of this account is the substantial increase in premiums in all parts of the world where the company is transacting business, the income for last year being the highest attained in the long history of the company. The claims' experience in the British Isles was again favourable, though not so good as in 1943, and, despite large payments for claims arising out of the serious explosion in Bombay last April, the overseas field—with the exception of North America—has produced satisfactory results.

Despite the difficulties, the fire account shows a trading surplus for the year of £112,187, out of which the sum of £92,046 has been added to reserve for unexpired risks in consequence of the increase in premiums, and the balance of £20,141 has been transferred to profit and loss account. Although the latter sum is small compared with the profits earned during the last few years, the result on the whole may be regarded as not unsatisfactory.

ACCIDENT DEPARTMENT

This account, which includes personal accident, employers' liability, motor, burglary and other miscellaneous risks dealt with by the accident department, continues to show sound and steady progress. There is a slight reduction in the motor revenue, but, in all other classes of business, the premiums have appreciably advanced. The overseas business continues to expand and the results generally have proved more favourable than in recent years. Reserves have been further strengthened, and the combined profit at £65,946 is highly gratifying.

It is recognised that the underwriting in the accident department as a whole has been generally favourable during the past year or two—one of the main reasons being

the considerable reduction in the use of private motor cars. While perhaps it would be optimistic to anticipate a continuance of this experience, I feel that we can look forward with confidence to continued development of our accident account.

MARINE DEPARTMENT

Compared with the previous year, there was a drop in marine premiums of nearly £136,000. This is due to some extent to a further reduction of privately owned tonnage but mainly to reduced rates of premium, both for war risks and ordinary perils of the seas. It is pleasing to note that the lowering of rates for war risks has been brought about by the lessening of the submarine menace, and, although there is no contraction in the scope of the activities of the marine department, it is to be anticipated that premium rates will continue to fall as the war moves towards its conclusion and hostilities finally cease.

Claims paid were £109,000 less than during 1943, but there are many outstanding claims awaiting settlement on account of the postponement of permanent repairs until larger supplies of materials and labour are available. After full provision for these and other outstanding liabilities has been made in the reserves, it is extremely satisfactory to be able to transfer the substantial sum of £150,000 to profit and loss account. The underwriting fund stands at 141 per cent. of the premiums written for the year compared with 129 per cent. for 1943.

APPRECIATION OF INVESTMENTS

Following the practice of previous war-time years, we have continued to assist the war effort by investing all our new money available in Great Britain and a large proportion of that derived from maturities and repayments in British Government securities. The total sum invested in these securities last year was £502,000, and, since the outbreak of war, we have invested over £3,085,650. We have also contributed to the war effort in a similar way in the British Dominions overseas and in the United States of America.

With the maintenance of strict Government control of finance, the difficulty of obtaining suitable investments to yield a liberal return continues, but it is satisfactory to be able to state that the market values of our investments have continued to appreciate substantially. During the year the total assets of the company have increased by £312,875, and now stand in the balance-sheet at £19,478,164—a sum considerably below current market values.

THE FUTURE

As regards the future, there is no doubt that insurance must play the same part in post-war reconstruction as it has played in the past, namely, the provision of security against loss from the many risks which beset life and property. The war has brought prominently to notice the great value of insurance as an invisible export, and arrangements have been made for British insurance companies to re-enter the overseas countries where they formerly operated as soon as those countries have been cleared of the enemy.

Whatever difficulties the future may bring, I feel that with the full use of our returning manpower properly directed and the continued support of all those who have contributed to the welfare of the company, and with bold and comprehensive planning, we can look forward with confidence to future progress and developments in all departments of the company's business.

The report and accounts and dividend were approved.

GENERAL ACCIDENT ASSURANCE

SUCCESSFUL OPERATIONS

The fifty-ninth annual general meeting of the General Accident, Fire and Life Assurance Corporation, Limited, will be held, at Perth, on the 23rd instant.

The following is an extract from the statement of the chairman, Mr Frederick Richardson, circulated with the accounts: Our operations during 1944 have been highly successful. There was an increase in net premium income in each of the main departments and the balance at credit of profit and loss account shows a gain of £272,996 over the previous year. However, this balance, totalling £912,603, includes certain exceptional items. We have been able to bring into the accounts an item of profit on exchange amounting to £197,298, mostly derived from United States remittances, and in addition have felt justified in transferring £50,000 from the Marine Account, in view of its successful operation by our Marine underwriters. Advantage has been taken of these transfers to set up a reserve of £250,000 against British income tax not yet assessable based on our 1944 results. In our subsidiary companies similar reserves, amounting to £62,535, are carried. Your directors have deemed it wise to make permanent provision under this heading.

We have very large funds in the United States and, as is customary, these have been translated into sterling at the pre-war par of exchange. Therefore, as long as the prevailing rate continues to favour the dollar, there will be an element of potential profit on exchange. In the years 1939-1944 inclusive we have incurred in British taxation the sum of £1,808,111 in respect of profits made outside the United Kingdom. Thus our world wide operations have been of much benefit to the Nation as well as to ourselves. The international scope of British insurance is a factor of great importance in our National economy.

JOHNSON AND PHILLIPS, LIMITED

DIVIDEND MAINTAINED

The fortieth annual general meeting of Johnson and Phillips, Limited, was held, on the 10th instant, in London.

Mr G. Leslie Wates, J.P. (chairman and managing director) said that the trading profit for the year under review fell short of that shown by the previous year's figures but was still the substantial sum of £458,000. The net profit, however, was higher by reason of the fact that they had employed more capital during 1944 than in earlier years. The recommendation as to dividend was the same as during the war years, namely 15 per cent.

The three electricity distributing companies had carried on their work without interruption or major incident and had all increased their turnover and profit. Since the close of the financial year they had purchased the whole of the issued share capital of Aurora Lamps, Limited. They had continued to devote a great deal of attention to their organisation overseas. In parts of the world still in the hands of the Eastern enemy, their business arrangements would have to be reconstructed to meet the enormous needs which would arise. In the Dominions it was inevitable that much of what had been formerly imported would be manufactured locally. So far as they considered such development sound they would participate; indeed they were already doing so.

It was difficult to say anything fresh about the post-war situation at home. It was obvious that controls would have to remain for some time until shortages of essential raw materials were made up and life sufficiently returned to normal to enable freedom in various directions to be recovered without dangerous repercussions on prices, but the sooner those controls went the better for British industry.

The report was adopted.

TARRAN INDUSTRIES, LIMITED

PROFITABLE TRADING BASIS REACHED

RECONSTRUCTION FORESHADOWED

The adjourned annual general meeting of Tarran Industries, Limited, was held, on the 10th instant, in London.

Mr Alan P. Good, the chairman, presided.

The following is a summary of the statement of the directors circulated with the report and accounts: The audited accounts for the year ended September 30, 1944, show a loss for the year of £347,941 and, after taking credit for the balance brought forward and other available items, a debit balance on profit and loss account of £327,009. By reference to the profit and loss account, it will be seen that this loss does not arise wholly from the year's trading; as to £14,000 it represents the writing off of the goodwill of R. E. Barchard and Son, which business was bought in 1943 and sold recently; as to £13,203, it represents reserves which the directors have considered it necessary to make against investments in subsidiary and associated companies. However, the greater part of the loss, namely, the sum of £296,402 arises primarily from a revaluation of stocks, work-in-progress and amounts outstanding on completed contracts.

TURQUAND, YOUNGS' REPORT

The directors' report dealing with the circumstances giving rise to this position states that in March, 1944, Messrs Turquand, Youngs, McAuliffe and Company, chartered accountants, were instructed by the company and its bankers to report on the financial position of the company as at March 31, 1944. Their report, with a balance-sheet attached, showed that as at March 31, 1944, there was a deficiency as regards creditors of £249,474, whereas the balance-sheet of the company as at September 30, 1943, had shown a surplus of £271,000. The difference between the surplus shown at September 30, 1943, and the deficiency shown at March 31, 1944, represents the apparent loss incurred by the company over the six months period and, in the opinion of Messrs Turquand, Youngs, McAuliffe and Company, that difference, being the apparent loss, was £520,574.

In their report, Messrs Turquand, Youngs, McAuliffe and Company stated that as eight months had elapsed since September 30, 1943—the date of the balance-sheet—it was not possible to identify all the items appearing in that balance-sheet, but certain large items could be identified and, in their opinion, such items had been overvalued at September 30, 1943, to the extent of £439,700; they attributed the balance of the loss to trading and sundry other matters not then traceable. The above report was dated June 16, 1944, and copies were sent simultaneously to the company's bankers and to the then chairman of the board.

CHANGES ON BOARD

In October, 1944, the Ministry of Works in considering the grant of a large contract to the company required to be satisfied as to the adequacy of its management and resources, and in consequence of these inquiries and the accountants' report, on the representation of the company's bankers there were appointed to the board Mr Alan P. Good as chairman, and Messrs R. W. G. Mackay, H. L. Dowsett and Colonel A. Ridley Martin, and a further investigation was instituted as at September 30, 1944, carried out by Mr E. McCann.

Early in December, 1944, Mr McCann presented his report, which, after taking credit for interim current profits, disclosed an estimated apparent loss of £465,603, being on reconciliation substantially identical with that disclosed by the accountants' report.

Mr R. G. Tarran and the other directors constituting the board prior to July, 1944, were not in agreement with the report as made, maintaining that on full investigation and proper claims being made and settled over all contracts with Government departments it would be demonstrated that the company had incurred no loss at all.

However, in view of the serious financial position disclosed, the board decided to suspend Mr R. G. Tarran from his position as managing director and appointed Mr R. W. G. Mackay as acting managing director in his place, while in February, 1945, the board accepted the resignations of Sir Noel Curtis-Bennet, Colonel C. D. Burnell and Mr A. Watts, Mr R. G. Tarran, however, remaining on the board although requested by the chairman to resign.

In accordance with statutory requirements an annual general meeting was convened before the end of 1944, and adjourned so that further investigation could be made before presenting accounts to the shareholders. These investigations disclosed possible recoveries under certain closed contracts on the basis of which the directors have felt able to increase the figure of work in progress by £100,000, although, in their opinion, recoveries are unlikely to exceed this and must in any case not be regarded as certain, while a further £38,000 has become available, representing amounts credited by claims realised, provisions not required and settlements made since September 30, 1944. These adjustments have reduced the figure of loss to the figure shown in the accounts and the directors explain that while they cannot give as full an explanation as they would wish, as the records of the company are insufficient to provide the data required, in their view the greater part of the loss was not incurred during the past year and relates to at least the previous three years and probably in part to large contracts undertaken prior to September 30, 1942.

ERECTION OF TEMPORARY HOUSES

Since the reconstitution of the board the Ministry of Works in December, 1944, issued "Instructions to Proceed" for the erection of 1,000 temporary houses in Hull, which contract it is hoped to complete by September 30 next. Further instructions have been obtained for the manufacture of 10,000 temporary houses to be erected on the site by local builders, which contract it is hoped to complete before March 31 next. The directors are already making plans for building permanent houses.

Mr H. L. Dowsett has retired owing to pressure of other work, remaining available in a consultative capacity, and Miss Elizabeth Denby, Hon. A.R.I.B.A., the well-known housing expert, has joined the board as a full-time director.

The directors report that they have under active consideration proposals for reconstruction of the company's financial structure, which they intend to place before the shareholders at an early date. In the meantime, they believe that the present organisation, having regard to the contracts in hand, is operating on a profitable trading basis, and they have from the company's bankers the assurance of finance sufficient to carry out these contracts so long as they, the bankers, are satisfied as to the control and management of the company. The report and accounts were adopted.

INCREASED BORROWING POWERS

An extraordinary general meeting was then held for the purpose of passing a resolution whereby the maximum amount which could be borrowed by the directors was increased from £500,000 to £750,000. The resolution was passed.

AULT AND WIBORG, LIMITED

RECORD TURNOVER

The eleventh ordinary general meeting of Ault and Wiborg, Limited, was held, on the 11th instant, in London. Mr Gerald Wellesley (the chairman) presided.

The Chairman, in moving the adoption of the report and accounts, said: The total turnover of the parent company and its subsidiaries is a record one, but once again owing to the lower margin of profit on sales this increase in business is not reflected proportionately in the net profit of the company. The latter amounts to £94,546, to which must be added £27,806 brought forward. There is an undivided balance of £45,677, and the directors recommend a further dividend of 6 per cent., less tax, on the Ordinary shares, making 12½ per cent., less tax, in all, and leaving to be carried forward £33,786 against £27,806. Since our company was formed rather over ten years ago, the net assets have increased from £350,000 to £606,642—the profits retained in the business during the period having amounted to £225,654.

It is satisfactory to note that the main increase in our turnover has been in our principal peace-time products, namely, printers' inks and rollers, varnishes, paints, industrial finishes and metal decorating products.

Relations with our good friends in the United States of America, the Interchemical Corporation, have recently been strengthened by the visit of our managing director to New York, where the principles of future exchange of research have been agreed. During the past six years the Interchemical Corporation, through their famous research laboratories, have accumulated a vast amount of knowledge and technique relating to our main products of printing inks, paint and industrial finishes which will be of very great value to our company.

The report and accounts were unanimously adopted.

LONDON ASIATIC RUBBER AND PRODUCE COMPANY LIMITED

MR H. J. WELCH'S ADDRESS.

The annual general meeting of this company was held in London on the 7th instant, Mr H. J. Welch (the chairman) presiding.

The following are extracts from the chairman's address:—We have still no knowledge concerning the conditions that have been obtained on the estates while they have been under the control of the invaders of Malaya and Burma. The news received from the thirteen European members of the former estates staff who are in Japanese hands is scanty, but we have no bad news of any of them.

The net liquid assets, which are equivalent to just over £13 per planted acre, are greater than they were a year ago, as in the meantime the provisional settlement of the basis of taxation for companies like ours, which had been previously reported to you, has come into operation. The settlement, on the basis of discontinuance of the company's business of rubber production, is subject to revision after the war if, in the light of the information then available, it then appears to the company that the alternative basis of continuance of business would be preferable. Under the provisional settlement, it has been unnecessary to pay approximately £36,000 in taxation which it is estimated would otherwise have been payable to the Inland Revenue and in addition we have received a cash refund of taxation previously paid amounting to £39,008. The credit balance of the revenue account, £5,892, has been added to the revenue and appropriation account. This now amounts to £101,532 and the directors recommend that it should be carried forward.

The accounts and the directors' report were adopted unanimously.

FINANCE AND BANKING

THE MONEY MARKET. The market in the past week has been dominated by two factors—the pressure caused by currency demands and by the hold-up of remittances over the VE celebration period, and the large allotment of bills secured by the discount houses at last week's tender. Official applications, which in the previous week had forced the total to a new high level, were apparently small; hence the market quota rose from 30 to 40 per cent. This represents some £52 million of bills, even more than was secured a fortnight earlier. At the same time, the net call on the clearing banks for T.D.R.'s was only about £3 million smaller, at some £22 million, than in the previous week. On two days immediately following the holiday, there was recourse to the special buyer, who took an appreciable volume of bills. Somewhat unexpectedly, no further assistance has been needed this week, although the banks have been only moderate buyers of bills. On Monday some night money was converted into very short-dated bills, but on Tuesday, as the delayed payments began to come through, the demand broadened and was extended to June maturities. Later, the position was further relieved by the monthly payments by the Milk Marketing Board. Over the week, the market's intake of bills will certainly exceed its sales and maturities. A further £10.5 million of notes, partly for Whitsun requirements, have gone into circulation—more than in V-Week—but this drain has been more than neutralised by a net increase of £16.5 million in the security portfolio. As, in addition, there has been a moderate release from public deposits, bankers' balances have recovered by £8.8 million from their low level of the previous week.

MONEY RATES, LONDON.—The following rates unchanged remained between

May 9th and May 16th:—Bank rate, 2% (changed from 3% October 26, 1939). Discount rates: Bank Bills 60 days, 1½%; 3 months, 1½%; 4 months, 1½%; 6 months, 1½%; Treasury Bills: 2 months, 1½%; 3 months, 1½%; Day-to-day money, ½-1½%. Short Loans, 1½%. Bank deposit rates, ½%. Discount deposit at call, ½%; at notice, ½%.

Exchange Rates.—The following rates fixed by the Bank of England remained unchanged between May 9th and May 16th. (Figures in brackets are per of exchange).

INDUSTRY AND TRADE

Sensitive Price Index.—There was no change in the index during the week ended May 1st. The complete index (1935=100) was 161.4, the crops component, 140.4, and raw materials index, 185.5. During the week ended May 15th there was no change until May 14th, when a drop in the price of Canadian wheat caused the crops component of the index to fall to 139.7. The raw materials component was unchanged at 185.5, and the complete index fell to 162.2.

A change has been made in the method of showing an excess of Post Office Expenditure over the Post Office Revenue. Such excess is now included as ordinary expenditure under "Total Supply Services" instead of being shown, as up to July 24, 1943, inclusive, as a deduction from ordinary revenue.

After decreasing Exchequer balances by £504,385 to £2,483,836, the other operations for the week (no longer shown separately) increased the gross National Debt by £50,998,299 to £32,695 million after allowing for £16 million of sinking funds in 1944-45.

BACKGROUND TO ACHIEVEMENT

Power

FOR more than forty years BTH has been pre-eminent in the design and manufacture of power station equipment. Not only does the Company provide generators, switchgear, transformers and rectifiers for very many electricity supply undertakings throughout the British Empire, but in many cases has also been responsible for the design and installation of the complete systems. The first successful steam turbine for utilising extra high temperature steam was manufactured by BTH for an electric power company in the U.S.A., this experience ultimately enabling BTH to make the propulsion unit for Air Commodore Whittle's jet-propelled plane.

THIS WOUND HEALER
MAKES BETTER BAYONETS

WHEN young Freddy cuts his knee playing soldiers, a dab of iodine prevents him becoming a real casualty. Yet this germ-killer which heals Freddy's cut can also be used just as successfully to improve the quality of steel for the real business of war.

Iodine's healing touch is but one role. Paint containing iodine registers heat changes. Headlamps can be made dazzle-proof with iodine. Iodized feeding-stuffs increase the milk yield of cows. Detectives, dentists, brass-founders, furriers, photographers, all have important uses for iodine. New information is being recorded almost every day at the Iodine Educational Bureau.

If you have a problem which you think iodine might help solve, you are invited to make full use of the Bureau. The Iodine Educational Bureau gives information and advice on the uses of iodine in Medicine, Industry and Agriculture. Every fact about iodine which has ever been published is recorded here. The Bureau is ready to assist any institution or commercial enterprise with an iodine problem. There is no charge for this service.

TO INDUSTRIAL GAS AND ELECTRICITY USERS

These 3 Bulletins
show the way to
Immediate Savings

Every man and woman in industry concerned with the use of gas and electricity should get hold of a copy of each of these three Bulletins: READ THEM AND KNOW THEM. They are:

- No. 5—"Practical Economy Points for Industrial Gas Users."
- No. 14—"Operation and Maintenance of Gas Burners."
- No. 13—"Fuel Economy by Saving Electricity."

Always keep them handy in desk or pocket for reference.

The Bulletins issued by the Ministry of Fuel and Power provide the latest "specialist" knowledge on all aspects of fuel saving. They show how waste may be occurring in unexpected places, and tell what the cure is. Only when plant has been considered in the light of all the appropriate Bulletins can there be reasonable certainty that every source of wastage has been discovered.

To Managements. See that copies of these three Bulletins are circulated among your staff at once.

To Staff. Keep the Fuel Efficiency Bulletins ready to hand so you can be sure that no opportunity for fuel saving is being missed.

Additional copies of the Fuel Efficiency Bulletins and Fuel Watchers' Badges can be obtained from the Regional Offices of the Ministry of Fuel and Power.

Clearing the Air

THE political air has been cleared. The Government has resigned and Mr Churchill is forming a new one. Parliament is to be dissolved on June 15th and a General Election will be held on July 5th. This is being described as an immediate election, but the immediacy is only relative. The law imposes a pause of three weeks after the election, for the arrival of Forces' ballots, before the counting begins, and the results will not be known until the very last days of July. The electoral process, on the resignation of the Cabinet that has carried the try to victory to its replacement by another fortified expression of the popular will, is thus to last more than two months, during which little will be heard above the din from the hustings. A decision for a July election was made as the result of Mr Churchill's choice between two alternatives put forward by Mr Churchill—an immediate dissolution and maintenance of the present Government until after the end of the Japanese war—with the curious suggestion of a referendum to decide whether the life of the present Government should equally be prolonged. The Labour Party and its friends made it clear to their leaders, some of whom were hesitant, that they could not tolerate a further indefinite suspension of party politics. So, with every sign of irritation, Mr Attlee chose July.

Labour would have greatly preferred to wait until the autumn, and a continuance of the present Government until

then. But that was the one alternative that Mr Churchill ruled out. Conflicting reasons of the public interest are being given, on both sides, for the attitudes adopted. The real reason, however, is party advantage. The Prime Minister, in his second letter to Mr Attlee, was indignant about the "aspersion" that his preference for July over October was due to a calculation of electoral gain, and in Mr Churchill himself the emotion is no doubt sincere, since he has unquestionably laboured to make the transition from coalition to party without bitterness and unfairness. But in the minds of some of his closest colleagues and friends there has obviously been the calculation that an election held in the bright sunlight of victory celebrations would almost certainly redound to the advantage of the main architect of that victory and of the party he leads. The Labour calculation is equally obvious. The rank and file of the party are even more impatient to get back to party politics than are the Tories; but they would prefer to wait until an accumulation of difficulties, and perhaps of mistakes, has dimmed the lustre of Mr Churchill's fame, until the elector ceases to think of him as a war leader, in which capacity he is impregnable, and begins to question him as a peace leader, where he is much weaker. These are the calculations, and it takes a strong stomach to say that one is any more moral than the other.

If the public interest could be sincerely consulted, it would show a balance of advantage in favour of an October

election. After ten years, three months is very little longer to wait, but it would enable pending legislation to be completed, it would allow time for the preparation of a new and (it is to be hoped) less imperfect register, and large numbers of men and women in the forces would have an opportunity of discovering what the issues of the election are. But it is only on balance that these advantages arise, since there are powerful arguments on the other side. The approach of an election has manifestly hamstrung the Government for many months past, and there is force in the Prime Minister's unwillingness to "go on bickering together until the autumn."

The difference between July and October is certainly not large enough to support a charge of sharp practice, and certainly not from the Labour Party. The truth is that the Labour Party, largely owing to its unwillingness to follow its own leaders, has allowed itself to be completely outmanœuvred, and though annoyance is natural, it is not justified. Labour was insisting on a return to party politics when the Tories were still talking of continuing the coalition for three more years, and they can hardly complain if they are now taken at their word. Although they never said in set terms that they wanted an election immediately after the end of the war in Europe, Mr Attlee's promise to summon a special conference "immediately after the defeat of Germany" to consider the withdrawal of the Labour Ministers did more than any action of the Tories to give currency to the idea that this would be an appropriate time. Moreover, most of the arguments against an immediate election apply with equal force against an election at any time before the end of the war. It is difficult to argue that a postponement of three months would be wholly good, while a postponement that might turn out to be only of four or five or six months is wholly bad; but this is the logical contortion to which the Labour Party is now committed. The Prime Minister's alternative of an immediate election or indefinite delay happens to suit the Tory book; but it also has a great deal of logic in it.

It is very difficult to foresee the result of the contest thus joined. The general expectation, even among many Labour people, is that the Conservative Party will return with a majority, though a reduced one, and that this result will be a personal vote of confidence in Mr Churchill. This, no doubt, is the most probable result. But it is by no means certain. It is a little difficult to imagine the Labour Party winning the 150 additional seats necessary to give it a bare majority and to get a working majority it would have to double its present total of 170 seats. But a House of Commons in which the two largest parties are evenly balanced is a distinct possibility. If there is a substantial Liberal Party, it could decide the issue, as it did in 1924, and in 1929; but it would take 40 or 50 Liberals to provide a solid working majority in such circumstances, and one of the unknowns in the coming election is whether the Liberal Party can win enough seats to play such a rôle. If there is no working

combination in the new House, then there will be no alternative but a fresh coalition—than which it is hardly possible to conjure up a more frightening prospect. The parties may have little enough ability to make positive decisions; but their capacity to obstruct each other is almost infinite, and this proclivity would be given free rein in a coalition no member of which commanded a majority of the House.

There will certainly be advantages in replacing this very stale and superannuated House of Commons by a fresh one. The turnover of individuals may be considerable, and there should be a lot of new blood. But it is hardly possible to hope for a great change in the conduct of national affairs. A general election, especially after so long an interval and such tremendous events, ought to be regarded as an opportunity for a great regeneration of national purpose. That it is not so regarded by the man in the street, but rather in the guise of a resumption of normal sporting events, comparable to a cricket Test match (and almost as lengthy), reflects the fact that there is a total lack of enthusiasm for either of the major parties. It is, in fact, very difficult to believe that a clear majority for either one would make very much difference. A few superficialities, no doubt, would be painted in different colours, but in the main the country will be ruled in exactly the same way, by the Civil Service, whichever side wins. On the immediate issue of the relaxation of wartime controls, the margin between the least that the Socialists would find it possible to do is, in the present circumstances of the country, very small. And on the further issue of economic policy, the most that a Labour Government could be expected to do would be to change the formal ownership of the mining, transport and power industries, while a Tory Government will certainly have to concern itself with the same industries, and might well be compelled by events to be almost equally drastic in its intervention in their policies, even though it left the formal facade of ownership untouched.

The fact is that neither party has any real, practical policy, because neither party has thought at all deeply about twentieth-century Britain in a twentieth-century world, and each therefore takes refuge in mere administration, using shades of emphasis as an apology for differences of principle. The honest citizen will find it very difficult indeed to decide how to use his vote. He is likely, perhaps, to end by voting for the Prime Minister. But he would do so far more gladly if he could vote for Mr Churchill as a real national leader, the breaker of outworn rigidities of doctrine, the founder of a party equipped to devote the whole energies of the people to the task of constructing a modern economic and social structure. Had Mr Churchill not succumbed to the lures of party leadership victory, a matchless opportunity for this country, but might also have established the means of ensuring that the opportunity is not missed.

Divided Germany

FIELD-MARSHAL MONTGOMERY is to represent Great Britain on the Allied Control Council, and his representative for control matters will be Lieutenant-General Sir Ronald Weeks—an admirable choice of an industrialist turned soldier. There is, however, no announcement yet on the actual setting up of the Control Council. No British or American Mission has gone to Berlin—or to Vienna. Meanwhile, a "Supreme HQ Control party with the German High Command" will be established at Flensburg to control Admiral Doenitz's officials until the demobilisation of the German armies is complete. The Russians will be represented on this Control party. But this appears to be the full extent of Allied co-operation so far.

It is becoming more and more difficult to believe that there will ever be very much more. At this moment, a violent cleavage is being created in Allied policy towards

the defeated Germans. In the west, the general aim of "non-fraternisation" (whatever that may be held to mean) still dominates policy. The Germans have been bluntly told that the first charge on their work will be the maintenance of the armies of occupation. If there is a margin, they may get it. The official broadcasts are curt and peremptory. A curfew is imposed in the towns. Schools are all closed while an inadequate number of education officers examine the teachers. Few or no places of entertainment are open and cultural activities have ceased.

The contrast could hardly be more striking between this picture and the facts reported on the Berlin and Vienna radio, which, incidentally, speak with an identical voice. The Russians are now doing everything in their power to conquer the Germans' distrust, to distinguish between the "Fascist beasts"—Hitler and his followers—and the ordinary German people, and to promise the latter

that their efforts of reconstruction will ensure their own prosperity and "give them the chance of finding their way back into the comity of nations." A Town Council under a Dr Werner has been established in Berlin and the Red Army will help it to rebuild and reconstruct the city. Red Army lorries are bringing in foodstuffs. Shops are opening. New ration books are already distributed. The workers are to have bigger rations than under the Nazis. Plays, cinemas and concerts are beginning again. The military commandant has appealed to all artists and professional people to rebuild Germany's cultural and intellectual life. The tone of the broadcasts is best summed up in the following extract from a Berlin woman's speech:

Now we know what lies the Goebbels propaganda told about the Red Army. Not only shall we not starve, but the working man gets more than under the Nazis. All this is a revelation to us. . . . It is now up to us to organise the distribution of work simply and efficiently. We all see rolling past us Red Army lorries carrying food to the Berlin population. . . . A new life is beginning; we have started on the way towards a better order.

Much of this, no doubt, is pure propaganda and window-dressing. But it is clear from the manner in which the Russians are approaching their problems that they have been seriously disturbed by the mass flight of civilians from their zone and the mass surrender of German troops to the Allies. They are trying to counter the Germans' obvious terror. They are going out of their way to present the Soviet Union as the enemy of Fascism only and the friend of the ordinary Germans. Inevitably—since no joint policy was established—this new Russian strategy has in it an element of competition, of bidding for support for Russia against the West. The Western Allies cannot ignore it. Even if in spite of all the other pressing reasons, they have still not fully formulated their policy, the Russian decision to adopt the policy with which the Western Allies started this war compels them to examine their own strategy.

They probably have to face the unpleasant fact that they will have no influence in the Russian zone. They will probably not even gain admittance. The Russians, on the other hand, through their local Communist groups, will be active not only in the British, American and French zones of occupation, but throughout Western Europe. It may still be possible at the highest level to get agreement on specific questions—on transport or food supplies or the distribution of labour—but even here, the outlook is not promising. The new European Transport Commission has been set up without Russian participation. In these unhappy conditions, how do Great Britain and America view their relations with Western Europe? Are they out to pursue in Western Germany a policy which ultimately gives the German people a stable place in West European life and prosperity? Or will the German community be left without guidance or leadership to accept, if only by default, the offer of a return to the "comity of nations"

under Russian auspices? There is no doubt that, faced with the choice between a vacuum and some sort of positive policy, the Germans will be drawn, whatever their present attitude, towards those who have something to offer.

If it is objected that the Western Allies cannot indulge in competition and propaganda, it can only be replied that they have no choice. Since there is to be no joint policy, whatever policy is adopted in either zone will compete with the other. It is thus vital that the Allies should move away from the vacuum of non-fraternisation, that they should not fall into the opposite error of Darlanism; in a word, that they should not drift into any policy whatever, but establish thoughtfully and precisely what their interests and the interests of Western Europe demand; and having established this preliminary, pursue a policy which is likely to satisfy those interests to the fullest possible extent. The step of arresting Doenitz and his High Command as prisoners of war is a step forward, but still only represents a negative decision—that there are some groups with which the Western Allies will not deal.

In a sense the talk of "Western Allies" is rather misleading if it suggests that the United States is under the same compulsion to define and work out a policy as Great Britain. Ideally it is. Ideally both countries should pursue the same policy. But it seems almost certain that the Americans will not sustain a very long occupation in Europe. There is a large element, in all American thinking on the subject of Germany, of seeking to achieve certain objects in the short run and then clearing out. The Americans will not have to live with the German problem thereafter—at least not at such close quarters and so continuously as the British. The responsibility for originating a policy thus rests squarely on Great Britain. It will not always be easy to secure agreement and co-operation from France and the smaller Allies, but the essential preliminary to co-operation is secure knowledge in Britain of what the policy ought to be. There can be no agreement on a non-existent strategy.

Unfortunately, the signs are accumulating that very little thought has been given to the high policy of European reconstruction. On the technical side the tactics of the operation—a certain amount of preparation has, it is true, been done, though cruelly hampered by shortage of staff. But the strategy is almost entirely lacking and the major questions are unanswered. Even the detailed arrangements are, in some cases, very incomplete. The Americans, it would seem, have done much more planning in advance. German scientists, especially those who have worked on new methods of warfare, are, if report is to be believed, being almost cornered by the Americans; who have also far-reaching plans for giving information to the German people about the world in which they live. In the British zone, the only decision that appears to have been reached about information and propaganda to the German people is that those who have been

WHOLE LIFE & ENDOWMENT ASSURANCES

Extract from the Chairman's speech, March 22nd, 1945:—

" . . . We believe that these rates now compare most favourably with any available in the market."

Temporarily transferred to

163-164, STRAND, LONDON, W.C.2

doing it from London for five years are to have no further hand in the business.

What hope is there that now, even at this eleventh hour, some coherence and decision can be injected into British policy? The Foreign Office seems so lost in *ad hoc* decisions and day-to-day administration and "dealing with matters as they arise" that it seems hopeless to expect an intelligent lead from that Department. Some people are suggesting the appointment, at War Cabinet level, of a Minister for European Reconstruction whose responsibility it would be to work out a policy and direct the various Government agencies in its fulfilment. The Ministry of Production, which is gradually going out of business in home production and is already much concerned with supplies to Europe, seems a possible instrument, though

Mr Lyttelton is hardly, by training or temperament, the man for the job. The prestige and influence of the Treasury suggest that the responsibility might rest there, the more so since Sir John Anderson is a skilled co-ordinator. The whole question of instrumentalities is naturally complicated by the General Election. There is certain to be an interregnum at a crucial time.

These difficulties, all thwarting the emergence of a policy, make it all the more urgent that the task of evolving a plan and a strategy for Europe should appear on a Cabinet agenda before any more time is lost. The situation has now reached a point where further drift, further temporary expedients, further vacuum of policy, can end only in the brutal choice between appeasement or conflict.

The World Larder

AFTER many months of wondering in just what ways reduced rations would affect the ordinary consumer, and innumerable hints and some plain statements that cuts must and would come, they have at last been translated into terms of ounces, and the extent of the world shortage can therefore be more easily understood. So far as the consumer in the United Kingdom is concerned, the cuts can be simply stated. From May 27th, the weekly ration of bacon goes down from 4 ounces to 3 ounces; the cooking fats ration from 2 ounces to one ounce. The soap ration is reduced by one-eighth; the points ration from 24 points for four weeks to 20 points; and one-seventh of butchers' supplies are to be in the form of canned corned beef. The Ministry of Food is also cutting down allocations to manufacturers and reducing stocks.

The principle that consumption levels ought to be similar in the United Nations has been followed to the fullest extent possible in regard to sugar, which is one of the commodities in shortest supply. The level in the United States, Canada and the United Kingdom is to be at the annual rate of 70.8 lb. per head for the last nine months of this year. This will involve cuts of 18.2 lb. in the United States, 14.4 lb. in Canada and only 0.7 lb. in the United Kingdom, compared with the consumption level in 1944. In the United States and Canada, cuts will be made in both domestic and manufacturing rations; but in Britain, all that is needed is the forgoing of an extra half-pound of sugar next Christmas. If, however, sugar production does not come up to expectation, manufacturers' allocations will have to be cut. British stocks of sugar will be drawn upon to the extent of 300,000 tons to maintain the ration.

Oils and fats have been allocated by the Combined Food Board, and the principle has now been agreed that the three countries will accept proportionately similar cuts. The United States and the United Kingdom will have much the same domestic consumption of edible fats after the cuts have taken place, since in America more oils and fats are used industrially, per head, than here. British stocks will be reduced by 350,000 tons by July, 1946.

America is to accept by far the largest reduction in meat consumption, although the level will still be higher than that in Britain. The following table gives the comparative position for meat and bacon consumption as it was in 1944, as it will be this year, and the percentage reductions in each case:—

	Lb. per Head		Reduction %
	1944	1945	
United Kingdom	115.0	106.4	7.5
United States	162.9	125.0	23.3
Canada	149.1	135.0	9.5

In North America the cut will be more severely felt than here, since it all has to come out of consumption during the rest of the year, and it will be interesting to observe to what extent the very loosely controlled form of meat rationing on the United States will be able to distribute fairly such a sharply reduced volume of total supplies. Canada's cut will provide an additional 25 million lb. of carcase meat for this country, and 90 million

lb. of canned meat for Europe. Australia, which has suffered so heavily from drought, has reduced the civilian meat ration by one-eighth so that supplies to this country can be maintained.

The foregoing are the foods in shortest supply, and in the main those most needed for the maintenance of health. Another group which is affected is dairy products. In this country, stocks of skim milk powder are to be drawn upon heavily. Traders will get no allocation, so that there will be less milk chocolate and less ice-cream. The non-priority allocation of liquid milk will be reduced earlier than last year because of the additional calls upon it. It is hoped to maintain the cheese ration at 2 ounces for the rest of the year by manufacturing more here and by importing more from the Dominions. The Services may get less evaporated milk because of the severe shortage.

All these decisions were reached in Washington recently, where the Ministers of Food and Production went to discuss the world food situation with the Governments of the United States and Canada. They had available the best possible estimates of world supplies and requirements in 1945. These estimates are set out in the table below. For the United Kingdom, North America, Australia and New Zealand, the figures are based on current production and on the level of consumption that has prevailed hitherto, without taking into account the existing stocks or additions to them or drafts upon them. Other countries are brought into the table only to the extent of their prospective export surpluses or import requirements. In short, the table shows the food position in the five countries as a unit, disregarding their stocks but allowing for their prospective trade with third parties.

Commodity	Supply from Current Production	Requirements	Gross Deficit	Percentage Deficit
	'000 tons	'000 tons	'000 tons	%
Meat and bacon (carcase weight equivalent)	15,179	16,974	1,795	10.6
Canned fish (pack year beginning July 1st)	418	801	383	47.8
Cheese	706	802	96	12.0
Canned milk (full cream)	1,999	2,424	425	17.5
Milk powder (full cream and skip)	456	605	149	24.6
Butter	1,204	1,204	—	—
Fats and oils (edible and technical)	5,687	7,124	1,437	20.2
Sugar (refined)	8,067	9,920	1,853	18.7

No plainer statement could be made of the position in which the world's larder finds itself. Equally well documented is the extent to which the main countries of the United Nations expect to draw upon the larder. But unfortunately, there is nothing in the table, or in the text of the communiqué which accompanies it, to indicate what level of consumption it is expected to provide for liberated Europe. From various hints which have been given it can be assumed that the level will not be as high as elsewhere. In this context it is unthinkable that there should be a rumbling among the more fortunate nations that they are to go on shorter commons. What should be asked is whether enough is being done to increase supplies of

food for liberated Europe. The British Government, and no doubt the American too, is firmly and rightly convinced that victory in Europe cannot be complete without the adequate feeding of liberated countries and without the help the United Nations alone can give them to restore themselves. The contribution that a self-reliant Europe can make to world food supplies is a very real one, and this is an aspect of the problem which should receive its due emphasis.

Although there is little indication of the scale of rations Europe is to receive, there is at least one authoritative statement of the plight it is in. It is worth quoting some extracts from the statement, dated April 30th, made by the British, Canadian and United States representatives at the Washington conference on supplies and distribution:—

... in many parts of liberated Europe consumption levels are deplorably low. Particularly in the cities, the amount of food available provides considerably less than the 2,000 calories a day which are normally regarded as the minimum. ... In Amsterdam and Rotterdam ... conditions are almost indescribable, with large populations existing on one meal a day mainly composed of sugarbeets and obtained at soup kitchens. These people

are getting no more than 450 to 500 calories a day, which means slow death. ... In Belgium and liberated Holland ... the ration now gives 1,700 to 1,800 calories a day, while in Athens the target of 2,000 calories a day is now closely approached. A level of 2,000 calories is, however, no more than an emergency level, insufficient to maintain a working population. At such a level it is not possible for a liberated people to engage upon the task of rebuilding their agriculture and industry.

This is a desperate, unhappy picture, and no effort should be spared to brighten it. Countries outside Europe can afford to share the burden. The same document, quoted above, gives the average level of civilian consumption in 1944 in the United States as 3,367 calories a day, in Canada, 3,435, and in Britain, 2,923. The cuts in Britain will amount to between 100 and 150 calories a day, and probably somewhat more in North America. This is a meagre sacrifice to add to Europe's store.

To say this is not, however, to detract from the merits of the job that has been done. When all the technical, political and human difficulties are taken into account, the arrangements made in Washington are a triumph for negotiating skill and goodwill. If the technique of combined action had no other successes to its credit, this alone would be enough to justify it.

War Crimes

TRIALS for war crimes are on this year's already overcrowded agenda. If they are to yield permanent results, two considerations must govern them. The first is that they must happen quickly; there must be a deadline after which an end is declared to arguments about who should and should not have been placed in the dock. The second is that all accusers should as nearly as possible use the same criteria. The first of these essentials is a matter for the Allied Governments: Mr Eden was, immediately on his return from San Francisco, subjected in the House of Commons to timely pressure for haste. The second is the task of the United Nations War Crimes Commission—a body of 16 national experts, with a British chairman and an office in the Royal Courts of Justice, which has summoned a Conference of its member Governments to be held in London on May 31st for the purpose.

The criminals to be caught and tried fall into two classes, one of which presents few or no legal difficulties. The simpler types are the quisling; the traitor such as Haw-Haw or Ferdonnet; and the Nazi whose offence has been committed against Allies of a single nationality or in occupied territory, who can be tried in the state he has wronged and by its laws. The more complicated class is that which has committed crimes against Germans or against more than one nationality or against mankind in general. Here some new form of international court is required; there is no precedent for trying war crimes through channels of organised international justice. If the recommendations of the War Crimes Commission are followed, the indicting nations will not find it difficult to agree on the procedure for trying a small class of the "major criminals" of whom Goering is the prototype. Their chief difficulty will be in deciding where to draw the line among the lesser fry, particularly among the tens of thousands of captured SS.

Thanks to the energetic work of the Police and Public Safety Departments of the army groups inside Germany, the process of catching the hares has gone unexpectedly well. No list of "major criminals" has been published, but it is safe to assume that there is plentiful evidence against, for instance, the five of the six members of Hitler's Inner Cabinet who are already in captivity. They are Goering, Lammers, Keitel, Frick and Funk. The British authorities also hold an ex-member of that body, Hess, and the "major" list is likely to include several other captives who took an active part in policy-making—for instance, Ley, Doenitz, Kaltenbrunner and Darré.

The chief flaw in the present plans for dealing with men of this calibre is that—despite the unity of purpose set out in the Moscow Declaration on War Crimes of Novem-

ber, 1943—there is no regular machinery for co-ordinating procedure with Russia. The Russians have never joined the United Nations War Crimes Commission. This fact-finding body is now efficiently able to collate the evidence collected by its 16 member states. It is also, thanks to the eminence of the lawyers who sit upon it, in a position to make recommendations on procedure to them. Thus the 16 policies of the European Allies, the United States, three British Dominions, China and India are, on fundamentals, unlikely to vary or conflict. But unless Russian agreement to procedure can be obtained outside the Commission, separate systems for judging war crimes are likely to prevail in Eastern and in Western Europe.

Agreement with Russia is, naturally, desirable. Without it, prisoners whose names appear on the Russian list as well as on others may become bones of contention. It seems probable, however, that the Russians rate Nazi behaviour in the East as so different from that in the West that they will prefer to try their own list in their own way. A likely compromise is a system whereby Russian observers attend trials in the western zone and vice versa. But even so far as Western Germany is concerned, no further progress towards the trial of major criminals can be made until prosecutors are appointed, charges are framed, and an international court is set up. The Americans have moved faster than Great Britain in making these preliminary arrangements. As long ago as May 9th President Truman announced that Mr Justice Jackson, of the Supreme Court, would act as American prosecutor—styled "Chief of Counsel"—to frame the charges against "such leaders, principal agents and accessories as the United States may agree to bring before an international military tribunal." It is with the appointment of a British counterpart that Downing Street is now being pressed to hurry. In Britain, where judges step down less easily from the Bench, the nominee is likely to be an eminent K.C.

There has for two years past been some debate among jurists about whether a civil or a military court would do the better service towards restoring international law and international morality. One eminent Committee, presided over by Lord Cecil, drew up the full statutes for a permanent civil body. But the establishment of such a court would call for the slow process of a multilateral treaty. Today, the view even of some of those who would have liked to see a Permanent Court established now is that military courts will be quicker, freer from convention and more satisfactory. The United Nations War Crimes Commission has made a recommendation to this effect.

Theoretically, this recommendation requires the consent of 16 Governments. In practice, British and American

forces hold the prisoners and occupy Western Germany, and whatever procedure they adopt is likely to be followed. The initiative taken by the United States when making the Jackson appointment is so important and valuable that the rest of the Commission is likely to fall in with it.

Under American law, the President of the United States, in his capacity as head of the armed forces, and under British law, the King in Council, are competent to set up a military court of the kind apparently envisaged in the Jackson nomination. The procedure of prosecution and defence would be the same as that in a civil court. The chief distinguishing point about a military body is that the Commander-in-Chief is competent to define the laws of evidence, to set the penalties, and to determine the right of appeal. The military judges to be appointed have a heavy task ahead.

On the principles that are to govern the trials, the

member states of the War Crimes Commission are all agreed. Their object is to re-set a standard of international behaviour. The cases are to be heard on a basis of evidence. Only the guilty will be punished. There will be no indiscriminate reprisals. Punishment will be inflicted for crimes, not political offences. The theory underlying the whole unpleasant task is that impunity for offenders against every canon of human decency would have a pernicious effect upon international morality.

It is not to be taken for granted that trials will serve this purpose any better than dogs' deaths such as that which befell Mussolini. If they are to do so, they must be summary and they must be unspectacular. To allow prisoners the luxury of famous last words in a Hollywood setting would be to defeat the United Nations' purpose. So would delays during which Europe might sicken with the smell of foul deeds gone stale.

National Parks

THE appearance of Mr John Dower's report on National Parks, long delayed, has now coincided happily with the end of the European war and the beginning of summer holidays; and at the same time has come a corresponding report from a Scottish Survey Committee.* National parks already exist in America and the Dominions, and the idea is not new in this country, where the need for action is far more urgent. The idea behind both reports is that the best areas of wild and beautiful scenery in the country should be preserved permanently for public use and enjoyment. The parks would be selected so as to meet national rather than local needs, bearing in mind such questions as their accessibility from large urban centres. Because of the large scale and national character of the whole project, the report suggests that the parks should be administered by a National Parks Commission, which would be responsible to the Minister of Town and Country Planning.

The first duty of the Commission would clearly be to put a stop in its area to the indiscriminate building which before the war was threatening to spoil even the remotest parts of the countryside. Mr Dower was only able to find, for instance, two long stretches of cliff scenery which are still unspoiled, in Pembrokeshire and North Cornwall. Generally speaking, building within national parks should be confined to meeting the needs of agriculture and local residents, and to providing necessary accommodation; and such building as there is should be designed to harmonise with its surroundings. The Commission might also undertake the removal of existing disfigurements. But it does not follow that the Commission's powers need be elaborate or extensive. It would not supersede any of the powers of local authorities, nor would it interfere with agriculture. It would not need to own all or even most of the land in its area, so long as it could exercise general control over its development. It would not supersede the National Trust, whose acquisitions of land it might even aid.

The greatest difficulty in any scheme of national parks would clearly be the control of tourist traffic. The word "park" suggests in England something rather small and tame; but to fulfil their functions, national parks would have to cover large areas. Indeed, if the parks were few or small, the influx of visitors would ruin the very beauty and solitude which it is wished to preserve. The English report suggests making a beginning with ten parks, covering 4,400 square miles, and the first five Scottish parks would add 1,870 square miles to this total. The tentative choice of areas, apart from the two stretches of cliff already mentioned, has lain with mountain and moorland—the Peak district and the Lake district, Exmoor and Dartmoor in Devon, Snowdonia and the Black Mountains in Wales, two parts of the Pennines, the Trossachs and the Cairn-

gorms, Ben Nevis, and two areas in the remoter Highlands.

This is the right way to set about selecting national parks—indeed the only way, if the scheme is not to be self-defeating. But even these large areas can be easily spoiled if they become littered with the facilities of seaside resorts and commercial holiday camps—facilities which can be easily and adequately supplied elsewhere. The Dower report makes it commendably clear that national parks should be designed for the walker rather than the motorist, and for the lover of nature rather than for the lover of crowds. Ample accommodation should of course be ensured, with the aid, where necessary, of grants to voluntary bodies, but its type and scale would have to be closely controlled. Adequate roads, too, including a suggested ring road around each park, would, of course, be needed, if only for access, but their number should be strictly limited, and motors kept from straying off the roads.

But before the prohibitions extend to a long list it is as well to add a word of caution. There are two constituent elements in the idea of a National Park—the preservation of the beauties of nature and the provision of access to them. In the United States and Canada, the risk of serious disfigurement was comparatively small, owing to the vast areas and sparse populations; National Parks could be represented to the public as means of granting access, of constructing motor roads where there were none before and of building hotels where previously there was no accommodation for tourists. It is largely for this reason that they have been so successful and popular. In this crowded island, the element of preservation against human encroachments is inevitably stronger. But it should not be carried too far, and perhaps not as far as the enthusiasts wish. National parks are intended to serve man as well as nature, and it would not be fair to deter through restrictions and limitations the very large numbers of people who will want to visit them in this country. The pleasure ground, the tea garden and the car park cannot be banned completely. The degree of success in controlling them will determine whether, in as small a country as this, the public can be given easier access to the beauties of nature without, in so doing, destroying them.

The idea of national parks will inevitably arouse strong opposition from some rural landowners. Farmers, despite their proverbial grumbling at the activities of rambles, do not present the main difficulty. It is not always realised that England's scenic beauty is largely the fruit of farming, and unfarmed "green belts" sometimes surprise their promoters by their bareness and ugliness. The Scott report remarked truly that

even were there no economic, social, or strategic reasons for the maintenance of agriculture, the cheapest way, indeed the only way, of preserving the countryside, in anything like its traditional aspect, would still be to farm it

—although it does not follow that the farming need be intensive. In particular, rough uplands are far pleasanter to look at—and walk on—when grazed, and this fact alone might justify the continuation of hill-sheep subsidies on their present generous scale. Within national parks, there would be every reason for encouraging agriculture, and the Commission might buy and improve stretches of land, especially rough grazings. In Scotland, it is suggested that the creation of national parks and the economic rehabilitation of backward areas should proceed together.

Opposition from the guardians of sporting rights and water supplies will be harder to combat. It may come as a surprise to those who have never found any difficulty in climbing a mountain except their own frailty, that the public has legal access to only about one-tenth of the country's uncultivated mountain and moorland. The Access to Mountains Act (1939), which was originally drafted to give the public free access to all such land, ended by doing precisely the opposite. It is difficult in practice to restrain rambles, yet owners in some important areas such as the Peak district make strenuous efforts. There is, however, little cause for any real clash of interests. Grouse rights, which form the main obstacle, could be adequately safeguarded by a few simple regulations and by the exclusion of the public on a limited number of days. It would not cost the national parks authority overmuch to buy such rights, which could be resold when desirable. Nor is it impossible to protect the purity of water supplies.

It need not be denied that the public, in return for being granted freer access to the countryside, should show much greater respect for the needs and rights of farmers and landowners, all the more so since strict legal enforcement of good behaviour is impractical. Rambling and hiking societies have already shown their willingness to educate their members. But even when legitimate grievances are allowed for, property interests have shown themselves unnecessarily obstructive. The problem is a much wider one than the needs of national parks. The whole law of rural trespass bristles with obscurities, anomalies and undesirable obstructions. For one thing, it is not even known for certain, far less printed on any map, what land is public common. For another, it is time that some quicker way was found of establishing public footpaths than that of proving "immemorial right of way," which, however much scope it gives for the loquacity in court of oldest inhabitants, tends to be both slow and

costly. New legislation should embody the principle of free and easy access to all uncultivated land, subject to appropriate regulations; and landowners should rely for the protection of their perfectly legitimate rights on wiser and fuller public education and on stronger penalties for detected offences rather than on universal prohibitions. After all, they will gain far more from controlling the urban invasion than from vainly trying to stop it.

There are sundry other questions concerned with rural preservation and rural recreation too numerous to discuss here. What protection should be given to wild life? And to geological and archaeological remains? Is it desirable, as the Scott Report suggested, to establish "hikers' highways" around the coast and along the Pennines? The list is a long one. But one question the taxpayer will certainly want answered. How much are national parks likely to cost him?

The cost, like the exact method of control over national park areas, is impossible to determine until the whole question of the control of land use has been settled. If it be assumed, as the Dower Report does, that a national fund for compensation and betterment is set up along the lines of the Government's White Paper, all unwanted development could be stopped at no cost to the national parks authority and, thanks to the collection of betterment elsewhere, at small cost to the nation. If, however, no comprehensive land use legislation is passed, the authority might need to pay large sums in compensation and would probably find it desirable to own directly a much larger part of its area that is at present suggested. Mr Dower, in suggesting that the annual cost of "a generous and progressive scheme of national parks" should, in any case, be measured in hundreds of thousands rather than millions of pounds seems to be steering a central course between the two main assumptions. With effective legislation on land use, it would surely cost much less; without it, much more. The difficulty is to know how to draft any national parks scheme before decisions are taken on the major question of which this is only one aspect.

There can in any case be little doubt that to preserve Exmoor, Dartmoor, Snowdonia and the rest for all time in their pristine beauty would be a handsome contribution to the health and happiness of this and all future generations. The planning of land use has become a public issue far too late in the day to prevent, or to erase, a very great deal of urban ugliness. But here is at least one small piece of rescue work that is well within reach.

NOTES OF THE WEEK

Deadlock in the Levant

Negotiations between France and the Levant States on their future relations have broken down almost before Syrians and Lebanese have had time to take in that there are—at long last—some new French proposals. The immediate cause of the crisis is less the terms now offered than the manner of their presentation. They arrived last week from Paris by the hand of the Delegate General, Général Beynet. A few days earlier the French cruiser *Montcalm* had entered the port of Beirut and landed troops. These later turned out to be replacements; the *Montcalm* subsequently left with an equal number of troops aboard. But a second and more heavily-laden cruiser followed her in and landed two battalions of Senegalese and other fighting men. Even if these, too, are replacements or troops in transit, the moment of landing them could not have been worse chosen.

As might have been foreseen by anyone conversant with present Arab emotions, the Syrian and Lebanese Governments interpreted the show of might as a threat to their sovereignty. In breaking off negotiations they have washed their hands of responsibility for any disturbances which may follow. In these conditions, the next step towards solving the dilemma seems to be with France.

The quarrel is the old story. It has simmered since 1941. Tempers have waxed and waned, negotiations come and

gone, but, at bottom, the basis has been constant. On the one hand is France, fully ready to end the mandate but determined to do so in terms which preserve as much as possible of its present position in the Levant. On the other are the two states, moving independently at first, but—as time went on—growing more united and more determined that no European Power should retain special privileges in their territories.

There were moments when this wide gulf was less difficult to bridge than it is now. One was in the first fine flush of liberation: another—at least in the Lebanon—was when France extricated herself with dignity from the troubles of 1943. A third was after Yalta, when a mixed team consisting of Mr Churchill, President Roosevelt, the Egyptians, the Iraqis and Ibn Saud had convinced even the more obdurate Syrians of the virtues of negotiation. But France never seized the day. Instead, this spring, the French Government has spent ten weeks drafting terms which contain next to nothing that is new, while in the Levant the impression has grown that the French are spinning matters out because they do not intend them to reach a conclusion.

The gist of France's present proposals is that the French mandate should end when the two states sign with France three conventions which—say the French—are *solidaire*, or inseparable. One guarantees to the French the independence

* "National Parks in England and Wales." Cmd. 6628. H.M.S.O. 1s. "National Parks; A Scottish Survey." Cmd. 6631. H.M.S.O. 6d.

of their cultural establishments; the second grants economic rights; the third is strategic. In return the states will be able to rate the much disputed *troupes spéciales*, or Arab levies, as their national armies though these are—under the military convention—to remain under the supreme control of the command France wishes to retain in the area.

The terms, to judge by their summary, are very much less elastic than, for instance, the British treaty with Iraq. Their contents, accompanied by French sabre-rattling and misjudgment over timing, suggest that the French Government fundamentally underrates two new factors which have grown up during its period of isolation from the Middle East. The first is the Arab League. This is on many counts a frail body, but it is strong and united on the two political issues of independence for the Levant States and justice for the Arabs of Palestine. The second is the fact that the Arab States have, during the war, met at first hand a procession of new peoples: Americans, New Zealanders, Russians, Czechs, Poles, Australians. Nowadays they establish independent relationships and make invidious comparisons. Of the friends who have recognised their independence, Great Britain is the only one who also recognises the special interests of France. This fact alone should make Paris think twice before instructing General Beynet to be high-handed.

British Policy in the Levant

The British Government, though not directly concerned in a quarrel that is France's affair, cannot turn a blind eye to its consequences. Yet it must be chary of giving advice too openly. For, by an obsession with old quarrels in the area, France is blinded to the fact that British interests are the same as its own. It must be confessed that this obsession has—since the war—been kept alive by certain of the British representatives employed in the Levant. But now that changes of personnel have been made, a logical people like the French should, on grounds of reason alone, see that the past is unimportant by comparison with the amount both powers stand to lose if they create trouble for themselves and for one another in the future.

Both want a tranquil Middle East through which they can run their imperial communications in security. Both want conditions of Arab contentment in order that their companies may peacefully extract the local oil. Both are concerned with political topics—Britain in Palestine, France in Syria—which, if mishandled, unite the Arab League against the foreigner. Neither can afford to take steps which antagonise Moslems in other parts of the world.

Thus British policy in Syria is, in sheer self-interest, to create conditions in which Franco-Syrian negotiations can carry on. The presence of a British command in the territories—General Holmes' Ninth Army is there—has to some extent complicated the scene, by causing annoyance to the French and raising Arab hopes of armed support. The British Government has therefore done well to announce that the British training division is to be withdrawn from the South Lebanon and to offer the withdrawal of the rest of its forces as soon as negotiations reach a point at which there is no further fear of disturbances.

For the moment, this point looks sadly remote. But the prospects of improvement are not hopeless. France has often before turned night into dawn by handing matters over to one of the Frenchmen of distinction who understand and know the whole Arab world. It is inconceivable that the French Government should persist in a course which jeopardises its interests everywhere from Kirkuk to Morocco in addition to unsettling Britain—the only sponsor it now possesses in the Levant.

AMG for Austria

In spite of the withdrawal of the Yugoslav troops from Carinthia, the situation in Austria is very far from satisfactory. This tiny country is to be submitted not only to different military controls but even to different types of government. In Vienna and the Russian zone—to which Graz has been annexed—Dr Renner's government exercises power under the Russian commander. In the British zone, Field Marshal Alexander has announced the establishment of a military government. American intentions have not yet been announced, but Washington does not recognise Dr Renner.

It may be that Russian intransigence makes this un-

happy division of authority necessary. The British and the Americans are not in Vienna, and it is possible that they are not allowed to go. If, on the other hand, they have refused to establish contact with Dr Renner out of dissatisfaction at the irregular manner of his coming to power, they are probably allowing indignation to cloud good sense. Such figures as Dr Renner or Leopold Kinsbach are anything but Communists. They represent the democratic political tradition of Europe with which it is essential that the Western Allies should establish contact, and the best way of preventing the Communists in Dr Renner's cabinet from dominating it would be to put it under the control of all three Great Powers instead of only one. Effective British and American support would have strengthened the position of the Socialists and the Christian-Socialists. The Western Allies' decision not to recognise Dr Renner and, on the contrary, to set up an AMG, must weaken the genuinely democratic groups in Vienna and may initiate the unhappy trend towards totalitarian government already observable in the Balkans and Eastern Europe.

Trieste in the Balance

There are prospects of a settlement in the disputed fringe of Allied and Yugoslav occupation. The Yugoslav units are withdrawing from Carinthia and Marshal Tito has made suggestions for the solution of the Trieste problem which can certainly be the basis of negotiation. A full report of his terms is not available, but he is believed to have returned to the agreements of February this year and to admit the overall authority of the Allied Military Government under Field-Marshal Alexander. In return, he asks that Yugoslavs should be represented in AMG, that Yugoslav units should remain in the area, and that AMG should work through the civilian authorities already established.

It is this last point that will create difficulties. An article on another page describes the methods by which the Yugoslavs have introduced their own civil authorities. The writer

is Italian, and it is probably necessary to modify his report to some extent. Yet the evidence is borne out by many impartial witnesses, and their testimony adds up to a very unsatisfactory picture of Yugoslav policy. It is, in fact, the old totalitarian principle, employing the same techniques of oppression and persecution and inflicting the same miseries. This fact, no doubt, roused Field-Marshal Alexander to compare the Yugoslav methods with those of Hitler. The comparison was certainly injudicious. Delicate negotiations are to be conducted, and it is unlikely that the Yugoslavs will forgive or forget the Field-Marshal's criticism.

It would be more difficult for them to disprove it. Even their willingness to negotiate is to a large extent a function of the Allied show of force before Trieste.

Progress at San Francisco

The United Nations Conference on International Organisation, or UNCIO, is making gradual progress from compromise to compromise. Three important matters have been mainly engaging the attention of the delegates during the past week, and the score book shows one settled, one on the way to settlement, but the third still in dispute.

The long contest over the place of regional agreements within the world organisation, which has hitherto proved to be the most stubborn of all UNCIO's problems, has been settled by a formula. The problem, in the end, resolved itself into that of finding enough autonomy for the Pan-American system without diluting the authority of the Security Council. The formula, evolved in long negotiations between the United States and the Latin Americans, recognises the "inherent right" of nations, individually or collectively, to defend themselves when attacked until such time as the Security Council takes control of the dispute. The Soviet delegation at San Francisco expressed the strongest distaste for this formula, but from Moscow they were overruled and the clause was accepted. This was a notable success in that deadlock was avoided, and an agreed text adopted. But it is open to doubt whether it is not the sort of successful operation in which the patient dies, since there has never yet been a war which could not be, and has not been, justified on the plea of the "inherent right of self-defence."

The second great problem is that of trusteeship for dependent areas, where the Great Powers now appear to be in agreement. The British have won their point that there should not be two systems of trusteeship, one of tight control for colonial areas (i.e., British mandates), and one of loose control for strategic areas (i.e., American mandates). There is to be only one system, but not all ex-enemy territories are to be placed under it, so that the American Navy Department can have its desire of ruling the Pacific islands without control. The British have also maintained the substance of their position on the extent of the international control over the mandatory power, though they have had to admit "independence" as well as "self-government" as one of the objectives of trusteeship and they have had to agree to seats on the Trusteeship Council for the non-colonial Great Powers, Russia and China.

The chief dispute remaining is the original and familiar one of the Great Powers' veto. It appears to be agreed that the veto shall apply to any use of force, and, at the other extreme, that there shall be no veto on matters of procedure. But ambiguity and dispute reign in between these two extremes. A Great Power is apparently not to be allowed to veto expressions of opinion on, or recommendations for peaceful settlement of, disputes to which it is itself a party (though even this is not quite certain). But shall it be allowed to veto such action where one of its allies or clients is the party directly concerned? This appears to be the point on which the smaller powers are directing their attack. The strongest defenders of the veto are the Russians; the British delegation has dropped hints that it has some sympathy with the critics.

Another unresolved matter, raised by Canada and the Netherlands, is whether a country can be called upon to contribute troops to an enforcement operation without being consulted either on their use, or even on the major question whether there should be forcible action at all.

Labour Party Conference

The certainty that Labour would have to face an election in July and not in October, as the party had hoped, and the resentment at what are regarded as "Tory tactics" in saddling Labour with the responsibility for breaking up the Coalition, had a galvanising effect on the delegates to the Blackpool Conference. The general level of debate was markedly higher than at previous conferences—partly because of the anxiety of so many candidates to get into oratorical training for the forthcoming contest, and partly because of the natural effect of releasing pent-up political emotions, after five years of repression under a Coalition Government.

The imminence of the election had the unusual result of smoothing away the differences between the National Executive Committee and the rank and file of the Conference. Normally there is a constant tug-of-war between the platform and the floor. This year, executive and delegates presented, at least superficially, a "united front." It was expected that the policy document, "Let Us Face the

Future," would come in for sharp criticism from the Left as a dilution of the pure milk of Socialism. But even the most hardened critics and out-and-out nationalists, faced with the possibility of a Labour Government actually having to bring in the legislation it has talked about for 25 years, accepted the more moderate time-table of transferring a few selected industries to public ownership.

The proposal to discuss again the party's decision to eschew alliances with other Left Wing parties was defeated by a margin so narrow (1,314,000 to 1,219,000) that it surprised the opponents and delighted the supporters of electoral unity. It may well be that had the election been fixed for the autumn the proposal would have been carried, but many delegates felt that, with only six weeks to go, there would not be time to reach workable agreements with parties already in the field. This may result in the return of Conservatives in seats which would otherwise go to a Labour, Liberal or Common Wealth candidate. There is still a possibility that local agreements may be made in a few marginal constituencies to which Transport House will conveniently turn a blind eye. One issue, which was uppermost in delegates' minds but which by common consent was not referred to publicly, was the question of the party leadership. Mr Morrison made what can best be described by two clichés—a "brilliant fighting speech" and a "bid for the leadership"—when he outlined the party's policy on Tuesday. But Mr Bevin's speech on Wednesday on foreign policy—a subject in which he has a growing interest—was equally impressive, and there is a strong current of trade union opinion which believes that "Vote for Bevin" would be the best rejoinder to the "Vote for Churchill" campaign.

Canadian Reconstruction

The full text of the Canadian Government's White Paper on "Employment and Income" has now reached this country. The problem that faces Canada has its peculiar difficulties. Thus the increase in the number of people in remunerative occupations (including the armed forces) between 1939 and 1944 was from 3,700,000 to 5,000,000—

War and Post-war Banking

While the war lasts, the resources of Barclays Bank will be devoted to the fullest possible extent to helping the war effort of the nation.

When the war is ended, the Bank will add its full weight to the forces of restoration. To ease the transition from war-time to peace-time conditions, customers will find the same progressive outlook, the same courtesy and sympathetic understanding of their banking needs and the same high quality of service which have kept the name of Barclays Bank in the forefront of British banking for generations.

The small business man and manufacturer will have the active co-operation of the Bank in solving his financial problems, no less than the large merchant and industrialist.

a considerably larger proportion than in this country—and it is estimated that to provide full employment, some 900,000 more jobs than in 1939 will have to be provided. The great wartime diversion of labour from agriculture to industry will be painful to reverse but difficult to absorb as a permanent policy. Secondly, not only is Canada very dependent on exports, but the Canadian balance of payments is intricately involved in the sterling-dollar complex.

When allowance has been made for these differences, however, the White Paper follows a line of argument closely similar to that of the British Government statement on Employment Policy. The title shows how complete is the acceptance of the new doctrine that employment depends on an adequate maintenance of the flow of incomes. As a theoretical exposition, the Canadian statement is an improvement on the British, since it recognises that the task of Government is to seek stabilisation in all the different categories of income-generating expenditure, private and public, home and overseas, capital and current.

The post-war employment policy is not to be solved by huge expenditures on "public works." Efforts to increase and stabilise employment and income must pervade all economic policies.

When it comes to practical measures, however, the Canadian document is somewhat vague; too many abstract policies are to be "continued and expanded" in "close and effective co-ordination" with other abstractions. It would seem that the Canadian Government's economists are more fully imbued with the necessities of the new policy than their British colleagues, but that the practical work on the implementation of the policy has gone less far.

To the reader in the United Kingdom, the most interesting passages of the Canadian White Paper are those that discuss the method of restoring overseas trade in the transition period. Canada is unequivocally in favour of a free and multilateral solution of commercial and financial problems. But it is recognised that the United Kingdom, "which has spent its substance without stint in the common cause," will face a very difficult balance-of-payments position. The Canadian Government therefore states its willingness to grant credits for the purchase of Canadian goods, and adds that, in its view,

appropriate terms for repayment of these credits would recognise unequivocally the dependence of such international debt payments on the expansion of world trade and ample markets for the exports by which credits must be repaid.

This is ambiguous—perhaps intentionally so. But if it means that Canadian credits to the United Kingdom would be repayable only if the British balance of payments permitted, it is an interesting suggestion. It has obvious defects from the British point of view. It would not be very pleasant to have a contingent liability overhanging the balance of payments, or to know that any improvement in export proceeds had to go to liquidate the debts of the transition period. Special facilities for the entry of British goods into the Canadian market—even if they were only temporary—would be a much more direct assistance. Nevertheless, the suggestion of conditional credits—if this is, in fact, what is intended—is at least welcome as showing a realisation, hitherto rare in North America, of the realities of the British position.

Yalta and the Poles

In his letter to the Moscow Correspondent of the *Times*, Marshal Stalin sought to separate the issue of the Yalta Agreement on a new Government for Poland from the vexed question of the 16 arrested Poles. The arrests, he declared, had nothing to do with any invitation to negotiate. The 16 men were simply engaged in wrecking activity in the rear of the Red Army and were arrested as saboteurs. As for a new Polish Government, he adhered to the Russian interpretation of the Yalta Agreement—that the Warsaw Poles should be the core of the new Government—but added that the problem should be solved "by agreement between the Allies."

In reality, the distinction the Marshal tries to make is an impossible one. Among the 16 arrested men there were respected political personalities—for instance, M. Jan-kowski, the Labour leader—who had been recommended by the British and American Governments and who were known to be sincere supporters of the alliance with Russia. To lump them together with General Okulicki, whose

record is more suspect, to paint them all as saboteurs, and to permit no communication to reach them or defence to be made for them creates such a precedent that no Polish statesmen of any independence and integrity can now take the risk of being suggested by the Allies as a possible member of a widened Polish Government. The Russians, by their brutal tactics, have closed the door to the solution they themselves propose. Their excuse is the existence, in London and in Poland, of Poles whose chief aim is to isolate Russia and to act as a *cordon sanitaire*, yet their policy can only have the effect of convincing the outside world that such a *cordon* is necessary.

Burmese Independence

None too soon after the liberation of Rangoon has come a Government statement of policy for the constitutional future of Burma. The White Paper in question is not an inspiring document; it appears to be touched more with self-conscious realism than with enthusiasm for the professed ultimate ideal of Burmese self-government. It is handicapped, in its tacit appeal for Parliamentary and public support, by its apparent indifference not only to Burmese, but also to Indian, suspicions of British procrastination. A little more attention to salesmanship and less to the letter of constitutional succession might have eased a somewhat unfriendly reception. But, in substance, there is no real alternative to the policy proposed.

In brief, the White Paper—prefacing its proposals with a summarised account of Burmese history and economy—maintains that ultimate power should rest in the hands of the Governor, for, at the most, another three years from next December. This extraordinary power, taken under the exceptional circumstances of December, 1942, the Government proposes to dilute gradually by introducing representatives of Burmese opinion into a small Executive Council (expanding to include members not directly appointed from above), and possibly, at a later stage, a small Legislative Assembly. When economic conditions and communications are sufficiently re-established to permit the holding of a *bona fide* General Election, Burma will return to the constitutional position she occupied, under the Act of 1935, at the beginning of the Japanese invasion. Only then, according to the White Paper, can "the ground be prepared" for the final replacement of British rule by a constitution agreed upon by the Burmese. According to some reports, the Burmese, however, are already planning to start discussions on this subject when military government is replaced by the civilian authority some time in the autumn.

If this political programme, which will seem to the Burmese to be very slow-moving, is not to be sabotaged by their non-cooperation, every effort will have to be made to retain their confidence in British good intentions. For the moment, economic reconstruction occupies the centre of the stage, and it is certainly unfortunate that the recent drastic currency measures of the BMA should, however inevitably, have added to the burdens of the Burmese people. These measures are discussed in a Note on page 709; and it is there suggested that the decision to repudiate the Japanese notes, whatever the real merits of the case, was not implemented in the manner best calculated to minimise the resultant hardship.

Both in the political and the economic spheres, the technique of implementing policy, quite apart from the policy itself, shows signs of being either clumsy or unimaginative. Remote and understaffed administrations are no way to handle practical problems with the necessary flexibility and delicacy of touch. Nor is the India Office the proper body to preside over a process that requires both prompt efficiency and ready sympathy. A leading article on an earlier page argues the case for a special executive body to plan British reconstruction policy in Europe. The need is no less in Asia.

Parks or Portals

The awkward choice of parks or Portals has at last been faced. The Government has introduced a Bill to permit local authorities to erect temporary houses in their own parks and open spaces without the complicated procedure previously necessary. For two years, the Ministry of Health would authorise the use of parks if no other suitable land were available. The temporary houses would be allowed to stay for ten years.

It is fruitless now to complain that this unpalatable step

need never have been contemplated had the Government decided earlier on temporary construction less wasteful of space than the bungalow design. The dies are, literally, cast and the Government should surely need no urging to make as much of the Duplex (and other prefabricated two-storey designs) as possible. The new Bill will need careful watching. This it will certainly get. It also provides an added spur to the public to press for the permanent building which alone can release the parks for general use before the ten years are up.

The contribution of the Bill to the housing shortage can necessarily only be small—though that in itself cannot be held against it so long as the need is desperate. In London, for instance, the greatest temptation to invoke the Act will be in those boroughs where open spaces are already depressingly inadequate, and where, for that reason, the Minister's permission, presumably, will be grudgingly given. At the same time, the spate of return from evacuation is beginning, and the demand for living-space continues to rise. Even at this late stage, a Government appeal to individuals and business organisations, for whom the country has been a safe retreat during the war, to stay where they are might have some effect.

A second measure concerned with housing—the Building Restrictions (Wartime Contraventions) Bill—attempts to clear up the future of wartime buildings which do not comply with existing building bye-laws or planning provisions. It gives power to the Ministry of Health to make the final decision between the local authority, whose inclination will generally be towards removing the building, and the owner of the land who may wish it to remain. The Bill would permit all individual cases to be decided on their merits. Certainly, the excuse of wartime construction must not be used later on as an excuse for extending the life of the Portals in the parks; although the political difficulty of removing them, if there is still—as there almost certainly will be—a housing shortage in ten years' time, will be very great.

Family Allowances in Committee

The progress of the Family Allowances Bill through the House of Commons shows that the grant of 5s. a child without means test is not such a simple matter as it sounds. Not only have there been long discussions on what is a child and when does a child cease to be a child—for the purpose of the Bill—and on the proper recipient of the money; there has also been a struggle over the question of non-duplication of allowances.

Clause 13 of the Bill, as first drafted, empowered the Minister to make regulations, subject to the House's approval, reducing or withholding the family allowance in respect of a child for whom an allowance is being paid in respect of service in the armed forces or in respect of the disablement or death of a person who has served in the armed forces, or in respect of civilian war injuries, disablement or death, or under provisions relating to pensions for the police or for firemen. Clause 14 provided that where a family allowance was being paid in respect of a child, no supplementary allowance for the child would be paid under the other social insurance schemes. The Government stated, in effect, that the serving soldier would receive both the service allowance and the family allowance, as the former is regarded as part of his remuneration. The power to withhold or reduce the family allowance is wanted, however, because the present review of service allowances may result in the adoption of scales which are all-embracing and include family allowances.

This explanation did not satisfy the House, which eventually persuaded the Government to withdraw both clauses for redrafting. In agreeing to this course, Sir John Anderson stated that an attempt will be made to remove any apprehension about the application of the Bill to the allowances of the serviceman and analogous cases. But he emphasised that the Government stands by the principle of no duplication in regard to social service allowances. He pointed out that although comprehensive social insurance is being put into force bit by bit, the final aim is to produce a scheme under which beneficiaries in different circumstances receive the same treatment. And by making the family allowance payment the firm payment, instead of the allowances already payable under the social service schemes, the Government is relieving the insurance funds and the insured at the expense of the Exchequer. Indeed, the Chancellor stated that if that course were not taken, "the finance of Part I of the social insurance scheme would be com-

pletely upset." It looks, therefore, as though Clause 13 will be completely redrafted, but that Clause 14 will remain without any substantial alteration, which may well mean a resumption of the opposition, particularly from the Labour benches.

Hospital Deficiencies

The Ministry of Health's regional survey of the hospital services of England and Wales is nearing completion, and the report of the survey of London and the surrounding area, with a population of just over 14 million, was recently published (HMSO, 10s.). It is not surprising that the survey revealed a big deficiency in hospital accommodation, for it has long been recognised that the lack of hospital facilities as a whole is one of the worst shortcomings of the present health services. The number of beds available and the estimated number required in 1938 was 50,973 and 70,805 respectively for general acute cases. Only for the chronic sick and for fever cases were there enough beds available, but the poor quality in many of the converted poor law institutions, used for the chronic sick, and in the isolation hospitals, offset the relatively favourable amount of accommodation. In particular areas, the deficiency is even more marked than is apparent in the totals. The south-east district of Kent, for instance, centred on Folkestone and Dover, and with a population of nearly 200,000, provided only 12 maternity beds, against an estimated requirement of 70, and these were in public assistance institutions. In the counties of Hampshire, the Isle of Wight and Dorset, "little or nothing has been done . . . to supplement the resources of the voluntary hospitals by building up municipal services. . . ." In Hertfordshire, in spite of the increasing population before the war, the county council refrained from developing any municipal service apart from a public assistance hospital at Barnet. The result has been

to create a general deficiency of beds, which is peculiarly acute in the Watford area, and a general shortage of specialist assistance, pathological services and other essential facilities. The chronic sick and fever accommodation are generally poor; maternity beds are inadequate.

"THE SHOES THAT HAVE
MEANT SO MUCH TO ME"

Too much blame should not be placed on the local authorities for these deficiencies. It was not until 1930 that the provision of general hospital facilities became an accepted function of the local authority, and it is still not a statutory duty. But, in spite of the difficulties of the thirties, some county councils, notably London, Middlesex and Surrey in this survey area, made great strides in the provision of hospital accommodation. What has, however, been almost entirely lacking is co-ordination between the different authorities and co-ordination between the local authorities and the voluntary hospital service. What has also been almost entirely lacking is the provision of a specialist service outside the Greater London area. In the voluntary hospitals, specialists are unpaid and tend, therefore, to settle in an area where private practice brings in an adequate remuneration. The municipal hospitals have still not evolved adequate methods of staffing, and the highest salaries are given to the administrators instead of to clinicians.

The authors of the survey make various recommendations for co-ordinating and expanding the hospital facilities throughout their area. But they emphasise, first, that the natural catchment areas of the hospitals rarely coincide with administrative areas; secondly, that no comprehensive service can be established "without considerable give and take on the part both of the local authorities and the voluntary hospitals"; thirdly, that it is very largely a problem of staffing rather than building—which raises the question whether many authorities will be able to offer high enough salaries to attract an adequate specialist staff. These three considerations themselves raise the further point whether even "joint authorities" are large enough to undertake the responsibilities of providing a hospital service and whether it would not be better, in view of the considerable reorganisation, rebuilding and new building that will be necessary, to nationalise the service from the outset.

Foreign Publicity

The debate on foreign publicity initiated by Mr Kenneth Lindsay deserved more attention than it obtained as a motion on the adjournment. Neither Foreign Secretary nor Minister of Information was present. Their representatives were reduced to tame assurances that the matters raised were under review. All told, it must be written off as a mere reminder that here is an activity in transition from war to peace that needs more attention and more forceful Government handling.

But the speeches were interesting because they revealed among members a wide first-hand experience of the publicity activities of H.M. Government. Thus the debate, though officially labelled "Foreign Broadcasts," roamed over most of the other important publicity channels now in use—films, books, magazines, special news services called to press attachés, exhibitions, the two-way traffic in chosen visitors. The tributes paid to the efficiency of all these services were, no doubt, gratifying to their organisers. But a glow of pleasure is a fleeting emotion. The permanent impression left by the debate is one of ends floating loose and unsolved problems hanging fire.

In particular: What provision is being made for retaining in Government service some of the men and women who have learnt the job of production and distribution for overseas? The inference to be drawn from what was said is that the best of them—always in demand—are for lack of a lead accepting jobs in other callings.

Secondly, what is to be the relationship between the three or more bodies which handle publicity abroad? There are, now and in the future, no easily definable boundaries between (i) the British Council, purveying culture, (ii) the BBC, covering one channel of publicity only, but on all subjects, and (iii) the general and political information service in other media which is believed to be going into the Foreign Office, but has hitherto been run by the MOI and Political Warfare Staffs.

Thirdly, who is going to pay for and control the foreign language services of the BBC? Are they to be the Corporation's Cinderella, paid for out of the fag-end of British licence fees, or is the Foreign Office to pay for one section of the Corporation in return for the voice in policy that is more important in peace as in war?

And other loose ends will only be tied up satis-

factorily if some one strong personality, conversant with publicity as well as with foreign countries, is made responsible for the job. With dissolution in sight, Mr Bracken's interests are turning elsewhere. No one representing the Foreign Office has both the two necessary qualifications. One of the good things that might emerge from a summer election would be a last-lap Minister of Information who relished the herculean task of dividing the Government's overseas publicity duties between an economic number of channels and departments.

MPs' Salaries

In the House of Commons last week several members had the temerity to ask for a "rise," and in doing so they put their case very strongly. Sir Herbert Williams, who had been "out of pocket for years," declared that only those Ministers who had private means were able to carry on without anxiety. Mr Montague went further and proclaimed that there was "not a member in the House who could live on his Parliamentary salary." His £600 a year was reduced to £8 10s. a week by taxation and to £3 by postage, meals in the House and travelling expenses. Mr Driberg wanted travelling allowances (vouchers) in addition to those granted between Westminster and the member's constituency since homes and constituencies are often far apart.

Most members would prefer any readjustment of salaries to take the form of additional concessions—covering postage, secretarial services and travel. But, as Mr Peake pointed out, such concessions—taking the free frankage of letters as a tried example—might well lead to abuses without adequate safeguards.

It is of the utmost importance that the nation's legislators should be remunerated adequately. If they are not, too large a share of their interests and energies are devoted to the earning of a supplementary income. It is not uncommon for members to lose their independence for the subsidies of sectional interests. If the remuneration of MPs remains inadequate a parliamentary career will become possible only for those with private means or private backing.

Mr Peake's opinion that a review of the position now would not commend itself to the electorate is not convincing. If readjustments are necessary, it is surely better that they should be made by a Coalition Government and by a Parliament that will not itself be a direct beneficiary.

Enticement

The case that came to be known as the Abbey Enticement case finished last week with a verdict in favour of the plaintiffs. They recovered judgment for £500 and an injunction against the defendants, to prevent the continued "harbouring" of Miss Lough. In view of the possibility of an appeal, the operation of the injunction was suspended until the end of the month, and in view of the same possibility comment on the details of the case are not possible. But actions for enticement are interesting in themselves, even if considered as no more than a curious mediaeval section of the mosaic that makes up our Common Law. Their basis is far removed from any ethical desire to uphold the sanctity and responsibilities of parenthood. They are founded on the rather earthly view that a father is entitled to the free benefit of his child's labour until the child reaches 21. Nor is the usual enticement action the result of a child's withdrawal into the spiritual fastnesses of an abbey in New Barnet. It more frequently arises from the child's unfortunate union with a member of the opposite sex, and the enticer, if a man, is called upon to pay damages to the head of the family as well as weekly maintenance for the illegitimate grandchild.

But the case does raise one point of social importance, that is the inability of the Court in which it was heard to deal with the custody of the child, having regard only to the best interests of the child. This is a defect in procedure only, for, while an action of enticement is heard in the King's Bench Division, the Chancery Division of the same Court has full power to safeguard the welfare of a child who becomes a ward of court. It would be a simple matter to alter the Supreme Court Rules so as to make it essential that the child involved in any enticement action should be treated as a ward of the court, and so considered when judgment in the action is pronounced.

Letters to the Editor

BETRO

SIR,—Mr Bruun appears to overlook the type of research to which BETRO intends primarily to devote itself, namely, research into the requirements of the consumer (which, unfortunately, are not always identical with "the export article of the individual manufacturer"). Others, too, have overlooked this type of inquiry, particularly in overseas countries, and BETRO's intention to fill the gap, where it exists, may be the cause of the boiling enthusiasm to which Mr Bruun refers.

Market research, which before the war was used by an increasing number of British manufacturers, is a science which the average manufacturer is not equipped to conduct for himself in every overseas market.

It is true that there is no substitute for individual effort, but co-operation is a valuable means of supplementing it. BETRO is an organisation formed by a considerable body of British business concerns who intend, by mutual co-operation, to supplement their individual efforts.—Yours faithfully,

PHILIP SCOTT,
Organiser for Formation Committee of BETRO

The Port of Cardiff

SIR,—The reference in your issue of May 5th to the Port of Cardiff and the Post War Reconstruction Report distributed by this Chamber calls for some comment.

Your remarks do not fairly interpret the claims and purpose of our Report as regards the development of a general cargo trade for the port. The object in view was not the acquisition of trade now or formerly moving through other ports, by instituting artificial conditions or preferential rates to the detriment of those ports. The position is, in fact, quite the reverse. It was clearly indicated that those

other ports, such as London and Liverpool, were already strongly protected—not, as you suggest, by geographic considerations, but by an accumulation of preferential traffic rates, some of which were enumerated. So long as these artificial preferences, both in railway and port charges, obtain, it is obvious that, even with geographic advantages, no great progress can be made in the development of Cardiff's general cargo trade.

The Government has called for, and expects, a 50 per cent increase in the export trade of this country, but much of the coal which would have been available for export will be used in this country for manufacturing purposes. It is, therefore, reasonable that we in Cardiff should hope and expect that a fair proportion of the general export traffic should pass through our port. It cannot be denied that we have distinct natural geographic advantages. The port's communications have been abundantly tested and proved by wartime accomplishments. Experience during the war has demonstrated that the equipment is undoubtedly adequate to deal with that larger proportion of traffic which we are hoping to secure.

What we ask for is that, with a population of 8½ millions within a radius of 80 miles, we should be allowed equal opportunities of trade within and beyond this orbit. This will only be practicable if the rates and conditions enjoyed by other ports are not, as they now are, preferential in character.

The authorities here realise the importance of efficiency in the post-war era, and they are confident that post-war traffic will, in all respects, be handled with the same efficiency as during the war, but if present disparities in rates and conditions are allowed to continue, Cardiff's efforts to expand its general cargo trade will be severely, and very unfairly, handicapped.—Yours faithfully,

H. KENDRICK, Assistant Secretary
Cardiff Incorporated Chamber of Commerce

AMERICAN SURVEY

San Francisco Side-Show

(From a Correspondent at San Francisco)

WHILE the delegates to the United Nations Conference carry on their deliberations in the Opera House and the neighbouring Veterans' Building at San Francisco, a side-show is being staged in the crowded lobbies and smoke-filled hotel rooms of that cosmopolitan city. Forty-six nations are represented at the conference. No reporter has computed how many national and international groups make up the side-show. Importunate minorities are a feature of most international conferences. Usually they include the lunatic fringes of public opinion, with their schemes to remake the world overnight into something rich and strange. But the pure crackpots have been pretty well barred from San Francisco, thanks to the alert stage-managers in the State Department at Washington. Railroad and plane travel to the Golden Gate city has been severely rationed. Hotel rooms are at a high premium. Nevertheless, in a country so addicted to "organising" and with scores of pressure groups maintaining offices in every large city, the sidelines in San Francisco are inevitably crowded.

Even the State Department found it expedient to invite forty-two national organisations—labour, industrial, educational, fraternal and the like—to serve as "consultants" to the American delegation. The overworked delegates have scarcely had time to glance at these consultants, much less to consult with them. Now this may be all right with, for example, the Kiwanis International, which has ample opportunity to lunch with the various "service clubs" that abound here as in every American city. And the National Council of State Garden Clubs may find edifying relaxa-

tion in the environs of San Francisco. But the official neglect is resented by the labour consultants, who feel themselves too important to be left out in the cold. Here, however, the conference has some reason for sticking to the main problem in hand. The trouble with so many of the consultative groups is that they cannot agree among themselves. The State Department was compelled to invite both the AFL and CIO labour organisations, fully realising that these gentlemen will not sit down in the same room together. When the World Trade Union Congress held its convention in Oakland, just across San Francisco Bay, the AFL boycotted the meeting because the WTUC included the CIO. The AFL belongs to the International Federation of Trade Unions, which will have no truck with the State-controlled Soviet unions. When Mr Molotov lost his plea that the WTUC be named official labour adviser to the conference, the reason may have been as much the obvious disunity of labour as the pronounced leftist hue of WTUC.

A similar confusion of aims marks the activities of the various Jewish groups operating on the sidelines. In one week four more or less different Jewish points of view were presented to the conference—by Dr Chaim Weizmann's Jewish Agency for Palestine, by the World Jewish Congress, the American Jewish Committee, and the Hebrew Committee of National Liberation. The groups are united in demanding an International Bill of Rights to protect all creeds everywhere, and in calling for a Jewish Commonwealth in Palestine. But the Hebrew Committee insists that, while "Jews" are a religious group, "Hebrews" must be

formally recognised as "a national entity." Though less numerous than the Zionists, the voices of the anti-Zionists can be heard amid the babel from the sidelines.

Distinguishable, too, are the voice of the American Negro, demanding his constitutional rights; the plea for "true equality" for women; the clamour of the farmers for high and steady prices, and the appeals of groups too numerous to mention for a place in the better world whose foundations, they hope, are being laid on the shores of San Francisco Bay. An apt, if undiplomatic, comment on the conflicting pressures was made by Mr Archibald MacLeish, the Assistant Secretary of State, who welcomed the consultants with the remark, "What wonderfully organised confusion!"

There are dozens of other groups, in no sense official, in what Mr Attlee called "this delectable city." Their spokesmen buttonhole delegates wandering through hotel lobbies or emerging from plenary sessions into the Opera House foyer for a smoke; they cram the reporters' mailboxes with literature; they arrange, endlessly, lectures, luncheons and cocktail parties for all who can be induced to lend an ear. Special pleaders who cannot appear in person hire publicity agents ("public relations consultants"), who, for a large fee, will convey smooth messages to the delegates.

From this studied propaganda one turns with relief to such colourful plaintiffs as Chief Dagarleehogo (meaning "Man-with-two-minds"), representative of the Six Nations' Iroquois Confederacy. The beaded and buck-skinned chief is trying, admittedly with no prospect of success, to interest the forty-six United Nations in repeal of the Canadian Indian Act of 1927.

The most important and most serious groups on the sidelines here are the spokesmen for uninvited nations and for national minorities who find themselves in jeopardy. Most prominent, of course, are the Poles. The Polish influence began to exert itself before the conference opened. Newsmen from many lands who boarded the special train at Chicago—a city with a huge Polish population—found their path to the gate lined with a double row of Polish-American beauties, garbed in native costume, who handed out envelopes crammed with anti-Lublin literature. The reaction to these brochures was mixed, but all the newsmen approved the delightful novelty of having propaganda spread by pretty girls with a charming smile and a curtsy.

Detraining at San Francisco, the newsmen were beset by invitations to a press conference with the "Free India Committee," where Mrs Vijaya Pandit, sister of Jawaharlal Nehru, warned them that the "so-called Indian representatives" at the conference do not represent India at all, and that India's millions will not be bound by the vote of "nominees of the British Government." Quieter but not less earnest are the peripheral activities of the American Croats and the Serbian followers of General Mikhailovich. While the Croats, from their Chicago headquarters, petition President Truman to investigate "Tito's reign of terror" in Yugoslavia, the Serbs here are arranging a meeting to undermine American confidence in the official Yugoslav delegation. Active on the sidelines are the Friends of the Spanish Republic. Enjoying powerful support from American reporters who covered the Spanish Civil War, they have asked the Conference Secretariat to boycott Franco and recognise a democratic Spanish government, "when it is formed." Rumours are afloat that the Finns will soon be heard from.

All these national group pressures are, of course, familiar to the European delegates. What surprises them is the number, variety and intensity of the American "causes" in a country which seemed so peaceful and prosperous on their long journey across the continent. Perhaps they do not realise that the United States is the home not of lost causes but simply of "causes," some good and some bad, some frivolous and some deadly earnest—but each with a board of directors, a publicity agent and a steadily mounting budget. They do not understand the organising tendency, which at times resembles a mania, of this over-organised land. And they are only now beginning to realise the magnetic force exerted by a conference, where there is so much talk of "justice," upon a people whom free speech and modern communications have encouraged to air their views on every real and imaginary ill which humanity is heir to. San Francisco has drawn a multitude of zealots, "do-gooders" and profiteers in public gullibility to its hospitable self.

To the student of crowd psychology, the San Francisco side-show is valuable source material. It should likewise

hold a serious interest for the European delegates. These minorities and pressure groups represent a continuing force in American political life. British delegates, who have so often meditated upon the delays, confusions and contradictions of the American Congress, should take a day off in San Francisco to study the side-show. Here are the kinds of pressures that are being steadily exerted upon Senators and Representatives. And this side-show will be transported to Washington, in person, by mail or by telegraph, when the Senate is called upon to ratify the charter of the United Nations.

American Notes

"World Planners"

A Bill to extend and broaden the Reciprocal Trade Agreements Act, which expires on June 12th, has been sent to the floor of the House of Representatives by a Committee vote of 14 to 11. The Doughton Bill provides for extending the Act for three years and gives authority to the President to reduce tariffs to 50 per cent below the rates existing on January 1, 1945, which are themselves, in some instances, 50 per cent below the Hawley-Smoot rates.

The dissenting report, signed by 10 Republicans and one Democrat, all of whom did their best to kill the Bill in committee and can be expected at the very least to try to emasculate it in the House, must have read very strangely to delegates at the San Francisco Conference, and certainly must have made the US delegates wince. They attacked "world planners" and insisted that an increased export programme "will bring us head on into conflict with Britain and other nations." The intransigent Republicans were not even swayed by a long procession of responsible, sober men who testified in favour of the Bill: heads of the most important Government agencies, Cabinet members, even Mr Robert Lincoln O'Brien, Republican chairman of the Tariff Commission under President Hoover. And certainly the dissenters were not affected by the endorsement of the Congress of Industrial Organisations.

They even turned a deaf ear to the findings of a two-party Committee of the House, which for many months has been working on post-war economic policy and planning. This Committee, under the chairmanship of Mr Colmer, Democrat, recommended an early international conference to consider the reduction or elimination of world trade restrictions. The Colmer Committee specifically called for the passage of the Doughton Bill, without qualifications.

Testifying before the Ways and Means Committee, Mr Wallace, Secretary of Commerce, saw in the American handling of tariffs a chance to prevent a third world war. Mr Knutson, his Republican interrogator, could only insist that if Mr Wallace were not so "naive" he, too, would understand that the lowering of tariffs was comparable to the lowering of immigration restrictions.

It is still too early to predict the fate of the Bill on the floor of the House, and still less in the Senate. The National Association of Manufacturers has proposed as an alternative the extension of the present Act for one year, with no provisions for further reductions in tariffs. Outright rejection is not likely, but some such compromise as this is by no means impossible.

* * *

Cradle to Grave

Congress recently cut by \$77,200,000 the Administration's Budget requests for the Labour Department, Federal Security Agency and related offices, and rejected a \$15 million increase required for the care of dependent children, the aged and blind. President Truman evidently believes that these actions are not a true barometer of the present temper of Congress, for he is expected very shortly to recommend a sweeping expansion of the Social Security programme. At the same time, Senator Wagner will introduce in Congress a Bill proposing the changes in the existing programme which the President will advocate.

The Bill, which inevitably will be called the "American Beveridge Plan," will seek to raise unemployment compensation to a maximum of \$30 a week and to bring under the wing of the Federal Government unemployment insurance schemes now handled by the states. It would add 15 million newcomers to the estimated 47,500,000 who held Social Security cards at the beginning of the year: domestic,

farm and social workers, teachers, self-employed, employees of non-profit institutions and other groups not included under the present Act. It would provide medical and hospital care to all who are covered by Social Security, to wives and to children under 18. To accomplish all of this and more, it would increase taxes on employees and employers from the present 1 per cent each to 4 per cent.

The principle of Social Security is no longer argued even in the United States, which accepted it only after the worst depression in America's history. In Congress, Democrats and Republicans have agreed that the provisions of the Act of 1935 are no longer adequate. It is on the methods of overcoming the inadequacies that the disagreements will arise. If the new Bill follows the patterns of its predecessor, the Wagner-Dingell Bill, which was introduced in mid-1943 and never got beyond the Committee stage, the chief target for opposition from Conservatives will be the medical provisions. Even a partial nationalisation of medicine will attract the powerful opposition of the American Medical Association.

Opposition can also be expected from those who believe that in lumping together all types of social security taxes the Federal Government is infringing on states' rights. There will be a revival of the conflict over how large the fund should be allowed to grow and whether it should be at the disposal of other Government agencies. And then, of course, there are still some very vocal diehards who believe that to protect the public from hazards over which they have no control means to stifle initiative and to vitiate economic enterprise.

* * *

Shortage becomes Absence

The shortage of meat in many centres in the United States is fast becoming an absence of meat. In New York City, for example, 400 restaurants of all types will have closed down by June 1st, and the number will be multiplied many times over if the meat and poultry famine is not arrested by July. At least 10,000 butcher shops in the metropolitan area alone have shut down temporarily. The remainder have found that they can dispose of their meagre supplies in an average of two hours a day.

So perhaps Mr Fred Vinson, Director of War Mobilisation, is not to be too severely criticised for bowing to the pressure of western Congressmen who turned the Senate Agriculture Committee investigation of the meat shortage into a drive for higher prices for large packers. Mr Vinson has announced a new subsidy schedule, to total \$30 to \$40 million on high-grade cattle, with a general, unspecified increase in the subsidies granted to packers of all grades of cattle and pork. Every attempt, it is said, will be made to keep retail prices at their current levels.

The public has been allowed to believe that present scarcities derive, to a considerable extent, from huge food shipments to liberated and Allied countries. It is ironical, therefore, that Mr Crowley's Foreign Shipments Committee, which was established by Mr James Byrnes ostensibly to protect the American consumer from having his supplies shipped abroad, in its first report pointedly states that in 1944 only 7 per cent of US food production went to foreign countries. Mr Crowley has no doubt that Americans will willingly reduce their food demands when they have assurance that their reasonable needs will be met with a minimum of inequity in distribution. "It is simply in the interest of humanity not to permit millions of hungry people in Europe to starve," he says.

Mr. Crowley reveals not even a vestige of the much-criticised Byrnes attitude which emphasised, to the detriment of hungry people abroad, the limitations of the American economy, while it disregarded some of the glaring reasons for those limitations.

* * *

La Guardia Bows Out

New York City will miss its thrice-elected mayor, Mr Fiorello La Guardia, the "Little Flower." For La Guardia recently followed the "Patience and Fortitude," with which, incredibly enough, he introduces his regular Sunday broadcasts, with the announcement that he would not run again. This uncontrolled, despotic little man, who browbeats his commissioners and showers unprintable abuse on newspaper reporters, brought to New York City, wearied by many years of corrupt Tammany Hall rule, an incorruptibility—and a passion for clean government. New schools,

magnificent park and highway systems, not so magnificent housing projects, a unified subway system, are monuments to his energies. And if a study of the monuments reveals notable gaps, in slum clearance, for example, or in still overcrowded schools, or in a Harlem which is still a series of promises, it is important to remember that his period in office has been one of depression and war and that in much of it he has not been in control of the city legislature. There is no denying that his arbitrary methods have created needless ill-will. And certainly his verbal outbursts in half a dozen languages have had no effect on a sinister black market in meat.

Who succeeds Mayor La Guardia is important not just to New York City but to the state and country as well. In Presidential elections New York State controls 47 out of a total of 531 electoral votes and over half of those votes are in New York City, with its population of over seven and a half million. It is safe to assume Mr. Truman will follow the pattern set by other Presidents and throw his support to one candidate. This opens the way for a regular Democratic administration, dependable at least from a party point of view. It should also warn New Yorkers to guard against the return of Tammany Hall rule, to be avoided even though it would be a temporarily chastened Tammany.

The position of the American Labour Party, which will be dominated by the CIO Political Action Committee, will be interesting to watch. In the past, the ALP has united with the Republicans to elect La Guardia. This year such an arrangement is likely to be equally distasteful to both sides. For the PAC is hardly likely to be willing to strengthen Republican Governor Dewey's position, and the Republicans, who in the past have gingerly accepted Labour support, will be eager to rid themselves of this embarrassing Left Wing tie. The most probable link-up is said to be between the Democrats and the ALP, with which goes PAC support, on the one hand; and between the Republicans and the Liberal Party, a right-wing offshoot of the ALP, on the other.

All of which depends, of course, on whether the mercurial La Guardia allows himself to be "drafted."

Important war contracts have kept us fully occupied during recent years but it won't be long now—in the meantime keep thinking of TEMCO.

THE WORLD OVERSEAS

Unrest in Belgium

THE chief impression made by M. Van Acker, the Belgian Prime Minister, is one of unfurried common sense. Since he succeeded M. Pierlot three months ago, he has gone about his work calmly and competently and for a time at least his Government was that rare thing in Belgian politics, an administration nobody criticised. It is, therefore, a sign of a considerable upheaval in Belgian life if he says, as he did in a broadcast to the nation of May 19th,

I am not in the habit of exaggerating or dramatising events. I view the situation with the common sense the country has ascribed to me. But I do not hesitate to tell you that the hour is serious; I can even say, very serious indeed.

The cause of the crisis is the wave of strikes that has swept the country. In the Borinage and the Centre, 90 per cent of the miners were on strike last week, in Liège and Charleroi, 50 per cent. Only the Limburg miners were unaffected. At the same time, there has been an agitation to extend these strikes to the whole country, and one small journal, *Le Pouvoir aux Travailleurs*, was banned for advocating a general strike. These strikes are in the main irresponsible. The trade unions have not ordered them and, although somewhat equivocally, are condemning them. Cabinet Ministers have gone to the microphone to appeal for a return to work. Finally, in this broadcast of May 19th, M. Van Acker himself tried to bring home to the men the seriousness of the crisis they had precipitated.

It turns on the fact that the recovery of Belgian production depends very largely on coal. Coal is Belgium's only raw material. Its highly industrialised pre-war economy was based on the import of raw materials—wool, cotton, iron ore,

copper—which were turned, with local coal, into processed and manufactured goods. At the moment imports are negligible. Whereas 100,000 tons a day were imported before the war, the figure for the whole month of May will not exceed that figure. Coal is therefore all the more important. The Van Acker government succeeded in March in increasing production to about a million tons a month (the pre-war figure was over two millions a month). Now production has fallen seriously. Gas and electric supplies are threatened. Train and tram services may be cut. Reconstruction in other branches of industry is at a standstill. For example, textile workers who were beginning to work on the small amounts of imported cotton and wool are again unemployed. This delay affects the whole Belgian economy. The effectiveness of the fight against inflation and the Black Market depends upon an increase in civilian supplies. The peasants will not deliver their produce without some hope of securing manufactured articles in return. Meanwhile, the absolute shortage is a constant temptation to all producers to sell illegally. The Prime Minister said recently that 99 per cent of the textiles that are being produced find their way into the Black Market.

The only effective answer is the arrival of more supplies. A recent shipload of fats reduced the Black Market price for butter from 60 francs to 25 francs a kilo. The end of the war in Europe will slightly ease the import position which has been inhibited not only by lack of shipping but by lack of internal transport. But the imports will not do more this year than put the Belgians in a slightly better position to help themselves—which, if they strike, they cannot do.

M. Van Acker has taken a number of steps to increase production and to counter strikes. The miners in particular have received a number of important concessions in pay, rations and pensions. This week, compulsion is to be added to inducement. All strikes have been declared illegal for three months and instigators are liable to arrest. The law of civilian mobilisation has come into force in all vital sections of industry. Workers may not change their work, although they may still move from one job to another within their own branch of industry. The Trade Unions appear to have acquiesced in these measures with rather bad grace. The Mineworkers' Union, which did not at first sponsor the strikes, agreed at its latest meeting only to postpone an official strike for another week, until the Government should have met the men's latest grievances.

In return for the greater discipline he intends to impose on labour, M. Van Acker and his colleagues have prepared Bills for a capital levy—5 per cent is the figure mentioned—and for the almost complete confiscation of war-time profits. The Government also announces that the representatives of organised labour shall be able to participate in all decisions on future economic policy.

Economic Distress

Will these measures restore stability to the Belgian economy? The difficulty lies in the very complex and diverse motives behind the present unrest. It is a symptom of general post-war malaise, and it is no coincidence that the ending of the war has led to a more violent expression of discontent. The reasons are partly economic. In spite of better rations and higher wages, the life of the miner, short of clothes and without soap, is very hard. The working class as a whole has gone hungry on a diet containing less than half the calories of their pre-war consumption. Although the drastic financial measures introduced by M. Gutt have probably checked inflation, inflation is there and prices have steadily increased through the winter and spring. A section of the community—the wealthier classes in the town and the peasants in the countryside—escaped the full rigours of the hard, fuelless winter. The fact that they, on the whole, support the conservative parties has added political bitterness to people's economic distress.

The ordinary split between Right and Left is aggravated

in Belgium by a racial and cultural split. Broadly speaking, Wallonia in the south is the radical section of the country. Here in the past a great part of Belgium's industry and coal have been concentrated. The people are French speaking, free thinking and tend to join the Socialist or Communist parties. The bulk of the peasantry live in Flanders; they are Catholic and Conservative. Even the new industrial area of Limburg does not share the political turbulence of the south. For instance, the miners there are not striking now. The Flemings have a high birthrate, while the Walloons are declining. Separatism is not an issue except among extremist Walloons, but the variety of social and economic differences make the cleavage between Fleming and Walloon a factor in Belgian life, which even the great national parties cannot entirely bridge. The Germans were able, as usual, to exploit this racial split. They drew their Quislings from both groups—the VNV from Flanders, the Rexists from Wallonia—but they took care to create friction and suspicion. For instance, at one point they returned to Belgium all the Flemish prisoners of war, leaving the Walloons in captivity. Peace has not entirely wiped out the bitterness. At this moment an extremist Walloon paper, *Le Gaulois*, is banned for its insulting comment on the Flemish people.

There are particular reasons why unrest should have come to a head now. The end of the war and the easing of tension is one. Another is the return of the political prisoners from Germany. Some of them have organised demonstrations against the "slowness and ineffectiveness" of the purge. In some towns there was rioting, and collaborators who had been released were re-arrested by the crowds. On the other hand, the question of the King's return does not appear to have caused any strong political upheaval. His decision not to resume his duties for the time being calmed the incipient crisis. His brother, the Regent, is quite popular with the Left Wing, and the issue of the monarchy as such is not in question.

Yet when all the particular causes of unrest are taken into account, they do not fully explain the malaise in Belgium. M. van Acker has spoken of Fifth Columnists and agents provocateurs. Dissident Walloons, ex-Rexists and ex-VNV men may indeed be active. The local Communists, too, are always ready to encourage action against collaborators and dissatisfaction over the black market and inflation. The official Communist party leaders work with M. van Acker, and in social policy are, so many Socialists affirm, to the Right of the Socialist Party, but this fact does not preclude local activities and agitation.

Back to 1939?

The action of dissidents would, however, be ineffective if the general atmosphere did not encourage dissidence. The economic reasons—shortage, inflation, black market—are obvious. The political cleavage between Walloon and Fleming is important, but should not be exaggerated. Perhaps one of the most significant reasons—one that can also be observed in neighbouring France—is general dissatisfaction among the younger and more radical elements that five years of war and intense internal struggle should have led to the re-establishment of something which looks so remarkably like the political structure of 1939. There have been efforts, since liberation, to change the political parties. The Left Wing of the Catholic (or Conservative) Party—the Christian Democrats—have talked of breaking away to join the Socialists. They in their turn are being solicited by the Communists to form a single working-class party. But the only structural change achieved so far has been the separation of the trade unions from the Socialist Party. Meanwhile, the basic political and economic structure of the country has not changed; and to-day far more people in Belgium than ever before want to see it changed.

The conditions for a peaceful evolution are good. Of all the countries in Europe, Belgium has emerged the most unscathed from the war. Its transport system is intact. Its industries may need modernisation, but they have not to be rebuilt. The magnificent harbours of Antwerp and Ghent are in full working order. Above all, the Belgian people represent one of the most skilled and hard-working labour forces in the world. With these assets, Belgium can play a great part in the reconstruction of Europe. For these reasons, too, it is probable that the present wave of unrest will decline, and the way be opened to hard work in the interests of Belgian and European recovery. The Allies can help the Belgians to maintain their country

"Liberated" Trieste

[FROM AN ITALIAN CORRESPONDENT RECENTLY IN TRIESTE]

May 15th

WHILE Italy, together with the rest of the world, was cheering the end of the war in Europe, there were few celebrations in Trieste and in the other towns of Venezia Giulia. At a time when the greater part of the world was eagerly awaiting the first consequences of the armistice, the military commander of the Yugoslav partisan forces, who had assumed the administration of the Italian territory into which they penetrated less than a day ahead of the New Zealanders of the Eighth Army, had begun to conscribe all male inhabitants between the ages of 16 and 60.

Military conscription is a blatant infraction of international law, even if the annexation of the territory announced by the "Slovene Federal Government" were recognised. To the outside world, it may seem preposterous to talk about annexations in view of the recent declarations of the Yugoslav Foreign Under Secretary. But inside the disputed area open publicity is given to the annexation, and anyone expressing public opposition would be arrested. If enquiries were made, the reply would probably be that no order of arrest had been issued and that, anyway, it would be difficult to obtain information owing to the lack of postal communications. Although arrests have now been going on for a fortnight—and there have so far been only about a dozen, very conditional, releases—there has been no report of a public trial. It is also worth noting that many of the arrested were active anti-Fascists, some of whom had only just been released from Fascist prisons. A number of people who did not fare badly under the Nazi occupation are, however, entirely unmolested; some of them are to be found on the new "executive council" of the town of Trieste, nominated in place of the National Committee of Liberation, which was not recognised because it contained no Communists.

Trieste's Junta

To this junta the military commander has handed over complete powers. It is composed of twelve Italians and seven Slovenes. Among the Italian Communist representatives are members of a new party executive, appointed after the arrival of the Yugoslavs and until then unknown in Trieste. The other members were informed of their nomination by the only newspaper, which is published by the authorities. They do not represent anybody. One of them had the courage to refuse to take office, others were not so brave. The Socialist Party declared officially that a man claiming to be their representative had never belonged to the party.

Cars, typewriters and all kinds of property are requisitioned, frequently without a receipt being given. Nobody is allowed to leave the area with more than 3,000 lire (£7 10s.). Many of those trying to leave, even after having obtained a permit, are deprived not only of that sum, but often also of their clothes, and are sent back or imprisoned. There is still plenty of looting. The Slav flag flies even on the memorial for Italy's killed of the last war. A peaceful demonstration of about 50,000 people was fired on, with the result that about 40 were killed, and wounded, among them at least one New Zealand soldier. It is impossible at present to confirm the news of massacres in Istria, except for the mass killing of 150 Italian Custom guards, of which

detailed reports are available. As in most other North Italian towns, these guards had for some time been secretly affiliated to the Italian partisans and gave considerable help to the insurrection.

The Facts of Liberation

After sharp fighting, in which 39 patriots were killed, Trieste was under the control of the Italian Liberation Committee by April 29th. The Germans were holding out in the port area and in the castle; but fighting had stopped, the Germans recognised the authority of the committee and had given a guarantee that no destruction would take place. The patriots had taken many prisoners, but the garrisons of the strong points declared that they would surrender to the New Zealanders, which eventually they did on May 2nd. On May 1st, however, Tito units had begun to infiltrate into the town and, helped by the local Communists, who by then still considered them as liberators, attacked the Germans. The Liberation Committee, which did not wish a conflict with an Allied Power, had ordered the 5,000 patriots who had not withdrawn to obey the Yugoslav order to surrender their arms. On the arrival of the New Zealanders most of the buildings in the town were, therefore, already occupied by Tito's soldiery and by *bona fide* Communists. They had, however, been unable to take the port or the castle.

These are the facts about "the liberation of Trieste by the 9th Corps" which is duly celebrated by innumerable bilingual posters in the streets. It led to the unrestricted rule of the "Osvra," the secret police whose significant name is interpreted by the population as a mixture of "Ovra" (Fascist secret police) and SS.

One week after the end of the war the whole area on the western approaches of Trieste is a huge military camp of troops preparing for battle. The fate of the northernmost port of the Mediterranean is important to many countries, whose economic interests demand that Trieste should be a free port. But the political fate of the town and of the province should only be decided according to the freely expressed desire of their population. No true decision can be taken during or immediately after a rule of terror.

To-day these hands have Victory in their grasp. To their inborn skill the nation owes its priceless air supremacy. To-morrow this same skill, heightened by five years' devotion to the nation's cause, will turn to the making of the future's finest cars.

SINGER MOTORS LTD COVENTRY & BIRMINGHAM

Portugal and the Peace

[FROM OUR LISBON CORRESPONDENT]

FROM start to finish, Portugal has kept to the strict letter of neutrality. The events of the first week in May were still in the tradition. Official condolences on the death of Adolph Hitler, with the flags on public buildings and naval craft at half-mast, were tendered to the newly-arrived German Minister in recognition of the death of the titular chief of the Reich. Not by any means a popular gesture, it was nevertheless considered correct diplomatic procedure, as Portugal had not up to that moment taken the step of severing relations with Germany.

Three days later that step was taken, much to the public's surprise. The interim Minister for Foreign Affairs asked Dr von Halem to call at the Ministry, and there and then gave him Portugal's reasons for requesting all official German representation now acting in the Republic to cease. It was pointed out that as there is no central authority in the Reich with which relations might be entertained, the German Minister, the consulates and certain other offices, notably that which housed military attachés and bore two great brass plates reading *Deutsche Wehrmacht*, had no *locus standi*. So seals were set on the locked buildings, which will be cared for by the Portuguese Government police until such time as a recognised authority again exists in Germany.

Another three days passed, and then came the announcement that all German funds and credits were blocked, any would-be transaction being subject to investigation by the Banking Inspection Department and later to the decision of the Bank of Portugal. To cap all this came a striking and unannounced speech of Dr Oliveira Salazar to the National Assembly. In few words he emphasised that Portugal had reason to be glad that England was in the forefront of the victorious nations, given her position on the Western Ocean. Neutral Portugal's aid had not been either depreciated or forgotten.

THE BUSINESS WORLD

Paralysis of French Industry

THE facts about the state of industrial activity in France contained in the first of the accompanying tables are disquieting. They show that, in a number of important industries, the rate of production in January and February was only a fifth, or even less, of the average for 1938. Railway car loadings, a rough index of the overall state of activity, were last February about 25 per cent of the pre-war average. If the state of French trade is compared with that of 1943, the reduction, though less marked, is still substantial. In sum, the recovery that took place after the liberation of the country, when activity was almost at a standstill, has not gone very far. There has been no further improvement since last February; in some industries there has even been a recession. Inevitably, long-term problems of economic reconstruction and expansion have receded into the background before the urgent task of getting the wheels of industry moving again. The obstacles to further recovery are not to be found in any lack of plant and equipment, but in the shortage of coal, materials, transport and labour.

The main obstacle to recovery is the lack of adequate coal supplies. Current output is at the annual rate of about 30 million metric tons, against 42 million tons in 1943 and 41 million tons in 1938. Imports are virtually suspended; they were four million tons in 1943 and 27 million tons in 1938. The amount of coal actually available has thus been reduced from 68 million tons in 1938 to 46 million tons in 1943, and is now at the rate of only 30 million tons. If allowance is made for consumption at the mines and for the coal to which miners are entitled—together some five to six million tons a year—the quantity disposable is now at the annual rate of only about 25 million tons, against 62 million tons in 1938. Table II shows that, after providing for the needs of transport and other essential services, the amount of coal available for industry and for domestic purposes is only a fraction of normal consumption. The amount allocated for domestic use last January, incidentally, included nothing for domestic heating; it barely provided for cooking—in Paris alone there are 330,000 dwellings linked neither to gas nor electricity—and for the needs of institutions such as hospitals.

The causes of the fall in coal production in France are the same as in this country. Output per manshift has shown a steady decline from 1,229 kilograms per manshift in 1938 to 943 kilograms in 1943 and—in spite of some improvement last winter—859 kilograms at the end of March, 1945. Absenteeism, too, has shown a steady increase. During the period of occupation output was maintained by drafting additional labour into the industry; for example, the number of miners working underground was increased from 149,000 in 1938 to 169,000 in 1943. Unfortunately, large numbers of them left their jobs during and immediately after the liberation of the country; by December, 1944, the underground labour force had been reduced to 135,000. Steps are now being taken to increase output. Thus extra rations are expected to reverse the decline in productivity and the rise in absenteeism; the labour force is to be augmented by the employment of prisoners of war. These and other measures should have the immediate effect of preventing a further fall in production; but it remains to be seen whether they will lead to an expansion before next winter.

While the shortage of coal is undoubtedly the chief difficulty to be overcome, the removal of this bottleneck would only permit a limited recovery. Complaints about the shortage of materials, transport and labour are only less insistent because the lack of coal dictates a disastrously low level of industrial activity. The supply of imported raw materials has been increasing, but it remains a mere trickle, and is behind the schedule set by the Monnet Plan for the first six months of this year. Up to April 15th less than a tenth (by weight) of the scheduled imports had actually

arrived. Although, compared with processing capacity, there may be no overall shortage of raw materials, there are individual bottlenecks; the lack of tanning materials, for example, is holding up the production of footwear; there is also a shortage of rubber for tyres. Transport capacity is reported to show a steady improvement. Increased numbers of repaired and imported locomotives and goods wagons have been put into service. Road haulage capacity has been increased by imports and the resumption of domestic production; the output of motor vehicles increased from 1,967 units in January to 2,514 in March. The shortage of labour, while potentially one of the most serious

problems, is not a major immediate bottleneck, except in certain industries, particularly coal-mining and, of course, in agriculture. In March the number of unemployed was less than 400,000, though of the remainder many were then working only part-time. The immediate problem is one of redistributing the available manpower in order to secure its fuller utilisation on urgent tasks not held up by other shortages. Inevitably, the shortage of food, clothing and other essential supplies has led to a fall in the productivity of industry, and to unrest, reflected in the recent strikes.

The difficulties of French industry, however, are not merely physical ones; owing to political disagreements within the government, industrial recovery has also been

THREE NUNS SAVES MONEY

—because of its

SLOW-BURNING CUT

There are two special reasons why 'Three Nuns' Empire Blend Tobacco saves the smoker money. It is scientifically cut to burn slowly, each ounce lasts longer, you smoke fewer ounces a week. It is made from fine leaf which is favoured by the lower duty on Empire Tobacco. To enjoy the fullest pleasure of smoking at a moderate cost, take to 'Three Nuns' Empire Blend.

hampered by a policy, or rather, a confusion of policies, that has given rise to uncertainty and has had the effect of forcing many concerns to operate at a loss. This confusion of policies arose from the fact that some elements in the government wished to introduce far-reaching structural changes immediately, while others set their faces against such changes in the absence of a test of public opinion.

The confusion caused by this tug-of-war has been reflected, for example, in the price policy pursued until the end of last month. Until then industrialists had not been allowed to raise their prices above the levels of last autumn.

II.—DISTRIBUTION OF COAL CONSUMPTION

(Excluding coal consumed in coal-mining; thous. metric tons)

	1938 Monthly Average	1945 January
Transport	835	592
Electricity (a)	262b	310
Gas	336b	191
Industry	1,732	455
Domestic use	1,365b	347
Military use	...	131
	4,530	2,026

(a) Excluding small quantity of electricity generated at mines and sold to other consumers. (b) The figures for January, 1938 are appreciably higher.

Yet their costs had shown a marked rise. Overhead costs per unit of output rose—appreciably in industries such as iron and steel—because of the low level to which industrial activity has sunk. Current costs rose substantially because industrial firms have had to pay 25 per cent of the wages of workers who had become redundant but had to be retained and, more importantly, because of the advance in wage rates—averaging about 40 per cent—granted by the Government last September. As a result of this policy, many firms have lost a substantial part of their cash resources as well as their working capital. The need for a decision became urgent in the spring because it was becoming increasingly clear that private enterprise could not effectively

carry on in those conditions. It was made at the end of last month, when it was announced that industry would be permitted to adjust its selling prices to the rise in costs by taking account of the rise in wages last September, the increased prices of raw materials and fuel, and part of the new advance in wage rates granted in April. No adjustment seems to have been permitted for the rise in overhead costs caused by the slump in production; on the contrary, industrialists were informed that in industries in which the rate of production was too low to permit profitable working, a solution should be sought by the concentration of output. Nevertheless, the change in policy is expected to restore the incentives of industry.

Other, though immediately less potent, hindrances to recovery are the uncertainties about the prospects of nationalisation and unsettled labour relations. French industry still does not know within what kind of framework it will eventually have to operate. Nor does it know how far the demands of labour to obtain representation on boards of directors will be fulfilled. The recently created joint production committees have only been given equality with shareholders in access to financial information; but, for this reason, the Government has come in for severe criticism from the trade unions. All these are political matters that are not likely to be settled before the general election.

French industry is thus not merely paralysed by physical shortages, but it is also hampered by uncertainty about the kind of framework within which it will have to operate. The change in price policy has removed some of the financial hindrances to recovery, but, unfortunately, the physical obstacles, especially the shortage of coal, cannot be removed at short notice. There is a serious danger, however, that a continuation of the disastrously low rate of industrial activity, coupled with the food shortage, may, by accentuating social unrest, make recovery more difficult at a time when the physical obstacles begin to be less formidable. On a longer view, there are, of course, no serious physical obstacles to recovery. But France, even more than Britain, has still to define the conditions in which industry and trade are ultimately to be carried on.

An Opportunity in Bicycles

THE bicycle has enjoyed an ever-growing popularity ever since its invention, and especially since the introduction of its modern version towards the end of the nineteenth century. By exception, its popularity—and, incidentally, that of the motor-cycle—have decreased in North America; there both have yielded to the motor-car, which has become part of the standard outfit of almost the whole population. But almost everywhere else the use of bicycles has steadily risen, and there is every reason to believe that it will continue to increase rapidly, especially in countries in which they have hitherto remained the privilege of a small proportion of the population. During the next few years the market should be exceptionally buoyant because of the special demand created by the curtailment of production during the past six years.

British manufacturers will have every opportunity to make the best of the heavy demand for bicycles. In contrast to

motor-cars, competition from the United States is not likely to be a dominating influence, for, largely because of the comparatively small home market, the industry in that country is much smaller than in Britain. Germany and Japan, hitherto the chief competitors of this country on the export market—Japan specialised successfully in cheap types—will be out of the world market, at any rate for a period. The British industry, in fact, should become by far the most important source of supplies, though of course it cannot expect to have the field entirely to itself. Major importing countries, such as India, have made plans to produce and assemble bicycles on a large scale; but even these countries will have to import, if not all, at any rate a substantial array of components. And there is no reason at all why British manufacturers should not set up or finance assembly plants abroad, if this is a condition of participation in certain markets.

The industry in this country has not merely the opportunity of raising its stature on the world market; it possesses most of the attributes needed to seize its chance. Even before the war, the British bicycle industry was the largest in the world. Between 1924 and 1935 the production of complete machines nearly trebled, while that of components doubled. At the census of production held in 1935, the output of the industry was valued at £11.5 million. Before the war it produced complete machines at the rate of 2,000,000 a year and components equivalent to another 1,500,000. The industry is assured of a large home market, that is, of a heavy demand in the short run and a stable, if not still expanding, demand on a longer view. In 1939 the number of bicycles in use in this country exceeded 10 million, that is, more than in any other country in Europe, with the exception of Germany. For many years, too, British manufacturers have successfully held a leading position in the export market. In 1938 they exported 576,000 machines valued at £1.7 million, and components valued at £1.6 million, a total of £3.3 million. (In the same year exports of new private cars and chassis were £7.3 million.) Bicycle manufacturers have yet another advantage, in that output, though curtailed, was never completely suspended during the war. In 1943, for example, they produced 658,000 machines, and the equivalent in components of a further 395,000 units. Nor were exports suspended; in 1944 these were still 113,000 complete machines valued at £523,000, and components valued at £742,000. This should enable manufacturers to be quick off the mark.

Although there are no indications of major changes in design, technical progress has by no means stood still during the war. The quest of the industry for less weight and greater strength has been assured further headway by the development of light alloys. New and ingenious gadgets have been developed, such as the hub-pump that will enable the rider to increase the pressure of his tyres without getting off the bicycle; it will even enable him to ride all day with a slow puncture.

As at present organised the industry is still highly competitive. In their paper read before the Royal Statistical Society, Mr H. Leak and Mr A. Maizels showed that in 1935 there were ten companies employing 500 persons or more; together these concerns controlled 75 per cent of the gross output and 83 per cent of the net output of "bicycles and tricycles." There is a good deal of variation, both in the size and functions of individual firms. The majority of the larger ones have interests other than bicycle manufacture, frequently of financially greater importance. These interests range from motor-cycles and motor-cars to more general manufacturing and merchanting activities.

In spite of the favourable immediate position of the British bicycle trade, its long-term prospects, especially abroad, are conditioned by its willingness and ability to

raise its productive efficiency still further (that is, to reduce its real costs), and to keep abreast in the matter of design. The industry would delude itself if it were to assume that it could maintain its lead indefinitely without enterprise and efficiency of the highest order. The history of the cotton industry, for example, has shown that competition alone is not necessarily a guarantee of efficiency. This is not to say that the bicycle industry is not alive to the conditions of sustained progress, or that it is unaware of the economics of large-scale production and standardisation, and of the need for careful research in overseas markets. Probably there is scope for further progress under some or all of these headings; clearly it is in the interests of the industry that this should not be neglected.

The industry is certainly alive to its favourable immediate post-war prospects, for it aims ambitiously at almost doubling its pre-war output, that is, at stepping up production to an annual rate of 6 million units, including 3 million complete machines and components equivalent to a further 3 million units. This target, of course, cannot be attained immediately; in the current year, for example, output is expected to reach 2 million units, inclusive of parts. But an ambitious programme is better than a modest one, in that it reflects a spirit of enterprise.

The favourable prospects and, on the whole, good profit-earning record of the bicycle industry have not been overlooked by the investor. He has fairly wide choice. In point of sales at home Raleigh, Hercules (a private concern), Birmingham Small Arms, New Hudson and Sunbeam are the most important; on the export market the order has been Phillips (a property of Tube Investments), Hercules and Raleigh. Raleigh is one of the leading and also most self-contained producers; its capital is owned by Raleigh Cycle Holdings. Enfield Cycle, a smaller concern, producing also motor-cycles and lawn mowers, has long enjoyed a good profit record. Renold and Coventry Chain, much the biggest manufacturer of bicycle chains, is largely exempt from the fluctuating fortunes of individual bicycle manufacturers. Tube Investments, although an important bicycle producer, is chiefly interested in supplying tubes for the frames of bicycles; this combine provides more than nine-tenths of the requirements of the industry, but it has many other interests besides. BSA normally derives the main part of its income from activities other than the manufacture of bicycles. An interesting concern in the industry with a good earnings record is Halford Cycle, which owns a multiple shop business dealing in cycles, motor accessories, and a variety of other goods. This, of course, does not exhaust the list, and, in the table on the page opposite, the companies listed are examples rather than a selection. It is certain that, after reconversion, competition in the bicycle trade will be keen; but it is also reasonably certain that the most progressive firms will benefit from the prospective increase in sales.

The New Finance Corporation

FOUR months have elapsed since the Chancellor's first announcement about the two new corporations for the post-war financing of industry. The announcement had a somewhat mixed reception, at all events in the City. But it was everywhere agreed that the success of the proposed institutions would depend absolutely upon the quality of their direction and management. The auspices under which they are being organised have certainly ensured the widest possible choice among men of the highest calibre and experience; yet it is generally understood that the delay in reporting further progress has been due to the difficulty of making the best selection. If this was so, this week's announcement of the board of the larger corporation, the Finance Corporation for Industry, Ltd., indicates that the time has been well spent. It is undoubtedly a strong board, perhaps not of all the talents—for, somewhat surprisingly, it does not include an economist; but, apart from that, it is well balanced without being too large. Above all, it is an independent board, which thus fulfils the precept laid down by the Macmillan Committee that an industrial finance corporation ought to be entirely separate from the banking system.

Lord Hyndley, the chairman, will bring to bear a wide administrative experience, a peculiar aptitude for inspiring effective teamwork, and a very extensive knowledge of the coal industry. It would probably be wrong to regard this last qualification, as some have been disposed to do,

as a pointer to the company's main spheres of operation; even though Sir John Morison—Director-General of Finance at the Ministry of Supply since 1942, but best known to the public for his unravelling of the Royal Mail group tangle, and as an active member of the War Damage Commission—also has an unusual knowledge of coal finances. Sir Robert Sinclair, of the Imperial Tobacco Co., and Lieutenant-General Sir Ronald Weeks, of Pilkington Bros., have extensive industrial experience, and both have held key posts in the organisation of war supplies and production planning—Sir Robert as, successively, Director-General of Army Requirements, Deputy for Mr Lyttelton on the CPRB at Washington, and Chief Executive at the Ministry of Production; and Sir Ronald as Director-General of Army Equipment and Deputy-Chief of the Imperial General Staff. Sir Jeremy Raisman, well known for his successful handling of India's wartime finances; Mr Thomas Frazer, prominent in the insurance world, and—a significant qualification—member of the Capital Issues Committee; Professor C. D. Ellis, physicist; Mr Ivan Spens, with special experience of company finance; Lord Westwood, spokesman for Labour aspects—each of these has a distinctive contribution to make.

The Chancellor, during the debate last March, declared that the project represented part of a new technique, an attempt to establish such a connection between the Government and private organisations as would promote the public

interest in the presence of a positive Government policy in the economic field. In this context it is clearly significant that no fewer than seven of the nine directors have during the war held important full-time Government appointments; they should be well-fitted to build the bridge between Government and industry, between public policy and private needs. Obviously, and inevitably, it is a board acceptable to the authorities, but it is one that should be well able to resist Government pressure where necessary.

Uncertainty remains about the scope of the Corporation's activities, and some quarters, indeed, still question whether there is any "gap" to be filled or whether, if there is a gap, the Corporation will be able to fill it. Because of this lingering scepticism, it is not generally recognised just how important it is, in the widest interests of the City no less than of industry, that the scheme should succeed. The war has driven home, as never before, the truth that no project that is economic from the national standpoint need, under a rational organisation, be ruled out on financial grounds. If in the post-war world the traditional mechanisms of private enterprise, as extended by these new organisations, fail to provide adequate finance for projects obviously necessary in the general interest, the public will sooner or later demand drastic change.

It is true that many schemes that are economically sound from the social standpoint will not be "commercial" propositions in the accepted City sense. It is emphatically not the province of the new Corporation—a private body, privately financed, despite its official inspiration and despite the obviously official selection of its board—to go beyond the limits of what is commercially prudent. At that point the Government itself must step in and provide further facilities. The ultimate danger, from the City viewpoint, is that this vital distinction will be blurred, not indeed, by the new Corporation—the calibre of the board is sufficient assurance against that—but in the public mind. If worthwhile schemes are turned down because they are genuinely not reasonable commercial risks, the public may blame the City for failing to do what it could never reasonably be expected to do. These are unresolved difficulties—they remain so because the coalition Government was not disposed to grasp the nettle firmly. But, in the meantime, the new Corporation, even within the limits assigned to it, should be able to make

possible some projects that would not be possible if they had to rely solely upon the pre-war channels of finance.

It has been plainly stated that the Corporation will not seek to pay more than moderate dividends on its capital; which in effect means that each of the many participants is willing to invest a small part of its resources for a lower return than it would consider reasonable, on the average, if it were doing the business direct. Secondly, the cost of even moderate dividends will be minimised by the very high gearing that will be achieved by a small called-up capital combined with large borrowing powers. Thirdly, the existence of the uncalled capital and the very great strength of the participants in combination will ensure extremely favourable terms for the Corporation's borrowings. Subject to the need for building up a strong reserve, it will be able to—and, indeed, must—pass on these benefits to its industrial clients. This should mean, not that it will undercut the market channels for finance, but that projects will be facilitated that would not look commercially possible on the terms offered by the market. And as the reserve position improves, there will be increasing scope either for the offering of progressively finer terms or for an increasingly elastic lending policy.

This seems to be the most important way, in principle, in which the Corporation may be able to do more than existing channels can do. But there may be other ways, not dependent upon differential terms. For example, large projects involving heavy outlays spread over a period of years are not always appropriate subjects for direct approach to the market—even supposing that the Capital Issues Committee would permit the whole requirement to be met in a single advance issue—and a series of issues has obvious disadvantages. This kind of operation may afford a fruitful field for the development of a new technique which may give industry, in significant instances, not only the assurance of the resources it needs for long-term development, but also a new independence of the more precarious methods of floating finance. If it should happen that, in working out its mode of operation to bridge such gaps as these, the Corporation's activities impinge upon—not to say, compete directly with—those of established institutions, the City must reflect that, in a very vital sense, its own long-term interests are bound up with the success of this experiment.

Business Notes

More Liquidation

The resumption of business on Tuesday brought the heaviest fall in industrial equities that has been experienced since late January, and the decline in the index of *The Financial News* is just over three weeks is now fully 6 per cent. Although the fall in this index attracted most attention, the weakness was general in almost every section of the market with only a few exceptions in favour of Far Eastern securities. The cause of the fall is again political; a

conjunction of the imminence of a general election, and the more definite evidence of awkward problems in foreign relations. The volume of business has fallen further, but, as gauged by the number of bargains received, is still at a very fair level. There is good reason to believe that at first such selling pressure as there was arose largely from sales by speculators of the inner ring, but there are signs that selling is now spreading to much wider circles. Further, the falls appear again to have been heaviest in those stocks which had recently risen most, and this is in some measure true of gilt-edged as well as of the more speculative industrial equities and overseas securities.

The recession appears to reflect the liquidation of a small speculative open position rather than a general adjustment of values to the possibility of an anti-capitalist programme. Nonetheless, members of the "House" are much less certain than they were of the success of the Conservative Party at the coming election. While speculators are reducing their open positions, it is not to be supposed that they are, necessarily, retiring from business until the outlook is clearer. From time to time there will almost certainly be movements in groups of securities based on political factors rather than on earning power: that is one of the inevitable concomitants of political uncertainty. But there is no reason to assume that these movements will invariably be downwards. As has been said before, there are few things which are as bad for stock market turnover and prices as preparation for a general election, and it is possible that, in this particular instance, the effects will be more marked than usual. The fall is not finished, but it may be expected that the pressure of cheap and plentiful money will play some part even in the few weeks between now and the issue of the election results on July 26th or 27th.

Inflation Danger in France

The policy of wages and price stabilisation laid down on behalf of the Provisional French Government by the Minister of National Economy and Finance, M. René Plevin, in his Budget Speech on March 29th and, more specifically in a broadcast address on April 21st, is being severely tested. The trade unions have been pressing hard for a fresh increase in wage rates in discussions with the Minister of National Economy and Finance and with the Minister of Labour. On Wednesday it was reported from Paris that the French Cabinet had categorically refused to authorise further increases in wages and prices. For the moment, therefore, the dam holds; but can it be held indefinitely?

Before calling a halt to the advance in wages and official prices, the Government made an attempt at restoring a measure of equilibrium in their relationship. The original increase in wages rates was granted last September, but, owing to the administrative difficulties at that time, it was applied unevenly; the hourly rate of an unskilled worker in Paris was then raised from Frs. 10 to Frs. 15, with corresponding but not proportionate advances for skilled workers. Inevitably and equitably, this advance led to a parallel increase in the pay of civil servants. The uneven application of the September increase in wages necessitated a levelling-up adjustment made in April; the basic rate of an unskilled Paris worker was then raised to Frs. 20 an hour. (At the present rate of exchange this is equivalent to 2s. an hour, against a London rate of about 1s. 9d.) A month ago, the Government decided to permit an upward adjustment in the prices of industrial products—these had hitherto remained unchanged in spite of higher costs—and in those of certain agricultural products as a means of restoring the incentive to production. This completed the levelling-up process necessitated by the original wages increase last September. The decision to permit an upward adjustment in prices and the withdrawal of food subsidies in April meant, of course, that wage-earners are now no better off than they were before. Hence the pressure for yet a further advance in wage rates.

Its Causes

The real cause of this inflationary trend, as has so often been said, is the shortage of food and other consumer goods. And the real cure, in other words, is an increase in the supply of goods. At present, the standard of nutrition in the towns is deplorably low. Before the war France was virtually self-sufficient in food, but last year's harvest was only two-thirds of the pre-war average, and this year's may be still smaller. If available supplies could be distributed equally, the daily calories per head of the population would be about 2,000, that is to say nearly a third less than in this country. But they are not evenly distributed. French farmers, like those in other countries, continue to eat reasonably well in conditions of scarcity; this diminishes *pro tanto* the supplies available to town-dwellers. With rations providing for barely 1,500 calories a day, that is about half the British rations—and even these are not regularly available—the craving for food is such that people are willing to pay almost any price for additional supplies and thus encourage a profitable black market. Other consumer goods are equally short, for, as is shown in an article on page 703, French industry is paralysed.

Against this background of misery the insistent demand for higher wages can be easily understood. A worker who cannot buy sufficient food inevitably tends to attribute his difficulties to lack of money, especially if there is a flourishing black market. And trade union leaders naturally find it difficult to resist collective pressure. Yet further concessions would certainly breach the dam and herald a sharp inflation, which would still further impoverish the poor and aggravate the already serious social unrest. No financial prescriptions can bring a cure in present conditions. More energetic direct measures will be necessary to ensure a more equitable distribution of supplies, though in any comparison with this country it should be remembered that the success of the British rationing system rests in no small measure on the facts that the rations of food and clothing are well above the hardship level and that the coupons are honoured with regularity. More energetic measures will be necessary to speed up production. And everything that can possibly be spared by more fortunate nations should be sent not only to France, but to all the liberated countries.

ICI Review

On Thursday, Lord McGowan took the opportunity afforded by the lifting of the black-out to give shareholders of ICI a review of that institution's contributions to the war effort. It is an impressive list and should be read, if only that it may be known to what extent the ramifications of ICI extend into almost every section of British industry. But the future is more important than the past, and it is perhaps a pity that Lord McGowan's comments on what the group intends to do were mainly general rather than specific. Taken by and large, the products of ICI are the materials of other forms of industry, and this means that, although the proportions in which the plants will be required in time of peace may be different, there will in many cases be no conversion problem. But there will be new factories to be built and equipped and old ones to be modernised. The group apparently contemplates the outlay of some millions for these purposes. The speed with which this will be done must depend on the extent of the release of men and materials for the purpose. On this point a reminder is voiced that the USA is far better placed than this country to put post-war trade plans into operation and that a market, once lost, may take years to recover.

The second point taken up by Lord McGowan is the coal position. At present ICI's coal bill is £4 million a year above that of 1939, and it is difficult to get the necessary supplies even at the higher price, while the outlook seems to promise a deterioration rather than improvement. The argument that something must be done with all speed is too familiar to call for repetition.

Many people will learn with some envy that ICI war-time costs have included making-up—in part only to women and single men—all Forces pay of employees to the level of peace-time wages and salaries, including increases in pay which they would have received had they been working for the group. There are plans for improving still further conditions and stability of employment; but, very properly, these have to go hand-in-hand with a thorough overhaul and re-equipment of factories.

G.E.C. In war or peace—at the service of the Empire

G.E.C. electrical equipment — motors, control gear, etc. — for trolley buses is serving public transport undertakings in many parts of the world, and confidence in its reliability is justified by long and dependable service under all sorts of conditions.

During the war the vast technical and manufacturing resources of the G.E.C. — the largest British electrical manufacturing organisation in the Empire — have been concentrated on the war effort. The Company's plant and apparatus are faithfully serving the United Nations on all fronts, and not least on the Home front where British industry has developed and maintained the greatest production effort in history.

Under the impetus of war the Company has made remarkable technical advances in all applications of electricity, including the important one of electronics, which will be of immense value to all concerned with carrying out electrification schemes for reconstruction or development in all parts of the world.

Electrification Schemes

G.E.C. Electrification Schemes have been applied to all industries, including: Aircraft Factories; Chemical Works; Collieries; Food Factories; Gold Mines; Iron, Steel and Copper Works; Motor Car Works; Oil Refineries; Ships and Shipyards; Textile Mills, etc.

G.E.C. — always in the forefront of electrical progress

Finally, Lord McGowan comes to the question of free enterprise and state control. He points to the fact that America is committed to the former, and asks what will happen if, when it comes to a question of spending money, the decision is to be made on the merits of each case not by those with long and intimate acquaintance with the trade concerned, but by the Treasury. His answer is that it would inevitably lower efficiency and ultimately lead to stagnation and paralysis. On the daily talk of nationalisation he quotes at length the plea of *The Economist* for more precision as to what is meant. But he fails to quote *The Economist* when he turns to the question of combines and cartels. He concludes with a statement that neither at home nor abroad has ICI engaged in what is called restraint of trade, and continues:

We have always believed in high productivity which carries with it low selling prices. . . . Moreover, we live in harmony with others who produce articles similar to our own, and do not seek to eliminate the small man.

Problems of Deconcentration

In an article in the April issue of the *Journal of the Institute of Bankers* Professor G. C. Allen draws attention to some awkward problems likely to arise in the process of industrial deconcentration. His special knowledge of this subject is derived from the fact that he was intimately concerned with the concentration of industry at the Board of Trade. In part the difficulties of deconcentration are the difficulties of reconversion; but the issue is complicated by the specific undertaking given by the Government that firms closed by concentration schemes would be assisted to return to production. It is in the fulfilment of this promise that awkward problems may arise.

Professor Allen quotes two examples. First, there is the problem of synchronisation in the re-opening of closed factories. In equity the closed firms in given industries should be allowed to resume production simultaneously; indeed, it appears to have been decided that all cotton mills closed by concentration shall be given permission to restart at a date that is to be announced. The effect of this

decision, which is in fulfilment of the Government's promise, will be to create a situation in which a large number of mills are running well below capacity, at least for a period, and, hence, uneconomically. Secondly, there may be a conflict between short-term and long-term aims. In the jute industry, for example, many mills have been converted to other forms of production during the war. Since the long-term prospects of the industry are not very bright because of Indian competition, and as employment in the district of Dundee depends in no small measure on jute, it would seem desirable to retain some of the new industries that have occupied the mills during the war. But jute manufacturers whose mills have been closed will presumably wish to share in the buoyant trade that may well exist immediately after the war. They, too, would have justice on their side.

It may be argued—and with some force—that the national resources will have to be used to the best advantage and as economically as possible. During the period of transition, in particular, the shortage of homes, clothing and the rest will be such that wasteful use of resources cannot be permitted. The problem of deconcentration will have to be faced in the context of the national interest. While some discrimination may be unavoidable, it should be possible to find a solution for each of the various concentrated industries that fulfils the Government's promise so far as this is possible within the context of the national interest.

Post-war Financial Controls

The substantial omission of the Defence (Finance) Regulations from the scope of the Supplies and Services (Transitional Powers) Bill, the objects of which were surveyed in *The Economist* last week, has given rise to some interested speculation in financial circles. The only Finance Regulation embraced by the new Bill is the quite formal DR 7AA, which extends to four years the time-limit (imposed by the 1928 Act) on the Treasury's authority to permit an increase in the fiduciary issue. But only in a mood of post-VE abandon could anyone in the City have seriously supposed that this minor inclusion signified that, in the official view, the major financial controls were of less importance than those more general controls that can be prolonged or transformed under the new Bill. The City has never taken kindly to restriction, but it well understands that, in the sphere of foreign exchange at least, it cannot look for any early relief. Hence it has reflected that the Supplies and Services Bill is directed towards transitional needs, and is limited to two years, and has concluded that in the financial sphere some more enduring structure is contemplated.

There is no doubt that this deduction is sound. Indeed, it is believed that legislation to put the financial controls on a new basis, and possibly also to codify into regular statutory form some at least of the many Statutory Rules and Orders, is already in draft. The need for continued financial controls should not be used as an excuse for retraining from an early and thorough combing-out process. There must be many minor restrictions that could now be dropped without loss of effective control. So far, only three provisions of the Defence (Finance) Regulations have been revoked. The first of these, DR 6A, which prohibited the transfer of businesses, or control of them, abroad (except with the consent of the Treasury) is of some significance. But it is noteworthy that the second revocation is, in fact, a withdrawal not of a restriction but of an emergency concession. The Scottish and Northern Ireland banks, under DR 7A, were permitted to keep the coin and Bank of England notes, which back their own note issues, at as many of their offices as the Treasury approved. This was an obvious emergency measure, but it also had the effect of affording for the banks a certain economy of cash, since till money carried at branches that formerly were not "reserve" offices could be counted as part of the note cover. Now that the regulation is revoked, these banks must again hold their note reserves at not more than two offices. This is a small point, but the promptness with which the authorities have withdrawn a concession and yet have delayed possible relaxations is hardly a promising augury. Certainly it is to be hoped that the Government will be distinctly more generous in dealing with the control of capital issues.

Currency Troubles in Burma

Reports from Rangoon this week have revealed that the recent proclamation by the British military authorities, whereby they refuse to recognise the Japanese occupation currency, is causing serious trouble in Burma. Precise information about the situation that confronted the authorities is still not available on this side, but there is no doubt that they were faced with a very awkward problem. The Japanese, it appears, have stripped the country of supplies of all kinds, both for maintenance of their troops and for export, and payment has been made in special Japanese notes. Given this facile means of payment, the Japs have not been very particular about the prices paid. The result has been a huge creation of paper, the amount of which is still quite uncertain, but some estimates put it as high as 3 billion rupees. The pre-war circulation, comprising Indian and Burmese notes totalling some 200 million rupees, disappeared immediately after the Japanese occupation, most of it into private hoards, which may now amount to rather more than half the original issue. These hoarded notes are now beginning to reappear, still further increasing the inflation potential.

If these figures are even approximately reliable, it is clear that recognition of the Japanese issues except at a fraction of their nominal value would have precipitated an uncontrollable inflation as soon as there were any goods to buy. The authorities had in any case to take drastic measures, and if the practicable conversion ratio would have had to be anything approaching the 100 to 1 that has been suggested, the difference between "recognition" and repudiation was not substantial. Such a ratio as this, however, hardly squares with provisional estimates of the circulations, and until more is known about the extent both of existing issues and of the future issues of BMA currency, it would be premature to conclude that the BMA decision has been needlessly harsh.

The authorities seem to have been influenced partly by the fear that any recognition might provide opportunities for fresh infiltration of Japanese notes, and partly by the view that, whereas the peasant population probably had only negligible holdings, the really large holdings would tend to be in the hands of those who had collaborated most freely with the enemy. This view finds some support in reports from up-country districts to the effect that the Burmese, generally speaking, had always assumed that the Jap money would be repudiated. Meanwhile, it is understood that every effort is being made to soften the impact of the decree by the distribution of relief supplies. Indeed, it appears that the officers concerned have discretionary authority to accept Japanese notes in payment in necessitous cases in which it appears that public morale would be better sustained by this course than by free distribution. The rate to be applied to Japanese notes for this purpose would certainly be very much less drastic than the 100 to 1 ratio suggested from Rangoon.

If judgment must be deferred on the general merits of the case, it does, however, seem that more vigour and imagination might have been shown in publicising the decree. Speculators from the towns are reported to be unloading Jap notes, for any supplies that can be bought, in remote districts still ignorant of the decree. Such activities may yet create an ugly situation unless the strongest measures are speedily taken to bring the delinquents to book. Perhaps the urgent military need for local supplies is in itself a sufficient assurance that there will be no diffidence about requisitioning—or even confiscating—goods thus acquired. But the next time this general problem arises, the British might well take a leaf from the book of the Americans, who, it is said, found in the Philippines large quantities of unissued Jap notes, printed repudiation notices on them, and then broadcast the whole supply by aircraft.

Sugar Supply Difficulties

The Minister of Food has announced that, although there will be no Christmas half-pound sugar bonus, in other respects the British sugar ration will remain unchanged for the rest of the year. Should the supply fall short of expectations, it is proposed that in this country the deficit should be met by cutting manufacturers' allocations.

During the past three years the international sugar supply position has been strained, and prevailing difficulties have

increased with the liberation of Europe. Java, a former sugar surplus area, is in Japanese occupation; while shortage of labour and shipping, combined with the strict price control practised by the United Nations, has adversely affected production in certain other regions, particularly Cuba, whose export surplus is in normal times the largest in the world. On the other hand, wartime demand for sugar has increased, especially for industrial purposes, such as the manufacture of industrial alcohol; and stocks have been heavily drawn upon for some years past. The Special Committee appointed by the United States' House of Representatives to investigate food shortages has recently reported that international withdrawals from sugar stocks totalled 1 million tons in 1943, not less than 1.4 million tons in 1944, and may reach another million tons in 1945. If by the beginning of 1946 reserves were exhausted, world consumption next year would have to be met from current production.

This year the Combined Food Board's sugar pool will have some 12 million tons of sugar at its disposal—about 2 million tons less than last year; of this total 10,640,000 tons have already been allocated; 6,274,000 tons to the US; 1,962,000 to the UK; 448,000 to Canada; and the balance of 1,956,000 tons has been earmarked for other claimants, including the liberated areas, European neutrals, Russia, and the Near and Middle East. Of this balance roughly half is available for the liberated areas.

The present main task is to ensure a bumper sugar crop for next season. The US House of Representatives' Special Food Committee has proposed that, in order to assist the European beet crop, the best US surplus beet seed should be made available to Europe; and further, that negotiations for the purchase of the next Cuban and Puerto Rican sugar crops should be immediately opened, in order that producers in these areas may be able to plan their crops on the basis of definite contracts. If, in addition, natural conditions should be such as to favour an abundant sugar harvest, there is reason to hope for a happy issue out of a position which contains many elements of serious world shortage.

Clothing Ration

In the first few days after the German surrender there was a good deal of welcome news in the shape of relaxation of restrictions, restorations of the petrol ration and so on, but this week has been notable for the announcement of cuts in the food ration and the confirmation of the cut in the clothing ration for the current period. When the current allocation of coupons was made available on February 1st, the President of the Board of Trade made no bones about the possibility that 24 coupons would have to last for seven months instead of six. He has now confirmed this, and no more coupons will be available, except for children (who get theirs on August 1st) until September 1st.

The new clothing book, which is shortly to be distributed with the food ration book, contains provision for an issue of at least 60 coupons. It must be remembered that it was probably planned some considerable time ago, when it was not foreseen, somewhat inexplicably, that clothing production would not keep up with consumption and that stocks would fall to the extent they have. That, however, is by the way. The only things certain about the new issue are that it will consist of not more than 24 coupons, and that

COMPANY MEETINGS

SUN INSURANCE COMPANY,
LIMITEDMR. W. M. PRYOR'S REVIEW OF
235th YEAR'S OPERATIONS

The annual general meeting of the office will be held on the 29th instant, when the business will be limited to the usual formal resolutions. In conjunction with the publication of the report and accounts, the chairman has issued a statement concerning the year's operations.

This opens with a reference to two grievous losses suffered by the board through the deaths of Lord Herbert Scott and Lord Essendon in June, 1944. Both had rendered eminent service to the office and their wise counsels will be greatly missed. The untimely death of Commander Sir Charles Craven, Bt., appointed a director last September, is also reported.

FIRE AND ACCIDENT EXPANSION

Following the advance in both fire and accident premium income in 1943, there was again a substantial increase in 1944. The premium income in each of these sections stands at a higher level than ever before and, notwithstanding the loss of income sustained by reason of the occupation by the enemy of territories in which the office formerly operated, premiums from fire (£2,904,053) and accident (£2,247,379) business in 1944 exceeded by over £1,000,000 the corresponding figure for the last pre-war year. In the marine section a reduction in rates, due to improved war conditions, brought with it a further fall in premium income.

The fire claims experience was very satisfactory at home and in the majority of countries abroad and there was a further decline in the expense ratio. The percentage of profit was slightly less than in 1943, being 11.33 per cent., compared with 11.61 per cent.

Accident premium income was £260,521 higher than in the preceding year. The claims experience was not so good, the profits earned amounting to 5.95 per cent. of the increased premium income. The heavy increase in burglary claims throughout the country had an important bearing upon the results as a whole. Losses of this kind continue to be numerous and costly and, unless the epidemic of burglaries now being experienced is checked, a profit from this class of business in 1945 cannot be expected.

Marine premiums at £846,642 showed a fall of approximately £140,000. While the experience with war risks was satisfactory, the strictly marine side had a somewhat less favourable experience. Nevertheless, the year 1944 is expected to close with a very fair profit after the transfer of £250,000 to profit and loss account, the marine fund stands at £1,686,281, representing almost 200 per cent. of the premiums.

PROFIT AND LOSS ACCOUNT

From the three revenue accounts, transfers amounting to £712,636 have been made. Net interest earnings were £199,042. Provision for British taxation called for £210,000. The sum of £250,000 has been transferred to the general reserve fund, bringing it up to £3,500,000. It is proposed to make grants of £200,000 to the pension fund and £12,500 to the widows' and orphans' fund. The balance of the profit and loss account carried to the balance-sheet is £1,395,232.

An interim dividend of 1s. 6d. per share was paid last January and a final dividend of a like sum has now been declared, making 3s. per share for the full year. The cost of these two dividends amounts to £192,000, which is within the year's interest earnings. The book value of the investments is now £11,229,570, an increase of £828,602 over 1943.

The chairman's statement closes with a tribute to the loyalty and efficiency of the management and staff at home and abroad.

John Summers Results

The preliminary statement of John Summers had already shown a fall of some £80,000 in profit of the company, offset by a drop of that amount in the tax provision. The full accounts reveal that total revenue declined rather less but that there was an increase in the provision for depreciation. The net result is that the directors have maintained the appropriation of £50,000 to war contingencies reserve, but have cut the transfer to general reserve from £160,000 to £150,000, but there is a rather larger addition to the carry-forward than was possible a year ago. In fact the whole position is virtually unchanged. The consolidated balance-sheet shows that additions to fixed plant, less sales, were some £245,000 against depreciation of £364,000. In consequence of this and of the additions to reserves, there is a considerable increase in net liquid assets to £3,345,000 odd before deducting the tax reserve of £537,000, which is designed, presumably, to cover liabilities which do not mature this year.

There is no evidence of any falling off in turnover and, for a concern whose main production is sheets and plates, there seems little reason to anticipate any immediate change in the position. The company has, however, certain sections of plant which are far from being as up-to-date as the continuous strip mill which started operations shortly before the war. Presumably some of its large cash reserves will be used for modernisation. Further, when the third continuous strip mill is in operation it is reasonable to suppose that it will be technically even more efficient than that of John Summers. The existing set-up in the iron and steel industry suggests, however, that competition is not likely to be so intense as to create difficulties, and it will, presumably, be possible for John Summers to effect such modernisation as is necessary. The price of the "A" ordinary units of £1 is some 28s. 9d. ex dividend, giving a yield of very nearly £6 per cent on the dividend of 8½ per cent.

Information, Please

The end of the war in Europe would seem to provide the occasion for a reconsideration of the statistical blackout. True, a wealth of statistics has been released in the White Paper on the British War Effort. The publication of annual export statistics has also been resumed. But surely the time has now come when further statistics might be made available, and when some of the pre-war series might again be released at regular intervals. In particular, the publication of monthly production figures might now be resumed for commodities, such as coal, pig iron and steel ingots. Similarly, in view of the need to expand exports, it would seem to be desirable to resume the publication of trade returns at monthly intervals, at least in summarised form. Without these indices informed discussion remains difficult. There may be reasons for further delay in lifting additional covers of the statistical blackout. But only good ones can now justify delay.

Shorter Note

Marks and Spencer 5s. "A" ordinary, which have recently stood as high as 72s. 9d., have lost only some 2s. in the recent fall. On Wednesday the board announced an increase in the total distribution from 35 to 40 per cent, the best wartime figure, and a rise in profits, before tax and depreciation, from £1,940,021 to £2,331,169. This seems to be the best since 1940-41. So far as can be told from the preliminary statement, the amount earned on the ordinary rose on the year from 61.9 to 67.4 per cent, while the yield is around £2 17s. per cent.

As there is now a long waiting list for *The Economist*, subscribers who wish to renew their subscription are advised to do so immediately upon receipt of a renewal notice. If they fail to do so, their subscriptions will be automatically cancelled on the date of expiry, and this may mean a gap of many months before the despatch of copies can be resumed.

it will be available on September 1st. No indication is given of how long it will have to last. It would be unreasonable to suppose (as even Mr Dalton hints) that clothing production will not be stepped up during the next twelve months. What is not certain is whether the increase can be fast enough to keep up with demand and to replenish stocks in wholesalers' hands and in the shops. It is certain that to maintain the clothing ration in face of even further reductions in the quantity of clothing available would make a mockery of the smooth working of the rationing system.

Labour is slowly and gradually returning to the making-up industries, but the increase in the labour force is likely to make even more evident the real bottle-neck—spinning and weaving, particularly the former, and particularly in the cotton industry. Mr Dalton's speech to the Labour Party conference last Tuesday, when he declared that the cotton industry was a most serious problem and that when he was "unmuzzled" he would express his own views on the subject, makes intriguing reading.

Alberta Agreement

The terms of the agreement between the Province of Alberta and its bondholders, so far as available here, appear to be a great advance upon any previous offer, but there is, as usual, no special reference to the bonds of the London issue. Until details are available no comment can be made regarding them. There are, however, two points of interest arising from the information so far available. One concerns the change of attitude of the Province, which has now accepted assistance from the Dominion Government. It is understood that the additional burden of implementing the new agreement will be borne by the Dominion, but it is not clear how far this carries any limitation of the freedom of the Province. The contrast between the credit standing of the Dominion and that of many of the provinces suggests that a greater measure of central control and responsibility might be desirable. The second point is the reported decision of the Alberta authorities to ban dealings in the stocks forming the subject of the agreement. Actually, only one stock is now dealt in in London, and no ban by Alberta can affect business in London. If, however, the Province were to refuse transfer of any registered stock dealt in here, that would constitute an interference with the rights of holders which ought to be strenuously resisted. Things have come to a pretty pass if the borrower, in addition to defaulting, is to depress still further the value of the lenders' security by depriving a would-be buyer of any reward for holding the security during a part of the period of default. Is that perhaps the intention? That is what is, apparently, intended.

STAGGERED
WORKING HOURS
SHORTEN QUEUES

... they go even further than that. Experience has shown that staggered hours mean better timekeeping, less crowding on trains, buses and trams, less weariness and more comfort. The thought may have already occurred to you... but have you done anything about it? London Transport's Commercial Manager will be pleased to explain how your firm can help. Write him at 55, Broadway, S.W.1.

IMPERIAL CHEMICAL INDUSTRIES,
LIMITED

GREAT WAR RECORD

The eighteenth ordinary general meeting of The Imperial Chemical Industries, Limited, was held at Grosvenor House, Park Lane, W., on the 24th instant, the chairman, the Rt. Hon. Lord McGowan, K.B.E., D.C.L., LL.D., presiding.

The chairman, in the course of his speech, said: Now that the war with Germany is ended, I owe it to all who have part or lot in our great enterprise to give some account of our contribution to the national effort. It is a record which is certainly unexcelled and probably unequalled. For more than six years I.C.I., like all concerns directly and deeply involved in the national war effort, has had to keep strict silence on their doings. In this we had no option, but our enforced silence has unfortunately left the stage clear to the critics and detractors who are ready to seize any and every opportunity to attack what is popularly known as "big business." They single out I.C.I. for most reckless attacks, partly because of its size, but mainly perhaps because they recognise I.C.I. to be one of the most efficient and successful examples of that system of free enterprise which they wish to overthrow. I make this statement without fear of contradiction, that had your company not been in existence, organised and directed as it was, the whole ability of Britain to prosecute the war would have been gravely, if not fatally, impaired.

Nitrogen is the basis of both fertilisers and explosives, and naturally in war-time the demand for them rises to dizzy heights. Bread is as necessary as bombs, and we are proud that throughout the war we were able to meet the needs of the farmer and the filling factories alike. Since 1939 almost 400,000 tons of explosives have been made in these factories, besides hundreds of millions of detonators, fuses and other accessories, including the filling for over 90 million incendiary bombs.

INVALUABLE RESEARCH AND EXPERIMENT

Not that we were content to remain producers only. Throughout the war our explosives division rendered invaluable service in the realms of research, experiment and development. Literally hundreds of new devices were tried and many put into successful operation.

New S.A.A. factories, together with the I.C.I. plant at Witton, produced a substantial percentage of the country's ammunition requirements. By the end of 1944 they had turned out over 3,500 million rounds. All forms of metal, whether rolled, extruded rods or rubs, registered large increases. Rolled metal and extruded rods were products which increased particularly, the former being in great demand for cartridge cases, for quick-firing gun ammunition and for S.A. ammunition, and the latter for fuses and other components of shells and bombs. Non-ferrous tubes of all kinds were also of great importance, and condenser tubes in particular were vital to our shipbuilding programme, both Royal Navy and Mercantile Marine.

In the air our contribution was as important as on land or at sea. We played an important part in the supply of fabricated sheet metal components such as radiators, oil coolers and fuel tanks, as well as of many special items of equipment, including hydraulic landing gear. Plastic materials, of course, were specially needed for war in the air. Our product "Perspex"—which I would remind you is also our invention—is almost universally used as a non-splintering, glazing material for British aircraft.

An outstanding I.C.I. achievement in the field of plastics was the discovery and development of polythene or polymerised ethylene. Without polythene, Radar could never have been developed so rapidly or so efficiently.

Penicillin, that wonderful discovery by Sir Alexander Fleming, is now a house-

hold word, and is too well-known to need description. I need hardly tell you that in the treatment of battle wounds it has had revolutionary results and has saved thousands of valuable lives. In its production I.C.I. has from the outset played an important part.

Our part in the development of petrol production in Great Britain has been told so often that I need not repeat it. I must, however, put on record that the knowledge and experience we had gained in the great plant we had had for four years in operation at Billingham were the foundations on which was built a successful home production of the highest grade aviation spirit in Britain.

By no means the least satisfying feature of our war-time records is the virtually complete freedom from labour disputes, even of the most minor character. This freedom is the more remarkable when it is remembered that the employees who have been brought up in the traditions of the company have been heavily diluted by new entrants in many cases from distant parts of the country, who know nothing about I.C.I., or the aims and objects for which it exists. I hope you will agree it affords an indication both that our workpeople are not dissatisfied with the conditions under which they work, and at the same time of the harmonious relations which exist between I.C.I. and the trade unions, those other outstanding examples of large-scale industrial organisation. Indeed I feel I should take this opportunity of putting on record our appreciation of the co-operation we have throughout the war received from those responsible for the control and direction of the unions with which we are concerned.

THE TRANSITION STAGE

The switch-over from war to peace production is naturally uppermost in the minds of most people today. I am glad to be able to assure you that the process will involve little delay as far as I.C.I. is concerned. Although we have necessarily had greatly to extend our plants which have been making products of direct war-time use, the majority of our works have played their part by continuing their normal peacetime production without which, as I have noted, the other industries of the country and agriculture would have been short of essential raw materials.

We are continually being told by responsible Ministers that Britain must export more and more if we are to import the necessities of everyday life, let alone meet the increased bill for social services. But how can we do this in a volume and at prices which other countries will pay if we are uncertain first of our supplies of coal and secondly of the price at which we can buy them? I may tell you that I.C.I.'s coal bill to-day is £4,000,000 a year higher than it was in 1939, and we are disturbed at the prospects of being unable to obtain adequate supplies even at the increased price.

FREE ENTERPRISE OR STATE CONTROL

I.C.I.'s war-time achievements are the result of the system of free enterprise. In certain quarters there is a disposition to consider that free enterprise has had its day and should now retire in favour of some form, which has never been clearly defined, of State control. In my view, the suggestion that free enterprise has had its day is certainly wholly incorrect. We have always believed in high productivity which carries with it low selling prices—a policy which has been much appreciated by our many customers. Moreover, we live in harmony with others who produce articles similar to our own, and we do not seek to eliminate the small man. In our national, as in our international arrangements, I.C.I. has nothing to hide, nothing for which to apologise and nothing of which to be ashamed. On the contrary, it has a great deal of which to be very proud. The report was adopted.

ALLIANCE ASSURANCE COMPANY, LIMITED

ANOTHER SUCCESSFUL YEAR

The annual general Court of the Alliance Assurance Company, Limited, will be held at the offices of the company on the 23rd instant.

The following are extracts from the review by the chairman (Mr R. D. Trotter) circulated with the report:—

In the life department the net new business completed shows a slight increase over that of the previous year, the comparative figures being £1,210,839 in 1943 and £1,399,439 in 1944, which, I hope, foreshadows that our prospects in this department are becoming brighter.

The claims by death in the year under review were a good deal higher than for the previous year, standing at £746,157, of which £160,098 represented war claims. In 1943 the total claims by death amounted to £701,082, £91,969 being the amount paid out in war claims. The total amount paid out in war claims now amounts to £468,557. At the close of the year the "Alliance" life and annuity funds amounted to £23,415,196.

FIRE DEPARTMENT

Turning to the fire department accounts, I have pleasure in reporting an increased net premium income amounting to £2,557,803, which is the first occasion in the history of the company that we have exceeded the two and a half million mark. This is due in large measure to the enhanced value of buildings and commodities.

The claims and contributions to fire brigades were higher than in the previous year, amounting to £775,953, as compared with £683,255 in 1943. After adjusting reserves for unexpired risks, the sum of £564,459 has been carried to profit and loss account. Our overseas business continues to increase in volume and shows a satisfactory profit.

The accident department shows further satisfactory expansion, the net premium income at £1,315,191 showing an increase of £71,633 over the figures for 1943. After the necessary adjustments of the reserves for unexpired risks, a surplus of £291,091 is disclosed, which has been carried to profit and loss account.

The marine department results have turned out better than one might expect. The net premium income for the year under review amounts to £1,045,744, an increase of £18,182 over the previous year's figure.

The underwriting account for 1942 shows a balance of £50,983 after maintaining the reserve fund for previous years at £425,000, and this amount has been carried to profit and loss account.

The Trustee department continues to expand, and it is hoped that our many friends will make use of this department by appointing the company as their trustees and/or executors.

INVESTMENTS

Turning now to our investments, the Stock Exchange securities (all funds) once more appreciated in value. We have fully given effect to the Government's expressed wish and have invested a further sum of £1,720,000 in Government War Loans during the year.

The following appropriations have been made from the profit and loss account: £50,000 to reserve for contingencies arising out of the war, bringing this reserve up to £300,000; £75,000 to writing down of premises; and £50,000 to the staff pension fund, and we have increased our contribution to the widows' and orphans' fund by £25,000.

This year marks the centenary of our associated office, the Law Fire Insurance Society, Limited, and we offer our congratulations to the board and management on the successful progress its history discloses. In 1907, when we acquired the stock of that society, the premium income was £160,000 and the profit was £71,313. At the close of its financial year 1944, the premium income was £345,000 and the profit £114,355.

STEWARTS AND LLOYDS, LIMITED

VAST WAR OUTPUT

SIR ALLAN MACDIARMID'S REVIEW

The annual general meeting of Stewarts and Lloyds Limited was held on the 17th instant at Glasgow.

Sir Allan Macdiarmid, the chairman, said: My first duty on this occasion is to deal with the directors' report and the accounts of the company for the year 1944, which are in your hands. Thereafter, I should like to give you an indication of the contribution which your company has made and is still making to the war effort.

E.P.T. POSITION

While the excess profits tax provisions remain as they are it is not possible, nor would it serve any useful purpose, to analyse and discuss the figures in the balance sheet and profit and loss account in the manner which was customary before the war. This, coupled with the complications arising out of the arrangements made by the Government during the war within the iron and steel industry, which involve the sharing generally by the whole industry of certain particular war burdens and to some extent the pooling of profits, renders it impracticable to discuss as in normal times the trading position of the Company, and makes the figure shown in the profit and loss account as trading profit largely arbitrary and artificial. That figure is, and must be, almost entirely controlled by the ceiling of the company's standard profits arrived at under the rules of the excess profits tax legislation.

In this respect your company has been unfortunate. Our standard profit for E.P.T. purposes is based on the average of the years 1936 and 1937. Both these years were seriously affected by the costly struggle which we had to wage for two years in the markets of the world against the deliberate and insensate competition of German producers, when they were selling at prices which bore no relation to their costs of production. Further, in neither of these years had anything more than the most partial benefits been derived from the comprehensive scheme which culminated in the building of Corby at a cost of some £8,000,000, and the Capital cost involved in scrapping some £3,000,000 of plant rendered redundant.

STRONG AND HEALTHY POSITION

Had we been permitted to include the year 1938 in our average, up to the end of which year the profits of the company were not in any measurable degree affected by Government contracts or work on armaments or munitions, we calculate that we should have additional cash reserves in our treasury to-day amounting, after income tax had been paid, to some £1,250,000.

I am not explaining these matters to you in any spirit of complaint or with any idea of seeking redress. Our case was fully explained to the authorities at the appropriate time.

My main purpose, apart from the fact that I think the shareholders have a right to such an explanation as I have given, and which I have refrained from referring to until now, is to lead on to the remarks I wish to make in regard to our plans for post-war development. I shall deal with these later, but, in the meantime, I may point out that it is obvious from my explanation that in our case the E.P. tax has removed, in an especial degree, necessary working capital and reserves essential to provide for obsolescence and development.

I do not think there is much more I need say in regard to the report and accounts. You will observe that out of the net profit for the year your directors propose to appropriate £500,000 to reserve for obsolescence, to pay a dividend on the deferred stock at the rate of 12½ per cent. and increase the carry forward by £63,839.

WAR-TIME ACTIVITIES

Proceeding to review the company's war-time activities, he said that as concerned the switch-over from peace to war and from war to peace the company was fortunate in that nearly all their products were equally essential for either purpose. There were few purposes for which tubes, pipes and castings were not required. It was that which made it difficult to describe the contribution of their ordinary peace-time production to the war effort because that had consisted more in the adaptation of tubes for war purposes than in the production of new articles.

For instance, over 15,000 miles of tubes had been supplied to the Admiralty for boom defence purposes; over 1,000 miles of fire-fighting water-mains for the principal towns; 1,200 miles of oil pipe-line for transportation of petrol from tankers to storage depots and airfields. The British Army had required large quantities and so had the oil companies. The demands of the shipyards had been very large, especially for marine boiler tubes, deck pipes and steam pipes. Boiler tubes had been supplied for locomotives, power stations and war factories, and tubes had been used in the production of projectiles, shells, bombs, other munitions and projectors. Over 10,000,000 tubular units had been supplied for those purposes.

50,000,000 SHELL FORGINGS

Probably the most spectacular matter to which he could refer was their contribution to the production of shell forgings. The total number of plants installed and operated was 23; a further 30 built to the company's design had been operated by other firms, at Royal Ordnance factories and overseas. The grand total produced in the works operated by the company up to the end of 1944 had reached a figure of 50,000,000; over 8,000,000 had been machined and 8,000,000 armour-piercing shot had been machined from the solid bar. The company had undertaken the manufacture of many other weapons of war, reaching a total of 14,000,000 pieces by the end of 1944.

The Stanton Company's principal single item had been aerial bombs, some 550,000 having been produced by the end of 1944; 2,000,000 castings had been produced for general munitions and Stanton had also undertaken the machining of gun barrels, torpedoes, tank components and other important war stores.

LEEWAY TO MAKE UP

Practically none of the expenditure and developments undertaken during the war for war purposes would be of value in their peace-time business. It had been impossible to keep abreast of technical developments in other countries. They had leeway to make up and anticipated large developments, quantitatively and qualitatively, in certain sections. That meant that if they were to maintain their pre-war position in the front rank of the tube makers of the world they must spend large sums of money on deferred repairs, alterations to plant and new developments.

The board had already approved a large amount of capital expenditure and had come to a provisional arrangement with their bankers to borrow up to a certain amount with the intention of funding at a later date. The future was likely to be a period of almost unlimited demand for home consumption and export. So long as commodities and necessities were in short supply, some form of control and rationing was necessary, but they should be dissolving bodies and their dissolution should take place at the moment when there was no urgent national need for their retention.

The report and accounts were unanimously adopted.

LONDON BRICK COMPANY, LIMITED

DIFFICULT CONDITIONS

The annual general meeting of the London Brick Company Limited was held on the 17th instant in London.

Sir P. Malcolm Stewart, Bt., O.B.E., LL.D., J.P. (the chairman), said that the profit on trading and income from various sources was down by £98,703 at £136,702. To that had been added the sum of £100,000 transferred from general reserve to provide for the cash bonus of 5 per cent. on the ordinary stock. Last year he had stated that conditions influencing 1944 were deteriorating and would adversely affect the trading results. The considerable reduction of profits afforded ample evidence of the accuracy of that forecast.

With regard to the causes which had brought about that state of affairs, three dominating factors had prevailed—the declining and ultimately abnormally low demand, the extreme severity and exceptional application of the transport restrictions on bricks, and the operation of departmental controls which had worked to their disadvantage through the lack of equity in their application, in particular that exercised through the Ministry of Works.

DIFFICULTIES OF ORGANISATION

He had never regarded it as practical to attempt to organise more closely or to regulate the brickmakers of this country as a whole. They worked a vast variety of raw materials, differing widely in character and employing different types of plant and machinery, producing a great number of products selling at different prices. Then there was a multitude of brickmakers, big and small, scattered widely over the country. There was no adequate uniformity or standard of product which would serve successfully as a foundation for corporate action. However, to further that policy and to give the impression that the brick industry was being effectively consulted, the Minister of Works then in office appointed the National Brick Advisory Council. The Fletton brickmakers had representatives on that council, but were a small minority and were voted down on every occasion of import to their interests by competitors, many of whom enjoyed the protection arising from transport restrictions.

They did not grudge them that war-time windfall, but they would fight their efforts to continue in the post-war those conditions which were now crippling the Fletton section, formerly the most efficient of the industry. The fact that they had used much less fuel and employed far less labour per thousand of bricks produced, matters of importance in war-time, had been completely ignored. That transpired at a time when industry was being constantly warned of the vital necessity of conserving both coal and manpower.

THE QUOTA PLAN

The committee on the brick industry was fortunate in having a prominent industrialist as its chairman, Sir Oliver Simmons, M.P. Needless to say he appreciated the value of efficiency and did his best. He inspected their Stewarthly works to acquaint himself with the facts at first hand. He further produced a helpful report which *inter alia* recommended a quota plan for all brick manufacturers. Under that plan there was allocated to the Fletton section 33.18 per cent. of the total. To that their competitors on the committee objected, and it was voluntarily reduced to 31.21 per cent. to secure harmony. Let them examine the figures and see how the plan which the Minister of Works approved should have worked out as far as their company was concerned. For the year 1944 the London Brick Company alone was

entitled under the quota scheme to some 21.18 per cent. of the national brick deliveries, but they only delivered 59 per cent. of the company's share of the demand. The position to the end of March this year was even worse. In the three months they delivered only 52 per cent. of the company's quota, about 24 millions. Pre-war in such a comparative period they would have delivered some 350 millions. It was not only in respect of quantity that they were hit, but by virtual prohibition of deliveries south of the Thames they were arbitrarily limited to deliveries only north of the Thames, and in many cases from rail depots adjacent to the river. So much for the approved quota plan, which had completely failed to give them a fair share of the much diminished national demand.

The first intimation they had obtained of the restriction of rail transport on bricks was from the newspapers to the effect that from December 1st, 1941, no bricks would be accepted for transport by rail to a destination over 75 miles. The effect on their business was to cut off overnight 50 per cent. of their current deliveries and to disrupt completely their organisation. They had lodged a protest with no effect.

They had protested against the raising of selling prices, but the most objectionable feature of the price control had been the fixing of a minimum price as well as a maximum. Their freedom to operate was thus rigidly restricted by minimum selling prices and severe limitation of transport. Road transport restrictions were equally severe.

NEED FOR FREEDOM

The post-war policy for brick-makers should be restoration of freedom for competitive prices, but with the retention of maximum prices so as to protect the consumer against exploitation. It was absolutely essential that minimum prices now operating should be abolished. He could not hold out any hope of improvement in results for the current year, but then should follow two years of building up to a position which should once more absorb their colossal productive capacity provided that freedom to expand was not cramped. The year 1945 should, in fact, represent the lowest ebb of the business if restrictions were not lifted, and thereafter they would have the help of the steadily rising tide of better demand. It must be clearly understood, however, that their progress depended upon the removal of the hampering controls now crippling the business.

THE NEGLECTED CINDERELLA

It was interesting to note that Lord Portal, when Minister of Works, had negotiated with marked success measures to secure such reasonable stability as could be expected in war-time to assist certain sections of industries producing building materials. The Fletton brick industry had throughout been condemned to be the neglected Cinderella, banned by political considerations. He could but hope that the present Minister would fit on her foot the slipper of efficiency and that comfortably cloaked she would be gallantly escorted to the party enjoying freedom and progress.

They were conscious that a far worse fate would have befallen them but for the indomitable fighting spirit of the Forces. They must remember how Providence had protected them through the steadfast bravery of the airmen in the Battle of Britain, through the watch kept by the Royal Navy and by the armies overseas, and all these efforts had been guided by the fortitude and inspiring leadership of the Prime Minister.

The report and accounts were unanimously adopted.

UNITED CANNERS, LIMITED

FAVOURABLE OUTLOOK

The thirteenth ordinary general meeting of United Canners, Limited, will be held on the 31st instant in London.

The following are extracts from statements by the chairman, Mr Joseph B. Dring, circulated to the shareholders:—

In view of the limitations imposed upon the production of canned fruits and vegetables during the war, we have developed other departments of food production, so that in spite of a restricted canning output our sales in 1944 showed a considerable increase on the previous year and our net profit before taxation was increased from £24,165 to £30,134. The board recommend a dividend of 10 per cent., less income tax, which rate your directors feel can easily be maintained, comparing with 7½ per cent. for 1943.

In our balance-sheet you will notice an increase of £5,538 in freehold land and buildings, due to the purchase, under expert advice, of a farm of 200 acres for fruit growing, and we have already commenced planting this farm out with fruit. It is anticipated that in the course of a few years it will become a valuable asset of the company. There is also an increase of £2,288 in plant, machinery, etc., which has been mainly occasioned by the increase in our production of dried peas, for which additional machinery was required.

The capital of the company is being increased to £210,000 by the issue of 280,000 shares of the nominal value of 5s. each at 7s. 6d. a share, as the purchase price of the ordinary share capital of J. and J. Beaulah, Limited, whose shares we are purchasing, took over in 1917 a business established in 1870. They are well-known canners of fruits and vegetables, and, like ourselves, are also largely interested in dried peas. They manufacture other food products as well, of which perhaps the most important is Beaulah's Malted Milk.

J. and J. Beaulah's average profits, before taxation, for the four years ended April 30, 1944, were £35,000 per annum, with an E.P.T. standard of approximately £14,000. Results achieved for the year to April, 1945, should show a profit in excess of £30,000.

SERVICE CONTRACTS WITHOUT PROFITS

During the war our canneries have been chiefly engaged in supplying Service requirements. Our contracts with the War Office and the Admiralty have included canned peas, beans in tomato sauce, canned potatoes, runner beans, carrots, turnips, and spinach, as well as canned fruits.

As an expression of patriotism during the European war the Services have been supplied without profit, and sometimes at a loss. Your board do not feel, however, that this should now continue.

Only very limited supplies of canned peas have been available for the British public, due to the acute shortage of labour, which will now be alleviated by the victorious end of the war in Europe.

SALES EXPANSION PREDICTED

It seems clear that at the end of the European war the canning industry of Great Britain stands on the threshold of great developments. We are looking forward to an enormous expansion in our sales of Benedict peas, on which we have spent upwards of £100,000 in obtaining national distribution and which are now well and favourably known throughout Great Britain. We have provided for all possible requirements of our canneries by growing 15,000 acres of peas this year, and J. and J. Beaulah, Limited, are also growing a large acreage. The combined companies will be probably the largest growers of peas in Great Britain.

In regard to our prospects for the future, your company, after this merger, will occupy a leading position among British canners. Even while canning was severely restricted the combined companies have been able to earn £60,000-£70,000 a year; by working only one day a week they could earn their combined E.P.T. standard, which is approximately £29,000, or 13½ per cent. on the increased capital of £210,000.

CENTRAL MINING AND INVESTMENT CORPORATION LIMITED

STRONG POSITION

SIR R. SOTHERN HOLLAND'S STATEMENT

The fortieth ordinary general meeting of the Central Mining and Investment Corporation, Limited, will be held, on the 12th proximo, in London.

The following are extracts from the statement by the chairman (Sir R. Sothern Holland, Bt.), circulated with the report and accounts:—

The net profit for the year amounts to £847,761. Our dividend income was lower and profits realised on the sales of shares were also less but, on the other hand, our revenue benefited by the payment during the year of arrears of debenture interest by the Anglo-Spanish Construction Company, Limited. An allocation of £50,000 has been made to contingencies reserve and the profits have been charged with the amounts necessary to provide for the writing down of the book values of certain of our stocks. Compared with last year, the net profit is less by £190,003.

THE DIVIDEND

The directors propose the payment of a final dividend of 8s. per share with a bonus of 4s. per share, making a total distribution for the year of 16s. per share and the allocation of £200,000 to the three reserves shown in the appropriation account. Provision for taxation calls for £250,000. The book value of our portfolio shows little change at £5,077,370. The reduction under the heading of gold mining is accounted for in the main by the writing down of book values, while under the heading of oil, coal and base metals the increase to £1,577,827 results from additions to our holding of oil shares. The balance-sheet shows a strong, liquid position, which I am sure the shareholders will contemplate with satisfaction.

GOLD MINING RESULTS

The results of the gold mining industry of the Witwatersrand in the year 1944, are summarised in the directors' report, and as you will see they continue to show a contraction in the scale of operations, attributable in the main to the shortage of native labour and materials. The decrease in tonnage milled, together with a further

rise in working costs, resulted in a marked falling off in working profits and dividend distributions.

In the Orange Free State, the presence of the Basal Reef underlying some portion of the areas in the Odendaalsrust district, over which we hold options, has been proved. We must await the results of further drilling upon our own and neighbouring properties before it will be possible to determine the economic prospects of our holdings.

TAXATION AND LABOUR DIFFICULTIES

During the war period the Witwatersrand Gold Mining Industry, as the mainstay of South Africa's economic structure, has been called upon to provide by way of taxation very large sums towards the war expenditure of that country. Now that the European war has come to an end, the time is at hand when the South African Government, in the interests of the country, must assist in restoring the Gold Mining Industry to a condition of maximum production. As a first step in this direction the present high level of taxation calls for drastic modification both to extend the life of the producing mines and also to encourage the development of new gold mining properties by giving capital adequate recompense for the risks inherent in such undertakings. Unless every encouragement is given to start up new mines as the older ones approach their end, the industry must inevitably contract, with serious consequences to the Union. Another immediate requirement of the industry is more active assistance in securing a sufficiency of native labour. These two matters call for the urgent consideration of the Government.

BRITISH MATCH CORPORATION, LIMITED

The eighteenth ordinary general meeting of British Match Corporation, Limited, was held, on the 16th instant, in London, Sir Clarence E. Bartholomew, O.B.E. (chairman and managing director of the company), presiding.

The Chairman submitted the report of the director, which states: The net revenue for the year ended April 30, 1945 amounted to £347,240 to which has to be added the balance brought forward £128,544 and after allowing for the dividends already paid, which absorbed £92,297, there is a balance of £383,487 available for distribution.

The directors recommend placing to dividend equalisation reserve £50,000, the payment of dividend on the preference stock for the half year to April 30, 1945, and a final dividend on the ordinary stock of 5½ per cent., making a total of 8 per cent. for the year, leaving £149,849 to be carried forward.

In spite of increasing difficulties, production in the United Kingdom has been well maintained, and the yield on the Corporation's overseas investments has continued to be satisfactory.

The report was adopted.

AGRICULTURAL MORTGAGE CORPORATION, LIMITED

MR E. J. BUNBURY'S REVIEW

The sixteenth annual general meeting of this company was held on the 17th instant in London, Mr E. J. Bunbury (the chairman) presiding.

The following are extracts from the chairman's statement circulated with the report: The new Agricultural (Miscellaneous Provisions) Act enabled us to reduce our lending rate of interest on mortgage and improvement loans to 3½ per cent. and enlarge our borrowing powers to over £30,000,000. These measures afford the industry long and medium term credit by mortgage and improvement loans at 3½ per cent. In the seven months from September, 1944, when our lending rate was reduced, £369,000 of mortgage loans had been taken up—more than five times the total for the previous five months, when our lending rate was 4½ per cent. In addition we had on March 31st some £280,000 of loans approved and awaiting completion.

To give existing borrowers benefit of the lower rate of interest for the unexpired period of their loans we have allowed them to convert to 3½ per cent. on payment of a fee of £5 per cent. Over £1,100,000 has been so converted during the last half of our financial year.

In 1944 acreage under crops in England and Wales again increased. Milk continued to receive first priority; dairy herd increased to 12 per cent. above pre-war but consumption has risen by 37 per cent. and dairy farmers have a large and expanding market for many years to come. The repair and the renewal of the capital equipment of the land is of greatest importance to the future of agriculture. In this field we hope to be of the greatest possible assistance.

The report was unanimously adopted.

FINANCE AND BANKING

THE MONEY MARKET.—The short loan position this week has been distinctly easier, thanks to the overtaking of the delays in payments caused by the V.E. holiday and to a reduction in the net requirements of the Treasury. There was a further fall in applications at the Treasury bill tender, suggesting that there had been no repetition of the recent substantial official demands, and the discount houses secured 44 per cent. This represents some £57 million, the largest take-up since last September, with its record quota of £59 million. The net call on the banks for T.D.R.'s was, however, no more than £5 million, the smallest for over three months, so that the total of new money passing to the Treasury was reduced from about £42 million to £25 million. Even so, the beginning of the monthly make-up—though this month it is comfortably spread over two weeks—might have been expected to produce some pressure. Actually, the market has benefited both from a release of funds previously immobilised in public deposits—these are down by £7.3 million—and by the effect of the shorter working week, which, by pushing payments for T.D.R.'s further forward, seems to have necessitated a substantial recourse to Ways and Means. Thus the Bank return shows Government securities no less than £33.8 million higher at £237.7 million a position which will no doubt be somewhat corrected later in the week. This heavy release of funds has much more than offset the efflux of a further £5 million of holiday notes, and bankers' balances have leapt by £34.4 million to the high level of £219.3 million. These changes have been reflected in a substantially better demand for bills from the banks than for some time. Whereas towards the end of last week money was in only fair supply and inquiry for bills for June paper and on Tuesday one of the large banks was actually buying on its make-up day. In some cases, at least, market houses have at last been able to sell more bills than they have taken up.

MONEY RATES, LONDON.—The following rates remained unchanged between May 16th and May 23rd:—

Bank rate, 2% (changed from 3% October 26, 1939). Discount rates: Bank Bills 60 days, 1½%; 3 months, 1½%; 4 months, 1½-1½%; 6 months,

NOTICES

UNIVERSITY OF LONDON

The Senate invite applications for the Readership in Public Administration tenable at the London School of Economics and Political Science (salary not less than £750). Applications must be received not later than first post on 15th June, 1945, by the Academic Registrar, University of London, Richmond College, Richmond, Surrey, from whom further particulars should be obtained.

UNIVERSITY OF DURHAM

Applications are invited for the Readership in Spanish and Latin-American Studies, tenable at King's College, Newcastle-upon-Tyne. The candidate appointed, if now on National Service, will not be expected to take up appointment until his release. The salary offered is £750 per annum. Further particulars may be obtained from the undersigned, by whom applications should be received not later than 30th June, 1945, although consideration will be given to later applications from those serving overseas. G. R. HANSON, Registrar of King's College.

UNITED NATIONS RELIEF AND REHABILITATION ADMINISTRATION

RELIEF WORK IN EUROPE

Men and Women are urgently needed by U.N.R.R.A. for welfare work among United Nations displaced persons in Assembly Centres in Germany, and applications are invited for posts as Principal (Ref. R.S.81) and Deputy (Ref. R.S.82) Welfare Officers. Principal Welfare Officers will be responsible for the organisation and direction of all welfare activities in Assembly Centres, and under the administrative control of the Centre Directors and in co-operation with the Centre Medical Officers, Deputy Welfare Officers will act as assistants to the Principal Welfare Officers. It is desirable that candidates should have had some social work training and they must have had substantial experience (preferably 3 years) in social welfare work. The work calls for a person with general or varied experience, but applications from specialists are also invited.

Age limits 25-50. Period of service, 6-12 months. Salaries: Principal Welfare Officer, £300-£600; Deputy Welfare Officer, £450-£650, according to qualifications. Selected candidates will be required to pass a medical examination and to be ready to go abroad immediately after appointment. Uniform, food and quarters will be provided. Candidates who have applied for the vacancy of Welfare Specialist in China need not submit a further application. Applications, which must be in writing, stating date of birth, full details of qualifications and experience, including present employment; also Identity and National Service or other registration particulars, and quoting appropriate reference number, should be addressed to the Ministry of Labour and National Service, Appointments Department, Sardinia Street, Kingsway, London, W.C. 2.

ECONOMIST. age 25, outstanding University record, two years' manufacturing and business experience, one year as economic adviser to Government Department, desires Position of Responsibility with good salary and prospects. Able, versatile and conscientious, with good personality and wide knowledge of people and affairs. Overseas appointment considered, especially if in New Zealand.—Write, Box 71, *The Economist*, Brettenham House, Lancaster Place, London, W.C. 2.

1½-1½%. Treasury Bills: 2 months, 1-1½%; 3 months, 1-1½%. Day-to-day money, 1-1½%. Short Loans, 1-1½%. Bank deposit rates, 1½%. Discount deposits at call, 1½%; at notice, 2½%.

Exchange Rates.—The following rates fixed by the Bank of England remained unchanged between May 16th and May 23rd. (Figures in brackets are par of exchange). United States, \$ (4-86½) 4-02½-03½; mail transfers 4-02½-03½. Canada, \$ (4-86½) 4-43-47; mail transfers 4-43-47½. Switzerland, Francs (25-22½) 17-30-40. French Empire, Francs 199½-200½. THE ROYAL MINT

Coins Struck in 1943 and 1944

The output of 81,840,000 halfpennies issued is easily the highest in the history of the Mint. Presumably, these have been issued to provide for the odd halfpenny that now figures in so many prices, but there is evidence that they have been used to a considerable extent instead of pence, although the

NUNDYDROOG MINES, LIMITED

Referring to the Notice issued on the 12th April, 1945, at a Meeting of the Board of the Company held to-day, the undermentioned dividend was declared:—

First and Final for the year ended 31st December, 1944, of 9d. (ninepence) per share (7½ per cent.), less income-tax at 5s. 4d. in the £, payable on the 18th July, 1945, to the shareholders on the books of the company at the close of business on the 22nd May, 1945.

By Order of the Board.

C. H. D. GARLAND, Secretary.

2, White Lion Court, Cornhill, London, E.C. 3. 22nd May, 1945.

APPLICATIONS invited for the Post of Assistant Editor of an old-established British Commercial, Financial and Political Weekly published in India. Age 25 to 33, unmarried, and should be exempt national service, or anticipating early release. Salary and terms of initial 3-years' contract according to qualifications, which should include ability to write leading articles and editorial notes on economic subjects, including investments, some capacity for research and acquaintance with Mechanics of newspaper production.—Write, Box No. 69, *The Economist*, Brettenham House, Lancaster Place, London, W.C. 2.

EDITOR sought for high-class, old-established commercial journal. Salary high. Good style, good experience and proven abilities essential. A knowledge of Export Trade and practice desirable. Confidential communications invited.—Box 70, *The Economist*, Brettenham House, Lancaster Place, London, W.C. 2.

SPECIALIST in Incentive Bonus and Labour Relations required immediately by The Wallace Attwood Company, Management Consultants, 7, Park Lane, London, W. 1. Applicants, who must have been fully trained in a recognised method of Time Study, should have First or good Second-class Honours Degree at a British University and varied experience in advising on and introducing types of incentive. Salary up to £1,500 according to previous posts and qualifications. Ex-Officers preferred. Write, stating when available. Full details should be given of age, education and previous posts (with salaries).

MARKET Research Manager requires educated Lady for interesting work. Permanent position. Must have knowledge of statistics.—Please write, stating fullest details, to Box 1,333, E. W. Barney, Ltd., 4, New Court, Clements Inn, London, W.C. 2.

ASSISTANT to Market Research Manager wanted immediately. Splendid opportunity for well-educated Girl requiring permanent position. Must be good at figures.—Please write, stating fullest details, to Box 406, E. W. Barney, Ltd., 4, New Court, Clements Inn, London, W.C. 2.

INDUSTRIAL Scientist, shortly proceeding on a visit to the United States, is prepared to make technical and other inquiries on behalf of a limited number of firms.—Write, Box 72, *The Economist*, Brettenham House, Lancaster Place, London, W.C. 2.

RECORDS and STATISTICS

INDUSTRY AND TRADE

The "Economist" Sensitive Price Index.—Owing to an error, the crops component of the index (1935=100) was last week given as 139.7 for May 14th. This should have been 140.0. The complete index, which was given as 162.2 should have been 161.2. During the week ending May 22nd there was no change in the index. The crops component was 140.0, raw materials, 185.5, and the complete index 161.2.

GOVERNMENT RETURNS

For the week ended May 19, 1945, total ordinary revenue was £42,887,000, against ordinary expenditure of £89,014,000 and issues to sinking funds of £30,000. Thus, including sinking fund allocations of £1,156,993, the deficit accrued since April 1st is £340,400,000 against £447,465,000 for the corresponding period a year ago.

A change has been made in the method of showing an excess of Post Office Expenditure over the Post Office Revenue. Such excess is now included as ordinary expenditure under "Total Supply Services" instead of being shown, as up to July 24, 1943, inclusive, as a deduction from ordinary revenue.

After increasing Exchequer balances by £183,311 to £2,667,147, the other operations for the week (no longer shown separately) increased the gross National Debt by £46,600,509 to £22,741 million.

THE Prime Minister's aim, in constructing his "caretaker government" has clearly been to make as few changes as possible. This, it is to be presumed, is only an interim Cabinet and there will be further changes after the election, whoever wins. If the Labour Party is to be accused of desertion while the Tories manfully labour on, it is an obvious tactic to fill only those gaps left by the deserters and not to give the appearance of seizing with any avidity on the opportunity of re-shaping the Cabinet.

In any event, the result has been to make what is really a major reconstruction look like a minor re-shuffle. The most difficult gap to fill was clearly that left by Mr Bevin at the Ministry of Labour—it is one of the major disadvantages of the Labour secession that the process of "unwinding" the manpower mobilisation is not to be presided over by one who enjoys such universal respect among the wage-earners of the country. But if a Tory has to fill the post, Mr Butler is as good a choice as could be made. He has had some experience at the Ministry of Labour, he is personally liked and conciliatory in method, and his successful piloting of the Education Act shows him to be a skilful administrator. The other major gaps have been filled, in the main, by promotions within the ranks of the Tory Ministers; Mr Bracken goes to the Admiralty, Mr Macmillan to the Air Ministry, Sir Donald Somervell to the Home Office. One of the few newcomers, Lord Rosebery, becomes Secretary of State of Scotland. The Ministry of Reconstruction is abolished and Lord Woolton moves, with the same duties, to the Lord Presidency. Mr

Lyttelton is to combine the Ministry of Production with the Board of Trade—a much better marriage than the rumoured one of the Ministries of Production and Supply, since the Ministry of Production's activities have for some time past been more concerned with post-war and reconstruction matters than with munitions.

All the above-mentioned Ministers are to be in the sixteen-man Cabinet—not apparently to be known as the War Cabinet. Possibly this is intended by Mr Churchill to be a permanent solution of the problem of the size of the Cabinet. Whether or not 16 is the best size, it is certainly better than 40, which is the number of posts of "Cabinet rank." The sixteen are made up of the Prime Minister, the two major sinecure offices (the Lord President and the Lord Privy Seal), the Chancellor of the Exchequer, the three Service Ministers, the six civilian Secretaries of State, the President of the Board of Trade and the Ministers of Labour and Agriculture. Whether the choice is of men or of offices remains to be seen. It also remains to be seen whether the Cabinet, unlike the War Cabinet, will in fact function as an exclusive body, confining its meetings to its members, or whether the distinction between "Cabinet" and "Cabinet rank" will continue to be almost entirely honorific.

Outside the Cabinet, the most interesting appointment is that of Sir Arthur Salter as Chancellor of the Duchy of Lancaster, with a particular mandate for matters concerned with European Reconstruction. Sir Arthur has recently been urging the appointment of a Minister to take in hand

the urgent problems of formulating and co-ordinating British policy in Europe and it is a very wise move to set him to a task for which he is so clearly qualified. The proposal was, however, that the co-ordinator should be of the highest authority and it is doubtful whether, from the Duchy of Lancaster, he will be able, for example, to persuade the War Office to his view of the proper priorities.

A queer state of affairs has been created at the Foreign Office. Mr Eden remains, of course. But Mr Law is replaced as Minister of State by Mr Mabane. It has not been specifically stated, but it is the natural presumption, that Mr Mabane will inherit Mr Law's duties connected with economic relations with the United States—such matters as Lend-Lease, Bretton Woods, and the negotiation of agreements on post-war commercial policy. Mr Law has acquired definite views on these subjects, as close to Free Trade and *laissez faire* as a latter-day Tory allows himself to approach, and it is difficult not to see in his transfer to the Ministry of Education, promotion though it technically is, a victory for the very different school of thought represented by Lord Beaverbrook. The two Parliamentary Under-Secretaries are Lord Dunglass and Lord Lovat. Lord Dunglass was Mr Chamberlain's Parliamentary Private Secretary and his only recent intervention in politics was to support the Tory "revolt" on the treatment of Poland at Yalta. Lord Lovat is a commando leader of the greatest distinction and bravery; from what is known of his political associations he can be expected to be to the Right of the Conservatives. It is perhaps a mistake to credit junior Ministers with much influence on policy, especially in the Foreign Office. But these appointments can hardly avoid creating an unfortunate impression both at home and abroad.

This is the greater pity because of the high desirability of keeping foreign affairs, at least during the period of peacemaking, on a non-party plane. What is more, there is good reason for hoping that this will be possible. It has been suggested that, if there is to be another meeting of the Big Three before the result of the election is known, Mr Churchill will invite Mr Attlee to accompany him and it would certainly be a most desirable thing to do, not only because of the political uncertainties of these weeks, but as a permanent policy.

A non-partisan approach to foreign policy, or to any other sort of policy, cannot, however, be had merely by waving the magic wand of consultation or by putting two

party leaders into the same aircraft. Indeed, it is the core of the case against coalitions that the attempt to impose agreement where there is none merely produces a paralysis of all policy. The particular circumstance that makes it possible to urge a lifting of foreign policy out of the party battle is that there is a substantial measure of agreement. Mr Bevin's impressive speech at Blackpool last week amply demonstrated not only that, in the event of a Labour victory, there is a competent candidate available for the Foreign Office—if, indeed, Mr Bevin is not installed on the other side of Downing Street—but also that there are very few differences, and those few unimportant, between the Labour view of foreign policy and the Conservative. Mr Bevin's advocacy of the policy of alliance with America and Russia and of the necessity for reconstructing collective security was unexceptionable from any point of view, and his conception of a Britain armed sufficiently to defend itself and equipped by compulsory national service was one which has hitherto been almost prescriptively Conservative. His blend of policies on the economic side was also well calculated to please a wide audience—support, on the one hand, for the principles of the Hot Springs and Bretton Woods agreements and for multilateral trade arrangements, but insistence, on the other hand, on the necessity of bulk purchases and of Empire preference.

Whether Mr Bevin's ideas on foreign policy are exactly those best fitted to advance the interests of the country is not, at the moment, the point. There are, in fact, a number of items on which it would be proper to make some criticism, particularly Mr Bevin's surprising willingness to put the cost of supporting domestic agriculture on the consumer of food—that is, very heavily on the poor—rather than on the taxpayer in proportion to his ability to bear it. But the point of greatest importance at this moment of returning party strife is that there are, in the field of foreign affairs, no differences of practical policy, and hardly even difference of approach, separating the parties. It will be a breakdown of statesmanship if no attempt is made to build on this fact a structure of active co-operation and mutual commitment within a sphere that is easily delimited. The time to do this is now, before it is known which of the parties will be the giver and which the recipient of the concession. It will be difficult enough to navigate through the dark waters of the coming years without manufacturing differences that do not exist.

Western Association—I

New Model in Europe?

THE proposal that the states of Western Europe should develop a closer association among themselves has had a chequered history. The Foreign Office has blown hot and cold, largely in accordance with the state of relations with Soviet Russia and the means thought best from time to time for improving them. American opinion has also been suspicious, divided as it is between those who are congenitally suspicious of all British moves and those who condemn as "power politics" and "spheres of influence" all proposals less sweeping than a universal and equal system of collective security. The Russians, alternately proclaiming that peace is indivisible and that their own division of Europe would be menaced by any association that was not formed under Russian leadership, have so far instructed the Communists in the West to oppose the idea root and branch. In Britain itself, the proposal has met with opposition both from those who dream the dream of a self-sufficient Empire and from those who see the vision of a federation of the whole of Europe, East and West, North and South.

On top of all this, the first authoritative sponsoring of the idea, in General Smuts's London speech of nearly two years ago, put it in the worst possible light. General Smuts rested his plea for closer unity on three points—the might and possible aggressiveness of Russia; the eclipse of France as a continental power; and the need for Britain to reinforce its own strength by dominating its neighbours.

Thus, in addition to the hostility that could have been expected in any case, General Smuts contrived at one blow to insult the French, to antagonise the smaller Western countries and to confirm Russian suspicions.

Nevertheless, in spite of this bad start, it is a very sensible idea. Moreover, the general posture of affairs has been moving, since General Smuts spoke, strongly in its favour. For the British people, the final stages of the war in Europe proved that closer association with Holland, Belgium and France is not a luxury dictated by a desire to pull level with the physical power of Russia or the United States but a first strategic priority in all planning for security after the war. A successful invading fleet has crossed the Channel from Britain to the Continent. The direction could be reversed now that the technique has been established. Bombs and rockets have rained on southern England from sites along the coasts and deep into the western fringe of Europe. It has been made equally clear to the European peoples that Great Britain is the last bastion of their independence and the only bridge-head through which the resources of the New World can be deployed for the safety and freedom of the Old. Thus a mutual strategic need has been established beyond any possibility of dissent.

The first year of liberation has demonstrated quite as clearly the inter-connection of all problems of economic reconstruction. In every sphere, from transport and ship-

ping space to supplies of raw materials, the needs of Western Europe can be satisfactorily met only if they are considered jointly and joint priorities fixed. A European Transport Commission covering Western Europe has already been set up. In the Emergency Supplies Committee, established this week to regulate the flow of materials to Europe, all the members except Greece and Turkey on the receiving side and the United States on the supply side, belong to the "western fringe." Nor is co-operation between these states essential only during the transition from war to peace. All the states of Western Europe are committed to the avoidance of the mass unemployment from which all suffered before the war. All, apparently, accept the degree of planning which a policy of full employment involves. What is more, the nations of Western Europe are almost the only ones that both have a problem of securing full employment and also recognise the necessity for positive action by governments to secure it. Soviet Russia and the primary producers do not have the problem; the United States does not recognise the remedy. And as if this were not enough to draw the economic policies of the Western European states together, there is the further double circumstance that all of them are highly dependent on international trade and that all of them trade largely with each other. For nations in these circumstances to lay their economic plans in isolation would end either in failure or in the most poverty-inducing autarky. It would be difficult to imagine a more conclusive case for purposeful economic integration.

It is not only that the internal reasons for closer association have grown more compelling. The general development of world affairs is steadily making the idea more acceptable than it was even three months ago. At the Yalta Conference, a supreme effort was made to prevent the division of Europe into spheres of influence, and the proposals for a Western Association, which had received the modified blessing of the British Government last autumn, were deliberately put aside lest they should be used by the Russians to justify an exclusive sphere of influence for themselves in Eastern Europe. When the conference was over it was possible for a brief moment to believe that this plan had succeeded and that the dream of a single structure of policy for the whole of Europe, presided over by the three powers in concert, could still be entertained. But that dream did not last long. Whether or not it is still possible to escape from the accomplished fact of a Chinese Wall running across Europe from Luebeck to Trieste, it is now clear beyond any mistaking that the Russian influence in Eastern Europe is intended to be exclusive. So clearly has this been demonstrated that the Russians now seem inclined to withdraw their opposition to a closer association of the Western states—which could never, of course, be intended to be a tithe as tightly drawn as the Soviet bloc in the East. In any case, the only approach that it is possible to make at present to the ideal of a freely federated

or united Europe is for the countries of the West—and possibly also of the Mediterranean—to draw more closely together.

On the other side of the Atlantic, the United States has moved decisively toward a policy of regionalism. The Act of Chapultepec, signed at the Pan-American Conference at Mexico City, is a full regional agreement covering defence policy and economic co-operation. At the San Francisco Conference, the regionalists, represented strongly by the Latin American states, succeeded in establishing the validity of regional agreements on defence under the loose surveillance of the Security Council.

The fact that both the Russians and the Americans have accepted regionalism as a cornerstone of their foreign policy does not necessarily mean that they would favour the application of the same principle in Europe. It is difficult to say precisely what their attitude now is. Marshal Stalin, in a recent speech, appeared to bless the idea of a Western bloc. His attitude would, no doubt, turn on the question whether the association in Western Europe seemed to be directed against a possible resurgence of Germany, or a possible extension of Russian power.

The Americans would undoubtedly regard special economic arrangements with suspicion. But it should be possible to convince the United States that the purpose behind closer association is to expand, not contract, foreign trade, and that as a prosperous market, 120 million strong, Western Europe would be a far more stable trading partner than a divided Europe, a prey to depression and unemployment. Nor would a local association prevent Western Europe from joining in world-wide policies for expanding prosperity and international trade. If the Western Association were modelled on the principles of Chapultepec and on the underlying doctrine of the Good Neighbour, it would meet with a far more sympathetic reception in the United States at present than at any other time in recent years.

The change in the attitude of the other Great Powers towards regional arrangements smooths the way towards a closer association of Western Europe. It is, however, a negative factor only. The decisive force is naturally the attitude of the Western States themselves. The Norwegians and the Dutch have in the past declared themselves emphatically for an "Atlantic Community." In 1943, Mr Van Kleffens, the Dutch Foreign Minister, specifically supported the conception of a Western Association as a defensive wall against future German aggression. The Belgian Government, with the exception of its Communist members, is known to favour the greatest possible degree of strategic and economic integration with its neighbours.

In France, policy appears to be divided. Public opinion generally and the milieu of the non-Communist Resistance and of the Socialists in particular support the idea of closer unity. They see it as a natural extension of the

system of security already initiated in the Franco-Soviet treaty. The bridge of security across Europe must be strengthened at its Western end. The policy of the Government is, however, equivocal and emotional—as it will very possibly remain so long as General de Gaulle has chief responsibility for moulding France's foreign policy. It appears that the British Government has already suggested an alliance. To this the French replied that in order to build the alliance on the firmest possible basis all outstanding problems—in particular, the Levant and the French zone of occupation in Germany—must first be settled.

There, it appears, the negotiations rest. Nor are they likely to prosper better so long as the basis of negotiation is the negative question of differences to be settled rather than the positive approach of policies to be jointly pursued. If advantage is to be taken of the changed attitude of the Great Powers, if the desire for co-operation among the smaller Western Powers is to be canalised into constructive channels, it is not possible to wait any longer upon France. The right course is to proceed with those countries that are more ready to talk business, to leave an honoured place for France at the table, and to have confidence that, before long, a less angular mood will prevail in Paris. The time has surely come to discuss, not the high politics of a Western Association, but the practical ways and means, the logistics of the proposal. This initiative can only come from the British Government.

Those who have been to Europe since the liberation say that people in this country do not realise on the one hand the prestige it now enjoys, and on the other the bewilderment felt over its apparent lack of a coherent foreign policy. There can have been few occasions in history when a constructive lead would have been more eagerly followed or when the diplomatic horizon was more earnestly scanned for the smallest cloud of policy. It is true that any proposals from Great Britain would have to avoid the errors which marred General Smuts's approach to the question. It would have to be made absolutely clear that far from constituting a menace to Russia, a Western Association was a

strengthening of the existing Anglo-Soviet and Franco-Soviet Pacts. It would be necessary to secure the understanding and acceptance of the United States and the Dominions that it was a practical application of the mutual assistance principle that was proposed, not the building of a ring fence round an exclusive and potentially aggressive combination. Any scheme proposed would have to be free of any taint of British "imperialism" or domination. The only possible policy is the Good Neighbour policy, worked out in a form to suit the strategic and economic needs of Western Europe. The framers of policy would also do well to avoid all suggestion of constitution-making or of working out rigid covenants. The proposal can succeed only as an association of convenience, based on pragmatic principles and justified, not by its theory, but by its performance.

These may seem a formidable list of obstacles to overcome. Yet there is nothing in the nature of the proposed association to make any one of the obstacles insuperable. At the same time, the achievement of such an integration might well start new currents flowing in international life. The world seems so far to have found no middle term between the one extreme of autarky and expansion by aggression and the opposite extreme of isolated sovereignty—political and economic—in which the devil takes the weakest, hindmost state. If in Western Europe the Powers can prove that sovereign independence is no bar to close political and strategic association, and that the co-ordination of economic policy is possible on a wider basis than that of the single national community, they may well create a nucleus to which other states, pursuing similar policies, can later join themselves. In the past, associations or federations of peoples have often tended to start from a single centre and grow outwards by attraction. Conceived and developed in this way, the Association of Western Europe could be a new model for internationalism in the twentieth century.

It is proposed, in a short series of articles, to examine more closely the ways and means of such a Western Association.

Exports and Industry

FOR economic policy by far the most interesting of the Government changes has been the replacement of Mr Dalton by Mr Lyttelton at the Board of Trade. Under Mr Dalton, the Board of Trade has been the target of the most widespread criticism for its lethargy and lack of policy, and Mr Lyttelton's main task will be to galvanise the department into life. He was an energetic and successful President four years ago, when he carried through both the concentration policy and the beginning of clothes rationing. Then he was a newcomer to politics; now he returns after more than three years in the War Cabinet. What is more, he is to retain the post of Minister of Production, with the final powers over the allocation of resources, that he wields in that office. There is no doubt that all the necessary authority for the re-conversion of British industry, with full powers over materials, productive capacity, machine tools, imports, storage and factory space, and conjoint powers over the industrial allocation of manpower, is being deliberately concentrated in one pair of hands.

The supreme test of Mr Lyttelton will be exports. The restoration of the export trade will not be, in a quantitative sense, his largest problem; the general efficiency of British industry and the attainment of an adequate and stable level of employment are both of them more fundamental. But the export problem is the most urgent, it is in the most critical state, and it presents the greatest difficulties. As a broad rule of thumb for the next few years, Mr Lyttelton might be well advised to assume that if he can set the export trade on its feet, his other problems will either look after themselves or at least be put well on the way to solution.

The crucial importance of an export revival has been often remarked. But it has not yet really sunk into the

public consciousness and no opportunity should be missed for repeating the emphasis. To pay for a volume of imports comparable to that of 1938 will require an increase of about 50 per cent by volume in British exports. Nor can the pre-war volume of imports be substantially cut down without grave inconvenience and discomfort to the country. After a decade of protectionism, there were not many unnecessary imports seven years ago. The 50 per cent increase in exports is not required to maintain some artificial standard of luxury, laid down as a target for no better reason than that it happened to be attained before the war broke out. It is required to maintain the standard of living of the country. Nor is a 50 per cent increase likely to be an easy task. On the contrary, it will be most difficult. The two great standbys of the British export trade have always been coal and textiles. British coal is now fabulously expensive and in critically short supply. Some of the textile industries, notably cotton, are experiencing great difficulty in getting their labour back at the prevailing wages and conditions of work; it is not unlikely that their labour costs will have to be increased, which will at once react on the possibilities of export. No part of the 50 per cent increase can be looked for in these two directions; indeed, coal and cotton cloth exports may find it difficult to regain their 1938 level. It follows that the proportionate increase in all the other export trades will have to be all the higher. If there is to be a 50 per cent increase in total exports, but coal and cotton make only their 1938 contributions, the increase in the rest will have to be well over 60 per cent. And if anyone, after examining the prospects industry by industry, is confident that such an increase in sales can be achieved, he has yet to be heard from in public.

In the short term, the problem is insoluble. The Chan-

cellor of the Exchequer, in his recent Budget speech, accepted the inevitability of further deficits in the balance of payments for the next few years. No doubt the countries of the Commonwealth and Empire and the other close commercial friends of this country who have taken payment for their goods in sterling balances during the war will be prepared to go on doing so for a short transitional period, provided grounds can be given them for confidence that thereafter they will be able to get real value for their sales. The crux of the problem in these next few years will be the dollar. The United States Congress has made it clear on many occasions that lend-lease is intended to apply only for the period, and for the purposes, of hostilities against the common enemy, and in particular that lend-lease and export drives do not mix. It might conceivably be just possible to squeeze through these years by spending only such dollars as could be currently earned. But if it would be possible at all it would mean, in many respects, perpetuating the full rigours of the war economy. The other alternative is the raising of credits in the United States, which would be difficult. There is no assurance that this could be done at all, and if the President did not seek to impose written or unspoken conditions of an economic or political character, Congress certainly would.

These two short-period alternatives—continued shortages or open borrowing from the United States—are both of them unpleasant. Nor could either of them be continued for very long. Continued shortages would try the temper of the people and undermine the economic fabric of the country. Continued borrowings would before long lead to the most unpleasant relations between Britain and America. Indeed, it is almost certain that a time would come when, for political or economic reasons, further loans would not be forthcoming. This country would then face the grim necessity of an immediate and unassisted balancing of its accounts without being able to count, as it can in the immediate future, on the buoyant support of a worldwide sellers' market.

The first requirement for a short-term export policy is therefore that it should aim to make the period as short as possible. In the main, the problem is one of supply, since there will be no lack of demand in the world for some time to come. The aim should be to ensure that in two years' time from now a volume of British exports is available for sale on world markets 50 per cent larger than that sold in 1938. This is quite inevitably a problem for Government. Ideological questions of control or no-control do not enter into it; the job must be done by the Government because no one but the Government can do it. If Mr Lyttelton, seeking to apply Tory principles, tries to leave it to "free enterprise," he will make himself look just as foolish as if he had tried to run the Ministry of Production on free enterprise. The job is, first of all, to see that there is a sufficient volume of non-war production; that is inevitably a task for the allocation machinery. Secondly, it is necessary to see that the first claim on the production is for exports; that is essentially a job for the priority machinery—in fact, for still more far-reaching intervention, since exports should not merely have priority, they should be compulsory.

Indeed, the reconstruction of exports in these next two years (without prejudice to what it may be thereafter) is precisely the sort of task with which Mr Lyttelton has been familiar at the Ministry of Production. First there must be a Programme. The task of estimating export requirements is certainly no more difficult than that of predicting what strategy, the state of the war and he military whim will require in two years' time; the programming machinery could be turned over almost intact to the new job. And then, when the Programme exists, there is the task of organising the production to meet it, of seeing that the capacity is available, that the orders are placed, that the materials, labour and machine tools are supplied and that the schedules are adhered to. If these procedures were something novel there might be an excuse for fumbling and delay. As it is, the familiar routine can be bodily transferred, and industrialists should be given

to understand that, in making for export during the next two years, they are serving the state fully as much as in making munitions during the six years of war.

There is, however, one large difference between munitions production in wartime and production for export in peacetime. Munitions production had to be achieved regardless of cost. In the next two years it is possible that overseas buyers will not scrutinise prices too closely; they will be only too anxious to get the supplies. But nothing could be more disastrous than to pursue the short-term programme without regard to prices. For a time will come, and come very quickly, when price will be all-important. The end of the short period will, after all, be indicated in two ways, by British production getting back to normal and by the abnormal world-wide demand disappearing. If, at that time, British goods are not competitive in price and in quality, then the first short period of supply difficulties will be succeeded by another period of demand difficulties. The only difference in Britain's plight would be that before the turning-point we should be able to sell but not to supply, and that after it we should be able to supply but not to sell.

There is no way of dodging the necessity of being competitive in price and quality. For a few years, no doubt, countries that are dependent on the British market could be compelled, by various Schachtian devices, to take British goods at high prices—but only for as long as was necessary for them to adapt their economies and escape from the compulsion. Depreciation of the pound sterling, in so far as it was not immediately followed by other currencies, might provide a temporary stimulus. But it would be likely, in most circumstances, to raise the price of imported food and raw materials and thus either lower the British standard of living or defeat itself by leading to a rise in wages. Subsidies to exports, even if they were possible without foreign retaliation, could only be paid out of higher domestic prices. In short, if British exports are not attractive enough to sell in the required volume, the only freedom of choice left to British policy is whether the reduction in the standard of living will be taken in the form of a physical shortage of all imports or in that of a fall in real wages—war economy or depression.

This is the real difficulty in export policy and the real challenge that it presents to economic statesmanship. The short-term problem can be solved by an energetic application of wartime methods of organisation. But a solution of the long-term problem can only be achieved by first solving the whole vast complex question of British industrial efficiency. It involves asking such questions as whether the universal prevalence of price rings and restrictive cartels is comparable with competitive prices in export markets; whether competition can be suppressed at home without making British industrialists incapable of competing abroad. It involves looking closely into the comparative productive efficiency of every British industry, on the lines of the Platt and Reid Reports. It involves what is far more difficult than the writing of reports, the acceptance of their recommendations. It involves putting the rival shibboleths of private enterprise and public ownership on the shelf and, in their place, entering upon a technical enquiry, industry by industry, into the possibility of improving productive efficiency by a change of structure and ownership. It involves asking why it is that British industry has such difficulty in keeping up to date.

To all these questions the Tory Party has hitherto closed its eyes. But if Mr Lyttelton closes his eyes to them he will be personally and individually ensuring a Tory defeat at the next general election—not to mention a disaster for the country. He has a chance to show that government by the Business Party means the encouragement of efficiency and enterprise. And he has also a chance of throwing away the country's opportunity of making a new economic start.

The Levant Crisis

FIGHTING has disastrously broken out in Syria. Damascus has been shelled, Hama is reported to have been bombed and it seems certain that unless some sort of truce can be quickly patched up, the situation will get completely out of hand.

It is hardly necessary to repeat at this stage that the dispute between the French and the Syrians and Lebanese is not a matter of their concern alone. The whole Middle East is involved now that the Arab League is in being. The Council of the League is to meet at once to consider the struggle, and the Egyptian Government has lodged a severe protest with the British, the Americans, the French and the Russian Governments. The Western Great Powers are equally involved, by their long-term strategic interests, by their unequivocal recognition of Syrian and Lebanese independence, and by their immediate need of speedy communications with the Far Eastern zone of war. Great Britain is involved in an especial and extremely delicate sense. Its treaties with Iraq and Egypt exasperate the French, who see no reason why France should not be conceded similar arrangements. The presence of British troops in Syria has, coupled with the intemperate attitude of certain past British officials, encouraged the Syrians and Lebanese to expect active British support in opposing the French. And this attitude, combined with the neighbouring problem of Palestine, induces many French people to denounce British "hypocrisy" and to regard all efforts at mediation as underhand methods of squeezing the French out. It is difficult to imagine a more tortuous and highly charged political situation or one with which the ordinary resources of diplomacy seem so inadequate to deal.

Nevertheless, the British Government has been inevitably and rightly obliged to intervene. Last week, when the crisis became menacing, it took the somewhat unusual step of issuing a Foreign Office pronouncement on this quarrel between two of its friends. This was followed—on Tuesday—by a statement in the House of Commons by the Foreign Secretary. Both announcements have virtues. Though the first, with its reproof to the French for mistiming their troop movements, and to the Syrians for breaking off negotiations at the sight of 500 extra soldiers, sounded a trifle sententious, it was impartial and calming. Further, the combined effect is not wholly negative. Both statements announced that the British and American Governments were in consultation. All this is a continuation of past policy. Everyone knows that the British Government has, since 1941, and particularly early this year when Mr Churchill and President Roosevelt were in the Middle East, done its utmost to bring together two negotiators whose differences it has not hitherto thought irreconcilable. Even after the fighting began, Mr Eden assured the House of Commons that the Government was continuing its efforts to restore calm and would work in the closest possible contact with the American Government.

But as things stand, it is now most questionable whether this attitude is enough: whether the British Government has said all that, in its own interests, it should now say. The Franco-Syrian quarrel has already passed the stage at which interested third parties can do their best work from the touchline. It has become one of those difficult disputes in which both parties have struck attitudes too uncompromising to abandon in face of threatened shooting. It has become a row in which each is too incensed to take the elementary diplomatic step of putting forward proposals sufficiently moderate to place the other in the wrong.

Once matters have reached such a pass, mere exhortation is not enough. Some outsider must take a plunge and proffer a solution sufficiently new to throw the old deadlock out of perspective. Great Britain is the most interested outsider, not only as neighbour to France and friendly sponsor to the Arab League, but also because the affairs of

the Middle East are of consequence to the whole Commonwealth. Not only the United Kingdom, but India and the three Dominions of Australia, New Zealand and South Africa are affected.

While it is easy to see the need for a fresh initiative, over and above the consistent effort to calm both sides, it is much more difficult, precisely because of the involvement of issues, to work out the kind of offer which would be new enough and attractive enough to create a new start. Some lines of approach are, however, obvious. First of all, any proposals should, if it is humanly possible, be made jointly in the name both of Britain and America. On the French side, this would have the effect of quieting the uncontrolled resentment which Britain's position in the Middle East seems to excite in some Frenchmen. On the Arab side, it would bring into the picture an outside Power whose prestige is high in the Levant and would also lessen the fears of Western rivalries splitting the Middle East into rival spheres.

Secondly, the proposals must take into account the extreme sensitiveness of French opinion and the somewhat unbalanced approach of France's leader. If any offer, gesture or phrase can be made to help French prestige and to provide a dignified and reasonable retreat from an impossible position, it should not be neglected. For example, one of the constant French criticisms in recent months has been the overlooking and brushing aside of the French desire to contribute to the fighting in the Far East. If that contribution were now to be recognised and stressed by the Chiefs of Staff and all proposals for a settlement in the Levant linked to the common need for peaceful lines of communication through the Mediterranean to the Far East, it would clearly be easier for the French to retreat from their present extremity.

Yet the proposals must meet the Syrian and Lebanese demand for the withdrawal of the French reinforcements as a preliminary to negotiation. It is useless for the French to point to Iraq and Egypt and plead that they have a right to the same military privilege. The truth is that the Iraqi and Egyptian treaties are probably out of date and the British, like the French, are under the obligation of discovering new formulae. This does not mean that the Arabs can dispense with outside military support. Their lands are rich, accessible and desirable, but at the same time too weak in modern weapons or industries to defend their assets. A hothead crowd in Cairo or Damascus may shout for an army, but every Arab statesman knows that self-defence is, and will for years be, impossible, and that some other means of protection against aggressors must be found.

Thus their reaction is not a simple slogan of "Away with the West!" They know that they need outside help. They need it militarily, and they need it in order to secure the political and social education that will raise them out of the morass of poverty, ignorance and ill-health of which they are now aware, and which they are beginning to want to cure. They are ready to see treaties which are mutual bargains, bringing strategic advantage to the one side and enlightenment to the other. But they are determined that, in future, such treaties shall carry no taint of tutelage. Their fundamental objection to France's present proposals is that these are couched in "the old-fashioned language of a colonial power." For the future, any bargain that is not to prove a recurrent source of resentment and disturbance must bring patent two-way advantage and must be struck between free and equal partners. Each side—east and west—needs the other; each has assets to offer.

If all these factors are taken together—American participation, common strategic needs of the Great Powers, the very real advantages they and the Arabs can exchange—it should not be impossible to devise new proposals. Britain would serve its own interests as well as other

people's if it were to put them forward. They will become harder to formulate if the Syrian sore is allowed to fester or if it were to spread to Palestine. Now is a moment at which to speak out.

The essence of the proposals would be a joint Anglo-American-French approach to the Arab League as a whole. The three Powers would jointly offer to lease from the Arab League the bases and commercial airfields that they need for their Middle Eastern purposes. Joint Anglo-American-French undertakings are not unknown in the Middle East—for instance, there is the Iraq Petroleum Company. But the new proposals should go further than the bare money payment for port or airfield. For instance, it would be more acceptable if the bases leased were so far as possible placed out of sight—that is out of mind of xenophobe feast day crowds. Modern forces are so mobile that it should be possible to take the necessary military precautions from stations such as Tobruk or Rutbah, Palmyra or Akaba. Going a stage further the proposal could be made not only acceptable but actively desirable to the Arabs if Britain and its colleagues were to accompany it not simply with the stale appurtenances of foreign policy—goodwill messages, foreign schoolbooks, laymen's prattle—but with samples of the progressive social policy which represents their true face and nature over the past fifty years. A Beveridge report is a British best seller, while a TVA book does duty for America. The French have the record of the

NOTES OF THE WEEK

No Policy for Coal

It was singularly appropriate that the first business of the House of Commons after the change of Government should have been a debate on coal, for there is no other issue about which party feelings run so high. Although the expected onslaught on Major Lloyd George from Labour and Liberal benches did not develop, there were plenty of sharp exchanges in Tuesday's debate, and it is quite clear that, however theoretically desirable it might be to keep coal out of politics, the future of the mining industry will in practice be one of the main issues at the election.

Major Lloyd George, rather in the position of a pebble left high and dry by the outgoing tide, announced that the policy of the Conservative Government, if returned to power, would be to leave the "working, treatment and disposal" of coal to private enterprise, "provided these were planned in accordance with the national need and conducted with the maximum efficiency." This generally agreed platitude sounds as if the Government accepted Mr Foot's plan, which extolled the virtues of free enterprise and whose two cardinal principles were the organisation of the industry on the basis of national service and the attainment of maximum productive efficiency. There is this difference, however, between the Foot and the Lloyd George proposals, that instead of leaving the industry to reorganise itself, the Government would appoint a central authority, subject to the general direction of the Minister of Fuel, with the object of promoting efficiency and with powers to enforce amalgamations, though the main reliance would be on voluntary amalgamations.

Major Lloyd George should know better than anyone else, after his experience of both sides of the industry, that his plan simply will not do. It does not represent any advance on the Coal Mines Act of 1938, and it relies mainly on the voluntary methods which failed so signally in the past. It is indeed difficult to see the need for a new authority if it is only to do what the Coal Commission was supposed to do. Indeed, these proposals are a deliberate attempt to perpetuate the worst feature of wartime control. It is not a workable system for any industry to have one set of people actually sitting in the driver's seat and another set sitting behind "controlling" them. Having discovered how lamentably bad this system is, the Government now propose to perpetuate it, thus showing how fully they take their place in the fine traditions of public intervention in the industry.

Whatever else is done, this dual control must come to an end. Either the industry must be handed back to the mine-owners to be run in accordance with each owner's conception

Resistance and their post-war plans for economic and social reform.

Finally, the offer should be underpinned by solid offers of economic assistance in the building of a strong unified Middle Eastern Economy and a statement on the priorities the Arab States can hope to obtain in the post-war period of shortage. Incidentally, a joint approach of this type would not jeopardise the special cultural interests of each Power in the area. French schools and colleges and institutions do not need exclusive military control, any more than the American university at Beirut has had to rely on American men of war.

No one would pretend that such a solution is easy to achieve. Yet it is difficult to see where else Mr Eden can look for a new formula on which to base fresh negotiations. The British Government will naturally remain in the closest contact with the Americans and with the parties to the dispute. It is to be hoped that its efforts will lead to constructive proposals on these lines. Naturally the way ahead is not all plain sailing. The British for instance have the Palestine dilemma to resolve before they can look at the Middle East without a mote in their eye. America may not be sufficiently involved to wish for military commitments so far afield. Some Frenchmen will find it hard to discard their old individualistic role. But the attempt is well worth making. Without it, murder and mistrust are likely to continue and to spread, and the Arabs will in time turn towards less supine defenders of their worldly goods.

of his rights and duties, or else it must be handed over to someone else who will have the responsibility of running it in accordance with some other clearly defined principle, and who will also have the freedom of action to do so. Since the former alternative is not practical politics—as the Minister, with all his talk of private enterprise, knows perfectly well—some variant of the second alternative is necessary. To lay down private enterprise as a fetish is fully as foolish as to think that nationalisation, by itself, will make any difference—indeed, in this industry it is more foolish.

No proposals for the coal industry should be entertained for a moment unless they clearly state how it is proposed to reconcile a decent standard of living for the miners with the urgently necessary reduction in the price of coal. This is essentially a technical problem, and schemes of ownership or control are not worth looking at unless they can be proved to be likely to assist in solving the technical problem and in solving it quickly.

Major Lloyd George is simply wasting time. Even if the Tory Party wins every seat in the House of Commons, a real coal policy will have to be produced before long.

Unfinished Business

Only two weeks remain to the Long Parliament before the Dissolution scheduled for June 15th. This limited time to wind up the unfinished business of the Coalition Government is, wisely, to be extended by the inclusion of Monday afternoons in the Parliamentary week. Even with this, and with the drastic weeding out of unessential or too-controversial business, the remaining sessions will not be able to escape an underlying sense of urgency.

First on the list of business to be included in the fortnight's timetable are those measures which are needed to preserve the continuity of the financial structure of government. Mr Churchill announced on Tuesday that an abbreviated version of the Finance Bill will, with the consent of the House, be introduced to provide for taxation, on the lines of the Budget proposals, in the interim period. In the same category are the motions for supply and supplementary votes of credit which will also have to be fitted in. Secondly, there are those measures so nearly completed that only a short time is needed to finish them. Among these, the Requisitioned Land and War Works Bill went through its last stages on Wednesday; the Law Reform Bill on contributory negligence should also be completed this week; and a six months' extension of the Emergency Powers (Defence) Acts should be approved. Pushed into this cate-

gory, like the truncated feet of Cinderella's ugly sisters, is the Distribution of Industry Bill. Clause 9, which would restrict industrial development in congested areas, is to be deleted to by-pass Conservative opposition, leaving the Bill—deserving its name less than ever—merely a Special Areas measure.

As a footnote to the Caretakers' timetable, the inclusion of the Government of Burma Bill, as yet untouched, which is to be discussed on Friday, seems very curious. There is no urgency about it, since the extension of the Governor's powers is not necessary until they become invalid next December. The time might well have been given to more pressing matters. The Labour Party expressed great indignation over the intention to drop Mr Morrison's Supplies and Services (Transitional Powers) Bill, seeing in the decision the "first victory for Big Business." But it would probably be wrong to take this interpretation too seriously, as the Bill would be difficult to pass in haste and some legislation on the subject will clearly be needed in the new Parliament.

On the fate of the remaining business outstanding, Mr Eden has promised a further statement on Thursday. But it seems unlikely, at present, that Bills for Scottish Education, for Industrial Injuries Insurance, or even the Family Allowances Bill, will be fitted in. Certainly they have no hope if the election mood—in which independence of the double harness was hilariously celebrated on Tuesday by time-wasting Parliamentary back-chat—is not to some extent restrained.

The Electorate

The admittedly imperfect new register, which was drawn up from the addresses registered on identity cards on a certain day last January, will be even more imperfect by July 5th when the majority of evacuees will have returned home. This disfranchisement will affect many of the new constituencies created by the House of Commons (Redistribution of Seats) Act, for most of the "abnormally large constituencies," which have now been divided up, were in London and the adjoining areas.

The report of the Boundary Commission for England, which has just been published (HMSO 15s.), gives a full list of the constituencies affected. The operations of the Commission have so far been concerned with "the temporary provision for the division of abnormally large constituencies . . ." and not with "the permanent provision for the redistribution of seats." Thus, the parliamentary map of England is still illogical and anomalous, and some of the Commission's recommendations were affected by the consideration that there will eventually be a general redistribution of seats. Of the 25 new constituencies made under its recommendations (making a House of 640, 19 are in the London area. The biggest changes take place in Middlesex. Baling parliamentary borough and the Harrow, Hendon, Twickenham and Uxbridge divisions of the county are redrawn to provide 12 constituencies. In Essex, Ilford is divided into two constituencies, and the Epping, Romford and South-Eastern divisions into eight. A discretion was conferred upon the Commission, in any case where a county borough or county district overlapped the boundary between an abnormal and an adjoining constituency, to include the latter in the area to be divided. The Commission availed itself of this opportunity so far as possible to bring a local government area wholly within one or other of the constituencies.

In the House of Commons this week, Mr Churchill announced that the final recommendation of the Speaker's Conference on Electoral Reform and Redistribution of Seats, with regard to the conduct and cost of elections, could not be adopted for the coming election as legislation could not be passed in time. Another difficulty is the disfranchisement of certain industrial districts because of mass holidays. July 5 will fall in the middle of the Wakes week for many Lancashire towns and will be a holiday in a number of Scottish constituencies. It now seems likely that a short Bill will be introduced to permit the postponement of polling day in "holiday" divisions.

"Wild Men of Blackpool"

Mr Richard Law was more picturesque than accurate in describing the delegates to the Labour Party conference

as "the wild men of Blackpool," and more than somewhat wrong in implying that the leaders are out of step with their following. In fact, it appears to have been the most orderly and united conference that Labour has held for some years. Miss Wilkinson, in the chair, was able skilfully to canalise a number of rather amorphous resolutions into votes of confidence for the Executive, without being accused of steam-rolling. Votes were taken on two occasions only—on the motion to discuss "progressive unity," where the Executive won a narrow victory, and on the proposal (which obviously had not been very carefully thought out) to introduce flat-rate gratuities for Servicemen, irrespective of rank or sex, where the Executive was heavily defeated.

The imminence of polling day had a sobering and unifying effect. Opposition was not pressed on controversial issues, such as conscription, nor on the shortcomings of the party's election document. The Citrine incident at San Francisco, which was expected to flare up into a major issue between the industrial and political sections, was tacitly allowed to drop. There was a general determination to bury hatchets and let sleeping dogs lie, in order to concentrate on the immediate business of the election.

Labour was perhaps fortunate in having caught the public eye and the public ear for its policy, when the annual conferences of other political parties had been largely forgotten. The Blackpool Conference was, above all, an electioneering conference. Mr Morrison gave good advice to candidates about how to run their campaigns, and the candidates reciprocated by rehearsing their election speeches. Mr Shinwell and Mr Aneurin Bevan injected vitriol into their speeches, such as would only be heard on the eve of a poll.

The conference has demonstrated conclusively that the Labour movement would not tolerate any of its leaders who sought to follow in the footsteps of Ramsay MacDonald. This feeling, indeed, was so strong that Mr Laski was obliged, on behalf of the Executive, to give an assurance that under no circumstances would Labour re-enter a coalition with the Tories, whatever the result of the election. The prospect of post-election agreement with other parties, however, has not been ruled out. It may yet be that Britain will have, belatedly, its *Front Populaire* Government, with the Labour Party inviting other minority parties to co-operate on a common and agreed short-term programme. That, however, must depend on the strength of the parties after the election. In the meantime, the Labour Party is seeking to win a clear majority.

UNCIO: The Last Phase?

Agreement on the major points of a new international charter seems to be in sight at San Francisco. The controversy over trusteeship is subsiding in a series of compromises, the Russians agreeing to a modification of their proposal that independence shall be the goal for peoples under trusteeship, the British agreeing that "strategic areas" shall be placed under the oversight of the Security Council, the Americans that where strategic areas are also populated they may, by a decision of the Security Council, be transferred to the supervision of the Trusteeship Commission.

The remaining differences centre on the crucial question of the Great Power veto. Russia has attempted to adhere throughout to the most strict interpretation of the Yalta voting agreement—that on all matters except procedure the Great Powers should be able to exercise a veto. The Americans and even more obviously the British showed a certain readiness to reconsider the formula and to go some way to meet the strong criticism of most of the "Middle Powers," energetically led by Australia.

The critics demanded that the Great Power veto should be limited to the final decision—the decision to use force. There is a general recognition of the validity of Mr Stettinius' point that the Great Powers alone can carry the physical burden of making and preventing war, and that if they fail to agree, the system to be set up at San Francisco cannot work. But many of the smaller Powers feel that the new League will be robbed unduly of moral authority if the Big Five are to be able to veto any recommendations not involving the use of force which may be made on a dispute by the Security Council. In the last few days, the Big Five have gone a certain distance to meet the criticism of the other Powers. The simple discussion of an issue will apparently not be liable to the veto. It has also been agreed that parties to a dispute may not veto actual recommendations (not involving force), but must abstain from voting. The critics demand, however, that no Power—a party or

otherwise—should have a right of veto at this stage; in other words, that everything—inquiry, discussion, recommendation—save the final decision on force should be passed by a simple majority.

It is unlikely that the Great Powers will make further concessions. Nor is it expected that their critics will press for a general Conference vote to force the issue. They realise that ultimately Great Power agreement is the final safeguard of the new League.

Great Power Agreement

The week has shed little light on the central question whether Great Power agreement is still possible for the settlement of Europe's outstanding problems. Strenuous efforts are being made to arrest the dangerous drift of recent weeks. President Truman has sent Mr Hopkins to Moscow and Mr Davies to London as his precursors, and it is hoped that a meeting of the Big Three may take place before many weeks have passed. Meanwhile, the solution of the two outstanding problems—the Polish Government and the administration of Germany—can only grow more difficult as time solidifies and sanctions policies which may well have started as temporary expedients.

Mr Hopkins's chief task must be to try to convince the Russians that their policies are creating alarm and suspicion in the West. It will not be an easy one. From all they write and say, the Russians appear to be as wedded as ever to the ideal of collaboration with the West. The San Francisco Conference has been given very great publicity in Russia as the best instrument of peace and co-operation after the war. At the same time, the various Provisional Governments set up in Poland and elsewhere are described and apparently thought of as expressions of democratic choice from which only Fascist elements have been excluded. Thus the Russian Government, in its own view anxious to collaborate with the West and doing nothing in its own zone to violate Western principles, faces the criticism of the outside world with apparent bewilderment and attributes it to lingering pockets of "Fascism," notably in any organ of the press in Britain or America which may happen to have voiced dissent. The unoffending *Yorkshire Post* was even taken very severely to task for venturing to suggest that Russia failed to understand the Western approach.

Yet this is precisely the crux of the difficulty. For the West, democracy cannot mean the complete unanimity of policy and expression now covering all Eastern Europe. It cannot condone arbitrary arrests such as were practised on the Polish leaders. Above all, it is at a loss to deal with a situation in which all non-Russian observers and reporters—except for especially "safe" and privileged people, such as the Dean of Canterbury or Mr Stefan Litauer—are excluded from the Russian zone of occupation. If there is nothing to hide, let the defences down. As long as the ban is absolute, suspicion must be bred. Unhappily, these differences of approach are so deeply rooted in the fundamental structure of East and West that only a superhuman effort can overcome them. The Big Three are the only men in a position even to contemplate such an effort. For this reason alone they should meet at once.

Policies for Germany

There is still little reliable news from Germany, but what there is suggests that the division between the Anglo-American and the Russian approach is still great. The first proclamation from Field Marshal Montgomery, as Chief British Controller, does indeed offer the Germans the prospect of food, transport and homes, and promises the demobilisation of soldiers for vital work. But the only guidance for the German people is willing and efficient work. There is little "guidance" from official sources, and the only evidence of reviving political activity was a stern reminder from Hamburg radio that all political assemblies are strictly forbidden. Yet this policy of banning all political action, although it is designed to stamp out Nazism, may end in its survival in the political vacuum which political inactivity creates.

From Berlin, Dresden and Stettin the reports are scanty but uniform. In each case a municipal authority is in office. Shops are being opened, transport restarted. Rations ("bigger than the Nazis'") are available, and the peasants are encouraged to set up free markets in the towns (this appears to be a punishable offence in the western zones). Much of this activity is probably the intention rather than

the actual practice of the Soviet authorities, but the tone in which the people of Germany are addressed is in itself a political factor of some importance. Even if rations are short, it is not altogether discouraging to be told that

they (the Red Army) no longer regard those who have surrendered as enemies . . . by shattering Hitler's regime, the Red Army has saved . . . the German people whom they are trying to lead back now to normal and peaceful life. The Red Army's magnanimity . . . is not an empty gesture, nor does it represent a passing gesture.

It is possible, however, that the divergence in approach between East and West is less absolute than it appears. The most important announcement of the week is probably the statement from Moscow that Marshal Zhukov has been appointed Russian representative on the Allied Control Commission, which will shortly meet. The decision to speed up the trials of war criminals is not only politically desirable. It can also be made an occasion of greater Allied solidarity. In Germany itself, Russian policy is not entirely wedded to sweetness and light. In several broadcasts and articles the necessity of Germany paying "in kind and in German labour" for the ravages done by the Wehrmacht has been stressed. The activity of the Reparations Commission in Moscow (on which Sir Walter Monckton is to sit) may possibly offer opportunities for co-ordinating the Allies' attitude. Finally, it should be obvious that in certain respects the Russian approach to the Germans is saner and more constructive than that of the supposedly more liberal West. Carefully chosen "fraternisation" with decent and co-operative Germans should begin. It is reported that the Allies have now chosen a mayor for Hamburg and a commissioner for the Rhineland, both from the pre-Hitler democratic parties. It looks as though a start is being made on the right lines.

Control of Engagements

The last action of the outgoing Minister of Labour, Mr Bevin, was to draft a new Control of Engagements Order, in accordance with the principles he had outlined to the House of Commons before the Whitsun recess. The

THE WISDOM OF MAKING A WILL

Unless you make a will the provision for your dependents may be different from that which you had intended. Several reasons, including unwillingness to place the responsibility of executorship upon the shoulders of an intimate friend or relative, who may pre-decease you, may have caused you to defer completing plans for the future.

No need exists for further delay, since you can appoint this Company as executor and/or trustee, either solely or jointly with your wife or husband, a relative, or a friend, and thus be assured of continuity of administration and of security. You are invited to ask any branch manager of the Bank for particulars of this service. Alternatively, you may apply to one of the Company's own offices at the following points:

Head Office: Poultry, London, E.C. 2.
Branches: 70 Pall Mall, London, S.W. 1, and in Bangor, Birmingham, Bournemouth, Brighton, Bristol, Carlisle, Hull, Leeds, Leicester, Liverpool, Manchester, Newcastle-on-Tyne, Nottingham, Oswestry, Sheffield, Swansea and Torquay.

MIDLAND BANK
EXECUTOR & TRUSTEE COMPANY
LIMITED

purpose of this Order, as he then said, is to avoid "what I had when I first came into office—a shortage of labour, a flood of advertisements and overdoses of people in some industries and none in others," and to build up a balanced labour force.

The effect of the Order is that from now on an employer can engage a worker between certain age groups (18-50 for men and 18-40 for women) only through an employment exchange or approved employment agency. There are a few specified exceptions to whom the Order does not apply. They include women who are living with their own children under the age of 14; ex-Servicemen or women exercising their reinstatement rights or during their period of paid leave after being released from the Forces; part-time workers; agricultural workers in England and Wales; and fishermen. Managerial and professional appointments are also excluded, apart from certain "scarcity" categories, such as qualified engineers, chemists, nurses and midwives.

The new Order represents a considerable relaxation of the tight manpower controls which were necessary during the wartime period of acute labour shortage. The powers of direction, under Regulation 58A, will be largely kept in the background and the Ministry of Labour will rely mainly on powers of persuasion to secure the allocation of labour between competing claims, though the Essential Work Orders will be continued over a range of key industries. A broad schedule of priorities has already been drawn up—first, the Japanese war; secondly, housing; and, thirdly, civilian industries both for home and exports.

It is clear that so long as there is an overall shortage of labour, and so long as there are priorities in production, the Ministry of Labour must keep a firm grip on the manpower situation. It will be some time before the full effects of returning Servicemen can be felt in industry, and it is interesting to note that the TUC has asked the new Minister of Labour to advance the release date for demobilisation. Mr R. A. Butler, the new Minister, is too wise a politician to seek to curry popular favour for his party between now and the election, by casting aside the elaborate mechanism of labour control, without which the country would be plunged into industrial turmoil.

Demobilisation of Doctors

For some time serving doctors have been writing anxious letters to the medical press raising the question of their demobilisation. They were prompted by fears that they would not be released with their age-and-service groups—some have now had these fears officially confirmed—and by envy of the many, often younger, doctors who have not been called up.

The Central Medical War Committee has attempted to reassure them in a letter sent to all serving doctors. It points out that the Far Eastern war will require a higher proportion of doctors to men than the European war, which means that for releases to take place in accordance with age and service a disproportionately large number of new recruits will have to be found. The Committee claims that very few newly qualified practitioners avoid being called

up, and that this pool will continue to be the main source of supply. But when releases from the services begin to take place, it will then recruit from doctors in all forms of medical work whose deferment will no longer be necessary on their colleagues' return. It has recommended to the Government that the age limit for the continued recruitment of doctors should be between 35 and 40 instead of the limit of 30 for general recruitment.

It is a mollifying letter, and if it is accompanied by action some grievances may be eliminated. But the serving doctor's main grievances are really directed, not at the Central Medical War Committee, nor at their civilian colleagues, but at the medical authorities of the three services. They do not think that civilian doctors have an easy life; on the contrary, they envy them their hard work. With some exceptions, the ordinary medical officer in the forces is grossly underworked. This is largely due to the wasteful organisation of the medical services, under which each unit has to have its own medical officer, even though the armed forces contain the fittest section of the population and in the case of air-crews the fittest of the fit. It is well known for an RAF doctor on a bomber or fighter station in this country to have, perhaps, two hours' work a day. If he complains, he runs the risk of being victimised. The Central Medical War Committee is powerless to act in this respect; the new service Ministers, and the old, should make it one of their first jobs to prod their Directors-General of Medical Services. It is ridiculous for the civilian medical services to remain gravely depleted when there is such a waste of man-power in the forces.

Councils or Cabals?

The National Association of Local Government Officers has produced a valuable and constructive report on relations between local government and the community. Public apathy over local government has shown itself not only in the small number of ratepayers voting at elections, but in the lack of popular interest in council activities and proceedings. Some of the blame, as the report freely admits, must be laid upon the local authorities themselves. Local administration affects the welfare of the citizen at almost every point of his life, and there are a myriad of ways in which its significance can be brought home to him. But public interest is naturally hard to arouse when, as the NALGO report points out, many authorities "make local government almost an esoteric rite, to be performed in secret and by the initiated only." The report accordingly calls for a vigorous policy of publicity which would make full use of the local press, teaching in schools, public meetings, and films and exhibitions of all types. It is even suggested that mathematics could be taught in terms of housing, and chemistry in terms of sewage disposal.

To undertake this programme, public relations committees would be elected by all authorities, full-time officers would be appointed by the larger ones, and (inevitably) a central committee would co-ordinate activities at the national level.

At present, far from advertising their activities, many councils do their best to conceal them. Some councils exclude the press from their full meetings by going into committee on any pretext; others fail to issue proper reports of committee meetings or delay their publication until the next full council meeting. Such practices make intelligent public discussion and comment next to impossible. That NALGO should need to press for their immediate abolition, if necessary by law, is greatly and alarmingly to the discredit of some of the elected representatives of the people. Merely to secure full disclosure of council debates is more vital than any active publicity, besides costing nothing.

Black Week for Japan

The news from the Far Eastern war is encouraging. After weeks of gruelling fighting, the Americans are almost in possession of Naha, capital of the stubbornly defended island of Okinawa. Tokyo has been laid in ruins by exceptionally heavy Super-Fortress raids and Yokohama is still burning after a fire-bomb raid. In China, the Chinese armies which liberated Foochow on the coast are clearing the coastal areas round the town and, although the victory may not be permanent, the Chinese are reported to have recaptured Nanning and freed an area in which the Japanese last year captured a number of American airfields.

The reasons for these sudden Chinese successes are variously reported. Some observers ascribe them to the arrival of American-trained Chinese units. Others suggest that the Japanese are pulling out of South China in order to concentrate their troops for the defence of the mainland. Such a policy would not be inconsistent with leaving very considerable forces of Japanese troops cut off from their main bases to resist the Allied advance in the Dutch East Indies and Malaya. In Indo-China, the local Japanese forces

appear to have broken French resistance in the Upper Mekong valley and they are resisting strongly wherever, in the fringe of their Co-Prosperity sphere, they are in contact with Allied forces.

The smashing of the capital and the gradual closing of the net of defeat have not so far had any striking political consequences. The field of diplomatic manoeuvre in which to secure a modification of the formula of unconditional surrender is severely limited by Japanese ignorance of Russia's intentions. The Soviet Union is, for the time being, the decisive factor in the Far East—decisive and entirely inscrutable.

New Blood for French Cabinet?

Beset as General de Gaulle is with domestic criticism, it is surprising that he has not yet made any move to reflect in his Cabinet the radical mood of the recent municipal elections. As things stand, his problems range from coal strikes in the Pas de Calais and a general strike in Lyons to almost daily demonstrations in Paris against his food minister, and even to raids by ex-prisoners on Paris clothes stores. He would be better able to stand the salvos if his government were broader—if it were to include more representation of the left wing voter and less of the *Mouvement Républicain Populaire* that succeeded so poorly at the polls. (Portfolios held by the latter party include M. Teitgen, who is a good Minister of Information, M. Bidault, who is at least hard-working, and M. de Menthon.)

Delay in shifting the balance of his Ministry would be less remarkable if there were not so many new and good men ready and willing to serve him. M. Herriot, back at the head of the Radical Party, has stated his willingness to take office and is, at the moment, probably the most esteemed political figure in the country. M. Blum, in a frank and dignified speech on Sunday last to the Conference of Socialist Party secretaries, stood out head and shoulders above the rank and file now in office. He, too, has expressed his readiness to serve. More unexpectedly, M. Thorez, speaking at Lille on the latest Communist Manifesto, has stated his party's readiness "to shoulder a larger share of the responsibilities of office within the Provisional Government of General de Gaulle."

If, as the General stated in his victory speech to the Assembly, the end of hostilities is but the beginning of the Fourth Republic, these offers, surely, are the ingredients with which to begin.

Franco in Situ

Interallied discussions on the future of Tangier, coupled with a resolution by the Foreign Affairs Committee of the French National Consultative Assembly calling for an Allied appeal to General Franco to resign, have raised a fresh crop of speculations about the stability of the Spanish regime. But all solid evidence suggests that hopes of change are wishful thinking.

Now that Himmler is dead and Quisling in the dock, General Franco is, *hors concours*, the most unpopular ruler in Europe. Everyone (except his privileged *Falange*) would be glad to see him fall, yet no Spaniard is strong enough, and no foreign government feels strongly enough, to give him a push of the size and style that would tumble him over. Like one of those wooden dolls fashioned with a round and weighted base, he wobbles, but comes back to the vertical.

Inside Spain he is hated for the graft and injustice, the suspicion and stultification of initiative, that he and his *Falange* have injected into every phase of Spanish life. Food cards buy no food; travel permits—essential even for short journeys—are available only to the wealthy or to *Falangists*; secret police of several brands are authorised to eavesdrop and pounce; there are houses to be had for the rich but none for the poor. Of twenty-six million Spaniards, some twenty-five would rejoice to see him go, yet no one internal issue is sufficiently compelling to call for effort from a civil war-weary people whose ruler holds nearly all the tommy-guns.

Thus any impulse strong enough to overthrow him would have to come from outside Spain. It is not, at present, forthcoming. The Republicans in France and Mexico still bicker in factions round their café tables. The Monarchist appeal for resignation, made by the Infante Don Juan from

Making the most of the NATION'S MILK

IN winter the supply of fresh milk falls, but in summer there is a surplus. This surplus can be conserved in a number of ways, one of which is to make Milk Chocolate. Cadburys Milk Chocolate retains the valuable milk solids (fat, protein and lactose). Only the water which comprises roughly 87 per cent. of the milk bulk is eliminated.

Milk Chocolate is a compact and highly concentrated food, easily kept and transported and requiring no elaborate packaging. It retains the full food value of the milk almost indefinitely without special storage or canning.

Cadbury means Quality

INSURE WITH

7, CHANCERY LANE, LONDON, W.C.2

Switzerland in April, fell flat because it offered no progressive policy. The French resolution of May 25th is equally likely to prove abortive. It came from a committee that wields no power. It has already rallied Spanish pride on an issue that is held to be none of France's business. Lastly, most Frenchmen think the country too busy with reconstruction and the Rhine, Syria and the Italian frontier to have any wish to follow it up. Altogether it was a surprisingly futile gesture from a body that is usually better informed than to make recommendations that it cannot follow through.

For intervention in Spain's internal affairs is an unlikely move to expect from either the British or the American Governments. Both have their hands full elsewhere, both are by instinct non-interveners, and both—the British primarily in order to buy and the Americans primarily in order to sell—have begun to re-establish trade relations with the Franco Government. The British Ministry of Food is buying dried fruit and the Americans have secured a concession for a large commercial aerodrome outside Madrid and are said to be negotiating deals for renewing Spanish rolling stock and Spanish taxis.

General Franco, therefore, sits pretty. In order to conform, at least outwardly, to the standards of the post-war world, he has abolished the press censorship, offered "benevolent treatment" to any "Reds" who care to return, and instituted the drafting of a Magna Carta called the *Fuero*. He is even talking of disbanding the *Falange*. But, in fact, special tribunals are still competent to try "Freemasons and Communists." These terms will no doubt remain elastic.

The Future of Tangier

General Franco's position is quite other when the future of Tangier comes into question. Here is one of the points at which he most blatantly took advantage of his Axis affiliation. In June, 1940, he threw over his obligations under the port's international statute and began a military occupation, "for purposes of preserving neutrality," when France was falling and Britain at her lowest ebb. In the following November the officer commanding the Spanish troops in the zone took over full control with the title of Governor. At the time, General Franco no doubt felt that he could afford to snap his fingers at the British Government's protests and at its reservation of the right to bring up the subject later. Tangier became a useful centre for Axis agents. To-day the boot is on the other foot. When the moment comes for Allied pressure, the General must give in or go. It is safe to predict that he will give in.

At present, preliminary discussions on Tangier's future are taking place between the British, French and American Governments. They are interesting not only as a well-merited reversal of the scales of justice, but also because the United States—not hitherto a signatory of the Tangier Statute—seems likely to become one when it is revised. There seems no doubt that the port will remain international. Because no one power could afford to see it pass to any one other, it became so *de facto* during the chaos which reigned in Morocco in the last century. It was so consolidated *de jure* in 1923 by the three Mediterranean powers chiefly interested—Britain, Spain and France. The Statute then signed was revised in 1928 when they opened their ranks to admit Italy.

In practice, the pre-war Statute worked out to the advantage of France, in her rôle as protector of the biggest and best zone of Morocco. General de Gaulle's Government is therefore unlikely to press for any revision other than the re-exclusion of Italy. The Americans would no doubt prefer changes sufficiently extensive to include them among the authorities responsible for the port and to further their new interest in commerce and communications throughout north and west Africa.

As there is now a long waiting list for *The Economist*, subscribers who wish to renew their subscription are advised to do so immediately upon receipt of a renewal notice. If they fail to do so, their subscriptions will be automatically cancelled on the date of expiry, and this may mean a gap of many months before the despatch of copies can be resumed.

Lord Wavell's Mission

In spite of the dominating influence of domestic subjects at election time, there is at least one matter of foreign policy which cannot well be kept beyond discussion. Mr Bevin last week added to the existing pledges of the Labour Party towards India by promising to close the India Office and transfer its functions to the Dominions Office. It was a gesture of good will—the kind of gesture from British hands that Indians might appreciate the more for their rarity in the past. The practical results of such a move, however, would not be, as Indians know, so great. The transfer of Indian matters to an Indian section of the Dominions Office cannot alter the fact that the policy pursued—so long as the United Kingdom Government has any responsibilities in India—must necessarily differ from the relations maintained with other Dominions.

Meanwhile, Lord Wavell's visit to London is nearing its end. He has been here two months, and nothing has so far publicly emerged from his discussions. On the eve of an election, some forward-looking step to steal the thunder of the Labour guns might easily have been expected. If nothing does emerge, Mr. Churchill's party cannot avoid some embarrassment at the polls, and the Indian situation cannot but deteriorate. As it is, nationalist opinion in India is hoping to make the best out of the election, and, failing that, might well be prepared to follow extremist advocates of more forceful methods. In that case, the more moderate and constructive proposals from either side will be passed over. The most recent of these has come from Mr Rajagopalachariar, the former Congress Premier of Madras. He has suggested three alternative proposals, based on the federal principle, to provide an interim government at the centre until a more permanent Constitution could be worked out.

The O'Neill Inquiry

The conviction of Reginald Gough of the manslaughter of Dennis O'Neill left all who followed the case anxiously wondering how it was possible for children to be boarded out with such foster parents and how it was that they were allowed to remain in their care for six months without being adequately supervised.

Sir Walter Monckton's report published this week tells the story in full. In view of the tragic end to the case it is a horrifying story—not because there was any gross neglect on the part of either local authority, though the Home Office rules for the medical examination and visiting of the children were not complied with, but because of a whole series of misunderstandings, delays, deferments, unanswered letters and misplaced documents, most of them the typical acts of official carelessness which normally merely cause exasperation, or amusement, but which can obviously add up to a very serious result.

But above all there was a complete lack of any sense of urgency on the part of either the Newport or the Shropshire authorities and a complete lack of any sense of personal responsibility for the children. Sir Walter Monckton points out that the relation between the "fit person" to whose care a child is committed and the child is a personal one. "The duty must neither be evaded nor scamped." Yet the local authorities in this case dealt with the children by infrequent letters and through subordinate staff who had not the qualifications or the experience for dealing with such a matter.

Sir Walter Monckton places the primary responsibility for failure to discharge the obligation they had undertaken on the Newport authority. But he also places some blame on the Shropshire authority, which among other things declined to accept the supervision of the children, after they had been at Bank Farm for five months, because Newport was paying a higher rate of allowance than the Shropshire rate. As he points out, it would have been better to carry out the supervision first and settle the administrative difficulty later. But the story has a wider moral. One justification for the red tape procedure of central and local authorities is that it is necessary to enable the machinery to go on running in the event of the absence of any particular official. The O'Neill case shows that not only is the procedure not infallible for that sort of contingency but that it may be a positive hindrance to action. Many of the difficulties in the case could have been settled, and Dennis O'Neill might still be alive, if a responsible official had picked up the telephone. Instead, the matter was left to be settled by letters and reports. Surely the right procedure is to act first and document afterwards.

AMERICAN SURVEY

The Trade Agreements Bill

The passage by the House of Representatives of the Doughton Bill is the most concrete sign yet visible of Congressional support for the Administration's foreign economic programme. The Bill provides for the extension and broadening of the programme of reciprocal trade treaties to permit the executive to make reciprocal trade treaties under which tariffs on particular commodities might be reduced by as much as 50 per cent below the present levels. The Bill now goes to the Senate, where it will meet with even sturdier opposition, although at least two Republican Senators, Mr Tobey of New Hampshire and Mr Aiken of Vermont, have pledged President Truman their support.

An analysis of the final vote of 239 to 143 in the House is considered significant, in that 33 Republicans crossed the floor and voted with the Democrats; while 12 Democrats joined the opposition. Supporters of the Bill repelled every Republican attempt to modify it and defeated by 212 to 181 a Republican motion to send it back to Committee, which would have meant certain death to the Bill in its present form. In this vote seven Republicans voted with the Administration, while thirteen Democrats voted against it. The House of Representatives contains 242 Democrats and 190 Republicans. The strongest opposition centred on the provision for cutting rates to 50 per cent below current levels, but other amendments ranged from one limiting the programme to two years, to a piece of special pleading that would have prohibited duty reductions on pottery and glassware. Mr Truman's letter to the House, read by Speaker Rayburn, in which the President frankly said he considered the measure of the first importance for the success of his administration, is believed to have played a large part in securing the majority.

The Administration has been further heartened by the approval of the Bretton Woods Bill by the Banking Committee of the House of Representatives. The Bill was sent to the floor of the House with a vote of 23 to 3. Fourteen Democrats, eight Republicans and one Progressive voted for and one Democrat and two Republicans against. Amendments to the Bill were made chiefly to meet criticism of the powers of the international bank and the stabilisation fund. Thus, as it goes to the House floor, the Bill provides for a Bank with authority to make long-term stabilisation loans, while the Fund is limited to short-term loans. The US member of the Board of Governors of the International Bank of Reconstruction is also to represent the country on the board of the International Monetary and Stabilisation Fund.

Mr Hoover Enters the White House

Mr Truman's Cabinet changes, which met with general approval, were overshadowed by his invitation to ex-President Hoover to talk over Europe's food problems and the announcement of the missions to London and Moscow of Mr Joseph E. Davies and Mr Harry Hopkins. Mr Hoover has not set foot in the White House since Mr Roosevelt replaced him at his inauguration in 1933, and it was assumed that only very strong necessity would have induced the new President to make so conspicuous and highly controversial a move. A variety of big assignments was immediately predicted for Mr Hoover, but the most liberal commentators were frankly worried at the shape this first divergence from Mr Roosevelt's policies had taken.

They pointed to the undeniable fact that Mr Hoover and his policies have been thoroughly rebuffed by the American public, not just in the 1932 elections, but in every election since, and they feared the effect of this much-publicised visit on the resistance movements of Europe and on the Soviet Union. They recalled the bitter criticism of Mr Hoover's alleged use of food as a reactionary political weapon in his position as head of the inter-Allied Food Council after the last war.

No matter how well founded these fears are, or how well based the lack of trust in Mr Hoover, certainly the missions of Mr Davies and Mr Hopkins, which by-pass the State Department, are more significant public expressions of the

new President's vigorous attempt to build upon a stronger base the constantly fluctuating relations between America, Britain and the Soviet Union. The selection of Mr Davies might almost have been the President's method of assuring Marshal Stalin that the suspected joint Anglo-American policy toward the Soviet Union at least did not have his support. Mr Hopkins, on the other hand, knows and understands Mr Roosevelt's understanding of the Yalta agreements better than any living person.

Viewed in this context the Hoover talks tend to fall into a different political position, particularly since later invitations were issued to the Republican candidates of 1936 and 1944, Mr Landon and Mr Dewey. Mr Truman may well be willing to pay the price of listening to anything that Mr Hoover has to say on the subject of feeding Europe, if in return he can use the talks as an almost brutally blunt way of approaching the problem of winning support for his foreign policy from the Republicans in Congress. It is quite possible, for example, that Mr Truman's ear has been well filled by his Congressional friends on the hazards that will face the San Francisco charter when it comes before the Senate.

An Idle Gargantua

Unquestionably the most gargantuan piece of surplus property in the United States is Willow Run. By August the last Liberator will have rolled off its lines and its approximately five million square feet of space will be vacant. Mr Henry Ford, who operates the plant, has expressed total unconcern about its future. Thus far, the most persistent and interesting rumour concerning the

Send your factory round the world

The old method of export selling was arduous and slow. The Sales Director with his samples and specifications tried to interest buyers, and successes were hard won.

The modern Sales Director is armed with a new tool. The film can carry overseas, in as many languages as you wish, the whole carefully considered story of your product and organisation, equivalent to a personally conducted tour of your works. It can also provide your representatives with the proper prestige background and help them to make new contacts. It is clear that British salesmen will in future have to compete with others already so equipped.

To make such a film you must have the advice of creative people, experienced in the art of successful film propaganda, backed by the best technical resources.

THE FILM PRODUCERS GUILD

PRODUCERS AND DISTRIBUTORS OF DOCUMENTARY INDUSTRIAL, EDUCATIONAL AND NATIONAL PROPAGANDA FILMS

Full particulars of the Guild, and the services it offers, can be obtained from the Secretary, Guild House, Upper St. Martin's Lane, London, W.C.2

future of the giant plant is that the Congress of Industrial Organizations has been looking at it with a calculating eye. Mr R. J. Thomas, President of the CIO Automobile Workers of America, is said to have had conversations with men interested in using Willow Run to build automobiles that will travel 40 miles on one gallon of petrol. Willow Run would be a very brave first venture in management for the CIO.

There has been so great an exodus of workers from the plant that Detroit already has been reclassified from a critical to a shortage labour area. Running at capacity, Willow Run has had 21,000 workers on its pay-roll, with 9,000 in other Ford operations making components. Throughout the country 100,000 workers have turned out parts for the giant plant, at least 70,000 of them in Detroit alone.

Thus Congress, still in search of a decisive policy on the disposal of \$15 billion worth of surplus war plants, has reason to consider with special interest and sympathy a plan put before it by the former Attorney-General, Mr Biddle. The selling price of a plant would be fixed on the basis of post-war "use," to be determined over a three-to-five year period during which the plant would be leased. The one important requirement would be that the lessee must guarantee to keep a predetermined number of workers employed. Default would mean returning the plant to the government. The yardstick, then, would be not cash paid, but jobs created.

The capacity of the country to produce goods is estimated to have increased by one-third during the war years, and sponsors of small business consider it all-important that this great new plant should not be ceded to monopoly interests on their own terms, to scrap if unprofitable, regardless of the public interest. Four-fifths of the government war plants are concentrated in the hands of 150 corporations. In steel, for example, three-fourths of the government's facilities are operated by five big corporations, 40 per cent of them by the United States Steel Corporation.

Mr Biddle's plan is almost identical with one presented to the Small Business Committee earlier in the year by Mr Henry Kaiser. Here the lease of property with job guarantees was proposed, with sale when the job guarantees have been made good.

The Battle of Freight Rates

A recent ruling of the Interstate Commerce Commission that railroad freight classifications were "unreasonable and unduly prejudicial" brings to a climax an investigation that has been pending for over five years. For the southern, south-western and western states, which have alleged that discriminatory freight rates have hampered industrial development in these regions, this is a great victory. The ruling gives the railways 90 days to submit proposals for a uniform method of freight classification as a preliminary to establishing a new scale of rates.

It is believed that the ICC action was finally precipitated by a previous decision of the United States Supreme Court to open its tribunal to a case filed by Governor Arnall of Georgia, for his state against the railroads operating within its borders. The suit charges that twelve rail lines in the eastern territory and eight lines in the southern territory have manipulated freight rates to the disadvantage of the southern states through a complex bureaucracy of rate bureaus, committees and rate-fixing agencies.

The battle over discriminatory rates began in earnest in 1937 when the Southern Governors' Conference was organised chiefly to fight for lower freight rates. The Board of Investigation and Research, established by Congress in 1940 to survey the nation's transportation facilities, joined with the Tennessee Valley Authority to recommend relief to southern states. President Roosevelt stated that "freight rate barriers . . . help keep the south on a raw material production economy."

But the ICC has hesitated, perhaps over-anxious to display that it was immune to pressures, turning a deaf ear to Congressmen from affected regions, whose passionate speeches calling for lower freight rates liberally sprinkle the *Congressional Record* of the past seven years. The industrial east, allied with the railroads, has proved to be a powerful opponent. Governor Dewey of New York has been in the forefront of those who apparently are not convinced that industrialisation of new regions will open new markets to eastern manufacturers.

* * *

Another Election for the US

The American public is uninhibitedly participating in, and apparently enjoying, the British elections, with none of the scrupulous reserve displayed by the British press last November. At first the headlines, "Churchill Resigns," spelled disaster, for the average American is unfamiliar with British government procedure. In America, presidents just do not resign. They are decently elected and re-elected, on schedule, the first Tuesday after the first Monday in November, every four years. But after the public had learned its lesson in British political science from press and radio, it settled down to watch the election of a country from three to six thousand miles away with more interest than it had ever shown in any election other than its own.

There has been a note of incredulity in American speculations about the possibility of Mr Churchill's defeat—comparable to the feeling of British commentators last November who, while recognising the danger of a Roosevelt defeat, still felt in their bones that he would be part of the Big Three again. Mr Churchill, who has been most often criticised by the isolationist press for luring America to war, has now one of his most impassioned supporters in the *New York Daily News*, which says that he should be given a dukedom in his own name and that, if he is not re-elected, "there is no gratitude in England." The *Journal American*, a Hearst paper with decidedly Anglophobe tendencies, now pays Britain the compliment of telling its readers that whoever wins, the government will be in the hands of trustworthy and able men. Admiration for Mr Churchill is not, of course, confined to the isolationist press. Conservative papers, which are overwhelmingly in the majority in America, see in him the bearer of the banner against world Socialism. There is fear that if Labour wins and Britain takes steps towards Socialism, America will be isolated from the other two-thirds of the Big Three. The Left Wing and Liberal papers, though admirers of Mr Churchill as a war leader, have been voluble critics of his foreign policy and would like to see a Labour victory.

It would be very foolish of anyone on this side of the Atlantic to take the slightest offence at all this. It will not affect the outcome and presents a golden opportunity for demonstrating that, whatever other people may be, the British are not touchy. Indeed, there is some real value in it, for such intense, though vicarious, interest in other people's affairs is hardly a sign of isolationism.

Letters to the Editor

Electrical Engineering

SIR,—You bring up, *inter alia*, on page 603 of your issue of May 5th the question of the relative prices of electric lamps in this country and the US. This seems to be a special point of grievance, and it seems worth while to make two points which I have not seen brought forward before.

The first is that up to the war one could buy a 60-watt pearl electric lamp for 6d., which is more or less the equivalent of 10 cents (the US price often quoted). Even to-day the same lamps are available at 10d., including purchase tax, so that it is still unnecessary to pay ring prices. Admittedly these lamps do not embody the very latest improvements covered by ring patents, but the layman has only advertising statements to indicate whether they are so very materially deficient as a consequence. Certainly, I personally have never paid more than 10d. for a 60-watt lamp for about 15 years, and have not noticed (a) an increase in the electricity bill or (b) any reduction in the life of the lamps. Before the war one could obtain these low-priced lamps to suit voltages between 100 and 230, so that one at least of your points does not appear to be completely valid.

The second point is that some American authorities supplying power used to supply lamps and replace them free as part of the service. That this practice was not necessarily to the advantage of the consumer was recognised by the Illinois Commerce Commission when they ordered the Commonwealth Edison Company in 1932 to reduce their rates by 0.15 per cent per kilowatt-hour in cases where consumers preferred to buy their own lamps. (This works out at 9 cents per 60-watt lamp assuming the usual average life of 1,000 hours.) While I do not know to what extent this form of free replacement service is now operative in America, it is clear that it would tend to reduce lamp prices there.

These two points do not, of course, affect your general thesis, with which a good many people—including myself—will cordially agree.—Yours faithfully,
Bolton P. C. SMETHURST

The Prospects for Exports

SIR,—Your article in your issue of May 19th is not encouraging in respect of textiles and clothing. There is another section, however—export of raw wool—in which this country played an important part before the war. The country is now the possessor of many million bales of wool more than it can possibly use on its own machinery during the next two or three years. There are a number of well-organised firms in Bradford and London whose pre-war business was the export of wool from this country or from the Dominions to various European destinations. The greatest desire of these firms is to return to full activity on pre-war lines. What has their experience been during the past few months in which a resumption of shipping has occurred to France, Belgium, Spain, Portugal and Turkey, with prospects of shipments to Greece, Yugoslavia, Holland and elsewhere? Such shipments as have occurred have been arranged between the Governments concerned, and the private exporting firms have been allowed a small commission, in some cases for acting as forwarding agent as far as the British port.

Pre-war exporters need no plea from you to become more active. At present they seem to be prevented from doing so by the facts that:

(a) Our Government owns the wool and prefers to sell direct.

(b) Importing countries prefer to buy as Governments.

(c) Receiving Governments have no arrangement whereby a quantity of wool could be allowed to each mill and the mill select its own private supplies in Bradford, as it used to do before the war.

(d) The Governments appear to prefer to trade rather than erect the necessary financial communications and leave the trading to the traders.—Yours faithfully,

BRADFORD EXPORTER

THE WORLD OVERSEAS

Nazi Legacy in Norway

ON the Norwegian people the Nazis imposed an artificial economy which lasted for five years and a month. Germany's war economy could only use Norway's natural and industrial resources if at least some of the food and raw materials previously imported from overseas were supplied from the continent. Even had that been possible, the Nazis would have needed the co-operation of the Norwegian people for making a success of their plan of turning Norway into an industrial supply base. But the Norwegian people never co-operated with the Nazis or the Quisling government; and the economic position of Norway under occupation disappointed the Nazis from the very beginning.

The relatively high standard of living of the Norwegian people declined gradually as soon as Norway had been cut off from its overseas supplies. It is interesting to note that the Germans were not able, even at the height of their military conquests, to supply adequate quantities of foodstuffs and raw materials for a population numbering only three million. Thus, agricultural self-sufficiency was imposed on Norway, a country where natural conditions are unfavourable for an adequate production of foodstuffs. The experiment of expanding the cultivation of cereals, root crops and even oilseeds demanded a disproportionately high outlay in capital and labour. The area under cultivation was expanded at times by more than 20 per cent, but there was nothing like the same increase in the production of food. Of all the European countries under German occupation, it was Norway which experienced the biggest reduction in livestock, in spite of the manufacture of large quantities of

cellulose for feeding cattle. The fishing industry, on the other hand, which could have supplied valuable food, was forced to work for export to Germany. The small imports of cereals from Germany made no difference to the general situation, and the Norwegian population had to put up with very small bread, meat and fat rations.

Germany's military and economic needs were opposed in Norway. A large army of occupation had to be maintained. For most of the five years, roughly 400,000 German soldiers, civilians and prisoners of war lived in the country. The construction of roads, fortifications and harbours for U-boats demanded vast quantities of material and a large number of workers. About 100,000 Norwegian workers were in the almost permanent employment of the Germans.

Step by step, the Nazis introduced their own totalitarian compulsion. Compulsory labour was first introduced in 1942, to which labour conscription was added in 1944. This measure brought the economic and political resistance of the Norwegians up to a new pitch. The young workers evaded labour conscription by hiding in the countryside or fled to Sweden and Great Britain.

The German army of occupation was assisted by military and civilian economic commandos. A wages, price and dividend stop was imposed after the German model and for the most part was maintained, although on several occasions prices had to be greatly increased. Black market activities became, naturally, almost a patriotic virtue, but so far as foodstuffs and other necessities were concerned, purchases on the black market were inevitable if undernourishment and privation were to be avoided.

An important fact is the failure of all attempts by the Nazis to form a Norwegian "Naehrstand," that is, the com-

pulsory organisation of peasants and farmers, or a "Labour Front." The employers, however, were finally organised in "economic groups" after the German model, but this organisation remained more or less formal. The trade unions whose chief leaders were executed were able to maintain a nucleus of their organisation.

The withdrawal of German troops, civilians and prisoners of war will take weeks and perhaps months. In Finnmark, the most northerly Norwegian province, the few towns and villages were destroyed when the German armies withdrew from Finland. All along the long coastline of Norway the Germans have left behind new roads and massive fortifications in concrete and steel. Some of the new roads and the harbour improvements will be useful for peacetime, but most of the material and labour sunk in the fortifications will be wasted.

During the occupation Norway's forests were indiscriminately exploited; and it will take years to restore the ravages. Wood was the most important substitute for raw materials formerly imported from overseas. It was used as fuel, fodder and industrial raw material. Before the war Norway imported on an average 3 to 3½ million tons of coal and coke annually, but the Germans were able to deliver only some 2 million tons of coal and coke for the first years, and during the second half of the occupation these imports gradually decreased. In spite of far-reaching plans for doubling the generation of electricity by new hydro-electric stations, the actual expansion of the capacity remained very small. The shortage of raw materials and labour prevented the planned increase in the production of aluminium and magnesium. The mining industry, especially the mining of pyrites, zinc, lead, nickel, wolfram, molybdenum and cobalt, expanded hardly at all under German occupation. Numerous new firms were founded as subsidiaries of German concerns, but even the famous chemical works of the Norsk Hydro, in which the German IG Farben concern had large capital interests, could not maintain production during the last years of the occupation. The attempt to use a substitute for bauxite, which was formerly imported from overseas, failed and during the whole occupation period aluminium production was less than the pre-war record production of roughly 30,000 tons. It seems that during the last years of

the occupation all development work had to give way to the construction of fortifications.

Norway's economic losses are substantial. Roughly fifty per cent of the merchant fleet has been lost during the war. The fleet of fishing vessels has also been depleted. The merchant fleet was Norway's most important industry and enabled the country to pay for its large import surpluses in peacetime. The costs of occupation have become a large national debt probably amounting to some Kr. 10,000 million. The country's actual financial position at the time of liberation is, however, obscure, for the Nazis stopped the collection and publication of all financial statistics. The reports of the leading banks were kept in general terms, and not even the amount of the note circulation was made public.

Fortunately the productive capacity of Norway remained largely intact, but a disproportionately large number of workers is needed at the moment to maintain agricultural production. Industry and indeed all the towns are at present badly in need of imported food, raw materials and machinery. Rehabilitation will depend on normal imports which will enable the available manpower to be redistributed between agriculture, industry and shipping services.

Eire's Finances

[FROM OUR DUBLIN CORRESPONDENT]

ALTHOUGH nothing corresponding to the Budget White Paper exists in Eire, the Budget speech is becoming, as in other countries, a review of the whole economic position of the country rather than a mere exposition of the state of the public finances. The Budget speech this year contained a survey of the effects of five years of war. Between 1938-39 and 1943-44 the gross output of agriculture rose in value by 79 per cent, while the value of the net output increased considerably more—by 103 per cent—because of the scarcity of raw materials. Agricultural prices nearly doubled during the period. The gross volume of agricultural output declined by 11 per cent. Between 1938 and 1943 the value of the net output of industry increased by 16 per cent, but the volume declined by 24 per cent. The volume of building declined by two-thirds. The value of imports declined by 32 per cent and the volume by 70 per cent. The value of exports increased by 22 per cent, but the volume declined by 44 per cent. Visible imports exceeded visible exports during the war by £16 million. It was the large credit balance on invisible account that caused the accumulation of sterling assets. For the first time official estimates of the national income are available. The figures for the years 1938-44 are:—

Year	£. million
1938	153
1939	163
1940	178
1941	194
1942	215
1943	240
1944	250

When allowance is made for the increase in the cost of living, which rose by 70 per cent, it appears that the real income of the country in terms of goods and services declined. The consumption of food, drink and tobacco has been well maintained, but consumption of many other goods and services, for example fuel and transport, has been drastically curtailed.

For the financial year ended March 30, 1945, revenue amounted to £46,175,495 and expenditure to £43,779,732. The revenue was £395,000 in excess of the Budget estimate and £2,395,000 in excess of the yield of the previous year. This result was caused by the buoyancy of income tax and corporation profits tax. The Minister for Finance admitted that these taxes are unduly high and expressed the hope that they could soon be reduced. Among indirect taxes, tobacco yielded £9,500,000. The deficit of £1,749,000 compared favourably with the estimated deficit of £3,375,000. It was, however, greater than in the previous year in spite of the increased yields of many taxes. The principal factor causing the deficit was the large expenditure on the Army and other defence services, which amounted to £8,147,000, compared with £1,766,000 in the last pre-war year. The cessation of the European war will enable large numbers to be demobilised. The consequent savings under the Army vote will be more than offset by issues in respect of demobilisation gratuities, deferred pay and the cost of resettlement and unemployment insurance. It is, however, comforting to the taxpayer to know that the expenditure on defence services has passed its peak and will henceforth continue to decline.

The deficit was financed by ways and means advances, the sale of savings certificates and the reduction of the balance in the Exchequer.

Growth in Expenditure

Based on the rates of taxation at present in force, revenue in the financial year 1945-46 is estimated at £47,995,000, an increase of £1,820,000 over last year's actual revenue. Unfortunately expenditure will increase even more. The estimate for central fund and supply services is £52,367,000, of which supply services amount to £47,166,000, a new record. The main constituents of increased expenditure are an increase of £1,224,000 for subsidies for food and fuel, of £682,000 for children's allowances and of £620,000 for an additional bonus to public servants. The cost of the civil service continues to mount. With the growth of state activity the number of officials necessarily expands. At the beginning of this year the number of civil servants was 30,333, which seems excessive for such a small country. Expenditure on social services in the current year will amount to £9,686,000, compared with £9,273,000 in 1944-45 and £7,494,000 in 1943-44. The provision in Eire of the Beveridge proposals would involve an annual expenditure of £38 million, of which the state contribution would be £23,500,000. The more modest Treasury White Paper proposals would involve expenditure of £36 million, of which £20,200,000 would be contributed by the state. Conditions in Great Britain and Eire are so different that the extension of British social services is not in every case desirable. In any event, these estimates show that Eire could not possibly afford services on the scale proposed in Great Britain. When adjustments are made for slight alterations in taxation and for expenditure of a capital or non-recurrent nature, the final estimates of revenue and expenditure are £47,942,000 and £51,649,000 respectively. The deficit of £3,707,000 will be met by borrowing.

The capital liabilities of the state continue to grow, though, compared with countries that have not enjoyed the benefits of neutrality, the rate of growth is relatively moderate. At the end of the last financial year liabilities amounted to £83,730,668, an increase in the year of £919,000, and assets amounted to £36,500,926, a decrease of £512,000. The estimated capital value of the state's liability in respect of housing amounted to £9,351,000. The net debt of local authorities amounted to £25 million. The state was liable to depositors in the Post Office Savings Bank and in Trustee Savings Banks to the amount of £31,199,000. There were also many contingent public liabilities amounting to about £60 million. A rough estimate of the capital value of the state's present liability in respect of civil service pensions is £21 million and in respect of national teachers about £15 million. Estimates for Army and Police pensions are being prepared. It is evident from these figures that the public debt of Eire is assuming substantial proportions. It must be remembered, however, that the whole debt is internal and that interest rates are low, as befits a strong creditor country. It must also be remembered that Eire suffered very little damage to real capital during the war and will not be faced with the disheartening task of rebuilding. As far as capital is concerned, every future construction will represent an addition to the existing stock and not a mere replacement of something that has been destroyed.

Palestine's Imports

[FROM OUR JERUSALEM CORRESPONDENT]

FOR a long time it has been maintained by local opinion that for political reasons—in order to placate Middle Eastern land-owners—Palestine has had to import superfluous quantities of grain from adjacent countries at exorbitant prices, and recent information indicates that there may be some truth in this allegation. In spite of an increase in the domestic production of crops, which has been more or less equivalent to the increase in population, and in spite of the fact that Palestine's standard flour now contains thirty per cent of barley and wheat and is milled to a ninety per cent extraction, imports of grain and flour have risen from some 100,000 tons in pre-war years to some 150,000 tons in 1943 and to about 220,000 tons in 1944; the greater part of this is barley and wheat bought in the Middle East at prices ranging in most cases from £P40 to £P50 per ton. It is also strange that the number of recipients of standard flour rations is now stated to be in excess of two millions, whereas the total population of the country is officially estimated at 1½ million persons. And it has been calculated that by a better import policy the

Government would virtually do without the standard flour subsidy, which in 1944-45 amounted to some £P25 million.

On the other hand, there are acute shortages of many raw materials and industrial equipment. The total quota of cotton yarn allocated to Palestine for 1945 by the Middle Eastern Supply Centre amounts to about 1,800 tons, whereas the quantity required is at least 3,800 tons. Iron and steel materials required are about 10,000 tons, while the quota allocated is only about 5,000 tons. The quota of tinplate is 500 tons, against a demand of over 2,000 tons. Dyestuffs are in such short supply that leather production has already been reduced and a breakdown in local textile production is imminent—although aniline exported from England to other Middle Eastern countries is being re-sold to Palestine in the black market. Woollen yarn, paper and cardboard, and many chemicals may be quoted as other examples. The local metal-working equipment, which for years has been working at heavy pressure on military needs without replacement, is so completely worn out that even with those units which the MESC has allocated for Palestine in 1945 the Government scheme for consumer-goods production cannot be properly carried out. Urgent replacements are needed in other industries as well, and orders may run into several million pounds. Civil transport requirements have been estimated at some 2,000 omnibuses and lorries and a number of smaller vehicles; railways are badly in need of new rolling stock. And there is, of course, a large accumulated demand for building materials and all kinds of consumer goods.

Britain's Chance

In 1943, the volume of Palestine imports was only 41 per cent of 1939, but its c.i.f. value was almost £P20 million (exclusive of petroleum products), against a total of £P17.9 million in the peak year 1935. In 1944, there was a substantial increase, both in terms of goods and of money, and there is every likelihood that post-war imports will be maintained at a level even higher than this. Of the pre-war imports, however, only twenty per cent (in 1938) were from the United Kingdom and Empire countries, and nineteen per cent came from Germany, Italy and Japan. In the case of many goods which could have been supplied by Empire sources, the share of the Axis countries was much larger; for example, it was fifty per cent or more in the following articles: industrial machinery and parts; aluminium sheets and foil; rubber thread and yarn; door and window fittings; steel pipes; cutlery; and cotton and piece goods. The removal of this competition may therefore open up good prospects for a British export drive, which will certainly meet with a friendly response. For these possibilities to be realised, however, Britain must be able to deliver the goods required in due time and at reasonable terms. This point needs stressing, first, because of the stringency of Middle Eastern controls, which sometimes ban imports of goods not actually in short supply; and, secondly, because American firms also have a lively interest in exports to the Middle East, and Palestine can afford to pay for American goods with the dollars it gets from its diamond exports (in 1944 some \$14 million) and from the income of Zionist funds (last year some \$8 million). In fact, the latter have already been set at the disposal of the Jewish Agency.

THE BUSINESS WORLD

The Future of Bank Advances

WHAT part will the banks be called upon to play in the post-war financing of industry? More particularly, how far will their contribution be made in the traditional form of loans and advances? These have been questions for animated discussion in bank boardrooms for many months past, but, so far as can be gathered, the bankers themselves are still without settled conclusions upon them. It is, perhaps, hardly necessary to point out that the rôle of the banks in the transition phase is not a matter that lies, to any significant extent, within the sphere of bank policy. In the absence of far-reaching changes in the traditional character of bank lending, and a sweeping movement towards "industrial banking," the extent and manner of bank assistance to industry must be very largely determined by forces outside the banks' control. The uncertainties and differences of view in banking circles to-day reflect, not any wavering on what bank policy should be, but simply the sheer difficulty of estimating the strength and nature of these external forces.

The whole problem divides itself naturally into three parts. First, there is the uncertainty about future Government policy. Government organisation for war has been such that a physical output far surpassing what might have been foreseen in the early days of the war has required a volume of direct bank advances only three-quarters as large as in 1939—despite the intervening rise in prices. In what directions, if any, will the techniques and policies that have made for economy in bank advances be perpetuated after the war, and how long, otherwise, will it be before they are discontinued? Secondly, how liquid is industry, both in the limited book-keeping sense and in relation to its prospective needs? Here, too, important questions of Government policy arise—notably, on the termination conditions of EPT. Thirdly, there is the question of the long-term secular trend of bank advances. Will the tendency, noticeable in the inter-war years, for industry to become increasingly "self-financing" become steadily more pronounced in future?

These are difficult questions, and it would be rash, at this stage, to attempt to suggest what the final answers may be. But it is certainly possible to indicate the salient factors in each equation. Clearing bank advances at the outbreak of war stood at £985 million and, after a moderate rise while the mechanism for prompt Government payments was being evolved, fell almost uninterruptedly until November, 1943. Despite two spasmodic upward movements since then, they are now back to a level only £15 million above the low point and £245 million below the pre-war figure. The causes of this decline are now well known, though their relative quantitative significance remains uncertain. First, perhaps, in importance was the closing of the principal commodity markets, the supersession of the merchanting organisations, and the concentration of import trade in Government hands. A closely related operation was the Government acquisition of privately owned stocks of many vital materials. Secondly, even in the early months of the war, the abrupt cessation of certain inessential activities, and the injunction to the banks to lend only for purposes essential to the war effort, produced a steady reduction in advances to the building trades, in those for "financial" advances and hire-purchase business, and in finance for property deals—three categories of particular pre-war importance. Thirdly, as the war progressed and produced really marked contraction of civilian industry, especially after the Limitation of Supplies Order and the launching of the concentration schemes, there were very heavy repayments of miscellaneous industrial and trade advances as stocks in the hands of manufacturers, wholesalers and retailers ran down. Finally, the war brought relative prosperity to various producers, notably the farmers and small manufacturing businesses, and liquidated many overdrafts that seemed "doubtful," if not actually "bad," before; and there was also a steady repayment of local authority indebtedness.

On the other hand, the rapidly expanding sector of the war economy did not make equivalent offsetting demands

on the banks. The main factor here has been the increasingly efficient and very liberal, system of progress payments on Government contracts and, *via* the main contractors, on subcontracts too. Some contractors, indeed, are known to have secured payments exceeding their outlays and, because of delays in costing and final settlement of contracts, were able temporarily to employ the excess receipts as a contribution towards the financing of fixed capital extensions; a substantial proportion of these was, in any case, provided for under Government "capital assistance" schemes. A further factor, the significance of which may only become fully apparent as the Government production machine slows down and outstanding contract and tax questions are settled, has been the use, especially by the smaller firms, of accumulating tax liabilities as a means of relieving cash stringencies.

It would be unreasonable to expect these wartime influences to be suddenly reversed, and some of them may well outlast the transition phase. In import organisation, much evidently depends upon the outcome of the election. But while a substantial restoration of private trade and merchanting seems probable in any case, the system of bulk purchases of certain foodstuffs and vital materials is likely, even under a Conservative government, to be continued for a considerable time. Government solicitude for home agriculture may also perpetuate methods of organisation that minimise demands for bank finance. Nor is it probable that the banks will play any large part in the finance of the building programme. Building in the inter-war years was heavily financed by bank loans. But in the ensuing decade an overwhelming proportion of it will surely be directly organised by local authorities, or even by the central Government; and although the bulk of the work may be let on contract to private firms, it seems certain that the sheer urgency of the problem will lead these authorities to provide financial facilities of the progress payments type. If this happens, the task of financing the local authorities will not fall to the banks, for under the new Act their borrowings must be canalised through the Public Works Loans Board—a change which will in any case deprive the banks of a significant category of pre-war business. In addition, there will probably be central purchases of many items of equipment, which will reduce the credit needs of the ancillary trades. Finally, even with some relaxation of the internal financial controls and a resumption, perhaps, of the Stock Exchange carry-over, it seems certain that measures will be taken to keep speculative activities within bounds. For this reason, among others, the purely "financial" lending activities of the banks are likely to remain constricted.

On the second main division of the whole problem, however, the question of business liquidity, it is particularly difficult to reach firm conclusions. There is no doubt that industrial holdings of liquid assets, in cash and securities, have been enormously expanded during the war. The net liquid position of industry as a whole, in the limited book-keeping sense, is abnormally strong—despite the known illiquidity of many smaller concerns, especially in the engineering trades, that have expanded very greatly during the war. Of the £2,284 million growth since mid-1940 in what the Government statisticians are pleased to call "net" bank deposits (i.e., after deducting advances), less than one-quarter has accumulated on personal accounts; a large part of the remainder must represent business holdings. But if industry is highly liquid now, it seems equally clear that its accumulated resources will not suffice to meet its prospective requirements for working capital and arrears of plant maintenance—quite apart from special transitional outlays and modernisation of plant. Government control of contract prices and 100 per cent EPT have between them prevented any abnormal accumulation of undistributed profits, so that the accumulated liquid reserves, after allowing for heavy outstanding tax liabilities, cannot be much greater than the monetary amount of the run-down of plant and of privately financed stocks and work-in-progress. But if

the post-war price-level is assumed to be 50 per cent above pre-war, this means that present liquid resources will not meet much more than two-thirds of the eventual requirements for these purposes alone. Transitional expenses will in some cases be met by EPT repayment claims (though to what extent cannot yet be guessed) and the E.P.T. deferred credits will provide some relief; but it seems certain that these sources, even with other forms of Government assistance, will not suffice to fill the prospective gap.

This rough analysis suggests that there is no reason yet to suppose that the large-scale wartime creations of liquid assets will have made industry, in the long run, independent of outside finance, though they may have reduced the degree of dependence. But sheer shortage of physical resources will make the re-building of industrial capital a protracted process, and for some considerable time the available liquid resources of industry considered as a whole will certainly exceed the amount of plant maintenance and stock replenishment that will be physically possible.

Obviously the concerns with the largest liquid resources now are not necessarily those that have the largest prospective outlays—an important feature of the re-creation of civilian industry, for example, will be the reopening of concerns closed down during the war. In many cases, too, the change-over of firms active during the war will make

immediate demands for outside finance, because of the withdrawal of Government finance now provided by progress payments. For these reasons, the banks—despite their doubts about the longer-term trend—are expecting appreciable demands for advances in the immediate future. Many inquiries have already been received, and overdraft limits have been arranged which have yet to reflect themselves in the published figures—in some cases, indeed, they have been granted to concerns now carrying large credit balances. Few are disposed to guess the probable extent of this movement—at a rough shot, perhaps it might be put at £150 to £200 million over the next two years; but nobody is yet envisaging any such demands as would carry the advances total to, say, £1,500 million, which would be the pre-war level adjusted for a 50 per cent rise in prices.

What the banks have perhaps not yet fully digested is the counterpart of these assumptions—namely that industry's relative independence of bank advances in the next few years will be achieved only because industrial concerns will be sellers of securities. Will the banks, with Government securities already an overwhelming proportion of their assets, be willing to add still further to their investments if the public's intake of securities does not suffice to absorb these sales? Maintenance of cheap money certainly requires that they should do so.

Fats and Vegetable Oils

THE need to fill the empty larder of Europe is likely to put a severe strain on the supplies of fats and vegetable oils at the disposal of the United Nations. The market in these products is one of the most complex, and one of the most difficult to describe within the compass of a short article. By way of a preface, its main features may be briefly noted.

Broadly, there are three sources of supply: vegetable oils, animal fats and fish oils. The recorded world production of these before the war was about 19 million tons a year. The proportion in which they contributed to total supplies was then as follows:—

Vegetable oils	59.4	Tallow	4.2
Butter	21.2	Whale oil	2.9
Lard	10.6	Fish oil	1.7

Vegetable oils, in turn, are derived from a multitude of plants and countries; some of them, like cotton seed, are joint products, while others, such as the soya bean, are grown for their own sake. The characteristics and relative importance of nine vegetable oils—comprising together some four-fifths of recorded world production before the war—are set out in the accompanying table. Again, vegetable oils, animal oils and fish oils are for many—but by no means all—purposes interchangeable.

Fats and oils serve a multitude of uses, as foods and in industry. In industrialised countries, such as Britain, the United States and Germany, approximately a third of the amounts used is consumed by industry. In peacetime, the largest industrial user of fats and oils is the soap industry,

followed by the paint, varnish and laquer trades, the manufacture of lubricants, candles, textiles, linoleum, oil-cloth, leather goods, tinplate, and so on. Butter and lard, of course, are used mainly as edible fats; whale oil is a material favoured in the manufacture of margarine. Among vegetable oils, the soya bean has become an important source of edible oil; in other vegetable oils the proportions used for edible and industrial purposes vary from product to product and from country to country.

Before the war Europe as a whole, as well as North America, were substantial net importers of fats and oils. In 1937, for example, the United States met from imports 73 per cent of its consumption of fats and oils of 4,350,000 tons. The United Kingdom imported the equivalent of 1,463,000 tons in 1938; in the same year the combined net imports of Belgium, France, Holland and Norway were 750,000 tons, and those of Germany 936,000 tons.

Hitherto the United Nations have been able to draw on an adequate volume of supplies, in spite of the loss of Far-Eastern vegetable oils. They are cut off from the main source of soya beans—in 1938 Manchukuo exported no less than 2,000,000 tons of soya beans—from the supplies of copra and palm kernels produced in the Malay States, the Philippines, the Dutch East Indies and the islands of the South Seas, and from Chinese tung oil, the chief drying agent in the manufacture of varnishes and lacquers. Moreover, whaling, which yielded an average of 500,000 tons of oil a year before the war, has come practically to a standstill.

A number of factors contributed to the comparatively easy supply position of the United Nations. First, the

overall loss of Far-Eastern supplies was offset, in a large measure, by the cessation of imports into Continental countries occupied by Germany. Secondly, the United States achieved an astonishing increase in the production of oils and fats, recorded below:—

INDICES OF PRODUCTION OF FATS & OILS IN THE UNITED STATES.
(1938=100).

	1939	1943	1944
Butter	98	113	(b)
Lard	122	263	(b)
Margarine	78	160	154
Linseed	244	645	292
Soya beans	159	341	323
Groundnuts	83	179	166
Cottonseed (a)	151	161	160

(a) Amounts crushed for oil. (b) Not yet available.

Thirdly, the reduction in the supplies of some kinds of oils, such as Chinese tungoil, was made good, for specific purposes, by the use of others which could be obtained in increased quantities from existing sources of supply, such as the United States and Latin America. In other words, the high degree of interchangeability prevented serious shortages for specific purposes. There have been changes in the use of raw materials in the manufacture of soap, paint, and generally speaking, in the industrial use of fats and oils. In soap-making, animal fats and coconut oil had to be replaced by cottonseed and soya oil. In the manufacture of paints and varnishes additional drying agents had to be found. For a time fish oil was used in Great Britain; later, castor oil was used in addition to linseed oil as a drying agent. In the manufacture of varnishes and lacquers natural oils have been eliminated in many cases by developments in synthetic varnishes and lacquers on the basis of nitro-cellulose. Technologically much progress has been made in the utilisation of oilseeds and fish oils. At the same time, the large synthetic rubber industry in the United States made a special call on high-grade soap. Glycerine, the important by-product of soap-making, has found new uses in the production of synthetic resins, which in the United States developed into the largest single user of glycerine. On the Continent, new methods have been used in the recovery of fats from dish water and from residues of fats used in industrial manufacture. In the United States, new crushing mill capacity has been constructed, whereas the large crushing industry in Holland and in France has been rendered idle. Many of these technological changes may outlive the war.

Such difficulties as did arise (apart from those of substitution) were often due, not to the overall shortage of

supplies in producing countries accessible to the United Nations, but to the shipping shortage, which particularly affected this country. For example, Argentina's exports of linseed declined from 1,315,000 tons in 1938 to 299,000 tons in 1944; for some time that country has converted each month about 100,000 tons of linseed into fuel.

Present difficulties, reflected in the decision to reduce consumption in the United Kingdom, the United States and Canada, arise, of course, from the need to supplement the reduced supplies of the Continent. Owing to the depletion of the Continental livestock—in France the cattle population has been reduced by a third—and the short-commons and consequent low yield of existing dairy herds, the production of animal fats may be expected to fall well below the pre-war average this year. It may be some years, indeed, before production can be fully restored. The Continental output of oil-seeds, too, is likely to be appreciably smaller than before the war; moreover, Western Europe will probably not be able to draw much from Roumania, Hungary and other Eastern European countries.

The satisfaction of Europe's minimum needs will thus require substantial imports. The recent cuts in consumption in Britain and elsewhere should meet part of the immediate deficiency, though perhaps not as big a proportion as might be expected, for the size of Europe's shortage is not only appreciable, but the output of butter and, especially, of lard in the United States will be lower this year than last. This means that available sources of supplies of vegetable oils in Latin America, Africa and India will have to be drawn upon; it is reported that the United States is negotiating with Argentina the exchange this year of 250,000 tons of mineral oil for 500,000 tons of linseed. The extent to which these sources of vegetable seed supplies can be drawn upon, however, must be conditioned by the shipping tonnage that can be spared for this purpose. And, with the offensive against Japan in full swing, shipping will remain the limiting factor.

While the provisioning of Continental Europe is imperative, if wholesale starvation and disease are to be avoided, the supplies that can be provided this year, unfortunately, will be limited. Next year, too, many imports will be needed for the reconstitution of the Continental livestock population will take time. When the war with Japan is brought to a conclusion, two of the chief limits of supplies—shipping and the absence of Far-Eastern vegetable oils—will again be removed. Of the two, shipping is the more important, and also the one in which relief could be expected most quickly.

Business Notes

Capital Issues Relaxations

The statement by the Chancellor of the Exchequer on Thursday afternoon, and the policy outlined in a White Paper, put new issues of capital on a much more liberal footing than at any time during the war. The news came too late for detailed comment. Broadly, the Capital Issues Committee retains absolute discretion as to what issues may be made, but it is instructed to give favourable consideration to issues for the production of exports, for use in development areas, for housing, land development and in raw material production, also for transport in the United Kingdom, and for essential capital goods. Issues are, however, to be related to ability to use the money in the near future. The limit of £10,000 on issues to be made without Treasury consent is raised to £50,000, and the purposes for which banks may lend are extended, but not to speculative operations.

As for the method of issue, all wartime limitations are withdrawn. The issue may be made in any way suitable, subject only to permission to deal by the Stock Exchange Council, and this provision frees past issues and, in fact, makes the Council master in its own house once more. There remain two conditions which are imposed by the Treasury: optional conversions of stocks carrying interest of 4 per cent or less are still not permitted, and the Bank of England will have charge of the timing of market issues of £100,000 and over and must sanction the terms of all trustee and quasi-trustee issues.

A Partial Rally

In short-term market fluctuations it is very frequently the unexpected that happens. No one was surprised when last Monday brought a slight recovery from the heavy falls of the previous week, but that the rally should continue with growing momentum for the better part of a week with scarcely a pause is rather surprising. By mid-week, the index of industrial equities, compiled by *The Financial News*, had recovered about one-fifth of the fall from the peak, so that the net decline from that point is now only a trifle over 5 per cent. The recovery is very general, and in the past day or so has included fixed interest securities and some foreign securities, notably French sterling bonds. It has, however, been most marked in British industrial ordinary shares, including home railway stocks. Further, while it has been strongest in those shares which fell most, there is beginning to emerge a modicum of selectivity—in particular, store and tobacco shares, with some of the lighter electrical equipment favourites, are among those which have shown the greatest strength. There is also emerging a tendency to select firms with a large export business.

All this looks like an attempt to pick winners in the reconstruction boom, a process which one would suppose had been completed long enough ago. This fact, coupled with the very modest volume of business on which the rise is based, suggests that present recovery may be short-lived. The fact of the recovery does, however, show that the pressure of money is a factor even when the outlook is very

CHIEF RAW MATERIALS FOR VEGETABLE OILS

uncertain. Enquiries suggest that, while many investors expect to receive reasonable compensation in the event of the state taking over their properties, many are afraid either of extreme measures of Government control without assumption of ownership or of rigid control of retainable profits. Either of these would be fatal, not only to the rise in values which would otherwise accompany a return to production for peace, but also to all initiative and to the accumulation of the funds necessary to finance expansion and re-equipment.

Greek Currency Troubles

The menace of inflation has reared its head again in Greece in recent weeks. Despite the announcement of price control measures as long ago as last January, it appears that control at present extends only to vital supplies distributed by Unrra, and prices of uncontrolled goods are again rising very steeply. Under pressure of hoarding and speculative demands, there has been a sensational appreciation, too, of foreign currencies and gold coin. When the new drachma was launched last November in a valiant attempt to clear away the chaos left by the galloping inflation of the closing phase of German occupation, the sterling rate was fixed at 600 dr. and the rate for the gold pound at 2,400 dr., representing a premium of roughly 100 per cent over the new exchange parity. A few weeks later the Greek authorities raised their dealing prices to 2,750-2,850 to the gold pound. This quotation still obtains, but is nominal, as the authorities have recently virtually discontinued their sales of gold. In the outside market, however, sovereigns have been changing hands at prices around 27,500 dr.—equivalent to roughly £46—while reports from Cairo have mentioned prices as high as £150.

This situation reveals plainly the great difficulty, if not impossibility, of re-creating a collapsed currency in conditions of acute shortages of every-day commodities. The public, fresh from the grim realities of last year, is naturally more concerned with the fact that its new paper money will not buy the food and clothing that it so vitally needs than with its 100 per cent gold cover. In such conditions, opinion is an easy prey to rumours that fresh uncontrolled issues are impending. The only remedy for this situation is an increase in the supply of goods, combined with strong administrative measures to ensure equitable distribution and effective price control. Admiral Voulgaris has stated this week that the shipping bottleneck has been widened, and that large quantities of food, clothing, medical supplies and materials will arrive in the next two months. It remains for the Government to devise an effective administrative machine in the meantime.

Gold Speculation in Middle East

The latest currency difficulties in Greece seem to have been one of the subsidiary causes of a new wave of speculation in gold in Middle East centres. The open market price for gold in Alexandria slumped violently when Germany collapsed, and there was a similar, though less steep, fall in the Bombay market. This decline, which carried the Egyptian price down from 184 piastres per dirhem at end-April to 162 piastres on May 10th, seems to have been due to the mistaken view that the end of the war in Europe would permit a substantial correction of the abnormal combination of money plethora and scarcity of goods that has ruled in the Middle East area for so long. This optimism naturally proved short-lived, and the rebound in the gold market carried the price to a new peak of 186 piastres, equivalent to roughly £19 per ounce. In the past week there has been a moderate recession, although official releases of gold seem to have temporarily ceased. But despite the easing of the gold bullion market, the Egyptian gold pound has risen sharply, touching 620 piastres—approximately £6 5s.—a few days ago. This suggests a smuggling demand for coin in order to reap the high profits obtainable from re-sale in Greece and possibly also Syria, where the civil disturbances are likely to whet public appetite for gold.

It would be wrong to attach much importance to these gold operations. They are spectacular rather than large, and, as in Greece, are the inevitable counterpart of the shortage of goods. The premia quoted on gold compared with the exchange parities are certainly not true indices of the values of the Middle Eastern currencies concerned. But it would

be equally wrong to accept the argument so frequently voiced from these areas—a fresh instance of it occurred in an article in the *Palestine Post* this week—that the wartime accumulation of sterling balances is a guarantee that existing parities can be maintained indefinitely. When price-levels have been multiplied anything from three to six times, even complete restoration of the normal flow of goods could not remove the need for eventual devaluation. But it is at least unlikely that it will need to be as drastic as present gold parities seem to suggest.

Savings Drive Postponed

It has been disclosed during the week that the annual Savings Drive, originally planned to start at the customary time, but later delayed to await VE day, has been postponed again in consequence of the election. The decision is no doubt inevitable. It is understood to be due mainly to organisational difficulties, and certainly not to any assumption that an election atmosphere is inimical to saving as such. During the local "weeks" the organisers have always counted upon a large amount of voluntary help from people outside the normal Savings organisation, and many of these helpers are expected to be fully engaged in the next few weeks in electioneering. There was also the certainty that it would be difficult to secure accommodation for local Savings meetings, and in any case competition for public attendance at Savings functions instead of political ones would have been obviously undesirable.

The arguments for postponement were evidently conclusive. But it is unfortunate from two points of view. Many have been disposed to doubt whether the savings "weeks" ever added much, in the long run, to the real total of public subscriptions. They have argued that, if the public were not expected to make bumper contributions in a particular week in the cause of local patriotism, they would subscribe more week by week. But there surely never was a time when this argument would have had less force than in the period immediately after V-day, when there really did seem to be a chance that vigorous capitalisation of the "Thanksgiving" theme might have induced the public substantially to increase its real savings, as distinct from merely turning idle cash into securities. The organisers of the movement will find it hard to recapture this opportunity in the autumn, when, apparently, the postponed drive is to be launched. Moreover, the absence of a drive this summer may tend to create the impression that now, after VE-day, saving is of minor importance. Between now and the autumn, every effort will need to be made to sharpen the appeal of general savings publicity.

In the meantime, there must be increasing reliance upon floating debt, unless the reduction in the budget deficit proceeds a good deal faster than at present seems likely. During May the deficit was again smaller than in the corresponding period of 1944, but the reduction—by £44 million—was actually £19 million less than in April. As the month's total savings were nearly £140 million less than in 1944, the total floating debt expanded by £96 million. The prospective growth should be an opportunity for the authorities further to correct the present disparity between the volume of bills and TDR's available to the banks.

Coal Statistics 1944

The Ministry of Fuel and Power has collated the periodical figures for the coal industry and issued a Statistical Digest for the whole of 1944. It has added a certain amount of fresh information about mining and about the gas and electricity industries, thereby justifying its title to be a Ministry of Power as well as of Fuel.

The 1944 figures, as might be expected, reflect the continued decline in production. As a table on page 752 indicating the long-term trend shows, output was lower in 1944—apart from the two strike years of 1921 and 1926—than at any time since the 1880s. From the long-term point of view, however, the downward trend of manpower is one of the most significant features of the table. In 1923, when production was 276 million tons, 1,160,000 men were employed in the industry. In 1944, with a production of 193 million tons (including opencast production), there were only 710,000 men employed.

The annual output per wage-earner declined steadily during the war years. It was 301.9 tons in 1939 and only 259.2 tons in 1944, while the corresponding figures of

output per manshift were 3 tons and 2.70 tons (in the first quarter of this year, it was 2.68 tons). This decrease is disappointing, because it seems that genuine efforts to introduce more machinery have been made. The proportion of coal cut by machinery increased from 61 per cent in 1939 to 72 per cent in 1944, while the proportion of coal conveyed by machinery rose from 58 per cent to 69 per cent. In both cases, however, the actual quantity of coal handled mechanically was smaller than it was before the war.

Interesting statistics are given about the composition of the labour force. Of the 649,300 effective wage earners on September 23, 1944, 16.5 per cent or nearly one fifth were over 55 years of age. The proportion of the normal labour force over 55 would obviously be higher, but for the abnormal recruitment of Bevin boys and optants, who may be expected to leave as soon as controls are lifted. Major Lloyd George's announcement that 12,000 underground miners will be returned from the Forces by September should help to provide a better balanced and more productive labour force. It is interesting also to note that 284,600 wage earners were employed at the face, 269,000 were engaged on other duties below ground and 157,500 at the surface, the latter figure having remained fairly constant since 1939. In other words, only about a third of the mining labour force are actually "productive" workers which makes it all the more important to mechanise underground haulage processes.

The top-sided age composition of the industry may be regarded as partly responsible for the high absenteeism figures. The rate of 16.1 per cent in the first quarter of 1945 is the highest yet, though only 6.3 per cent is classified as voluntary. It is clear that the involuntary rate due to such causes as sickness and accidents is likely to be higher among the older workers, while at the other end of the scale, the voluntary rate is highest among the young men, and most particularly the Bevin boys.

In contrast to the declining productivity reflected in these figures, costs of production have increased startlingly. Wages per ton rose from 10s 10d in 1939 to 23s 8d in 1944, and average weekly earnings increased from £2 15s 9d to £5 9s 4d (excluding allowances) during the same period.

More Gas

The wartime record of the gas industry, set out in the Statistical Digest, is one of steady expansion. The following table shows the trend of the volume of gas sold by authorised undertakings since 1938, the distribution of consumption in 1943, and the total revenue of the industry:—

GAS SOLD BY AUTHORISED UNDERTAKINGS

	1938	1941	1942	1943	1944
<i>Gas sold (million cubic feet):</i>					
Public lighting	15,052	1,521	1,669	1,265	(a)
Mainly domestic use:					
Propayment				138,470	
Credit				69,806	
Industrial				103,160	
Govt. depts. and services				6,824	
Local authorities				6,999	
Other premises				36,104	
Total	322,086	328,758	358,419	362,628	379,106
" (million therms)	1,530	1,529	1,667	1,690	1,767
<i>Revenue (£ million):</i>					
Local authorities	23.3	30.2	32.1	(a)	(a)
Companies	45.8	58.1	65.7	(a)	(a)
Total	69.1	88.3	97.8	(a)	(a)

(a) Not yet available.

Although precise details have not hitherto been available, it was known that the consumption of gas has increased since 1938, mainly for industrial purposes. The increase between 1938 and 1944 was 17.7 per cent in terms of cubic feet, and 15.5 per cent in terms of therms. The most interesting statistics now released are those relating to the distribution of consumption, recorded for the first time in 1943. They show that, in that year some 28 per cent of the volume of gas sold was used in industry.

Even More Electricity

The expansion in the consumption of electricity since 1938 has been at a faster rate than that of gas; between 1938-39 and 1943-44, the volume of electricity sold to consumers by authorised undertakings rose by 53 per cent.

The most remarkable feature disclosed by the accompanying table is the expansion in the use of electric power; this has almost doubled since 1938. Moreover, 66 per cent of the total volume of electricity sold was used in the form of power; electricity has thus a much bigger stake in industry than gas. In part the increased sales of electricity to industry reflect a change-over from private to public supply rather than an increase; but much the biggest part of the higher sales represents an addition to total con-

ELECTRICITY SOLD BY AUTHORISED UNDERTAKINGS

	1938-1939	1941-1942	1942-1943	1943-1944
<i>Electricity sold to consumers (million units):</i>				
Lighting, heating and cooking	8,340	9,875	9,353	9,721
Power	10,841	16,754	19,517	20,951
Public lighting	376	20	21	20
Traction	1,236	1,166	1,170	1,140
Total	20,793	27,815	30,061	31,832
<i>Revenue from sale of electricity to consumers (£ thousand):</i>				
Public authorities (including Central Electricity Board for traction purposes only)	55,664	72,059	73,764	78,402
Companies	34,468	47,931	52,751	56,003
Total	90,132	119,990	126,515	134,405

sumption. It is not possible to estimate how far the rise in total consumption is due to the expansion in industrial activity and how far it is a reflection of an increased consumption per worker and, therefore, of a higher degree of mechanisation. There is no doubt, however, that the modernisation of British industry—at any rate, the munitions sector of industry—has been given a fillip during the war.

Edmundsons Wartime Expansion

The publication of accounts and statistics for the four years of the statistical black-out by Edmundsons Electricity

times change principles endure...

Born in the stage-coach days of 1845 the "Royal's" first century now belongs to history.

The ideals, traditions and principles of the past years remain steadfast to be carried forward into the second century, into an age when the service of insurance must accelerate to the tempo of the aeroplane.

The "Royal" looks to a future as industrious as the past, firm in the resolve to continue to merit the trust imposed in it by millions of policy-holders world-wide.

1, North John Street, Liverpool 2. — 24-8, Lombard Street, London, E.C.3.

Corporation makes a very important contribution to the story of the war-time development of electric supply. The parent company owns or controls 16 concerns, whose areas are mainly rural. The report provides statistical data for the whole group for the seven years 1938-44, and consolidated accounts for the last six of those years. Further, it contains the accounts of the parent for the year ended March 31, 1945. The whole story is summarised in the following table:—

	1939	1944	Increase	%
Units sold to consumers (millions).....	957	2,305	1,348	141
Consumers connected ('000).....	443	504	99	14
Average units per consumer.....	554	1,000	494	81
Cost of coal per ton.....	21/10	37/-	15/2	70
Price of units, all purposes.....	1.21d.	1.08d.	*0.13d.	*11
„ domestic and commercial.....	2.58d.	1.94d.	*0.63d.	*25
Capital employed (£ mill.).....	32.8	46.5	13.7	41
Rev. from current (£ mill.).....	4.97	11.36	6.39	129
Provision for taxation (£ thousands).....	95	1,077	981	1,033
Net profit (£ thousands).....	583	535	*48	*8

* Decrease.

The total sale of units rose by 168 per cent over the period, while the group's own production increased from 974 to 2,554 million units, or 162 per cent. These figures compare with ones of 62 to 107 per cent, quoted on page 664 of *The Economist* of May 19th for concerns operating in mainly industrial areas of the north and midlands, and of 10 to 50 per cent for London concerns. For the whole country, for a slightly earlier period, the increase was 41.2 per cent. They demonstrate clearly that the numerous developments to meet wartime emergencies have led to a very rapid development of the countryside. Among these, some—such as the dispersion of industry and the increased demands of farmers—are likely to be permanent; others, such as aerodromes and special wartime depots, will have to be replaced by a further use of electricity for domestic and farm requirements, if the expansion is to be maintained. That, however, does not detract from the achievement.

A study of the consolidated profits shows that, so far at least, the shareholders in the parent company have not done very well out of the expansion in demand and the resultant fall in the cost to the consumer. Profits available for distribution have been virtually unchanged over the five years at around £720,000, and the ordinary dividend unaltered at 6 per cent. But that is not the whole story. There is little to be deduced from the balance-sheet of the parent, but the consolidated figures of the operating concerns show that of the rise of £13,664,000 in total assets, some £8,600,000 has been financed by increases in provisions for depreciation, taxation and contingencies, and £1,065,000 by increases in reserves proper, while less than £1,200,000 has been added to debentures and loans. Meanwhile net liquid assets increased from £909,000 to £4,125,000. Total provisions rose from just over £1,000,000 for 1939 to £1,378,078 for 1944, and there have been yearly increases in the amounts retained by the subsidiaries. Plans in an early stage suggest an outlay of £16 million odd over the next five years, of which about £10 million will be financed from the resources of the group.

Workmen's Compensation in America

There is no disposition on the part of private insurers in the United States to accept with resignation any transfer of their business to state funds. A pamphlet issued by the Association of Casualty and Surety Executives entitled "Workmen's Compensation—Monopoly or Free Competition?" presents very forcibly the case for retention of the right to work in this field. The Association is able to make numerous comparisons between the working of private enterprise and state funds because of the present rather mixed arrangements in the United States; in 29 states private insurers alone operate, in 11 states private insurers compete with state funds, and in a further seven states state funds have a monopoly.

Considering first the question of employer preference, the Association shows that in each of the 11 states where the two methods of protection are available the volume of business transacted by private insurers has in recent years increased at a very much faster rate than that written

by state funds. In 1942—notwithstanding that state funds enjoy various privileges including relief from certain taxes—private insurers had 78.9 per cent of the total business in these 11 states. As regards the seven monopolistic state funds, it is pointed out that these were all created in the early days of workmen's compensation and that no state has established such a fund in the last 25 years.

Besides enjoying employer preference, private enterprise also, it is contended, gives more satisfaction to employees. For one thing, they receive their compensation more promptly. Private insurers generally consider 18 days as the maximum period which in an uncontested case should elapse between the date of the accident and the date the first payment is received by the worker; many companies require a personal letter of explanation from their representative if this period is exceeded in any individual claim. On the other hand, in Ohio—one of the seven monopolistic fund states—60 per cent of all claims notified in April, 1944, were more than a month in process of filing, after which at least another 18 days was required before the payment was made to the employee. Figures are also quoted to show that in Ohio many more cases are taken to appeal than in states where private companies operate. The Association ascribes the relative inefficiency of the state funds to red tape, understaffing and the payment of salaries insufficient to attract competent employees.

Further arguments adduced are that private insurers are generous in the provision of medical care and rehabilitation services and spend large sums on accident prevention—in 1943 nearly \$20 million. In consequence of this work the industrial employee of today has a better than 2½ to 1 chance in comparison with 1913 of not losing his life, and the severity rate of accidents (measured in terms of days lost) has fallen from 1.72 to 1.20. By contrast the safety work performed in Ohio is stated to be extremely limited, with the result that during the ten-year period 1933-42 over two million claims were filed—more than the number of persons gainfully employed in the state.

Competition or Monopoly

The case made out by the Association is clearly strongest where based on widely-drawn statistics and weakest where dependent on comparison between individual states. It is evident, however, that the apparent economical working of the state funds may be entirely misleading if account is not taken of differences in services rendered both to employee and employer. The contention of the Association is that monopoly—and particularly Government monopoly—tends to develop arbitrary, mechanical and autocratic attitudes and procedures; the tendency is away from research, experimentation and progress. Money spent on safety work justifies itself many times over. Accidents upset production schedules and time and money must be spent to train new workers. The total economic loss alone is estimated at four times the actual money outlay on compensation and medical payments. In sum, only the best is good enough—and that is secured by free competition. It would be misleading, however, to argue the British case in the American context. Perhaps one conclusion is that neither state nor private business can claim a monopoly in enterprise.

Building Repairs

The new scheme of unlicensed and licensed building repairs comes into operation on August 1st, and is to last at least until January 31, 1946. The whole country will be regulated uniformly. The chief points of the scheme are as follows: Work costing up to £10 may be undertaken without licence—and it now applies to separate dwellings and offices, instead of, as formerly, to separate buildings; work costing up to £2 may also be undertaken in each calendar month. Local authorities are empowered to issue licences for work costing between £10 and £100. Work costing more than £100 will be licensed by the Ministry of Works on a local authority certificate declaring it essential. As at present, work of an emergency nature will not need a licence.

In some parts of the country—particularly London and the south—the new scheme will be a slight relaxation of

the existing regulations. In those in which the £10 limit has not hitherto applied, it will represent a tightening up. The main reason for the regulations is, of course, the shortage of labour, which, according to the Minister of Works, will dominate the position for the next 18 months or two years. In view of this it is just and equitable that workers should be so spread that the ordinary repairs and decorations are within the reach of all, and so that where more extensive work needs to be done, allocations are made on the basis of need.

A great deal of bomb damage remains to be made good. The housing shortage, particularly in London, grows daily more acute. Houses which have been damaged or unoccupied could relieve the pressure if work were done on them. The Government is hoping to vacate some blocks of flats which it has been using as offices. Conversion of the many three-, four- and five-storey London houses into flats, too, would do something to assist the unfortunate house-hunters, who are now discouraged even from entering the offices of estate agents by notices on their doors saying "No unfurnished flats or houses to let."

* * *

Dunlop Outlook

The preliminary statement of the Dunlop Rubber Company showed a fall in profits due to a rise in costs without compensating increases in selling prices. The full report suggests that there was an increase in turnover to meet the peak demands of the services, but that the increased use of synthetic rubber was a material item in raising costs as was untrained labour. The former finds a reflection in inventories which have risen for the whole group from £11,310,246 to £12,827,422, the increase having been financed to the extent of over £500,000 by the sale of Government securities. The main outlines of the accounts will be found on page 747. They show, *inter alia*, a further but moderate rise in net liquid assets and a fall in net inter company items. This is due to a writing down of holdings in the important French subsidiary whose damaged factories are now being reconstructed. The written down value is considered reasonable.

Of the overseas companies, those in India and South Africa continued to show excellent results, while turnover and profits in America were again satisfactory, but the Irish subsidiary suffered a modest reverse. The export trade remains severely restricted owing to shortage of materials. Altogether, concentration on Government work meant a lack of men and materials in those sections working for the public and the shortage, apparently, continues. The shortage was particularly felt in the garment section.

Apart from the brief re-stocking period, Sir George Beharrel, chairman of the company, expects a permanent increase in demand for the output of the group and the new shadow factory at Speke is intended for footwear, golf and tennis balls and some other goods. For the time being, however, it is to be used, at the request of the Government, to help to overcome the tyre shortage. Confidence is expressed that it will be possible to improve on pre-war qualities as well as quantities, but there is an inference that this must in many cases await supplies of plantation rubber.

*

Included in the profits of the year are a number of items which result in a net credit of £74,114 which arise either from previous years or are of a capital nature. It appears that the writing down of the French associate comes under this item. The net liquid assets of the group exceed £16½ million, the bulk of which is in inventories. (During the year the parent has withdrawn some £640,000 from subsidiaries to finance expenditure on plant and inventories.) Total provision for EPT up to the end of 1944 for the group was £8,927,674 of which 20 per cent, less tax at the rate then prevailing, will eventually become available. It is a pity that there is no word of reconstruction plans, but it is evident that the company has enough money to finance a substantial programme, if the inventories can be reduced to a normal proportion of total assets. They were in 1944 some 33 per cent against 11.8 per cent two years earlier.

* * *

Two Oil Results

According to the preliminary statement, the profits of Burmah Oil for last year available for dividends and free reserves recovered, the figure being £2,625,513 against

£2,155,462 for 1943 and £2,550,178 for 1942. This figure is reached after making a slightly increased provision for provident fund. The dividend is unchanged at 12½ per cent, but the reserve receives £600,000 against £100,000. Owing to the fact that the rate of Dominion income tax relief is not disclosed, the amount earned for ordinary cannot be grossed up accurately. Before grossing up it is 16.9 per cent, against 13.5 last year and 16.5 for 1942. Both the profit earned for dividends and the percentage are the highest since 1941, but the rise on the year is due solely to the vagaries of taxation and its treatment in the accounts of the company. The statement makes it clear that gross profits were below those of 1944. The shareholders should shortly have some information as to the condition of their properties in Burmah.

In comparison with this result Venezuelan Oil Concessions record a substantial increase in earnings without any explanation. This is all the more regrettable as the profits appear to be presented on a new basis, so that it will be necessary to await the accounts before a full comparison is possible. The profit disclosed is £688,329, after providing £250,000 for exploration and general reserve, compared with £492,262 after placing £400,000 to reserve for deferred maintenance. This suggests a rise of some £50,000 in earnings. Both interim and final dividends have been raised, and the total distribution is 18½ per cent against 16½ per cent for each of the six preceding years. This is payable on both preference and ordinary capital. Both are in shares of 13s. 4d., quoted at 50s. 7½d., to yield some £5, per cent. The full accounts should be much more informative than in the past, and it is reasonable to suppose that they will show a comparatively favourable position.

Scottish Steel

Speeches made recently by the chairmen of Scottish iron and steel concerns sound a note of optimism about the prospects of the steel industry, mixed with doubts and alarm about the future of coal-mining. Sir John Craig, chairman of Colvilles, points out that his company's transition from war to peace production is not difficult, that it has received good export orders, and that it will be helped rather than hindered by the wartime capital schemes, costing £5,000,000, which are paid for by the Government. It is clear that the iron and steel industry must undertake a large capital outlay in the near future, and, as is well known, all schemes of extension and expansion are being vetted by a committee inside the industry.

It is to be hoped that the committee will have, as Sir John claims, "the national needs as the great objective." But it is not altogether encouraging to find that Colvilles prefers to improve its present method of producing steel sheets rather than to construct a modern continuous sheet mill, which is admitted to be a great improvement on the present system. The crucial point is whether, with three such mills in existence or planned, a market can be found for the produce of a fourth. Colvilles have decided that they dare not run the risk that it will not be found, and so continue with plant which is excellent for small runs, but costly for large ones.

The difficulties inside the coal industry affect iron and steel producers such as Colvilles, and Bairds and Scottish Steel, in two ways. In the first place, it raises the price of their most important raw material, and, secondly, it affects severely their own colliery holdings. In the privileged position of the iron and steel industry, the second factor may be the more harmful to the companies in question, although hardly to the national interests. Mr McCosh, chairman of Bairds and Scottish Steel, roundly blames the miners for the present situation. He goes so far as to say that their lack of discipline is costing the nation 40 million tons of coal a year. There may be some truth in this accusation, but it will convince no one to claim that, since the owners and management have not been changed during wartime, they cannot be blamed for the fall in output. A very important reason for this wartime fall, and for the miners' discontent, lies in what the owners failed to do before the war, when they had ample opportunity and official encouragement for improving efficiency.

The Wool Conference

The conference of officials and wool experts from the United Kingdom, Australia, New Zealand and South Africa has now concluded its discussions in London. The British

COMPANY MEETINGS

ATLAS ASSURANCE COMPANY, LIMITED

FURTHER PROGRESS

MR G. F. HOTBLACK'S REVIEW

LIFE DEPARTMENT

The annual general Court of the Atlas Assurance Company Limited, was held on the 25th ultimo at 92, Cheapside, London, E.C.

Mr. G. F. HOTBLACK (the chairman), in the course of his speech, said:

FIRE ACCOUNT

Our fire department premium income at £2,268,364 is higher by £124,207 than the corresponding figure in 1943. The underwriting profit of £140,788, or 6.2 per cent., is, however, less than half what it was in the previous year, the profit then being £283,629, or 13.2 per cent. Although this shrinkage is partly accounted for by an increase in reserve, amounting to £49,683, which follows automatically upon the increase in income, what is mainly responsible is the fact that losses in 1944 were markedly higher than in 1943. The year 1943 was, however—and I think I should emphasise this—an unusually fortunate year for us from the point of view of loss experience.

Although this heavier loss ratio was to some extent due to the bush fires in Australia, and the severe explosion in the docks at Bombay which took place in the earlier part of the year, and, later in the year, to a hurricane which swept down the Atlantic Coast of the United States, what has chiefly contributed to our less fortunate experience has been a general increase in, what I might call, everyday loss by fire, both at home and abroad.

ACCIDENT ACCOUNT

In the accident department it is satisfactory to see that the premium income, amounting to £631,949, has also moved forward compared with the corresponding figure in 1943, which was £598,143. The profit secured is £66,352, or 10.5 per cent. of the premium income, against £71,104, or 11.9 per cent., in the previous year. Bearing in mind that the increase in income brings with it the need for an increase of £13,523 in the reserve for unexpired risks, I think that the result achieved is once more worthy of our commendation.

MARINE ACCOUNT

The marine department premium income at £436,782 is lower by £78,134 than the corresponding figure in 1943. We saw a similar state of affairs in the comparison between 1943 and 1942, and once again it is a reduction in war insurance premiums which is responsible. When addressing you last year I said that we looked forward hopefully to the time when war-risk premiums would become but a very minor source of income: to-day we are much closer to the fulfilment of that hope—a circumstance which must give us all good reason for much gratitude.

As to the claims experience, losses paid in respect of the 1944 account amounted to £98,404, the corresponding figure in 1943 being £128,630, and this improvement in our fortunes is also a reflection to some extent of the lessening of war-time perils of the seas. With the outlook so much improved we have had no hesitation in making a transfer to profit and loss of £40,000. After providing £100,000 for United Kingdom taxation the fund now stands at £631,393. This is slightly lower than the corresponding figure at the close of 1943, but, having regard to existing conditions and the fall in premium income, places us in a stronger position than that which we occupied at that time.

I am sure you will share my view that the result of the operations of the marine department is a clear indication that the activities of those responsible for the underwriting have been marked by sound judgment.

The difficulties with which the life department has to contend are by no means over and 1944 was not so good a year as 1943. New business was only £2,742,615, compared with £3,257,642 in 1943 and £2,663,416 in 1942. The consideration for annuities was also smaller than in 1943, being £158,128, compared with £176,782. Death claims were heavier than in 1943, but nevertheless were surprisingly light considering the times through which we have been passing.

During 1944 our life assurance and annuity fund increased by £718,624 and additional amounts were invested in British Government securities, the total sum so held amounting, at the end of the year, to the substantial figure of £5,881,663.

The low yield on this large investment in British Government securities, combined with the high rate of income-tax to which our life business is subject, has naturally prevented us from earning a satisfactory net rate of interest, this having fallen to £3 5s. per cent. by comparison with £3 7s. 9d. per cent. in 1943.

During 1939 and 1940 we wrote £489,105 off the values of our Stock Exchange securities. This sum has been proved by events to be unnecessarily large and we have felt justified in reinstating the amounts written off to the extent of £246,873. At the end of 1944, after this writing back, the Stock Exchange securities included in our life and annuity fund had a market value of rather more than £1,000,000 in excess of the value at which they stood in our books.

Towards the end of 1944 it was felt that we could, in a modest way, recommence bonus distributions and, in respect of the six years 1938 to 1943 inclusive, a bonus was declared at the rate of 14s. per £100 per annum calculated on the sum assured and existing bonuses. Interim bonuses in respect of the current triennium 1944-46 are being paid at the rate of 21s. Since 1938 we have in one way or another strengthened our life and annuity reserves by £1,111,322, and bonuses to policyholders, including interim bonuses, have cost £520,840.

PROFIT AND LOSS ACCOUNT

I will now briefly refer to the profit and loss account. Net interest receipts at £97,056, as against £91,753 in the previous year, again show a welcome improvement. Also to the credit of the account are the underwriting profits, aggregating £247,140. To the debit of the account are taxation charges, expenses not charged elsewhere, and the contribution by the "Essex and Suffolk" to their staff provident fund. The balance remaining, including the carry-forward from last year—namely, £463,492, amounts to £693,096. Of this sum the dividend at 10s. 6d. per share, subject to tax, absorbs £135,711, and £25,000 having been transferred to the staff pensions reserve and £50,000 provided for the purpose of writing down building properties, the balance carried forward is £482,385.

FIELD OF ACTIVITIES EXTENDED

It will be of more than passing interest to you to know that we are already playing our part in the great endeavours which are now actively on foot to assist the peoples and territories which have been liberated from enemy occupation. We are, in fact, operating once more in Belgium, France, and Greece; we are assisting to meet the demands for insurance in free Holland; and as liberation proceeds in various parts of the world we shall further extend these activities.

The report and accounts were unanimously adopted.

COMMERCIAL UNION ASSURANCE

INCREASED NEW LIFE BUSINESS

The annual general meeting of The Commercial Union Assurance was held, on the 29th ultimo, in London.

The following is an extract from the statement of the chairman (Mr John F. G. Gilliat), which was circulated with the report:—Fire Dept.: The premium income of £6,844,510 shows an increase of £546,142. This expansion is largely at home and in the United States, but there has been a general contribution in other places abroad. In spite, however, of our efforts everywhere, and especially in the United Kingdom, to reduce the hazard, there has been little headway; regrettable losses having occurred—losses, the cost of which we as insurers can meet, but which cannot be replaced readily for National use. We take comfort in the thought that but for our efforts, preventable losses would have been greater.

A SIGNIFICANT RESULT

Life Dept.: For 1944 the total new sums assured were £5,292,648, of which, after deducting amounts reassured, £5,124,497 was retained at the company's own risk. It is significant that the 1944 net new business figure, £227,264 in excess of the 1943 total and 86 per cent. of our best pre-war result, has been realised at a time when nobody in the company's service remains in whole or even part-time employment for the primary purpose of securing new life business. The premium income during 1944 was £2,207,972, showing an increase of £60,767 over the previous year, while the Life Fund increased by £807,417 to £32,168,399. This increase in the fund, together with a substantial proportion of the investments maturing or repaid during the year, have been applied to increase the Life Fund holding of United Kingdom war issues to a total of nearly £6,500,000.

As to payments out of the Life Fund, for the first time in the company's history more than £2,000,000 was required to cover death claims and maturing endowment assurances. Subject to reconsideration should unforeseen circumstances arise, the directors have decided to continue the allowance of an interim bonus at the full rate of reversionary bonus declared at 31st December, 1942, to all policies becoming claims by death or by maturity during 1945.

Marine Dept.: The premium income of the department again shows a substantial reduction and amounts to £1,155,283, which is a decrease of £517,907. This decrease is mainly accounted for by the reduction in war risk premiums. A sum of £500,000 has been transferred to profit and loss account and with the Marine Fund at 223.73 per cent. of the premium income, we consider all contingencies are provided for and we confidently look forward to a continuance of successful operations.

ACCIDENT DEPARTMENT

Accident Dept.: The premium income amounted to £8,396,659, an increase of £661,910. So many classes of insurers are underwritten in this department that it is difficult to imagine conditions unfavourable to all the sections at any one period. The war has reduced the income in the motor section and increased the home income in the Workmen's Compensation section, but it now seems that peace will bring the home Workmen's Compensation business to an end as we recover our motor income.

The results in this department have been greatly assisted by our business in the United States of America where our associated office, the "Ocean," and its American subsidiary, the "Columbia Casualty," have built up an extensive organisation.

Our accident business has always been profitable at home and therefore to a large extent the improved results of recent years have been due to the better experience abroad.

THE EMPLOYERS' LIABILITY ASSURANCE CORPORATION, LIMITED

INCREASED PREMIUM INCOME

The sixty-fourth ordinary general meeting of the Employers' Liability Assurance Corporation, Limited, was held on 23rd ultimo, at the head office of the corporation, Hamilton House, Victoria Embankment, E.C.

The following are extracts from the statement by the Chairman, the Right Hon. Lord Courtauld-Thomson, K.B.E., C.B.

My first words on this occasion must be devoted to recording the loss we have suffered in the death on July 14 last of Sir Joseph Brodbank. He had been a director of the corporation for nearly 30 years, was appointed deputy chairman in 1925, and was chairman from 1928 until 1934. We, his colleagues on this board, have lost a friend whom we held in affection and respect, and an adviser on whose judgment and experience we greatly relied.

Our results for 1944 may be briefly summarised as follows. Our total premium income was £7,182,633, an increase of £376,702 over 1943. Our underwriting profit of £316,080 (which is arrived at after charging dominion and foreign taxes) and our gross interest income of £328,852, together amount to £644,932. The aggregate of the taxes, British and dominion and foreign, paid or provided for in the accounts, is £650,413. We are recommending the payment on June 1 of a final dividend of 2s. a share, which, with the interim dividend of 1s. 6d. a share paid on October 27 last, makes a total payment a share for the year of 3s. 6d. We then carry forward £682,155, an increase of £68,557 on the year. This sum of £682,155 is additional to the general reserve of £2,500,000.

DEPARTMENTAL FIGURES

In the fire account I ask you to note that the premiums show a further increase, and produced a profit of £64,294, or 11.9% of the premium income.

The accident and general account contains a premium income of £6,642,845 which represents an increase of £327,222 over 1943. This increase is fairly widespread over most of the areas in which we transact business, but the greater part of it comes from the United States. Our United States business again showed a satisfactory profit, and other contributions to the favourable result in this account, from which we transfer £251,786, or 3.8%, to the credit of profit and loss account, were made by our branches in Canada, Australia, South Africa and India, as well as those at home here.

TRANSITION PROBLEMS

I hope you will consider that the foregoing results are not unsatisfactory having regard to the complexity of the conditions under which our business has to be transacted in war-time; and it would be right, I think, to remind you that the period of transition from war to peace will bring special problems of adjustment, difficult to solve, and to tell you that there are indications in the current experience, both in motor business and in workmen's compensation business, of a trend towards higher loss ratios than we have had in the last few years.

The total of our investments (including freehold and leasehold properties and our associated companies) expanded during the year to £11,807,431, an increase of £825,913. We added substantially during the year to our subscriptions to British Commonwealth War Loans, and those of the United States.

You will be pleased to know that the 1944 reports of our associated companies, the Clerical Medical and General Life Assurance Society and the Merchants' Marine Insurance Company, Limited, record satisfactory results.

The report was unanimously adopted.

BRITISH AVIATION INSURANCE COMPANY, LIMITED

14th ANNUAL REPORT

MR J. DYER SIMPSON'S REVIEW

Mr J. Dyer Simpson, J.P., chairman of the British Aviation Insurance Company, Limited, issued the following statement in connection with the 14th annual general meeting of the British Aviation Insurance Company, Limited, held in London on the 24th ultimo.

Our results for the year 1944 were eminently satisfactory. Net premiums, at £293,374, were higher by £38,410, an increase of more than 15 per cent. over the 1943 figure. After transferring £90,000 to profit and loss account, compared with £50,000 in the preceding year, the fund at the end of 1944 amounted to £437,320 (an increase of £23,553) or over 149 per cent. of the premiums. Profit and loss account has been credited with interest, less income-tax, of £12,649, and a reserve of £91,000 has been made in respect to British taxation.

By reason of the E.P.T. liability, the provisions required for British taxation for the past five years (1940-1944) have amounted to £423,000 and have exceeded the gross underwriting profit transfers for that period by £18,000.

A dividend of 4 per cent., less income-tax, is recommended by the directors and, after providing for this and all other outgoings, the balance of profit and loss account carried forward at £49,896, is increased by £5,032.

TRIBUTE TO STAFF

It speaks well for the work of the management and staff, both in this country, in Canada and elsewhere, that after over five years of war, we are able to show a position of such stability and vitality as is disclosed by the accounts and balance-sheet for 1944.

I would like to pay a special tribute to our underwriter, officials and staff at the head office in London for the splendid and courageous manner in which they continued their work despite the dangers and discomforts of flying bomb attacks.

I make particular mention of the services of Captain A. G. Lamplugh, our principal officer and underwriter since the company was founded in 1931. Captain Lamplugh's wide knowledge and experience of aviation matters dates from the first world war and his enterprise has been untiring ever since. He was responsible for the convening of and conducting the independent Lamplugh Committee of experts who, in 1943 and in 1944, examined the future of civil aviation. Their published reports received an appreciative reception both here and overseas. Under his experienced guidance, the British Aviation Insurance Company will be able to deal with the many complex problems in the immediate years ahead.

CIVIL AVIATION

We have heard much in the past five years about global war. With the accomplishment of triumphant victory in Europe the thoughts of the nations are being directed more urgently to global peace and its effect upon civil aviation. The concentrated pressure of war has brought nearer the realisation of a world of 2,000,000,000 neighbours—though it may be doubted if the meaning of an air-routed globe is yet fully appreciated. We must realise that at cruising speed, the maximum flying distance to any part of the world is now round about 60 hours. "Isolationism" is an anachronism—more especially in a closely-populated area such as Europe. Future air maps of the world will not require to show either the physical details of the land nor the boundaries which States

have drawn upon it, but simply the main centres of population and the direct routes connecting them.

That there will be great development of civil aviation is one of the certainties of post-war days. Its progress must be closely bound up with the provision of efficient insurance protection; for, just as shipping has behind it the strength of a world-wide marine insurance market, so must air transport have its independent market for insurance, and the "British Aviation," with its extensive experience, is fully equipped to meet all the insurance requirements of civil aviation.

THE LICENSES AND GENERAL INSURANCE COMPANY, LIMITED

The ordinary general meeting of this company was held in London on 23rd ultimo.

Mr Stanley Christopherson who presided said: The premium income has advanced in the year under review, and the total assets have gone forward by a further quarter of a million pounds to a figure of £1,837,779 15s. 7d. Throughout each underwriting department, reserves have been increased and adequate provision made for all outstanding claims. Additions have also been made to the contingency and investment reserves. Investments in the Government funds now reach a total of over £700,000.

Viewing the changing scene and the cessation of hostilities in Europe, one is inspired to hope for a gradual return to more normal business practice. Your company emerges from this period of world upheaval unimpaired—and with increased confidence in the future.

The report was adopted and a final dividend of 20 per cent. making 25 per cent. for the year was approved.

EQUITABLE LIFE ASSURANCE SOCIETY

MR D. ABEL SMITH'S STATEMENT

The one hundred and eighty-third annual general meeting of the Equitable Life Assurance Society was held in London on the 30th ultimo.

The following are extracts from the statement by the President, Mr Desmond Abel Smith:—The accounts for 1944 reveal a further substantial growth in the holding of British Government securities, which now amount to £4,000,000 out of total funds of £15,000,000. There was a considerable increase in the margin between the market and book values of our assets, and for Stock Exchange securities alone the figure exceeds £1,000,000. There was little change in the net rate of interest earned on our funds, which in 1944 was £3 9s. 1d. per cent.; there can be no substantial improvement in the interest position without material relief in taxation.

After charging to expenses certain sums reserved to meet exceptional expenses likely to be incurred in resuming normal activities, the ratio of expenses to premium income is only 5.3 per cent.

During 1944 new policies were issued for sums assured of over £1,650,000, representing 80 per cent. of the figure for 1938. Claims by death were substantially lower than in 1943 at £340,819 net. Those under whole life major profit policies have established a remarkable record: every year for more than 100 years over £2,000 has been paid on the average in respect of each £1,000 of original assurance.

The income from investments in the three societies controlled by us has been particularly welcome in difficult times. The Equitable group of societies administers funds exceeding £18,000,000. The accounts represent another satisfactory year's working and provide an answer to those who would have us believe that private enterprise has failed to supply the needs of the community.

The report was adopted.

RAND MINES, LIMITED

(Incorporated in the Union of South Africa)

INDUSTRY'S WAR EFFORT

Mr John Martin, chairman, presided at the annual meeting of Rand Mines, Limited, held in Johannesburg on 18th ultimo and said that the profit earned at £689,964 showed a small increase of £352 over the profit for 1943. Dividends received—the chief source of the company's revenue—had been on a lower scale of reduction compared with the previous year, amounting to £69,389. On the other hand, revenue from interest and exchange at £104,830 had been considerably higher due to the inclusion of arrears of interest of £79,245, of which £76,097 had been in respect of debenture capital of the Anglo-Spanish Construction Company.

MINE OPERATIONS

The gold-mining industry in 1944 had experienced another difficult year. Nevertheless, their predominant reflection must be one of thankfulness and satisfaction that operations were relatively so well maintained and that the gold mines continued to be the mainstay of the National economy at this critical period of our history. Tonnage of ore milled in 1944 by the mines of the Witwatersrand area and its extensions had been 58,504,400 tons, a decrease of 1,448,500 tons compared with the previous year. Gold output had been 11,992,717 ounces fine, a decrease of 467,949 ounces fine. Profits had shown a reduction of practically £5,000,000. Profit decline had been progressive.

Operations of gold mines during the war had throughout been regarded by the Government as an essential part of the war effort of South Africa. The task of the industry had been to carry on as best it could with the object of maintaining the high gold output needed directly and indirectly for purposes of war, and, subject to fulfilment of that condition, to release men for the armed forces and assist in munitions production and associated war activities. All demands made upon the industry had been met. In looking back over the war-time experiences of the industry all those identified with its operations might well feel proud that by hard work and co-operative effort they had been able to cope with the many troubles and difficulties encountered with a very considerable measure of success.

TAXATION POSITION

Taxation last year of gold mines in the Transvaal, including the share of profits paid to the Government by leased mines, had amounted to £18,000,000, of which £7,000,000 had been accounted for by special contribution. The Minister of Finance, in his recent Budget Speech, had made certain announcements concerning taxation, saying that it was recognised that aspects of the system of taxation might be regarded as calling for re-examination in the light of what had taken place since 1935, and that the Government therefore proposed to appoint an Inter-Departmental Committee similar to that of ten years ago, to take into review the system of mining taxation as a whole. The taxation factor as affecting the extension of existing mines into the ultra-deep levels and to the opening up of new ultra-deep level mines would be given detailed examination and consideration by the mining taxation committee.

The working results of producing Witwatersrand gold mines of the group during the first 4 months of the current year had been very much the same as those for the corresponding period in the previous year. Many employees of Rand Mines and the Central Mining-Rand Mines group were absent on active service. Now that the European war had victoriously ended, it was in a spirit of joy and thanksgiving that the company looked forward to their return.

CROWN MINES, LIMITED

(Incorporated in the Union of South Africa)

MR JOHN MARTIN'S ADDRESS

Mr John Martin, chairman, presided at the annual meeting of Crown Mines, Limited, in Johannesburg, on 16th ultimo. After reviewing operations, the chairman said that the total profit had been £2,192,482. Dividends had absorbed £801,603, and provision for taxation had amounted to £1,283,432.

The tonnage milled, while showing a small increase compared with 1943, had been still far below the results achieved in earlier years, mainly due to continued shortages of native labour.

The available ore reserve had been re-estimated at December 31, 1944, to be 12,497,000 tons of an average value of 4.9 dwts. per ton over a stopping width of 44.8 ins. Compared with the position of the year previously, available reserve showed a decrease of 2,312,600 tons, the value being 0.1 dwts. higher and the width greater by 0.2 ins.

The company was one of the pioneers in deep level mining. At present the company's deepest workings were at 8,685 feet below the surface. The company was therefore particularly concerned with the possibility of extending profitable operations to greater depths than had hitherto been found practicable. It was the view of the deep level mining committee under the chairmanship of Sir Robert Kotze that "we are very near the final limit that can be reached in the existing circles," and the question, therefore, became one of seeing whether and how those circles could be changed. Great co-operation and consideration on the part of the State would be necessary if ultra-deep mining was to have a chance of becoming a reality.

The report was adopted.

CITY DEEP, LIMITED

(Incorporated in the Union of South Africa)

MR G. V. R. RICHDALE'S REVIEW

Mr G. V. R. Richdale, chairman, presided at the annual meeting of City Deep, Limited, held in Johannesburg on the 16th ultimo. After reviewing operations for 1944, the chairman said that total profit had been £643,363. Dividends had absorbed £245,250, provision for taxation had amounted to £330,568, net expenditure on capital account had been £8,308, further provision made in respect of miners' phthisis outstanding liability had been £12,680, and there had been a transfer to contingency reserve of £7,300.

The drop in tonnage milled had been again due to acute shortage of native labour which had continued throughout 1944. The scale of development had been increased to some extent during the latter part of the year, and footage accomplished, namely, 28,477 ft., had shown an increase of 8,178 ft. compared with the previous year's total. Main Reef Leader development had continued to show satisfactory results, but a small amount of work done on South Reef had given poor values. Payable ore developed during the year had amounted to 762,900 tons valued at 5.7 dwts. per ton.

Available ore reserve as re-estimated at December 31, 1944, had been 3,522,800 tons of an average value of 5.7 dwts. over a stopping width of 43.9 in. The available reserve showed a decrease of 8,000 tons compared with the previous year's figure, the value being 0.2 dwts. higher and the width 0.4 in. greater.

Since the close of the period under review the Minister of Finance had made a welcome announcement that the whole system of gold mining taxation was to be investigated by a special inter-departmental committee.

The report was adopted.

ASSOCIATED GAS AND WATER UNDERTAKINGS, LIMITED

WAR-TIME DEVELOPMENTS

The twelfth ordinary general meeting of this company was held, on the 29th ultimo, in London.

Mr W. H. Bennett, MInstGasE, the chairman, said that after payment of the full year's dividend on the preference stocks and the interim dividend on the ordinary and deferred stocks, the sum to be carried forward, subject to final dividends, would be £32,500. During the five years ended in September last the annual output of their 29 undertakings supplying gas had increased from 19,218,000 to 27,592,000 therms, whilst the total coke made yearly had risen from 158,700 to 212,500 tons. The total of coal carbonised annually had increased from 248,800 to 330,200 tons, and the gas oil gasified yearly had risen from 405,900 to 1,136,400 gallons. Units bought and generated by their four undertakings supplying electricity had increased by 51 per cent. Expansion had been general throughout the group, the largest rise in gas output of any one undertaking representing an increase of 82 per cent. over its pre-war figure.

FIVE YEARS' EXPANSION

At the outbreak of war there had been 25 undertakings operating under their aegis. That had been increased to 30, their total embarked capital amounting to £4,247,000. Their gas undertakings now supplied 158,400 consumers through 1,565 miles of main.

Assuming reasonably stable social conditions and no violent fluctuation in the supply and price of coal, materials and labour, coupled with the maintenance of the principle of consumer freedom of choice amongst the competitive fuels available, they could look forward with confidence to the continuance of a satisfactory output during the post-war period.

The gas industry was agreed that its future planning should be based upon an increased measure of functional and geographical integration in the manufacture, distribution and utilisation of gas and coke.

The "Report on the Planning of the Gas Industry" of the British Gas Federation had been followed by the appointment by the Ministry of Fuel and Power of a Committee of Enquiry into the Gas Industry, "to review the structure and organisation of the gas industry, to advise what changes have now become necessary in order to develop and cheapen gas supplies to all types of consumers and to make recommendations." Pending the publication of such recommendations there was necessarily hesitation in embarking upon major schemes of reconstruction. Evidence had been submitted to the Committee of Enquiry by the Association of Gas Corporations in the form of a memorandum describing, factually and statistically, the policy, practice and services of its member corporations.

FREE ENTERPRISE JUSTIFIED

The disadvantages to the consumer which would follow the substitution of bureaucratic control for free enterprise and the particular benefits attaching to the development of gas supply by the Association of Gas Undertakings under Gas Corporations, had been fully demonstrated. The question of nationalisation was increasingly ceasing to be one of economic and practical considerations. It was being drawn more and more into the political arena, where the facts were liable to become obscured by political rivalries masquerading under the guise of social principles. A crucial test would be—would nationalisation result in gas being cheaper to the consumer? There was nothing to show that it would.

The report was unanimously adopted.

GOVERNMENT RETURNS

For the week ended May 26, 1945, total ordinary revenue was £34,256,000, against ordinary expenditure of £84,124,000 and issues to sinking funds of £130,000. Thus, including sinking fund allocations of £1,286,993, the deficit accrued since April 1st is £390,398,000 against £501,288,000 for the corresponding period a year ago.

A change has been made in the method of showing an excess of Post Office Expenditure over the Post Office Revenue. Such excess is now included as ordinary expenditure under "Total Supply Services" instead of being shown, as up to July 24, 1943, inclusive, as a deduction from ordinary revenue.

After increasing Exchequer balances by £209,930 to £2,877,077, the other operations for the week (no longer shown separately) increased the gross National Debt by £51,342,957 to £22,793 million.

THE CHINA BANK OF INDIA

CHINA
(1858)

CAPITAL (PAID UP) £1,000,000
RESERVE FUND £1,000,000

Branches and Agencies throughout the EAST
AFFILIATED BANK IN ALLAHABAD BANK LTD., with 15 Agencies

The Bank offers a complete Banking service and provides exceptional facilities for financing every business with the East.

Deposits for Fixed Periods or repayable at call or on notice are received at rates which may be ascertained on application. The Bank also undertakes Trusteeships and Executorships.

Head Office: 30, BISHOPSGATE, LONDON, E.C.2

28, CHARLES STREET, LONDON, W.1
Manhattan Building, 100, NEW YORK CITY

COMMONWEALTH BANK OF AUSTRALIA

Guaranteed by the Australian Government. Branches and Agencies throughout Australia.

Banking and Exchange Business of every description transacted. Bankers to the Government of the Commonwealth of Australia, the Government of the State of Queensland, the Government of the State of South Australia, the Government of the State of Western Australia, the Government of the State of Tasmania, Commonwealth Savings Bank of Australia, 3,946 Agencies at Post Offices in Australia. As at 30th June, 1944—General Bank Balances £299,100,898

Savings Bank Balances £800,588,785
Note Issue Department £199,536,045
Rural Credits Department £2,472,089
Mortgage Bank Department £1,860,420
Other Items £22,320,811

£292,076,908

London Office: 8, OLD JEWRY, E.C.2.
Also at AUSTRALIA HOUSE, STRAND, W.C.

NATIONAL BANK OF INDIA LIMITED

Bankers to the Government in Kenya Colony and Uganda.

Head Office: 26 BISHOPSGATE, LONDON, E.C.2

BRANCHES:
Aden and Aden Point (S. India) Madras Kismayu Kenya

Churchill and Attlee

IT is so long since there was a General Election in this country that the average elector has forgotten what one is like. But if faulty memory had led him to cherish the delusion that a British general election was a reasonable appeal to reasonable people he would have been undeceived by the Prime Minister's lamentable broadcast on Monday evening. The line that a statesman of Mr Churchill's calibre could have been expected to take in opening an electoral campaign of exceptional gravity would have been one of dignity and of forward-looking, constructive leadership. Instead, Mr Churchill chose to be almost wholly negative and to devote almost the whole of his time to abuse of his opponents. There are the most manifest signs that the country is anxious to know what the Conservative Party proposes to do with the power for which it is asking and what guarantees it can give that it will not make as sorry a mess of the national affairs as it did in the 1930s. On these subjects Mr Churchill had not a word to say. So far from developing his "Four Year Plan" speech of two years ago, he dissolved it into the vaguest generalities; he seemed to be reverting, by instinct, to the days of his youth, when an election was a sporting event in which anything could be said without its being taken seriously. The culmination of this astonishing

performance came when Mr Churchill solemnly assured his listeners that a Socialist policy would require a "sort of Gestapo" for its enforcement and that it would endanger the savings of the people.

These two charges are, of course, complete nonsense. They are pernicious nonsense and if their author were anyone less respected than the Prime Minister still stronger language would be appropriate. As for the savings of the people, nothing proposed by the Labour Party is likely to do one-tenth the damage that would certainly be inflicted by a hasty removal of controls. And as for a Gestapo, there are few groups of men less capable of moving in that direction than the leaders of the Labour party, who have never been able to impose their wishes even on their own followers.

What is surprising is that Mr Churchill thought that this sort of fustian was good electioneering. Such a patent appeal to prejudice will obviously have an effect only on the lowest intelligences, and all those whose minds are conditioned to believe it would probably have cast Tory votes in any event. On the other hand, this election, more perhaps than any other, will be decided by the great central mass of the honestly puzzled. And one of the things that puzzle them is whether Mr Churchill, who has proved

himself so great a war leader, will be a good peace leader. He himself has written that the two qualities are rarely, if ever, combined in the same man, and the line that would win him the election would be to devote all his efforts to proving that he is the exception. Instead, he deliberately chooses to give the impression that his Government will be one of blind and stupid partisanship.

In elections, however, you cannot beat somebody with nobody. Mr Attlee's broadcast on Tuesday night was all that Mr Churchill's was not—moderate, sensible, constructive, fair—and Lord Samuel's opening broadcast for the Liberals on Wednesday was also, as might have been expected, reasonable and well argued. If the matter were to be decided on the sincerity and honesty of purpose of the leaders, and the evidence was limited to these three broadcasts, the opposition would win the election hands down. The difficulty lies in imagining Mr Attlee as Prime Minister or his colleagues—with a very few exceptions—providing an able administration. If the Conservative campaign takes its cue from Mr Churchill's broadcast, then many thousands of voters will take the plunge and give Labour the benefit of the doubt. But if Mr Churchill gives them half an excuse to believe that the Tories have, after all, got a policy and some honest intentions, the majority will probably give him their votes. In short, if Mr Churchill tries to win the election on his personality alone, he may get an unpleasant surprise. But if he fights on personality plus policy, he should be safe.

In the matter of policy, the only issue that has yet emerged is that of the removal or maintenance of controls—this year's immediate aspect of the endemic quarrel

between "Socialism" and "private enterprise." A great deal of nonsense is being talked on both sides. The remarks made by Mr Bevin and Mr Morrison in the House of Commons on the Government's decision to drop the Supplies and Services (Transitional Powers) Bill, which they criticised as a surrender to wicked vested interests, will hardly bear rational analysis, and in much of the Labour propaganda about the necessity of retaining controls in order to frustrate the profiteer, there is a strong echo of the pernicious doctrine that any form of profit-earning activity is *ipso facto* bad and to be suppressed. But on the whole the greater nonsense about controls is being talked on the Tory side. Lord Beaverbrook's speech at Bradford a fortnight ago set the tone. Lord Beaverbrook's speeches are written in the style of popular journalism; there is always something to catch the eye for the headlines, while the cautious qualifying phrase is tucked away in the small print for use in confounding the critics. It is therefore always difficult to be sure exactly what he did mean. But it is the headlines that leave an impression on the public, and the headlines of this speech said "Away with Controls and Up with Wages"—surely as irresponsible a piece of vote-catching as is anywhere on record.

It is too early yet in the campaign for any comprehensive judgment to be possible on the appeals of the parties. But it is not too soon for impressions to be forming. One impression is that the bankruptcy of the parties is even greater than was apparent before. The other is that such modicum of reasoned and constructive argument as has appeared has been almost entirely on the side of the Opposition.

Drift in the Levant?

THE British decision to intervene in Syria has put an end to bloodshed but it has not resolved the crisis. Indeed, it cannot do so, for the only possible justification for intervention would be that such a step cleared the way for a return to negotiation and the search for an agreed solution. Until the first step of military intervention is followed by the second step of discussion and agreement, the crisis in the Levant, far from being solved, may grow into an ugly international quarrel.

At the moment the situation in Syria is outwardly calm. French troops are being withdrawn from the main centres of population and British troops have taken over the military control of the area. The French have recalled General Roget, who bears a heavy responsibility for the outbreak of disorder. On the other hand, General de Gaulle has refused the Prime Minister's invitation to begin talks in London on the Levantine issue and, in Cairo, the Arab League, meeting for the first time, has demanded the complete withdrawal of the French from the Levant.

There are the makings here of a diplomatic crisis so delicate and tortuous that British statesmanship will need all its skill to unravel the knotted skein. The situation at the moment is that the British are in military control of an area in which they recognise the French to have a special position. The immediate crisis came about, as Mr Churchill explained to the House of Commons on Tuesday, when in May this year the French Government, while sending out, through General Beynet, new proposals for a settlement between France and the Levant, sent reinforcements at the same time. This action apparently convinced the Arabs that the French intended to use force to secure concessions. They broke off negotiations; strikes and demonstrations began and, almost immediately, fighting broke out, the French shelling Damascus and attacking the Syrian gendarmerie wherever they were to be found. At this point, "to prevent further bloodshed," the British Commander, Sir Bernard Paget, intervened. The French were invited to cease fire and return to barracks and the British took over the policing of the area.

This bare recital of the facts make it clear that the

French Government has acted foolishly and precipitately and that French policy has created an impasse from which it will be difficult to devise a dignified retreat. Moreover, General de Gaulle, in his press conference in Paris on June 1st, demonstrated a spirit of such hostility to Britain that it is difficult not to despair of good relations between the two countries so long as French diplomacy is so unrelially and temperamentally conducted. But French mistakes and French bad temper do not make up the whole story. General de Gaulle's statement was not all railing at a friend and ally. It contained a solid charge against British policy, a charge which many Frenchmen, who are far from sharing the General's ungovernable emotions, implicitly believe. At all costs this charge must be met and completely refuted if the Levant is not to prove a permanent obstacle to the Anglo-French entente.

This charge is quite simply that the British have always resented France's presence in the Levant and have used their influence at every point to ensure its exclusion. In particular since 1941, when the British, with some help from the Free French, drove out the collaborationist Vichy administration, the French accuse them of expressly encouraging the Syrians and Lebanese to a precipitate assumption of independence and of supporting them in their unwillingness and final refusal to negotiate with France. The French further accuse the British of maintaining large armies in the Middle East to reinforce their policies while encouraging the Arabs to resent moderate French reinforcements, and of supplying arms to the Arabs, of sending in British agents to stir up unrest and, quite apart from individual acts of hostility to the French administration, of generally weakening French prestige and influence and playing up the obstinacy of the Arabs.

Mr Churchill met a number of these points in his balanced and friendly reply to General de Gaulle. The arms found on Syrian police are British simply because, with the exception of American material, both French troops and local gendarmerie in this area have been armed by Great Britain. Mr Churchill assured the House "no arms were issued by us to the Syrians or Lebanese except by agreement with the French." Mr Churchill

was also able to refute the accusation that official British policy had been designed to exclude the French. If this had been Britain's aim, what could have been easier in 1941 than to have driven out the Vichy French administration and established British military control? The De Gaulle-Lyttelton agreement, in which the British Government expressly recognised France's special position, represented the official policy of this country at a time when no other Power, Great or Small, had any interest in reasserting France's lost position in the Levant and when the Levant states concerned would gladly have seen the French go. Nor has this official attitude changed since. In particular, as Mr Churchill reminded the French, this year saw renewed efforts on the part of himself, Mr Roosevelt and the King of Saudi Arabia, to persuade the Syrians and Lebanese to negotiate. Finally, it must be said—although Mr Churchill refrained from saying it—that General de Gaulle deceives himself and France if he lays the blame for the unpopularity of France in the Levant at Britain's door. The French administration had a bad name before the war. Ever since 1936, when a new treaty was offered to the Levant states by the Popular Front Government and not ratified by its successors, the Syrians and Lebanese have been strongly suspicious of France's intentions of ever granting them independence. That suspicion thus exists quite apart from any action on the part of Britain; and General de Gaulle, by arresting the Lebanese Government and President in November, 1943, and again by sending reinforcements at the most delicate moment of negotiation, has only turned suspicion into certainty.

*

The major charges of bad faith against Great Britain cannot be substantiated. But is this the whole story? It must be remembered that one or two influential people in this country do desire precisely what the French accuse the British Government of desiring—the exclusion of France from the Levant. They have, until recently, held important positions in the Levant and it is no secret that their influence has been used to undermine the French position. Anyone who has heard their statements, official and unofficial, in London must realise that they have used their influence to encourage the Syrians and the Lebanese to work for France's exclusion. It is true that much of the undermining of the French position is done by Arabs themselves coming into Syria from Transjordan and Palestine. The French, noting their provenance, suspect them of receiving British backing. This suspicion is quite ungrounded. What is more solid is French criticism of the policy pursued by a tiny minority of British officials on the spot.

This factor has been reinforced by the attitude of the Arabs themselves. It is true that the British Government has not officially encouraged them to intransigence, but it is also true that the presence of British troops and British

officials in Syria and Lebanon has greatly increased their sense of confidence. One or two British officials have not always shown the discretion of Mr Terence Shone, whose attitude, by common French consent, has been "impeccable." What more natural than that the presence of British administrators hostile to their French colleagues should have encouraged the Arabs to extreme opposition in the confidence that, if the worst came to the worst, the British would intervene—as indeed they finally did. Policy apart, the mere presence of Britain in the Levant aggravates French frustration and Arab confidence. When to this presence is added the hostility of many local British officials to the French, the bitterness felt in France becomes understandable. General de Gaulle has weakened his moral position by wild and unjustified accusations, but there is a sufficient core of truth in French suspicions to make the Levantine crisis far from the conflict of light and darkness which it has been painted in this country.

This oversimplified version of the troubles has led to a certain rather naive acceptance in Great Britain of the rôle of patron, guardian and protector of Arab interests. Headlines have carried the story of British tanks cheered by the Arab peoples of Damascus and the news that the Arab League began its first meeting with a vote of thanks to Britain has been received here in an atmosphere of self-confidence and congratulation. The mood is easy to understand, but it is dangerous. Great Britain is undoubtedly useful to the Arabs as a means of removing the French from the Levant. If they can secure British co-operation for that purpose, they will feel a certain gratitude. But it is probably nothing to the gratitude they would feel if, say, the United States could be persuaded to remove the British. Already the Egyptian Government is preparing to raise the question of the Anglo-Egyptian Treaty. The Palestine volcano is dormant, not extinct. The French may be the first problem on the Arab agenda. The British are the second. To lose France's friendship, which is vital to British life and security, in return for a brief period of Arab gratitude would be folly indeed.

This does not mean that British intervention in Syria was wrong. On the contrary, bloodshed had to cease. But it does mean that intervention can become a costly error if it is not immediately followed by constructive proposals for a settlement. If General de Gaulle cannot see his way to accepting what appeared to him a summons to come to London and open negotiations, then the British, with the assistance of the Americans, should at once seek to find some other means of convening a conference. General de Gaulle has now asked that Russia should be included. If General de Gaulle's aim is—as it appears to be—to play East off against West, little constructive work is likely to result from the widening of the negotiations. On the other hand, the joint interest of the Great Powers in all disputes is a principle of importance, and nothing should be done to

a 'Capital' Annuity!

... Part capital, part interest . . . £200 per annum guaranteed for eleven years . . . of which, on average, £175 is capital repayment and £25 is taxable interest . . . and, after the eleven years, an annuity of £300 (subject to tax) continuing for life . . . this can all be secured by a male life aged sixty-two for a present investment of £3,000.

increase Russian suspicions of Western exclusiveness.

The crux of a successful conference will be—whoever attends—the existence of firm proposals and a worked-out agenda. The responsibility here rests squarely upon the British, for although they command some sympathy and following among the Arabs, they are fundamentally in the same position as France. How can both Powers maintain a military and economic footing in the Middle East—which is vital to their economic interests and imperial communications—while at the same time maintaining cordial relations with the Arab world? The lines on which these aims might be secured have already been discussed in *The Economist*—the leasing of bases jointly from the Arab League, the establishment of a joint economic secretariat to carry on the work of the Middle East Supply Centre,

the provision of credit—in a word, a mutual exchange of advantages to take the place of the old Western hegemony. At present, passion and prejudice and faulty policy blind the two Western Allies to their common interests. The first task of British diplomacy ought to be the restoration of French confidence in British good faith, the recovery of cordial relations and a joint settlement of the Levant crisis. All these things are possible, provided Britain has a constructive policy to offer and offers it with some understanding of the French dilemma. If nothing is offered, if British occupation in Syria continues and no negotiations begin, the effect can only be disastrous. French friendship will be irrevocably lost, and the British will only be saddled with one more Arab commitment from which, like the French, they will ultimately have to find a difficult retreat.

Civil Service Reform

(By a Civil Service Correspondent)

THE detailed arrangements were published this week for recruiting new entrants to the Civil Service during the unsettled "reconstruction" period before the return to the placid and gradual absorption, by good old methods, of normal times. These methods were criticised in *The Economist* when they first appeared, in general outline, in the White Paper (Cmd. 6567) of last November. At the time, most attention was concentrated on the principle of giving a fair chance to ex-Service men, which is unexceptionable, rather than the methods of recruitment outlined in the White Paper, which were tame and traditional. In brief, the White Paper maintained that full opportunity, subject to minimum educational conditions, should be offered to anyone who might have competed but for the war. The entrance age would therefore be raised until normal competition could fairly be restored—in the Administrative grade this would not be until 1949 when entrants could have completed a three-years university course. A large proportion, usually 80 per cent of "reconstruction" vacancies would be reserved for ex-Service people and a smaller proportion for temporary civil servants.

This was a great advance on the wholesale hold-up of young recruits which took place after the last war. But the methods of selection show no such improvement. No recognition is given to the demonstrated benefit to the Service brought by the men and women who, during the war, have entered, ready trained for a particular kind of administration, from other trades and professions. The question immediately arises whether this disinclination to change is to be permanent or whether the absorption during the reconstruction period of a new type of administrator cannot be followed by the introduction of new methods of selection and recruitment. Although the planning of the Civil Service, unlike that of town and country, is not a matter in which reform, to be effective, must be now or never, there is surely no better moment to consider the possibility of change.

What is required? One widely canvassed suggestion is that there should be a separate economic class or branch of the Service, just as there is a Foreign Service distinct from the Home Civil Service. It is almost certain that any such proposal would meet with great resistance within the Service—partly, no doubt, from sheer conservatism, but also from a realisation of the difficulty of defining the province of economic affairs, which is not nearly so clearly demarcated as that of the Foreign Service. The purpose of this article is to suggest that the greater part of the objects intended to be secured by a new economic or other professional class could in fact be gained by a new policy in relation to the administrative class itself. The current theory of the Service is that administration is a profession, which is true, and that it is an undifferentiated profession, which is false. A really good civil servant should, it is thought, be competent to tackle anything, though it may take him a few months to learn

the ropes in a completely new department. This applies *a fortiori* to the allocation of new entrants, who find themselves doing work which has no relation whatsoever to their interests or previous education.

The most striking consequence of this state of affairs is the civil servant's dependence on outside advice. He does not seem in the least embarrassed at confessing that of course he doesn't know anything about . . . and he will have to consult. . . . In matters economic it is usually "the trade," i.e., the trade association; in other technical matters it may often be the Ministry's expert advisers—doctors, architects, agronomists and others, even in some departments, economists. It is not, it must be emphasised, in economic affairs alone that this weakness is found; it exists wherever the Service is called upon to administer the positive functions of the social state. The personnel of the Service is highly intelligent, independent, public-spirited, or it would not achieve so much. But it is ill-informed from a specialist's point of view, and ill-equipped to understand it.

The multiplication of the existing classes of technical advisers is not the solution. An advisory post is in its nature frustrating to a first-rate man. What is more, the technical advice, by his very position, tends to adopt a narrowly professional point of view: his duty is to offer technical advice and comment. The administrative officer mediates, as it were, between the claims of technical and political or administrative requirements, but he is not well equipped to understand the former. In the relevant divisions of the Ministry of Health he is probably neither a doctor, a biologist, nor even any sort of natural scientist; in the Board of Trade he is neither an economist, a geographer nor an engineer. In any case, he has probably not remained for very long in any one division, unless he is one of the plodders who will never rise to the top. He is an administrator pure and simple, not a health administrator or a trade administrator or an administrator of town planning.

It is true that the inadequacies of the Civil Service, as at present organised, have been most notable in the economic branches. This is partly because these branches have had to modify their functions more rapidly than any others, partly because of the inherent difficulty of the problems arising, and partly because they, more than the others, have had to rely upon outside advice. The civil servant rightly distrusts this; he knows it is not disinterested, and that he is not equipped to sift the grain from the chaff. So he hesitates to take sweeping action, and if forced to do so, abdicates completely and asks the outside body to accept responsibility. It is notable that policy has been more adequate in the Treasury, whose officials are more expert and whose outside adviser, the Bank of England, is more disinterested, than elsewhere.

If this analysis is correct, the solution is apparent. It is to regard the administrative posts in the various departments as essentially specialised and to appoint to

them individuals qualified by aptitude or experience to fill them. Doubtless technical advisers will still be needed; but they will be better understood and appreciated, and they should be much more freely transferred into the administrative class if their interests lie in that direction. It may be granted that the new entrant should still be given a period of training in which he or she should work in several divisions of the particular department; but he should then settle down to become really expert in his own line. It may also be granted that the higher positions must become progressively more generalised again, as they do in business; but expertise in one branch does not unfit a man to hold them, even though it is not by itself a sufficient qualification. Junior private secretaryships to the Minister could be used, at intermediate periods, to renew an officer's general acquaintance with the work of the departments and additional similar posts should be created.

A reform of this nature would be far easier to secure than the establishment of a separate economic service—and it might be at least as effective. The administrative class should comprise men equipped to deal with economic matters, health, education and the rest. They would not be first-rate technical experts, but first-rate administrators in their own line. It may be said that the present system trains everybody to become a Permanent Secretary but no one to be a Principal or an

Displaced Persons

FOR a conglomeration of human suffering that has never in all history been paralleled for size, the terse and characterless official symbol is DPs. It is estimated that there are ten to eleven million of these hapless people in Germany alone. On the Western Allies' side of the occupation line approximately 4,500,000, including one-time prisoners of war, have been located and are being registered. They consist of 1,500,000 Russians, 1,200,000 Frenchmen, 600,000 Poles and smaller consignments of Belgians, Netherlands, Yugoslavs, Czechs, Greeks and Scandinavians. As long as General Eisenhower remains in supreme military command, these people are the concern of Shaf through its Civil Affairs branch, G5.

In handling them, Shaf is assisted by Unrra, which is in its turn receiving help from various national voluntary organisations. When the post-military period begins, Shaf will fade out and Unrra alone will become responsible for repatriating or maintaining such DPs as remain.

There have been some doubts whether Unrra is capable of handling a job of these dimensions. Last winter, it was popularly judged to have fallen down over the provision of emergency supplies. Now, it seems to have picked up confidence and momentum. The reason is that, then, it was—by military standards—a Cinderella. Now, a lesson rammed home by last winter's near-revolutions behind the lines is bearing fruit. The Supreme Command ranks civilian contentment as a "major allied objective" and a "direct military responsibility." Otherwise the feat of getting 1,800,000 DPs out of Western Germany and home by the first week in June would not have been possible.

Unrra relief teams, made up of all nationalities, are trained at a huge assembly point at Granville, near Cherbourg. Its personnel division recruits additional staff in each liberated country and forms them into teams after a short training in every form of work from the technique of classification to how to dig an efficient latrine. Two hundred and thirty Unrra teams are already in the field; the target, to be reached in July, is 450.

Each team takes over a camp as and when instructed by the military. These may be anywhere, from an ex-German penal settlement complete with electric fencing to a row of villa residences that is soon labelled "*rue Charles de Gaulle*" at one end and "*Ulitza Stalin*" at the other. Here the complications—human and political—

Assistant Secretary. These proposals might seem to err in the opposite direction. But special steps have been suggested above, and others might doubtless be taken, to equip men to take the higher, less specialised posts. There might be some loss of flexibility in the Service as a whole, but it should be greatly outweighed by the increase in competence.

Just how far this process of specialisation should go would have to be decided very largely in the light of experience. It could go further in those fields in which governmental activity is most continuous and administration most direct; least far in relation to those affairs which only call for occasional intervention. In the nature of the case, public attention must be concentrated now on one facet of a department's work, now on another; and the machine must be sufficiently flexible to meet this requirement. Particularly in industrial and commercial affairs, the administrators will require information as well as representations from outside. But if they are well acquainted with the general group of industries or with the class of problem under discussion, they will know what questions to ask and what degree of attention the answers deserve; above all they will have a general framework of policy into which to fit the particular circumstances of the case. At present they lack the knowledge and self-confidence to frame broad constructive policies.

begin. The Unrra reception chain runs as follows: registration, delousing, medical inspection, first meal, soap, blankets, feeding utensils. Repatriation cannot follow until the DP has been checked and accepted by an Allied Liaison Officer of his own nationality. Each country has a team of these repatriation experts accredited to Shaf for the purpose. There is one to every 5,000 DPs.

It is possible to move too fast. The French, working to a slogan of "*vitesse, ordre, humanité*," have concentrated on the first and passed some prisoners through without all necessary medical tests. They paid for the mistake with a short outbreak of typhus in Paris, and with demands for clothing and food that the Minister responsible, M. Fresnay, has not been able to meet. Hence last week's raids on the *grands magasins*. The incidents are a measure of France's national rehabilitation and re-employment problem for next winter.

Within the camps themselves the Unrra welfare officer has to handle a bewildering variety of complications. His earliest problem is how to restore a sense of privacy and decency among people who have led a wholly public life for years. Clothing complications follow. The heaviest DP always appears, later, in the best of the clothes. Thefts are constant. Once needles are distributed, blankets vanish and several young women appear next day in soft grey woollen dresses. The range of requirements to be catered for runs from provision of religious services and restoration of a moral sense to properties for concert parties. Further, "welfare" amounts to far more than the mere employment of hand and mind. Most officers who visit the rear on scrounging raids report that their powers of judgment are taxed with legal conundrums such as the right to marry, divorce, adopt and prosecute.

For the present, a major trial to them is the anguish, often needless, caused by the lack of communication between camp and camp. DPs who have lost one another make extra work. The central register which would solve this problem has proved impossible to create in the early stages, when about half the camp inmates have been joyful repatriates, in to-day and out to-morrow. It is badly needed for the residue and is now in preparation.

So far, the job to be tackled has been the relatively simple physical one of handling things that the doctor and welfare worker can touch or see. A DDT spray, a piece of soap or a pass for an aeroplane has been sufficient

to turn despair into joy. From now on the problem changes shape as the flood of simple repatriates disappears and the hard core of the homeless—uncertain, bitter or despairing—is left on Unrra's hands. The organisation is bound by its charter not to send anyone back to a country to which he does not wish to go. Only the Russians are sent home without reference to their personal views. What is not yet clear is: For how long is Unrra to maintain people who do not want to go whence they came and what, if not stateless, is to be their nationality?

Technically the Inter-Governmental Committee on Refugees already possesses the machinery for solving such a question. But since the bulk of the new wanderers come from Poland and from lands now incorporated in the USSR, Russia has views on what should happen to them. They leave the human wreck stage only to become so many units in a political problem, and a problem which, since Russia is involved, will doubtless prove insoluble at any level below that of the Big Three.

The Poles present the worst conundrum, both numerically and because the United Nations are not agreed on which Polish Government has a right to speak in their name. Colonel Paravicini, who is the Shaeff officer in charge of DPs, has stated that only about one per cent want to return to Poland. Russian spokesmen and the Lublin authorities reply that this figure is the result of undue influence exercised by the Polish Repatriation Officers attached to Shaeff and by the Polish workers in Unrra, all of whom owe their appointment to the Arciszewski Government in London or to the even more uncompromising and anti-Russian Polish army command. In the opinion of relief workers of unbiased and neutral nationality, the percentage quoted is only temporary and will alter as the DPs gather strength and are given time to see what is to happen inside Poland. But it is clear that anti-Russian propaganda conducted among them by extremists of their own nationality will cause a legitimate

Western Association—II.

Western Defence

THE argument of the preceding article in this series, which appeared last week, was that, if anything is to come of the beneficent idea of a closer association among the nations of Western Europe, the approach must not wait upon sweeping decisions at the loftiest plane of high politics, but must begin more humbly by tackling the practical ways and means. A political document of alliance and unity would be difficult to negotiate and almost impossible to defend against the suspicions of the outer world. But the case for practical co-operation among the Western countries is so overwhelmingly strong that no possible objection could be raised to something in the nature of a joint working party to investigate the possibilities of joint action.

In no sphere of public policy is the case for joint action clearer or stronger than in that of defence policy. Before the war, the nations of Western Europe remained disunited and divided in the face of Germany's growing aggression. Norway and Holland adhered to the neutrality of the earlier war. Belgium, after joining for a time in the very moderate Locarno system of mutual defence, returned to neutrality in 1937 after the German reoccupation of the Rhineland. France and Britain passed through the successive crises of Abyssinia, the Rhineland, Austria and Czechoslovakia without even a general understanding, quite apart from detailed agreements between their General Staffs. When war overtook the western fringe of Europe, it was not a wall but a ragged edge.

The lessons of Hitler's campaigning are so obvious that they hardly need repetition. The first guarantee against renewed aggression is a firm understanding between East and West. The Anglo-Soviet and the Franco-Soviet treaties are the front line of defence, but they in their turn depend upon the solidarity of the strategic and political foundations in Eastern and Western Europe. Even an alliance between Britain, France and Russia, had it existed in 1940,

Russian grievance. This is not worth creating. It is time that the Western Allies face this fact and enable Unrra to employ moderate Poles of the Mikolajczyk school who take a broader view of future relations with Russia. It is understood that M. Mikolajczyk would be ready to co-operate but cannot at present do so because the Arciszewski Government holds the key to passports.

But whatever the percentage of Poles that, ultimately, opt to return to Poland, it is clear that some, from both sides of the Curzon Line, will continue to prefer another home. Mr Churchill's offer of British Empire citizenship so far applies only to those who have fought for us. Conscience must prick the victorious Powers into offering a future to the rest.

Nor are the Poles the only people so placed. The DP camps are full of lesser colonies of other races—Latvians, Estonians, Lithuanians, Jews from Hungary and elsewhere and anti-Tito Yugoslavs. Here again political problems abound. Marshal Tito, for instance, is averse to any maintenance by Unrra of Serbs or Croats who are in his view politically suspect.

The ultimate dimensions of the problem cannot yet be foretold. The first year of peace is always the worst. The numbers wanting a new horizon may shrink as Central and Eastern Europe settles down. But the would-be refugees may top the million mark. The United Nations will then be faced with a moral problem. Shall they bend the residue of the world's homeless and stateless to the will of authoritarians who want them back, or shall they jointly create a new National Home, or shall each liberally offer a fair share of sanctuary? Their experience with fugitives from Hitler is a warning that neither of the two latter projects is an easy international feat. But the charter they devised for their Relief and Rehabilitation Organisation is proof that most of them would find the first of the three choices morally unacceptable.

might not have prevented Hitler from crashing through to the coast, since he had a corridor of weak neutral communities between him and the North Sea. In this age of aircraft and armoured divisions, the whole of Europe west of the German frontier—one might as well say west of the Elbe—is too small to form more than a single strategic area. No single sub-division of the area provides elbow-room for a properly co-ordinated strategic plan. The question confronting all the Western nations is whether they are going to continue to defy this technical fact, so terrifyingly demonstrated to them in 1940, or whether they have learned the lessons of this war sufficiently to reshape their defence policies. It is not simply that their defence policies would be more effective if united, but that none of them, Britain included, can have any effective defence policy at all in isolation. Nor need any time be wasted in answering the inevitable inquiry into the identity of the enemy against whom these policies are directed. Individual nations have defence policies without their existence being taken as a hostile act, and when half-a-dozen nations discover that, owing to developments in the technique of war, the only sensible defence policy open to them is a joint one, that also is surely a natural and reasonable course to pursue.

The first lesson to be learned from the war is the need for the pooling of supplies. The painful steps by which, during a war, allies gradually accept common supplies, common strategy and a common command should be as far as possible anticipated, since modern war leaves an ever narrowing margin of time for improvisation. Ideally, of course, the creation of a single defence force, with the different Western nations serving as separate regiments and divisions under a general staff drawn from all and dominated by none, would be the full answer to the strategic problem. Such a degree of unity is clearly not practicable, at least for the time being. During this war,

the intermixture of foreign units in the British forces has gone far, and among some of them a kind of inter-allied solidarity has certainly grown up. But this type of comradeship is only a faint foreshadowing of some future and genuinely international force. So far, national sovereignty has had its way. Even Empire units within the British services have their separate organisation. Now that the war is over and the Western European Governments are home again, they are bent on re-creating the nuclei of separate armed forces, with especial vigour in France. Nor is it at all probable that the heads of the British Services would be ready to consider the "dilution" of the High Command with foreign Admirals and Generals.

However much a final pooling of resources is maintained as an ultimate objective, immediate post-war policy must be more modest. It is, therefore, all the more important that the joint planning should cover as wide a field as possible, and that the nations' defence policies should be integrated from the first needs of supply to the last decisions on strategy.

The most obvious need in the field of military equipment is the standardisation of all weapons and supplies. But merely to ensure that the various armies use interchangeable equipment does not go very far towards solving the problems of joint supply. It should be possible to set up for the six Western nations—and for any other nations that may subsequently join—an Armaments Commission. Its first task would be to allocate the physical burden of armaments; the fairest basis would probably be a certain percentage of the national income. Closely allied to this would be the problem of allocating orders between the different nations, and of ensuring that full advantage was taken of any special advantages in the matter of supply or technique which they might happen to enjoy. In the immediate post-war period, it is almost certain that Great Britain should bear the heaviest burden in armament production. The economies of the other Western nations have been badly dislocated by the war and are not geared up to high production. At the same time, the needs of their civilian population are far graver. It would put an intolerable strain upon French economy if it were, in the next few years, to attempt both to re-equip the French Army and to restore civilian life. An offer from Britain to devote part of its surplus stores of modern weapons and of its industrial capacity to arming and equipping its neighbours, while they produce primarily for civilian life, would, if tactfully offered, constitute a very genuine pledge of co-operation and a readiness to sacrifice material wealth in the common cause. Once a certain measure of material reconstruction had been achieved in the other countries, a more equitable sharing of the burden would be possible. A final task of an Armaments Commission would be to act as a joint buying agency for outside supplies if the purchase of armaments, for example from the United States, became necessary.

*

The same problems of dividing the burden of defence arise in the sphere of man power. It now seems likely that after this war all political parties in this country will agree to the continuance of a measure of national service. This step alone would remove a reproach that has hitherto helped to separate Britain from its continental neighbours. As long as the nations of Western Europe laboured under conscription while the British made no attempt to impose military service, there was always ground for the taunt that the British fought their wars with European armies. It should be possible after this war to convince the peoples of Europe that Britain is ready to bear any burden which common defence may impose. But how big ought the burden to be? And what form should it take? For instance, ought the nations to specialise—the Dutch and the British giving more to the Navy, the French to the Army, and so forth? How could the best use be made of their particular aptitudes and resources? In this war and the last, there has been a certain division of function between France and Britain, the French in the initial stages of both wars providing more soldiers, the British throughout the war keeping the sea lanes open. In a more closely integrated defence policy, this accidental division of labour

would have to be more deliberate and carried further, and it would obviously entail delicate problems of tradition and prestige. The decisions of such problems might be the province of the Armaments Commission, or of a Chiefs-of-Staff Committee, or of some special body; but it is clear that an agreed policy would be far more effective than the very rough and ready balances struck in the past.

It is probably in the training of the sea, land and air forces that the most can be done to draw them into closer unity. The standardisation of equipment should be matched by standardisation of tactics and training. In this war British, French, Polish, Dutch, and Norwegian Commandos all went through the same battle schools, emerging with something of an *esprit de corps*, and a great deal of shared knowledge and experience. At a higher level, it should be possible to set up joint staff colleges to which staff officers from the different national defence forces could come together to receive their training. Institutions of this kind would make it possible to carry on a systematic exchange of officers between the various national armies, and to develop the feeling of a common military tradition. In some fields common training is essential. The smaller nations of Western Europe in particular need far more "living space" than Europe provides if they are adequately to train their air forces. Bomber Command of the RAF could not have any long-distance training—except over the sea—in peacetime. The role of Canada as a training ground in this war has been an example of how an international training system can be worked. Norwegian pilots are going back to their country with memories of the "Little Norway" they left behind in Canada. There is no reason why this type of co-operation should not be carried on. Quite apart from its value for defence, it is needed for pilots in civil aviation. Another essential aspect of joint policy is the pooling of scientific research into new methods of war. All the nations have an overriding interest in discovering the antidote to the rocket and the flying bomb, and will proceed much more quickly if they pool their results.

Somewhere halfway between the sphere of training and the high problems of strategy itself lies the question of bases. If the countries of Western Europe with their colonial dependencies were to co-operate, their territories would girdle the earth, and on every Continent and in every sea they would be in control of air fields and naval bases from which to guard the peace of the world. They would vastly increase the effectiveness of their defence system, if these bases were used collectively, if for instance the French Navy could use not only Toulon and Bizerta but Valletta and Tobruk and Alexandria, with equal ease. Indeed, in the case of France, the obtaining of joint bases in the Middle East is probably the only solution to the deadlock into which the French have brought their Syrian policy. But the possibilities for joint bases are not confined to the Mediterranean. Durban, Colombo, Singapore, Sourabaya, Camranh, Sydney, the anchorages off Tahiti, the British and French West Indies, Dakar, the ports and harbours of the Metropolitan countries could be brought into a world-wide system of pooled defence, and might thereafter be opened on equal terms to any other nation that would offer the same facilities.

Finally, if the strategy of Western Europe is to be fully co-ordinated it is essential that at the very top of the structure of defence there should exist a joint body capable of planning the activities of all the separate forces in the different states. The best instrument would probably be a joint Chiefs-of-Staff Commission, resembling the combined body which has, up to a point, determined Anglo-American strategy in this war. Such a Commission, served by officers who had passed through the same staff colleges, disposing of a world-wide system of joint bases, commanding troops whose equipment and training had been based on the same lines, would stand a chance at least of producing a more coherent defence policy than the hastily constructed and speedily demolished defence plans of 1940. And such a body, even though it would be far from the unified command within a unified service which would be the ideal guarantee of effective defence, would be an advance along the road towards unity sufficient to offer some hope that unity itself would be finally achieved.

NOTES OF THE WEEK

One Germany or Four?

The four generals who met with a flourish in Berlin on Tuesday have dispersed without making much progress towards co-ordination of policy. They signed a Declaration regarding surrender which has obviously been waiting for some time in a drawer at the European Advisory Commission. They also signed two Declarations on the administration of Germany, which give, at first reading, an impression that a considerable advance towards harmony has been made in recent negotiations. They sound mellow enough. Berlin is to be occupied by the four Powers jointly; the frontiers within which the agreement is to be operative are those of Germany on December 31, 1937, which, in theory, brings the whole Oder basin and Russia's Polish colonisation policy within the Commission's purview.

But the ink on the four signatures was scarcely dry before Marshal Zhukov revealed that he could do nothing further until British and American forces had withdrawn from such parts of Thuringia, Saxony, Mecklenburg and Anhalt as they now occupy. Till then he could discuss neither the machinery of control nor the entry of Western Allied troops into Berlin. It even appears that his remarks threw some doubt upon Russian readiness to see Berlin as the final seat of central control. Later, and as if to press his point home beyond all question, Moscow published, without prior consultation, a map of the zone he had described.

This gesture is one of impatience with the West, and undoubtedly the Western Allies should have agreed on and been ready to publish their zones earlier. The delay has been chiefly due to difficulties over the claims of the French, who now occupy Baden and Wurtemberg, but want a Rhineland-Ruhr zone instead.

But impatience, however justified, does not warrant brusque unilateral action with one hand while the other is signing an agreement on joint policy. The Russian technique is bound to cause delay in putting into operation the joint agreements already reached in the European Advisory Commission. The Western Allies, who of course knew that their troops were over the ultimate line of their zone, may, before retiring, want to be sure that Russia is within its agreed limits in Vienna and Styria. Yet, inside Germany, such delay can be ill-afforded. The speedy conclusion of joint arrangements is essential if all four zones are not to be unnecessarily difficult to handle next winter. Co-ordination of food policy, in particular, is as important to the Russians as to the Western Powers. Famine will ensue in all zones unless all parties quickly combine to right the present unbalance between the East, which contains the wheat and rye lands but too few hands to reap them, and the West, which is seriously overcrowded with hungry humanity.

Crux at San Francisco

The San Francisco Conference has reached a stalemate. Discussions proceed on minor points, but behind them looms the fact that there is, for the moment, a total deadlock on the vexed question of the veto. The Conference cannot now end quickly. Four of the Big Five on one side, and one—Russia—on the other, have taken opposite stands. The four, influenced by an accumulation of middle and small power views, would like to see adopted the formula first advanced by Mr Eden on May 10th, then slightly modified by the Big Five to meet Russian points advanced by M. Sobolev and then—as is becoming a routine—referred to Moscow. This formula is that the veto should not apply to simple discussions of a dispute, and that parties to disputes under such discussions may not vote upon them. The Russians' reply was the recall of M. Sobolev and a categorical "No" to San Francisco. This new Russian stand, which tends to narrow further than ever before the subjects free from veto, is a recession even from the relatively extreme view agreed at Yalta.

Are the stands adamant? A personal appeal is being made to Marshal Stalin from London and Washington, but unless Mr Harry Hopkins can work a miracle in Moscow, the outlook is not bright. If the Russians will not budge,

their four partners are faced with a major decision. Either the world must trim its organisation to suit a single one of its members, or else, contrary to their principles and inclination, the Four must flout the smaller powers with whom they agree. The dilemma is perhaps worse for the British than for the rest, since they must choose between Russia and their kin, the Dominions.

This is not an isolated example of Russian unwillingness to bend to the common opinion of her Allies. There is beginning to be a feeling that too many topics and arrangements are hanging on answers from Moscow. That feeling is reflected in the fact that, in recent weeks, the European Coal Commission, the Inland Transport Commission and the European Economic Emergency Commission have all begun work rather than wait indefinitely for a Russian reply. It would be disastrous if the world organisation were to have to go ahead without Russia, but there is a limit to the price at which universality is worth the purchase.

Design for the Secretariat

Another fissure has appeared in the structure of world organisation. There is not general agreement on the recruitment and terms of service for its secretariat—now under discussion in its Membership and General Provisions Committee. The secretary-general is to be appointed for three years (renewable) and so are his deputies, who are to number four or, if the small powers have their way, five.

This short term of office has come in for much criticism. It compares with an initial minimum of eight to ten years at the League of Nations. Its advocates argue that it enables the organisation to curtail bad appointments.

This is true, and the arrangement may pay in a few top-most posts, where frequent changes of nationality, though they make for patchiness, offer in compensation a fine appreciation of trends in a variety of countries.

But the short-term principle is disastrous if applied in the layers below. The secretariat must, if it is to generate loyalty and continuity, contain a hard core of semi-permanent, internationally-minded officials. That such a body of men and women can be recruited from the nations was proved at Geneva, where the staff contained many members on whom delegations came to rely for impartial international opinions. But since, for most of these slightly less senior officials, promotion to the highest posts is out of the question, long tenure as well as high pay must be offered if able employees are to be attracted into the service. A term of office as short as three years would oblige them to work with an eye to a future career in their own countries and to think constantly of standing well with their own Foreign Offices. All told, seven-year contracts (renewable) with a pension on retirement seem to be the workable optimum. They keep the employee up to the mark, but give him time to wean himself from national ties and pressures.

Power of appointment is another debatable matter. Under the League it was in the hands of the secretary-general, subject to Council approval. There is now a proposal that it should rest with the Assembly. This suggestion can only lead to nominations made to suit national interests. Even at the League the secretary-general was—in the later years—often confronted with heavy national pressure. Probably the only way of avoiding undue national lobbying would be the delegation by the Assembly of its powers to a body of Permanent Staff Commissioners—a group of men chosen on a basis of personal standing rather than nationality.

The Trial of War Criminals

The United Nations War Crimes Commission has been meeting in London since May 31st. The war criminals already listed by the Commission number 2,524 Germans, 110 Italians, 2 Albanians, 17 Bulgarians, 2 Hungarians and 2 Roumanians. In addition, there are 561 Germans in key positions listed on a general charge of terrorism, and the unknown number in the hands of Russia, which is not represented on the Commission.

In a recent article in *The Economist* (May 26th, page 689), a plea was made for haste in settling the procedure to be adopted, and in bringing the criminals to trial. The meetings held so far by the Commission have underlined the difficulties in the way. As Lord Wright pointed out, there is a vast body of evidence to be sifted, and the potential witnesses number hundreds of thousands or even millions. The Commission has found a *prima facie* case on which Goering can be tried as a war criminal, but it has still not been decided whether he is to be tried by an international court on a general charge, or by a national court on a charge of robbery or murder. The case of William Joyce has also not been settled. If the question of his nationality is solved, he will presumably be tried under the English treason laws as a traitor.

All this delay, however, does no good to the cause of justice, whether the criminals concerned are mere traitors or offenders against mankind. That a criminal should be given a fair trial is instinctive in the British people. But is any trial of at least the major war criminals likely to be fair? Is it likely that a criminal will be acquitted however flimsy the legal evidence against him—as distinct from the general repute of mankind? It is difficult to see how, in the circumstances, any court can have an unbiased mind. And how will history judge the sincerity of a legal process that leads to wholesale convictions, however formal the trappings of justice? Would it not be better to draw up, as soon as possible, an indictment of the major criminals, and then execute them summarily, instead of running the risk that formal trials become a mockery of justice?

Controls in the Transition

In the House of Commons last week, the Labour Opposition made a great issue out of the Government's decision not to proceed with the Supplies and Services (Transitional Powers) Bill. Mr Herbert Morrison, who had introduced the Bill before the coalition was dissolved, described the decision as a "shameful surrender to the vested interests which control and dictate the policies of the Conservative party..."

To the legal arguments advanced by Sir Stafford Cripps the Government gave an effective answer. Under the Emergency Powers (Defence) Acts, controls can be used "for maintaining supplies and services essential to the life of the community," a phrase which covers priorities and rationing in all its forms. On the question of how long these powers can be used, the Attorney-General claimed that so long as shortages are due to war causes, the use of emergency powers would be within the purview of the Act, and that no one could suggest that within the six months ending February 24, 1946, for which the life of the Emergency Powers Acts is to be extended, any shortages would not be related to "the present emergency."

The procedure to be used after next February is to be discussed in the new Parliament. Where the Opposition was wrong was in apparently thinking that placing the Supplies and Services (Transitional Powers) Bill on the statute-book before the dissolution would make a ha'porth of difference to the Government's policy. However strong the dislike of Mr Churchill and Lord Beaverbrook for controls, it would be suicidal for the Government, if it is returned, to let the controls run off next February, and, presumably, powers to renew them for a longer period will be taken. But if it is the present Government's intention to abandon them as soon as possible, it does not matter what, or how many, Emergency Powers Acts are in force. There is no legal sanction on a Government that acts *infra vires*, but only the sanction of the public's reaction to the ensuing chaos. A Government is judged by its actions, not by its enabling Acts.

Summer Taxation

Sir John Anderson's introduction of the abbreviated Finance Bill to cover taxation in the summer months added little to Mr Churchill's bare announcement six days before. He merely emphasised that the few provisions of the Bill were essential to the "orderly management" of financial affairs during the election period. These few provisions cover income-tax; purchase-tax (including a footnote clause concerned with the marking of utility goods subject to the lower rate); the hops duty; the National Debt Charge; and the EPT relief to small businesses.

There was, therefore—or should have been—little ground for debate. But the leniency of the Speaker allowed fairly

wide comment on the exclusion from the Bill of any mention of the motor taxation changes proposed in the Budget speech. Apparently, no final agreement has been reached with the motor trade. Mr Bevin's criticism was much to the point. He rightly stressed the appalling handicap which the present graded horse-power tax imposes on the expansion of the industry on the export side. The objections to change which, presumably, the large manufacturers are putting forward cannot possibly, on any balanced long-term view, stand against the overriding interest of the national economy as a whole.

The second part of Mr Bevin's speech (as much out of order, on any strict ruling, as the first) concerned the Bretton Woods agreement. On this subject the official Labour Party view has never been carefully defined. The agreement was reached after the general Labour statement on financial policy. Quite apart from the election—in which the subject will probably be elbowed out of public discussion by more straightforward and simple issues—it is interesting to see that Mr Bevin, acting apparently as financial spokesman of his Party, is not altogether in favour of the agreement. As an instrument which might prevent the insulation of the home market against violent fluctuations in the international price-level, he was not persuaded that it provided adequate safeguards. It would be valuable, in the international field as well as the national, if Mr Bevin's remarks could, before long, be more fully developed by the Labour Party.

The Canadian Election

The new Dominion House of Commons is to be elected on Monday. The general report of observers in the last few weeks had been that Mr Machenzie King's stock was rising. This was based in the main, it would appear, on two sets of considerations. In Quebec, the opposition to the Liberals has not been able to organise itself as effectively as at one time seemed likely. An attempt to form a party of Liberal secessionists under Mr Cardin failed, and many of Mr King's opponents are standing as Independents. The Liberal Party's chances of winning a fair proportion of Quebec's 65 seats are brighter than they were. Outside Quebec, the Opposition campaign had not been very effective, and Mr King, it was reported, was benefiting from the same unwillingness to swap horses before the stream is fully crossed that is helping Mr Churchill.

This Liberal optimism has, however, suffered a rude setback from the Ontario provincial election held this week. A year ago, Colonel Drew's Progressive Conservatives, though they were returned as the largest party, had no majority. This year they have very nearly swept the board, rising from 48 seats to 66. The Liberals have fallen from 16 to 11, and the Co-operative Commonwealth Federation, whose advance seemed so irresistible a year ago, has fallen from 34 to 6. It is true that Ontario is traditionally the Conservative province. It is also true that the turnover of popular votes may prove to have been less startling than these results would indicate. It is further true that provincial politics is one thing and Dominion politics another.

But the augury can hardly be ignored. Mr Mackenzie King may not, after all, come back at the head of the largest party (even his own followers hardly hope for an independent majority). A Liberal-Conservative coalition is still, perhaps, the most likely prophecy for the next Government, since both these parties dislike the CCF more than each other. But the leadership is in doubt.

More Changes at Chungking

The appointment of Mr T. V. Soong as Prime Minister at Chungking in the place of General Chiang Kai-shek marks the culmination of a series of political developments largely dictated by the need to preserve and strengthen good relations between Chungking and Washington. The recall of General Stilwell in the summer of 1944 was followed by a sudden spate of criticism of Chinese corruption and autocracy in the hitherto unanimously Sinophile American press. Under this pressure, General Chiang Kai-shek inaugurated a series of changes. He reduced the power of the "reactionary" group centred upon the Kung family, he brought in Mr T. V. Soong as Vice-Premier, he later announced that constituent elections to create democracy in China would be held in the autumn of 1945.

He agreed to receive an American economic mission under Mr Donald Nelson, and accepted their fairly drastic criticisms and suggestions.

All this was apparently insufficient to still criticism in Washington. It was still felt that the Generalissimo was too stiff in his relations with America and too autocratic in his approach to the Chinese. Now, however, Mr. T. V. Soong's appointment may be taken as a signal for a full and complete restoration of confidence between China and the United States. He is *persona grata* in Washington. He has, it appears, successfully negotiated new economic agreements. He is a Liberal and is believed to have a better chance than any other Chinese statesman of mending the breach between Chungking and the Communist headquarters at Yen-an.

This last point is not a matter of internal politics. In recent weeks, the Moscow press has grown more open in its support of Yen-an and its criticism of Chungking. If peace is to be restored, the road now leads through Moscow. Thither Mr Soong intends to go on his return from the United States. His chief asset is American backing; Russia's the strength of its strategic position on the Mongolian and Manchurian frontiers. The basis exists for a bargain, but the negotiations will doubtless be long and hard.

"Liberation" for Persia

The Persian Government has asked the Allies—British, Russian and American—to withdraw their troops from Persia as soon as possible. The Persian note provokes no urgent crisis. The tripartite Treaty of 1942 lays down the date of departure of the troops as six months after the end of hostilities with Germany "and her associates." In unequivocal language, it goes on to define those associates in terms that cover Japan. The United States is not a signatory to the Treaty, but is little affected by the new request since arrangements are complete for the withdrawal of all American troops this summer.

The reply to be sent to Teheran is therefore an Anglo-Russian problem. It is under a discussion between London and Moscow that is described by both Foreign Offices as "sympathetic." It calls for, first, agreement on timing and, second, mutual readiness to quit *pari passu*. The fact that the Americans feel able to withdraw their men is a pointer to the way it should go. Their troops were guarding a stretch of the supply line to Russia and their job is done. Is there other war work for the British and Russians to do?

For the Russians, there is none. Shorter and less switch-back routes to Russia are now open and the USSR is not at war with Japan. The British Government could, no doubt, summon up some reasoned argument that, for the duration of the Japanese war, it needs special security in South Persia for the Anglo-Iranian wells and refineries that are supplying the forces in the Far East. But this argument would not be worth advancing if its purchase price were a Russian counter-claim to remain in North Persia, for instance, to guard its oil concessions, as yet unworked, or still further north to protect the Azerbaijan separatists, some of whom are always at loggerheads with Teheran. In order to guard against a situation which gives new scope to old Anglo-Russian jealousies, the departure had better not be delayed, and should in any case be whole and not piecemeal.

Italy and AMG

Some weeks have passed since the final liberation of Italy, but there is still no central government. Negotiations continue between the National Liberation Committees of North and South, the existing Government and the various political parties. The delay is unsatisfactory, for the best method of building up Italian morale is to set the task and responsibility of government firmly upon Italian shoulders. The most remarkable factor about the liberation of Northern Italy was the self-confidence with which the partisans and their political supporters were ready to take over the administration. The mood was in complete contrast to the apathy and apparent hopelessness of many regions in the South. After liberation, however, AMG took over and is for the time being the sole source of political authority in Northern Italy. On top of this has come the delay in rebuilding the Government in Rome. The general tone is degenerating. Suspicion of the Allies and of political opponents has taken the place of earlier confidence.

The Allies have a responsibility to arrest this drift. In one matter, at least, they have sole responsibility. They could usefully set a term to AMG and make it clear that beyond a certain amount of garrisoning to ensure peaceful communications, they will, at a stated time, bring their administration to an end.

The second point—the need of a new government—is more delicate, for it is a point upon which the Allies must not be thought to intervene, yet they can by encouragement and advice influence the Italians' efforts. The type of government needed is not in doubt. It is a new coalition in which the parties of the Left are relatively strengthened to reflect the return to freedom of the industrial North.

The Italian Liberation Committees

In the lengthy negotiations between the six anti-Fascist parties on the construction of a central government, the part to be played by the various Liberation committees in northern Italy has proved a stumbling-block to agreement. The parties of the Left—Communists, Socialists and Actionists—wished them to be the basis of a new administration, but it looks now as though the dispute will be solved by the gradual supersession of the committees.

On June 1st Colonel Poletti, the American Governor of Lombardy, issued an order making AMG the sole source of authority, but permitting the National Committee of Liberation and the regional committees to continue in an advisory capacity. Dr Sereni, the President of the Lombardy NCL, has broadcast his approval of the new arrangements.

There is no question of any form of duplicate power. . . . The great spirit of understanding shown by the AMG authorities . . . enabled the NCL to continue as an officially recognised representation of Italian interests. . . . The Lombardy NCL is recognised as the only regional organisation entitled to collaborate and represent national interests with AMG.

The political parties, too, appear to have accepted the advisory capacity of the NCLs, and thus to have paved the way to agreement on the formation of a new government. In a statement issued by all six parties, it is laid down that the committees shall advise and assist the prefects until the calling of a constitutional assembly. They will not be called on to exercise authority themselves. Under these conditions, it seems likely that the committees, caught between the political parties on the one hand and the official administration on the other, will lose influence as speedily as they did in France, a gain possibly for the coherence of the administrative structure, but equally possibly a grave loss to the cause of radical national reconstruction.

The Boundary Commission

Parliament's rushed time-table of legislation is running to schedule. Among the assorted Bills passed this week is the one setting up the local government Boundary Commission. The few amendments which have been made to it are not calculated to strengthen the Commission's hand. The Minister of Health is now explicitly instructed, in drawing up his "general directions" to the Commission, to consult all the existing local authorities who are concerned. These consultations, as Mr Willink pointed out, would have taken place anyhow. But the debate showed the tenderness which all parties, Left as well as Right, display towards the susceptibilities of existing authorities. The trouble is that if the Commission is to do any good at all, a number of these authorities will have to go; and attempts to reach agreement in the condemned cell are not the best prelude to execution.

The Minister of Health is now given a free hand to appoint the members of the Commission, and to draw up his general directions to it in consultation with the local authorities. These directions cannot now be approved, and the Commission get fully under way, until the new Parliament meets in the autumn. Since the directions will decide in practice the whole scope and character of the Commission's work, it is a pity that Parliament has been unable to express its opinion on how they should be formulated. To judge by the vague and unsatisfactory suggestions in the White Paper, the Commission will be encouraged to make minor changes and discouraged from attempting major ones. This is just the opposite of what is needed. The number of urban and rural districts, for instance, has already been pruned by at least a third during the 1930's. What is really needed for the efficient administration of major services, let alone for

the replanning of "blitzed" cities and the rehabilitation of rural areas, is a considerable thinning out of the number of counties and county boroughs, and it looks as if the Commission's wide theoretical powers may be rendered nugatory in this respect. Mr Willink's first step toward removing this impression should be to appoint men of wide sympathies and independent status to the Commission.

Agricultural Plans

Mr Hudson has not made a statement this week, as was expected, on the Government's general agricultural policy, but in a speech to the Council of Agriculture, on Wednesday, he gave some interesting information about the target figures for 1946-7. These, in comparison with the targets for 1944 and 1945, are summarised in the following table:—

	1944	1945	1946-7
Cereals ('000 acres)	7,530	*	6,920
Potatoes and sugar beet ('000 acres)	1,400	*	1,280
Vegetables ('000 acres)	480	*	460
Other crops ('000 acres)	2,190	*	2,290
Total tillage ('000 acres)	11,600	11,160	10,950
Temporary grass ('000 acres)	2,970	3,630	3,850
Total arable ('000 acres)	14,570	14,790	14,800
Dairy cows ('000)	2,800	*	2,870
Other cattle and calves ('000)	4,400	*	4,750
Sheep ('000)	12,600	*	15,000
Pigs ('000)	1,630	*	2,500
Poultry ('000)	32,900	*	41,000
Milk for human consumption (million gallons)	1,315	*	1,490
Beef and veal ('000 tons)	352	*	384
Mutton and lamb ('000 tons)	104	*	116
Pig meat ('000 tons)	112	*	200
Eggs ('000 tons)	73	*	100

* Not given.

This changeover from crops (other than feeding stuffs for livestock, which are the main constituent of "other crops") to livestock is undoubtedly in the right direction, and a necessary move in the transition from a war economy, with its emphasis on reducing the bulk of imports, to a peace economy, with its emphasis on encouraging the forms of agriculture which are of greatest value both to the farmer and to the nutrition of the people. It should go even further once Europe's immediate needs are met.

Food and Cheap Food

The rest of Mr Hudson's speech was another of his entertaining attempts to prove that, for a nation of consumers, dear food is really better than cheap food. His first point was that imported food may, after the war, be just as dear as home-produced food. If he himself believed that argument, the Minister would be moving to abolish all protection and assistance for the British farmer. His second point was that men and women are not all readily interchangeable, and that they cannot be "fitted at will into any pattern." That surely is an argument against any further expansion of British agriculture by the artificial recruitment of townsmen; the address against which the Minister's criticisms were directed (which was given by the Editor of *The Economist* on lines that are familiar in these columns) advocated the stabilisation of employment in agriculture at the present figure. Thirdly, Mr Hudson argued that it will be impossible to sell enough exports to pay for the imports. This may turn out to be true, but if so it will be a national disaster. Why precipitate the disaster by assuming its inevitability before it happens?

Fourthly, he complained that agriculture is the only industry for which an economic test is proposed. But this is simply not true; indeed, the reverse of the truth, for while other industries are under increasing public pressure to raise their productivity and avoid the need for a subsidy, public opinion is ready to grant assistance to agriculture, within limits. Fifthly, Mr Hudson said that the cheap food argument "assumes that we in this country are not concerned with the welfare and living conditions of primary producers in foreign countries, or even in our Dominions and Colonies." This also is a perversion; the argument is that the British consumer should not be charged more than the equivalent of the price at which the foreign producer is willing to sell. Sixthly, Mr Hudson complained that the cheap food argument

assumes that however effective British agriculture may become in relation to other agricultural systems, so long as a man

hour in manufacturing industry can purchase more food from abroad than could be produced at home in that man hour, then British agriculture is a loss to the nation. The economists would say that would still be true even if we could produce and sell food here at prices cheaper than we could buy it from abroad. . . . Could you have anything more absurd?

But the hypothesis is a false one. So long as agricultural wages are the equivalent of industrial wages (as Mr Hudson advocates), the case could not arise. The truth does not require these complicated arguments. It is really very simple; so long as imported food is cheaper, it is cheaper, and the British industrial worker's income will buy more of it. That is all.

Mr Hudson's score is thus one half-truth out of six attempts. He is coming on.

Education in Scotland

Scotland differs from England in many respects, not least in religion, education, and local government. This fact explains why many major reforms need two Parliamentary Bills, one for England and Wales, and the other for Scotland. But, as Scottish MPs are always pointing out, Scottish Bills are often in danger of being no more than rough imitations of English ones. The Scottish Nationalists are not alone in thinking that a different tradition and way of life need radically different treatment for their proper nurture and development.

In the case of the Education (Scotland) Bill, passed through the Commons this week, the mere fact that its 92 clauses were rushed through the Scottish Grand Committee in an hour and a-half, and its third reading taken still more quickly, where days were spent on debating the English Education Act, is sufficient indication that Scotland's special problems had to be scamped. In the issue, the contentious part of the Bill, which dealt with local administration, was scrapped. Scottish education committees differ from English ones in that they are obliged to co-opt the representatives of particular organisations. It is felt that this co-optation has gone too far, and that it should be limited to the representatives of the Churches, who have property interests in many schools. A strongly favoured alternative is that the education committees should be elected direct and separately. This would meet the desire of many citizens to have a say in educational matters only, without thereby being committed to the rest of local government drudgery. The Bill had compromised to the extent of suggesting that two-thirds of each committee should be elected in this way. The abandonment of this part of the Bill merely means that the whole educational machinery, which is too weak and creaking to perform its new tasks, will have to be re-examined.

In its purely educational aspects, such as the raising of the school-leaving age, and the creation of junior colleges for part-time further education, the Scottish Bill follows the English model. It does not, however, require the total abolition of fees, so long as local authorities make adequate provision for free secondary education. It should be remembered, however, that Scotland does not have so many independent schools outside the state system as England; and "public" school there means more nearly what it says, and not, as in England, its converse.

Reconstruction in Burma

As the first major territory in South-East Asia to be liberated mainly by British arms and to be administered by British military and, later, civil authorities, Burma is something of a test case. The task of an orderly and speedy reconstruction should not be impossible. True, bridges and railways have been destroyed and towns, of which Rangoon is the most important, laid waste. But in a country mainly agricultural these obstacles are not to be compared with the effects of destruction in the closely integrated economy of European battlefields.

To begin with, the danger of famine in Burma itself is not serious. As a country which normally exports half the 6 million tons of rice produced annually, Burma should find little difficulty in harvesting enough at least to cover the austerity needs calculated by the experts. But it is as a food supply base for parts of South-East Asia yet to be liberated that a quick recovery in Burma is most vitally important. Of the next harvest only half a million tons of rice are expected to be available for export. In the present circumstances no return to normal production is expected before the end of four years. In the meantime, what happens

if Malaya, Borneo and the rest of South-East Asia are quickly freed from the Japanese?

The major obstacles to recovery are too big to be tackled on the small scale of local administration. The first is the shortage of "inducement goods" to persuade Burmese producers that the money paid by the authorities for their rice can readily be spent—for their inclination is not towards saving. The second is the destruction of large rice mills which are necessary for export, though not for home-consumption, paddy. Out of over 600 pre-war mills, perhaps less than half remain—and only 80 small mills are to be sent from this country. For the greatest need of all—transport—the civil authorities who will take over this autumn are to be dependent on the totally unknown number of lorries and, to a lesser extent, of power craft for inland water transport which the military see fit to leave behind.

The solution of these difficulties is, clearly, a matter of interest to every ally concerned in the liberation of Asia. The task, all along, is one of procurement—of suitable inducement goods, of milling machines and spare parts, and above all of transport. It is in the British interest and also in that of the United States, Australia, France, China and the Netherlands to see that these obstacles are cleared.

* * *

Polish Resettlement

Confusion seems to reign along the eastern frontiers of Germany, where a tremendous *Völkerwanderung* is taking place. First it was the precipitate flight of the German settlers east of the Oder. Some Poles claim that 85 per cent of the inhabitants fled. The figure must be treated cautiously in view of the Polish desire to find the western lands empty. It is nevertheless certain that the exodus was vast.

Since that time, two contradictory movements have been taking place, each complicating the administrative task of coping with the other. "Hundreds of thousands of Poles," according to articles in the Polish press, are streaming back from prison camps in Germany. They line the stations, fill the roads, and hang about towns and villages. There is some complaint that they are nobody's responsibility. They get a welcome from "neither the State Repatriation Office nor a single friendly soul." On the other hand, thousands of Poles are being moved from central Poland into the lands formerly German. According to published reports, East Prussia is to accommodate 600,000 people, Silesia and the River Neisse region about 500,000, Western Pomerania 1,000,000, and the towns in the western lands are to accommodate four millions. The trouble is to find the people. For Western Pomerania the Government's estimates only provide for between 500,000 and 750,000 souls. There are only 1,800,000 available for the towns. The enormous deficit is to be made up by "voluntary re-emigration of Poles from abroad," particularly from the United States.

Meanwhile, it is not likely that even the official quotas can be filled. Volunteering will not provide enough, for the Polish peasant has the customary attachment to his own soil. It is certain that mass conscription will be necessary if the millions upon millions are to be uprooted and replanted. In the short run, this policy is already leading to intense misery and dislocation. In the province of Breslau, under 40 per cent of the spring sowing has been done. The long term effects may be even more catastrophic, for the Germans will neither forgive nor forget.

* * *

The Communist Line

The new Communist Party line, which was widely discussed among the membership at the time of its formulation in March, is explained by Mr Harry Pollitt in a pamphlet entitled "Your Questions Answered," designed, presumably, to allay any doubts about the "correctness" of the policy. Communist candidates or Communists speaking for Labour candidates may find it difficult to put this line across at the election, for it would seem to run contrary to the official Labour policy, announced by Mr Laski at Blackpool, that Labour would under no circumstances re-enter a coalition with the Conservatives.

Mr Pollitt's formula is:

We shall fight in the General election to secure the ending of the Tory majority and after that election, the continuation of national unity, but national unity based on a new government, having behind it a majority of Labour and progressive Members of Parliament.

In other words, it is apparently intended that Mr Churchill,

Mr Eden and other "progressive" Conservatives who supported the Crimea decisions, will be invited to follow the example of Mr Ramsay MacDonald, only in reverse, and join a national, Labour-dominated Government. It is not, however, clear whether the line would still apply to Mr Churchill after his virulent broadcast against Socialism.

It is perfectly true, as Mr Pollitt points out, that there is a broad measure of agreement, on political, international and industrial affairs, and that there are issues which cut right across party politics and call for the maximum national co-operation. The Communist line seems to be an attempt to split the Conservative forces into "progressives" and "reactionaries" and to take advantage of the "contradictions of capitalism." It is, however, a far cry from the party's line in its revolutionary, class-struggling days, now regarded by Mr Pollitt as starry-eyed and romantic, and it seems strange electioneering tactics, to say the least, to advocate a post-election coalition with Labour's opponents at the election, however individually "progressive" some of them may be.

Curiously enough, while the British Communists are pressing this new "broad" line, there are signs that Mr Earl Browder and his Communist Political Association in the United States are beginning—under pressure from outside America—to swing away from their extremely "broad" line of co-operation with the capitalists into a more revolutionary conception of Communism. The "correctness" of the American party line is now being re-examined, though until Mr Browder's full statement is available, it is not possible to see exactly what the change will amount to.

* * *

Release and Resettlement

Mr Butler, who has acquired in demobilisation one of the most difficult tasks of the Government, is very chary of estimating the rate of release from the Services. Questioned in the House of Commons last week, he would not go beyond the already published statement that it was hoped to complete the release of Groups 1 to 11, which begins on June 18th, by the middle of August, and that the target of releasing 750,000 men from the Forces by the end of the year still held. He added that it was expected to release age and service groups up to the early twenties from the Army by the end of the year.

The Navy and Air Forces releases have not yet been announced, but in the Navy, Group 1 (that is, men born before 1895) is relatively larger than in the other services, and may take longer to release. For the Navy, too, more than for the other services, the needs of the Japanese war may slow up the progress of demobilisation. In general, the pace of release, as Mr McCordquodale pointed out in a debate on the adjournment, depends largely on the mechanics of transport and reception. Mr Butler is showing good sense in neither accelerating nor slowing down the programme, which has been very carefully thought out, for it would indeed be deplorable if demobilisation were to become a party issue. At the same time, it is important from the point of view of the men in the Navy and the Air Force that they should be given some idea of the programme of release, and from the point of view of industry, that it should know what are the prospects of obtaining key workers under the Class B procedure.

The Resettlement Advice Service has now been launched, with the official opening of a London office by Mr Bevin—a welcome sign that there will be continuity in Ministry of Labour policy. By the end of June there will be some 400 Resettlement Advice Offices, which, if properly operated, can play a valuable part in easing the individual Serviceman's transition from war to peace.

* * *

Labour for the Land

The Government has announced an extensive scheme of agricultural training for ex-members of the armed forces and civil defence, which has been decided in agreement with farmers' and workers' organisations. The Women's Land Army is also included under special arrangements. Men without previous experience will be given a year's training on selected farms, and not at special centres. Three-fifths of their wages during training will be paid by their employers, and two-fifths by the Government. Altogether, the scheme will recruit up to 100,000 new entrants into agriculture in the next few years. In addition, the specialised training of men having previous experience

will be undertaken separately at new centres, modelled on existing farm institutes. Unfortunately only a few of these new centres, which will be set up in almost every county, will be designed for permanent use.

Some training scheme of this sort is needed in order that skilled workers may replace the valiant force of miscellaneous amateurs who have helped out on the land during wartime. But the scheme is larger and wider than normal pre-war recruitment to agriculture would warrant. It envisages in fact, putting into reverse the "drift from the land" and sending townsmen back to the country. Nothing is said, however, about what will happen to the 100,000 recruits after their year's training, beyond the promise that the county agricultural committees will take "all practicable steps" to find them employment. Even if farmers could be persuaded to find work for all of them, this could only be done by lowering agricultural productivity per head. This is clearly not the way to improve the low wages and shocking housing conditions, which constitute the very reason why the more enterprising farm workers were leaving the land before the war. The difficulties of finding accommodation alone are staggering. A much higher target would have to be set, and reached far more quickly, than the 50,000 houses, which is about all that were built for agricultural labourers between the wars. Hostels are being set up for trainees, but they will not do permanently.

In practice, however, most—probably the majority—of ex-servicemen will wish to become not farm workers, but smallholders. This training scheme has been propounded quite independently of any scheme for settling or assisting smallholders; but its political effect may well be to drive the Government of the day into setting up a large number of smallholdings irrespective of their economic desirability.

The Government's real mistake lies in yielding, in an interim way, to the pressure for land settlement before deciding its long-term agricultural policy. That prospective entrants should learn, at the Government's expense, the rigours of land work is very much to the good. But improvisation of this sort begets, instead of following, policy and, when long-term policy is considered there can be little doubt that agriculture will be found to need not so much more labour as more capital. Further than this, the greatest need where labour is concerned is for more and better specialised training and higher education.

AMERICAN SURVEY

Fruit in the Future

(From a Correspondent in Oregon)

THREE major developments of the war decade promise to broaden the post-war market for fruit. This is especially true for the fruit-growing regions in the states of Oregon, Washington and Idaho, and also the Canadian province of British Columbia.

Fruit production is a major industry in each of the three coastal states, and each has its specialities. In California these are citrus fruits and grapes. In Oregon, prunes, pears and cane berries. Washington leads all the states in apple production. All of the commonly known fruits are grown commercially in the far west. Besides citrus fruits and grapes California produces peaches, figs, apricots, avocados, quince, apricots, dates, and even a few bananas. Washington, apart from apples, produces prunes, sweet cherries, pears, and cranberries. Idaho grows prunes, apples, pears, cherries, and in addition cane berries of many kinds, and the humble delectable strawberry. Oregon and Washington had not before the war developed their market so well as had the growers in California. In fact some peaches, prunes, apricots grown in Oregon are still marketed as Californian fruit.

The three developments which promise a widened market in the future are aerial transportation, quick-freezing, and public understanding of the importance of vitamins and minerals to health together with the belief that fresh fruit is the most agreeable source of these substances.

The war was a blow to the fruit industry, especially in the Pacific north-west, where prosperity hinged on exports. The apple and prune growers were the hardest hit, and of these

London's Shortages

That the end of the German war would bring no increase in rations has in recent weeks been brought painfully home to Londoners. Coffee, of which up to the end of last year there has always been a miraculous abundance, has been getting scarcer for some months, although the Ministry of Food claims that allocations to shops are 105 per cent of pre-war allocations. Cigarettes are short again—to the customer at least, however plentiful they may be to the Tobacco Controller. Towards the end of the last rationing period there was an acute shortage of soap, and people who had deferred buying their ration until the last few days may have had their coupons dishonoured. Many points goods are scarce. Fish, to which people were looking forward as compensation for the ration cuts, seems to be as difficult to buy as it ever was. And now there are local shortages of bread.

To a certain extent, London, which is now receiving not only returned evacuees, but an influx of visitors as well, is feeling the pinch just as the reception areas did on other occasions. There is also, in the case of bread, a labour shortage in the bakery trade. But in some respects it is the old, old story. There is a mild, temporary and local shortage. This is magnified, and people begin to buy more than they need where the commodity in question is unrationed. This, in its turn, creates a real shortage, and the classic remedy—to swamp the market with supplies—is out of the question.

In the case of coffee the shortage does not matter, nor—pace the smokers—is it very important in the case of cigarettes. But bread is different. Not only is it essential that a real shortage should be avoided in this country, but as much grain as possible should be spared for the Continent. The bread wasted in this country before the present shortage would have made a not unappreciable difference to the supplies of calories for the worst-fed districts of Europe. At present, to avoid the danger of having no bread at all, people tend to buy when they see it rather than when they need it. The logical remedy is to ration bread, in a large enough quantity to satisfy the biggest bread-eaters, but as this is now administratively impracticable and politically impossible, at least the Ministry of Food should see that there is enough in the shops to stop the run.

the growers of yellow Newton apples were hit hardest of all. Their market had been chiefly to Great Britain. The apple was once the universal fruit in America. But through the years imported pests made it practically impossible for the home orchardist to produce good sound fruit, and the people turned away from wormy, scaly apples to berries and citrus fruits. Growers in the Pacific north-west, whose orchards came into bearing after the national demand began to decline, sought and found markets in Europe, and when war came no market for yellow apples had been developed in the United States. But, fortunately for the industry, the apple crop was short that year and all the growers were able to dispose of their product at home.

Washington now leads all states in apple production because the growers are imaginative and aggressive. They went to the state legislature and got a law requiring every owner of apple trees to spray regularly and properly or grub out his trees. Another law levies a tax of one-half cent on each box of apples sold, the money being used in research and in promoting consumption of apples. Results have been gratifying. A spray has been developed which inhibits the apple tree's tendency to set a heavy crop one year and to rest the next. New ways of using apples have been developed. Cider, which never was really popular, has been filtered and pasteurized, the name changed to apple juice, and is finding a market in competition with other fruit and vegetable juices.

Dried apples are being used. Sulphur dioxide is used to keep them bright and attractive and they are packaged in

cellophane. They are not called "dried," but the more euphonious "dehydrated." Cull apples are processed for their pectin, which is used in making jellies from low-acid fruits, like strawberries. Pectin also has some medicinal use. An unexpected windfall for the apple-growers is the use of pectin under the name "apple honey" as a moistening agent for cigarettes, replacing glycerine, which is scarce in wartime. Apple pumace is used as a carrier for poison bait for slugs, snails and other pests which feed on garden produce. Experiments are under way in processing pumace, the residue from juice, vinegar and pectin making, into feed for livestock.

Another new market for apples, and pears, is in gift packages. This started when lumber mills would place a few boxes of delicious apples in shipments of lumber as gifts to customers in the Middle West and East. Now some growers specialise in preparing attractive gift boxes of fruit and nuts. At first it was a holiday business. Now, thanks to cold storage, shipments are made every month in the year.

In spite of all these innovations, apple growers are looking again to Europe as a market. Some of the less efficient orchardists, especially in Oregon, have given up hope of ever again finding prosperity in apples, because of production costs. It is sometimes necessary to go over an orchard ten times a year, seven times to spray, once to prune, another time to thin in order to get fruit of uniform size, and finally to pick. Then the picked fruit must be double washed, once in mild acid and then in clear cold water to remove spray residue, and finally cold storage is necessary for orderly marketing. With labour scarce, many growers are replacing their apples with pears, which have fewer insect enemies and a growing domestic market.

Less capital and quicker returns are possible in berries, and aerial transportation and quick-freezing open the door to expansion of the berry industry. Owing to the extreme perishability of berries, the market until recently has been limited to the area which could be reached within a day, to canneries, and a limited extent to wineries. Oregon growers are aggressively trying to create a berry wine market, but success is uncertain. Cannery customers have been chiefly public eating places and bakeries. Berries of a sort can be grown almost anywhere in America, and the people grew and canned their own. Canned berries, however, do not taste like fresh. Moreover, the product from certain favoured regions, like the Pacific North-west, is distinctly superior, and American housewives no longer do very much canning (except in wartime), so the growers believe there is a big market if a way can be found to get the fruit to the buyer in a fresh condition. Aerial transport is the way. After the war, berries picked in Oregon one morning may be served for breakfast in Chicago or New York the next morning.

Even greater possibilities are opened by "quick freezing" by which the fruit is placed in a temperature of 25 to 30 degrees below zero Fahrenheit. Frozen quickly in this way, the cells do not break, the fruit can be kept in storage at a temperature around zero indefinitely, and, when thawed it not only resembles but also tastes very much like freshly picked fruit. The present limiting factor in this market is cold transport and cold storage. It is estimated that 10 per cent of retail food stores, measured by volume of business, are now equipped for storage of frozen food. After the war it is predicted that 90 per cent will be so equipped.

Aircraft may solve the problem of transportation, and even, say some optimists, of freezing. Freshly picked fruit may be loaded in a transport plane, which will fly to market through the sub-stratosphere, where the intense cold will automatically quick-freeze the cargo. The use of dry ice (solidified carbon dioxide) in railroad cars and trucks is another possible method of keeping food frozen in transport.

In California, nearly all the citrus fruits are marketed by grower co-operatives. The oldest berry growers' co-operative in the nation was formed near Portland, Oregon, nearly 40 years ago, but generally in the Pacific North-west, marketing is divided approximately evenly between co-operatives and independents. Established orchardists who number their trees in tens of thousands can handle their own marketing. The smaller grower, with a few hundred trees usually must join a co-operative or go out of business.

In any case, when peace is restored, and refrigerated ships are available, the people of Europe, especially of Great Britain, will find the fruit growers of the Pacific North-west knocking at their doors with yellow Newton and big red Delicious apples, prunes and frozen berries, such as raspberries, boysenberries, youngberries, blackberries, loganberries and strawberries—and with fresh pears so large and juicy that they are eaten with a spoon.

A disturbing element is the fact that what the Pacific North-west can do can also be done for exotic fruits from tropical regions. Even before the war canned papaya juice was finding a market in the United States. But growers reflect that advertising is taking fruit out of the luxury class of foods, and thus is opening a potential market big enough for all.

American Notes

One Mr Johnson Stands Pat

The current hearings by the Finance Committee of the Senate on the repeal of the Johnson Act, which prohibits private loans to countries in default on their debts from the last war, reveal in an interesting way the new political and economic orientation of the United States. It was only a short time ago that most American public opinion on Finland, for example, was able to be shaped almost entirely by its high moral status as a country that had always paid its war debts. Now, Senator Edwin Johnson of Colorado, Democratic member of the Committee (and not to be confused with its Republican member, Senator Hiram Johnson of California), created barely a ripple when he suggested not just the repeal of the Johnson Act, but the cancellation of the debts by an Act of Congress.

The Assistant Secretary of State, Mr Clayton, who sees the very real relationship between repeal of the Johnson Act and the Reciprocal Trade Agreements extension, which recently passed the House of Representatives and is now being bitterly contested in the Senate, has been one of the most vigorous champions of the repeal. The United States, he told the Committee, can choose between economic isolation or a policy of interrelated political and economic cooperation with other countries. But America's position must be consistent, which it was not after the last war, when "we lent with our right hand," but by erecting high tariff barriers with the left we said, in effect, "be damned if you can pay."

Important support for repeal has been given by the influential and highly respectable Committee for Economic Development. This organisation goes so far as to recommend cancellation of obligations where that seems the most effective and practical method of settlement to encourage trade and movement of capital, both public and private. The Chairman of the Securities and Exchange Commission, in advocating repeal, recommends that the US Government be provided with adequate data on private capital transactions, which are not now required to be reported. Thus, government officials called upon to make transactions through the Export-Import Bank or the proposed International Bank, could correlate foreign investment and export of capital with the whole general foreign economic programme.

The Committee is expected to send its recommendation for repeal of the Act to the Senate by a large majority. Senator Taft is a certain dissenter, as is Senator Hiram Johnson, who maintains the position he held in 1934 and threatens to carry his fight to the floor of the Senate.

Mr Baruch has a Plan

A plan for Germany and Japan, originally drawn up for Mr Roosevelt by Mr Bernard Baruch, who was President Wilson's adviser on German reparations after the first World War, is now being studied by Mr Truman. It is probably the first reparations plan that bluntly and unashamedly suggests that policy should be governed by the elimination of German and Japanese export trade. The limitation of industrial potential would be enforced not just to keep the aggressor countries impotent to make war, but to keep them out of the world's markets.

This plan, which has been circulated among Government officials, and is reported to have been seen by Allied leaders, divides into three parts: (a) Germany and Japan must be stripped of heavy industry, and thus prevented from re-establishing themselves as aggressor nations; (b) Germany and Japan must not be permitted to re-establish their export position, and thus to depress world commodity and labour prices, through exploitation of sweated labour; (c) by preventing the two countries from re-establishing themselves in world markets, the living standard of the rest of the world will be higher, and will enjoy a certain degree of protection. On reparations, the plan calls for the return

of all stolen and annexed property, material and monetary. Payments would also be made in raw materials and manufactured products, with the provision that goods must not be manufactured in sufficient quantities to permit a revival of export industry.

There are other points. But whatever else the plan contains, its focal point is the destruction of German trade and its peculiarity is its assumption that even after the Nazi system has been destroyed, wages will remain at slave levels. The memorandum calls for the elimination of the "subsidised, sweated competition of 170 to 200 million Germans and Japanese"—to expand the industrial opportunities of the rest of the world.

Mr Baruch issues a warning against the public apathy that is so likely to grip war-weary victors once peace is achieved, but in the published document at least he gives no indication of how long he believes it would take to transform Germany into a country of small land holdings and small industry, and how, after that period, the emergence of an exportable surplus could be prevented.

Businessmen and industrialists in America who might until now have given little thought to plans for the defeated countries, are expected to be anything but apathetic toward a plan that would keep German products off the world market. In any event, the plan is said to have produced such great interest in Washington that Mr Baruch has been invited to address the Senate Military Affairs Committee on June 18th. It has been noted with interest that the memorandum, although just recently released, was dated March 18th, and that the elder statesman's visit to Britain, when he conferred with Mr Churchill, was during the first two weeks in April.

Unfortunately, very few voices have been raised to state the simple fact that Mr Baruch's plan is immoral, uneconomic and unworkable.

Reconversion—Slow but Sure

United States industry, while producing two-thirds again more war material than in 1942, is beginning in all seriousness to prepare for peace. To many businessmen

the symbol is the revocation of Order M-126, which was issued on May 5, 1942, five months after Pearl Harbour, and fulfilled the promise of the chairman of the War Production Board, who said that it would "change the face of American Industry." The order prohibited the use of iron and steel in the manufacture of 1,200 items, ranging from bathtubs to typewriters to roller skates.

According to a report issued by Mr Krug, chairman of the WPB, the United States is better prepared for reconversion in the middle of this war than it was at the end of the last one, when Armistice Day suddenly confronted a country with no detailed methods or procedures developed for settling contracts or financing contracts while awaiting settlements. The report revealed that although the industrial equipment and durable consumer goods industries would require from three to seven months to begin production after cancellation of war contracts, the majority of industries could turn immediately to peacetime production—if materials were available. The 44,600,000 workers in agriculture, steel, retail trade, transportation, mining and other jobs will find themselves when their industries are finally able to produce for peace in much the same jobs, though possibly making new products. It is the 6,600,000 in aircraft, ships, ordnance and signal equipment, war chemicals and federal war agencies who will be most severely affected, who will have to transfer to other industries, who may suffer temporary unemployment, and may have to transfer to other areas if labour shortages occur in any phase of the munitions programme, which, even with cancellations estimated at two billion dollars a month, will still be producing about nine-tenths of the munitions produced in 1944.

War controls will not be removed until it is clear that the primary criterion in an industry is no longer how the use of a material or a facility would best contribute to the prosecution of the war. Then controls will be lifted and dependence placed on what Mr Krug called the natural resilience of the economy, the capacity of the manufacturers, wholesalers and retailers to adapt themselves to changed conditions.

Although businessmen who had hoped for a rapid expansion of reconversion were disappointed, Mr Krug's report served to outline the possibilities of a reconversion period with minimum dislocations.

The Baltimore and Ohio Railroad Company

SUMMARY OF THE 118th REPORT YEAR ENDED DECEMBER 31, 1944

	Year 1944	Compared with 1943
EARNINGS:		
From operations—transporting freight, passengers, mail, express, etc.	\$ 387,193,036	± \$ 29,050,884
From dividends and interest on securities owned, rents, etc.	7,741,295	— 896,674
Total	\$ 394,934,331	± \$ 28,154,210
EXPENSES:		
Payrolls, fuel, material, etc.	\$ 287,068,754	± \$ 36,484,401
Taxes	48,984,845	± 2,227,636
Equipment and Joint Facility Rents	9,823,057	± 890,685
	\$ 345,876,656	± \$ 39,602,722
Other charges—principally rent for leased roads and equipment, interest on debt, etc.	28,143,237	— 1,853,470
Total	\$ 374,019,893	± \$ 37,749,252
Net Earnings	\$ 20,914,438	— \$ 9,595,042

DISPOSITION OF NET EARNINGS:

Additions and betterments to Company property	\$ 4,906,110	— \$ 146,370
Appropriated for sinking and other reserve funds—to retire debt	8,021,881	— 11,097,232
Other appropriations	45,188	± 1,309
Added to the Company's surplus	7,941,259	± 1,647,251
Total	\$ 20,914,438	— \$ 9,595,042

Freight and passenger traffic handled in 1944 exceeded all previous records due largely to the heavy tonnage of war supplies, troop movements and other war travel. Totals were 147,314,981 tons and 14,303,937 passengers. The tremendous task of moving this extremely heavy traffic volume was accomplished through the continued co-operation of the various agencies of the Government, shippers, and the public generally, in the conservation of equipment and man-power and in meeting the unusual war-time conditions. Operating Revenues—\$387,193,036, and Operating Expenses—\$287,068,754—were highest in the Company's history.

The Company's tax bill at \$48,984,845, was larger in 1944 than ever before. During 1944 debt of the Company was reduced by \$34,801,828. Total debt reduction during the last three years was more than \$105,000,000.

The President and Directors acknowledge with grateful appreciation the loyalty and co-operation of stockholders and others interested in the Company's success; the Army, Navy and other agencies of the Government; our patrons, whose patriotic understanding of present day conditions has been most helpful; and, the officers and employees, without whose enthusiastic support we could not have accomplished the tremendous task of 1944.

More than 16,000 employees of the Company have been furloughed for military service and more than 150 of these have given their lives for their country.

R. B. WHITE, President.

"Despatch is the Soul of Business"

So Lord Chesterfield wrote, two centuries before air mail added real dispatch to business communications. Air mail offers nation-wide delivery overnight, reaches other continents in just a few more hours. It cuts waiting time for answers. It speeds sales orders, contracts, all other business or personal mail.

Yet think of the advantages if all first class

mail moved by air. Not local letters, or from city to suburbs, of course, but all first class material moving more than, say, 150 miles.

Modern planes have the capacity to carry the mail loads which would result. Wright Cyclone engines give them the load-lifting power. At ordinary surface rates, the extra mail revenue would provide increased air transport service with national benefits. And both the business world and the general public would gain from this type of mail service and the increased speed which it would bring.

The Shape of Planes to Come

On world air routes you will see the Wright Cyclone engine in the heart of the plane. The Wright Cyclone 18 is a 2,200 horsepower engine.

Everything for the Veterans

A Congressman who values his political future is tempted to wait dreams before the serviceman and his family—loans with no collateral, a choice of new jobs in his home town, the shiny top layer off the country's economy. Fortunately, in some of the dreams there is substance. If, for example, an ex-serviceman wishes to open a business with less than \$50,000 capital, he will have first choice of such surplus war materials as trucks, office equipment and farm tools. Also, a plan is being discussed by Congressmen which would make temporary war housing available at low rents to returning servicemen and their families. The "GI Bill of Rights" offers opportunities for education and job training and provides weekly cash benefits to veterans until they are able to find jobs.

About loans to ex-servicemen, Mr Wallace, Secretary of Commerce, has had some very practical, although disillusioning, things to say, particularly to the estimated two to three million men who want to go into business on their own. The economy, he warned them, cannot safely absorb more than 500,000 to 700,000 separate and new enterprises, while the same precautions and criteria should be observed in making loans to servicemen as to civilians.

It is not against the plans themselves, however, but against the administration of the plans, that some exceedingly harsh criticism has been directed. This is the responsibility of the Veterans Administration, under the directorship of Brigadier-General Frank Hines. The administration of the veterans' hospitals has been the chief target, with bitter complaints of careless, often incompetent, treatment, inedible food, insanitary conditions. The Journal of the American Medical Association says the VA, with ample funds at its disposal, uses outworn methods and makes no attempt to utilise the best physicians or most modern medical techniques. The handling of loans and insurance has also been severely criticised. At least 150,000 unpaid insurance claims for disabilities or death have accumulated, while families, often badly in need of funds, can do nothing but wait.

President Truman, perhaps with an over-abundance of tact, has said that overhauling the VA to meet new conditions is as necessary as was its creation, but emphasised that he implied no criticism of anyone connected with the VA. If the Senate investigation conducted by Senator Pepper produces the results critics of the VA expect, it is difficult to see how General Hines can help but bear at least a large measure of responsibility. The public, highly sensitive to the debt it owes returning servicemen, is not expected to accept serious staff shortages and lack of facilities for expansion as adequate answers. General Hines has already offered his resignation, but it has not yet been accepted.

Another Enemy

Race hatred has been one of the most virulent enemies of the United States in this war, and against this enemy victories have not always been decisive. Now that the fighting has moved eastward to Japan, the Japanese-Americans who were segregated, by an unprecedented and possibly unconstitutional Army order, in War Relocation Authority camps in the interior of the country, are expected to leave these centres by the end of the year. It cannot be said that a uniformly warm welcome is being prepared for them in the west coast areas from which most of them came.

Incidents have become so frequent, and follow so clearly in the ugly pattern of violence and intimidation, that Mr Ickes, Secretary of the Interior, has publicly denounced the "planned terrorism of hoodlums" determined to employ "Nazi Storm Trooper tactics." Recognising the economic fears behind such attacks, Mr Ickes warned the offenders that "they will not be able to establish an economic beachhead on the property of the evacuees." Thus the whole country has been, in a sense, officially informed of a situation which until now has not been widely

enough realised outside the coastal areas. And in this there is a hope of brighter prospects for the home-comers.

From Portland, Oregon, comes a story of a highly organised attack on the returning evacuees by the "Japanese Exclusion League," whose avowed purpose it is to exclude all Japanese, by "legal and peaceable means," from the west coast and ultimately from the country. In the first of a series of papers to be circulated through the north-west, they issue the warning that the Government plans to "dump" 25,000 evacuees on the west coast this year. It is unfortunate that they could find in the statements of military leaders material for their very different brand of warfare. A quotation from General MacArthur, "The Japanese have proved that they are barbarians," and another from Admiral Halsey, "Japs are not fit to live in a civilised world," must surely convince these military men that they cannot avoid responsibility for the political content of their public statements. In Hood River, Oregon, 500 out of a population of some 11,500 gave their signatures to a full-page advertisement: "So Sorry, Please, Japanese not wanted in Hood River." This was in support of the local American Legion Post, which removed 16 Japanese names from its honour roll.

The constructive work of dozens of sound organisations, lacking the neurotic, lunatic-fringe quality of the Japanese Exclusion League and of The Sons and Daughters of the Golden West, does not receive as wide public notice. Much of the success of these organisations will depend upon a sound programme for full employment and encouragement to small businesses.

In the meantime, 33,000 of the original 110,000 evacuees have been assisted in leaving the relocation centres and have resettled in almost every State in the country, naturally gravitating toward the large cities in the East and Middle West. In Chicago alone, which had a pre-war Japanese population of 300, there are now 7,234 Japanese-Americans working in war plants, opening shops, absorbing themselves into the lives of comparatively friendly, or at least not actively hostile, communities.

The Formula May Go

Pressure for an increase in hourly wage rates is expected soon to snap the elastic wage line the War Labour Board has managed to keep during the war period. Mr Philip Murray, President of the Congress of Industrial Organisations, has recommended to President Truman a 20 per cent increase in prevailing wage rates to "restore pre-war relations between wage rates, prices and productivity per man hour." And a resolution has been introduced into Congress calling on President Truman to permit pay rises up to thirty per cent of the January 1, 1941 rates, 15 per cent over the Little Steel Formula.

The administration's determination to control wages and prices until after the Japanese war does not basically conflict with the CIO recommendation, since Mr Murray merely wants hourly rates to be set at a higher figure to offset at least in part the loss in "take-home pay" that will occur when overtime comes to an end.

Mr William H. Davis was in favour of rises on a limited and controlled scale when he was head of the War Labour Board. In his new position as Director of Economic Stabilisation he must approve increases because of their relation to prices. The new WLB Chairman, Mr George W. Taylor, believes that foundations for peacetime wage rates can be built by collective bargaining methods in those industries that will absorb them without price adjustments.

This will be Labour's first test of the new administration's attitude on a continuation of Mr Roosevelt's Labour policy. The new President inherits what can be construed as a promise for a minimum wage of 65 cents an hour, a guaranteed annual wage law, and basic wages high enough to make a 40-hour postwar week as remunerative for labour as was a 48-hour wartime week. It will be rather a precarious tight-rope walk Mr Truman will have to accomplish to satisfy Labour, which on his record one can assume he will want to do, and to keep the conservative elements in Congress in line at a time when they must not be antagonised.

One of the primary problems will be to subdue those who want to scrap all controls. Senator Taft, leader of this group, has made it clear that he is tired of controls because he believes the result is control of profits and not of prices.

THE WORLD OVERSEAS

Letters from Germany—1

The End of a Dream

(From Our Special Correspondent)

Munich, June 1st

THE picture that greets the visitor to Germany is so indescribably fantastic, confused and contradictory that it would be futile to attempt any definite clear-cut description. The journey across Germany is a journey in a dream. Life here has lost all solid shape and outline—it is completely atomised. Germany's national existence seems to have broken up into millions of individual beings, each with their own individual anxieties and worries; it defies any accepted sociological and political classification because the individual existences have few, if any, social ties to link them together. For a time the collective identity of the German nation has dissolved into nothingness. In this respect the difference between 1918 and 1945 is really striking. After the first world war, the German nation saved not only its territory, its wealth and the fabric of its social life, but also the means for its spiritual and political self-expression. In 1945 the nation is mute. The individual German speaks his mind, sincerely or insincerely, at a somewhat surprising length. But the infinite variety of individual confessions makes the foreign onlooker even more confused than he was before. The confessions fall into no orderly pattern—and the talkativeness of individuals only underlines the muteness of the community.

Yet some features of German life are so universal that a tentative outline may be given to them. The German nation has been rudely awakened from a dream. Some will say that it was nothing but a pleasant dream of world conquest, and what all the Germans most feel is regret and despair at the loss of the *fata morgana*. Others, and the Germans first of all, claim that the dream was a nightmare that oppressed and strangled them, and that their present feeling is one of relief and gratitude. Both views seem an over-simplification, but both are undoubtedly true. The dream of National Socialism was a combination of both elements. It lured all classes of the German nation with a vista of German domination over the world; and even now it is enough to scratch a German industrialist or an intellectual or a worker to realise that all classes (with a few exceptions) succumbed to the temptation at one time or another, though very probably they did so to differing extents. But it is also true that all classes—again to a varying extent—were oppressed by the prodigious terror machine in which the regime had caught them. As long as there was some reality in the promises of German power, Germany gave up all its dignity and self-respect and bowed meekly, though not without a vague reluctance, to the political *lumpen* that had saddled it and ruthlessly spurred it on to war. To-day most of the German people seem to remember only the kicks, the wounds and the insults inflicted upon them by National Socialism.

Accomplice and Victim

In most cases, the sincerity of their present feelings of relief is so striking that it can hardly be questioned. Hitler succeeded in turning—again to a widely varying extent—nearly all classes and groups in Germany into his accomplices as well as his victims. In their present mood of self-pity, the German people most often looks upon itself as the victim of National Socialism and denies its other rôle—that of the accomplice.

This cannot be explained by sheer opportunism alone, though the opportunism and the cowardice of many Nazis and their former sponsors among the German upper and middle classes is staggering. The observer is confronted

with a baffling transformation of mass psychology, a transformation so sweeping as to appear unreal. In the light of total defeat and of the innumerable human tragedies that have beset it, the German people is now venting all its accumulated, long suppressed resentment, and pouring curses on its former gods.

Germany is thus living in an orgy of humiliation, self-humiliation, repentance and *saute-qui-peut*. Who can tell how real is the repentance? Who can probe the souls of the German soldiers crowding the huge prisoners' cages by the sides of Bavarian roads? Who can look into the hearts of the economic experts who worked under the Nazis and now work under the Allied Military Government, earning praise for their efficiency and dutifulness? Who can say what thoughts and feelings are hidden under the surface obedience to the Allied authorities—an obedience which springs perhaps from the old *Kadaver-disciplin*, the most virtuous vice in the German national character?

"Capital of the Movement"

Here, in Bavaria, the *Kadaver-disciplin* quite obviously broke down in the last days or weeks of the war—it had shown some faint cracks even before. Munich was officially called the "Capital of the Movement." In the centre of the city there stands the Mecca of National Socialism, the famous Beer Hall, now guarded by an American sentry, presumably as a grotesque relic of some museum value. Yet, in this "Capital of the Movement," it is almost impossible to find anybody to attack the Nazi record. The citizens timidly tell the foreigner that Munich's half-jocular and unofficial title was "the Capital of the Counter-Movement." Even in the hey-day of Nazism the local intelligentsia took delight in discreetly pin-pricking the Nazis on the stage or in timidly displaying an archaic sentiment for the old Wittelsbach dynasty. For the Bavarian Left, which occasionally attempted some less innocent gestures of opposition, there was the nearby Dachau concentration camp, which never failed to act as a tremendous damper on any anti-Nazi reflexes in the Bavarian mind.

Throughout the years of totalitarian darkness the Catholic Church was a refuge for some faint non-conformism. It was not destroyed by storms and outbreaks of terror. This and a certain pro-Catholic bias in the American Military Government has given political Catholicism in Bavaria a decisive start, and the symptoms of its actual, though not yet formal, rebirth are unmistakable. Cardinal Faulhaber's influence was decisive in shaping the new Bavarian administration that is to work under the supervision of the Allied Military Government. In the *Rathaus* a prominent Right Wing Catholic, Herr Scharnagel, acts as Oberbürgermeister, another Right Wing Catholic and former chairman of the *Bayerische Volkspartei* has been appointed Minister-President for Bavaria. Bavarian Left Wingers who have been lucky to survive the Nazi regime or to return from concentration camps are quick to point, in private, to all the blots on the record of political Catholicism in pre-Nazi days. They point out that the *Bayerische Volkspartei* which ruled the province before the Nazis "has always preferred to sit down with the devil rather than with the Social Democrats." Its attitude *vis-à-vis* Hitler's plots in Bavaria was equivocal, if not condoning. Are the "Blacks," they ask, really the men on whom the Allies ought to rely for restoring some democratic order in the former Capital of the Movement? But the critics admit that political Catholicism has deep roots in

There are many men and women in the Services who would welcome a chance of reading this publication. If you would hand it in, unwrapped, unstamped, and unaddressed at any Post Office, it will go to them.

the conservative countryside; and with some reluctance they agree to participate in the coalition with the "Blacks" that is now being formed with the blessing of the Military Government.

The first shoots of a new political life in post-Nazi Bavaria are, of course, pathetically weak and anæmic. All political matters are concentrated in the officers of the Military Government and in the private homes of a few survivors of the Weimar democracy. The leaders of the new Bavarian administration act as individuals without the backing of any organised bodies of political opinion. The formation of such bodies has been strictly prohibited by the Military Government, which has made it more than sufficiently clear that there must be "no politics in Germany," and that the ban on political activities applies to all anti-Nazi groups without distinction.

Effects of the Ban

The ban on anti-Nazi groups is certainly prolonging the political formlessness which is apparent under the broken crust of the single party system. In the closing days of the war there were some stirrings underneath. Individual survivors of the old parties of the Left—Socialists, Communists, Trade-Unionists—came together and discussed the new position. Soon they were joined by inmates of the concentration camps. Quite independently, completely new, loosely united groups appeared in the turmoil. It is extremely difficult now to trace their origins and background. The Bavarian Freedom Action, which gained some notoriety in Munich itself, was led by complete novices in politics—young merchants, officers and intellectuals. It had no programme, except to stop the fighting, to clear the road-blocks and to open the way for the American forces. It was simply a latent instinct of self-preservation stirring in the Bavarian middle-class. When the Americans occupied Munich, the leaders of the Freedom Action seem to have become for a while the heroes of the day. Their weak improvised organisation was suddenly under the pressure of all sorts of people—genuine anti-Nazis as well as opportunists and probably also former Nazis—who rushed to join its ranks. Besides the Freedom Action, there existed a host of new, loose but fairly widely ramified, socialist organisations, bent on resuming some forms of activity though not necessarily on linking up the threads of the Social-Democratic tradition of the Weimar Republic.

It is almost impossible to measure the weight and the potential *elan* which such rudimentary trends of new political thought in Germany would have acquired, if they had not been for the time being nipped in the bud by the Military Government's ban on politics. The law of action and reaction seems to suggest that the German people, which has so long been starved of independent politics, would pretty soon have found in these organisations new spokesmen and leaders.

The ban has certainly not killed these vague stirrings in the depths of Bavaria's formless existence. But it has prevented them, at least for a time, from becoming anything more than just stirrings. Up to a point the spiritual and political life of the German people is now clay in the hands of the potters of the Military Government. But it is very easy to take an exaggerated view about its malleability. The chance for Allied policy is unique; so are the difficulties, the dangers and the risks. The first question which demands a reply is: Is the present shapelessness of German politics going to be maintained—and for how long? Or will the indubitable popular reaction against Nazism be used as a starting point for the crystallisation of a new political outlook in Germany?

French Canada and the War

[FROM OUR OTTAWA CORRESPONDENT]

CANADIAN political strategy for the past five years, including the timing and some of the issues of the general election campaign which ends on June 11th, has been profoundly affected by French Canadian sentiment about the war. It has been necessary for the Government to keep continuously in mind the political reality that Canada is by composition 50 per cent British in origin, 30 per cent pre-revolution Norman-Breton-Picardy French, and 20 per cent miscellaneous (largely German, Ukrainian and Scandinavian), and that the degree of wholehearted devotion to the overseas prosecution of the war varied widely in different parts of the Dominion. It is not a new phenomenon: it was even

more marked in the war of 1914-18, and at that time drove a wedge between English and French Canada which is not yet repaired. It puzzles and enrages many Canadians in other parts of the country that Quebec resisted universal service from the outset of the war and that her voluntary enlistment rate fell behind that of the rest of the country. If French Canada is maligned and berated elsewhere it is partly her own fault, but there is little evidence either that the position of the French Canadian is fully understood either in the rest of Canada or in other parts of the world; or that much constructive effort has been expended by the rest of Canada to win French Canada over to a more uniform and zealous course of action. Now that the European phase of the war is over and Canada has returned to a voluntary basis for overseas service, the issue has become historical if not academic, but it has played an important part in the current election campaign, and the course of French-British relations in Canada will be affected by the success or failure of Canadians generally to appreciate what lies behind the thorny and now hoary point of contention.

The fundamental fact is that the French Canadian is a North American. He is an essentially self-centred peace-loving person who would fight to the death to preserve his own civil and religious liberties, but, partly through the failure of his own leaders and English Canadian educators, he has, by and large, never seized the fact that both this war and the last were defensive wars fought against a German aggression which threatened not only the liberty of France and Britain but of North America as well.

The theory that the French Canadian is either a coward or a slacker will not hold water. His lukewarm attitude about the war of 1914-18 and his failure to match the impassioned participation of the British Canadian in this war stem from his suspicion that both wars were fought for the salvation of England from an European enemy in what was fundamentally a clash of rival imperialisms. Many French Canadians sincerely believe this. In spite of such convictions they were willing to play a minor part in the war of 1914-18, and a much greater part in the present war, but in both wars were disposed to set prudent limits to their help rather than throw themselves in the struggle to the death.

It should not be necessary to document the assertion that the French Canadian is and has always been courageous and devoted to any cause in which he wholeheartedly believes. The early story of French Canada is one long saga of reckless adventure against the elements and hostile Indians, and of the martyrdom of intrepid priests. French Canadian regiments in the last war as in this fought at times with almost fanatical bravery and many volunteer French Canadians were dropped into France before D-day to assist the Maquis in what must often have been missions of desperation.

Isolationism

When so experienced and eminent a leader as the Hon. P. J. A. Cardin, for many years a member of the Mackenzie King Government, could say, as he did on his resignation (as a protest against immoderate participation), that the English Canadian went to war because of the blood ties with the Mother Country, but that the French Canadian lacked any such incentive to go "all out" to save England from Nazi Germany, it is not surprising that obscure nationalists like Dr Rene Chaloult, of Quebec City, go further, and in anti-British diatribes describe the conflict as a clash of rival empires in which French Canada had no stake. The honest and enlightened Canadian to-day knows that Canada went to war in 1939, not primarily because of any altruistic sentiments toward Britain, but because of our inner awareness that if the United Kingdom were overthrown by the powers of darkness, this continent would have stood alone and defenceless against Nazi tyranny. Had such a conviction seized the French Canadian the participation by that section of the Canadian people would presumably have been on a level with that of the remainder of the country. The French Canadian would defend his hearth and home with stubborn courage, but his lack of imagination concerning world politics deprived him of the sense that the right place to protect those sacred possessions might be half way around the world, before the conflagration approached his own shores.

This lesson was never learned by French Canada, and as a consequence it was necessary to rely upon voluntary enlistment for overseas service until a few months ago, when the basic decision against the enemy had already been won. It is unfortunate on both sides, for in the rest of Canada there exists considerable resentment against French Canada for its apparent willingness to let the sons of other Canadians die in

their defence; while the extreme notes of invective sounded by anti-French agitators in Toronto and other Canadian cities have further aggravated the feelings between the two racial elements, and thus weakened the harmony and unity between the two elements which are so desirable in Canadian affairs.

A minor point of misapprehension concerns the attitude of French Canada towards its own European Mother Country. People ask why the French Canadian was not equally concerned over the fate of France as the British Canadian was about Britain. But the French Canadians, who now number 3½ million, are all descendants of the 60,000 who were here when Wolfe took Quebec. There has been no more recent immigration from France. The France to which the nostalgic French Canadian feels attracted as his ancestral home is the Catholic, monarchist France of pre-Revolution days. The France of to-day, partly rationalist, anti-clerical, Freemason, Communist, is looked upon with considerable misgivings, much as its cultural achievements may be admired. The devout French Canadian *habitant* in his village-parish community, led by an old-fashioned priest, is more likely to feel the ties of Rome than Paris. But essentially the French Canadian is a North American. He is passionately attached to his own province, his own soil, his own native institutions. He is proud to be a Canadian, remembers that it was his own ancestors who founded Canada, and sometimes feels that the others who arrived afterwards are less Canadian, more colonial, than himself. He has no military instincts, never had dreams of territorial conquest, has known no North American enemies since the Indians were pacified, and the Americans were driven off in 1814, shrinks from the hatreds and massacres of Europe, and is very slow to adopt a world consciousness which sees that peace is indivisible, and that it may be necessary to wage defensive war in distant lands.

Despite these qualities, French Canada's actual contribution toward the present war has, of course, been very impressive. It is only by comparison with the military record of other parts of Canada that it requires marginal comment.

Italy's Economic Underground

[FROM AN ITALIAN CORRESPONDENT]

IN the midst of their fight for liberation, right under the nose of the Gestapo and the "Black Brigades," the CNLAI, the Upper Italian Liberation Committee, was able to prepare elaborate plans for the re-organisation of the national economy.

Four general sub-committees were formed to deal with economic matters, and they will continue their functions until the constituent assembly gives Italy its new shape. These sub-committees are concerned with finance, industry and commerce, agriculture and fisheries and transport. In all of these, the representation of all parties has been preserved.

The same is true of all local and individual bodies, for instance, the factory liberation committees, which played a part in the insurrection and in the preservation of industry from destruction or robbery by the Nazis. The all-party composition of these committees is remarkable, as the overwhelming majority of workers are Socialist or Communist, so that it was sometimes difficult to find a true representation for the Liberal party.

Two days before the insurrection actually began, the underground CNLAI had already issued a decree for the convocation of *consigli di gestione* (directive councils) and for the nomination of commissioners in all industries, the councils to be composed equally of owners and workers. These councils have very wide powers, and in most cases the CNLAI accepts their proposals for the nomination of the works commissar and of the purely technical "works chief," who is mostly either the former works manager or, where he was incriminated or unreliable, some leading member of the technical staff.

The CNLAI issued an appeal to owners to collaborate actively with the "directive councils" and to nominate their representatives without delay. Many industrial leaders succeeded in making their works into arsenals for the partisans, in defiance of Nazi or Fascist surveillance. Others, like architect Beltrami, who came from a millionaire industrialist family, became leaders of partisans. Beltrami himself was caught and beheaded.

Some bankers also took an active part in the underground fight. Alfredo Longhi (whose real name is Piccozzi), now Finance Commissar of the CLNAI, disappeared from his office at the *Credito Italiano* immediately after the armistice in order to work exclusively for the finance of liberation. To get financial help from Allied Headquarters he crossed the lines secretly. As it would have been too risky to take back cheques or transfer orders, he relied on his own reputation. His confidence was fully justified. Northern Italian banks paid to patriots on his word the huge sums paid into Roman banks by the Allies. Their accountants had recourse to all manner of tricks in order to hide what was happening from the Nazis.

Thus, while it is only just to admit that workers were in the forefront of the actual fighting and suffered the greatest number of casualties, the Italian insurrection was, in truth, a movement of the whole nation, actively supported by the best elements of all classes. The economic preparation was as efficient as the military and political planning. As a result, a great number of industries are intact and only await raw materials in order to continue full production. But every day which is lost increases the danger of mass unemployment. It would be a pity to miss an opportunity of getting at least one part of Europe quickly on its feet, and of thus speeding up the reconstruction of the whole continent.

Books Received

The International Who's Who, 1944-45. Europa Publications, Ltd. 951 pages. £4 net.

The latest edition of *The International Who's Who* renders a valuable service by providing up-to-date information, now hardly accessible elsewhere, to the investigator interested in personalities of international standing.

The Left Was Never Right. By Quintin Hogg. Faber & Faber. 224 pages. 4s. 6d.

Vote Labour? Why? By Licinius. Gollancz. 77 pages. 2s. 6d.

Can the Tories Win the Peace? By Diplomaticus (K. Zilliacus). Gollancz. 103 pages. 2s. 6d.

The Future of British Farming. By A. W. Menzies-Kitchen. Pilot Press. 80 pages. 5s.

BRITISH EXPORT TRADE RESEARCH ORGANISATION

Application for Appointments.

A number of Executive positions will shortly be available at the B.E.T.R.O. Headquarters. The Organisation has been formed to provide a complete service of overseas marketing research and intelligence for manufacturers in all branches of British industry; it will not engage itself in actual sales work or act as selling or export agents.

The work is of immediate and increasing national importance; the appointments now to be made offer careers of considerable responsibility, and of scope limited only by individual capacity. They will be commensurately paid.

Applications are invited from men (or women) qualified by background or experience to fill senior executive positions in the Organisation.

It will be realised that the whole work of the Organisation is focussed on overseas research and its application to export marketing problems. Certain qualifications (variable only in degree) are therefore basically essential to any of the positions:—

- Experience of modern marketing practice.
- Acquaintance with overseas economic, social and trading conditions, and types of marketing problems likely to be met.
- Knowledge of research principles and practice, interpretation and application to marketing.
- Ability to formulate policy based on the sales and consumer data collected.

Foreign language ability is naturally desirable, but by no means essential.

There will also be vacancies for younger individuals who may be less qualified or experienced, but who must have an adequate educational background to train for junior executive or research positions.

Applications must be made in the first place by letter and will be treated in strict confidence. Applicants should state specifically exact position in view and salary required, give their age and outline clearly their qualifications and experience, adding any relevant details (though not testimonials or other documents) which may assist the Appointments Board in coming to a decision. Applicants are asked not to call at the B.E.T.R.O. Offices.

All applications should be addressed to:—

APPOINTMENTS BOARD,
BRITISH EXPORT TRADE RESEARCH ORGANISATION,
Georgian House,
Bury Street,
St. James's, London, S.W.1.

THE BUSINESS WORLD

Capital for Reconstruction

THE statement of the Chancellor of the Exchequer last week and the accompanying White Paper on Capital Issues Control (Cmd. 6645), bring a very welcome relaxation of the wartime control of the purposes for which new capital may be raised and the methods of raising it. Before a would-be borrower can raise capital in the market, he will still have to get the consent of the Capital Issues Committee to the amount of the issue and of the use to which it is to be put (with exemption for all issues below £50,000). If his issue is for more than £100,000, he will have to follow the instructions of the Bank of England as to the timing. But as for the method of issue—whether by prospectus or by placing, whether to shareholders or to the public—control is restored (except in the case of trustee and quasi-trustee issues) to the Stock Exchange authorities.

In respect of the method of issue, therefore, the relaxation is fairly complete. The Council of the Stock Exchange and the companion bodies in the provinces are restored to their pre-war position, once the Capital Issues Committee has given its sanction to the amount of the issue, and the applicant for capital is free to choose his own means. The Stock Exchange authorities have given their loyal co-operation in carrying out a policy which has always seemed to them illogical and which was often manifestly harmful to the interests both of their members and of the borrower. The decision of the Treasury to restore to the public the

machinery of the new issue market is a triumph for commonsense over a doctrinaire policy imposed with little apparent solicitude for, or even knowledge of, the detailed functioning of an intricate machine. It is now for the Stock Exchange community to see that any imperfections are removed as rapidly as may be.

This relaxation is important and welcome. But the methods by which borrowing may be effected are naturally less important than the purposes for which capital can be raised. Here also, though control is not removed and the CIC is clearly intended to function as an instrument of Government policy, there are substantial relaxations.

The new purposes for which permission to issue will normally be given—subject to circumstances at any time requiring stricter control—cover for the most part ground already very familiar. The list includes exports, development areas, public utilities and housing associations, agriculture and fisheries, exploitation of raw materials in the United Kingdom, transport of all kinds and the catering industry. There is also an omnibus item to cover "such productive and constructional purposes as may be notified from time to time by the Treasury," with a first list including housing, the "basic items of household furniture and equipment," clothing and footwear, other essential consumable goods and "the manufacture or acquisition of capital goods, in particular, capital goods needed to re-start and re-equip industry." Special priority, within the general category of consumption goods is to be given to issues promoting manufacture in replacement of imports.

The general categories are not arranged in order of priority but there is a special instruction that sympathetic consideration be given to manufacture for export, for issues required to establish, restart, convert or expand undertakings in "Development Areas," which include Northern Ireland, to undertakings requisitioned or concentrated and those which have suffered war damage. Thus there is no priority for modernisation as such. It has priority if it contributes to exports or the providing work in the development areas. But what portion of a company's output must be pledged to export to obtain this benefit? And what is the position if a concern can promise a great contribution to the satisfaction of the consumer but cannot find a suitable labour force within the depressed areas?

In addition to the positive priorities, several categories are mentioned for which permission will be withheld in the absence of special circumstances. These include the domestic distributive and retail trades, hire-purchase, issues arising out of the acquisition, amalgamation or absorption of existing undertakings, and bonus issues.

★

As a priority list for the right employment of a painfully limited national supply of capital, this list is not open to serious cavil—though an eyebrow may be raised at the very high priority given to the Development Areas. Broadly speaking, these are the things towards which the flow of capital should be directed. To say this, however, is not to answer the main question that any scheme of control of capital issues inevitably raises. To what extent is it right, or necessary, to impose control, and to establish the order of priority, at the financial stage of the process of capital formation? Should not the controls be on the physical resources needed for capital formation—on the labour, the materials and the machinery—and should not the financial operations be left free?

That this point is at least partly taken is shown by the provisions that all applications for new money are to be submitted by the CIC to the appropriate Government Department and that the Committee is to be guided by any advice given to it by the Department in question. In particular, the Department will say whether any physical resources in scarce

supply can be made available to the applicant within a reasonable period, and reasonable period is defined as, possibly, twelve months. It is also indicated that the CIC should give priority of consideration to concerns who already have received licences for labour, materials or buildings.

But these provisions do not fully cover the case. They make it clear that there is to be a physical control and a financial control, but they do not exclude the possibility that the financial control may be the narrower bottleneck of the two. Why should this ever be so? As a general rule, the doctrine should apply, in peace as in war, that if the physical resources are available, no project should be held up for lack of finance—or that if it is, something is radically wrong with the financial mechanism. There may, indeed, be marginal cases in which an issue should be prohibited even though there is no physical objection. But the prohibitions go much further than these, as is shown, for example, by the prohibition of investment trust issues.

The fact is, of course, that, apart from the proper marshalling of the demand for capital, the continuance of control has another purpose, unavowed in the White Paper—namely, the protection of the gilt-edged market. In wartime that purpose has rightly been paramount (though some of the methods used to achieve it have been very hard to understand). But as peace returns, the scale of values alters. Which would be the greater disaster, a set-back to the current "tap" issue, or an obstruction to the flow of capital formation for which physical resources are available? At some point—and an early point—the latter will surely become more noxious. Yet the form of capital issue control now sketched out might give priority to avoiding the former. It is easy to envisage circumstances in which, through fear of inflation, the banking system and the capital market are kept a little too short of cash, with the result that the tap issue hangs fire and the CIC and the Bank of England shut down the flow of issues to finance projects for which physical resources are available. The better remedy, in such cases, would be to provide more bank cash.

Unfortunately, there is at the very least a possibility that circumstances such as these will occur. Although the Treasury has abandoned its policy of restricting the method of issue—a policy which certainly paid no dividends—there are indications even in the White Paper that it still clings to every expedient for protecting the tap issues. It is reasonable that it should, through the Bank of England, control the rate of demand for new money when the issue exceeds £100,000 and regulate the terms upon which securities of trustee and quasi-trustee status are to be made, and no complaint can be made at an injunction to the CIC to avoid over-capitalisation, although it would be wise to err in that direction rather than in the opposite one. But the maintenance of the ban on optional conversions

when the old stock carries interest of 4 per cent or less suggests restriction for restriction's sake.

It is also to be noted that there are even restrictions upon the raising of new money as part of a scheme of amalgamation, despite the fact that in many fields amalgamations ought to be encouraged. Further, financial institutions are excluded from the right to raise money unless it is to be used for the finance of one of the permitted purposes, and investment trusts and unit trusts are completely barred. These prohibitions, coupled with the recommendation that no firm should raise money unless the physical requirements are obtainable within the year, suggest strongly that the Treasury is still wedded to the policy of keeping a very large share of the market to itself instead of encouraging the public to put some of its savings into industry either directly or through the medium of risk spreading investments such as unit or investment trusts and finance companies. True, the Government will need to raise large sums; but the fact that, in face of the possibility that Labour will be returned to power, investors are prepared to risk buying shares which yield little more than 1 per cent above the return on gilt-edged shows that a part of all savings will only take this form of investment. It would be tragic if this part were prevented from financing new capital development.

★

There is nothing in the White Paper that suggests the probable life of these new arrangements. But they are clearly of a transitional character, and they naturally give the signal for the debate on the next stage to begin. The present proposals severely circumscribe the sphere within which the CIC can work. Before it pronounces its decision, the Government Departments have given decisions on the physical aspects of the project; after the consent of the CIC has been given, the Bank of England, the Stock Exchange and the normal processes of the market take care of most of the interesting details of an issue. There is not much left for the CIC to do, and if the economic or physical view supersedes the purely financial, as it should, there will be still less.

Is the next stage the disappearance of the Capital Issues Committee? There will be many who devoutly hope so. It is true that the project of a National Investment Board is a familiar and a popular one, and it might be thought that the CIC is the natural nucleus for such a body. But the duty of such a Board, in any foreseeable future, would be more often to stimulate, than to restrict, the flow of capital, to apply the spur to the lender rather than the rein to the borrower. If any such plan is set on foot, it will be far better to start free from the legacy of restriction—and, let it be added, of obstinate illogic—that will be left by the Capital Issues Committee.

The Occupations of the British

POPULATION statistics always make fascinating reading. After all, the people occupy the centre of the stage. Statisticians carefully record changes in the size of populations, and they have even evolved methods of forecasting them. In recent years, they have devoted much time to the study of the material conditions of the people, and their comparisons—often odious—have done much to arouse a conscious quest for improvement, so marked at the present time. In a paper entitled "The Industrial Distribution of the Population of Great Britain in July, 1939," Mr H. Frankel revealed to members of the Royal Statistical Society, on May 29th, how the people of this country gained their living before the war. Occupational statistics, of course, are not new; they have been compiled at ten-yearly intervals on the occasion of the census of population. But the last census was held in 1931; the merit of Mr Frankel's analysis (his estimates are based on the national health and unemployment statistics and on the results of the 1931 census of population) is that it provides a useful basis of comparison with post-war statistics.

The detailed results of Mr Frankel's calculations are summarised in Table IV on page 778; it shows the distribution of the gainfully occupied population (employed as well as unemployed) in Great Britain in July, 1939, as well as the changes that had taken place since 1931. There is no need to duplicate the table by an enumeration of the detailed facts it discloses. But, by way of comment, some of

the trees may be singled out from the wood of statistics. Apart from the distribution of employment, one of the most interesting features of an occupational census is the proportion of the population that is gainfully occupied. Here are the figures from 1911 onwards, for men and for women:

I.—OCCUPIED AND UNOCCUPIED PERSONS IN GREAT BRITAIN
(in thousands)
(a) Persons aged 16-64

	Males			Females		
	Population	Occupied	%	Population	Occupied	%
1911.....	12,154	11,744	96.7	13,191	4,864	36.9
1921.....	12,901	12,450	96.5	14,528	5,158	35.5
1931.....	14,204	13,661	96.2	15,726	5,758	36.6
1939.....	15,236	14,827	97.3	16,633	6,250	37.6

(b) Persons aged 65 and over

	Population	Occupied	%	Population	Occupied	%
1911.....	915	520	56.8	1,221	140	11.5
1921.....	1,103	630	57.0	1,480	148	10.0
1931.....	1,425	683	47.9	1,892	155	8.2
1939.....	1,783	668	37.5	2,324	197	8.5

Among men aged 16-64, the proportion of persons without occupation has been very small, and almost constant,

Outward bound

From Great Britain to the four corners of the earth they went—ships of all sizes and every description, carrying British goods and manufactures to the peoples of the world. In a word: *Exports*. For over five years this stream of trade has been interrupted, but now the interruption is nearing its end. The Westminster Bank, fully alive to the vital importance of a healthy export trade, has built up an extensive fund of up-to-date information on world conditions, through its world-wide organisation of agents and correspondents. This information, which daily is being extended, the Bank gladly places at the disposal of all concerned with overseas trade

WESTMINSTER BANK LIMITED

except for a decline in the thirties. Among women in this age group, the proportion without gainful occupation has been much bigger, nearly two-thirds of the total, and, perhaps surprisingly, it remained fairly constant during the thirty years before the war. In spite of the large-scale recruitment of women for war work during 1914-18, the proportion of gainfully occupied women was actually smaller in 1921 than in 1911. The question whether the wartime recruitment of women will this time lead to a permanent increase in the proportion of gainfully occupied women cannot yet be answered with certainty. Recent investigations have disclosed that large numbers wish to stay on at work. But it would be unwise to draw hasty conclusions from opinions expressed while normal home life remains suspended through the absence of menfolk.

In the category of persons aged 65 and over, an increase in numbers has been accompanied by a progressive and—in the case of men—steep decline in the proportion occupied since 1921. The desire to retire after the age of 65 has undoubtedly shown a marked increase, hastened, probably, by the greater material security provided by old-age pensions and by the increased opportunity to save caused by the rise in real wages. The difficulty of finding employment during the inter-war years has probably been a contributory cause. As the population as a whole grows older—a tendency revealed both by the increased numbers aged 65 and over, and by the decline of nearly 1,100,000 between 1931 and 1939 in the number of children under 14—an increased burden will therefore be thrown on those aged 16-64. This will be accentuated by the raising of the school-leaving age; in July, 1939, the number of occupied boys aged 14-15 was 514,900, and that of girls 458,700. Hence the need of the financial incentives to stay at work at the age of 65, provided for in the Government's new pensions scheme.

If the occupied population is expressed as a proportion of the total population instead of as a proportion of the population of working-age, the percentage occupied is, of course, higher for 1939 than for 1931. Thus, the proportion of the occupied male population to the total number of males rose from 69 per cent in 1931 to 71.8 per cent in 1939; among females the increase is even more marked, from 26.9 per cent to 32.7 per cent. This phenomenon, of course, is a reflection of a change in the age distribution of the population, that is of the fall in the proportion of children to the total population. The fact that there were more hands relative to mouths in the population in 1939 than in 1931 is, perhaps, not entirely irrelevant to the persistent unemployment of the 'thirties; both employment and unemployment were higher in the 'thirties than ever before.

Another interesting question that can be answered from Mr Frankel's statistics is how many gainfully employed persons are manual and non-manual workers. These are the figures for July, 1939:

II.—MANUAL AND NON-MANUAL WORKERS, JULY 1939
(in thousands)

	Males	%	Females	%
Manual workers.....	11,065	69.2	4,510	65.4
Non-manual workers.....	3,753	23.4	2,035	29.4
Working on own account.....	942	5.9	361	5.2
Members of the Forces.....	250	1.5	...	...
Total.....	16,010	100	6,906	100

These figures, too, are somewhat surprising. The proportion of manual workers is still relatively high, and it is almost as high among women as it is among men.

The distribution of the occupied population between manual and non-manual workers is, of course, a function of the British economy as a whole. The growth of the national income has been accompanied by a decline in the proportion of the occupied population engaged in the so-called productive activities (items 1 to 16 in the accompanying table), and an increase in the proportion engaged in commerce service industries, and in the service of the Government (items 17 to 21). This trend, marked between 1921 and

1931, has continued in the 'thirties. Changes between 1931 and 1939 have been as follows:

III.—DISTRIBUTION OF OCCUPIED POPULATION
(in thousands)

	Males			Females		
	1931	1939	% Change	1931	1939	% Change
Productive occupations.....	10,051	10,570	+ 5.6	2,549	2,707	+ 6.2
Other occupations.....	4,750	5,440	+ 14.5	3,724	4,199	+ 12.8
Total.....	14,801	16,010	+ 8.2	6,273	6,906	+ 10.1

In 1939, the proportion of the occupied population engaged in the productive industries was 66 per cent for men and 39 per cent for women. (The marked difference among women in the proportion of manual workers and the proportion in productive industries is, of course, due to the fact that many service trades, especially domestic service, require manual labour.) Within the productive trades, there has been a further decline in the number occupied in the so-called primary industries, that is fishing, agriculture and mining. Some of the changes within productive trades other than primary industries, revealed by the table, are equally significant. With the exception of textiles, all the industrial groups have gained in numbers. The metal and related trades have gained substantially. Among the tertiary or service industries, one of the most remarkable features is the growth of the civil service.

Inevitably the trends revealed by Mr Frankel's statistics

IV.—OCCUPATIONAL DISTRIBUTION OF POPULATION OF
GREAT BRITAIN, JULY 1939

	Males (Aged 14 and over)			Females (Aged 14 and over)		
	1939 (000's)	Increase since 1931		1939 (000's)	Increase since 1931	
		Number (000's)	%		Number (000's)	%
Total population.....	22,332	873	4.1	24,135	788	3.4
Under 14 years of age.....	4,587	-530	-10.4	4,465	-552	-12.4
Aged 14 years and over.....	17,745	1,404	8.6	19,670	1,340	7.4
Unoccupied, aged 14 yrs. and over.....	1,735	196	12.7	12,764	717	6.0
Occupied, aged 14 years and over.....	16,010	1,208	8.2	6,906	623	10.1
1. Fishing.....	67	6	9.3	1	-1	-32.0
2. Agriculture.....	934	-186	-16.6	73	-1	-1.9
3. Mining.....	1,097	-234	-17.6	11	-2	-14.5
4. Bricks, pottery.....	185	14	8.4	60	1	1.1
5. Chemicals, dyes.....	217	36	19.7	70	13	22.5
6. Metals, machines.....	2,650	495	29.0	414	104	33.5
7. Textiles.....	474	-73	-13.3	666	-125	-15.8
8. Preparation of skins, leather.....	68	5	8.4	33	4	15.2
9. Clothing.....	332	-6	-1.6	603	61	11.2
10. Food, drink, to- bacco.....	496	51	11.5	291	27	10.3
11. Wood-working.....	305	20	7.1	41	6	15.6
12. Paper-making.....	355	31	9.6	196	23	13.3
13. Buildg., decorating.....	1,388	279	25.2	18	3	23.2
14. Other manufactur- ing industries.....	161	7	4.3	84	2	2.8
15. Gas, water, elect'y.....	289	52	21.7	12	5	58.4
16. Transport and com- munications.....	1,403	10	0.7	57	7	14.0
17. Commerce and finance.....	2,525	211	9.1	1,188	167	16.4
18. Govt.: Defence.....	250	171	63.4	110	21	23.8
" Central Govt.....	441	99	14.0	323	8	2.5
" Local Govt.....	803	56	16.3	417	94	29.0
19. Professions.....	1,399	56	4.3	417	94	29.0
20. Entertainment and sport.....	184	49	38.7	109	47	74.5
21. Personal service.....	838	98	13.2	2,052	146	7.6
22. Other occupations.....	150	12	8.9	76	32	71.6

have been completely distorted during the war. After reconversion the occupational pattern will once more resemble that of 1939, at any rate in broad outline. But in detail the figures for 1949 are likely to be very different from those for 1939. They will be influenced, as in the past, by the march of time. They will be influenced by the re-distribution of the national income in favour of the lower income categories, and by the need to expand exports. They will be influenced by Britain's ability to shed low-yielding occupations and trades in favour of high-yielding and more productive ones, and to make existing industries more productive. But, in the absence of a permanent and marked increase in the proportion of gainfully occupied women, the total occupied population will be smaller in 1949 than it was before the war. Britain can no longer afford to waste manpower; one of the major tasks after the war will be to economise it.

Business Notes

Election Markets

After more than a week of recovery, the markets took a turn down once more, but so far this new recession appears to have even less force behind it than the preceding recovery. The recession immediately followed the Prime Minister's first broadcast. Whether that was purely accidental, or whether investors were slightly alarmed at the lurid picture which Mr Churchill painted of the ultimate effects of a socialist regime, is difficult to say. Possibly, the speech was merely received as a reminder, and a somewhat sharp one, of the characteristics of the atmosphere in which a general election is fought. (It is worth noting that Mr Attlee's reply produced no acceleration of the decline.) However that may be, it is beyond question that minor fluctuations, amounting to two or three per cent in the index of equities, are to be expected for some weeks to come, irrespective of whether or not there develops a larger movement. All that can be said at present is that it seems more reasonable to expect a downward trend than the reverse.

The high lights of the general situation are shown by the chart of the indices of *The Financial News* and a rather subdued picture of some of the details by the figures of *The Actuaries' Investment Index*, both of which appear on page 790. The latter refers only to the position on Tuesday of last week, when the recovery had barely started, but as against that this monthly figure missed the peak of last August by some days. It is interesting to note that, while preference shares suffered appreciably, the only other fixed interest group to fall was 2½ per cent Consols. This week the gilt-edged market has been favourably affected by the announcement of the new issue of 2½ per cent National War Bonds. Its longer date has, inevitably, tended to push up the value of previous issues of these bonds, but there is also an improvement in longer dated stocks.

Other movements of interest outside the category of industrial equities are a marked rally in Argentine railway stocks on the renewed negotiations between the companies and the Argentine authorities and a rise in French railway bonds on the report from Paris that an agreement has been concluded for the payment of arrears of interest. There is no specific mention in the message concerning bonds drawn for redemption during the occupation, but that will presumably also be covered.

The House and New Issues

So far as can be ascertained, the new regulations covering capital issues grant to the Stock Exchange everything of importance for which its representatives asked, and there is widespread satisfaction with the result. There is, however, some regret at two aspects of the Government's policy. Of these, only one has any logical connection with the subject of new issues and that relates to the very modest possibilities allowed to financial institutions for increasing their capital. Some members suggest, and there is much force in the suggestion, that more money will be required by many of these to handle the increased business likely to come forward. Their contention may, perhaps, be expressed as a belief that the amount of capital in this section of the machine ought to bear a fixed proportion to the national income, or rather, to that portion of it which is devoted to raising new capital through the market. It is felt that there are still too many impediments to the actual obtaining of permission to issue. The fact that members of the exchange naturally wish to raise new issues to a maximum, provided that the projects are reasonably sound, does not destroy the force of the argument.

The second group are those who had hoped that the end of the war in Europe would bring the restoration to the Stock Exchange of full liberty, including fortnightly settlement and the right to deal in options. This group is probably ahead of the general body of members, and certainly ahead of the policy of the Council on these matters. On the particular point of dealing in options, it may prove to be the case that this will be one of the things which the market will definitely abandon. The volume of this business has declined with the fall in the volume of speculation, and it is a matter for consideration whether any use-

ful purpose will be served by restoring the practice. On the much larger question of the resumption of dealing for the account, there is also much to be discussed. It is doubtful whether, with existing staffs, the officials of the Stock Exchange could carry through their part in a fortnightly settlement. But it is also doubtful how far the market is anxious for a general resumption of the pre-war method, even when conditions are more normal. There is a good deal to be said for encouraging people to deal for cash even when the time comes, as it certainly should, when those who wish to deal for the account are permitted to do so. This is a matter, however, which, if account dealing is permitted, will have to be carefully reviewed as part of a wider policy.

The New Deputy Governor

The impending retirement of Mr B. G. Catterns from the deputy-governorship of the Bank of England and the appointment of Mr C. F. Cobbold in his stead, draw attention afresh to the great change that has come over the Bank since the close of the last war. Mr Catterns' nine-year tenure of his office does not, of course, equal Lord Norman's as governor, but it has been far longer than that of any of his predecessors. He was also the second only of the Bank's permanent officials—he graduated through the chief cashier's office—to reach the deputy's chair. The need for continuity in the highest offices, and for detailed knowledge of the Bank's internal organisation—even more important, perhaps, in the deputy-governorship than in the governorship itself—have wholly swept away the traditional system of two-year rotation of governors and deputies elected from a court of part-time directors largely recruited from the ranks of the merchant bankers. A further step in the same direction was taken by the Bank in 1932, when it inaugurated the system of full-time "executive" directors. This system may perhaps be expected to provide a natural training ground for the highest offices, more important for this purpose even than the non-directorial permanent appointments.

The appointment of Mr Cobbold to succeed Mr Catterns, with effect from September 1st, certainly lends support to this view. Mr Cobbold joined the Bank in 1933, and has now served seven years as an executive director. Many who knew him in the City have long felt that he was destined for high office—eventually, perhaps, even the

STAGGERED WORKING HOURS INCREASE TRAVEL COMFORT

There is only one way to ease the congestion of rush-hour travel—by spreading arrival and departure times over a longer period. If every other firm in a particular area were to alter working hours by 15 or 30 minutes, rush hour congestion would be greatly eased at Underground stations and adjacent 'bus stops. Already 600,000 London workers benefit from staggered hours.

As there is now a long waiting list for *The Economist*, subscribers who wish to renew their subscription are advised to do so immediately upon receipt of a renewal notice. If they fail to do so, their subscriptions will be automatically cancelled on the date of expiry, and this may mean a gap of many months before the despatch of copies can be resumed.

highest. During the war he has been especially concerned with problems of external finance, which will certainly not be less important or less intractable in the post-war years. At the directorial level, he has been responsible for the creation of the system of exchange control, generally regarded as one of the most outstanding of the Bank's war-time achievements. The appointment is one of real promise, and has been welcomed as such—for Mr Cobbold is not yet 41, almost certainly the youngest deputy-governor in the Bank's long history. In the particular case of the Bank, youth not only has its usual advantages, but it also confers the benefit of freedom from the preconceptions of the pre-1931 world, which are often a positive handicap to clear thought about the very different problems of to-day.

New Bank Notes for France

The French Government is steadily adhering to the programme of financial action outlined in his Budget speech on March 29th by M. René Plevin, Minister of National Economy and Finance. The latest instalments are the exchange of all banknotes of Frs. 50 and over and the exchange or stamping of Treasury bills and short-term Treasury bonds. The operation, to be completed within 12 days from last Monday, is an administrative *tour de force*; some 1,600 million notes will have to be exchanged over 35,000 counters serviced by 120,000 employees.

The exchange of notes and the inspection of short-term paper forms part of the census of individual wealth that has been in progress for some time, and is, therefore, in line with previous steps, such as the requests for the declaration of foreign assets and for the registering of bonds and other securities. This census, which is to include other forms of property, is to form the basis of the forthcoming levy on war-time gains, estimated to bring in Frs. 100-125 milliards in four years; it will assist the Government in tracking down illegal and, especially, black market transactions; and it should facilitate the efforts now made by the Government to curb the long-standing evil of tax evasion of which M. Plevin gave some striking examples in his Budget speech. Incidentally, the nominal note issue will be reduced by notes that have been looted by the enemy, stolen or destroyed, and by notes whose owners do not care to hand them in for fear of investigation. If it can be successfully carried out, the census of notes and bonds will be a further step towards financial rehabilitation.

Checking Inflation

The exchange of banknotes is to be the occasion for a further attempt—the first was the issue of the 3 per cent National Liberation Loan last autumn—to reduce the volume of notes in circulation and, therefore, to diminish the inflation potential represented by hoarded notes. Owners of notes surplus to needs have been exhorted to convert them into bonds. On May 8th the nominal note circulation was still Frs. 589 milliards, compared with Frs. 632 milliards on October 5, 1944, and Frs. 123 milliards before the war. Since the exchange of notes will automatically involve the disclosure of individual holdings—the disinclination to do so has in the past been one of the obstacles to conversion—the latest appeal is expected to meet with some response. Obviously, the Government will have to pay a price for conversion, for it will involve the transformation of an interest-free debt into one carrying interest. It has been estimated, for example, that the farming community has hoarded Frs. 150-200 milliards of notes; at 3 per cent, conversion would cost the Government Frs. 4½-6 milliards gross in interest, compared with the yield of only Frs. 2 milliards in 1944 of the tax on farm profits.

The reduction in the note circulation, necessary though it may be, will not in itself remove the inflation potential. In France, where the banking habit is much less developed than in this country—total bank deposits, at Frs. 240-250 milliards, are less than half the note circulation—notes are still widely used as a store of value. But given an increase in the velocity of circulation, a note issue much smaller than the existing one could still carry prices to new heights; any such movement, moreover, would be accelerated by an increased turnover of Treasury bills, which in France are widely held by individuals. The real remedy, as has so often been said, is an increase in the supplies of goods and services. Meanwhile, the only efficient expedients to hand are those

practised by this country during the war in public finance and in the control of scarce supplies; but as supplies in France are much shorter than they have been in Britain at any time since 1939, the controls need to be applied more harshly if they are to be effective. Fortunately for Britain and unfortunately for France, there is a world of difference between controls applied loosely and harshly.

Drachma Devalued Again

The fresh wave of currency difficulties in Greece, discussed in these columns last week, has impelled the Government to announce new and drastic measures to bring the economic situation under control. Details are not yet available, but the main objects of the programme have been stated by M. Varvaressos to include fair and quick distribution of imported foodstuffs, reduction in the prices of certain essentials, increased agricultural and industrial production, and restoration of monetary stability and budgetary equilibrium. These are fine phrases, but it is not the first time they have been heard in Greece in the seven months since the new drachma was introduced. For that reason judgment on them must be deferred until it can be seen whether the Government can and will grapple vigorously with the difficult administrative problems involved.

The actual measures so far announced, like those imposed by other liberated countries facing comparable difficulties, appear at first glance to be contradictory. The policy of reducing certain key prices, for example, is to be combined with wage increases, which in some cases will reach 80 per cent. Moreover, despite the wavering confidence in the new currency, and despite the hopes of internal price reductions, the drachma is to be drastically devalued. The stabilisation law of last November, which fixed the exchange with sterling at 600 dr., is abrogated, and the drachma is to be devalued to 2,000 dr. to the paper pound and 4,000 to the gold pound. The contradictions are, however, more apparent than real. Since last November wages have been pegged, but most prices have in practice been uncontrolled. Hence the acute shortages of goods and fears of fresh inflation have combined to produce steep increases in prices, and in the black market rates for foreign exchange and gold. In such circumstances, a renewed breakdown of monetary economy could not be prevented unless the special hardships of the poor were relieved both by an increase in wages and a reduction in prices; and it was obviously necessary to reduce the drachma to a level at which there was reasonable prospect that it might be held. Whether that level has yet been reached cannot be judged by comparison with recent black market rates. The value of the Government's programme will depend absolutely upon its capacity to enforce reasonably watertight physical controls—which in turn depends not only upon its administrative ability, but upon political confidence even more than economic.

Cheque-Encashment Restrictions

A significant restriction of the customary cheque-encashment facilities became effective last Monday. As from that date, no bank which is a member of the British Bankers' Association will cash or exchange any cheque, payable order or draft unless it is

- (i) uncrossed and drawn on the branch at which it is presented;
- (ii) presented by the drawer or his known agent;
- (iii) payable under a credit established on behalf of the drawer;
- (iv) drawn for a sum not more than £10, in which case the branch manager may cash or exchange it at his discretion "on exceptional or isolated occasions."

In all other cases the cheque must be paid in full through a banking account. The effect of this is to restrict the payment of cheques over the counter and, in particular, to stop the quite common practice of cashing "third-party" cheques for customers on what is known as an "exchange" form. A person who received an open cheque from a third party drawn upon a bank at a distance, or a crossed cheque, could nonetheless often secure immediate cash for it from his own bank. The banker, if he exercised his discretion to grant an "exchange," in effect bought the cheque from the customer, and although he took it subject to recourse to the customer, was then collecting it on his own behalf. Hence neither the credit nor the corresponding cash debit figured in the customer's account.

Victory in the Far East will be hastened because our tanks and armoured fighting vehicles can operate through swamp and river and sea-water.

Their waterproofing systems were designed and perfected by the Nuffield Organisation. The same kind of skill and experience is being applied now to the manufacture of all Nuffield vehicles for use in peace.

What is the best chocolate being made today?

IT'S a tough job to make good chocolate now. There is little milk. Sugar is short. Cocoa beans are of mixed quality. Skilled craftsmen are mostly on other work.

All the same, by refusing to be discouraged, we have been able to make

the remarkably good Rowntree's Blended Chocolate. It is not as good as the finest pre-war milk chocolate; it contains the same amount of milk, but it is not full-cream milk. We are satisfied that no better chocolate can be made in this country today; and what is more important, those of you who have eaten it are satisfied too.

No mean achievement, this! We claim a spot of credit for a painstaking piece of work.

ROWNTREES

For the present—but we hope not for long—there are large parts of the country where Rowntree's Chocolate cannot be sold

Trade Winds . . .

From winds to wings . . . the difference is but a single letter . . . that era—in which winds dictated to international trade—is separated by generations of transportation development from today when wings have become the servant of industry. Speed and the ability to reach places inaccessible by any other means are two features exclusive to air transport which are indispensable to industry in this fast-shrinking world. The "Bristol" Freighter has been evolved to exploit fully and economically these advantages . . . an aircraft stripped of unessentials, easily maintained and readily adaptable to any specialised project or circumstance . . . an aircraft designed to provide an air transportation service at fare and freight rates lower than any previously possible. The Bristol Aeroplane Company Ltd.

6558E

This is the clue to the reason for the tightening-up of practice. It is understood that the new restrictions result from the initiative of the Government, and have as their primary object the prevention of tax evasion and, possibly too, black market operations. If all receipts by cheque must figure in a banking account, the task of the evader is obviously made more difficult, not because the tax authorities have any access to the banks' books—an order of the Court is required to compel them to produce them—but simply because a suspected person would find it hard to refuse to exhibit his pass-book to the authorities, and must in any case submit it to the scrutiny of his auditors or accountants. The step seems a sensible one, and must be welcomed even though, like other measures of the kind, it will inevitably cause a certain inconvenience to the general public.

Payments on Account

Some months ago *The Economist* drew attention to an argument, advanced by Mr F. A. Roberts, Incorporated Accountant, to the effect that payments on account constituted an addition to the capital of the contractor receiving them for purposes of determining EPT. This point has now been taken up by the Tata interests, who have obtained legal opinion in this country. Of two opinions taken, that of Mr N. E. Mustoe supports this view in full—a second opinion agreed, with certain reservations, as to the position under Government contracts. After full argument, Mr Mustoe says:

(1) An advance payment is neither a debt nor borrowed money within Rule 2 of Schedule II. The payment is received by the contractor absolutely, although he is under contingent liability to pay an equivalent amount to the purchaser if he should fail to perform the contract.

(2) The work in progress should be included in the balance-sheet and in the capital computation at its full value. In contracts between subject and subject the work in progress remains the property of the contractor until delivery has been taken. The payments on account, having been received absolutely, are also assets.

The opinion then goes on to consider the position under wartime contracts. Under these work in progress is commonly the property of the Government (even when it is financed by the contractor) and so cannot be considered an asset of the contractor. But he has the right to receive payment when the work is complete, and Mr Mustoe considers that

the asset consisting of this right should be shown in the balance-sheet and be included in his capital computation.

Further:

Unless the contract makes payments on account debts due to the Government, these payments should also be treated as assets because the contractor acquires a title to them at the time when they are made.

It would be hard to ask for anything more definite than this statement. The new point which emerges is that concerning the inclusion as an asset of a debt from the Government which will not become due until the completion of the contract. Actually, this places the contractor in the same position as that envisaged when the contract is between subject and subject, if he has not himself financed the purchase of the materials. If he has, he is still worse off than when dealing with another subject.

The financial interest of the British public in this opinion lies in the fact that the clauses of the Indian EPT Act appear to be identical with those of the British Acts on this particular matter. If the Tata interest press the matter to a conclusion—as it is understood they will—a decision by the Privy Council would, it is believed, be binding on the British Court of Appeal. There would still be a question of a further appeal to the Lords, and it is by no means certain that either they or the Privy Council would agree with Mr Mustoe, but the matter is one of considerable interest even if—as should be the case—a beginning is made this autumn with the removal of EPT.

Mr Bevin's Motor Car

The highlight of the second reading of the Finance (No. 2) Bill in the House of Commons on Monday was Mr Bevin's forthright attack upon the present horse-power tax on motor cars and upon the lack of standardisation in

the industry. (The occasion was the exclusion from the Bill of a revised system of taxation.)

Mr Bevin, who had been allocated a Morris 10 for his use as Minister of Labour, must have voiced the feelings of many when he explained the discomfort of a motorist who has to ride in a car "with his knees in his mouth." But his purpose was not merely to ridicule the small car; his criticism was directed at a system of taxation that has tended to concentrate demand on a kind of car ill-suited to foreign markets, and at the obstruction to changes by some members of the industry. He urged the adoption of a system of taxation that would cause a shift in home demand in favour of a bigger car which would find a ready market abroad. Mr Bevin also drew attention to the need for a greater measure of standardisation in the industry as a means to a reduction in costs. The result of the multiplication of types and sizes, he said,

is that the cost of a motor car in the United States of America, per pound weight—at three times the wages—is 9d. a pound on (the basis of) 1938 prices. In this country it is 1s. 4d.

It has been said often enough that the British motor industry will have a better chance of becoming a big export industry during the next few years than it ever had before; and the apparent reluctance to undertake the modifications of policy necessary to success is inevitably giving rise to impatience. The production of motor cars has already been resumed, and output is reported to show a steady expansion. For a time the industry will have to produce pre-war models, and given the pent-up demand at home and abroad it will have no difficulty in selling them. The industry will thus have a short but limited breathing-space to design the cars that will ensure it a permanent footing in the foreign market, and provide the British motorist with a more comfortable and roomy low-priced car.

Food Subsidies

The current level of the cost of subsidising foods has recently been given in Parliament about once every three months. On June 1st, the Minister of Food produced a table, in answer to a question, showing the retail price of

	Retail Price	Retail Price Plus Subsidy	Yearly Rate of Subsidy in March, 1945
Bread, per 4 lbs.	s. d. 0 9	s. d. 1 1	65
Flour, per 5 lbs.	1 3	1 9½	
Oatmeal, per lb.	0 3½	0 5	
Meat (home-killed), per lb.	1 0½	1 4½	24*
Potatoes, per 7 lb.	0 7	0 10½	28
Eggs, per doz. (large)	2 0	3 6½	16
Eggs, per doz. (small)	1 9	3 3½	
Sugar, domestic, per lb.	0 4	0 6	17
Milk, per quart	0 9	0 10	20
Cheese, per lb.	1 1	1 4	4
Bacon, per lb.	1 10½	1 11	2
Tea, per lb.	2 10	3 0	3

* Including imported.

subsidised foodstuffs and an estimate of what the retail price would be if the amount of the subsidy were included in prices. The table is reproduced on the preceding page, and the last column, which has been added from *Hansard* of March 23rd, shows the annual rate of the subsidy. The total cost of the subsidy was then at the rate of £225 million a year, including subsidies not shown in the table amounting to £46 million a year.

Whether food will continue to be subsidised at its present rate may be a matter for decision in the next Budget. The figures in the table apply to the position on May 1st. The tonnage subsidy on potatoes has since been withdrawn, and the retail price of potatoes raised, from May 27th, by 2d. per 7 lbs. for most grades. This increase is bound to have some effect on the cost of living index, which on May 1st stood at 203 (1914 = 100)—the highest point reached since 1921.

Tobacco Scarcity

The public is almost used to the recurrent periods of tobacco shortage, although it never ceases to grumble about them. For some time past output of cigarettes has been only enough to keep up with requirements, even

though more are being manufactured than before the war. The quota of tobacco which goes to manufacturers is based on the year ending March, 1940. In 1940 the quota was 90 per cent of consumption in the basic period and in 1941 it was raised first to 99 per cent and then to 108 per cent. In that year the decision was made to use more leaf in cigarettes, which brought the amount of the quota to 117 per cent (and incidentally affected quality), where it remained until this month, when an increase of 5 per cent was granted. Output is at the rate of 1,700 million cigarettes a week for civilian consumption and over 500 million for the forces.

The present shortage is due to a number of causes. Retailers' stocks have been insufficient to meet the drop in output and hold-up, in distribution arising from the VE celebrations and Whitsun holidays, and in London particularly the position has been aggravated by the return of evacuees and the influx of visitors.

Manufacturers could produce more cigarettes if they had more labour—there is no shortage of tobacco—and the purpose of the five per cent quota increase is to enable them to take immediate advantage of any labour they may be fortunate enough to acquire. Meantime an attempt is being made to adjust distribution to the shifts in population, and London supplies are to be increased by two-and-a-half per cent.

Aviation in India

The future policy for Indian civil aviation—at any rate, in the "post-war period"—has now been fully decided so far as national services are concerned. The Government has accepted, in general terms, the recommendations of Sir Ardeshr Dalal's Reconstruction Committee. In their Second Report, published last November, the Committee outlined the rather hesitant attempts at a development policy in civil aviation. The Government had at that time been authorised by legislation to make rules for an Air Transport Licensing Board, and to decide the principles on which it should work.

The latest development is, therefore, the outcome of a policy already half-decided. In effect, air transport in India itself is to be operated by commercial enterprise, but only through a limited number of companies, which would be approved by the Board. This plan, though broadly similar to the American pattern of the Civil Aeronautics Board, differs from it insofar as the Government reserve the right not only to participate financially in selected companies, but also to operate services themselves. Further, it remains to be seen whether negotiations with the Indian States will result in the Board having power enough to guide development of air transport on an all-India plan.

While the Government statement mentions the preparation of plans for building the necessary aerodromes and buildings, and for organising, training, telecommunications, time-tables, and so on, there is no mention at all of aircraft to fly the proposed 11,000 miles of air-routes. Undoubtedly, a fair number of 12-20-seater transport aircraft will be needed for expanding routes, and to replace obsolete machines. Until the Indian Government can arrange to import British aircraft or to buy, directly or indirectly, some of the American surplus, these development plans must remain paper projects.

Iraq's "Hard" Currency Needs

As had been expected, the Exchange Requirements Agreement with Iraq announced last week follows closely the lines of the agreement reached with Egypt early this year. The *raison d'être* of both agreements is, indeed, the same. Egypt and Iraq are the only important non-Empire members of the Sterling Area. Both countries, moreover, have fallen within the scope of the Middle East Supply Centre, which, in consequence of the acute shipping and supply bottlenecks, has throughout the greater part of the war imposed a tight rationing upon the imports of all Middle Eastern countries. So long as this system operated, the extent of Egyptian and Iraqi demands upon the "hard" currency resources in the London pool was, in effect, determined by Anglo-American policy. But, with the substantial withdrawal of MESC control at the beginning of this year, the Middle Eastern countries became free to direct their own import policies. It thus became important to reach agreement with the Sterling Area members concerned upon an equitable

limit to their net demands on the "hard" currency pool, and to persuade them of the need for setting up effective import control machinery—to ensure both that the "hard" currency target was not exceeded and that other imports were kept within reasonable bounds.

Under the Egyptian agreement, the "hard" currency allotment for 1945 was fixed at £110 million plus a possible £5 million for special imports of wheat and fertilisers, if available. For Iraq the quota has been agreed at I. D. 3.5 million—the Iraqi dinar is at par with sterling—a limit which applies for the whole of 1945 and not, as has been suggested in some quarters, simply for the remainder of the year. As in the case of Egypt, there is provision for a raising of the limit in certain contingencies, such as an increase in American prices by more than 10 per cent, or if supplies are present expected to come from "easy" currency areas can in fact be obtained only from "hard" currency areas. The Iraqi Government agrees to introduce an import licensing system; to restrict imports from "easy" currency countries outside the Sterling Area to the "real needs" of Iraq; and to relinquish the special dollar pool procedure whereby Iraq in the past has retained her own dollar earnings for her future use.

These agreements have been criticised in some quarters as being over-generous, on the grounds that Britain, with her top-heavy external position, can ill afford to make dollars available to third parties. This, of course, is a wholly unrealistic view. The Sterling Area cannot function as a closed circle for trade, and its members—especially countries that have been kept as bare of supplies as have the Middle East territories—cannot be deprived of essential goods simply because they make demands on the exchange pool. It is to be hoped, however, that those demands will be reduced as Britain's export capacity revives. It has also been suggested that Iraq's "hard" currency quota will be larger than her dollar receipts under the special pool arrangement. This may be true, but, if so, it is no proof that the quota is too liberal, for the dollar accumulation occurred at a time when sheer physical shortages prevented the import of vital supplies.

Profit Limitation in Australia

The latest instance of the effects of labour legislation in Australia upon the British investor is provided by a statement of the board of British Tobacco (Australia). According to this the price of tobacco leaf imported from the USA has risen continuously throughout the war, while the company has been prevented from raising its selling prices by the regulations imposing a ceiling. It is stated that the sole concession made has been the granting of a rebate of 4½ per cent of the Customs duty paid. With the latest rise in the price of leaf, the net revenue remaining with the company will be insufficient to cover the dividend at the reduced rate of 9 per cent paid during the war.

This, however, is not all, for the Government has imposed an arbitrary upper limit to the retainable profits of the company. This limit is also well below the sum required for necessary appropriations, and the maintenance of the 9 per cent distribution. The company has taken the best legal opinion available, and on the basis of it has informed the Australian Government that it cannot consent to hand over the profits above the prescribed maximum. There has been continuous contact with the Government, and the whole case was presented in February, since when no intimation has been received of the Government's reply to the case. So far the quarterly dividends of 2 per cent have been maintained, but if there is no change in the attitude of the authorities, these and the usual final of 1 per cent can only be distributed if the board decide to trench on the surplus accumulated from earlier years. The price of the 20s. shares is some 36s. 6d., to which it fell from 38s. on the announcement.

Tap 2½ per Cents Return

From next Wednesday, 2½ per cent National War Bonds will again be on sale through the tap, and on Tuesday the 1½ per cent Exchequer Bonds will be withdrawn. This news was not unexpected, for when the issue of 2½ per cents ceased last October, the Chancellor stated that it was his intention to give them a "short rest," and implied that a similar security would be introduced after a relatively short run of the shorter-dated Exchequer Bonds. In the meantime, it is true, there has been much discussion in the City of the possibility of the introduction of a some-

what different type of security, and it was surmised at one time that the decision to continue the offer of 1½ per cent Bonds beyond last February indicated the intention to make a different kind of appeal as part of a post-VE savings drive. If this was so, the postponement of the savings drive has led the Chancellor to revert to the original plan.

The new issue, with a latest maturity date of August 15, 1956, and an optional redemption date two years earlier, thus has a maximum life of eleven years and two months, which is eight months more than the maximum life of the last 2½ per cent issue (1952-54), when first offered in September, 1943. Once again, therefore, the terms have moved in favour of the Treasury, but it would be wrong to regard this lengthening of the currency as imparting a fresh "screw" to the market. The better terms really do no more than reflect the psychological, and rather irrational, effect on the market last November of the decision to offer a security carrying less than 2 per cent. Indeed, the new issue seems to be closely aligned to the existing market structure, even though the announcement did lead to a significant rise in the Gilt-edged market. As for the 1½ per cents, their departure will cause no regrets. They have not been a popular security, and although their total now reaches £300 million, it is widely believed that the large reduction in the volume of outstanding "tap" Treasury bills in recent months is really in the main the counterpart of official subscriptions to the bonds.

IC Gas Revenue

The liberation of France and Belgium has enabled Imperial Continental Gas to obtain at least partial information about its undertakings in those countries. These, with a substantial holding in Edmundsons and a block of general investments, make up its principal assets. Most of the companies in both France and Belgium paid dividends throughout the war and the parent company has received the equivalent of £417,135 from the latter country. Nothing has been received from France, but there are some 40½ million French francs and 50½ million Belgian francs in the hands of the German Custodian or otherwise blocked, both of which should be recoverable. No credit has been taken for either of these sums in the accounts, but the sum actually received from Belgium is included.

The net profit shown in the accounts, after meeting taxation of £275,883 compared with £54,000 for 1943-44, is £165,103 for the year to March 31, 1945, and £138,833 for previous years. As already announced, dividends totalling 10 per cent are to be paid, which absorb £280,000 net and reduce the carry forward from £235,197 to £199,133. With the paucity of information so far available as to the state and prospects of the Continental undertakings, it is quite impossible to hazard a guess as to the revenue to be expected from them. Owing to the acute coal shortage, there is a reasonable probability that it will for some time be poor, but there are the payments still due which amount to a sum not much short of £500,000 to cover the period before full operation is restored.

The payment of a 10 per cent dividend cannot be read as suggesting that that rate is to be maintained. Indeed it is made clear that only 3½ per cent is paid from current income. The stock of the company stands at 126, which, on the basis of the yield on home gas stocks, would suggest that a dividend around 4½ per cent is expected. The net revenue available for dividends from home investments has averaged 1.3 per cent per annum for the four years of the occupation. This may be expected to increase somewhat, but the main contribution required to realise even a 4½ per cent distribution must come from the Continental investments, concerning which it is hoped that more information will be provided at next week's annual meeting.

Engineers' Jubilee

The Amalgamated Engineering Union, now 25 years old, is celebrating its Jubilee in London this week at an extremely critical period for the future, not only of the union but for the whole engineering industry. The AEU has not achieved its hopes of reaching the million membership mark in 1945, though it now has just under 900,000 members. There has in fact been a slight decline in membership from its peak in 1944, and the union leaders admit that their main problem now is not so much to increase the number of members as to retain those they already have. When numbers of war workers, recruited to

the AEU in wartime, are leaving industry union strength will almost inevitably wane. By contrast, the AEU is financially stronger than it has ever been before. With nearly £7 million in its funds, it is the richest union in the country.

One of the chief problems which the National Committee has been discussing this week is the thorny question of "redundancy," which is bound to increase enormously in the transition period. Workers affected are inclined to regard the term "redundancy" as a Whitehall circumlocution for unemployment, but the union has been pressing that they should be regarded not as unemployed and eligible for unemployment benefit, but as "temporarily displaced" workers and paid the normal week's wages until they can be absorbed elsewhere. The extent of redundancy is not reflected in the Ministry of Labour unemployment figures, nor in the union's own unemployment returns. In order to minimise the effects on unemployment of the change-over, the union is pressing for Government orders to be continued for peacetime production as they were for wartime production, and for a continued control over industry, without which they fear large-scale dislocation and unemployment. The AEU has presented its plan for reconstruction of the engineering industry to the Government, incorporating these points and emphasising the need for improvements in industrial efficiency.

Important discussions on a new wage structure for the engineering industry were held on Thursday, too late for comment this week.

A Contrast in Coalfields

The two latest reports in the series of regional coal surveys conducted by the Ministry of Fuel and Power both deal with Midlands districts. The survey of the Midlands coalfield covers North and South Staffordshire, Warwickshire and Shropshire; that of the North Midlands deals with Nottinghamshire, North and South Derbyshire and Leicestershire. They present a complete contrast.

The report on the Midlands coalfield is extremely discouraging. Output declined from its peak of 20,365,800 tons in 1939 to 16,039,800 in 1944, the chief cause of the decline being the fall in manpower (from 66,479 in 1939 to 60,002 in 1944) and the increased age of the miners. Other reasons listed by the Committee, such as absenteeism, are the familiar ones which apply more or less to every coalfield. On the owners' side, the lack of development and the failure to apply scientific methods of production are blamed, while there has been a general lack of good will and co-operation.

The Committee's positive suggestions for meeting the deficiencies include efforts to reduce voluntary absenteeism and to combat involuntary absenteeism through the prevention of industrial disease and the rehabilitation of incapacitated miners; the centralisation of output and an overall increase of mechanisation. In point of fact, as much as 79 per cent of the district's output was cut mechanically in 1943, but there seem to have been a number of mechanical breakdowns and inefficient maintenance. The utilisation of machinery, as the Committee points out, calls for a higher standard of training, and

the raising of the status of a man working in the coal mines to the more efficient and dignified one of a mechanic. With the Reid Report, the Midlands committee concludes that increased output per manshift and efficiency in production should be the keynote for the future.

The report on the North Midlands coalfield is unfortunately far less detailed, because its committee considered technical questions and methods of working to be outside its terms of reference. It concerned itself entirely with the geological reserves, which are of course enormous. The North Midlands coalfield is extremely rich and productive, and there are a great many unexplored seams, which the committee urges should be investigated and developed without delay. Indeed, since it is clear that the burden of meeting Britain's coal needs will fall more and more on this coalfield, it is essential that it should be developed to the maximum. By contrast with the position in the Midlands and elsewhere in the country, output from the North Midlands has been well maintained; in fact, the peak of production was reached during the war. In 1942, the peak year, 38,094,700 tons were produced with a manpower of 99,266; in 1944, output was slightly less, 35,659,600 tons, and the manpower about the same. In 1938, production was only 32,180,000 tons and manpower 98,692.

COMPANY MEETINGS

GEORGE WIMPEY AND COMPANY, LIMITED

MR G. W. MITCHELL ON WAR ACHIEVEMENTS

The twenty-sixth ordinary general meeting of George Wimpey and Company, Limited, was held, on the 6th instant, in London.

Mr G. W. Mitchell (chairman and managing director) in the course of his speech, said:

The country faced the war unprepared, and with immense tasks of construction to carry out. In these works our contribution up to the end of last year has amounted to over £70,000,000, involving the continued services of some 15,000 workers and hundreds of units of modern contracting plant. We count ourselves fortunate in having been able to make what we feel is a significant contribution in our field to the nation's war effort.

When I addressed you before the war, at the time when steps were first being taken towards national defence, we had commenced the construction for the Office of Works of a new ordnance factory in the North Country, and we had also been entrusted by the Admiralty with the construction of the largest bomb-proof oil store in the country. The ordnance factory was considerably expanded at the outbreak of war, until finally it covered 20 square miles and included its own power stations, concrete water reservoirs, many miles of roads and railways, and piled foundations to buildings. The oil storage reservoir covered eight acres, was 6½ ft. high, and contained 360,000 cubic yards of concrete and 22,400 tons of steel reinforcing rods. Since the completion of the job, early in 1942, we have not returned to carry out even the slightest maintenance or repair, and there has been absolutely no leakage.

AIRFIELDS AND OTHER CONTRACTS

At this early date construction of some six airfields for the Air Ministry had also commenced. The size of airfields during the course of the war has been so increased that nowadays the construction of a modern airfield is an extremely large undertaking. Your company has carried out either the whole or the major section of 91 airfields. The latest, and by far the largest, of these—on which we are now engaged—will, we hope, become one of our main links of Empire after it has served its military purpose.

A contract of some considerable interest was the construction for the Imperial Chemical Industries of a finely conceived plant for the production of oil, involving not only very extensive brick and concrete buildings, but a Goliath crane track, a reservoir, huge pipe duct, roads, railways, and an outfall drain 1½ miles out to sea on a piled foundation in the sand.

Another contract of interest was the conversion of extensive underground workings into stores for the safe keeping of many of this country's historic treasures, as well as underground factories for the manufacturing of certain of this country's vital war-time needs. In addition we erected a miniature township near the same site to house the many workers so employed, complete with a reservoir and sewage plant. Owing to the demands for water supply to large Government factories, we were called upon to construct with the utmost speed an impounding reservoir of 800,000,000-gallon capacity to supplement existing supplies.

VARIETY OF WORKS

It is not possible for me to give you even brief particulars of all our contracts, but you will be interested to notice the immense variety of the works undertaken. They include shipbuilding berths and slipways, harbour works of various types, factories for the construction of

one of Britain's leading 'planes, mills for aluminium and steel works, railway marshalling yards, many miles of water and electricity mains, large numbers of oil tanks and 130 miles of pipeline—some 2½ miles of it submarine—houses for workers, grain silos, munition depots, emergency hospitals, bomb decoy stations, hostels, ordnance factories, balloon barrage depots, storage depots, Army training camps, gun sites, coastal defence works (following Dunkirk), and major repairs to blitzed factories.

Cost-plus work—principally emergency defence works and blitz repairs and reconstruction (which it is impossible to measure)—amounting to less than 6 per cent., the remaining 94 per cent. being taken in competition.

Though many of the contracts were of a value exceeding £1,000,000, you will perhaps get some idea of the progressing, planning, and administrative organisation involved when I mention that the total number of contracts secured since the outbreak of war is 1,562, spread all over England, Scotland and Wales, so that there is hardly a hamlet where our name is not known.

The work I have briefly outlined has involved the use of 1,500,000 tons of cement and the excavation and haulage of 100,000,000 tons of materials.

Then I must also mention our asphalt and tar-macadam department. During the war years they have laid no fewer than 16,500,000 square yards of surfacing, and have kept in the forefront of this particular branch of the contracting industry.

More recently, when all war-time factories were developing full production, there has been, as you know, a severe shortage of coal. In order to supplement normal supplies certain contractors have undertaken the excavation by mechanical means of coal near the surface. We have been engaged in a number of contracts, which are still proceeding.

EQUIPPED FOR POST-WAR

Great as the tasks of war have been to us in our industry, those facing us in peace will be far greater. Our war experience has really been a battle against the shortage of material means and, most important, time. We have been driven to consider every technological device for scientific aid which could improve our efficiency. Backed by this experience, we should be able to play an important part in the physical rebuilding of Britain.

We have established a very completely equipped laboratory, where we do the maturing and testing of concrete, the analysis of materials used in construction, and investigate foundation problems on modern soil-mechanics principles.

DIVIDEND OF 20 PER CENT.

Our building department was highly developed prior to the war, and made a substantial contribution towards the solution of the housing problem over a number of years. This department should in the days ahead make a much greater contribution in a wider field of activity.

At the present time we have a substantial amount of varied work on hand, and we anticipate with confidence that we will be able to play our part in the peace, as we have done in the war.

The profit for the year is £219,000, compared with £227,000 for the previous year. Your directors recommend the payment of a dividend on the Ordinary shares at the rate of 20 per cent. for the eleventh successive year.

The report was unanimously adopted.

EVER-READY COMPANY

ALL SERVICE REQUIREMENTS MET

Mr Magnus Goodfellow (chairman and managing director) presided at the ordinary annual general meeting of this company held, on 4th instant, at Hadley Common, Barnet.

The following is his statement, issued with the report and accounts for the year ended March 31st, 1945:—

The accounts before you show a reduction of net profit of £33,000 compared with the previous year. Stripped of various unimportant items, the profit of the year is the profit permitted under excess profits tax, the fall being due to the reduction of the E.P.T. capital structure owing to the writing off on the plant establishments, etc., account.

During the past five years we have operated fifteen factories in England and since 1942 one in Scotland. Of these factories 12 are established in north and north-east London, in which area some 5,000 people have worked throughout the war. I have unstinted admiration for them for the courage and determination they have shown under conditions of great danger and discomfort.

PROMPTNESS AND QUALITY

In common with most industries our supply to the civilian population has taken second place to the needs of the fighting forces, and I am happy to be able to say that the requirements of all the service departments have been promptly met; indeed, we have on a number of occasions been complimented on our promptness and quality.

We have sustained heavy damage by enemy action, which has from time to time reduced production, but we have throughout the war been fortunate in that we have not had to face damage that put us at any time entirely out of action. The cost value of destroyed stock, etc., has been paid to us under the Government insurance scheme, and we await the payment for the damage to buildings, fixed plant, in the now, we hope, not distant future.

HOME MARKET AND EXPORTS

The unconditional surrender of Germany, and therefore, the termination of hostilities in Europe, will enable us rapidly to increase and improve our supply to the home market, and we also have our eye on the export trade.

As stated in the directors' report, C. H. Dade retired from the board during the year. Mr Dade has served upon the board of your company since its first formation in 1913. J. Lister also retired during the year. Mr Lister entered the service of the company in 1914 and was elected to the board in 1936. I will propose that we send to them our thanks for their services and our good wishes. In conclusion, I cannot speak too highly of the work and conduct of everyone engaged in the Ever Ready industry.

The report and accounts were adopted.

SIMMS MOTOR UNITS, LIMITED

The twenty-fifth ordinary general meeting of Simms Motor Units, Limited, was held, on the 31st ultimo, in London.

Mr Tom Thornycroft (the chairman), in the course of his speech, said: During the past year our activities have continued to expand, the company being very fortunate in having as most of its war product items which are the normal production in peace. There has been a reduction in the profit before taxation, from £149,910 to £122,839, not due to reduction in turnover, which actually went up.

Before the war we were producing electrical mechanism and fuel injection equipment for commercial motor vehicles of the best class. We were also developing the aero magneto. The company has not only produced a very large number of machines but also developed the finest high altitude aero magneto in the world. The report was adopted.

JOHN SUMMERS AND SONS, LIMITED

VAST STEEL OUTPUT

MR RICHARD F. SUMMERS ON WAR PRODUCTION

The annual general meeting of John Summers & Sons, Limited, was held on the 1st instant at Hawarden Bridge, Steelworks, Shotton, Chester, Mr Richard F. Summers, the chairman, presiding.

The following is an extract from the chairman's statement circulated with the report and accounts:

For the last five or six years practically all our energies have been directed towards ensuring that this company should make the greatest possible contribution to the successful prosecution of the war. Nevertheless for the last twelve months or so we, in common with the industry as a whole, have whenever possible been considering our plans for the future, so that we may be in the best possible position to fulfil whatever demands the post-war world may make. So far as I can see there is every reason to suppose that there will be a heavy demand for all classes of steel for many years to come. The unprecedented destruction that has taken place throughout the world in the last five and a half years will certainly result in there being an enormous demand for steel, and in addition, because all our products have had to be diverted to war uses, there will be a tremendous shortage of civilian articles for the manufacture of which we have to provide the raw material.

A GREAT CONTRIBUTION

I should now like to say something about the great contribution our company has made towards the defence of this country and the overthrow of the forces of the aggressors. We have been working at very high pressure for the last six years, producing some 3,350,000 tons of ingots. From this tonnage a vast variety of weapons and equipment has been manufactured, including incendiary bombs, army vehicles, Bailey Bridges, jettison tanks for aircraft, and Anderson and Morrison air raid shelters. Perhaps the most outstanding contribution has been the supply of sheets sufficient to make over 60,000,000 shell and ammunition boxes, over 40,000,000 jerrycans, and 16,000,000 drums for petrol and oil. These and innumerable other articles of a warlike character absorbed almost the whole of the 2,220,000 tons of sheets which we have made.

In Normandy our products were on the beaches and in the harbours, and they also played a very large part in the final assault on Germany and the successful crossing of the Rhine. The directors feel that you are entitled to be proud of this contribution made by your company during the war years.

STEEL TRADE'S PART

Too little credit has I think been given to the steel trade for the part it has played in the war. I know that this is in some measure due to the security black out which has been placed upon us, but the industry has in my opinion always been too modest in informing the general public of what it does and what it achieves. I believe that when the full story of the steel trade's contribution towards winning the war is made known, it will be a clear vindication of private enterprise, and of the policy of improvement and modernisation which was carried out in the national interest in the years just prior to the outbreak of the war.

No doubt you will have read in the Press of the proposed developments of the sheet and tinplate industry in South Wales, and of the possibility of the installation of another continuous strip mill, and I imagine some of you may have wondered what effect this development is likely to have upon our company. I think it is almost universally recognised by the users of steel

sheets and tin plates that the quality of these articles produced on continuous mills is vastly superior to the quality of those made by the old fashioned method. In these circumstances it seems to me essential that the two industries should be in a position to fulfil the requirements of their respective customers by this modern method, and, therefore, your directors look upon the proposed developments as logical and in the best national interests. We are satisfied that through the medium of the British Iron and Steel Federation there is adequate machinery to ensure that these developments shall take place in an orderly manner, and that there is no need to fear that too much modern capacity will be installed, resulting in over-production.

HEAVY DEMAND EXPECTED

With regard to the future, I look forward to a period of heavy demand, but it will undoubtedly be a period in which there will be many difficulties to overcome. For instance, it will be hard for this industry to compete with foreign producers so long as we have to bear the present very high cost of coal and raw materials. Undoubtedly also the far reaching schemes for social improvements and security which are either now in being, or envisaged, will necessitate a high rate of taxation, and a heavy charge on industry. It would also seem probable that we shall have to face an increase in the cost of transport.

I expect some of you will have seen the criticisms which from time to time have been levelled against the British steel industry. Statements have been made that its prices compare unfavourably with those of some other countries, and that the industry has lacked foresight in the past and has been far too reluctant to modernise its equipment. I cannot help feeling that some of our critics cannot be in possession of all the facts, and do not fully appreciate the very substantial natural advantages which are enjoyed by the steel trade in America as against the conditions under which we have to work here. It should be remembered that the British steel industry was founded on the basis of adequate and cheap supplies of coal. Now that the price of that commodity is rather more than double what it was in 1939, it should not be difficult to appreciate the very serious adverse effect which this and the resultant increase in the cost of gas and electrical energy will have on the price of British steel.

IMPORTANCE OF EXPORTS

The industry is well aware of the necessity of producing the right quality of steel at the lowest possible price and by the most modern methods, and it is also fully alive to the fact that it is essential for the future prosperity of this country that we should be able to compete in the export markets of the world. Much modernisation has already taken place—a good deal more, I think, than is generally appreciated—and in nearly every case it would I believe be true to say that the plans for completing the task have been prepared, and can be embarked upon as soon as the war situation will allow and the necessary equipment is made available. I would, however, emphasise that whilst we are engaged upon these developments everything possible must be done to lower the cost of our vital raw materials. I feel convinced that if this country is to regain its pre-war position in the commerce of the world, it is essential that there should be the closest co-operation between producer and consumer, and that the national unity, which has been such a marked feature of the years of war, should be carried forward into the years of peace. The report was adopted.

HOME AND COLONIAL STORES, LIMITED

INCREASED TURNOVER AND PROFIT

SIR GEORGE SCHUSTER ON FOOD DISTRIBUTION

The fiftieth ordinary general meeting of the Home and Colonial Stores, Limited, was held in London on the 8th instant.

The following are extracts from the annual review by the chairman (Sir George Schuster, K.C.S.I., K.C.M.G., C.B.E., M.C., M.P.) circulated with the report:—The profit for the year shows an increase of about £82,000. Apart from savings effected in special war expenditure and increases in sundry revenue, this sum represents additional profits on the retail and overseas sections of the business, against which the earnings of our factories have been less. The turnover of the group, as compared with the previous year, shows an increase of about 4 per cent. but the margin of gross profit was slightly less. Our turnover is still 15 per cent. below the figure for 1938, in spite of higher price levels. This is due, of course, to rationing and restricted supplies. The companies in the group whose shops are run more on specialist lines have suffered most by reason of these war-time conditions, the turnover of some being 30 per cent. below pre-war level. Other companies in our group doing a general business have maintained and even increased their trade. The net profit on the retail side of our business was about £17,000 up.

The Lipton Overseas business, which during 1943 was affected by special trading difficulties in India, has shown improved results, the profits in the aggregate being some £60,000 better than the previous year.

POST-WAR TASKS

We are now at the stage when we must concentrate on our post-war problems. Our first task is obviously to build up our turnover and make good the reduction in trade which has occurred during the war years. In so far as this reduction has been due to restricted supplies and rationing regulations, we shall be independent on the supply position and the extent to which controls by the Ministry of Food are retained. We can, hope, however, in due course to benefit from the restoration of normal travelling facilities, the lifting of the blackout and the release of married women from war work. All these factors can be expected to help our trade by making it easier for the housewife to shop where she pleases and come to our more centrally situated branches. There is much to be done in overtaking the arrears of our branch repairs and maintenance programme. Refitting, too, which has been entirely held up during the war, must be taken in hand as soon as materials and labour are available.

RESETTLEMENT OF SERVICE PERSONNEL

One of the major tasks which will face us almost immediately is the reinstatement of our staff who are at present serving with the Forces. Having regard to the large numbers involved, the problem will not be easy, especially as the volume of business to be done at the outset is, by reason of the restrictions already referred to, likely to be much below the pre-war figure. We hope, however, to overcome such difficulties as may arise and to succeed in getting all our former employees happily at work again in positions worthy of their capabilities.

DIVIDEND POLICY

We have, after careful consideration, decided to maintain our conservative dividend policy and to recommend again a distribution of 3 per cent. on the ordinary

shares. We fully appreciate that such a return on the equity capital of a company of this kind is inadequate, and that the Home and Colonial ordinary shareholders have suffered unduly owing to the fact that the war came just at the moment when our re-organisation plans, started in 1935, were beginning to bear fruit. This involved not only the complete frustration, for the time being, of our policy of high turnover and low profit margins, but also, owing to the way in which E.P.T. has been assessed, subjected our company to a totally unfair tax burden.

GENERAL PROSPECTS

We look forward to the future with confidence and we are preparing an enterprising and progressive policy. In these days there is much talk on the one side of the State taking over business undertakings and on the other of the dangers of "Big Business." We do not, however, feel greatly perturbed by this kind of talk. In fact we feel confident about our position provided that we concentrate on doing our job as well as it can be done, and thus are able to convince the consuming public that we are performing a valuable national service in distributing food of first-class quality as economically as that is possible. Looking at the matter in this way, we consider that one of the most important things at present is that the public should be enabled correctly to appreciate the facts about the business of distribution. We therefore welcome the Government's apparent intention to carry out a regular census of distribution. On the other hand we have been much concerned to see that, in the special Income Tax Bill introduced this year, the Chancellor of the Exchequer has discriminated between the business of distribution, on the one hand, and so called "productive" industry on the other, and has given the former much less favourable treatment in the matter of depreciation allowances. Such discrimination implies a complete failure to appreciate the significance of distribution. It is an essential element in production, and efficiency in it is a factor of the greatest importance in the national economy. Wasteful or costly processes of distribution must tend to raise costs of living and, as a result, both to depress living standards and also to weaken the competitive power of British industry and agriculture. This discrimination against distribution should be corrected. In the meanwhile we believe that full public knowledge as to the facts can only strengthen the position of businesses such as ours.

BRITISH ENKA, LIMITED

The twentieth ordinary general meeting of British Enka, Limited, was held, on the 28th ultimo, in London.

Mr A. D. Carmichael presided and in the course of his statement said:—

The working profit for the year 1944 is £169,963. After making provision for depreciation, deferred repairs, full provision for taxation and other charges, the net profit is £39,853.

Production was slightly increased during the year, but cannot be expanded to the normal rate until more labour, of our pre-war standard, is available. In the past year more than one-third of our production was exported, either in the form of yarn or woven or knitted fabrics, and in the last part of the year more than one-quarter of our production was in high tenacity yarn for tyres, a direct contribution to the war effort.

If it were not for the accumulated debit on profit and loss account modest dividends could be paid from current earnings, but in view of the uncertainties and difficulties which have beset us in the war years it has been unwise to attempt to deal with this problem of disposing of the debit to profit and loss account.

The report and accounts were adopted.

NORWICH UNION LIFE INSURANCE SOCIETY

ANOTHER GOOD YEAR

The hundred and thirty-seventh annual general meeting of this Society was held on the 29th ultimo, at Norwich.

Sir Robert Bignold (the President) said that the Society was again able to record a very good year. They had increased their holding of British Government securities by £2,047,000 and of Dominion Government securities by £380,000. Their net new business at £10,293,699 showed an increase of £822,000. The mortality experience, owing to increased war claims amounting to £286,558, had not been so fortunate as in 1943, but was still below the normal expectation.

Their Head Office had escaped serious injury as by a miracle, and only two of their branches had been destroyed, although others had been damaged. Their assets in France including all buildings in which they were interested, were intact, premiums and interest had been collected almost normally, and claims by death had been remarkably light. In Belgium the picture seemed to be almost as good.

In conclusion, the President said he thought it would be agreed that this old Society had weathered another world-storm with credit to all concerned and that its repute stood as high as ever, which was demonstrated by the fact that during the six troubled years they had put £51,000,000 of new business on the books and the funds had increased by over £11,000,000 and now stood at £59,700,000.

The report was unanimously adopted. The General Manager, Mr W. W. Williamson, F.I.A., in responding to a vote of thanks to the executive and staff, said he hoped it might be possible to make an announcement of the amount of bonuses on 1st January next; they would be in respect of all premiums due and paid since 31st December, 1935.

NORWICH UNION FIRE INSURANCE SOCIETY

GROWTH OF PREMIUM INCOME

At the hundred and forty-seventh annual general meeting of the Norwich Union Fire Insurance Society Limited held on the 28th ultimo at Norwich, Sir Robert Bignold (the chairman) said that in the Fire Department the premium income showed an increase over the preceding year of £103,594, although the amount available for transfer to the profit and loss account of £107,641 was smaller.

He was glad to report another excellent year on the Accident side of their business, the premiums having increased by £118,475, resulting in a most satisfactory underwriting profit of £228,840.

In the Marine Account the income stood at £694,483, and the Fund was left in a strong position after crediting an amount of £75,000 to profit and loss.

The total premium income of the Society now stood at £4,879,776. The full assets of the Society now totalled £9,003,970, an increase of £318,172 over the previous year.

In France, so far as they could ascertain, their assets were intact, and the framework of their Branch operations had been maintained during the German occupation. In the case of Belgium it would appear that the Society's affairs had not been too seriously prejudiced.

In conclusion, the chairman expressed the fullest confidence in the future strength and well being of the Norwich Union Group, linked closely as they were with the Life Society. They were eager to take their full share in rebuilding and maintaining the national industry, but it was essential that the great British Insurance Institutions should not be fettered by irksome control. Private enterprise must be allowed full scope.

The report was unanimously adopted.

CROSSES AND HEATONS, LIMITED

MR JOSEPH R. HEATON'S REVIEW

The twenty-fifth annual ordinary general meeting of Crosses and Heaton's, Limited, Bolton, was held at the Albert Hall, Manchester, on the 31st ultimo.

Mr. Joseph R. Heaton, the chairman and managing director, presided.

The secretary read the notice convening the meeting, the minutes of the last annual ordinary general meeting, and the directors' report.

The chairman, in the course of his address, said: The report of the directors and balance sheet for the year to 31st March, 1945, have been in your hands for some days, and with your permission I will take them as read.

The profit for the year before making provision for depreciation amounts to £167,799, which compares with £170,160 for the previous year. Your directors have set aside £45,000 for depreciation in addition to which £41,305 has been spent upon repairs and renewals and in up-keep of plant, as against £34,224 during the previous year.

Land, Buildings and Machinery, etc., total is increased from last year by £9,488 and is accounted for by additional plant and machinery, and canteens for our work-people.

Investments are reduced by £55,295 and represent the proceeds in connection with the sale of securities held by the Debenture Trustees prior to the Reconstruction Scheme.

Debtors stand at £130,227 as against £192,444, the reduction being mainly due to the receipt during the financial year of estimated excess profits tax repayable.

Stock-in-Trade is £36,391 more at £563,129, and is due to an increase in the value of our raw cotton stocks.

Cash Position.—The credit balance amounts to £243,427 as against £144,421.

Sundry Creditors are £90,067 as against £117,400 for last year.

Profit and Loss Account.—The balance on profit and loss account transferred to the balance sheet is £167,799 and after setting aside £45,000 for depreciation and making the recommended appropriations, there is a balance to carry forward of £171,566 against £136,311 brought in.

OUTPUT OF COTTON YARNS

During the year our output of cotton yarns has been further reduced, the production for the past year having fallen to approximately 45 per cent. of capacity as against the figure of 50 per cent. which I gave on the last occasion I addressed you. This is again due entirely to absenteeism of females through many causes and shortage of juvenile labour. You will realise the seriousness of this matter when I say that the industry in the Bolton area, where the majority of your mills is situated, requires an additional 15,000 workers to operate the 5,000,000 spindles made idle under the "cut and concentration scheme." A further 4,000 are needed to equip the mills at present running, upon a properly staffed basis. I can only repeat what I said in my annual address as chairman of the Bolton Master Cotton Spinners' Association that we must press the Government to fulfil its promise to give the industry every assistance to restore the position to what it was before the Board of Trade enforced the policy of concentration.

The equipment of our mills compares very favourably with any others in the trade, but we are not blind to the fact that our overseas competitors lose no opportunity of acquiring and installing the latest types of machinery. The directors' policy of maintaining the company's mills and

plant in an efficient condition should stand the company in good stead in the near future. Margins, however, do not permit of adequate sums being set aside for replacement of plant at to-day's enhanced values. In this connection, as an interested party, I have quite recently obtained several estimated costs of re-equipping a standard mill with new machinery, and I find that such costs are prohibitive.

POST-WAR PLANS

Your directors have formulated post-war plans to be put into operation as soon as possible after the cessation of hostilities in Europe. We have already opened export offices in Manchester under the title of The Heaton Sales Company, Limited, to conduct our overseas trade as soon as control is taken off our activities.

In conclusion, I desire to express the thanks of the board and myself to the staff and operatives for their help and co-operation during the year, and look forward to an early peace with the return of all our employees at present serving in the national interests.

The report of the directors and statement of accounts for the year were adopted, and the retiring directors and the auditors were re-elected.

ENGLISH ASSOCIATION OF AMERICAN BOND AND SHAREHOLDERS

DIAMOND JUBILEE

EXTRA 3 PER CENT. DIVIDEND AND STAFF BONUS

MR. J. F. A. SWANSTON'S STATEMENT

The annual general meeting of this company was held in London on June 7.

The following is the statement of Mr J. F. A. Swanston, the chairman, circulated to the shareholders:—

The association was incorporated on December 1, 1884, and consequently reached its diamond jubilee year on December 1, 1944. It is interesting to recall that in 1884 the only United States stocks dealt in in Great Britain—apart from their Government issues—were the stocks of railroad companies, in many of which there was a free and active market. The prospectus included, among the directors, two members of the London Stock Exchange Committee, Mr J. H. Hutchinson and Mr S. R. Scott, the latter gentleman described as late chairman of the said committee. The prospectus contained the following statement: "This association is formed for the purpose of representing and protecting the interests of holders of American securities in Great Britain and Ireland by uniting such holders under one organisation."

A majority of the original shareholders were members of the Stock Exchanges of Great Britain, some notable names being among them. The association soon made its influence felt and took an active part in many reorganisations of American railroads. Committees were formed to protect the interests of British security holders, which did invaluable work. As the years progressed, the association developed fresh channels of usefulness and became firmly established in the British Isles. The average dividend distributed over the period of 60 years is 7½%. In the first world war and in the present war the association has been privileged to play a not inconspicuous part in connection with dollar holdings.

To mark this important occasion it is proposed to distribute an extra dividend of 3%, and the shareholders will be asked to approve of a bonus to the executive officers and staff, including those serving with H.M. Forces, of a sum not exceeding £1,000 to be distributed at the discretion of the board.

MOSS' EMPIRES, LIMITED LARGER PROFITS

The forty-sixth ordinary general meeting of Moss' Empires Limited was held, on 6th instant, at the company's London offices.

Mr R. H. Gillespie, the chairman, presided and the following are extracts from the chairman's statement and from the report:—The trading profits for the year have increased from £332,238 to £350,826. Five theatres are still closed owing to enemy action and otherwise. The provision for Imperial taxation for the year amounts to £256,544, an increase of some £29,000 over the last year. In addition the company paid £517,000 in entertainment tax, making a total of over £4,800,000 since the tax came into operation.

Reserve for future taxation has been increased by £50,000 by transfer from reserve account. Investments show an increase from £178,440 to £234,631. Expenses, such as staff and orchestra wages, have very materially increased and Government restrictions have cut revenue from other sources. The directors recommend a final dividend of 5 per cent., making 10 per cent. for the year, less income tax.

Since the termination of the financial year under review, the Board and the company have suffered loss by the death of Mr George Black, who was a man of outstanding ability and will be greatly missed not only by his colleagues but by the whole entertainment industry. His right-hand man for many years, Mr Val Parnell, has been appointed managing director to succeed him. The maximum number of directors has been increased to eleven to permit Mr Prince Little, Mr T. F. Birch and Mr A. Stewart Cruikshank, all directors of the Stoll Theatre Corporation, holding a substantial block of capital, to join the board.

Business has been well maintained during the present year to date but it is impossible to attempt to forecast the future under present conditions.

The report was adopted.

GOVERNMENT RETURNS

For the week ended June 2, 1945, total ordinary revenue was £63,056,000, against ordinary expenditure of £126,499,000 and issues to sinking funds of £40,000. Thus, including sinking fund allocations of £1,326,993, the deficit accrued since April 1st is £453,880,000 against £593,978,000 for the corresponding period a year ago.

Total	567,938	1,032,153	892,380	124,746	128,499

A change has been made in the method of showing an excess of Post Office Expenditure over the Post Office Revenue. Such excess is now included as ordinary expenditure under "Total Supply Services" instead of being shown, as up to July 24, 1943, inclusive, as a deduction from ordinary revenue.

After decreasing Exchequer balances by £3,318 to £2,873,759, the other operations for the week (no longer shown separately) increased the gross National Debt by £63,324,238 to £22,856 million.

On June 1, applications at £99 14s. 11d. for bills to be paid for on Monday, Tuesday, Wednesday, Thursday and Friday of the following week, were accepted as to about 32 per cent. of the amount applied for, and applications at higher prices were accepted in full. Applications at £99 15s. for bills to be paid for on Saturday were accepted in full. £130 millions of Treasury Bills were offered for June 8. For the week ended June 9 the banks will be asked for all Treasury deposits at a maximum amount of £130 millions.

RECORDS and STATISTICS

FINANCE AND BANKING

THE MONEY MARKET.—At the Treasury bill tender official applications were evidently a good deal larger than in recent weeks. Total applications were, indeed, the highest, and the average allotment rate was the lowest, since May 4, when there was a record demand and the average rate dipped below 1 per cent. Thus, the bill market quota dropped from 41 to 32 per cent., equal to slightly less than £42 million of bills. The offering of TDR's was stepped up sharply, from £90 to £130 million, and, allowing for pre-encashments, the call for new money was increased from £12 to £22 million. Payments for TDR's have, indeed, been the principal factor in the short-loan position since the week-end. On the previous Thursday the market required substantial special aid, which was given partly by purchases of very short bills from the market and partly by indirect assistance through the banks. The fact that the authorities had secured some Friday maturities probably accounts for the suggestion, in fact without foundation, that on that day there had been some special operations "in reverse" in order to mop up the credit surplus caused by the passing of month-end and make-up pressure, and by the payment of War Loan interest. This ease led to an active demand from the banks for July bills, but since the week-end the offtake has been small. There were no bill maturities on Monday, and the banks have apparently been paying for TDR's in the first half of the week, whereas maturities were mainly concentrated in the second. Hence, until Thursday, money was only just sufficient to go round.

The Bank return this week reflects the lowest level of market resources: the heavy payments to the authorities on the first three days of the week have produced a fall in bankers' balances by £31 million from the relatively high level of the previous week. The counterpart of this movement is shown in a fall in Government securities—evidently due to repayment of ways and means—and in a further increase in public deposits; there has also been a substantial reduction in "other" securities. The note circulation rose only fractionally.

MONEY RATES, LONDON.—The following rates remained unchanged between May 30th and June 6th:—Bank rate, 2% (changed from 3% October 26, 1939). Discount rates: Bank Bills 60 days, 1½%; 3 months, 1½%; 4

Tired?

Give your digestion
"an evening off"

YOU can't digest a full meal
when you're tired. Don't try to,
or you're heading for gastric
trouble. Instead, drink a cup of
Benger's Food. It will soothe
your stomach and give your
digestion REST and a chance to
build up its strength. Benger's
provides all the warmth and
nourishment you need but in a
form you can absorb without strain.

BENGER'S

— an essential factor
in REST-THERAPY —
the natural treat-
ment for indigestion

Benger's, today, is as easy to make as a cup
of cocoa. From all Chemists and high-class
Grocers — The Original Plain Benger's, Malt
Flavoured or Cocoa and Malt Flavoured.

Benger's Ltd., Holmes Chapel, Cheshire.

BALKAN SOBRANIE CIGARETTES & TOBACCO

THIS ENGLAND...

A memory of blue hills and really green fields? A
snap taken in a suburban garden? The thump of
bat and ball or the cheers that glory in a try? ...
For ourselves, in the sixth year of war, it is a simple
wish. To be alone once more in a deep armchair
with just the tinkle of tea-cups for accompaniment,
a log fire toasting toes, and ready to hand, a
favourite briar to be filled circumspectly with Balkan
Sobranie and smoked slowly and peacefully with
infinite satisfaction. Balkan Sobranie is not for casual
smoking; it is a tobacco for the man who loves his
pipe and is faithful to it, who pays it the compli-
ment of consistently offering it the finest leaf that
hereditary genius can supply

SOBRANIE LTD. LONDON, E.C.1.

PHILCO RADIO & TELEVISION CORPORATION OF GREAT BRITAIN LTD

Philco radio receivers are bringing entertainment to
millions of people in every part of the world. Philco
Radio, in common with other radio manufacturers,
have been devoting all their efforts to war pro-
duction during the past five years. But just as
quickly as conditions permit, the experience gained
in this national service will be reflected in still
better Philco receivers for home, car and television
— and, of course, better radiogramophones.

PHILCO RADIO AND TELEVISION
CORPORATION OF GREAT BRITAIN LTD
Parent of the Philco Group of Companies

all. No community can have a bottleneck of decision and remain efficient—or, for that matter, free—for very long. Sir John Anderson, in the wisest of the political broad-casts, had some effective words to say about the limited absorptive capacity of the state machine.

But Sir John also said that "there are certain activities hitherto wholly or largely in private hands, which may well require a large measure of public control." This is, of course, a monumental understatement. In recent decades, the community has formulated in precise terms the demands that it makes of its economic system and has come to realise that untrammelled private enterprise alone will not provide all that is needed. No community is likely to put up either with the fluctuations in prosperity or with the gross inequalities of individual wealth that are the consequences of a system wholly free from control. Moreover, as these demands have been more and more articulately stated, there have also been great strides in social technology. The state has become both honest and efficient. No one, for example, can contemplate the record of the Ministry of Food in the present war and still believe that the state is wholly incompetent in economic affairs. The new demands made upon the economic system are matched by the new possibilities of meeting them.

A democratic industrial community, aiming to preserve the essential liberty of the citizen and to assure a high and rising standard of material existence, must avail itself to the full of all the potential strength that lies in both principles, that of private enterprise and that of collective organisation. Nor does this mean that the two principles need to be watered down and counter-balanced, until free enterprise is controlled to a standstill and collective organisation is hamstrung by reservations. It is not a bit of each that we want, but a great deal more of both. The politicians and the economists ought by this time to be hard at work discovering ways in which the business man's road can be made smoother and the power of the state, with its resources of finance and compulsion, can be harnessed to the needs of economic policy. The social chemists should be at work exploring the possibilities of different compounds of the two basic elements in the same spirit of honest enquiry that inspires the industrial chemists in their exploration into the possible combinations of hydrogen and carbon.)

These matters are not rehearsed here because there is any novelty in them. On the contrary, if it were not for the daily evidence from the hustings, one would have thought they were familiar commonplaces. But they receive no mention from the politicians, who are still apparently in the dark ages so far as modern economics is concerned. In thirty years time the present hullabaloo about private enterprise and public ownership will seem as irrelevant to a modern society as the quarrels over the Occasional Conformity Bill that filled the politics of Queen Anne's reign while larger matters were afoot. It will be possible to believe that politics and reality have some contact with each other when Labour candidates start praising the business man and Conservatives have a good word to say for deliberate economic policy. Until then the economist is compelled, not of his own choice, to stand aloof.

There will be no necessity, even when that time comes, for the politicians to submit themselves to the discomforts of agreeing. There will be plenty to quarrel about. Indeed, what is here being argued is in no sense that flattest of bromides "all men of good will are really in agreement." For there is a very real and important issue hidden behind these economic quarrels. What is particularly exasperating in the present spectacle is not that it is a sham fight, for if that were all one could smile tolerantly, but that it obscures the real battle for which the lines ought to be forming. Even if every active politician would agree to recognise that, in any foreseeable future, a great deal of free private enterprise and a great deal of conscious public direction will be needed, it would still be necessary to ask by whom economic policy is to be directed and by what methods and to what ends.

It is here that the issue lies. All would agree that the object should be to serve the common interest. But there are two quite different and largely incompatible doctrines about how the common interest is to be served. One school would do it directly, by requiring the managers of economic policy to regard only the interests of the community in the round and to be no respecters of particular persons or groups. They would think of the national income in total, not of any constituents of it, and damage to the interests of particular groups would be recognised as part of the price to be paid—and to be settled generously—for the progress and security of the whole. The other school of thought would see the generality as the confederation of a number of special groupings, and would seek by protecting the livelihood of each of these to serve the common purpose. If the word had not already been misappropriated for a wholly different doctrine, the first might aptly be called Communism. The second doctrine is Particularism or Protectionism, and in these columns it has often been christened the New Feudalism.

Most people, when faced with the choice as a matter of abstract principle, would doubtless prefer the first. But, when it comes to action, very many people follow the second. Both the major parties at the present moment are heavily committed to the New Feudalism. It was the very essence of Conservative economic policy between 1931 and the outbreak of the war and two of the high priests of the cult sit in the Cabinet. And it is a central part of Trade Union doctrine that every group of workers has the right to defend its own standards and interests, and to exploit its own collective bargaining power, if need be against the community. In the debate on cartels in the House of Commons a fortnight ago, Mr Lyttelton made the point very clearly when he explained that restrictive practices

are the natural protection which, on the one side, the employer makes against bankruptcy, and, on the other side, the trade union, or the worker, makes against the incidence of unemployment and when he challenged the Labour Party to say whether it was the mutual object of both parties to protect the consumer at all costs—

Are we doing that, or does there, somewhere at the back of hon. members' minds, enter the idea that it may be necessary to give some measure of protection to the producer and the workpeople whom he employs?

To Mr Lyttelton the answers to his rhetorical questions seemed quite obvious. And so they are, for as much as concerns the trade associations and the trade unions, which dominate the two major parties. But they are not in the least obvious when it is a question of the general interests of the community, for the ideas so innocently expounded by Mr Lyttelton, and used in the defence of virtually every restrictive device known to the ingenuity of man, are the very negation of a policy of the common interest.

This is the real issue of economic policy. If the state is to have a conscious policy, shall its aims be those of the New Feudalism or of the common welfare? The conscience of both the major parties is a little disturbed by the question, as is shown by their anxiety to blacken each other in the matter of cartels and restrictive practices, but their organic interests pull them both together in the other direction. It is a tragedy that the other side of the question is not more powerfully organised. The issue is bound to emerge and when it does it will dominate the whole of British politics. But as the parties are now organised, it is kept below the surface, just as the slavery issue was suppressed for so many years, and with such disastrous results, by the Whig and Democratic parties in the United States. Had Mr Churchill not committed himself beyond recall to the Tory Party, had he kept his hands free, one can imagine him rallying a grand confederacy of Socialists, Liberals and Tory Reformers and leading a mobilisation of the national resources to ensure the national safety in peacetime as well as in war. As it is, he looks like ending his career in a sham fight on the brink of a vacuum.

Lord Wavell's Plan

LORD WAVELL'S offer to Indian political leaders, which is becoming known as the Wavell Plan, has lifted the future of India out of the list of major issues at the British general election. The length of his stay in this country had begun to cause misgiving lest it might mean disagreement between Viceroy and Cabinet. The subsequent relief testified to a general satisfaction that, as a first step, the Wavell Plan fairly reflected popular feeling in the country at large. Although it is probable that the offer would have been slower in coming were Britain not on the eve of a general election and were a caretaker Government not anxious to have the best case to put to the electors, yet it is in general true that the temptations of vote-catching have been resisted and that the Viceroy's action was related at least as closely to the pattern of Indian politics as it was to those of an eve-of-election Britain. Nor are Britain and India the only countries concerned. Indian independence has become a matter of international politics and, from this angle, the offer is doubly welcome as an earnest of Britain's sincerity towards Indian independence and of its readiness, so often under suspicion, to maintain a reputation for liberalism as well as for strength.

Against the Indian background, the Viceroy's invitation comes in answer to a reiterated demand for a new initiative from the British Government. The Viceroy would have been within his rights in insisting that the next move should come from those who rejected the Cripps offer. But he has chosen the more magnanimous course. In brief, he has offered to reorganise his Executive Council to include members representative of all the main communities—Moslems, Hindus, the Scheduled Castes, Sikhs and other special interests. No longer would three Members of the Council have to be British civil servants of long standing. In future, and until a new constitution is fashioned, only the Viceroy, who is to retain his overriding veto, and the Commander-in-Chief as War Member, would remain among an otherwise wholly Indian and representative Government.

A very real indication of the extent to which the Government is willing to hand over control, within the limits of the 1935 Act, is the proposed transfer of the External Affairs portfolio to an Indian Member. In recent months feeling has run high in the Legislature over the Government's handling of the dispute with South Africa over anti-Indian discrimination in Natal and suspicion has attached more to the warmth of the Government's concern for Indian prestige and welfare than to the practical details of its policy. Now an Indian Member responsible to a representative Council—which however will not yet be itself directly responsible to the Legislature—will handle such matters, assisted by fully accredited representatives abroad.

The members of the new Council are to be party politicians. But they are not to be directly nominated by the parties, since the Viceroy is to choose them from lists submitted by political leaders. The only conditions imposed are that there shall be equal representation of Moslems and "caste Hindus" and that all those chosen are to pledge themselves to co-operate in the war against Japan. The offer is to be submitted to a round-table conference of political leaders which has been summoned to meet at Simla on July 25th and, to clear the way for a fresh start, the remaining eight members of the Congress Working Committee have been released. The proposals relate to government at the centre; but it is hoped that one of the by-products will be a resumption of responsible government under the 1935 Act in those provinces where it was suspended by the resignation of Congress Ministries in 1939.

The transitional nature of these changes has been emphasised both by the Viceroy and by Mr Amery. It is only by looking at them in this way that their place in the perspective of Indian political development can be truly appreciated. In sum, the Wavell Plan is an attempt

to get back to the road towards Dominion status from which Indian affairs have digressed since 1939. But the new proposals, like the Cripps offer of 1942, recognise that there can be no simple return to the conditions of 1939. Too much has happened in the intervening years. In particular, the growth of the Pakistan movement has made it impossible to envisage a central government of all India elected by majority vote and if the implementation of Part II of the 1935 Act had not been made impossible by Congress's withdrawal it would have been ruled out by the new attitude of the Moslems.

The Wavell proposals are not, however, a mere repetition of the Cripps plan. For one thing, the external circumstances are quite different. The Cripps offer was made—with over-anxious haste—in 1942, and there is now no suspicion that Britain needs to buy India off with promises to protect herself against the Japanese. Since then, too, the ultramontane exposition of communal differences has led only to bitterness and frustration. Attempt after attempt to find a solution has at last brought both sides closer to realising that concessions must be made if the common aim of independence is ever to be achieved. Thus, while the Cripps proposals tried to tempt Indian leaders over the transitional gap by fixing attention on a post-war constitution in which they did not wholly believe and on which in any case they did not agree, the Wavell Plan now concentrates on the transitional gap, leaving it to the leaders' commonsense to see that it is the only possible stepping-stone towards their final objective, whatever that may be. The Cripps offer looked beyond the 1935 Act to a new constitution, the Wavell Plan makes the last extension of self-rule possible under the Act in the hope that this itself will lead smoothly to the first steps towards a new Act. This is firmly stated in the White Paper and by Mr Amery. The proposals plainly refuse to go further just because to do so would involve decisions giving bias to a new constitution.

Even so tentative a step as this, however, will not easily be taken. The prompt assembly of the Simla conference desired by Lord Wavell is still in doubt. Objections are being raised from both sides. On the success of its deliberations depends the success of the proposals and as an augury for willing co-operation at the conference table the frantic exchange of argumentative telegrams, though not unexpected, is also not particularly encouraging. The objections raised are not easy to understand in this country. The specious explanation that both sides may be out to build prestige by being "difficult" is not entirely adequate.

Mr Gandhi, in particular—though he disclaims official status in Congress Party—is clearly disturbed by the Viceroy's insistence, even in the interim arrangement, on equal representation for Moslems and "caste Hindus." Mr Gandhi has objected that Congress is a political more than a religious organisation and that to fix the parity on a purely religious basis will stiffen the religious division of India and endanger the acknowledged goal of Indian unity. His argument would be more effective if there were any likelihood of Congress nominating Members not under the orders of the Working Committee which, where it is concerned with the issues of the religious communities, is primarily dominated by Hindu interests. The term "caste Hindus," in any case, caused no difficulties when used by the Sapru Reconciliation Committee, and the Viceroy has explained, reasonably enough, that the term intended no offence and referred merely to Hindus other than the Scheduled Castes, who would be separately represented. The general effect of Mr Gandhi's succession of objections—to each of which the Viceroy has courteously replied while maintaining his determination to hold the conference without postponement—is that he is feeling his way by means of minor objections to the Viceroy's procedure. At any moment, however, any one of them might well be inflated to a

major obstacle for reasons which, in Britain, would seem obscure. Both parties would prefer more definite assurances on the use of the Viceroy's veto and on the final transfer of sovereign power, but the pressure to make the best of a firm offer which asks for no final commitment is still considerable. As leader of the minority party, Mr Jinnah must be influenced by the advantages offered him in equal representation, and can hardly hold out for postponement once Congress objections are smoothed over.

There have been, and are, two major questions of Indian policy before the British Government. Expressed with the over-simplification of brevity, they are, first, the method of resolving the communal problem without destroying the unity of India; and, secondly, the choice between waiting for Indian agreement on the outlines of a constitution and trying to hasten that agreement by exerting third-party pressure. The Wavell plan gives a final answer to neither of these questions, but it gives indications of an attitude on both. The answer is more definite on the second issue. Statements for the British Government both in London and in Delhi have strongly reaffirmed that the Cripps offer is still open, insofar as it leaves the Indians free to shape their own institutions, but the responsibility for doing so is very clearly placed on the political leaders, backed by the full consent of their communities. In the present mood at least, there is clearly not going to be a British-suggested, still less a British-imposed, constitution.

On the first question, the resolution of the communal issue, any permanent decision is specifically disavowed. But the proposal that, in the interim government, Moslems and caste Hindus shall be equally represented cannot be wholly deprived of significance. It is a clear invitation to the two largest communities to see whether they cannot conduct the central affairs of India by mutual treaty, on a basis of equality, between themselves; it is an equally clear implication that those affairs cannot be managed by majority vote.

The Liberal Outlook

"War has always been fatal to Liberalism. . . . After every great war there is a period during which belligerent nations incline to divide into two extreme camps—roughly known as revolutionary and reactionary. In that temper Liberalism is at a disadvantage. That is why it is to-day at a discount throughout Europe."

THIS was how Mr Lloyd George explained the progressive decline in the Liberal Party's fortunes when, in 1933, seventeen years after the first rift between himself and Mr Asquith, he wrote his War Memoirs. Will history repeat itself? Will the second world war prove as catastrophic for Liberalism as the first, and will it shatter the remaining nucleus of the once vital Liberal organisation? Or will Lloyd George's judgment be disproved after this war by a recrudescence of Liberalism in Britain? No one could describe the present-day Labour party as revolutionary (in spite of Professor Harold Laski), or the Tory programme expounded, for instance, by Lord Woolton in his broadcast, as reactionary. Yet, by and large, it is likely that the electorate will interpret the coming election as a contest between Toryism and Socialism. What are the chances for a third party in this situation?

The Liberal party is certainly making a bid—if not exactly for power—at least for an increase in its Parliamentary representation, commensurate with the strength of liberal feeling in the country. Posters in one London constituency advertise the great "Liberal Revival." This is hardly good propaganda—it savours too much of artificial respiration or of a Seventh Day Adventist meeting. But it does indicate the aims and aspirations of Liberalism in 1945, and the party is evidently determined to place its policy and its personalities before a wide public, even in constituencies where its chances of success are the most slender. There are now nearly 300 Liberal candidates in the field and the Liberal party, like its more powerful rivals, includes a high proportion of servicemen among its candidates.

Unquestionably, the smooth working of a joint Hindu-Moslem administration presents the greatest hope for a way out of India's difficulties. Underlying every problem of Indian government, even the ticklish problem of balancing political power between the communities, there is to-day the desperate urgency of economic reconstruction. The popular enthusiasm in India for a speedy industrial and agricultural development has been reflected in the increasing attention which the present Executive Council, led by Lord Wavell, has given to economic matters. As plans of development from both private and official sources have been made public and scrutinised, the overriding advantages to be gained from political coherence to match the economic needs of the whole country have been increasingly appreciated. This is where an interim Government may serve a useful purpose, always provided it does not founder on supposed insults or lose contact with the sources of power and opinion whom it is supposed jointly to represent. By working together in a day-to-day harness Moslems and Hindus may, just conceivably, be persuaded to widen the limits of authority that their communities will concede to an all-India government, and to extend the representation of Moslems and other minorities to ensure the political peace on which the whole structure of government would rest.

If any such a result is, in the next few vital years, to come even within the bounds of possibility, its gradual development will demand more than considerable tact from the Viceroy and more luck than can fairly be expected. Unfortunately, the passions and prejudices which have been conjured on all sides during the backsliding years of war will not be easy to dissipate. Certainly there have recently been signs of a greater willingness among the leaders of the communities to find an agreed solution. But extreme policies maintained with such apparently unshakable conviction are not going to be lightly discarded.

The electorate is untried and untested. There is no way of gauging its reactions and its desires, beyond the general assumption that it has moved to the left. The leftward trend will certainly injure the Tories, but it may not automatically benefit Labour, and it is probable that the Radical elements of Liberal policy, typified by Sir William Beveridge's campaigning phrase "A Liberal Party with a Radical programme" will attract the young voters who have not formed any party attachments. This is certainly the hope of the Liberal leaders. Lord Samuel, writing in last month's *Liberal Magazine*, said:

An increasing number of people . . . are coming forward to promote a Liberal revival. . . . The need exists not only for a Conservative party and for a progressive party of Socialists, but also for a progressive party of non-Socialists—that is to say the Liberals.

The present moment undoubtedly offers an opportunity for the Liberals to recapture lost ground. Their independence from dogmas and discipline, and the sporting instinct to give a fair chance to a group which has not been associated with the mismanagement of the interwar years, should carry weight with many electors.

On the other hand, it is equally likely that the prolonged Liberal impotence may detract from their chances, since it is obvious that they cannot at present hope to do more than hold the balance between the two major parties. The experience of two minority Labour Governments, in 1924 and 1929, which had to depend on Liberal support for their proposals, was not particularly happy. Moreover, the record of British Liberalism between the wars is hardly calculated to inspire confidence in the party's present strength. The Liberals never really recovered from the successive shocks of the Asquith-Lloyd George split in 1916 and the crushing defeat of the Asquithians, through Lloyd George's agency, in the 1918 election. Though the reunion of the two groups on the issue of Free Trade versus Protection in 1923 resulted in the return of 150 Liberal MPs,

recovery was short-lived, and 116 of these seats were lost in the next year. Even in 1929, when the party's popular vote reached its post-war peak, only 59 seats were won. The cleavage over the MacDonald Government in 1931, between the Samuel Liberals and the larger group of Simonites (Liberal Nationals) and the Lloyd George family group dealt another shattering blow to the party, and in the 1935 election, the anti-Government Liberals, including the Lloyd George group, secured only 21 seats in the new Parliament, against the Liberal Nationals' 33. The strength of the two groups at the dissolution was 18 for the Sinclair Liberals and 26 for the Liberal Nationals.

This historical digression is not intended in any way to prejudice the prospects for a Liberal recovery at the coming election, but merely to illustrate the progressive decline of a party which until the last war had been such a dynamic force in British politics, and to show the extent of leeway which it will now have to make up. The latest developments—the defection of Major Lloyd George and the impression, right or wrong, that Sir Archibald Sinclair would privately have preferred to remain with Mr Churchill—have not helped the unity of the party. It is, however, only fair to point out that Liberal M.P.s have more than made up in capacity what they lacked in numbers. And it is also true that after the loss of members, both to the right and the left, in what might be termed an involuntary purge, the party should emerge in a healthier condition. The slimming process cannot continue indefinitely. The Liberals should now begin to put on weight again.

★

It seems reasonable to assume, in view of all the factors involved, that the Liberal vote will not only be maintained, but substantially increased at this election. This however—unfortunately for the Liberals—does not necessarily mean an equivalent increase in their representation. There have always been plenty of Liberal voters in the country, even when the party's fortunes were at their lowest ebb. Their lowest poll since 1918 was that of 1935, when as many as 1,377,962 Liberal votes were cast. Mr. R. G. W. Mackay calculates in his book "Coupon or Free?" that if Parliamentary seats had been distributed in proportion to votes cast, the Liberals would have secured 38 in 1935 instead of 21, and the Conservatives and their supporting parties 308 instead of 405. In 1929, the Liberals had 59 seats on a poll of 5,300,000 votes—a poll a million larger than that on which Labour won more than three times as many seats in 1923. It is small wonder that the Liberals place electoral reform high in their programme.

The electoral system, however, will not be changed, because both the major parties (not unnaturally since it benefits them) are wedded to it. For the present election, all that can be done is to estimate the prospects for the Liberals on the basis of previous elections. Although the Liberals won only 21 seats in 1935, they came near to winning a number more. In 60 constituencies it was the Liberal, not Labour, who was the runner-up to the successful Tory, and a swing to the left might be thought likely, on this evidence, to give the Liberals a chance of winning these seats. But it would have to be a substantial swing to produce much result, for in only 17 of the 60 was the Conservative majority less than 5,000. The areas where the Liberals did best last time were principally in the English Counties, such as Yorkshire, Somerset, Dorset, Devon and Cornwall, and in the Scottish and Welsh counties, where there is a strong Liberal tradition. With the exception of Mr Lloyd George at Caernarvon and Mr Dingle Foot at Dundee, no Welsh or Scottish boroughs returned a Liberal or even had a Liberal runner-up. The same applies to the majority of English boroughs, where for the most part the Liberals lost a great deal of the ground that they had held in 1929. Out of 160 seats in the cities and big towns of the country, the Liberals secured only four victories. In all, the Liberal party (excluding the Lloyd George group, which exactly held its ground) gained three seats and lost fourteen, four to the Tories, nine to Labour, and one to National Labour.

The moral of 1935 is fairly plain. The best tactics the Liberals could adopt would be to concentrate their forces

on the winnable seats, that is those which they held in 1929 or where they were runners-up in 1935. So far as can be judged, however, this does not seem to be the party's policy. A glance at the provisional list of Liberal candidates suggests that they are contesting many seats where they have never fared well and where their chances of success cannot be placed high, such as the London boroughs, Birmingham, and the urban and semi-urban districts of Middlesex, Essex, Kent, Surrey and Hertfordshire. Every such candidature will increase the total Liberal poll. But it is not likely to add to the total of Liberal seats.

The effect of Liberal intervention in what would otherwise be a straight fight between Conservative and Labour is not always easy to determine. The obvious and popular view is that, since the Liberals are a "progressive" party, any votes given to a Liberal candidate are taken away from Labour. In and around London, this may well be true, and in these areas a Liberal candidate may have the same effect on the result of the poll as a Common Wealth candidate. Much depends, of course, on the personality of the rival candidates, but where, in the Home Counties, there is a good Labour candidate, possibly from the services, the intervention of an equally attractive Liberal service candidate is much more likely to split the anti-Tory vote.

But it is very doubtful whether this is true in the country at large. In the provinces, the rank and file of the Liberal voters are probably still closer to the Conservatives than to Labour—owing, in large part, to the hostilities aroused in municipal politics. It is noteworthy that, of the seats won by the Liberals in 1929 but since lost, 20 have gone to the Tories but only 3 to Labour. It is the view held by many Labour organisers that, in a year when the country is swinging to the Left, Liberal intervention helps Labour, since it attracts out of the Tory ranks many people who would never vote Labour. This may be such a year.

★

The impression that the Liberals lean more to Left than to Right is supported by their policy, which has been embodied in a twenty-point manifesto. This document unquestionably has more in common with the Labour Party than with Conservatism. All three parties, of course, declare the same general objectives in regard to full employment, housing, social security, agriculture, education and foreign policy. But the Liberal programme appears to travel a good way further down the radical path than many of the traditional Whigs in the party would probably approve. It states that:

Where public ownership is more economic [than private enterprise], Liberals will demand it without hesitation. Where there is no further expansion or useful competition in an industry or where an industry or group of industries has become a private monopoly, Liberals say it should become a public utility.

This criterion is applied to the mining industry—which it is proposed should become a public service and "not be treated merely as a private profit-making concern"—to the railways and the railway-controlled road transport undertakings and to electric power. The land policy is radical, too. Development rights outside built-up areas would be acquired for the public, and the State would be empowered to take over badly managed or badly farmed land.

These are near-Socialist proposals, which may shock old-fashioned Liberals. Indeed, the criticism may be made that, in its policy, the Liberal Party does not sufficiently distinguish itself from Labour; free trade is hardly enough by itself. There could be a neo-Liberal policy, designed to apply to the problems of the twentieth century the new social techniques which have been built up in recent decades for combining liberty and efficiency. Sir William Beveridge has given glimpses of this new approach to political problems, but the Liberal party as a whole does not seem to have seen the vision. It still seems to prefer sense and moderation as ends in themselves, to be attained by taking the edge off most of the issues of the day.

But how many voters in this unpredictable election will vote in a moderate and sensible way, and how many of

those who are intellectually attracted by liberalism will in fact vote Liberal, and whether enough of them are collected together in any one place to win the seat for the Liberal party are open questions. The past history of the party will not altogether be forgotten, and it is hard to remove the feeling that, with the present electoral system, a vote for the smallest party is a vote thrown away. If Labour does well, so will they, not because of any positive

attraction, and still less because of any active co-operation but because both will benefit, in different places, from any tendency to ignore the Churchill magic and vote against the Tories. But, by contrast, if this is a Churchill year, the Liberals can be expected to do even worse than Labour, since they suffer, after so many years of misfortune, from the lack of a hard core of faithful adherents.

Western Association—III

Prosperity Through Trade

THE major argument upon which this series of articles is based, it may be recalled, is that a closer association for mutual profit of the Western European nations is not so much a policy to be proclaimed or denounced as a practical necessity imposed by the facts of international life in the middle of the twentieth century. The need is not for supporting arguments on the wide canvas of high politics and diplomacy but for practical work to be done on the logistics of problems that are inescapably common to all the peoples living on the Atlantic edge of the Continent of Europe.

Nowhere is the truth of this approach more apparent than in the sphere of economic policy. So long as international economic policy remains on the plane of generalised expressions of good will, coupled, in practice, with beggar-my-neighbour protectionism, there is no particular reason why Britain and France, the Low Countries and Scandinavia should need to put their relations on a basis different from those of the rest of the world. But once the transition is made to a more positive economic policy, with defined aims and a public assumption of responsibility for attaining them, the coherence of this Western European group immediately becomes apparent. Within the last decade, the process of defining the aims of economic policy has been carried out in all of the Western European countries, with the same results. The aims were long ago defined by the economists, but they have now been given popular titles—Social Security, Full Employment and Rising Standards of Living. Social Security, it is true, is largely an internal matter; it is for each state separately to decide what minimum share of the national dividend shall be guaranteed to every citizen—though naturally the force of example plays some part in determining the answer that each country gives. But the other two problems—Full Employment and Rising Standards, the prevention of catastrophic fluctuations in the national income, and the most rapid possible increase in its total dimensions—are neither of them matters that can be dealt with in abstraction from the international position of the country. Some countries, in fact, can hardly begin to lay their plans under either head until they know what is to happen to their international trade.

The suggestion that the countries of Western Europe should work out the basic essentials of a co-operative approach to these two economic problems does not, however, arise simply from any vague general belief that co-operation is a good thing, or from the geographical accident that they are each other's closest neighbours. The

argument, as this article will attempt to show, is much more closely knit than that.

In the first place, these countries all approach the problem in the same way—and they are almost the only countries in the world that do. All of them are fundamentally individualist societies. To say this is not to deny that they all have large Socialist parties which may well attain to power and carry through substantial modifications of the economic structure. But none of them is in the least likely to abolish private property, or to nationalise anything like the whole of economic activity or to run even nationalised industries on other than business principles—or an imitation of them. Above all, none of these countries is likely to deprive the citizen of the right to dispose of his own labour or to decide for himself how much of his income he shall save and how much he shall spend and what he shall spend it on. This being so, there can be no simple and automatic solutions of economic problems, such as can be achieved in autocracies by the issue of an edict. Full Employment can be attained and Rising Standards of Living secured only by delicate mechanisms designed to influence free decisions and to create an economic climate within which free, or at least, undictated, enterprise can work to the common goal.

There are few other countries that find themselves in exactly the same economic position. A totalitarian state differs because it does not permit any economic freedom, but solves the problem of Full Employment by directing labour and that of Rising Productivity by imposing forced saving to finance the growth of capital. The United States is in a different position because, while it recognises the problem, it refuses to entrust the solution of it to the organs of the state. And another large group excludes itself because its members are still in a less complex stage of development and base their economic life on primary production, which has a different order of problems of its own. When these exclusions are listed, not much more than the British Dominions and Western Europe is left. Even if these countries were not close geographical neighbours (as, indeed, if the Dominions are included, they are not) they would inevitably be thrown together by their common approach to the problem. They, and they almost alone, are concerned with both halves of the economic problem—to attain the objects by deliberate policy and to attain them by democratic means.

Secondly, these countries are all dependent, to a high degree, on foreign trade. The dependence of the United Kingdom is considerably less than it used to be; but it is

still large. In 1937, for example, imports amounted to nearly a quarter of the national income (Professor Bowley's estimate) and exports to not much less, when invisible items are included. French national income figures are notoriously unreliable, but such as they are, they show foreign trade making up approximately the same proportion of the total. For the smaller countries of the group, the degree of dependence is much higher. For Norway in 1937, for example, imports amounted to over 40 per cent of the total; visible exports, omitting the large item of shipping earnings, were over 25 per cent. For Belgium, Holland and Denmark, the latest available figures show imports ranging from 33 to nearly 60 per cent of national income, with the export ratios (since they omit invisible items) running somewhat lower.

It is a commonplace of economic doctrine throughout the Western world that the way to ensure an adequate and stable level of employment is to stabilise, at a high level, the flow of income. No country can pretend that it has a full employment policy unless it can see its way to bring about a stabilisation of each of the main varieties of income. Small fluctuations can be offset by artificially induced and opposite fluctuations in the expenditure of the state—that is, in incomes generated by public expenditure. But public works cannot be expected to be so variable that they can offset major disturbances in other income flows. In the case of the six Western European countries, overseas trade generates anything from one-quarter to one-half of the whole national income. It follows that there cannot, in any of these countries, be an effective full employment policy without provision for the stabilisation of foreign trade. It is strange how much this obvious fact is ignored, or given only empty formal recognition, in most of the current discussion. It is not enough in this context to work for the expansion or development of international trade, valuable though that is, without its also being stabilised. Other countries may possibly ignore this aspect of the matter. The proportion that foreign trade bears to national income in the United States, for example, is small, and in Soviet Russia still smaller. Even in pre-war Germany, after all the artificial stimulation of foreign trade by the Nazis, it amounted to only some 8 per cent of national income. These countries can, at a pinch, offset by public works any probable degree of fluctuation in their foreign trade. They can ignore the problem, or even use it as an instrument for allaying their internal disturbances. The countries of Western Europe cannot so easily escape. If they are to have full employment, they must take steps to stabilise their foreign trade.

Thirdly, not only are these countries dependent on foreign trade, they are also dependent to a high degree on trade with each other. This is demonstrated by the two tables on p. 842, relating to imports and exports. Each of these tables is given in three columns, owing to uncertainty

about the geographical extent of any commercial arrangements that the Western European countries could arrive at among themselves. The first column shows the minimum extent—the six metropolitan territories in Europe and their non-self-governing colonial dependencies. But if such arrangements could be made in a way that did not stir up conflicts with the rest of the world, it is likely that some at least of the British Dominions would wish to be included. And, thirdly, it is possible that Germany, or at least Western Germany, would also be associated, voluntarily or involuntarily, with the policy. It would be a mistake to drive these figures too far. But the message they tell is perfectly clear. A Western European trade grouping would cover from half to two-thirds of the external trade of the six countries. And since that external trade itself is responsible for a quarter to a half of their national incomes, it will be seen that a stabilisation of Western European trade would be a most powerful contribution to Full Employment policies in these countries. A general stabilisation of all international trade would, of course, be still better; but it is hardly a practical policy, partly because of the inherent instability of trade in primary products, partly because of the unwillingness of some other countries, notably of the United States, to give their governments stabilising powers. But in the absence of the universal ideal, a policy of stabilisation within the Western European group is the indispensable minimum, without which they cannot hope to pursue effective economic policies at home.

The next article will be concerned with the means by which this could be brought about. But one remark should, to prevent misunderstanding, be made at once. There is no prospect whatever of a self-sufficient economic union in Western Europe. Political principle and physical circumstances are alike opposed to it. If the mutual trade of these six countries is half their total trade, the second half is as important as the first and must not be prejudiced. To stabilise one half merely by thrusting all the instability on to the other half would serve no useful purpose. What is here in question is not a penalisation of trade with third parties in order to create an artificial prosperity within the ring, but a suggestion that these countries should stabilise what can be stabilised, without prejudice to the rest—in short, what Ottawa should have been, not what Ottawa was. If such a commercial pact is not in fact directed against the rest of the world, it must not look as if it is directed against the rest of the world. It does not follow that every last detail must be formally agreed with each of the three-score nations of the earth. But the methods by which the aims are to be attained must be such as do not outrage other trading nations. And the association must be open to the adherence of all who are willing not merely to share its benefits but also to bear its burdens. These conditions make the problem more difficult, but they do not make it wholly impossible, as the next article will attempt to show.

NOTES OF THE WEEK

Trials and Talks at Moscow

Until more evidence of the Polish trials in Moscow is available, it is impossible to comment on the justice of the sentences of imprisonment which have been passed on some of the accused men. It seems certain that some sort of anti-Russian organisation existed in Poland and that some of these Poles were connected with it. The organisation received instructions from the London Government and although General Okulicki strenuously denied that he had even ordered terrorism, local groups probably got out of hand and acts of sabotage and murder occurred.

But who is chiefly to blame for this? The Russians have throughout the long agony of Polish resistance and liberation persistently done everything calculated to encourage Polish extremism, to undermine the position of such moderate statesmen as Mr Mikolajczyk and to alienate the sympathies of the great Polish political parties. General Okulicki in his spirited defence admitted his distrust of Russia. A man would need to be a very blind or very partisan Pole not to share that distrust, for the Russian occupation has brought with it everything the opponents of Russia feared—the puppet government, the single-party dictatorship, the OGPU, mass arrests and political trials, complete with confessions.

Do the Russians think that these trials, which hang like a sword of Damocles over the heads of the non-Lublin Poles gathered to form a new Polish Government, are the best way to secure the confidence and friendship they insistently claim?

New Angle on Syria

The debate on the Levant in the French Consultative Assembly has done nothing to resolve the Anglo-French diplomatic deadlock. It revealed General de Gaulle to be as intransigent as ever in his determination not to sit round a table with his British and American critics. There is, in his counter-proposal that the matter shall be referred to the new World Organisation, a measure of his remoteness from world opinion. The posse of criticism which he is there likely to meet from small states will surely be even more distasteful to him than the strictures of the great Powers.

But the debate had one important new feature. For the first time, it revealed to the French public that the alleged "handiwork of British agents" is not alone enough to explain France's intense unpopularity in the Levant States, and the bodily danger in which her citizens now pursue their business in Syria. For the first time since before the war, Frenchmen heard from the lips of Frenchmen that French policy over the last twenty-five years accounts for much of the trouble. M. Pierre Cot—a pre-war Radical minister—won more applause than any other speaker for a speech in which he blamed the Government for trying to win by force of arms a position that must—in the modern world—be won by confidence. Madame Braun, the secretary of *Front National*, put her finger on a major French weakness: the maintenance of Vichy officials in high posts in Syria. "The British should not be able to reproach us for using Vichy generals," she said. She might have added that Syrians cannot be expected to respect Generals like Oliva-Roget (known as Colonel Olive in the Vichy regime), whom they have watched changing their names and coats.

What can be done to end the miserable deadlock. The French Assembly went as far as it could to bring General de Gaulle into a more accommodating temper when it finished the debate by noting Mr Churchill's declaration on June 13th—that Britain has no intention of supplanting France in the Levant—and demanding that

all proposals which may be put forward by the British Government in connection with their statement on June 13th be considered in the same spirit and that the Government should increase their efforts toward drawing up a Franco-British treaty which, with the Franco-Soviet treaty would be one of the European foundations for the building of world peace.

It is now therefore up to the British Government to make proposals for a settlement in the Levant and, if possible, to link them with the outline of a wider settlement.

There is still a warm and solid desire for friendship in France which must be encouraged in every possible way. Perhaps President Truman would be the intermediary least hurtful to French prestige. But whatever the method of ending the deadlock, speed is essential. Good will is a wasting asset. It is not certain how long the Assembly will maintain unaided the moderation of its approach.

Mountains and Molehills

Astonishing capital is being made out of Mr Harold Laski's ill-considered and ill-timed statement that Mr Attlee should attend the Big Three meeting only as an observer, because the Labour Party could not be committed to decisions which it had had no opportunity to discuss. This, together with the incident at Newark, where he is alleged to have said that Labour would if necessary use violence to attain its objects, is being worked up into a real Red scare—it is rapidly becoming a second Zinoviev letter or a second J. R. Campbell case. What proportions the incident will have reached by the eve of the poll defies the imagination. But since its real content is very small, it may well recoil on to the heads of those who are trying to make it into a major issue.

There is no doubt that Mr Laski has blundered. Not only has he provided excellent copy for his opponents, but he has placed Mr Attlee in an embarrassing position. That, however, is a long way from creating the "major split" in the Socialist ranks which the *Daily Telegraph* and the *Daily Express* have reported with such avidity. There is no split over this issue. Mr Laski, whose authority in the party is purely transient (a new chairman is elected every year), has spoken out of turn, and he has admitted that his was a personal statement. Mr Attlee has accepted the Prime Minister's invitation to attend the Big Three meeting as "friend and counsellor," and that ought to be an end of this particular incident.

It does, however, raise certain questions of principle—not necessarily germane to the present election, but too important to be ignored. It reveals the long nurtured suspicion (originating from the MacDonald days) among the Labour rank and file of allowing their leaders too free a hand. But sensible people would surely realise that it would be an intolerable position if the leader of a party, associated with highly difficult and delicate international negotiations, had to convene a special party conference before he took a decision. Democratic government does not mean that the people must assume direct responsibility, but that they must delegate responsibility for carrying out an agreed policy to their elected representatives—which is a very different matter. Surely Mr Laski, after all his lectures and books on this subject, would not deny this?

National or Tory?

Lord Beaverbrook, in one of his recent election speeches, announced that he personally was only too willing to drop the word National, and refer to the Tory Government and the Tory Party. That would certainly have the merit of honesty. There are far too many men in the Conservative Party who seek to make the words National and Tory synonymous, and to claim the Red, White and Blue as their exclusive symbol.

Another piece of political honesty is the action of the National Labour Party, which has declared its decision to drop the suffix Labour from its title. It will be interesting to see whether the Liberal Nationals follow suit and run on a straight National ticket. The Liberal Nationals, it is true, have rather more claim to an independent existence than the National Labour Party. They had 26 seats at the time of the dissolution, compared with the latter's five. In 1931, when both the parties were formed, the Liberal Nationals had 38 seats and the National Labour 13. But the followers of Mr Ernest Brown (late Simonites) have long since lost their right to represent the Liberal point of view, and they have no visible distinguishing marks which differentiate them from the Conservatives.

None the less, the Liberal Nationals are putting forward

52 candidates, and in no divisions are they being opposed by a Conservative—with the possible exception of South Molton, in Devon, where the local Tories are anxious to run their own nominee. Apart from a doubtful electioneering advantage, it is difficult to see what the Liberal Nationals gain by continuing to call themselves Liberals—since they can only be returned on the strength of their Conservative support. Their election manifesto, issued over the week-end, dots the i's and crosses the t's of Mr Churchill's own policy declaration. It has six points more than Mr Churchill's, however, and places even more emphasis on individual rights and liberties, and "the freeing of enterprise and the liberation of industry from the shackles of bureaucratic control." In these days, phrases like this have a more Conservative than Liberal ring.

Labour and Industrial Efficiency

The Labour Party, it appears, is at last beginning to realise that whatever Government is returned to office will have to devote its energies to raising the level of technical efficiency in industry, if Britain is not to sink to the level of a second-rate industrial power. Hitherto, it has been largely left to the Tory Reform Committee and to individual MPs to call public attention to the pressing need for increasing the productivity of labour in industry. But this week Sir Stafford Cripps, who has, after all, had ample experience of these problems in aircraft production, dealt at some length with efficiency, and particularly managerial efficiency, in his broadcast speech. And Mr Morgan Phillips, the Labour Party's Secretary, at a week-end meeting, compared the high productive efficiency of the United States mining, cotton and building industries with the sorry record of the same industries in Britain, and indicated that a Labour Government would seek to modernise and reorganise industrial processes wherever they fell below an efficiency level. He said:—

We cannot tackle this problem with nineteenth century minds and nineteenth century techniques. . . . We must modernise or perish.

This attitude is indeed welcome. But in this question of efficiency, it is the industrial rather than the political section of the Labour movement which counts, and the election manifesto issued by the Trades Union Congress does not exactly inspire the same confidence. There is only a cursory reference to industrial efficiency (it is stated that nationalisation of the mines, iron and steel and internal transport would "promote their efficient development"), and it is abundantly clear that trade union pressure would be for higher wages—irrespective of output—and shorter working hours, without reduction of wages. The 40-hour week may be good electioneering, for the idea of more leisure for the same earnings after the long years of war strain will be attractive to workers everywhere. But it is open deceitfulness if it distracts attention from the fact that the first aim of workers and their trade unions in the immediate post-war period must, in their own interests, be to maximise output.

There is no indication in the manifesto of how far the trade unions would actively co-operate in maximising production under a Labour Government by agreeing to remove restrictive practices, such as the insistence on demarcation lines and other defensive customs which have hindered high output in the past. Many trade union leaders have, it is true, given assurances that these barriers would be removed in the interests of full employment, but it is not so certain whether the rank and file in the workshops, shipyards, building sites and pits would follow suit in practice. They should, however, be told that unless they do, the efforts of a Labour Government to secure full employment might well be discredited.

Housing Subsidies

Mr Willink's announcement last week, in Parliament's eleventh hour, of a small part of Government policy for subsidising housing was doubtless intended as a promise of better things to come. He promised legislation—if his party were still in power—to provide grants for small private houses built for sale or renting. The grants would be made by local authorities, but the Exchequer would bear the whole cost up to £100 and half of any further cost up to a maximum of £150. Strict conditions of size, construction, rent, and price would be required for the subsidy, which would not be available for houses with an inclusive cost of more than £1,200. The grant is to be paid, either in a lump sum or in five annual instalments, to the owner-occupier or pur-

chaser. This will prevent it from merely swelling the builder's profit, but houses will command a scarcity price for some time to come and the Minister did not make it clear how the first purchaser will be prevented from reselling the house at a profit.

This subsidy is to apply only to private enterprise building. The subsidy to local authorities is still to be determined. This apparent priority for private enterprise naturally attracted the criticism that it was being done for party advantage, and there may have been an element of that in it. But in the main it is right and proper. Local authorities are not likely to be unduly hampered in their plans for lack of the final figure of the subsidy, since the principle has been agreed, while private enterprise building might be held up if there were any uncertainty. For the same reason, the grant is to be made retrospective to June 7th.

One improvement of this new subsidy over the old is that it is not to be given at a wholly flat rate, but that the larger house is to get a higher subsidy. It is to be hoped that some way will be found of restricting these larger houses to the use of larger families, though that is inevitably difficult in the case of privately owned houses. Nor is it clear from the Minister's announcement whether the inducements to build houses of the less profitable but socially more desirable types—particularly houses for letting—will be sufficient. There are clearly many gaps to be filled in. And the biggest unresolved question of all is whether building costs will ever come down to a reasonable level, or whether the wartime reform of guaranteed wages in the building trades, admirable though it is on humanitarian grounds, is to have the permanent result—as it has certainly had the temporary result—of substantially lowering output per head and raising costs to a level that the public cannot afford to pay.

King Leopold and the Belgians

The spectacle of a king seeking to return to his throne in the teeth of opposition is always baffling to those who do not envy kings. King Leopold of Belgium has now

War and Post-war Banking

While the war lasts, the resources of Barclays Bank will be devoted to the fullest possible extent to helping the war effort of the nation.

When the war is ended, the Bank will add its full weight to the forces of restoration. To ease the transition from war-time to peace-time conditions, customers will find the same progressive outlook, the same courtesy and sympathetic understanding of their banking needs and the same high quality of service which have kept the name of Barclays Bank in the forefront of British banking for generations.

The small business man and manufacturer will have the active co-operation of the Bank in solving his financial problems, no less than the large merchant and industrialist.

BARCLAYS BANK
LIMITED

Head Office:

54, LOMBARD STREET, LONDON, E.C.3.

announced that he will not abdicate despite the news that three out of the four major Belgian political parties have lined up against him. The Liberal Party Executive joined the Socialist and Communist opposition by a surprising majority of 88 votes to nil, with three abstentions.

King Leopold has been a psychological puzzle since 1940. He is now creating a situation which no responsible man should create, but in his justification it must be said that the entire volume of the feeling against him is not of his making. Some of it is due to the ill-advised campaign which—long before VE-Day—his supporters opened on his behalf. But the last six weeks of pause and consultation with advisers—some nationally respected, others nationally despised—have given time for the development of numberless reasons why King Leopold personally will not suit the nation. The cleavage of opinion goes deeper than that between Flemings—for him—and Walloons—against him—or than that between Catholics and the rest. It is complicated by the views of those who condemn his collaborationist father-in-law, who mistrust his choice of the entourage that, in 1940, advised surrender, and who dislike the political leanings of his influential mother, Queen Elisabeth. It is further aggravated by an accumulation of small human reasons why his people do not want him on their throne. Returned prisoners, in particular, feel that they have nothing in common with a self-styled "prisoner" who felt able to marry while in "prison"; many members of the armed forces do not want to salute as Commander-in-Chief a man who seems to have ignored their experiences; former resisters feel out of step with a man who, of choice, sent his daughter to school in Italy. Such grievances alienate even the stolid countryman who does not hold with politics and does not like upsetting routine.

The outcome hangs upon whether the King can form a Cabinet of his supporters. Some of these are men of standing and high repute. They include, for instance, M. Jean Harinckx, Governor of Brabant. Meantime, M. van Acker, who has handled the crisis with tact and wisdom, keeps the wheels of government turning, keeps in touch with the King's representatives and keeps in check the many workers' organisations that are seething on the verge of a general strike. British sympathies go out to Belgians in the situation that confronts them. It is not many years since Britain faced an abdication crisis of its own.

Franco Swims with the Tide

General Franco is an adept at staying on the top of his little world. If it were centrally placed in Europe, his political acrobatics would before now have tumbled him down. As it is, he lives out on a limb, and is able with impunity to extol his Falange to the Germans as "the political expression of Spain's rebirth" (only six weeks ago he mourned for Hitler in its uniform) and to write it off to a British enquirer as "of no political importance."

During the latter interview, given last week, he also announced forthcoming elections in Spain, the total abolition of press censorship and the appointment of a Council of State to choose a prince as the country's future ruler, whose "fitness to mount the throne" could not be in doubt. These steps, he said, would bring Spain back to a "normal state of government." In accordance with his usual practice, this interview was not reproduced in the Spanish home press pending the receipt of favourable reactions from abroad.

When assessing the scope of the proposed reforms, it should be remembered that Falangists continue to hold many key offices. In particular, they reign at the three important Ministries of Labour, Industry and Commerce, and Agriculture. They also rule in the provinces, where the civil governorship goes, automatically, to the local Falangist party chief. They also continue to maintain their special police (*Policia Armada*) whose sinister title denotes full powers of arrest. What more could a dictator want? Again, under the new regime for the press, editors are to be personally responsible to the Caudillo for what they publish; in other words, their jobs will hang upon their discretion.

All recent foreign visitors to Spain confirm that it is quite beyond General Franco's power to recapture public confidence or to uproot the constant fear of eavesdropping and arrest that warps every judgment even though it does not prevent Spaniards—being Spaniards—from grumbling aloud. Yet his regime shows every sign of lasting. On foreign

as on home affairs he is ready to be endlessly elastic. For instance, he has now reversed his Tangier policy of 1940, and has displayed, in preliminary discussion with the Governments interested in the Tangier Statute, extreme moderation over the future regime that is to apply there. It seems that nothing can stale his infinite variety, or at least, not yet.

Too Little Food—

The short food conference, attended last week-end by representatives of Great Britain, the United States, and nine European countries, yielded little in the way of positive results. Britain was strongly represented by Colonel Llewellyn and Mr Hudson, but the French Food Minister was not present. No new estimates of production were revealed, beyond the welcome news that Denmark should be able to export 89,000 tons of food, mainly butter and bacon, before September 30th. The Danish surplus, Colonel Llewellyn has since revealed, will go in the first place to the Occupation Forces, and much of the remainder will be available to make up—not to supplement—civilian rations in this country; and not, as might have been supposed, to make up still scantier rations elsewhere. But even food from Denmark, the only European country which can hope to export any, is dependent on supplies from outside of coal, fertilisers, and feeding-stuffs. Only one quarter of the 400,000 tons of coal per month that are needed can be produced inside the country.

No plans for expediting essential supplies to Europe were revealed at the conference. They are still apparently being formulated. A detailed survey of the probable production and needs of every country, on the basis of which available supplies can be allocated, is urgently needed. Above all, supplies themselves must be sent as quickly as can be, and to the fullest possible extent. Until more light is shed on these matters, little can be said about the prospects of rehabilitating European agriculture. It was stressed at the conference that every country must rely mainly on its own efforts to repair its food shortages. But how quickly European countries can get to work, as they are only too anxious to do, depends on the rate at which they will receive a few essential supplies to ease their transport situation and to facilitate their food production.

The need for Europe to find its own food is all the greater since, after the recent food cuts in Britain, the United States and Canada, there can be little hope of securing supplies through reducing food consumption in other countries. Virtually, the only sources of supply which are not fully tapped lie in South America. Colonel Llewellyn last week called on South American countries to help Europe both by reducing their consumption and by expanding their production. Whether some of the countries concerned are prepared to join in pooling all supplies remains doubtful.

—And Not Enough Labour

It is against this grim background of world food shortage that the National Farmers' Union have pleaded with the Government, unsuccessfully, for the prompt release of farmers and farmers' sons from the Services. The lack of fully skilled men is the farmer's worst difficulty at present, more troublesome by far than the shortage of unskilled labour. But this fact alone would not warrant their release; the only acceptable proof would be that their presence is essential for gathering in the harvest.

The harvest is even more vital, and looks like being bigger this year than last, when large quantities of potatoes and sugar-beet were wasted for lack of labour. The NFU have issued the serious warning that

if Britain's acres are not harvested to the full this year, the people of this country will have to live on the most frugal rations within living memory.

Certainly, most people will not wish to take the risk of losing this year any part of the harvest through lack of labour. To gather in what has already been sown should have at least equal priority with building new houses.

The difficulty is to estimate how much and what sort of additional labour is needed, since farmers themselves unofficially at least, are not agreed. Most types of labour needed for harvest work are admittedly scarce. There are fewer adult volunteers for harvest camps. There are also fewer land girls. Although the Women's Land Army is not

being demobilised, it is now impossible to prevent many girls from resigning or from denuding some counties by returning to work nearer home. The Army, as last year, is not officially available to give any help. Further, it is true that amateur efforts are of little use unless there are enough skilled men to supervise them.

These difficulties, taken together, undoubtedly mean that farm workers will be badly overworked this autumn. It is more doubtful, however, whether crops will actually be wasted, with the possible and dangerous exception again of potatoes and sugar-beet. Harvesting these crops requires a high proportion of unskilled labour at a time (late autumn) when, despite all inducements, it is especially hard to secure. This makes it all the more important to see that the services of German prisoners, who are to be increasingly used for agricultural work, are distributed fairly and evenly throughout the country. If the release, perhaps temporary, of some skilled men from the Forces is also needed in order to avoid a further reduction in the sugar ration next winter most people will think the case strong enough.

Teschen Again

For some time now it has been apparent that the old frontier disputes between Poles and Czechs would cause trouble, whatever the European framework into which they were fitted. Both nations claim the racially mixed areas in Silesia and along the River Olsa and neither has so far recognised any frontier in these disputed regions to be finally valid.

Trouble came to a head last week in spite of the presence of Red Army garrisons in both the Polish and Czech zones round Teschen. The local Czech authorities appear to have ordered the Poles in the Czech area to register as aliens. When the four Polish democratic parties decided to refuse to register, the Czechs arrested a number of Poles and extended to the whole community the curfew imposed on the Germans.

The Polish press denounced these proceedings vigorously and on Saturday, under the personal command of General Rola-Zymierski, Polish troops marched into Teschen, hitherto garrisoned by Soviet forces. They have thus taken over the territory which the Polish Government occupied in 1938 when it delivered its celebrated "stab in the back" to the Czech Republic.

The Polish forces have not, however, advanced beyond the zone predominantly occupied by Poles and it does not seem that the Russians will allow these frontier incidents to flare up into open hostility. The Prague Radio has announced that a Czech Commission will go to Moscow and will accept Russia's arbitration in all outstanding issues between Poles and Czechs. The Poles, on their side, have laid the blame for the incidents on "local Czech chauvinists" and exonerated the Central Government at Prague.

The settlement arranged at Moscow will probably give most of the Olsa region to Poland and compensate the Czechs with strips of Silesia. And so the frontiers may well be fixed unless new upheavals and shifts of power reopen the issue.

Signor Parri Succeeds

The new Italian Cabinet has been formed at last, and in the new Prime Minister, Signor Parri, the Italians appear to have found a leader capable of transcending the very deep cleavages which divide the six anti-Fascist parties on which the new Coalition is based.

The new Cabinet is much stronger than its predecessor under Signor Bonomi, from which the Socialist and Action Party were absent and which in any case did not represent the North. Nevertheless, Signor Parri will have a difficult and delicate task to keep his team together until the preparations for a Constituent Assembly are complete. The Government took weeks to form and at the last minute long party wrangles held up the announcement of the full Ministry. These delays sprang from deep divergences and suspicions. The Communists and Socialists in particular oppose the "clericalism" of the Christian Democrats, for which reason a tough struggle developed over the Ministry of Public Instruction, the Christian Democrats and the Left wing parties both claiming it. By way of compromise it has been left with the former Liberal Minister, Dr Ruiz. But this compromise will not remove the cause of the dispute.

The Allied authorities can help to give stability to the

Parri Government by practising the strictest non-intervention in internal politics. The question of the Monarchy seems for the moment to be satisfactorily shelved, although the Socialists, under Signor Nenni's exuberant leadership, claim the right to raise the issue with the people at large. Whatever action is taken, it must be Signor Parri's responsibility to deal with it, not that of the Control Commission.

Again, supplies should be given to Italian industry without any stipulations about the control or structure of the various industries. To insist on efficiency is reasonable. To use efficiency as a lever for returning discredited industrialists to power only invites distrust and disorder. Efficiency, after all, depends on workpeople as well as on managements. Finally, the more responsibility the new Italian Government can carry, the fairer are its chances. The provinces of Florence, Pisa, Leghorn and Pistoia have been transferred to direct Italian administration. The sooner the northern provinces are transferred, the better.

Freedom of the South Seas?

The firm establishment of Australian troops in North Borneo gives a new shape to the Far Eastern war. A vital step has been taken in the encirclement of the Japanese in Malaya and the Dutch East Indies. The process of driving them out and linking up with the British armies in Burma will be long and arduous. General Slim reminded the people at home that without hard work the Japanese war would be on their hands a long time. But the pattern of victory seems clear, and it may well be that the surrounded colonies—British, Dutch and later possibly French—will be liberated before the final defeat of Japan.

The temptation will be to postpone all consideration of the future status and development of these dependent territories until some final settlement. Such a postponement would, however, be impolitic and unwise. The position of the Metropolitan Powers—Britain, Holland and France—is under steady criticism in the United States. It may be that in the new division of functions in the Far East, with the Americans claiming the right to defeat Japan unassisted, the liberation of the Malaya, Borneo, Dutch East Indies triangle will be accomplished largely by Empire forces, with the assistance of Dutch and, if possible, French forces. But even so, the overwhelming contribution the United States has already made in the Far Eastern zone entitles it to hold views about the future of the area, and there is no secret about the views. The Americans want drastic changes in the direction of "free trade" and independence.

The colonial Powers have therefore not only a responsibility, but a direct interest to concert their post-war plans, and to give their colonial policies a stronger orientation towards native prosperity and self-government. The American solution is no solution for defenceless and relatively backward territories, but it does not follow that the *status quo* is either acceptable or right. The Australian and New Zealand Governments made a first initiative early in 1944 in proposing a South Seas Regional Commission, on which British, American, Dutch, French, Australian and New Zealand representatives would sit, and which would safeguard native welfare and coordinate economic policy. This conception could obviously be extended to cover defence, and within such a regional framework the metropolitan Powers could proceed more boldly in their granting of autonomy and self-government of the native peoples.

The time to make the plans for post-war reconstruction in the South Seas is now, so that the immediate policies of occupation and government do not contradict the wider objectives or draw down on the colonial Powers the vigorous criticism of the United States.

Federation in the West Indies

Shortly before Parliament was dissolved, the Secretary of State for the Colonies circulated the text of a dispatch he recently addressed to the Governors of the West Indian islands on the subject of federation. The West India Royal Commission recommended that political federation, though "not of itself an appropriate means of meeting the pressing needs of the West Indies," is "the end to which policy should be directed." Colonel Stanley's dispatch describes the conditions under which this end can best be achieved.

It emphasises, first, that a movement towards federation must come from the colonies themselves; federation will only be attempted after the fullest publicity and discussion. Secondly, federal administration should be proved capable of being independent of "recurrent financial assistance from outside." Thirdly, political federation alone should not be considered, but also the "development of unified action in the administrative and economic fields."

It cannot be said that any of these conditions are anything like being fulfilled at the moment. Until very recently, there was little or no sign of any Caribbean feeling among the peoples of the West Indies. For one thing, the area is not compact geographically as is, say, that of the East or Central African dependencies. Seven hundred and fifty miles of sea separate Belize in British Honduras from Kingston in Jamaica. Eleven hundred miles separate Kingston from Port of Spain in Trinidad. From Port of Spain to Georgetown in British Guiana is 360 miles and from St. Kitts, the northernmost island of the Leeward group, to Port of Spain is about 500.

Moreover, the islands are at very different stages of constitutional progress. Jamaica now has a large measure of internal self-government and adult suffrage. Most of the other colonies have only a limited franchise and the elected members of their legislative councils are in a minority. Financially, there seems at present no hope of any federation being self-supporting. The phrase "recurrent financial assistance" does not preclude grants from the Colonial Development and Welfare Fund, but even now it is difficult to see how the West Indies can maintain many of the schemes whose original capital cost is met from the Fund. In the administrative and economic sphere, it does not appear that the individual governments have seized with enthusiasm the opportunities for regional thinking presented by the (ex-)Stockdale organisation but rather appear sometimes to resent its assistance. All the islands—even the federated Leewards—levy import duties against each other.

But remote though the prospects of federation may seem at present, it is still an "end to which policy should be directed," and the absence of any communal problem makes its ultimate chances good. A promising start was made by the first West Indian Conference, which arose from the Anglo-American Caribbean Commission and was held in March last year. For the first time unofficial delegates from the British—and American—colonies met to discuss matters of common interest. The Colonial Secretary's invitation to the legislatures to discuss the advantages of federation will itself do something towards breaking down their insularity still further.

Colonial Service Recruitment

Appointments to the Colonial Service, held up owing to the prior claims on manpower elsewhere during the war, are now beginning again. The leeway to be made up after the cessation of recruitment over five or six years and the necessity of restaffing on a large scale in the Far East have created about 4,000 vacancies. The official recruitment programme, details of which were released early this month, falls into two sections: vacancies for administrative and technical pensionable posts and for appointments on short-term contract. In the former group, applicants are required particularly for technical posts in the specialist departments,

but an effort has been made to tap the stream of demobilised men from the Forces by raising the age limit for technical appointments from 35 to 40 and for non-technical appointments from 30 to 35, by allowing war service to count in computing the initial salary on the relevant scale and by offering seniority to early successful candidates equal to that for those few appointed during the war.

Special interest attaches, however, to the terms of appointment for technicians and specialists on short-term contracts. (The importance of this problem to certain colonies is discussed by our Accra correspondent in an article on page 854.) If the colonies are to receive a worth-while stimulus from advancing technical knowledge in this country there must be a steady flow of technical expertise overseas and back. This is a form of subsidy on which the funds available under the Colonial Development and Welfare Act could well be expended and which would provide a better basis for a long-term policy of colonial development than local tariffs, import restrictions and the fostering of uneconomic projects. Under the scheme, while the terms of contract as regards age limits, salaries and conditions of service are to follow broadly the conditions of pensionable appointments, there are indications that each case will be considered on its merits and that the service will not be starved of expert advice and experience by slavish adherence to a formula.

This discretionary power will have to be used boldly by the Colonial Office, for it is competing over the Reconstruction Period (that is, until some time after the defeat of Japan) in a sellers' market. A specific case is that of Nigeria, where 400 temporary development officers are to be appointed. Contracts are offered for 3, 5, 8 to 10 years for men between 30 and 45. The salaries offered afford little margin for saving, though gratuities will be granted on the completion of the contract. There is an ominous note in the "varied character" of the duties to be performed, which include "relieving members of Departments . . . for other tasks, particularly in connection with the preparation and execution of development schemes." An experienced applicant of 30 to 35 will wish to be more than a "stand-in" for an administrator and will surely wish his particular development duties written into his contract. Altogether, colonial service recruitment will have to be tackled resolutely and honestly. The best men will be obtained only if amenities overseas and imperial communications are further improved. Men who have served overseas during the war are in a very advantageous position for judging any offers made for their services.

Goering and Ribbentrop

Of the five Nazi leaders best known to the world outside Germany, three are dead, but two are in the Allied bag. Even a very minor prophet might have hazarded that the fate of the five would work out thus. Hitler, Himmler and Goebbels knew that they could expect no quarter. Goering and Ribbentrop, having heiled kings and dined with archbishops, and having shot or golfed their way round Europe, suffered from the delusion that old acquaintance with the great might see them through. Hess, it will be remembered, thought so too. What is strange is that the belief could be sustained right up to now. Here is proof of the vacuum in which the Germans have been living. So is Ribbentrop's letter to Mr Vincent (" . . . never could remember Christian names . . .") Churchill.

Unfortunately, the procedure for dealing with these major figures is still far from settled. Machinery for the lesser fry has gone ahead because it can be handled zone by zone. So far, civilian offenders against the laws and usages of war have been tried by *ad hoc* courts martial. Henceforth, military courts competent to try all local war criminals are being set up. In the British zone a Royal Warrant authorising these is now imminent, and regulations governing the trials have already been issued by the Judge Advocate's department. In the limited number of cases where satisfactory affidavits are already available these courts are competent to try the trained thugs who ran the concentration camps.

But the criminals on a broader scale, belonging to the Goering-Ribbentrop class, call for inter-Allied procedure. The present proposal, advanced by the Americans, is that they should come before a court established by agreement between the four Occupying Powers; that the four Chief Prosecutors should meet in London to frame the unprecedented charges, and that the trials should then take place on the Continent. Delay, with such procedure, seems un-

avoidable. It is perhaps poetic justice that Goering and Ribbentrop, who have always each been jealous of the other's capacity for stealing the thunder with foreigners, should be given time to realise that there is now none left to steal.

The Farrell Government Between Fires

The Buenos Aires Stock Exchange and the Argentine Chamber of Commerce are among 319 industrial and commercial organisations which last week issued an appeal to President Farrell to revise the Argentine Government's social and economic programme.

Criticism from such sources is not a new feature of Argentine politics. In particular, the Buenos Aires Stock Exchange has, since the 1943 *coup d'état*, shown some concern over the withdrawal of the country's financial leaders from the problems of government. Towards the end of 1943 it officially deplored Sr. Santamarina's resignation as Finance Minister. He was the last of the influential moderate element in the Ramirez Cabinet and had been chairman of the Bank of the Nation. His successor there declined to replace him as Finance Minister and in turn relinquished the bank chairmanship. Dr. Ameghino, an extreme nationalist, became Finance Minister. Other significant resignations at this time included that of Dr. Raul Prebisch, who gained an international reputation as General Manager of the Argentine Central Bank under successive Ministries.

Since these resignations, the military government has contrived to combine an anti-communist drive with what the manifesto calls "very advanced and dangerous" social policies, with the result that labour as well as capitalists have been alienated. Colonel Peron, Secretary of Labour and Welfare, and strong man of the Cabinet, has dissolved the Argentine trade unions, including the OGT, with 250,000 members, and has put into effect his plan for bringing workers and employers into a joint cooperative organisation under state control. Subsequent reports indicate that the unions have only been driven from public into underground opposition to the present regime. It appears an open question whether recent industrial disputes, such as the meat-packers' strikes, owe more to the encouragement of Colonel Peron (who as leader of the "young Colonels' group" in the Government openly sought the nationalisation of foreign-owned industries) than to the opposition of organised labour to his "co-operative" programme. The situation in Buenos Aires is obviously both confused and dangerous.

Research for the Services

The last report of the Select Committee on National Expenditure deals with the research and development of warlike stores. It does not particularise; but many examples which it has investigated, taken together,

conclusively show that the daily cost of this war, at least during the earlier years, was unnecessarily increased and the duration of the war prolonged because of three simple facts—

- (1) That research had for long been starved.
- (2) That adequate steps had not been taken to maintain during the years of peace a nucleus of skilled men which could be rapidly and efficiently expanded for the purposes of war; and
- (3) That the system of departmental responsibility was not sufficiently flexible fully to meet the changed requirements.

These are serious findings. They show that technical initiative has in the past been thwarted in a way which is all too familiar. Research has been not only inadequate in quantity and quality, but at the same time too closely controlled and inadequately co-ordinated.

This second defect is the one which closely concerns Governmental machinery, but its proper investigation would go well beyond the Select Committee's terms of reference. The Committee does, however, point out that inter-Service committees set up during the war have not prevented "a certain degree of overlapping" between the supply organisations of the three Services. There can be still less certainty that research into new weapons will be properly pooled and co-ordinated after the war, and the Committee urges an immediate investigation into departmental machinery.

It also repeats the demand for a select committee to inquire into public control of expenditure on research. It is on the financial side that research is too rigidly and too narrowly controlled. Money should clearly be voted in the form of block grants, guaranteed over a period of years

instead of continuing to be tied down by a detailed and rigid annual estimate.

The New Evangelism

The report of the Commission on Evangelism, presented this week to the Church Assembly, strikes a new note in its suggestions for combating the religious apathy of modern man. The Commission, which was appointed by the late Primate, Dr Temple, whose views it closely reflects, does not underrate the problem before it. This is nothing less than "the conversion of England to the Christian faith." It is admitted that scientific humanism has permeated the clergy as well as the laity, so that many of them have become more concerned with man than with God; but it is rightly emphasised that the full assistance of the laity as well as the clergy must be now recruited if there is to be any hope of a fundamental change of heart.

In undertaking this tremendous task, the Commission is willing to adopt scientific, and even commercial, methods. A majority of its members favour the use of a nation-wide advertising campaign, undertaken with the help of expert advice, to promote Christian education. It is claimed that "in the advertisement columns of the press we have a vehicle for a modern form of tract," and it is urged that wireless, television, cinemas and theatres should also be mobilised for the task.

To make Christian problems come alive by presenting them in modern terms through modern media was always one of Dr Temple's aims. Possibly the startling and interesting methods now suggested will promote an evangelical revival that will rival the Wesleyan. By both religious and historical standards, it is time for this to happen. And the modern way of going out into the highways and byways may well be to turn to the microphone and the printing press. But doubts, which are clearly shared by the Commission, will remain. It is recognised that while these new techniques will prepare the ground, they cannot sow the seed. Faith cannot be prefabricated; and for this reason alone the suggestion that small groups or cells of Christians should be formed to spread the Gospel of precept and devotion is probably the most valuable one in the report.

The new issue of 2½% NATIONAL WAR BONDS

1954 - 1956

Now "on tap"—No limit to holdings

A Full Trustee Security repayable at par on the 15th August, 1956, the Treasury reserving the right, on giving three months' notice, to redeem at par on or after the 15th August, 1954.

- Price of Issue, £100 per cent.
- Payment in full on application.
- Subscriptions will be accepted in any amount, not being less than £50.
- Interest 2½% per annum payable half-yearly on the 15th February and 15th August. First Interest payment on the 15th February 1946.
- Interest accrues from the date of purchase.
- Income Tax is deducted at the source from Interest payments of more than £5 per annum.
- Bonds are transferable free of Stamp Duty.

PROSPECTUSES AND APPLICATION FORMS OBTAINABLE FROM ALL BANKS AND STOCKBROKERS.

There are also for this Security a Post Office Issue and a Trustee Savings Bank Issue, of which full details can be obtained at any Post Office or Trustee Savings Bank respectively. Subscriptions for the bonds must be for amounts of £5, or any multiple of £5, subject to a minimum of £10 for the first subscription. Maximum subscription £1,000. Income tax not deducted at source.

As there is now a long waiting list for *The Economist*, subscribers who wish to renew their subscription are advised to do so immediately upon receipt of a renewal notice. If they fail to do so, their subscriptions will be automatically cancelled on the date of expiry, and this may mean a gap of many months before the despatch of copies can be resumed.

Letters to the Editor

The Levant Crisis

SIR,—The question which you have manifested in all your articles on the Levant question about the paramount need for preserving Anglo-French concord, and your sensitive realisation of the delicacy of England's position *vis-à-vis* France in this matter, are perfectly understandable and right. But one cannot help feeling that your anxiety over your relations with France has led you to overlook or skate thinly over the facts, and gives the impression that you are defending a policy of appeasement towards the French. It is not by appeasement that the basis of a healthy friendship and genuine co-operation between England and France can be laid. If Britain needs France, France needs Britain just as much, and the situation calls not for appeasement but for an honest stand on the facts and rights of the case. In the first place, France declared and Britain guaranteed the independence of Syria and the Lebanon in 1941. In the second place, while Great Britain on more than one occasion in 1941 recognised a "special position" for France, this recognition was only hypothetical, not categorical. It implied that if any European power was to be given a special position in the Levant that Power should be France; it did not state that any European Power *had* to have a special position and it was clearly incompatible both with the promise of independence which the British Government had made to Syria and the Lebanon and with morality that Britain should concede to France something which was the primary concern of the Levant States themselves. It is clear indeed that the Lyttelton-de Gaulle agreement was not meant to be made at the expense of the independence of the Levant States, but at British expense. It was a self-denying ordinance, and as such could not infringe upon Syrian and Lebanese independence.

Your support for the French contention that the whole Middle East question (including Britain's position in Iraq and Egypt) should be dealt with at once does not offer the hope of a quick or practical solution. Any such move would only confuse the present issue. The basis of Anglo-French friendship and co-operation must be in Europe: it is Europe that really matters to France, not Syria and Lebanon, where her interests are relatively small. And the causes of Anglo-French misunderstanding are to be found not in the activities of British officials and officers in the Levant, but in the failure to establish a complete understanding over the problems which face France and Britain in the West. The Syrian affair was the occasion for de Gaulle's outburst: it was not its cause. Restore French confidence in British friendship in the West, and the Syria problem will be easily settled. But no good either to Great Britain or to the Arabs, nor for that matter to France itself, can come of seeking to establish Anglo-French relations on the basis of a bargain at the expense of the Syrians and Lebanese.—Yours faithfully,

EDWARD ATIYAH,

Secretary-General Arab Office, London

Coal Policies

SIR,—In the leading article in your issue of June 16th you say that Labour advocacy of nationalisation "has considerably less specific content" than the Government's proposals. In your issue of June 2nd you had described the Government's proposals as submitted to the House of Commons as a "generally agreed platitude" upon which the Minister was "simply wasting time." On the strength of a speech to the National Association of Colliery Managers, you appear to be converted to the Government's policy.

The new points made in that speech, which have led to your conversion, are (1) an emphasis on the "independence" of the Central Authority from the coal owners—relative independence only, which in any case was never in doubt, and (2) an apparent intention to proceed with amalgamation more quickly than seemed to have been contemplated in the original pronouncement. There is actually no material difference between the two pronouncements, and no light at all is shed upon a crucial question—whether the Central Authority will itself determine when an amalgamation is "necessary," or whether (as in the past) necessity must be proved. It is to be noted that the pledge is not that amalgamation will be effected where the Authority "sees fit," yet if that had been meant surely it would have been said. The Government, in short, have as yet no policy which could justify your conversion.

By comparison with the Government's proposals, the Labour policy of "nationalisation," with implementation of the Reid recommendations, simple as it sounds, is an almost complete policy; for it solves forthwith the four major problems in the way of rebuilding the industry:—

- (1) The problem caused by the existence of 1,000 separate undertakings, the vast majority of which have been shown to be unfitted for their responsibilities.
- (2) The problem of protecting the consumer without competition, and of fixing prices without fixing the profits of private enterprise.
- (3) The problem of obtaining the finance necessary for reorganisation, without security of tenure for the owners.
- (4) The problem of overcoming the deep distrust of the present owners by the miners.

The remaining problems are mainly problems of administration, and their successful solution will depend on the way the Board appointed to run the industry handles the situation, and on the general directions from the Government under which they will no doubt have to work.

It is, I suggest, only superficially profound to maintain that the solutions to the problems of the structure, ownership and organisation of an industry are immaterial in comparison with the technical problems. All we laymen can do is to advocate the creation of an environment within which the technical problems can be solved. They obviously cannot be solved in the present environment; they obviously can be solved if the mines are nationalised. Whether or not they will be solved is another matter, which falls within the realm of prophecy rather than of economics or politics.—Yours faithfully,

JOAN ROBINSON.

Cambridge

[We do not know why Mrs Robinson thinks *The Economist* has been converted to the Government's plan. The comparison of the Labour plan with Major Lloyd George's proposals was not intended as a compliment to the latter, but as a condemnation of both, as the word "even" clearly implied. Mrs Robinson's statements about the meaning of the Labour Party's policy are interesting; evidently she has information that is not generally available. We completely dissent from her last paragraph. *The Economist* has frequently said that the necessary reforms of the industry cannot be carried out with its present structure; but surely it would be an abdication not to insist that these technical reforms must be carried out, and not to condemn as meaningless any plan for the industry which does not clearly provide for them.—EDITOR.]

The Book Trade

SIR,—Since Mr Faber wrote the admirable letter which you published in your last issue, the so-called quota book-publishers have received a further considerable increase in their quotas. Few people will disagree with Mr Faber that "trade follows the book," and I have little doubt that Government Departments realise this too. I certainly wholeheartedly concur with Mr Faber in his claim that books are the embodiment of ideas, and the most important medium for the dissemination of knowledge. It is a great pity that at the same time as Mr Faber is propounding these ideas, the association in which he plays such a prominent rôle has become a standard bearer of most restrictive practices.

Your readers may be interested in the main outline of the policy of the Publishers' Association as representing the interests of the quota-publishers. According to present arrangements, no publisher who had not actually used paper in 1939 is entitled to purchase paper for book-publishing. In contrast, quota-publishers, through the economies which they have made in the use of paper, and most of which will stay for many a year to come, already manage to produce more than double the number of books in 1944 than in a pre-war year, and have trebled their turnover. The Publishers' Association is now trying to persuade the Board of Trade to accept a policy under which no publisher without a quota would get as much as a sheet of paper for books until the quota-publishers get 100 per cent of their pre-war consumption, that is, until they are enabled to produce about five times the number of books as before the war, and to increase their turnover sixfold. Does the Association, and Mr Faber, think that they would get equal public approval for such a policy, or do they not think that it largely destroys their own arguments for a specially favourable consideration?—Yours faithfully,

PAUL ELEK

AMERICAN SURVEY

Taxation of Co-operatives

(From a Correspondent in Colorado)

FARMERS' marketing and purchasing co-operatives in the United States in 1944 handled about four billion dollars' worth of farm products or farm supplies at one point or another along the distribution line. Consumers' co-operatives in the same year dealt in almost a billion dollars' worth. Farmers' co-ops had an estimated 3,850,000 farm families as members—with some duplication, since one family may belong to several varying types of co-operative—and consumers' co-ops claim a membership of about 2,500,000 persons.

Thus the US co-operative movement may be definitely said to have grown up and to have become big business, or at least middling big business, and on that score it is now drawing bitter attacks from competing "profit" business enterprises that until recently paid little attention to it. Attempts are now being made in Congress, and in many of the state legislatures, to take away special tax and other exemptions and privileges, which have allowed the co-operatives to grow, and further to penalise them (along with other businesses that do not in the ordinary sense make a profit) by imposing taxes upon patronage dividends, rebates, refunds and all other types of profit-sharing with customers.

The course of the struggle is a curious illustration of the "regionalisation" of the United States, both geographically and in its economic interests. In the big cities little is heard of it, but in many rural regions it is the subject of the hottest interest of any domestic issue. In Kansas, this spring, the Legislature was placidly preparing to withdraw tax exemptions from farmers' co-operatives, when its members were startled by an invasion of the farmers themselves, who came into town hundreds strong to attend a hearing, with so belligerent an attitude that the legislators hastily postponed the whole question for two years by naming a committee of inquiry.

Head and front of the movement against the co-operators in the United States is the National Tax Equality Association, with headquarters in Chicago, which claims to represent millions of small business-men suffering from the competition of the co-operatives, and is headed by Mr Ben C. McCabe, a grain commission merchant of Minneapolis. It is campaigning everywhere and energetically. Its general manager is Mr Loring A. Schuler, formerly an editor of the Curtis publishing firm of Philadelphia, and it has published many searching studies of co-operative finances and practices. To combat this organisation, the co-operatives themselves have organised the National Association of Co-operatives, also operating from Chicago.

The advantages the farmers' co-operatives enjoy in contrast with private business are of two kinds:

1. During the long agricultural depression which began early in the 1920's, Congress granted many special helps to farmers' co-operatives to aid them to help themselves. Among these were special income-tax exemptions; special exemptions from the anti-trust acts; a special division in the Department of Agriculture to aid co-ops; special credit facilities (at the end of the fiscal year 1943-44 the Bank for Co-operatives had \$144 million on loan to farmers' co-operatives) and special exemptions for their truck lines from the provisions of the Transportation Act of 1940.

2. These things have certainly helped farmers to organise co-operatively, and the opponents of co-operatives would like to see them repealed or modified, but they are not the big factor. That factor is the exemption from income tax enjoyed by all business, co-operative and non co-operative alike, on rebates, patronage refunds, patronage dividends or any refund handed back or credited to members at the year's end in proportion to their patronage.

It is probable the struggle might never have started had it not been for the high war-time rates of income-tax and super-tax on the profit of corporations. "Private" business men found themselves handing over to the tax collector from 40 to 95 per cent of the profits earned by corporations

as entities; and the income of the shareholder, derived from distribution of such earnings as remained, was then taxed as individual income.

Meanwhile the farmers' co-operatives are beginning to earn (or to save, in co-operative parlance) large profits, as in the instance of the Farmers' Union Grain Terminal Association of St. Paul, which in seven years has built itself to be the largest grain-handler in the United States and last year "saved" more than \$2,000,000 for members. This \$2,000,000 goes back entirely to them, untouched by the Federal income tax, and is taxed only once—i.e., as income to each individual member, and then naturally at a much lower rate than a corporation's profits are taxed.

Any law which would tax patronage dividends as income before distribution would strike a crippling blow at the further growth of co-operatives, because in practice such savings have furnished the "seed money," the large capital which has enabled the farmers' co-operative movement to grow so swiftly. Members in the overwhelming majority of instances have agreed to leave all or most of their annual earnings with the co-operative, protected by various evidences of the debt. To compel withdrawal of this money as cash dividends, or to tax the whole income of the co-operative before distribution, would pretty effectively limit co-operative growth hereafter, and both sides admit that in this point lies the crux of the struggle and to a large extent the fate of the farmers' co-operative movement.

But involved also are many types of business—some of it large business—not co-operative in the strictest sense, if at all. "Patronage dividends," under one name or another, are paid by the huge mutual insurance companies; by wholesalers and manufacturers to retailers; by "profit" businesses which hire co-operative services at cost, and by many others. Indeed, the classic case in which such dividends were held non-taxable was that of the Uniform Printing Co., which several big insurance companies had incorporated to do their printing business at cost. Thus, unless some form of legal verbiage can be devised which would tax farmers' co-operatives alone, the issue may split "profit" business right down the middle. And if such a form of law were to be devised, the powerful "farm bloc" in Congress would have plenty to say. It is not probable that for all their power and zeal, the opponents of co-operation will get anywhere in the present Congress.

Consumers' co-operatives are on the sidelines. They have never been given the special advantages and tax exemptions of farmers' co-operatives, but, on the other hand, their members enjoy an even more distinct type of tax exemption. A farmer's savings through marketing his produce co-operatively are part of his income and must be accounted for to the tax collector; his savings through co-operative buying of farm supplies likewise increase his income and his income-tax. But a member of a consumer co-operative makes savings in his cost-of-living and does not thereby increase his taxable income, and therefore does not have to account for these savings to the tax collector. Nor is "profit" business yet excited about the consumer co-operatives—at least, not to the extent of the excitement and hostility raised to the farmers' co-operatives.

American Notes

Treaties in the Senate

The prospects for ratification of the United Nations Charter and other international instruments brightened considerably when the Senate, the crucial and thus far recalcitrant body, rejected its Finance Committee's amendment to the Reciprocal Trade Agreements Bill. The Amendment would have emasculated the Bill quite thoroughly, since it deleted the provision to allow further reductions in tariffs up to 50 per cent of their present level.

THE WORLD OVERSEAS

Letters from Germany—II

Bavarian Roads (From Our Special Correspondent)

Munich, June

ONE of the traveller's most striking impressions in southern Germany is the sharp contrast between town and countryside. The towns seem to be waiting for a German Jeremiah to bewail their ruins. The placid countryside shows almost no trace of destruction. The solid, spaciouly built, sunlit houses of the farmers tell of well-being and prosperity that may survive both war and defeat. The fields look well cultivated, the grazing cattle are well fattened. In the Danubian grain belt, the ears of corn have grown high early in the season. It is a scene to gladden the eye and heart of a Virgil, though it would puzzle him also that so many women and children should be feverishly working in the fields, that so many women should be dressed in black and that there should be so few men.

It is otherwise on the Bavarian roads. There, even more than in the destroyed cities, one feels the effects of a deluge. Every major road here is a cross-section of the great problems of Germany and Europe. It is a chaotic picture—and unique, for history such as this will surely not repeat itself.

South of Munich, against the sharp background of the Alps, can be watched the last scenes of the *Wehrmacht's* surrender. Long convoys of lorries crammed with German soldiers, preceded by officers in staff cars, roll on to assembly points and prisoners' cages. The soldiers are disarmed, some officers—*Luftwaffe*, SS, infantrymen—still carry their side-arms, and shout loudly in the typical *feldwebel* fashion their last orders to the men. The discipline of the surrendered armies is still exemplary, at least in outward appearance. Here and there a *Wehrmacht* convoy becomes mixed with an American convoy rushing in the opposite direction. There is momentary confusion. Embarrassed German officers salute the victors. The soldiers of the two armies eye each other with curiosity or indifference or, correctly, they ignore each other, according to their individual moods. Along the roads in the areas allotted to the surrendering units, the German military police, either alone or with the American police, watches the traffic and keeps order. It helps to disentangle the convoys; it checks the credentials of passengers in military vehicles and thus, businesslike, it performs its last military functions. The act of capitulation is here translated into detailed traffic schemes and traffic regulations, and at a check point a sturdy youth from Texas may watch the traffic side by side with a thin *Luftwaffe* pilot from Hanover, who still wears his decorations for the *Blitzkrieg* on London and the march into the Sudetenland.

The Underdog

Somewhere by the side of the road a man in the striped uniform of the concentration camp is trudging slowly home. A short time ago he was stopped by an SS officer, travelling with his orderly in a car. A sharp exchange of words and threats accompanied by violent gesticulation takes place. As an American jeep approaches the quarrel stops, and the SS officer's car moves off. The ex-inmate of the concentration camp explains with some pride that he was an official of the Social Democratic party at Breslau. Yes, it is true. SS men occasionally bully people like this on the roads. But the peasants are kind and hospitable; they put the KZ man up for a night and fill his rucksack with food before he starts out on a long day's march. And yet life is strange—the SS man, even in captivity, still travels about in a car, while he, the underdog, will walk all the way from Dachau to Breslau. Will he still be among the underdogs at home? His home is in the Russian zone; and until he was dragged away to the concentration camp he had been a "Social-Fascist" in the eyes of the local Communists. Yet

he must walk home; and he has not heard of his family for many years. It is bad that Germany has not freed itself from National Socialism on its own. This has terribly complicated its fate; and it encourages an inferiority complex among German anti-Nazis. Oh, an American cigarette? With bows and smile of timid thankfulness the underdog goes his way.

A Hitler Legend?

On the roadsides released prisoners of war, bent under heavy rucksacks and with drooping heads, march home singly or in twos. They are released farmers, coal miners or transport workers. A hundred and thirty years ago marched the survivors of the *Grande Armée*, perhaps along the same roads, as in Heine's "Two Grenadiers"—"Und als sie kamen ins Deutsche Quartier, liessen sie die Köpfe hängen." Yet the two grenadiers on the Bavarian road are not, apparently, echoing the proud words: "I do not mind about my wife, I do not mind about my child, the Emperor, the Emperor is a prisoner." But it would probably be too early to assume that no seeds at all have been sown for the revival of a Hitler legend at some later time. Very few among the survivors of his army seem to believe that the Fuehrer is really dead.

On the roads to the north of Regensburg, between the Danube and the Bohemian Forest, can be seen another fragment of the present migration of peoples. Lorryfuls of Czech and Russian displaced persons, beflagged with Red banners and Czech national colours, move eastwards and northwards. There is joyful waving. There is also the tense expression of uncertainty and suspense on the faces of Russian, Ukrainian and Caucasian peasants. A friendly word spoken in Russian lights a gleam of hope in their sunken eyes. They do not know yet whether they are going straight home or are merely being shifted from one assembly point to another. The Russians are even more home sick than the others. But they are also ridden by fears. Their homes, near Smolensk or Poltava, no longer exist. Many had seen their families perish before they went to Germany. And now, will they be accepted in Russia as unfortunate members of the community returning home or will they be spurned as traitors? Will they be allowed to settle down in the old familiar places or will they be ordered to remote Siberian lands? Such questions are asked by Russians on all German roads. And then there are the Poles, most of whom—though not all—have shunned the Russians even in captivity and in DP's camps. Will they be compelled to go home? they ask. Is it true that the Polish Government in London has found territory for them in which they can settle now that Warsaw, Lodz and the rest of Poland already belong to Russia? "We need no such land," replies a Polish officer in our prisoners' camp. "Ninety-nine per cent of the people believe that Britain is going to fight Russia and to free Poland." All Polish officers present nod approvingly and look with scorn on an old peasant woman who wants to return home to her children and knows nothing about politics.

NATIONAL PROVIDENT INSTITUTION FOR MUTUAL LIFE ASSURANCE

Established 1835

48 Gracechurch Street, London, E.C.3

Next Valuation - 31st December 1945

Mr Truman has widely-based support in his wish to have the United Nations charter ratified before the Senate recess and Senators are already receiving a sample of public reaction in wires and letters from national organisations and individuals insisting that they finish the job before taking their summer holiday. Unquestionably, the accomplishment of ratification would be a support for the President at the Big Three meeting. Mr Walter Lippmann, in urging this view, added rather cryptically that the charter must be explained carefully when it is presented to the Senate. Possibly he was concerned with the opposition group, which is gathering its forces now, and will be only too eager to interpret the highly complex language as they want it to be understood.

The isolationist Senator from Montana, Mr Wheeler, who believes that peace terms should be worked out before the Charter is approved, is said to be compiling a report based on gossip he gathered on a trip to Europe about atrocities committed not by the Germans, but by the Americans, the British, and most importantly, the Russians. Senator La Follette, an isolationist who has not hitherto expressed himself on foreign policy since Pearl Harbour, insists that he is no perfectionist, but objects most violently to the veto power by which the five Great Powers can veto charges of aggression against themselves. Mr La Follette does not deny that if the United States were deprived of the veto power which he attacks the chances of Senate ratification of the treaty would drop abysmally.

While there are definite indications of the possible outlines the campaign against ratification will take, there seems to be agreement with the prediction of Mr Capper, Republican Senator from Kansas, and member of the Foreign Relations Committee, that the Senate will ratify the charter with few if any reservations. It is pointed out that the Senate has not just been a consultant, but has contributed to the formulation of the charter. Also, public opinion in the United States, shaped by months of radio talks, round tables, lectures, films and other forms of information, has rarely been more articulate on any issue.

The Transport Bottleneck

Americans are no longer being asked if their journeys are really necessary. The unparalleled movement of population and material over the railroads makes most journeys, unless essential, almost impossible. "Redeployed" soldiers alone, during the first three months after V-E Day, will move across the country at a rate of 280,000 a month, and will eventually reach a peak of 500,000. The armies which took almost four years to move into the European theatre of operations will transfer to Japan by way of the United States in ten months. Added to this, there are casualties—44,000 a month from Europe alone—furlough trips and trips for the estimated 2,000,000 men to be discharged.

Vast quantities of material must accompany the troops moving westward to ports on the Pacific Coast, while European rehabilitation supplies move eastward in steadily increasing amounts. The burden imposed upon a railway system already operating beyond capacity is intensified by the shortage of skilled workers, by deficiencies in equipment, and by industrial migration caused by cancellation of war contracts.

Meanwhile, satisfaction over a wheat crop for 1945, which the Department of Agriculture predicts will reach a new high record of 1,084 million bushels, is tempered by disturbing reports that the box car shortage has been so acute that farmers have been dumping freshly harvested wheat crops at depots. Goods wagons are being rushed to the area to carry the wheat from the middle west.

This is of grave concern to the European countries, to whom 285 million bushels will be sent if transport can be found. The War Shipping Administration has announced that present shipping levels to liberated Europe would be maintained, but has issued a warning that from July, when the war programme in the Pacific will be accelerated, a "tighter situation" would prevail. This presumably means less flexibility and less possibility of adding tonnage to meet emergencies.

Relations with Russia

Propaganda against the Soviet Union was reaching alarming proportions in the United States when Mr Harry Hopkins returned from Moscow after completing his successful mission. Twice in two weeks Mr Wallace, Secretary of Commerce, had found it necessary to speak out against "enemies of peace" who "would provoke war between the United States and the Soviet Union." He emphasised

that Mr Truman's policy toward Russia was identical with the policy of which Mr Roosevelt was the architect, designed to cultivate friendship in peace as well as under the stress of war necessity.

Responsible elements of the press, from left to right, seemed grateful for Mr Truman's generous praise of Mr Hopkins's mission, and for his statement that Russia has done "some very pleasant yielding." For out of this they could fashion strong comment on the brightening possibilities for friendship between the two Great Powers despite the differences in their economic and political systems.

Writing in the *New York Times*, Mr Reston listed "ten concessions by Russia which have contributed greatly to liberalising the proposals" emerging from the San Francisco Conference. True, they might be matched by concessions the other Powers have made, but insufficient attention has been paid to the fact that the Russians, like other countries, were willing to give up part of their programme to help keep the conference intact.

Other commentators have been recalling the all too ample justification for Russia's suspicions of her western Allies: the United States, not the Latin American countries, they said, now appears to be responsible for the admission of the Argentine; they pointed to Anglo-American dealings with Franco when even faintly justifiable reasons no longer exist; to sometimes implied, sometimes outright support of the right movements and hostility to the left in Greece, Italy, France, Holland, Belgium. The Soviet Union, with some justice, has been criticised for ignoring public opinion in America, but it is not unlikely that a study of some of the press commentary on the San Francisco conference has contributed to its attitude.

Meanwhile Mr Hopkins, who was always content to be an extra set of ears and eyes to the dead President, and was quite willing to disregard the almost contemptuous appraisal his years of service were granted by most American newspapers, must have rubbed his eyes incredulously when he saw attached to his name such words as "courage," "self-sacrifice," "loyalty," "skill." And by one radio commentator, Mr Swing, Mr Hopkins was called "one of our strongest war leaders."

Post-War Conscription

The issue of compulsory military training is now out of the realm of polls and talk, and is facing the cold, hard light of a hearing before the Post-war Military Policy Committee of the House of Representatives. Public opinion polls have indicated that a majority of Americans, who in the past have nourished a tradition opposed to the conscription of youth, would now vote for one year of military training for all able-bodied young men. But poll techniques do not encourage careful study of an issue of such complexity.

The Bill now in Committee is strongly backed by the Army and Navy, by veterans' organisations, the US Chamber of Commerce and other organisations. Army leaders explain, with almost disarming frankness, their haste to pass the Bill even while one-fifth of the male population is in service, with those who are overseas unable to influence legislation. Apparently they are convinced that conscription is necessary for national defence, and they believe from past experience that public interest in military affairs will inevitably fade after the war.

The discussions thus far have many of the elements of a selling campaign conducted in a vacuum and embellished with fine and totally undefined phrases like "adequate security," "vital for public defence," "contribution toward the effectiveness of the world security organisation." Many of those who oppose the Bill are saying that intelligent conclusions cannot be reached until the shape of the post-war military system of the United States, in support of its foreign policy and inseparable from its international relations, emerges. Moreover, they are inclined to discount the arguments that conscription would be good for health, discipline, leadership, and education, or that it would relieve unemployment, since none of these things is the proper concern of the Army.

Writing for *Harpers' Magazine*, Mr Hanson Baldwin, military analyst for the *New York Times*, who is uneasy about hasty legislation on a matter that will have a profound effect on the future political, economic and social life of the country, recommends that a fact-finding commission be appointed to study the place of compulsory military training in the context of the post-war United States. Military men would advise, but should not be members of this commission, which would be composed of the ablest judges, scientists, lawyers, educators and Congressmen. A sound decision on peacetime conscription, he says, would result from the findings of such a commission.

From the Bavarian Forest another sort of convoy descends slowly into the Danube plain. It consists of gypsy-like, horse-drawn carts crammed with human beings, bedding, sacks and wooden boxes. The gypsies are Germans. Some of them fled from Moravia before the Russian armies. Others have been expelled by the Czechs from villages near the frontier. They are resigned and apathetic. For themselves they expected no better fate. Some hope to settle down with distant relatives in Bavaria. Others have no straw to clutch at; they only hope that there will be less famine in Bavaria than elsewhere in Germany. They want to work; and the fatherland or the victors must provide employment for them. They are the torn branches and leaves of the blasted German tree, and they want to be grafted back again.

At the other side of the road, a tall, thin woman tries to explain something in broken English to two American officers. In her confused, unintelligible story two words keep on recurring: *Gas-kammer*. It turns out that seven years ago her child was classified by a Nazi doctor as mentally defective. The family doctor disagreed with the diagnosis, but his opinion was ignored. In accordance with the rules of "racial hygiene" the child would have to be thrown into a gas-chamber, the Nazi version of the Tarpeian rock. The mother hid the child in a remote place, some two hundred kilometres away. The last time she saw the child it was nearly starving. Could she now get a permit from the Military Government to go and fetch her child? There are no trams or buses, so she would go on foot. But it is so difficult to come into the presence of the Military Government to ask for a travel permit—the German Bürgermeister is powerless.

The sufferings and fears of half a score of nationalities have for a while met here, in the middle of the pleasant sunlit Bavarian road. Soon they will float away, each carried by a different wind and into a different country. But not soon, nor very easily, will they be cured and dispelled. Many peoples have such strained, shattered nerves that for a long time they will remain prone to phobias, hysteria and other mental disorders that may overhang the spiritual and political life of Europe. Not soon will the stench from the corpse of National Socialism be blown away.

If the roads of Bavaria could speak of the things they have seen in the last few months and weeks they would tell a story as broad, simple and stirring as Tolstoy's "War and Peace," more fearful than Dante's "Hell" or the phantoms of Edgar Allan Poe, and, at times, as tragicomic as Hashek's "Brave Soldier Shveik."

Development in West Africa

[FROM OUR ACCRA CORRESPONDENT]

WITH the publication last March of the Nigerian Government's "Preliminary Statement on Development Planning in Nigeria," it is possible to form some idea of the strategy which may be employed in West Africa in applications for assistance under the Colonial Development and Welfare Act. Under the Act of 1940 expenditure in the colonies was provided for at the rate of £5 million a year for ten years. Funds up to that annual amount not expended reverted to the Treasury. But under the new Act £120 million are provided over the ten years beginning in 1946; up to £17 million may be spent in any one year, and sums up to that amount not spent may be carried over into the next and subsequent years. Thereby, an important element of elasticity is introduced into the Act, for expenditure can be planned so as to have the optimum effect on each colony's national income and to coincide with the availability of men and materials to carry into effect the various development schemes. Capital investment assisted by the Colonial Development and Welfare Fund can now be used as a flexible instrument of long-term economic policy. The Nigeria Government has made an attempt to fit applications for assistance under the Act into a time schedule based on certain assumptions. Apart from the question of whether the schedule can be adhered to, the layout of the programme and the accompanying explanations should serve as an excellent model for the other West African Governments which are all faced with very similar post-war problems. The history of development and welfare schemes in West

Africa up to March 31, 1944, can best be summed up in the accompanying table:

Colony	Agriculture, Forestry and Vet'y	Communications	Education	Housing and Sanitation	Medical Services	Misc.	Total
Gambia.....	89,204*	£	52,521	£	30,000	£	213,299
Sierra Leone ..	303,500	...	48,500	...	37,674	3,900	396,400
Gold Coast.....	...	...	100,000	...	41,400	1,000	108,400
Nigeria.....	50,700	50,000	9,000	104,000	7,480	234,155	447,855
W. Africa†.....	...	...	...	...	...	128,270	128,270

* Shared with Sierra Leone. † Not attributable to any one colony.

Most of the schemes up to that time were of an isolated nature, submitted largely by the two smallest and poorest colonies where development had been retarded for years by lack of funds and for whom the Colonial Development and Welfare Act was a providential opportunity for effecting long delayed plans. Nigeria and the Gold Coast were slower to ask for assistance, after allowance has been made for their larger populations, partly through difficulties of staffing and co-ordinating development committees in war-time and perhaps partly through a wary scepticism of this "new deal" for the colonies. But in 1944 a development secretary was appointed in Nigeria and an economic adviser in the Gold Coast, and a development adviser was added to the Resident Minister's staff. These and other circumstances resulted in a more coherent arrangement of the planning committees and the discussion of development plans between the West African Governments as well as in the individual colonies.

The Importance of Timing

The difficulties involved in planning capital outlay under the Act of 1940 were seen in the Gold Coast development plan of 1944. The fact that Governments could rely on obtaining funds in only limited and approximately equal amounts each year over ten years was no doubt a factor in the Gold Coast's emphasis on the major rôle to be assigned in post-war development to its surplus of some £4,256,000 accumulated over the last few years. The Colonial Development and Welfare Fund was to be applied to for assistance only for a few specific schemes, fixed provisionally at £1,075,000. Applications were not related to a time schedule, nor was there, in the published programme, any discussion of the rôle which carefully timed capital investment might play in the expansion of the Gold Coast's national income on various hypotheses regarding the trend of exports and imports over the next ten years or so.

Yet such an approach to the problem is of the greatest importance if the four colonies are to deal with the problem of transition from war to peace satisfactorily. From the Nigerian statement on planning it would appear that the Government has taken into account certain broad facts regarding the possible trend of Nigeria's economy over the next decade. These can be expressed in general terms and apply to each of the four colonies in much the same degree. During the war large numbers of men have joined the armed forces, and have saved money or have given their dependants separation allowances which have had to compete with increased labourers' earnings for a limited supply of price-controlled consumer goods. Purchasing power has therefore been pent up in much the same way as in Britain. This purchasing power will help to stimulate activity inside the colony and to attract increased imports as controls are removed. Increased imports of machinery and of materials can also be expected as a result of the development schemes. To balance this, the colony must rely on an expansion of exports and on receipts from foreign loans, including assistance from the Colonial Development and Welfare Fund. This state of affairs may last for some time after the end of the Japanese war. Once wartime jobs and demobilisation are finished with, provided that capital investment has been on a large enough scale and that exports can be maintained to a reasonable extent, Nigeria's internal economy may be able to take up the slack. To quote the Government's statement:—

It is also hoped that the country will become more productive and consequently wealthier as the developments proceed. . . . If this does not happen, the development programme will not have fulfilled its purpose.

No one can disagree with this. It is only unfortunate that it has not been possible to include the agriculture and forestry development plans in the general framework as

yet and to publish a flexible import and export programme which must remain, to the public at least, a major unknown quantity.

The salient features of the Nigerian plan can be briefly sketched. The whole scheme, portions of which have still to be worked out in detail, is to cover the years 1945 to 1960, but attention is focused at present on the years 1945 to 1955. Development expenditure over this period is to be between £35 million and £40 million. Schemes already submitted from this total are to receive £6,598,000 from the Colonial Development and Welfare Fund as already approved in London. Clearly, this is only a beginning, and further extensive demands will be made on the Fund later. The following table sets out the estimated provisional cost of the principal schemes; plans for the vitally important departments of forestry, agriculture and veterinary have yet to be published.

Nature of Scheme	Approximate Development Period	Provisional Estimated Cost of Scheme
Road development	1945-60	7,000,000
Telecommunications	1945-57	900,000
Hydro-electric development	1945-59	1,800,000
Rural water supplies	1945-60	5,000,000
Urban water supplies	1945-58	5,000,000
Building programme	1945-55	9,000,000
Education	1945-55	1,688,000†
Medical Services	1945-60*	8,000,000*
100 Temporary officers to operate schemes	1945-51	400,000

* Very provisional. † Beginning of a £5-6 millions scheme.
§ Early stages to have C. D. and W. assistance. † Later stages to be financed by loans.

Assistance from the Colonial Development and Welfare Fund is to be concentrated, as far as possible, into the early years to stimulate Nigeria's internal activity sufficiently for it to finance the later stages of the schemes by increasing its external indebtedness in the London capital market. In this connection it will be noticed that a substantial part of the money for development is to go into improved communications and hydro-electric installations, two key plans for opening up the trade of the territory. The order of priority of the schemes and the outline of the strategy of finance have thus been arranged. The detail of the tactics can be left flexible to take account of changing circumstances.

Men and Materials

But, as has been stressed out here repeatedly, the crux of development is adequate staff, machinery and materials. Carefully timed schedules of investment and money from the Colonial Development and Welfare Fund are no more than blue-prints unless administrators and technicians can be found to carry them out. Constant reference to technical developments in Britain and America, and frequent discussions between officials in the United Kingdom and West Africa, are vitally important. The isolation, both administrative and technical, which money without men will bring can lead only to disappointment and disillusionment among Europeans here and strong resentment among Africans. The release of men and equipment for West Africa—indeed, for all the colonies—is an urgent matter of policy—now.

Swiss Trade and Finances

[FROM OUR GENEVA CORRESPONDENT]

DURING the first four months of the year, imports totalled 147 million francs against 483 million during the corresponding period of 1944, a drop of 75 per cent in value and of 90 per cent in volume, while exports reached 318 million francs, a drop of about 45 per cent in value and of 70 per cent in volume. The Government is, therefore, very concerned about the replenishment of the country, and the negotiations with the Allied Governments were keenly awaited. The Allies guaranteed, to a certain extent, that Switzerland would be able to obtain from overseas the supplies of essential foodstuffs and raw materials it now lacks. These imports depend on transport facilities through France. The port of Toulon has been put at Switzerland's disposal, and some ships have already unloaded goods which are transported by rail to Switzerland at the rate of about 600 tons a day. So far, Switzerland has concentrated on the importation of all sorts of goods which had long remained in the Portuguese and Spanish docks.

Despite these efforts, Switzerland's position will remain precarious for a long time to come as present imports are insufficient to replenish stocks, which are on the point of exhaustion. Thus, drastic rationing is being maintained, especially in regard to foodstuffs. The food situation has been further aggravated by the abnormally cold spell at the beginning of May when an overnight frost destroyed almost all vineyards, fruit trees and even vegetables, the result being a rise in the price of the few fruits and vegetables available. It is announced, however, that stocks of potatoes will enable the gap to be filled until the next harvest.

Industry is still severely hampered by the lack of raw materials, especially of coal, imports of which have almost completely stopped. Gas had therefore to be drastically rationed and the gas and by-products industries are at a standstill.

The result of the negotiations with the Allies are nevertheless felt in certain trade quarters. Several Swiss mechanical works are now engaged on repairing French rolling stock and motor trucks; some printing firms are working on orders placed by the Allied Armies; and the machine and textiles industries register a small rise in their exports. Nevertheless Switzerland is so deprived of everything that it is a ready market for anything that exporters can offer.

The Budget Deficit

The accounts for 1944 show a deficit of 144 million francs for the ordinary Budget, and of 1,032 million for the emergency Budget which mainly concerns war-time emergency expenditure. These deficits added to those previously accumulated reach a grand total of 6,750,000,000 francs, which represents the debt of the Confederation at the end of 1944. It is estimated that, by the end of 1945, the debt will rise to about 9 milliards, including the 900 millions reserved for the redemption of the Federal Railways' Debt.

It is a large sum for a small country of 4,500,000 inhabitants, but it has arisen from various factors: the defence of the country, which involved 2 million francs a day for the upkeep of the armed forces; the building of fortifications and armaments; the emergency measures resulting from wartime conditions; and economic and social measures carried out by the Government. But these measures enabled Switzerland to go on living and working despite all difficulties.

THREE NUNS SAVES MONEY

—because of its

SLOW-BURNING CUT

There are two special reasons why 'Three Nuns' Empire Blend Tobacco saves the smoker money. It is scientifically cut to burn slowly, each ounce lasts longer, you smoke fewer ounces a week. It is made from fine leaf which is favoured by the lower duty on Empire Tobacco. To enjoy the fullest pleasure of smoking at a moderate cost, take to 'Three Nuns' Empire Blend.

**Sunsets can be preserved in
IODINE**

SOON your snapshot album will contain natural colour prints of your most treasured moments. Iodine is helping to make this possible. Colour photography is not unique in its indebtedness to iodine. Iodine has many and diverse applications. It has a part in the manufacture of dye stuffs, in the scavenging of metals, in the sterilization of animal tissues, in the sensitizing of telegraphic papers. The veterinary and agricultural sciences, as well as medicine and industry are finding new uses for iodine every year.

There may be an opportunity to use iodine in your work. If so, the Iodine Educational Bureau will be glad to assist you.

The Bureau is a non-profit making organization which provides information and advice on iodine's uses. Every fact published about iodine since its discovery in 1811 and each new development is recorded here. Any institution, commercial enterprise or professional man with a problem which iodine might help to solve, is invited to write to the Bureau. There is no charge for its services.

THE BUSINESS WORLD

Reconversion Problems for Copper

THE copper industry has arrived at the crossroads. In this country demand began to slacken as long ago as the beginning of last year. After absorbing annual net imports at the average rate of 465,000 long tons from 1940 to 1943, compared with average retained imports of 262,000 tons between 1935 and 1938, the Ministry of Supply was able, in January, 1944, to order a cut in Northern Rhodesia's copper production. One year later, on January 31, 1945, the Ministry finally cancelled its wartime bulk buying agreements with the Empire copper producers. On both occasions, however, the heavy United States military copper consumption brought a postponement of production cut-backs. Now the position is changing in the United States also. A statement recently issued by the Copper Division of the War Production Board puts the immediate reduction in military copper consumption as a result of the change from the two-front to the one-front war at not less than 264,000 tons per annum. [The announcement that liberated and certain other countries will be able to meet their needs of copper—and of lead and zinc—by direct negotiation with producer is no doubt a reflection of the reduction in military demand.] The turning point in United States consumption may be regarded as an indication that the negotiations for a planned reconversion of the international copper industry cannot be far off.

Copper producers look at their prospects in the reconversion period with considerable apprehension. This does not mean that they doubt a revival of civilian demand in the traditional copper consuming industries. The uses of copper in civilian industry have always been dependent on three important factors—the excellent electrical and thermal conductivity of the metal, its great resistance to rust and corrosion and the ease with which it can be processed. These properties have secured for copper a strong position in the electrical industries, in building, motor vehicle manufacture, general engineering, household equipment, chemical plant, food processing and a multitude of lesser activities. The majority of these traditional copper consuming industries may in the next few years experience the greatest boom in their history.

Nevertheless, in the short and medium term, the copper outlook is not encouraging. World consumption of copper rose fourfold in the first three decades of this century, but the market was beset by a chronic surplus problem, which found expression in the introduction of a series of restriction schemes, the last of which was in force up to September, 1939. The chief reason for these surpluses, apart from the introduction of more efficient production methods and equipment, was the development of the rich copper resources of Chile, Canada and Central Africa. The two factors combined raised the potential output of the world's copper mines by 1939 to close on 2,500,000 tons a year, roughly five times the total in existence at the beginning of this century.

During this war the world output of virgin copper does not, on the latest evidence, appear to have been much in excess of 2,500,000 a year; but in Chile, Northern Rhodesia, Canada, Belgian Congo, Cyprus and Soviet Russia development schemes have during the past five years been initiated which, after their consolidation, may add a substantial tonnage to the industry's capacity. This prospective addition to productive capacity may give rise to difficulties. There will be some increase in civilian demand in countries such as the United States, Great Britain and the Soviet Union; but this is likely to be accompanied by a decline in the demand from the Axis areas, which before the war were in the front rank of copper-importing regions.

But the problem of restoring equilibrium in the post-war copper market is not confined to adjusting current production to the level of current absorption. At the end of this war the British and United States Governments

will be left with substantial reserves of new copper, which may total as much as 500,000 tons. There will be in, addition, a large reserve of copper scrap which, after retreatment, will be suitable for re-use in the majority of copper products. During the whole period of this war non-civilian consumption of copper appears to have been in the neighbourhood of 10 million tons and, while the amount that may be available after demobilisation in the form of scrap cannot be estimated accurately, it is not inconceivable that as much as one-fifth of the total war consumption may be recovered during the next few years. This would suggest that in addition to new production an amount not far short of a full year's potential output of the world copper mines will be available during the transition period in the form of Government holdings of new and secondary copper.

Moreover, apart from these rough edges in the short-term supply picture, the copper industry will have to face increased competition from other materials, especially from aluminium. Formerly, this metal competed with copper to a limited extent; today the aluminium industry is a far stronger competitor. Before the war the volume (as distinct from the weight) of the world aluminium output was somewhat smaller than that of copper; at the time of the wartime peak output of both metals it was almost three times as large, and the aluminium industry will have to make use of every opportunity to extend its civilian markets. In this it will be greatly assisted by the fact that aluminium prices, in contrast to those of copper, have been substantially reduced since 1939 and, on a volume basis, are now half those of copper.

The re-conversion of the copper industry will thus be no mean task. The industry itself will not be able to solve it without active co-operation from the Governments; some plan for the withholding or gradual disposal of Government surpluses of both new and old copper seems indispensable. The adoption of such a plan—towards which the United States' project of creating permanent reserves of strategic materials may make a considerable contribution—would not suffice to restore equilibrium on the copper market. Despite the impending boom in the electrical, building, motor-car and other copper consuming industries, world consumption of copper is unlikely during the next few years to reach or exceed 2,500,000 tons per annum; apart from the temporary limitation of consumption in the Axis countries (before this war these absorbed one-quarter of the world's new copper supplies) the destruction of fabricating facilities in Continental Europe and the possible encroachments of aluminium on markets formerly held by copper will put a brake on the expansion in world absorption.

In addition to the regulation of surplus stocks, steps will have to be taken to stimulate consumption and to adjust output to the capacity of the market. In the first direction the copper industry has already initiated extensive research and development schemes. As regards the regulation of future production, persistent rumours of negotiations between international copper producers and copper producing Governments were in circulation at the turn of last year, but, so far as can be ascertained, no definite moves towards this end have been initiated.

The introduction of constructive plans for the regulation of world copper supplies on a basis which does not penalise consumers is complicated by the artificial structure of the international copper market. The United States, the world's largest copper consuming region, is, in normal times, through its prohibitive customs barrier, a closed market for copper. There are no prospects that these conditions, designed to reserve the American market for the domestic producers, will be altered during the next few years; in the long run, on the other hand, the growing depletion of United States copper resources may force the country to re-integrate itself with the world market. Until this stage is reached, there can be no basis on which a world-wide regulation of copper production can be attempted. While United States producers will have to work at full capacity

to meet their home demand, the whole problem of surplus capacity is thrown back on to the rest of the world. Moreover, since United States producers are working at higher average costs than their foreign competitors, their only interest in any international scheme would be (as the example of Copper Exporters' Incorporated—the world copper cartel of the 'twenties—has amply proved) to raise the international copper price level. Such an arrangement, while perhaps not unattractive to individual firms in the copper mining industry, would not only hit the copper importing countries, of which the United Kingdom is the largest, but it would also delay, if not prevent, a gradual rise of copper consumption to the level of the industry's productive capacity. A low copper price is the best means of stimulating consumption. Since the advent of the aluminium industry to maturity this has become more indispensable than ever, and attempts at combining any post-war copper regulation schemes with designs of keeping

prices at the highest possible level would invite disaster. Fortunately the great copper producers of Chile, Canada, Rhodesia, and to a lesser extent of the Belgian Congo, which control the greater part of what must, within the present artificial market structure, be classified as excess capacity, are producing at low cost. This fact should facilitate the creation of conditions which permit a gradual normalisation of the copper market. In this the interests of consumers and of low-cost producers are identical, and any concessions which the British Government proposes to make to the copper industry as regards the disposal of its war stocks should be made subject to the acceptance by the producers of principles which guarantee fully adequate supplies of the metal for all needs at prices which are in line with the production costs of efficient suppliers. It would be the height of folly if the British Government, by sanctioning a high price policy, were to deprive British industry of a price advantage in one of the most important raw materials.

Responsible Stockbroking

THE stock markets of the country are from now on free to perform their function of bringing together those whom Government policy permits to raise money and investors desirous of finding suitable securities for their savings. It is the purpose of this article to set out recent changes in organisation and to see how far they contribute to the efficiency of the machinery for this purpose and for business ancillary to it. A second article will outline further projects already in contemplation and attempt to make suggestions for further improvement.

The market, if it is to render full service, must take account of the changing organisation of industry—which is, after the Treasury, the principal source of demand for capital—and of the altered distribution of incomes, from the unexpended portion of which the supply of capital must be derived. Much has been said of the changed attitude of the stockbroker towards his function in recent years, but it is by the degree to which the new circumstances have been met that the recent developments must be judged. Space must limit detailed consideration to the period since the regrettable new issue boom of 1927-29, but it will be useful, as a preliminary, to take a glance back to earlier conditions and to some earlier developments.

Forty years ago, that is, at a time when some of those who are to-day the leading figures of the profession were already in, or about to enter, the "House," competition between brokers was as nearly absolute as may be. Between 1905 and 1909, however, as a result of continuous pressure, the Committee was persuaded to introduce the scales of minimum commissions, which remain in force, with minor changes, until to-day. To a large extent, this reform substituted competition in service for competition in price, a distinction which has been of growing importance from then on. The principal classes of security dealt in at that period were home railway stocks, foreign bonds, and more frankly speculative issues, such as gold mining shares, American railway ordinary stocks and, later, rubber plantation shares. In the few years preceding the war of 1914-18 possibly the largest turnover was in purely speculative "Yankees," in which there was a huge arbitrage business between New York, London and several Continental centres. There were, of course, other more solid securities, but the list of gilt-edged stocks was restricted, while of long-dated Government stocks the supply was extremely exiguous. Many of Britain's leading industries financed themselves at long-term entirely out of funds ploughed back from profits, which were then subject only to income tax at a rate averaging some 1s. 6d. in the pound. Market business originated mainly from rich men, whose savings provided most of the "new money" coming into the market, and from institutions, many of which indulged in large-scale speculation on money borrowed from the market in the first instance through the means of the "contango." It is no exaggeration to say that two of the most important qualities in a good broker were ability to do exactly as instructed, and to do it more quickly than the next man.

The war of 1914-18 brought several great changes, some of which have their counterpart in the past six years. These included the creation of a large volume of Government stock; high taxation and larger capital demands from industry; a redistribution of income, with the result that the broker was much more frequently treated as an adviser

rather than a mere executant of orders; and finally, the disappearance of the "Yankee" market, at least for the time being. To these changes brokers voluntarily added two more: the evil practice of dealing in results of an allotment of a new issue before the allotment was made was forbidden; and most brokers refused to do "contango" business. That is, in effect, they told their clients that they must persuade someone else to finance their speculations if they had not the money to do it themselves. All these moves struck a blow, the first of several, at the more rabid type of speculator, and left the broker free to consider the more essential elements of his business.

Regrettably, for the next eight years or so, little more was effected. But throughout that period a number of men, some in the provinces, but most members of the London exchange, were working to secure reforms. While the House as a whole was prosperous their efforts gained little ground. But the character of the new issues in the 1927-29 boom and its culmination in the Harty scandal convinced all but the most conservative that substantial reforms were overdue. The method of the "Harty settlement" was itself a first step, for it abandoned the principle that, in all circumstances, each individual firm was solely responsible for its own losses. Instead, the committee of the London Stock Exchange appointed a body to prepare a scheme which allocated the bulk of the cost of covering the balances necessary to effect a full settlement between the various groups involved, including country brokers, and provided that contributions should be forthcoming to fill the gap from those not directly involved.

This sub-committee reported on January 15, 1930. Eight months later, the London Committee had greatly extended the information which a company must provide when seeking permission for dealings in its securities. These changes some of which followed from the new Companies Act greatly increased the protection of the investor. Since that time, the sub-committee charged with the examination of applications has always considered it has a duty to the public to see that the position of the company is made reasonably clear. Very properly, it assumed no right to refuse permission on the ground that a security was "speculative." It did insist that the character of the security should be apparent to an intelligent reader who took the trouble to inquire. The definition of how much information was "reasonable" to expect has changed as the years passed, and will, it may be hoped, continue to expand. The last important step was taken in 1939, when it was made obligatory for the voting rights to be specifically stated in the case of preference issues, and when the publication of consolidated accounts was made a condition of any new issue.

The modern technique applied to the "vetting" of new issues, including the fullest use of the new central Record Office of the Stock Exchange, which contains all available information about the status of those through whose hand the business of application for permission to deal is likely to pass, has been of great service to the investor and should render valuable aid in the approaching period of reconstruction. Despite the fact that any deterrent placed upon new issues means a reduction in business, at least for the moment, the very stringent rules now applied have aroused very little opposition among members, although, as is shown

by a case recently decided, the duties assumed by the sponsors of a new issue toward the sub-committee which deals with them and to the Council are still not universally appreciated. According to the ruling then given, the applicant broker is in the position of one engaging in a contract *uberrimae fidei*, in that he must disclose any information in his possession which is detrimental to his principal, and he may be censured if he does not take reasonable care to obtain such information as is available. The London market has still no control over the conditions in which a provincial exchange grants permission to deal on its own floor. But this is not a serious breach in the arrangements.

While the control of new issues in the public interest is probably the greatest service that the London market has rendered to the investing public, there is another matter of prime importance which has received much attention in the past fifteen years and in which the London market has done a great deal. This is the cost, and the improvement, of the facilities which it affords. The controllable cost is made up of two elements: the broker's fees and the jobber's turn. The contention of London in this respect is that the greater the proportion of the total business transacted that passes through its market, the lower both of these will be per unit. (Exception is allowed for certain securities for which the best market is in one or other of the Associated—that is, provincial—exchanges.)

With this object in view the Stock Exchange has developed three lines of attack on practices considered undesirable. These are: the limitation of full commission rebates to members of recognised institutions; the revision of commissions paid to agents; and the conclusion of arrangements with recognised institutions for a common policy and for the elimination of certain practices held to limit the efficacy of the London market. The whole question of the absolute cost of services rendered by brokers will be dealt with in the subsequent article. But a word may be said here about the limitation of competition which these changes appear to involve. The only cases in which business could be done more cheaply than through the London market were those where a house could collect, usually by advertisement (which it is an article of faith to forbid), a large volume of business in a few selected securities—the list being changed as speculative interest shifts—and could "marry" the bulk of these orders. It is to be observed that, in these cases, the marriage price is based on the London quotation, and that the house in question can only adopt this method if it has the assurance of being able to sell or acquire any balance of stock left over, or required, on the London market.

As for the sharing of the London brokers' commission with other brokers and agents, the development of the Committee's policy has proceeded by stages. Originally, everybody who brought in business received half the commission, but there was a ban on brokers who advertised and on members of institutions within the London area, whether they advertised or not. At the beginning of 1933, the percentage was cut to 33½ for everybody but bankers, stock exchange clerks, and recognised brokers who, for all practical purposes, were members of provincial exchanges, and those on the Somerset House list. Four years later, the London exchange substituted a much reduced "White List" for that of Somerset House, but recognised all members of provincial exchanges as such. Again in mid-1941 the "White List" was abandoned and its members had to apply individually for admission to the General Register. At the same time, the rates of rebate allowed were cut from 50 per cent to 33½ per cent, and those previously fixed at 33½ per cent to 25 per cent. Thereafter members of the Associated Stock Exchanges (those exchanges which provide a trading floor of their own) and the Provincial Brokers' Stock Exchange (an association of recognised brokers not members of any exchange)—to which was later added the Oldham exchange, which is not a member of either body—were charged 50 per cent, banks, remisiers and clerks received a return of 33½ per cent, and all others 25 per cent of the full commission. Each class had to obtain admission to a special list, and this list is revised yearly. This not only removed the need for a rise in the London broker's charges; it also made it possible for London to force outside brokers to conform to the standards of conduct laid down for the London Stock Exchange, and to concentrate agency in the hands of those who make a business of it and can render some service to their clients, to the brokers or to both. It is only fair to add that the reduction in rebates to agents was also an element in a general scheme of securing common practice as between London brokers and others,

for in the past many provincial brokers had given no rebate whatever, the agent being left to find his remuneration where he could. Since June, 1941, members of the Associated exchanges, of the PBSE, and later, of Oldham, have for the most part adopted similar rules. In September, 1941, the advantages of half commission were extended to a long list of Dominion, Indian and Colonial exchanges recognised by the London Committee.

The position as regards other dealers in stock and shares is still not ideal, but the arrangements concluded with the Associated Stock Exchanges and the Provincial Brokers' Stock Exchange in June, 1941, mark a great advance towards the ultimate objective of common practice throughout the profession. Briefly, the Consultative Committee of the Council of the Associated Exchanges agreed to recommend regulations as to commissions, the treatment of non-members and general professional etiquette towards members in order to bring their practice into line with London. *Mutatis mutandis*, the Committee of the PBSE agreed to put forward recommendations designed to promote the same aim. In the following year there was set up a Joint Advisory Committee of the three bodies, London, the Associated Exchanges, and the PBSE, before which all questions of common interest could be ventilated. The deliberations of this body are not made public and it is difficult to claim that its existence has greatly influenced the actual regulations of any of the three bodies. But its effects in securing the ventilation of grievances, real or supposed, in explaining the different needs of members, and in promoting smooth working and the adoption of a common standard, have exceeded the hopes of the most sanguine.

It will be observed that all these developments have two main effects. They tend to a standardisation of practice within the business of stockbroking, and they tend equally to limit the full rigour of competition by restricting the devices permitted. In the case of dealers in stocks and shares outside the three groups named, there is definite discrimination, since they do not enjoy the benefit of dealing with members of the groups at less than full commission. The intention of London in this matter was, and is, definitely to achieve the former effect and to prevent the unfair use of the London market by people who do not observe its regulations and make no contribution to its maintenance. The Stock Exchange quite genuinely does not consider that its object is to limit competition, and it points out that no new limitation is placed upon competition so long as the would-be competitor will bind himself to pay his share and observe the rules. Further, it is maintained that the restrictions placed upon members of the three groups can be, and are intended to be, used in the public interest. These are all familiar arguments of those who practise association price-fixing and limitation of the field of competition. But there is this difference. Whereas the trade association normally makes it more difficult for new entrants to get a start, the stock exchanges are making it easier, at least on the financial side, for new blood to get in, whether as new firms or as partners in established ones. Further, competition in service remains unrestricted.

All these changes add up to an altered mentality among brokers, which is the counterpart of similar movements in many other fields. It is a mentality which prefers reasonable, but secure, profits to long risks with the alternatives of a brilliant success or equally striking failure. The business of stock broking is becoming a service industry, and the members are behaving in a way which tends to limit the possibilities of speculation both for themselves and for the public. There is not necessarily any danger in this change. Everything depends upon the energy and acumen with which the new objective is pursued.

There have to be added to these major changes a number of others, each possibly of minor importance in itself, which collectively account to a great deal. These include the publication of stock exchange accounts; a realisation that the public—and therefore the press—has a right to know what the Stock Exchange is and what it does, and that the officials of the Stock Exchange have a duty to spread this knowledge; and a number of other efforts to obtain and provide accurate information, such as the insistence that announcements of dividends and preliminary statements shall not be misleading. Whereas even ten years ago almost every decision of the Committee was considered a domestic matter concerning which it was impertinent even to enquire, to-day there is scarcely any body in the country so willing to discuss and explain its action as the Council—to give its new title—and the appropriate officers of the London Stock Exchange.

Business Notes

Canadian Dollar Rumours

Rumours of an appreciation of the Canadian dollar, which have recurred—and subsided—at intervals for some time past, have become unusually persistent this week. They seem to have originated in New York, and have been accompanied by such substantial demand for Canadian securities from that centre that the effects have been noticeably felt in the London market as well as Canada. The markets readily assume that such buying must be “knowledgeable” but on such matters as these the secrets of the leading monetary authorities have usually been extraordinarily well kept. On purely economic grounds, it is no easier now than it has been for months past to forecast that a rise in the Canadian dollar to parity with the American is, rumour would have us believe, imminent, for the normal economic criteria have long pointed to substantial undervaluation. When, on the eve of the war, sterling was depreciated by 13½ per cent against the US dollar, the Canadian dollar, previously at parity with the US, followed this movement to the extent of 10 per cent. As Canada was at war but the US was not, this depreciation from a position of presumed equilibrium was designed to give the Canadian authorities elbow-room for the meeting of wartime stresses without putting undue strain upon the pegged exchange rate. But the subsequent trends, especially since America entered the war, so far from wiping out this apparent undervaluation, may even have increased it.

Canada, with her wartime system of physical controls, wage-stops and subsidisation of the cost of living, has kept her price and cost structure more tightly in check than the US has done. Thus, farm products since 1939 have risen by 63 per cent in Canada, but by 95 per cent in the US; raw materials by 55 per cent compared with 65 per cent; foods by 37 per cent compared with 49 per cent; and manufactures by under 20 per cent compared with 26 per cent. Over the same period, the Canadian cost of living, rigidly stabilised since the end of 1941, has risen by only 18 per cent, whereas the US rise has been 27 per cent. Official price indices are not particularly unreliable guides to purchasing power parities, but in this case it is safe to assume that any inflation in the uncontrolled sector will certainly not be greater in Canada than in the US. At the same time, Canada's external position has been transformed by the war. In 1944 her export surplus (including mutual aid) reached \$1,850 million, easily the largest ever attained, and contrasting with \$436 million at the peak of the prewar decade.

These wartime trade movements are not, of course, indications of a corresponding flow of international payments. Still less are they sure pointers to post-war trade. But the evident strength of Canada's economy, the under-valuation of her currency, and fears of postwar inflation in the US have combined in the past two years or so to stimulate an increasing inflow of American funds. Quite apart from purchases of securities and direct investments, there has been a growth of nearly \$300 million since 1940 in the foreign deposits of the chartered banks, and one-third of this increase has occurred in the past year. Evidently, the pressure of natural forces against the stabilised internal price structure is increasing, and the mere expectation of a change in the rate accentuates it. The question whether to alter the exchange is, of course, entirely one for the Canadian authorities to decide, but it seems reasonable to infer that, having held the peg for so long, they would prefer to maintain it until post-war trends become more clearly discernible. As there is no likelihood of any early change in the sterling-US dollar rate, an appreciation of the Canadian dollar against the US, if it were to occur, would be accompanied by a similar movement against sterling.

Local Authority Loans

Last week the decision was taken to bring into effect the Local Authorities Loans Act, 1945, on August 1st, and in this connection there have been issued three SRO's, Nos. 678 to 680 Treasury Minute and an explanatory letter to local authorities. It is the last only which contains any new elements, and these concern procedure. Consent for any loan under the Act will normally be required from the

appropriate Government department and from the Public Works Loan Commissioners. It may also be necessary to obtain sanction from the Capital Issues Committee. The arrangements are such that it will normally be necessary for the borrower to make only a single application, that to the Department concerned. This is a great improvement on the rather cumbersome procedure applicable to issues through the market, and there would appear to be little reason why a similar simplification should not be adopted.

It is worth while to put on record the rates to be charged on loans advanced out of the Local Loans Fund under this and other Acts. Under the Local Authorities Loans Act, loans to territorial associations will bear interest at 2 per cent, if for not more than five years, rising to 2½ up to 10 years, 2½ up to 15 years, 3 per cent up to 30 years, and 3½ per cent for longer periods. Loans to housing associations under the Housing Acts will bear interest at 3½ for any period up to 50 years, and the same rate will be charged to companies and persons limiting their profits for all periods up to 40 years. If profits are not limited the rate is 3½ per cent. For loans under the Harbours and Passing Tolls Act, 1861, the rate is 3½ per cent with collateral and 3½ per cent without for all periods up to 50 years in each case. For all other loans and for any period the rate is 3½ per cent. The rates under the Housing Acts apply only to the provision of houses for the working classes.

So far as Local Authorities are concerned, these rates are no doubt an advantage to the borrower of little standing, and especially to the very small authority who is accorded access to this method of borrowing for the first time, but they are definitely the reverse of favourable to those of the highest status. The regulations limit borrowing on mortgages, which are not marketable, to the highest figure of the pre-war period and ban optional conversion to stocks carrying a higher rate than 4 per cent, while permission must be obtained for those not thus banned. The sole consolation for the efficient Local Authority of high standing is that, at present, the provisions of the Act expire at the end of 1950.

Market in Doldrums

The principal development in the stock markets over the past few days has been a progressive decline in the volume of business. This has been accompanied by a minor recovery in industrial equities, and a tendency for fixed interest prices to fall. Both these movements, however, owe something to dividend and interest payments. According to the figures of *The Financial News*, the yield on fixed interest stocks is unchanged, while the fall in the yield on equities is only about one-twelfth as much per cent as the rise in the price index. Nonetheless, it is rather surprising that equities should stand, amid the dust and fury of an election campaign, at less than 5 per cent below the peak figure of end-April. It is also interesting to note that, insofar as any conclusions can be drawn from the figures of bargains received, the fall in activity appears to have been significantly less in the industrial and commercial section than in the list as a whole.

Following on the short-lived activity in gold mining shares, there has been a distinct falling off in interest in all the more speculative sections, including even some of the foreign stocks. In market parlance, the investor is very definitely off his feed, and, although there is plenty of time for a number of developments before the result of the poll is known, it seems that the attitude of the investor towards the possible outcome is apathy rather than alarm. One section which remains active is that for the so-called internationals, that is to say, mainly Canadian Pacific, Nickels and Brazilian Traction, with a few other stocks of minor importance. It is suggested that a substantial amount of these stocks has been sold to North American buyers, the purchases being based on the supposition that the Canadian dollar is shortly to be raised to parity with the US currency. This point is discussed in detail in a preceding Note.

Shipping Profits

The Select Committee on National Expenditure has published the conclusions of its investigation into the war-

time profits of shipping companies resulting from the rates of hire paid by the Government for requisitioned vessels. The rates of hire include 5 per cent for depreciation and a 5 per cent return on capital, together with an allowance for certain costs based on average operating expenses. Although the basis of remuneration for war work varies as between manufacturing industry, rail transport and shipping, the Committee has found that, in terms of capital employed, the earnings of shipping companies have not been disproportionate to those of other enterprises engaged on war work; the Government's financial arrangements with the shipping industry have proved “fair and reasonable.” For example, statistics submitted to the Committee by the Financial Adviser of the Ministry of War Transport showed that on an average, liner companies whose financial years ended between September, 1940, and March, 1941, earned 3.6 per cent (taking account of the Inland Revenue allowances) on the capital values used in the calculation of wear and tear allowances; two years later earnings averaged 4.5 per cent. The experience of individual companies, inevitably, has varied, as has the rate of equity earnings which, obviously, depends on the ratio between fixed interest and equity capital.

The Replacement Problem

The Committee also inquired whether the tonnage replacement scheme, which envisages a seven-year replacement period, was likely to help towards the speedy reconstruction of the British Merchant Navy. By this scheme owners receive in cash the basis or pre-war value of the ships they lose; an additional payment is made to owners in respect of the difference between the basic value and the value at the time of the loss, but this is deferred until the equivalent of both amounts is used for the replacement of lost vessels.

Shipping witnesses have declared themselves in favour of the spread-over of seven years; the losses sustained cannot all be made good at once, and a rush of orders, like that after the last war, would merely drive up prices. On the whole, liner companies are eager to replace their ships as quickly as possible in order to maintain their goodwill and their crews. Tramp-owners are less anxious to rebuild unless “there was some guarantee that freights would be maintained on a paying basis”; to this end they favour the conclusion of an international agreement. This apparent conflict of views is largely a reflection of the probable supply of ships at the end of the war; liners and specialised vessels will be scarce, while cargo vessels are likely to be more plentiful. The Committee did not consider the implications of the probable disparity—at any rate during the immediate post-war period—between the cost of replacement and the amounts paid in compensation for losses; the problem of compensation for war damage, true, not only concerns the shipping industry, but it is of special concern to it if an official British Merchant Navy is to be re-created after the war.

Rising Note Circulation

To judge from the recent trend of the note circulation, the victory-in-Europe atmosphere and the relaxation of public restrictions are producing a significant increase in public spending. The jump in the circulation for VE-Day celebrations has not proved to be a purely temporary movement. The total has been rising now for eight successive weeks, and although this week's increase was small it compares with an actual reduction in the corresponding week of 1944 and 1943. Since April 25th there has been an expansion by over £42 million, in contrast with only £4 million in 1944 and with an even smaller change in 1943 if the incidence of Easter is allowed for. Of the recent expansion, however, some £5 million is attributable to the additional cover required, in consequence of a technical change, for the Scottish and Irish banks' note issues. In 1944 the rate of growth in the circulation was retarded after D-Day by the large exodus of troops, but in the earlier period of that year the expansion was substantially larger than that for the similar period of any previous wartime year. From the post-Christmas low point to June 21st there was a rise of £61 million. Yet this year, despite the fact that the post-Christmas nadir came four weeks later, and despite the calling-in of notes of denominations greater than £5, there has been an almost identical increase.

In these days it is particularly difficult to assess the implications of such movements. The effects of the return of

evacuees, prisoners of war and of demobilisation have to be set against those of the repatriation of emigré Governments, officials and others to liberated Europe, and of the outward movement of forces from overseas. But it does seem likely that the currency demands for holiday spending will this year reach record proportions.

Inflation in China

Main interest in the 1944 report of the Hongkong and Shanghai Banking Corporation, as in its recent predecessors, lies in the light it sheds on the internal financial situation in Free China. It is evident that the rampant inflation has been greatly accelerated in the past year. Regular indices of internal prices, if still published, now rarely seem to pass the Chinese censor. But in his statement for the annual meeting of the bank, the chairman, Mr A. Morse, reveals that the index of wholesale prices of domestic commodities in Chungking had by last March reached the astronomical figure of more than 1,200 times its pre-war (1937) level. In March of last year the multiplier was 230, and in June, 438. The Chinese authorities began in the early days of the war to rely upon note issue as a main source of finance, and thus grew accustomed to a geometric progression of prices. During 1942 and 1943, it was generally understood, they were well satisfied if the increase could be kept within the bounds of 10 per cent per month. In the past year or so, as the above figures show, this rate has been far exceeded. The cost of living—if indices have any real meaning in such conditions—seems to have risen somewhat less steeply, but even this has been multiplied by 3.7 times in the twelve months to March last.

Meanwhile, the official exchange rate for the Chinese dollar has been maintained at 3d. Despite the concession of a 50 per cent discount on this rate (giving an exchange of 1½d., or 160 dollars to the £) for certain foreign remittances, the official market has become even more widely out of touch with the realities of the price situation, and only a nominal amount of business passes through it. The real market is the outside market, where US dollar notes and gold change hands at widely varying but huge premiums over the nominal official parity. In consequence, the Hongkong and Shanghai Bank, which at Chungking is an “approved” bank for exchange control and consequently must deal at official rates, has been virtually debarred from any exchange business.

Not until the military situation permits of an increase in the supply of goods will it be possible to make any effective assault upon this financial chaos. While goods remain desperately scarce, even strong administrative measures, such as last year's introduction of the death penalty for hoarding, will not suffice to stop prices from rising. But, in allowing their fiscal and taxation machine to break down so completely, the Chinese authorities have greatly added to the difficulty of the task of restoring order.

Empire Trade

The system of imperial tariff preference is often discussed abroad as though it were an unclimbable fence built round the British Empire. The facts are given in the accompanying table; it shows the distribution of the imports of the Dominions and the Colonies in 1929 and 1938 (the latest year for which complete statistics are available). Both

	EMPIRE IMPORTS			
	(£ million)			
	Dominions, India, Burma	Colonies and Protectorates	1929	1938
Imports from:—				
United Kingdom	285	195	61	56
Other British countries ..	73	101	57	45
Foreign countries	427	270	111	110
Total	785	567	230	211

the Dominions (including India and Burma) and the Colonies and Protectorates obtained about half their imports from foreign countries in the two years. The proportion of the total imports of the Dominions purchased in foreign countries declined from 54 per cent in 1929 to 48 per cent in 1938; that of the Colonies, on the other hand, rose from

48 per cent to 52 per cent. In view of the heavy prospective demand for imports, the system of preferential tariffs is not likely to be a serious obstruction to the exports of foreign countries during the next few years. Ultimately, the absorptive capacity of the Empire is likely to be more important (though not the only) determinant of the scope of foreign exporters than a system of moderate imperial preference.

British and American Exports

The statistics of British and United States exports since 1938, given in the accompanying table, provide a significant contrast. (Although their definitions are not identical, the figures of commercial exports are broadly comparable.) Except for a slight improvement in 1944, British commercial exports have shown a steady decline in value since 1938, and an even more marked fall in volume to less than a third of the pre-war level.

EXPORTS STATISTICS									
UK					USA				
	Com- mercial Exports (excl. mu- nitions)	Average Price	Volume		Com- mercial Exports (incl. re- lease)	Lend- Lease Exports	Average Price (incl. Lend- Lease)	Volume (incl. Lend- Lease)	
1938	£ million	1938=100	1938=100	\$ million	\$ million	1938=100	1938=100	1938=100	1938=100
1939	471	100	100	3,094	...	100	100	100	100
1940	440a	93a	94a	3,177	...	99	105	105	105
1941	411a	87a	88a	4,021	...	105	112	112	112
1942	365a	77a	78a	4,408	739	112	147	147	147
1943	271	57	58	3,145	4,890	137	190	190	190
1944	233	49	50	2,608	10,105	151	274	274	274
1945	258	55	56	3,000b	11,300b	...	...	...	...

In the United States, on the other hand, commercial exports rose by more than two-fifths in value between 1938 and 1941 (America's pre-war year), and by about a third in volume; the entry into the war of the United States brought a decline, but in 1944 the value of exports was still almost as high as in 1938, though its volume was then probably less than two-thirds of the 1938 level. Significantly, but not

“Why I read The Yorkshire Post”

“When I was a much younger man, a colleague gave me a useful tip. It was, simply, to keep an eye on ‘The Yorkshire Post,’ as a golfer does on the ball. Through the years I’ve proved the wisdom of his advice. You see, we business men need to have a broad vision of men and affairs. We can’t afford to have blind spots through lack of inside knowledge, as it were. Experience has shown me how important it is to understand what

the North of England is thinking, not only of finance and politics, but of matters in everyday living. After all, Yorkshire is not only the heart of industrial production, but a big slice of our National consuming market. “The Yorkshire Post,” you will find, gives just that ordered and detailed knowledge of the North that is essential to guide your judgment. That is one reason so many people outside Yorkshire read it.”

The Yorkshire Post

Voice of the North

unexpectedly, average export prices rose faster in this country than in the United States. A substantial proportion of lend-lease exports consists of goods other than munitions; a reduction in the volume of goods delivered on lend-lease terms would not, therefore, involve a corresponding fall in total exports, but, at least in part, merely transference from the category of lend-lease to that of commercial exports. In other words, the British starting point for post-war exports is well behind that of the American.

Higher Coal Profits

Although coal output is falling, the profits of colliery concerns seem to be rising. Powell Duffryn's net profit for the year ended March 31st, at £688,643, is higher by £86,000 or 14 per cent. At the same time, Pease and Partners consolidated trading profit (which excludes East Hetton Collieries, acquired in August, 1944), for the same period, at £713,419, is up by £133,000 or 23 per cent. The chairman of the latter company, Mr Andrew Whyte, points out that production of disposable coal has declined by 21 per cent since 1939, although miners' earnings have increased by 87 per cent. Absenteeism during the last year is described as “abnormal, after making full allowances for all unavoidable causes contributory thereto.”

The only inference that can be drawn from this picture is that prices have risen substantially more than costs. The White Paper on the Coal Charges Account, published two months ago, confirms this impression. The difference between total costs and proceeds per ton of coal supply is given in it as 11d. in 1943, 2d. at the beginning of 1944, and 2s. after taking into account the increases in wages and in prices authorised up to August 1, 1944. The difference in 1939 was 1s. 7d., so that the profit margin is now apparently higher. Although further declines in output may reduce still more the advantage to be had from this fact, it is at least clear that colliery profits per ton for the last six months have improved very considerably indeed.

But whatever satisfaction this gives to the mineowners, the rise in profits can be no compensation to the nation for the fall in output. Mr Whyte, like other colliery chairmen, roundly blames the miners for this situation, but he also adds a second villain to the piece in the form of “the cramping and unimaginative”—and, in another context, “inexperienced”—“control of a Department of State.” He concludes that

until the direction of operations is handed back to the colliery technical managements and essential discipline restored no amount of planning will produce coal at economic prices and in sufficient quantities to meet the nation's requirements.

This is grossly unfair. The state is the one party of the trilogy concerned—owners, miners, and state—which is not to blame for the falling output, except indeed insofar as it has failed to drive the other two parties into any sort of energy or efficiency.

Polish Coal for Sweden?

Negotiations between Sweden and Poland about the delivery of Polish coal to Sweden seem to have started in earnest. A Swedish delegation consisting of one representative of the Swedish Foreign Office and two delegates from the Fuel Commission are empowered to conclude a coal purchase agreement, and to make the necessary arrangements for putting it into operation. It is understood that the delegation will also be able to discuss “in principle” with their opposite numbers in Warsaw the possibility of providing Poland with a number of Swedish goods that Poland is anxious to obtain. Preliminary negotiations have already taken place between the Swedish Legation and Polish representatives in Moscow. They showed that while the Lublin-Warsaw Government were willing to supply coal to Sweden, they could apparently only sell it at the pits, leaving the solution of the transport problem to Sweden. In other words, Sweden will have to provide both coal waggons and coal barges to move the coal from the mines to a Baltic port, and shipping space to transport it from there to Sweden. The necessary waggons and barges would in that case be loaned by Sweden to Poland; it is rather fortunate from the Swedish point of view that, while most of the Polish railway net was changed to the Soviet gauge, the lines connecting Silesia with the Baltic remained untouched.

Sweden, of course, is not the only Scandinavian country short of coal; they are all dependent on supplies from abroad. In 1938, Sweden imported 7,700,000 tons of coal, of which 2,680,000 came from Britain, 2,400,000 from Poland, and 660,000 from Germany. Out of a total of

1,939,000 tons of coke, 577,000 came from Germany, 198,000 from Great Britain, 153,000 from Poland, and 140,000 from Czechoslovakia. Though the Swedish Coal Commission had accumulated large stocks of coal, the fact that since August all coal imports came to a standstill, meant that the present allocation to “priority” industries is down to 15 per cent of the industries' normal requirements, and will have to be cut to 7 per cent failing an agreement in Warsaw.

During the recent negotiations of the Anglo-Swedish trade agreement in London Sweden was informed of the difficulties in the way of an early and substantial resumption of British coal exports to Sweden which, according to the last pre-war Anglo-Swedish Trade Agreement, were stipulated to amount to 47 per cent of total Swedish coal imports. A similar clause in the Anglo-Norwegian Trade Agreement of 1933 fixed British coal supplies to Norway at 70 per cent of the Norwegian coal import, amounting to 3,300,000 tons in 1938. Since very little British coal will be available for export during the current year, and since the prospects of early and substantial coal exports from the Ruhr are not promising, Scandinavian supplies, and, by implication Scandinavian employment, will depend in no small measure on the size and distribution of the Polish coal surplus.

Aviation Petrol

An outstanding technical achievement which has played no small part in the European victory is the remarkable increase in the production of aviation petrol. The intensified air activity in the vast field of Pacific warfare is now calling for still larger supplies of 100-octane petrol. Since Pearl Harbour some \$900 million has been spent in the construction and enlargement of aviation petrol refineries and their supplementary plant in the United States; and according to recent official information from 65 to 70 refineries within the US are now producing from 400,000 to 500,000 barrels of finished 100-octane petrol per day—compared with 22 refineries at the end of 1941, producing just over 40,000 barrels daily.

The security blackout concerning aviation petrol production outside the United States has lately been lifted by Mr Ralph K. Davies, US Petroleum Administrator for War, who states that the most generous estimate of extra-United States production of 100-octane petrol at the time of Pearl Harbour was not more than 15,000 barrels a day; there were then three refineries at work in the United Kingdom and a fourth at Abadan in Iran, whilst a fifth plant, in Trinidad, was just about to begin production. Since that date an expansion programme (estimated to cost about \$200 million) has been almost completed. The Abadan refinery has been twice enlarged, and a third extension will soon go “on stream.” The Trinidad plant has attained capacity production. The refinery at Bahrain has been adjusted to production of 100-octane petrol; and two small plants in Canada are now producing aviation fuel. In the Dutch West Indies, three major projects have been completed in Aruba, and four others are now operating in Curaçao, where a fifth is still under construction. In Mexico also, plant is being set up for the production of high octane petrol. With the completion of these last two projects—probably in December—programmes for the increased production of aviation petrol outside the United States (exclusive of the Soviet Union, for which no details are available) will be complete. The combined capacity of aviation petrol plants constructed by the United Nations outside the United States has not been revealed, but Mr Davies affirms that by the end of 1945 over 14 per cent of the aviation petrol produced for the Allied Air Forces will be coming from these refineries. This would suggest that extra-United States output may, at full capacity, be in the region of 100,000 barrels a day, or nearly seven times as much as at the time of Pearl Harbour.

The world's peacetime demand for civil aviation has been estimated by Standard Oil experts at 150,000 barrels per day. After the defeat of Japan, therefore, this great increase in the production potential of high octane fuel may present a surplus problem of some magnitude.

VOC Developments

The preliminary statement of Venezuelan Oil Concessions, dealt with on page 746 of *The Economist* of June 2nd, showed a considerable increase in earnings without explanation. The full accounts for last year contain

once more a reasonably full profit and loss account, whose publication was suspended during the war, and incorporate a number of improvements. The better showing is associated with a rise in proceeds of oil sold and stock in hand from £6,336,954 to £7,701,421, which appears to be the highest ever achieved. There have been roughly proportionate increases in field expenditure, including drilling, and in office and general expenses in London and Venezuela, but the tax provision absorbs a considerably higher proportion of the total at £1,585,000 against £1,077,278. The amount remaining, after making a slightly increased depreciation provision, is £938,329 compared with £892,262, and, as previously stated, £250,000 is placed to exploration and general reserve against £400,000 to deferred maintenance. After paying the higher ordinary dividend, it is possible to make a rather larger allocation to carry forward than was the case last year. It is difficult to regard the specific allocation of either year as additions to free reserves.

The principal development this year is the acquisition of new concessions in Lake Maracaibo. An initial payment of £1,174,174 has been made for these out of net liquid assets, which at the balance-sheet date were slightly in excess of £1,900,000. The modest balance has to be considered against a total of reserves for exploration, deferred repairs, taxation and general reserve of £3,368,117. Exploration in the new concession means drilling in 100 feet of water, which will be expensive. The company will also have to undertake more extensive exploitation to make good the decreased drilling of 1943-44, when the average yearly footage fell to 141,500, against 469,000 feet average over the four preceding years. As to costs, those of wages were increased in November last. The position appears to be that there are good prospects of increasing output, but that very large expenditure will be necessary, and that costs are still on the up-grade.

British Coal Distillation

On Friday of last week the Council of the Stock Exchange withdrew permission to deal in the 2s. ordinary

HONGKONG AND SHANGHAI BANKING CORPORATION

(INCORPORATED IN THE COLONY OF HONGKONG.)
One Hundred and Twenty-eighth Report of the Board of Directors, to be submitted at the Ordinary General Meeting to be held on Wednesday, 27th June, 1945, at the Offices of the Corporation, 9, BILLS PAYABLE, 348, 349, 350, 351, 352, 353, 354, 355, 356, 357, 358, 359, 360, 361, 362, 363, 364, 365, 366, 367, 368, 369, 370, 371, 372, 373, 374, 375, 376, 377, 378, 379, 380, 381, 382, 383, 384, 385, 386, 387, 388, 389, 390, 391, 392, 393, 394, 395, 396, 397, 398, 399, 400, 401, 402, 403, 404, 405, 406, 407, 408, 409, 410, 411, 412, 413, 414, 415, 416, 417, 418, 419, 420, 421, 422, 423, 424, 425, 466, 467, 468, 469, 470, 471, 472, 473, 474, 475, 476, 477, 478, 479, 480, 481, 482, 483, 484, 485, 486, 487, 488, 489, 490, 491, 492, 493, 494, 495, 496, 497, 498, 499, 500, 501, 502, 503, 504, 505, 506, 507, 508, 509, 510, 511, 512, 513, 514, 515, 516, 517, 518, 519, 520, 521, 522, 523, 524, 525, 526, 527, 528, 529, 530, 531, 532, 533, 534, 535, 536, 537, 538, 539, 540, 541, 542, 543, 544, 545, 546, 547, 548, 549, 550, 551, 552, 553, 554, 555, 556, 557, 558, 559, 560, 561, 562, 563, 564, 565, 566, 567, 568, 569, 570, 571, 572, 573, 574, 575, 576, 577, 578, 579, 580, 581, 582, 583, 584, 585, 586, 587, 588, 589, 590, 591, 592, 593, 594, 595, 596, 597, 598, 599, 600, 601, 602, 603, 604, 605, 606, 607, 608, 609, 610, 611, 612, 613, 614, 615, 616, 617, 618, 619, 620, 621, 622, 623, 624, 625, 626, 627, 628, 629, 630, 631, 632, 633, 634, 635, 636, 637, 638, 639, 640, 641, 642, 643, 644, 645, 646, 647, 648, 649, 650, 651, 652, 653, 654, 655, 656, 657, 658, 659, 660, 661, 662, 663, 664, 665, 666, 667, 668, 669, 670, 671, 672, 673, 674, 675, 676, 677, 678, 679, 680, 681, 682, 683, 684, 685, 686, 687, 688, 689, 690, 691, 692, 693, 694, 695, 696, 697, 698, 699, 700, 701, 702, 703, 704, 705, 706, 707, 708, 709, 710, 711, 712, 713, 714, 715, 716, 717, 718, 719, 720, 721, 722, 723, 724, 725, 726, 727, 728, 729, 730, 731, 732, 733, 734, 735, 736, 737, 738, 739, 740, 741, 742, 743, 744, 745, 746, 747, 748, 749, 750, 751, 752, 753, 754, 755, 756, 757, 758, 759, 760, 761, 762, 763, 764, 765, 766, 767, 768, 769, 770, 771, 772, 773, 774, 775, 776, 777, 778, 779, 780, 781, 782, 783, 784, 785, 786, 787, 788, 789, 790, 791, 792, 793, 794, 795, 796, 797, 798, 799, 800, 801, 802, 803, 804, 805, 806, 807, 808, 809, 810, 811, 812, 813, 814, 815, 816, 817, 818, 819, 820, 821, 822, 823, 824, 825, 826, 827, 828, 829, 830, 831, 832, 833, 834, 835, 836, 837, 838, 839, 840, 841, 842, 843, 844, 845, 846, 847, 848, 849, 850, 851, 852, 853, 854, 855, 856, 857, 858, 859, 860, 861, 862, 863, 864, 865, 866, 867, 868, 869, 870, 871, 872, 873, 874, 875, 876, 877, 878, 879, 880, 881, 882, 883, 884, 885, 886, 887, 888, 889, 890, 891, 892, 893, 894, 895, 896, 897, 898, 899, 900, 901, 902, 903, 904, 905, 906, 907, 908, 909, 910, 911, 912, 913, 914, 915, 916, 917, 918, 919, 920, 921, 922, 923, 924, 925, 926, 927, 928, 929, 930, 931, 932, 933, 934, 935, 936, 937, 938, 939, 940, 941, 942, 943, 944, 945, 946, 947, 948, 949, 950, 951, 952, 953, 954, 955, 956, 957, 958, 959, 960, 961, 962, 963, 964, 965, 966, 967, 968, 969, 970, 971, 972, 973, 974, 975, 976, 977, 978, 979, 980, 981, 982, 983, 984, 985, 986, 987, 988, 989, 990, 991, 992, 993, 994, 995, 996, 997, 998, 999, 1000, 1001, 1002, 1003, 1004, 1005, 1006, 1007, 1008, 1009, 1010, 1011, 1012, 1013, 1014, 1015, 1016, 1017, 1018, 1019, 1020, 1021, 1022, 1023, 1024, 1025, 1026, 1027, 1028, 1029, 1030, 1031, 1032, 1033, 1034, 1035, 1036, 1037, 1038, 1039, 1040, 1041, 1042, 1043, 1044, 1045, 1046, 1047, 1048, 1049, 1050, 1051, 1052, 1053, 1054, 1055, 1056, 1057, 1058, 1059, 1060, 1061, 1062, 1063, 1064, 1065, 1066, 1067, 1068, 1069, 1070, 1071, 1072, 1073, 1074, 1075, 1076, 1077, 1078, 1079, 1080, 1081, 1082, 1083, 1084, 1085, 1086, 1087, 1088, 1089, 1090, 1091, 1092, 1093, 1094, 1095, 1096, 1097, 1098, 1099, 1100, 1101, 1102, 1103, 1104, 1105, 1106, 1107, 1108, 1109, 1110, 1111, 1112, 1113, 1114, 1115, 1116, 1117, 1118, 1119, 1120, 1121, 1122, 1123, 1124, 1125, 1126, 1127, 1128, 1129, 1130, 1131, 1132, 1133, 1134, 1135, 1136, 1137, 1138, 1139, 1140, 1141, 1142, 1143, 1144, 1145, 1146, 1147, 1148, 1149, 1150, 1151, 1152, 1153, 1154, 1155, 1156, 1157, 1158, 1159, 1160, 1161, 1162, 1163, 1164, 1165, 1166, 1167, 1168, 1169, 1170, 1171, 1172, 1173, 1174, 1175, 1176, 1177, 1178, 1179, 1180, 1181, 1182, 1183, 1184, 1185, 1186, 1187, 1188, 1189, 1190, 1191, 1192, 1193, 1194, 1195, 1196, 1197, 1198, 1199, 1200, 1201, 1202, 1203, 1204, 1205, 1206, 1207, 1208, 1209, 1210, 1211, 1212, 1213, 1214, 1215, 1216, 1217, 1218, 1219, 1220, 1221, 1222, 1223, 1224, 1225, 1226, 1227, 1228, 1229, 1230, 1231, 1232, 1233, 1234, 1235, 1236, 1237, 1238, 1239, 1240, 1241, 1242, 1243, 1244, 1245, 1246, 1247, 1248, 1249, 1250, 1251, 1252, 1253, 1254, 1255, 1256, 1257, 1258, 1259, 1260, 1261, 1262, 1263, 1264, 1265, 1266, 1267, 1268, 1269, 1270, 1271, 1272, 1273, 1274, 1275, 1276, 1277, 1278, 1279, 1280, 1281, 1282, 1283, 1284, 1285, 1286, 1287, 1288, 1289, 1290, 1291, 1292, 1293, 1294, 1295, 1296, 1297, 1298, 1299, 1300, 1301, 1302, 1303, 1304, 1305, 1306, 1307, 1308, 1309, 1310, 1311, 1312, 1313, 1314, 1315, 1316, 1317, 1318, 1319, 1320, 1321, 1322, 1323, 1324, 1325, 1326, 1327, 1328, 1329, 1330, 1331, 1332, 1333, 1334, 1335, 1336, 1337, 1338, 1339, 1340, 1341, 1342, 1343, 1344, 1345, 1346, 1347, 1348, 1349, 1350, 1351, 1352, 1353, 1354, 1355, 1356, 1357, 1358, 1359, 1360, 1361, 1362, 1363, 1364, 1365, 1366, 1367, 1368, 1369, 1370, 1371, 1372, 1373, 1374, 1375, 1376, 1377, 1378, 1379, 1380, 1381, 1382, 1383, 1384, 1385, 1386, 1387, 1388, 1389, 1390, 1391, 1392, 1393, 1394, 1395, 1396, 1397, 1398, 1399, 1400, 1401, 1402, 1403, 1404, 1405, 1406, 1407, 1408, 1409, 1410, 1411, 1412, 1413, 1414, 1415, 1416, 1417, 1418, 1419, 1420, 1421, 1422, 1423, 1424, 1425, 1426, 1427, 1428, 1429, 1430, 1431, 1432, 1433, 1434, 1435, 1436, 1437, 1438, 1439, 1440, 1441, 1442, 1443, 1444, 1445, 1446, 1447, 1448, 1449, 1450, 1451, 1452, 1453, 1454, 1455, 1456, 1457, 1458, 1459, 1460, 1461, 1462, 1463, 1464, 1465, 1466, 1467, 1468, 1469, 1470, 1471, 1472, 1473, 1474, 1475, 1476, 1477, 1478, 1479, 1480, 1481, 1482, 1483, 1484, 1485, 1486, 1487, 1488, 1489, 1490, 1491, 1492, 1493, 1494, 1495, 1496, 1497, 1498, 1499, 1500, 1501, 1502, 1503, 1504, 1505, 1506, 1507, 1508, 1509, 1510, 1511, 1512, 1513, 1514, 1515, 1516, 1517, 1518, 1519, 1520, 1521, 1522, 1523, 1524, 1525, 1526, 1527, 1528, 1529, 1530, 1531, 1532, 1533, 1534, 1535, 1536, 1537, 1538, 1539, 1540, 1541, 1542, 1543, 1544, 1545, 1546, 1547, 1548, 1549, 1550, 1551, 1552, 1553, 1554, 1555, 1556, 1557, 1558, 1559, 1560, 1561, 1562, 1563, 1564, 1565, 1566, 1567, 1568, 1569, 1570, 1571, 1572, 1573, 1574, 1575, 1576, 1577, 1578, 1579, 1580, 1581, 1582, 1583, 1584, 1585, 1586, 1587, 1588, 1589, 1590, 1591, 1592, 1593, 1594, 1595, 1596, 1597, 1598, 1599, 1600, 1601, 1602, 1603, 1604, 1605, 1606, 1607, 1608, 1609, 1610, 1611, 1612, 1613, 1614, 1615, 1616, 1617, 1618, 1619, 1620, 1621, 1

shares of British Coal Distillation. This company, formed during the 1928 boom, has so far paid no dividend on its capital. The shares, which stood at 1½d. at one time last year, were run up to 1s. 5d. in May on a progress report and had fallen to about 10d. at the time the suspension was considered. On the report that action might be taken, they fell further to 6d. The action of the Council does not necessarily imply any criticism of the company's officials, but is quite certainly based on a belief that the market was being "rigged."

In such circumstances, it is always desirable that the board should take the shareholders fully into their confidence at the earliest possible moment, but almost a week after the event nothing has been heard from them beyond a letter from the chairman, Mr Wakefield Adam, in which he states *inter alia*:

There has been no prior complaint from the Committee (sic) of the Stock Exchange whose action I consider unwarranted, unjust and definitely harmful to the interests of the company, and I register my protest against their hasty and misjudged attack.

This letter shows a complete misunderstanding of the whole position, but if Mr Wakefield finds that the company is, in fact, prejudiced by the action taken, he has only to publish an interim statement of the company's position, fully backed by his auditors, to make it reasonably certain that the quotation will be restored.

Actually the latest information is nearly a year old. In the last balance-sheet, dated July 31, 1944, there were no net liquid assets and the auditors were unable to express an opinion as to the value of patents, rights and trade marks or of interests in subsidiaries which constituted the sole assets of the company. In the circumstances, it is not clear how finance was arranged for the purchase of a Welsh anthracite colliery which was the main point of the progress report published last month.

Kaffir Dividends

Any minor effects which the declaration of dividends by the companies operating on the Rand may have had on quotations were submerged in the general swing in prices

on the raising of the price of gold, and the subsequent disappointment about the very meagre benefits to be reaped by the companies. Actually, the changes were few and small. Of the 28 companies in the four main groups, nine reduced their dividends as against six months ago, while the rest merely maintained them. There were also nine reductions compared with the payments of June, 1944, and three increases as against that time. The rate of decline in new distributable profit slowed down, but had not ceased, and it is by no means certain how far the modest improvement in the position occasioned by the rise in the gold prices will suffice to halt the downward swing. As was stated last week, the immediate outlook is largely conditioned by the findings of the Committee appointed to examine the question of gold mining taxation and the action taken by the Government of the Union on their report.

Cocoa Research Conference

It has been recognised for many years past that one of the major cocoa supply problems is the widespread incidence of diseases and pests among cocoa farms, and during the last fifteen years research has been going forward in both Eastern and Western Hemispheres, with the double object of fighting these pests, and of discovering breeds of cocoa which might be immune from the more virulent ones. Since about 60 per cent of the world's cocoa crop is grown within the British Empire—the higher qualities in the British West Indies, and the ordinary qualities in British West Africa—certain recommendations upon this subject made by the Cocoa Research Conference which recently met at the Colonial Office are important. Whilst it was recognised that the Research Institutes of both regions should concern themselves with questions of general cocoa research, it was emphasised that the West Indies would do well to give special attention to the "witch-broom" disease which is so prevalent in that area, whilst the West African Institute might most profitably concentrate upon "swollen shoot"; the Cocoa Research Committee in London to exercise a general co-ordinating function. It was further suggested that the British chocolate industry might collaborate in research directed towards the improvement of cocoa quality; and that the Department of Agriculture in each of the producing colonies should accept the responsibilities of surveying the cocoa areas; of educating peasant cultivators to apply the results of research and of economic and sociological surveys based on the need to adapt their product to a long-term agricultural policy; and of enquiring into means of improving the packing and storage of the crop.

These recommendations usefully clear the ground for a long-term cocoa research policy; but as the Conference indicated, there is urgent need for staff to carry out such a policy. Two other requirements are essential to success: that the surveying and organisation of the industry should keep pace with research; and that the co-operation of other cocoa-producing areas, particularly Brazil and French West Africa, should be obtained in prophylactic and therapeutic measures.

Post Office Engineers

One of the civilian services which has inevitably suffered seriously from the war is the telephone. This is not surprising in view of the call up of Post Office engineers—of the Post Office Engineering Union's 46,000 members, about a third have been engaged in the Forces, mainly in the signalling and engineering branches—and in view of the priority requirements of the military and of Government departments for telephone facilities. It is indeed creditable that the civilian services should have been maintained as well as they have been, especially throughout the air-raids.

But praiseworthy though the wartime record of the Post Office may be, the British telephone service is in need of technical improvement. The chairman of the PO Engineering Union at the union's annual conference at Morecambe this week claimed that

The State-controlled telecommunications industry of this country is now the most efficient in the world and would be the cheapest if only it were free from the tentacles of the monopolies upon which it must depend for its equipment.

It would be interesting to have more details of the ramifications of the telephone equipment industry, for it is certainly in the public interest that telephone services should be cheapened and extended. Those who have had occasion to use the telephone in the United States, moreover, might be inclined to challenge the claim that the British service is the most efficient in the world. In this country the tele-

THE LONDON ASSURANCE

*celebrates its 225th Anniversary
on the 22nd June, 1945*

THIS date marks the completion of two and a quarter centuries of successful service by The London Assurance. In celebrating this 225th Anniversary the Governor, Court of Directors and Management express their grateful appreciation to the Staff, Shareholders, Policy Holders, Agents and Friends everywhere, whose support and goodwill have brought to the Corporation its record of successful achievement and will ensure still greater progress in the years to come.

Head Office:

Attractive Terms for IMMEDIATE ANNUITIES

Advantageous rates are available for Immediate Annuities payable either half-yearly, quarterly, or monthly.

Annuities on special terms are quoted when purchased for groups of lives.

Arrangements of a particularly favourable nature can be made for firms who, at the moment, are paying pensions themselves to retired employees.

Particulars may be obtained on application to:

LEGAL & GENERAL ASSURANCE SOCIETY LTD

Established 1836

ALDWYCH HOUSE, LONDON, W.C.2

WHAT WILL BE YOUR INCOME WHEN YOU RETIRE?

You may receive a Pension under the National Scheme.

You may receive a Pension from your employers.

BUT will your pension be sufficient for your needs?

Why not secure an additional yearly income of £100, £200, £300 when you retire by means of a Prudential Endowment Assurance Policy?

NORVIC SHOE CO. LTD. NORTHAMPTON

HONGKONG AND SHANGHAI BANKING CORPORATION

POSITION IN CHINA

MR A. MORSE'S STATEMENT

The ordinary general meeting of the Hongkong and Shanghai Banking Corporation will be held on June 27 at the offices of the Corporation, 9, Gracechurch Street, London.

The following is an extract from the statement of the chairman, Mr A. Morse, C.B.E., circulated with the report and accounts:

Until the enemy has been ejected from the territories which he has invaded, we cannot, with any degree of certainty, even commence to measure the extent of the havoc he has created, but much time and thought are already being devoted to the problems of reconstruction which will have to be faced and solved before the Far East again enjoys freedom and prosperity.

I am confident that with our long experience of banking in the Far East, our organisation, and the goodwill which attaches to our name throughout the world, we will not only surmount our own difficulties but will play an important part in the rehabilitation and reconstruction of those centres with which we have been so long connected.

SURPLUS MAINTAINED

It will be observed that the position we present is again one of strength.

The profit and loss account, which includes only the results of offices under our own control, shows that the surplus for the year to December 31, 1944, amounts to £214,063, which is substantially the same as the surplus for the previous year. With assets amounting to many million pounds under enemy control, it is, of course, impossible even to estimate the profit and loss position of the bank as a whole, and in the circumstances the board have again transferred the profits of the free offices to contingencies reserve. In doing so, the board regret that they are again unable to recommend the payment of a dividend, but they feel that in the circumstances the course they have adopted is the proper one, and that it has the support of shareholders generally.

Thanks to the enterprise of the Allies under United States Military and Naval command in the Pacific and the successful campaign under British command in Burma, the outlook in the Far Eastern theatre of war has vastly improved since my last statement. Manila has been liberated, and we have been able to send a skeleton staff to prepare for the reopening of our branch there. Unfortunately, our building has been seriously damaged, but repairs are now in hand, and I hope that before long our office will be ready for use.

Of our staff who were interned in Manila, all except one are safe. They have had a very trying time in the hands of the Japanese, but all pay tribute to the hospitality of our American allies after their release from the internment camps. I regret to say that our accountant, Mr O. J. Shannon, and his wife have been reported killed. How exactly this came about we do not yet know. Their death is indeed a tragedy, and to their relatives we extend our deepest sympathy.

THE CHINESE PROBLEM

The economic and financial situation in China has continued to cause anxiety. The picture differs entirely from that seen elsewhere, and for this reason those who have not studied the situation carefully would be rash to draw comparisons with other countries. The problem is a Chinese one, with its special distinctive features. At the present time such measures as are feasible to check the growing inflation are, in the main, little more than palliative measures.

Amongst these, the most important are the sale of gold and the importation of small amounts of key commodities. It is hoped that such steps, coupled with the psychological stimulus of the favourable war situation, will be sufficient to tide over the interim period until more radical measures can be taken. As I said last year, the Allies with their immense resources are standing by to help, but, of course, the greater part of the effort will have to be made by China herself.

That the task will be a difficult one may be seen from the fact that the index of wholesale prices of domestic commodities in Chungking in March this year was over 1,200 times the pre-war (1937) level, while the cost of living there increased 3.7 times between March, 1944 and 1945. Fortunately, Dr. T. V. Soong, as President of the Executive Yuan, has been applying his outstanding abilities to the problem. This is a good augury. Moreover, as Dr. Soong himself said recently: "All the principal factors are working in favour of China." Another cause for optimism is the appointment of Dr. Wong Wen-hao, the able Minister of Economic Affairs, as Head of the War Production Board.

FLUCTUATING MARKET RATES

Although the official rate of exchange still remains at the nominal figure of 3d. per dollar, open market rates, which fluctuate widely according to the type of currency held, are in normal use for remittances from overseas, except through the "approved" banks. Our Chungking branch, being an "approved" bank under the freezing arrangements introduced in 1941, is still unable to operate except at the official rate, and its duties are thus largely confined to routine work for depositors, maintaining contacts with the official and commercial community, and keeping in touch with such developments as may arise in regard to foreign trade and interests.

In this connection it may here be useful to draw attention to the services we are able to offer to our customers and friends in providing information about the various aspects of economic, financial, commercial, or industrial development in China. Our manager in Chungking, with the help of our Chinese adviser, Mr K. C. Lee, is in an excellent position to follow the trend of day-to-day events there, and we are thus kept fully informed.

POST-WAR DEVELOPMENTS

Recent reports about China's policy in regard to post-war economic developments confirm what I said last year about the improbability of restrictive Chinese legislation being imposed on foreign capital and foreign companies. Dr. Sun Fo, the President of the Legislative Yuan, has made several important pronouncements on this subject. In November last, the Chinese Supreme National Defence Council adopted some important "guiding principles for economic enterprises," and as recently as March of this year two other authoritative statements were made in Chungking on foreign investments in China.

In all these cases the tendency has been to encourage foreign investment and to welcome the establishment of foreign enterprises in China. However, no new legislation applying to foreign companies and banks has yet been enacted, although it is believed that such is under the consideration of the Legislative Yuan. We ourselves—and I think that British firms in general also—are anxious that any new legislation of this kind which is under contemplation should be published at an early date, in order that we may know just how we stand in the light of Chinese laws and regulations.

SMITH'S POTATO CRISPS (1929) LIMITED

SIR HERBERT MORGAN'S SPEECH

The sixteenth ordinary general meeting of Smith's Potato Crisps (1929) Limited was held on the 14th instant, in London.

Sir Herbert E. Morgan, K.B.E. (the chairman) in the course of his speech, said: The net profit for the year, after provision for taxation, amounts to £88,967 as against £84,148 for the previous year. This is a result with which I feel the shareholders will be well satisfied, though adjustments in our tax position are partly responsible. The directors have no hesitation in making the same recommendation as last year for a final dividend of 20 per cent. and a cash bonus of 5 per cent., making a total distribution of 32½ per cent. for the year, for the eighth year in succession.

The year just passed has been subject to conditions which have affected the prosperity of many businesses. There has been a constant drain on manpower for war purposes. The drain on our manpower is not the only factor; we have had higher wages, and an increased cost of raw materials to face. Nevertheless, myself and my colleagues were never more optimistic with regard to the future of the company than we are to-day. One of our reasons is that the shortage of supplies has brought to light masses of consumers of Smith's Potato Crisps whose endeavours to obtain them is a great tribute—and a well deserved one—to our product. Our popularity is a living thing; the shortages have disclosed friendships and enthusiasms, and a knowledge on the part of the public of Smith's Potato Crisps, which one never quite realised.

HIGH PERCENTAGE OF FOOD VALUE

Give us the labour and material, and we shall soon eclipse our pre-war turnover. We deserve friendly popularity, which I consider firmly established for all time. But such a reputation does not just happen. It is based on the solid foundation of the quality of Smith's Potato Crisps, with their high percentage of food value. It is also the result of cooking the right potatoes.

We greatly regret that we have not been able to meet the persistent and sometimes clamorous demands for Crisps, but have done our best. The future of this business lies in that demand being maintained, and we are sure that not only will it be maintained, but will be increased as soon as we are in a position to supply it. I do not think our old friends will ever desert us, but I foresee in the future, as I have already indicated, a demand above that of pre-war days. In the future millions of new housewives who will be faced with the responsibilities of home-keeping will wish to take advantage of the use of Smith's Potato Crisps, because they are a prepared product of real food value, appetising, economical, easily served hot or cold, and conveniently packed.

TWO NEW CENTRES

We are making plans to create two new centres of our industry and build factories for that purpose. Our plans at the present moment cover the erection of new buildings in the Newcastle area and the South Wales area, both great hives of population hitherto supplied from others of our factories.

I must again pay tribute to Mr. Frank Smith, our founder and managing director. He is approaching the completion of the first 25 years of his brilliant leadership. During that quarter of a century he has never ceased to apply the whole of his resourceful capacity and energy to the furtherance of this famous enterprise. To the whole of our executive and staff, appreciation is due.

The report was adopted.

LEYLAND MOTORS, LIMITED

PRODUCTION OF TANKS, SHELLS AND BOMBS

MR C. B. NIXON'S REVIEW

The twenty-sixth annual general meeting of Leyland Motors, Limited, was held, on the 20th instant, at Leyland.

Mr C. B. Nixon, the chairman, said, in the course of his speech: At the outbreak of war, without hesitation, we placed the whole of your company's resources at the disposal of the nation. A programme was agreed for the production of tanks, high explosive and incendiary bombs and other instruments of war to the complete exclusion of commercial type wheeled vehicles.

During the early stages of the war, whilst preparing for this complete change-over, wheeled vehicles were built in the greatest possible numbers, and, in that short time, over 8,000 medium and heavy four- and six-wheeled service vehicles were produced—a number greater than our total production during the whole of the 1914-1918 war.

DESIGN AND OUTPUT OF TANKS

From the outset this company was involved in tank manufacture, and first of all a Leyland diesel unit was selected as standard for the Matilda. Tank production proper began with the manufacture of the Covenanter and assembly of the Churchill. Later, in addition to manufacturing, the company was appointed by the Ministry of Supply to collaborate with them in the control of design and the co-ordination of production, throughout the country, successively of the Centaur, Cromwell and finally the Comet, which, equipped with its high-penetration 77 mm. gun, played a major part in the advance from the Rhine to the Elbe and beyond and the final disintegration of the German forces.

The output of tanks from the company's own factories represents by far the greatest number of heavy cruiser type tanks produced in the country and is greater than that from any single organisation in the whole of the British Empire. Your staff and workpeople have given unstintingly of their services to make this achievement possible.

OTHER WAR STORES

Other units and components produced for war purposes were so varied that it would be impracticable to give full details in this short report, but it may be stated that the following major items were manufactured and delivered:—Wheeled vehicles prior to tank production, over 8,000; heavy 10-ton six-wheeled Government vehicles, recently placed in production, over 1,000; tank engines, over 10,000; tanks (medium and heavy), over 3,000; high-explosive bombs of heavier types, over 7,500; incendiary bombs, over 11,000,000; 20-mm. shells, over 5,000,000; and light alloy castings (mainly for aircraft engines), over 10,000 tons.

Due to the world-wide area of operations and to the necessity of providing against loss by enemy action requisitions for spares have been on a colossal scale, often exceeding 100 per cent. of the value of the new production.

FIRE ESCAPES, ETC.

The company has also manufactured motor fire-escapes, independent pumping units, power units for dealing with magnetic mines, land mines and aero engine mountings. Many tanks have been rebuilt, and at the same time there has been maintained an ever-increasing output of spare parts to meet the demands of the operators of commercial vehicles employed for essential civil purposes, many of which vehicles have been maintained in service with road mileages exceeding the million mark.

When the terms for research grants were announced, twelve months ago, your directors immediately submitted a scheme for new research laboratories. There have been many conferences and authority to proceed

has only been received within the last few weeks, but we are now informed that no labour can be made available. A year has already been lost; such delays are most regrettable when the need for re-equipment is immediate.

STAFF

The war created many varied problems far removed from the normal. Your company's staff has benefited from a wide experience here and overseas and achieved outstanding success. With this unique experience and up-to-date equipment new models will be evolved, which, if the Government succeeds in bringing into being favourable trading conditions, should find ready markets at home and abroad.

The war in Europe is at an end. The company still has, however, a considerable volume of war contracts to complete. Civil, as well as Government, production is still under control. The change-over to our normal peacetime manufacture will, therefore, be spread over a number of months. We have already produced a series of prototypes, and have authority to manufacture a limited number of public service vehicles this year, and are assured that this authority will be extended in the very near future to a very much greater quantity and variety of vehicles in both the passenger and goods ranges.

THE FUTURE

The basis of an expanding, mechanised war was, and, if the need again arises will be, the motor industry. The country must never be allowed to forget that it is essential to have a prosperous British motor industry, which employs a large number of experienced, trained technicians and constitutes the first line of defensive preparation. Safety depends upon it. The motor industry should become the largest single industry in this country. Its potentialities to ward off unemployment, to provide well-paid regular work and to sustain the export trade are unlimited.

Though the need for export is declared to be essential, for twelve months the heavy vehicle manufacturers have asked in vain for authority to build, as standard in this country, the types of vehicles acceptable overseas. The Minister of War Transport refuses this authority on the grounds that to make this concession would be "the thin edge of the wedge" and because it must be many years before our roads will be safe for the passage of omnibuses which are not more than 6 inches wider than those now permitted and no wider than the overall width of many loaded goods vehicles. The operation of some tip-wagons of a width of 10 feet has recently been authorised. Operators and builders are prepared for temporary local limitations where obviously necessary.

EXPORT HOPES

Our export trade was not inconsiderable in 1939, and it will be our endeavour to extend this trade to the greatest possible extent as soon as civil vehicles can be produced in quantities again. By that time we hope that handicaps imposed by Government control will have been removed.

It can now be stated that during the five war years taxation amounted to £3,379,889 (E.P.T. £1,210,108, N.D.C. £36,387, I.T. £2,133,394)—which figure includes provision for the estimated amounts payable on all profits earned at the date of the accounts. This may be contrasted with a pay-roll of £13,092,648, and a gross distribution on the ordinary shares of £630,000 for the same period. At the date of the balance-sheet, cash, Tax Reserve Certificates and Government securities at home and abroad amounted to £1,378,294.

The report and accounts were adopted.

MILNERS SAFE COMPANY, LIMITED

PRODUCTION OF ARMoured FIGHTING VEHICLES, ETC.

SOUND FINANCIAL POSITION

Major G. A. Frost, R.A., the deputy chairman, presided at the annual general meeting of Milners Safe Company, Limited, held at the registered offices, 21, Hampstead Lane, London, N., on the 14th instant.

The following is his statement circulated with the report and accounts:—

Your chairman, Lieutenant-Colonel Sir James Ritchie, is still absent from this country on military duties, but I am pleased to say that his early return is anticipated. You will, I am sure, be delighted to hear that Major Dodge has safely returned to us after five years as a prisoner-of-war in Germany.

ACHIEVEMENTS DURING WAR YEARS

Your company has again been employed throughout the past financial year on Government work and continues to be so engaged. With the relaxation of restrictions, shareholders will learn with interest some of Milners' achievements during the years of war. Our main concentration has been on the production of armoured fighting vehicles, and it has been a source of pride to us to see tanks of our manufacture leaving our works for the fighting forces. In addition, we have carried out contracts for modifying and converting heavy tanks and other fighting vehicles and generally adapting them to the changing conditions of battle. Tanks fitted by us with ducting apparatus landed in Normandy on D-Day, where, in addition, units manufactured by us helped in the construction of "Mulberry." We also made and fitted the "flail" devices to tanks, the success of which in clearing landmines has been made public. For a time we were also producing armour-piercing shells, and in many other directions we have been actively engaged in providing equipment for the Army.

For the Navy and Merchant Navy, apart from providing large quantities of storage equipment, we have been engaged in the manufacture of special protective armour, which has proved its efficiency against enemy attacks at sea. To the Air Force, too, we have contributed, many aircraft factories having been fitted out by us with specialised storage equipment. Shareholders will, therefore, appreciate that our veiled annual remark that "the works continue to be employed at high pressure" has been no under-statement.

EQUIPPED FOR EXPORT AND HOME TRADE

As has been previously pointed out, our ability to pull our weight to this extent during the war was only made possible by the facilities provided by the works we built just before the war. Our low E.P.T. standard limited our available profits, and has not permitted us to add greatly to our reserve account, but we are hopeful that the promised rebate—though its form of application still remains obscure—will be some compensation. Shareholders can, however, be assured that the productive capacity of our works at Speke has been fully tested, and we are confident that when we are able to return to the manufacture of the products for which we are renowned we shall be well equipped to compete in both export and home markets. Our plant and machinery has been brought up to date, and the extra expenditure incurred will in due course prove its worth.

During the year we have acquired the century-old undertaking known as "Whitfields Safe and Door Company, Limited," which explains the increase in the figure of investments in subsidiary companies. That concern has freehold premises and works in Birmingham, and your directors are confident that when their plans for modernisation are effected it will prove a valuable acquisition. Our London head

offices after their sojourn at Highgate, following two disastrous visitations by the enemy in the City, will be returning to 58, Holborn Viaduct, E.C.1, in the course of a few weeks.

SOUND FINANCIAL POSITION

Finally, although problems of rehabilitation may be vexing, we can face the future with confidence. I think shareholders will agree that the balance-sheet shows us to be in a sound financial position, and we are glad to be able to maintain the dividend and bonus at the rates of the past few years. All employees of the company have contributed to this satisfactory state of affairs, in particular your managing directors, Mr Dyer and Mr Hitches, and to them our thanks are due.

On behalf of the board I send greetings to our chairman and to all employees of the company in the services, with a hope that their return will not now be long delayed.

The report and accounts were adopted.

ASSAM RAILWAYS AND TRADING COMPANY, LIMITED

An extraordinary general meeting of this company was held, on the 18th instant, at Winchester House, Old Broad Street, London, E.C., for the purpose of submitting resolutions reducing the capital of the company from £1,160,000 to £615,000, divided into £315,000 "A" stock and £300,000 "B" stock by paying off the whole of the capital paid up on the pre-Preference "A" shares 1886; paying off the whole of the capital paid up on the 15,000 new 6 per cent. Preference shares; and paying off £315,000 of the capital paid up on the "A" stock.

Mr E. A. A. Joseph (the chairman) explained the resultant position of the company assuming the resolutions were passed. The resolutions were then put to the meeting and passed unanimously.

F. FRANCIS & SONS, LIMITED SATISFACTORY RESULTS

The forty-fourth ordinary general meeting of F. Francis and Sons, Limited, was held, on the 14th instant, in London.

Mr John Ismay (the chairman), in the course of his speech, said: The profit for 1944 at £65,383 shows a reduction of £8,394 on the previous year. Against this, however, the taxation provision at £41,000 represents a reduction of £7,000. Your board recommends the payment of a final dividend on the ordinary share capital of 10 per cent., less tax, which, together with the interim dividend of 4 per cent. already paid, makes a total of 14 per cent. for the year, being the same distribution as the previous four years. I think you will agree, having regard to the very trying circumstances pertaining during the last half of 1944, that the results are very satisfactory.

Our main works are all situated in the areas most severely affected by the flying bombs and rockets, and naturally production was considerably interrupted as a result of these attacks. During this period, however, our works did not suffer any permanent damage, although naturally production was affected.

Whilst we are still engaged to a large extent on Government work, your directors have given considerable thought and taken active measures to provide for the change-over to full peacetime activities. We are, perhaps, fortunate in that our peacetime production is on very similar lines to that of our wartime manufactures, and, therefore, the change-over does not present any great difficulties on the manufacturing side.

Whilst it is very difficult to forecast at the present time, your board is of the opinion that your company can look forward to a busy period in view of the undoubtedly heavy demand for the company's products for civilian and domestic use, a world shortage of which has to be expected.

The report was adopted.

UNITED KINGDOM GAS CORPORATION, LIMITED

REMARKABLE EXPANSION IN GAS SALES

The tenth ordinary general meeting of the United Kingdom Gas Corporation, Limited, was held, on the 19th instant, at Shell House, 55, Bishopsgate, London, E.C.

Mr Bruce Ottley (chairman of the company), in the course of his speech, said: The European victory has relieved the strain upon industry in so far as this country is no longer subject to enemy attack; but it must be borne in mind that the war is not yet over, and wartime conditions, exigencies and priorities still exist, which must be promptly and efficiently met. Anxieties in respect of the supply of coal, labour and materials are everywhere apparent, and in the sphere of public utility in which we are engaged the difficulties are considerable.

I believe that they will be satisfactorily overcome, and that we shall be able to devote our efforts to improve and expand our services to the public in those areas we are privileged to serve.

During the past year, as you know, the Minister of Fuel and Power has set up a Committee of Inquiry whose terms of reference are:

"To review the structure and organisation of the gas industry, to advise what changes have now become necessary in order to develop and cheapen gas supplies to all types of consumers, and to make recommendations."

And pending the completion of the report of this Committee and its consideration by the Minister, a virtual embargo is placed upon acquisitions and amalgamations; consequently, schemes of integration, most of which were initiated prior to the commencement of the war, are held up.

This presents a serious and dangerous aspect in that the provision of gas supply is suspended in relation to new houses, new factories and, in some instances, to the requirements of factories changing over to peace-time production, with the result that the gas service will not be available in some instances in time to meet the demand of the new houses and factories when completed.

GAS SALES FIGURES

The expansion that has taken place in gas sales during the period of operation of your corporation during the last nine years, more than five of which have been years of war, has been truly remarkable.

The total gas sold for all purposes in the year 1944 amounted to 10,863 million cubic feet, exclusive of 3,200 million cubic feet sold in bulk by the West Yorkshire Gas Distribution Company to gas undertakings as compared with 7,029 million cubic feet in the year 1936, an increase of no less than 54.5 per cent.

The sales of gas to domestic consumers have increased by 1,822 million cubic feet, or 32.2 per cent.

The sales of gas to industry have, on the other hand, increased from 939 million to 3,140 million cubic feet, or no less than 235 per cent. At least 90 per cent. of this increased industrial load has taken place in bakeries, engineering, copper, chemical, glass and other works existing and operating prior to the war, and the survey of potential loads over the whole of the areas supplied by the corporation indicates that this load will not only be maintained but, in reasonable time, will be doubled.

Considering the corporation's subsidiaries as a whole, the average price received for all gas in 1938 was 9.3d. per therm and in 1944 10.4d. per therm.

A REMARKABLE ACHIEVEMENT

I submit this is a remarkable achievement if one considers the great increases in prices of coal, labour and all materials. It

has been made possible by the improvement and cheapening of the services resulting from the operation of your corporation, the structure of which, I repeat, provides all the advantages of central control and co-ordination while de-centralising and developing to the full advantage the individuality and initiative of the managements of its subsidiaries.

I suggest that this is something that could not be achieved by any other system, and certainly not by bureaucratic control, which invariably results in multiplication of officials and the stifling of individual responsibility and enterprise.

DOMESTIC SUPPLIES

Our domestic tariffs, on the other hand, have been suspended during the war, but it is our intention to reintroduce them by means of a simple tariff common to all our subsidiaries.

This tariff will provide for a weekly payment of one shilling to meet standing charges, and gas consumed will be charged at one-half the declared price; that is to say, in undertakings where the declared price is one shilling, the commodity charge will be sixpence per therm.

A further new development we propose to introduce in connection with new housing sites is a complete fuel service for the home, involving the use of gas and coke for room heating, cooking, domestic hot water, washing, clothes drying and refrigeration at an inclusive charge of from seven shillings to eight shillings and sixpence per week on present values, depending upon the area—truly a low cost for the fuel service of an ideal smokeless and labour-saving home.

Our immediate future policy is to complete the integration in so far as may be economic in the areas in which we are operating, and we are pressing forward our surveys and investigations to this end.

Here I would like to repeat once more what I have so constantly stressed in my previous speeches to you, namely, that the interests of the consumers must rank first, and our shareholders will appreciate that the value of their investment is entirely dependent upon our being able to offer a cheap and efficient service that will meet the competition of other fuels.

Your directors look forward with high confidence to the future of this great corporation, which has made such good progress in integration, cheapening and improving the gas services in the areas it serves, and which has such a great contribution to make in the conservation of our coal resources.

MANAGING DIRECTOR'S VIEWS

Col. W. Moncrieff Carr, OBE, TD, MInstGasE (managing director), said: I would emphasise the future potentialities of the corporation, provided always that we are permitted to proceed with our schemes on the lines which we have proved to be sound and in the best interests of the public we serve.

Replanning of the gas industry to succeed must be based on the existing structure; that is, if it is to come within the terms of reference of the Heyworth Committee—"to develop and cheapen gas supplies to all types of consumers."

The work that has so far been done by this corporation, in spite of war conditions, is only an indication of what benefit the public can and will receive if we are not unduly hindered by bureaucratic control. In short, the planning can only be done by people who are wholly employed in the industry and thus are equipped with the necessary ability and experience.

The report and accounts were unanimously adopted.

FORD MOTOR COMPANY, LIMITED

GREAT WAR EFFORT

The sixteenth ordinary general meeting of Ford Motor Company Limited was held, on the 20th instant, in London.

The following are extracts from the statement by the Right Hon. Lord Perry, K.B.E., LL.D., circulated with the report:

The 1944 annual accounts disclose in detail the company's satisfactory financial position. Gross trading profits of 1944 were smaller, but the decline was offset by reduction in E.P.T. liability for that year, and as a consequence the net profit position has not only been maintained but slightly improved. We have continued the policy, which I am sure you approve, of strengthening the company's financial position to facilitate post-war reorganisation and resumption of peace-time activities.

The holding company has again earned a profit, which it has retained in preparation for the time—fast approaching—when assistance to continental associated companies may be possible and necessary. Information we now have about these companies makes us hope that, generally speaking, most of them may be in better condition than we had been led to expect.

The forces of the United Nations reached their peak war-time requirements during the year 1944. Our many employees—the figures rose to 22,640 men and 11,600 women—worked hard and consistently, with excellent results achieved in the face of danger, especially in the London area, from renewed and heavy enemy air attacks which, I regret to inform you, killed 41 employees and injured many others and members of their families. On your behalf I thank everyone for another year of fine achievement.

GREAT PRODUCTIVE ACTIVITY

Our great productive activity has placed at the disposal of H.M. Government a considerable volume, value and variety of products used by all the Services in every fighting zone, by agriculture and afforestation, and on essential civilian work. Vehicle production ranged from small vans to large four wheel drive trucks, most of the types having been evolved by us to meet special Service demands. We have been principal manufacturers of the invaluable Bren Gun Carriers—and we made and supplied caterpillar tracks for our own carrier production and that of other manufacturers. Nearly all Bren gun and similar carriers were powered by our famous V-8 engine, many thousands of which have, in addition, been supplied separately for use in a wide variety of ways, such as, for example, auxiliary motors for naval and air craft, generating sets, power units, de-gaussing merchant ships, and for maintenance purposes.

The call for intensified agriculture found us ready. Before the war started we had, by arrangement with the Ministry of Agriculture and Fisheries, evolved a plan for producing and speedily distributing tractors for augmenting and intensifying food production. At the outbreak of war we stepped up and maintained production of the Fordson tractor, and have since developed improved models and assisted in the advance of implement design. Long experience in these matters proved of vital help in feeding this country's population during its years of need. The Fordson tractor has been described as the "keystone" of the Ministry of Agriculture campaign.

The "civilian population" had its essential war duties to perform, and the company's products and dealer organisation were in great demand, including vehicles for ambulances, fire engines and essential industrial transport generally, engines for auxiliary pumps, and many other needs. Our output of parts has been vast, and our service and instruction classes for the training of men and women in the Forces have, we are sure, been of considerable assistance.

AIRCRAFT PRODUCTION

In the aircraft world we have been called upon to play another vital part. The aero engine factory which we manage on behalf of Ministry of Aircraft Production was built and equipped under our direction, and its management and supervisory staffs were supplied almost entirely from the Dagenham works. The product is the famous Rolls-Royce Merlin engine. When I tell you that, starting from scratch, our aero factory has, by the manufacture of tens of thousands of complete engines and millions of pounds worth of parts, achieved a quantity and quality of production comparatively second to none in the aircraft industry you will, I know, endorse my message of thanks and congratulations not only to the many thousands of workers concerned but also to its controller, one of our managing directors, Sir Rowland Smith, upon whom H.M. The King has been pleased to confer the honour of knighthood.

Our other activities away from Dagenham include specialised foundry work, assembly of imported vehicles, new methods of packing parts, and repair and reconditioning of Service vehicles, tanks, carriers and engines. We are proud to have received messages of appreciation from departments of H.M. Government and from generals and fighting men in the field.

ENORMOUS WAR OUTPUT

The following is a short statistical summary of our war output, which has a total value of no less than £179,420,000:—Vehicles manufactured, including carriers and agricultural tractors, 332,509; V-8 engines produced, 262,000; imported vehicles assembled (commenced February, 1941), 25,918; value of automobile, carrier and tractor spare parts, assemblies and components, £39,642,370; value of output from our separate and specialised foundry (commenced July, 1940), £4,434,440; value of repair work on Service vehicles, tanks, carriers and engines, £1,316,280; Merlin engines produced by the Manchester Aero Engine factory (commenced August, 1941) to equivalent brake horsepower of 36,741,000; value of spare aero engine parts, assemblies, and components produced (since August, 1941) £4,892,000.

To the great wealth of our pre-war experience we have added that gained by contributing to the needs of fully mechanised warfare.

The United Kingdom is faced with a hard post-war industrial problem, and to tackle it effectively manufacturers and traders must be freed as soon as possible from all unnecessary controls and restrictions both at home and, more especially, in the export markets. With greater freedom of action restored, this company faces the future with confidence, although it is proper for me to emphasise that many difficulties lie ahead.

SERVICE OF EMPLOYEES

I have already referred to the sterling worth of our employees, both men and women. On your behalf I congratulate the many who have received honours, decorations, and awards. We welcome those who have returned to us from H.M. Forces, and I know you will endorse my message that we hope to have back with us before long the 4,259 still serving to help to build a better post-war world.

We are greatly indebted to suppliers and dealers for their valuable support. To my colleagues and the executive staff I express my, and your, sincere thanks. I also record appreciation of the courtesy and consideration which has been extended to us by officials of H.M. Government.

The report and accounts were adopted and a dividend of 6 per cent. was approved.

DUNLOP RUBBER COMPANY, LIMITED

IMPORTANT WAR PRODUCTIONS

SIR GEORGE BEHARRELL'S STATEMENT

The forty-sixth ordinary general meeting of the Dunlop Rubber Company, Limited, was held, on the 8th instant, in London, Sir J. George Beharrell, D.S.O., chairman of the company, presiding.

The following is an extract from his statement circulated with the report and accounts:—The turnover in the tyre division and in aeroplane equipment was substantially increased, but there was an increase in costs, owing to the use of synthetic rubber and the continual necessity of employing inexperienced labour. In the general rubber goods division both volume and profit maintained the satisfactory levels of 1943, but the garment factory had a decrease in net profits through the reduction of the industry's labour quota, while the footwear and sports divisions continued to suffer from the concentration of their industries and lack of materials. The cotton mills still experience serious difficulties owing to general labour shortage in that industry.

The net profit for the year amounted to £2,615,700 compared with £2,765,797 for 1943. Included in the figure of £2,615,700 are abnormal items which result in a net credit of £74,114. Eliminating this net credit, the profit for 1944 is £2,541,586.

We have arrived at a point from which we can see the war receding and conditions approaching which will not be entirely those of war or peace. This period will have its difficulties for industry. For a time, no doubt, supply will lag behind demand, but, given materials and labour, such a situation can be quickly corrected. We are satisfied that there will be a permanently increased demand for the company's products, quite irrespective of the first period of shortage. Our firm intention is to return to and improve on the quality levels of 1939 immediately we can secure the necessary material and labour, and the technical experience gained during the war will materially assist towards this end. We have substantially completed the programme of replacement of natural by synthetic rubber in all products where the synthetic material can be used.

POSITION OF FRENCH COMPANY

Replying to questions, the chairman said: The situation in France has from time to time caused us a great deal of very careful thought. The claims for loss of stores have been met, and, with regard to the fixed assets, the basis on which we shall be paid for assets which have been damaged, as and when they are reconstructed, has been settled.

We have been treated with every possible consideration by the French Government. Arrangements have been made for the re-financing of the French company in a way that does not involve any money going from this country or from this company. I have every confidence that we shall see the matter brought to a successful conclusion. I wish to pay tribute to the great help which Mr Szarvasy has rendered in the financial negotiations with the bankers in Paris.

NEW TYPE OF TYRES

The whole of the services of the company and its staff were placed unreservedly at the disposal of the Government immediately on the outbreak of war—in fact before that. Our main developments during the war were in the manufacture of tyres. We produced two very specialised tyres—the bullet-proof tyre and the sand-track tyre. The former enabled a vehicle which had received a point-blank shot in a tyre to run for a very considerable distance in

perfect safety, and the latter proved to be the only tyre which would really facilitate movement in the desert. These tyres were so successful that after the battle of Alamein Field-Marshal Montgomery—or General as he then was—wrote specially to say how much he owed to our equipment.

We were, I think, the first company to make barrage balloons by mass production. We were asked to do that in 1938. It was very fortunate that we had proceeded with that development because after the battle of Pearl Harbour it was possible for this country to send 4,000 balloons at once to America for the protection of her coasts.

AIRCRAFT DEVELOPMENTS

We have had considerable developments in regard to aeroplanes. You would expect us to provide tyres and to some extent wheels for aircraft, and also some form of brakes. We have provided such things for nearly the whole of the Royal Air Force, and we have gone much further than that. We have provided many parts of engine-mountings. We have developed a gun-firing and cannon-firing mechanism to such an extent that every plane brought down in the Battle of Britain by British fighters was brought down through the use of our mechanisms, which became standard

throughout Fighter Command. That, I think, is a matter which reflects great credit upon the design, development and production staffs of this company. (Applause.) Then we made some of the buoyancy equipment for the pontoons of the floating piers of the great Mulberry Harbours. They were made in some of the shops where we were making balloons.

You can imagine that when we were making these things we had to invent reasons to explain why we were making them in order that not one person more than was necessary should have the slightest idea of what we were making. Then we were engaged in developments in connection with flame-throwers. We took a very big part in that, and, by and large, I think you can take it that we made a war effort which has proved very satisfactory. We have operated during the war no fewer than 32 separate factories for the production of munitions of war.

FUTURE OF RUBBER

A question has been raised about synthetic rubber and the quantity of it and also of natural rubber which is being, or will be, produced. I am one of the representatives of the British Government on a

convention at present confined to the United States, Holland and Great Britain. At the moment our title is "Rubber Study Group," which represents how far we have got at the moment. It is clear that some international arrangement will be called for to avoid chaos in this great industry.

The qualities of the two products, natural and synthetic rubber, are hardly comparable. I do not think that at present synthetic rubber can compare at all in quality with natural rubber for the manufacture of tyres, and I do not believe that any manufacturer would willingly use synthetic rubber to any extent if natural rubber were available. In fact, it is ever present in our minds that when more natural crude rubber becomes available we shall perform have to let the Americans have some, as otherwise they would be so handicapped that a very difficult situation might arise. When the two types of rubber are in greater supply the matter will have to be discussed in order that one country shall not be unduly prejudiced as compared with another. With regard to controls, at the moment I cannot see how they could be done away with, but I am in favour of their removal as soon as it is wise and safe.

The report and accounts were unanimously adopted.

of each class of capital express their views for or against the amalgamation. At present only rather more than half have done so, and all holders who are not attending the meeting are urged to send in proxies, for or against, without further delay.

(Continued from page 864)
phone is still regarded by most people as a luxury—in some cases a terrifying instrument—and Britain before the war was only ninth in the list of telephone users, with 5.4 telephones per 100 inhabitants, compared with 13.7 per 100 in America. There is, however, a considerable elasticity of demand for telephone services—as the experiment with cheap night calls showed—and the introduction of cheaper services would undoubtedly pay, in the literal as well as the broader sense.

The PO engineering union was mainly concerned at its conference with internal problems, and its members' wages and conditions, but it is interesting to note that they have expressed hopes about the prospects of a postwar expansion which would provide steady employment not only for its existing members but for newcomers to the industry.

French Economic Press

After a prolonged absence, the French economic and financial press has made its re-appearance in strength. There is now a quartet of them, all weeklies. They are *La Tribune Economique*, *La Vie Française*, *L'Economique*, and *Les Nouvelles Economiques*. The first has been sponsored by the Resistance press, while the third reflects trade union opinion; the other two are radical in their approach. The first three are traditional in make-up, but *L'Economique* not only closely resembles *The Economist* in appearance, but its editors have also adopted the principle of anonymity in respect of individual articles.

The re-appearance of an economic and financial press fills the urgent need of providing a platform for discussion and is to be heartily welcomed. Hitherto, *Le Monde*, the successor to *Le Temps*, has been the only journal devoting part of its space to the serious discussion of economic problems. The new economic press, inevitably, has still to find its feet. The journals give a great deal of information and are full of statistics; but most of the articles are descriptive rather than critical and constructive. They still have to develop consistent policies. Potentially, however, they could assist in canalising public opinion and policy towards a series of objectives designed to give the French people the opportunity of a fuller life.

Shorter Note

There appears to be some danger that the adoption of the scheme for the fusion of British Insulated with Callender's Cable will be held up by a technicality. Under the Articles of the former concern, the business of the meeting cannot proceed unless holders of at least two-thirds

FINANCE AND BANKING

THE MONEY MARKET.—This has been an uneventful week in Lombard Street, with the credit position rather unexpectedly comfortable, and demand for bills at a low ebb. The absence of any substantial enquiry for bills from the banks is, of course, attributable to the approach of the half-yearly balance-sheet date, but an increase in the Treasury's requirements for new money had led to expectations of a distinctly tighter short loan position. The call for TDR's, which in the previous week had balanced nominal maturities at £120 million, was last Friday raised to £140 million. Nominal maturities were again £120 million, but pre-encashments had been smaller, leaving a net call of about £23 million, compared with £8 million in the previous week and £22 million a fortnight earlier. The nominal addition to the tender bill issue is again £20 million—this is the seventh week in which £130 million has been on offer—but the discount market secured a bigger share. Special requirements were apparently smaller, for total applications dropped by another £6 million, and the average allotment rate was slightly higher. Thus the market quota rose from 32 to 39 per cent., which is almost up to the high levels that obtained in May, and represents nearly £51 million of bills.

The Bank return indicates that the continued ease in the short loan market has been due to further Ways and Means borrowing. Government securities have risen by £13.5 million to £249 million, their highest level for three months. Thus, despite a small rise in the note circulation—the recent trend of which is discussed on page 861—and despite a slight recovery in public deposits from their low level of the previous week, bankers' balances have risen by £9.2 million.

There has been a good response to the new 2½ per cent. National War Bonds. The first week's subscriptions totalled £16.6 million, which is much above the rate at which money was flowing into them before the tap was turned off last autumn.

MONEY RATES, LONDON.—The following rates remained unchanged between June 13th and June 20th:—

Bank rate, 2% (changed from 3% October 26, 1939). Discount rates: Bank Bills 60 days, 1½%; 3 months, 1½%; 4 months, 1½-1½%; 6 months, 1½-1½%. Treasury Bills: 2 months, 1½%; 3 months, 1½%. Day-to-day money, 1½%. Short Loans, 1½%. Bank deposit rates, 1%. Discount deposit at call, 4%; at notice, 1%.

Exchange Rates.—The following rates fixed by the Bank of England remained unchanged between June 13th and June 20th. (Figures in brackets are par of exchange).

United States. \$ (4.861) 4.021-031; mail transfers 4.021-031. Canada \$ (4.861) 4.43-47; mail transfers 4.43-47. Switzerland. Francs (25.221) 17.30-40. French Empire. Francs 1937-2004. Syria. p. 8.81-85. Sweden. Krona (18.159) T.T. 16.85-95. Dutch West Indies. Florin (12.11) 7.58-62. Portugal. Escudos (110) 99.80-100.20; mail transfers 99.80-100.30. Panama. \$ 4.02-04; mail transfers 4.02-04. Brazil. 84.56½ cr. (buying). Uruguay. 7.6597 p. (buying).

Fixed Rates for Payment at Bank of England for Clearing Offices. Spain. Pesetas 44.00. Turkey. Piastres 520. Italy. L. 71.25 lire.

Market Rates.—The following rates remained unchanged between June 13th and June 20th.

Egypt. Piastres (971) 971-8. India. Rupee (18d. per rupee) 17½-18½d. Belgian Congo. Francs 1761-1. China. National \$ 3.35. Iran. Rl. 128-130. Special Accounts are in force for Chile, Peru, Bolivia and Paraguay, for which no rate of exchange is quoted in London.

GOVERNMENT RETURNS

For the week ended June 16, 1945, total ordinary revenue was £37,558,000, against ordinary expenditure of £101,341,000 and issues to sinking funds of £170,000. Thus, including sinking fund allocations of £1,976,993, the deficit accrued since April 1st is £576,445,000 against £731,699,000 for the corresponding period a year ago.

A change has been made in the method of showing an excess of Post Office Expenditure over the Post Office Revenue. Such excess is now included as ordinary expenditure under "Total Supply Services" instead of being shown, as up to July 24, 1943, inclusive, as a deduction from ordinary revenue.

After decreasing Exchequer balances by £139,911 to £2,706,192, the other operations for the week (no longer shown separately) increased the gross National Debt by £68,867,663 to £22,984 million.

On June 15, applications at £99 14s. 11d. for bills to be paid on Monday, Tuesday, Wednesday, Thursday and Friday of the following week, were accepted as to about 39 per cent. of the amount applied for, and applications at higher prices were accepted in full. Applications at £99 15s. for bills to be paid on Saturday were accepted in full. (130 millions of Treasury Bills are being offered for June 22. For the week ended June 23 the banks will be asked for all Treasury deposits at a maximum amount of £140 millions.)

MAGDALEN COLLEGE

OFFICIAL FELLOWSHIP AND TUTORSHIP IN ECONOMICS.

The College proposes shortly to elect to an Official Fellowship
and Tutorship in Economics.The initial stipend will not be less than £800 per annum, to-
gether with the usual privileges and allowances, and is subject
to the regulations of the Federated Superannuation Scheme for
Universities.Applications made on behalf of candidates who are abroad will
be considered. The choice of the College will not be limited to
those who apply; nor will it refuse to consider applications from
those who are uncertain of their ability to take up the appoin-
tment immediately on election. Application forms may be ob-
tained from the Secretary to the Tutorial Board, Magdalen Col-
lege, and should be returned to him on or before 1st September
1945, together with the names of three referees. Late entries
from men serving abroad will be considered.

THE QUEEN'S UNIVERSITY OF BELFAST

The Senate will shortly appoint an Assistant in Economics
to take up duty on 1st October, 1945. The salary offered will be
the rate of £275 per annum, and will be in the first instance
the period of one year.Applications, together with copies of testimonials, should be
sent to the undersigned, from whom further particulars may be obtained
not later than the 31st July, 1945.

RICHARD H. HUNTER, Secretary.

APPLICATIONS are invited for the post of Acting Head of the
Cambridge University Settlement, Camberwell, and Residen-
tial Warden of the Community Centre to be established in the
Settlement. Age over 30—single or married. Salary not less than
£350 p.a., plus free board and lodging. Applications from candi-
dates not immediately available will be considered.—Apply to the
Secretary, Cambridge House, 131, Camberwell Road, S.E. 5.

INDUSTRIAL REALIGNMENT: Independent Consultant is
prepared to act in an advisory or executive capacity with a
view to assisting in the solution of problems arising out of
Industrial Relations, Training Schemes, Education of Young
Workers, Workers' Co-operation, and Social and Industrial Inter-
pretation. Preliminary interviews to be arranged on a mutually
confidential basis. No liability or obligation in the first instance
is, of course, involved.—Box No. 78, The Economist, Brettenham
House, Lancaster Place, London, W.C.2.

RECORDS AND STATISTICS

The New Charter

ON June 26th, the fifty nations assembled at San
Francisco to draw up a Charter for the new world
organisation signed the completed document. After nine
weeks of negotiation, after delays, hesitations, disputes
and several deadlocks, agreement has been reached and
it now only remains for the interim Commission, working
in London, to wind up the affairs of the old League of
Nations and to work out the methods whereby the new
organisation is to come into being.

In substance, the Charter follows the lines laid down
at Dumbarton Oaks. The only substantial modifications
are the introduction of an entirely new body, the Trustee-
ship Council, which will fulfil the functions of the old
Mandates Commission, and the very great elaboration
of the Economic and Social Council. For the rest, the
pressure of the Middle and Small Powers to reduce the
overriding authority of the Big Five has resulted in only
very slight modifications—for instance, the right of a
state-member, called upon to contribute armed forces to
the settlement of a dispute, to take part in the Security
Council's deliberations on the use of those forces.

Men who remember the mood and atmosphere with
which the first League Covenant was launched twenty-five

years ago will undoubtedly feel some sense of disappoint-
ment with the new effort to create an international peace
system. In the first enthusiasm of the Wilsonian ideal,
it was felt that the new methods of collective security, of
collaboration and peaceful settlement, represented a com-
plete and decisive break with a discredited past of power
politics and perpetual war. This League was indeed a new
heaven and a new earth and its sponsors launched it with
an almost messianic hope.

The new League starts its career in a more sober
atmosphere. The Charter cannot be accused of excessive
idealism. On the contrary, almost every article is marked
with the experience of two grim decades between the
wars during which, in Europe especially, politics,
imperialism and aggression grew up like tenacious ivy
within and over the brave new League. In the United
Nations Charter, there is no reliance upon better and
more idealistic methods of conducting international
relations. The dominant position is occupied by
those whose physical power would give them a dominant
position in any unorganised world society. Nor is any
attempt made to put them—for all the solemn emphasis
on "sovereign equality"—on the same footing as the

small states. They are above the law because they are the wielders of the power behind the law. The rest of the world may be compelled to good behaviour; with the Great Powers, good behaviour is a matter of sovereign choice. Again, the provisions justifying "self defence" in the event of aggression and allowing "regional agencies" great latitude in settling their disputes and maintaining peace can easily become mere licence to carry on separate defence policies with little or no attempt to co-ordinate them with any wider conception of security.

In a word, it is possible for the cynic or the embittered idealist to argue that the new Charter is only old expedients and separate nationalism writ large and covered over with a stucco facing of general good will.

No one can deny that there is force behind the criticism. The smaller nations which battled for nine weeks at San Francisco were obviously haunted by the same fears. Yet extreme criticism of this form goes too far and leaves on one side all the new and genuinely encouraging features of the new Charter. The first and obvious improvements on the old League is the presence at the San Francisco discussions and ceremonies of the two great absentees of 1919—the United States and the Soviet Union. There is, according to most observers, an excellent chance of the Charter passing the Senate; Senator Vandenberg, whose influence is strong with Republicans and isolationists, wishes to see the Charter accepted with reasonable speed. It is difficult, looking back, to imagine how statesmen came to have welcomed with so little misgiving a world organisation from which two of the greatest world powers were absent.

There is also, apart from this specific difference, the general question whether the approach of idealism was not in itself wrong. Did not the belief that the League transcended the Powers which were its members, that the Covenant was in itself a guarantee against war and that collective security was an alternative to national defence and not an extension of it—did not these illusions make the chance of keeping peace more, not less, difficult? Collective security, by making the checking of aggression the responsibility of all, left it the responsibility of none. The fact of power was whittled away and the need to put force behind pacific as well as aggressive purposes was lost to sight in a flurry of well-intentioned attempts on the part of the victors to reduce their armaments. The stress on a general international system drew the peoples' attention away from the need for each nation to pursue an effective foreign policy in concert with other peace-loving Powers. The League became first a substitute for defence and then a substitute for policy. Finally, the belief

in an all-provident system of collective security encouraged the victors to fall apart and break the coalition which had defeated aggression. It is, of course, true that the League was not in any way responsible for these misfortunes. It had no existence outside the policy (or lack of policy) of the Powers. But its existence in a rarified and idealised form certainly prevented people from seeing what was really afoot in the jungle of European and Far Eastern politics.

The new organisation, precisely because it has no Utopian élan, may keep the nations more firmly on the path of security. The responsibility for preserving peace is placed squarely where it alone can rest—on the broad shoulders of the Great Powers. General internationalist aspirations do not replace concrete regional groupings for defence. Finally, all Powers, great and small alike, have testified to the necessity of preserving the war-time coalition of the Great Powers.

It is true that by giving the international organisation greater reality, the Powers have brought it very much to earth and made it resemble in very many ways the expedients of alliances and defence systems which have, in the past, been the usual—and in the end always ineffective—methods of preserving peace. But to say this is not to deny any value in the international framework within which the old methods are to be fitted. It is almost certain that the acquiescence of the United States could have been secured on no other terms. The conference itself has already shown how powerful the effect of world opinion can be on the policy of great States and how salutary the public airing of injustice and heavy handedness can be. As a forum of world opinion, the international structure of the new League can play a direct part in checking wrongdoing and aggression. Equally the habits of co-operation and of contact—in every sphere, political economic and social—will certainly be educative and may also be fraternal and conciliatory.

Apart from these wider benefits, the new League offers the Powers, especially the Great Powers, an executive machine for their continuing alliance. It is now to the preservation and the deepening of that alliance that the nations must turn. As President Truman pointed out, the new Charter is only a beginning. It can be a foundation or a framework of better things, if the Powers within it so desire and so work. In spite of all the idealism of its framing and the aspirations of its founders, neither more nor less could in reality have been said of the old Covenant. The advantage of the new is that the obligation on the Powers themselves for good and pacific international conduct is so much more clearly underlined.

make itself responsible for the general economic climate and for matters of overall management, while detailed industrial administration is best left to the decision of individuals. Secondly, the severance of control from responsibility, the subordination of one set of men who have the initiative for action to another set who have to give or refuse permission without bearing the responsibility for the consequences, is always bad. Generally speaking, it is always better for the state to take an industry over completely than to "control" it. The final test of any state intervention should be whether it stimulates useful activity or curbs it. "Take the brakes off" should be the guiding principle, whether the means of applying it are by private or by public enterprise.

1. *National Efficiency.* Policy should proceed along six lines:—

- A great increase in the standards of technical education and in the volume of industrial research.
- A complete reversal of policy towards restrictive practices. The fixation of minimum prices or of maximum quotas of production, limitation of entry to a trade or deliberate restriction of productive capacity should be declared illegal and prohibited

except under licence in cases where it can be proved, in each instance, to the satisfaction of an independent tribunal, that the licence would be in the public interest.

- A substantial remission of taxation on profits retained in industry and genuinely ploughed back into extension or improvements of capital.
- A Treaty with the Trade Union movement, by which a lion's share of the benefits from any increases in productivity was guaranteed to wages, in return for a withdrawal of all restrictive practices by Labour, for consent to multiple shift working and for general support for the principle of maximum output.
- Planned reorganisation of key industries, of which coal, steel and cotton should be the first on the list. The reorganisation should follow strictly technical lines and questions of ownership should be settled on their merits. In coal, the element of public ownership and management would inevitably be large, in cotton small, with steel about midway between the other two. Transport and Power are two industries in which the benefits of a greater community of interest between what are now separate parts should be further canvassed; until the results of these enquiries are clear, mere changes of ownership or management of the separate parts would serve no useful purpose.
- The general economic policy of the Government should be designed to ensure that an adequate portion of the national resources is set aside each year for the extension of the community's productive equipment, with the aim of doubling productivity in a generation.

2. *Full Employment.* The essential requirement for a high and stable level of employment, apart from questions of foreign trade (dealt with below), is a smoothing out of the flow of funds into capital investment. To achieve this purpose, a whole armoury of instruments of influencing business decisions need to be developed. These should include the control of interest rates; an investment board, equipped to encourage as well as to check the flow of savings into capital; a flexible taxation policy, designed not only to foster the formation of capital but also to influence the timing of investment; the giving of guarantees for particular forms of investment at advantageous moments. A Public Works policy—that is, the deliberate unbalancing of the stream of government expenditure to offset fluctuations elsewhere, should be regarded as a policy of last resort. The responsibility of the Full Employment policy should be clearly defined and placed on one Minister.

3. *Social Security.* The chief remaining needs under this head are for rounding off the structure that is emerging from the Beveridge Report. The further steps needed are:—

- Acceptance of the subsistence basis for benefits as soon as possible.
- Development of benefits in kind, especially in connection with food.
- Simplification of the whole structure of financial relationship between the state and the individual, so that PAYE, income tax allowances and social security benefits and contributions are combined in a single simple scheme.

4. *Housing.* This is in the main a matter of energetic administration rather than of policy. The following measures are, however, needed:—

- A Housing Plan, district by district, to ensure that the numbers of houses of different kinds that are built, and their location, are not left to chance.
- Subsidies designed to carry out the Plan, rather than that the number and kind of houses should be left to the accidental products of the subsidy.
- A declaration of war on price rings, going so far if necessary as purchase by the Government of the whole output.
- A wage system for the industry which will put a premium on high, not on low, output per head.
- Legislation on compensation and betterment, following, broadly, the lines of the late Government's White Paper.

5. Food and Agriculture.

- Guaranteed prices sufficient to ensure a good living to an industry of approximately one million workers.
- Emphasis on products for which this country is best fitted.
- No part of the cost of guaranteed prices to be added to the retail price of food.
- No interference with the cheapness of imported food.

6. *Shipping and Shipbuilding.* The Government should take over the responsibility for ensuring that there is at all times an adequate, and adequately modern, Merchant Navy, and that there is regular employment for the shipyards. This can best be done by the Government itself building ships to a regular programme, and hiring them, on long charters extending over many years, to shipping companies. A reserve of 3,000,000 gross tons of shipping should be kept.

(b) Social Questions

7. *Birth Rate.* Full development of policy must await the Report of the Royal Commission. But the following interim measures should be carried out:—

- Adequate family allowances, free of tax.
- The children's allowance for income tax to be a proportion of income instead of a fixed amount.
- A Home Help Service to assist the mothers of large families, not merely in sickness.
- Acceptance of a single system of education for rich and poor as an aim of educational policy.

8. *Health.* The White Paper scheme should be amended to make the Health Service a national concern, nationally financed, independent of the local authorities. It is right to preserve the professional freedom of the doctor, but it is wrong in so doing to conceive of a National Medical Service as being no more than the subsidisation out of public funds of private practice and voluntary hospitals.

9. *Local Government.* The efficient operation of the social services depends on a reform of local government finance, which will otherwise exercise a crippling effect. The lines of action should be:—

- The removal from local authorities' financial responsibilities of the greater part of the health services, as proposed above.
- Standardisation throughout the country of rating valuations.
- A National Rate to be levied uniformly over the whole country, the proceeds pooled and distributed according to need. This to cover the greater part of local authorities' revenue (other than grants from the Government) but Local Rates to remain for any excess.

(c) External Policy

External policy lends itself far less than domestic policy to condensation into a programme. This is partly because it is a region where the issues are less sharply defined between the parties, partly because it is a matter of detailed administration from day to day rather than of sweeping decisions of policy and partly because it depends so much on the actions and attitudes of others. The following three paragraphs are therefore inevitably less precise than the preceding ones; but they contain the essentials.

10. *Foreign Policy.* The aims of British foreign policy should be:—

- To foster the growth of international institutions strong enough to enforce international law.
- In the meantime to ensure that enough strength remains in the hands of states that will use it to preserve peace and prevent aggression, and that are jointly committed to these policies.
- To foster the growth all over the world of liberal and democratic institutions, the best exterminators of aggression.

The means by which these aims should be pursued are:—

- The closest possible alliance, based on frankness and mutual respect, with the United States and Soviet Russia. How far these two nations will be willing

An Election Manifesto

In recent weeks The Economist has had little that was good to say about the election manifestos of all three political parties. Several correspondents have, in consequence, levelled the charge of purely negative criticism—a charge more wounding than any other to a journal such as this. Accordingly, herewith The Economist tries its hand at its own election manifesto—that is, an attempt to set down briefly but clearly what it believes could be accomplished in the lifetime of the next Parliament.

(a) Economic Policy

THE great issues of economic policy are to raise the standard of production of the worker, so that his standard of living may also increase (National Efficiency); to prevent depressions (Full Employment); and to prevent individual poverty (Social Security). In pursuing these aims there should be no exclusive dogmas either of private or collective ownership. Indeed, the fullest potentialities of both systems will have to be exploited. No rigid distinction can be laid down between the proper province of collective organisation and the proper province of individual enterprise. But two guiding principles should, as far as possible, be followed. First, the state can best

to go in constructive co-operation is beyond our control, but Britain should always be the most willing of the three to formulate joint policies and to act in common.

- (b) A close association—economic and cultural as well as strategic—with the nations of Western Europe.
- (c) The defensive strategy of the British Commonwealth should be conceived as a whole, even if it is carried out by each British nation on its own responsibility.
- (d) Maintenance at all times of a "Battle of Britain" standard in the defences of the United Kingdom—that is, armed forces and munition industries adequate to ensure the minimum defence of the country.
- (e) Fullest co-operation in building up the international bodies that emerge from the peace settlement. Britain should never be a laggard in pooling national sovereignties.

11. *International Economics.* Free Trade and the Gold Standard are to international economics what International Law and World Government are to international politics—the obvious ends of policy. But, equally obviously, they cannot be set up as practical policies overnight. The immediate aims for British policy should be:—

- (a) The reconstruction of an export trade large enough to pay for imports. In the short run, this is a question of production and supplies and can only be solved by the initiative and under the direction

of the state. In the longer run, it will be a question of prices and markets, and can best be accomplished by private enterprise, though assisted and, in some cases, organised by the state.

- (b) So long as there are in the world such things as trade depressions and unbalanced accounts, British policy should be directed towards ensuring that our imports and exports are preserved against catastrophic declines. This can be done by long-term bulk purchase contracts and by similar stabilisation agreements with other countries.
- (c) British co-operation should always be given for the elaboration of such schemes as those evolved at Bretton Woods and Hot Springs, and for co-operative effort in working towards the stable world in which alone they can hope to be effective.

12. *Imperial Policy.* A high standard of living should be set alongside self-government as one of the aims of British imperial policy and both should be pursued with full vigour. Rising standards of living in the colonial Empire can be secured by education, by welfare services, by technical assistance and, above all, by the provision of capital. Specific targets, to be attained by specific dates, should be set for economic and political progress.

No claim is made that this Manifesto is free from ambiguity, that it is complete, or that all the difficulties are explicitly faced. But the claim is made that it is far more precise and comprehensive—and no less practical—than anything sponsored by the political parties.

Western Association—IV

Stable Trade

THE preceding article in this series established the case for a series of agreements among the countries of Western Europe designed to foster and stabilise their trade with each other. Each of them is intent upon a policy of full employment, pursued under the purposive direction of the state; but none of them can hope to stabilise its domestic economy if its foreign trade is left to fluctuate widely. Fortunately, however, in every case a very large proportion of these countries' total foreign trade is done with each other. If this body of trade could be preserved against shrinkage in times of threatened slump, the Western European countries would be making a powerful contribution to the solution of each others' economic problems. The question of how this could be done, without creating an equivalent amount of disturbance in their trade relations with other countries, was left over for consideration in this article.

The traditional approach to such a problem would be by a mutual reduction of tariffs. Those of the Western European countries which were members of the pre-war "Oslo group" have fully explored this route, and Belgium and Holland got so far as to conclude the Ouchy convention in 1932 for the purpose. But all these attempts were blocked by Great Britain and the United States, citing the most-favoured-nation clause, and demanding, without contribution of their own, to share in any benefits that the Oslo countries conferred on each other. It is possible that this obstacle would not be quite so stubborn now as it was in the depths of the Great Depression. If Great Britain was itself a sponsor of the proposal, British opposition would *ipso facto* be withdrawn. The United States, under a Democratic President, is not quite so rigid as it was under President Hoover. In 1933, the year after the failure of the Ouchy convention, Mr Cordell Hull assisted in the adoption of the Montevideo resolution of the Pan-American Conference, which proposed to exempt from the most-favoured-nation clause "multilateral treaties which have as their general purpose the liberalisation of international economic relations, and which are open to the accession of all countries." Moreover, Mr Hull's own Trade Agreements policy has demonstrated how it is possible to subdivide a tariff classification so minutely that a concession given on one substance, though in form open to all, is, in fact, confined to

one or two countries—a practice clearly contrary to the spirit of the most-favoured-nation clause, but accepted even by the purists as being within its letter.

There are therefore some possibilities of loopholes in the most-favoured-nation barrier, and they should certainly be explored. But they are likely to be small; and long established interests in the different countries may prevent the governments from taking full advantage of them. And in any case a trade that has been relieved of its tariff obstructions, though it may be larger on the average, is in no way stabilised. What is necessary to prevent the import and export of unemployment is that the volume of trade, whatever its normal level, whether protected or not, should be prevented from crumbling away at the onset of depression. Let the volume of trade between the Western European countries first of all be expanded by such removal of protectionist barriers as is possible; but the further problem is then to find means of stabilising it at these high levels.

The most obvious way of accomplishing this is by the direct method of long-term bulk-purchase contracts. These have come into favour in the war years and the technique has been greatly developed. But they are not a new invention, and guarantees for the purchase of British coal figured in a number of the trade agreements made between this country and the Scandinavian countries in the early 1930's. These Scandinavian agreements also illustrate the fact that such bulk-purchase agreements can be made without involving any large measure of State trading, since the contracting Government need only engage itself to take up what private importers do not buy. There is considerable scope for the extension of such methods. Wherever, among the Western European countries, there is a regular trade in more or less standard commodities, quantitative arrangements can be entered into. Danish butter and bacon are obvious examples, as well as a great variety of primary products exported from the British, French, Dutch and Belgian colonies. The British Dominions have been the major beneficiaries of the long-term contracts of wartime and they will doubtless be anxious to continue this system of disposing of their produce—though, no doubt, it can be adapted to fit more closely into normal trading channels.

But bulk purchases are appropriate only for bulk commodities of a standard nature. Textiles, engineering

exports, and the multifarious products of an industrial country cannot be disposed of in this way. This is a difficulty that arises whenever an industrial country and a primary producer confront the problem of stabilising their trade. It has been most squarely faced in New Zealand, where the answer that is given to it is that every pound sterling earned by bulk sales of New Zealand produce in the United Kingdom will, by New Zealand control, be spent in Great Britain. Just how far this sort of arrangement comes within the new orthodoxy is a little uncertain. Lord Keynes has said, in the House of Lords, that, provided it is a voluntary arrangement—that is, that the control is exercised by New Zealand and not by the United Kingdom—it is permitted by the Bretton Woods Agreement. How far this interpretation would be accepted in the United States is uncertain.

In the interim period, however, the machinery for such arrangements already exists in the form of the financial agreements that have been negotiated with most of the Western European nations. In the Belgian agreement, which was the prototype, the two countries undertake to provide each other with such supplies as they need of their respective currencies, within a limit. As was pointed out in *The Economist* at the time, this limit could become a device reducing the trade in both directions to the level of the lower constituent. But if it were imaginatively used—if every time the Belgian debt approaches the limit the reaction is not to cut down British exports to Belgium, but to seek means of expanding Belgian exports to Britain—these financial agreements could become the means by which each country could stabilise its own purchases, secure in the knowledge that it would be fairly done by—and there is no reason why "fairly done by" should mean an exact balance between each pair of countries, but only that trade between each pair shall be continued in its normal proportions.

By these means, a considerable beginning could be made, within a very wide area of trade, with a new variety of commercial policy, designed to play a definite part in securing full employment. It is, of course, impossible to guarantee that American opinion would not be annoyed by such "bilateral" methods. But the Americans would have no right to be annoyed provided that two conditions are observed: first, that the trade to be stabilised is normal trade in normal volume and that its stabilisation does not therefore simply subtract from America's own trade with these countries (which would not, in any case, serve the object of stabilising employment); and secondly, that the stabilisation agreements are open to the accession of any country that will make its contribution. After all, in current American discussion, a planned volume of exports is expected to make its contribution to full employment, and it is very difficult to draw a distinction of morality between ensuring this volume of exports by making loans and doing so by promising to import. Indeed, the latter is preferable, since it results in a balance between imports and exports. If the doctrine of non-discrimination means that, when

one country allows its trade to fall off, all others must catch the infection and none must inoculate themselves, it will turn out to be the most powerful weapon for spreading the virus of depression and restriction that was ever invented.

Arrangements of this kind are probably the major contribution that can be made by mutual action towards the goal of full employment in Western Europe. They do not, however, quite exhaust the list and there may be other lines of policy that would be worth investigating. For example, a large part of the technique of economic stabilisation lies in presenting a balance between the saving propensity of the public and the rate of formation of capital. In theory, cases would arise when one country could provide savings for the capital needs of another, or possibilities of investment for the surplus savings of another. How far this sort of situation would be likely to arise in practice among countries so similar in their economic structure as those of Western Europe is perhaps open to doubt. But there should be many opportunities of mutual benefit to be found in such capital exchanges between the metropolitan countries in Europe and their colonies, and a co-ordinated policy of capital development of colonial territories might yield great advantages.

Nor should full employment be regarded as the sum total of economic policy; there are other departments in which mutual aid could also be organised. Is it, for example, entirely fanciful to see the possibility of a much higher degree of mobility of labour among the countries of the group, with a mutual extension of social security benefits? The productivity of industry is another matter that will increasingly engage the attention of these governments. The British Government, for example, will have to concern itself with the reorganisation of the steel industry. There is no doubt at all that a technical rationalisation of the steel industry of the whole of Western Europe would result in much cheaper production than if its purview were restricted to any one country—though it is doubtful how far defence considerations would permit a relaxation of policies of national self-sufficiency. Or, again, the planning of agriculture and food supply on the wider canvas could achieve results outside the reach of any one nation.

These articles are not a programme so much as an agenda—and not an agenda so much as an attempt to prove that an agenda could be constructed on which fruitful discussions between the countries of Western Europe could be carried on. Enough has possibly been said to establish this point. Together with the British Dominions, this group of countries is almost the only group that is of a mind to tackle the problems of economic policy in the way that they are being approached in this country. This fact by itself would be enough to establish a community of interest. When, in addition, it can be shown that they can substantially assist each other in the solution of their problems, the case for at least an exploration of the practical possibilities is complete.

Middle Eastern Oil

THE end of the war in Europe and the intensification of air and sea warfare in the Pacific have greatly increased the immediate interest in Near and Middle Eastern oil supplies. There are two reasons for this. First, the oil requirements of the United Nations this year, at a daily rate of 7,000,000 barrels (equalling 1,000,000 metric tons) will be one-quarter greater than world oil supplies in 1939. Of the 7,000,000 barrels of crude oil produced by the United Nations since Pearl Harbour, all but 75 per cent have been supplied by the United States. After the heavy increases in production throughout the war, the United States oil industry finds it difficult to expand its output further at short notice, and the supply arrangements for this year have limited the contribution of the United States to the Allied pool to 69 per cent of the total. More oil must now be secured from other sources. Among these the Middle Eastern wells must pull an increased weight.

Secondly, the oil requirements of the Pacific war are increasing at an extraordinary pace. The amphibian forces engaged in island-hopping consume fantastic amounts, while every Super-Fortress attacking Japan consumes over 8,000 gallons of aviation fuel—the carrying capacity of a large railway tank car. Late last year it was officially stated in Washington that, even then, oil requirements for the Pacific front were exceeding the total which two years before had been the estimated potential maximum of military requirements throughout the world. This figure has since increased further and is likely to continue to increase during the next few months.

The oilfields of the Persian Gulf region, owing to their geographical situation, are predestined to play a particularly important part in the oil supplies for the Pacific war. They are several thousand miles nearer to the South-East Asia base, which is now being connected by pipe-line with China, than are the oil-producing centres of North and Latin America. Further, the sea lanes which connect them with the Pacific fighting zones are not nearly as exposed to enemy attack as are the trans-Pacific routes from the American Continent.

The oil industry of the Near and Middle East has in the course of the past three years been frequently upbraided in the United States for failure to pull its full weight in Allied war supplies. On a first view, these accusations may not appear unfounded. The five oil-producing areas of the Near and Middle East—Iraq, Bahrain, Saudi-Arabia and Egypt—together produced, as lately as 1943, little more than they were producing in 1939. Their output over the three years of the main Middle Eastern campaign was: 1941, 111 million barrels; 1942, 110 million barrels; 1943, 125 million barrels—an increase of 12.6 per cent. The reason for failure further to increase production is provided by the shortage of tankers on the one hand and by limited local refining facilities on the other. These two factors made it impossible to use the rich Middle Eastern oil resources to a fuller extent. Over the same three years, and for the same reason, United States production increased by only 7.8 per cent, and total world production, estimated at 2,249 million barrels, was a fraction lower in 1943 than in 1941.

By 1944 the output in the Middle East had begun to rise. Owing to important changes in the local refining situation and in the world tanker position, the five fields

between them were stimulated into producing 163 million barrels. The proportion they now represent of total world production has risen to 6.3 per cent.

In the course of the past twelve months tanker construction in the United States and the British Empire has overtaken wartime tanker losses. For the first time since 1940 the United Nations have enough tanker space at their disposal to meet all essential needs. Moreover, within the limits set by shortage of materials, Middle East refining facilities have greatly improved. The vast refinery of the Anglo-Iranian Oil Company at Abadan, at the head of the Persian Gulf, which entered the war with a capacity of less than 250,000 barrels daily, has been expanded in several stages. Late last year its daily throughput had been raised to 320,000 barrels, and a further expansion scheme, now approaching completion, will increase this figure to almost 400,000 barrels before the end of this year. In the course of this expansion, Abadan has been adjusted to produce the topmost grades of aviation petrol at a high rate. On January 9, 1945, the refinery was in a position to announce the production of its five-hundred-millionth gallon of 100-octane aviation spirit, a quantity large enough to sustain a force of 1,000 four-engined bombers on five night attacks a week over a period of one year.

The Bahrain refinery, which is controlled by two United States companies, handled under 25,000 barrels daily at this time last year. It is now capable of treating 56,000 barrels of Bahrain and Arabian oil. A new and modern refinery at Ras Tanura in Saudi-Arabia, with a daily capacity of 50,000 barrels, is being built by the Arabian American Oil Company and is scheduled to go "on stream" within the next three months. Like the expanded Bahrain refinery, it will be able to supply all types of "war oils," including 100-octane aviation petrol. Certain increases have also been carried out in the modern refineries elsewhere in the region, for instance, at the Haifa refinery belonging to Consolidated Refineries Ltd. and at the Suez refinery that is run by Anglo-Egyptian Oilfields Ltd. These expansions, though limited by the inflow of crude oil, have proved of the greatest importance during the war operations in the Mediterranean area.

Production in 1944 showed a particularly important increase in Iran, which reached for the first time an output of 100 million barrels or some 22 million barrels more than in 1939. Egypt, at over 9,000,000 barrels, was last year producing twice as much oil as in 1939, the direct result of the development of the new oilfield of Ras Gharib, while Saudi-Arabia, the youngest of the Middle Eastern producing regions, in 1944 produced 9,500,000 barrels against less than 4,000,000 barrels in 1939. These increases were in the main attained in the latter months of last year. This year the rate of expansion will be still greater, and if the refinery expansions now in progress are completed to time, the Near and Middle Eastern production in 1945 will not fall much short of 200 million barrels. Particularly important increases in supplies are, within the next few months, expected from the refinery expansions at Abadan and Bahrain and the completion of the refinery at Ras Tanura. The latter development will for the first time permit a freer flow of oil from the developed Arabian fields—Dimman, Abqaiia and Abu Hadriya—the output of which is scheduled to be quadrupled within the next twelve months.

These latest developments, though important, have been strictly limited by the available supplies of equipment. They do not nearly exhaust the potentialities of the region, the oil resources of which are estimated to account for three-tenths of the world's known oil reserves. For the duration of the Pacific war the overwhelming part of the newly developed oil supplies will be used to strengthen the offensive powers of the United Nations'

fighting forces in the Far East. After the defeat of Japan they will at once completely change the oil supply picture of the whole Indian Ocean area.

They could become an important influence on the European oil market, but the changes they will bring to it are still an open question. Middle East production costs are considerably below those in the great United States fields, but the discrepancy is offset by Suez Canal dues on tanker freight. It should be remembered that, with two exceptions, all the Middle East output is shipped at points east of Suez. The exceptions are Iraq's Kirkuk field, the supply from which is piped to the Mediterranean, and the Egyptian oilfields, which, though at present they ship their output chiefly at Suez, could without difficulty switch it to Alexandria or Port Said. Avoidance of canal dues was one of the arguments which prompted the American companies interested in Arabian oil to back Mr Ickes in his pipe-line project of last year. That plan

Safe Seats

(By a Correspondent)

IN the spring of 1940 a team of American sociologists trained in the operation of public opinion polls set out to study the determinants of peoples' votes in a Presidential election. Their observation post was Erie County, Ohio. Many months before polling day they found that the men and women who had firmly decided to vote Republican exhibited an almost constant set of characteristics—they were in the upper income groups, they were Protestants, they lived outside the big cities, and they were at least second-generation in their American citizenship. Conversely, those intending to vote Democrat were working class, Catholic, urbanised, and often naturalised immigrants. In between these two groups there were of course many citizens with conflicting vote-determining traits—and frequently these were the people who decided the local outcome of the election. But one of the most striking conclusions reached by the investigators was that almost invariably social characteristics determine political preference. After a while, all that the investigator needed to know about any citizen was his or her "constellation of social traits"; given this information, the voting behaviour of the informant was immediately revealed to the investigator. Very rarely did candidates, issues or propaganda upset the expected play of social traits.

No similar direct attempt to discover the how and why of political opinion has ever been carried out in this country. Even an indirect approach is difficult because of the very limited statistical information on the electorate that is available. All that is known with certainty is the size of the electorate in each constituency and its sex composition. Something, however, can be learned by starting from this latter point.

In 1935, in the total British electorate of 31 million, women exceeded men by approximately 10 per cent. This excess, however, was not uniform throughout all constituencies. At one extreme there were 139 constituencies—stretching from Torquay to Dulwich and Bury to Aberdeen—where women exceeded men by at least 20 per cent; the Conservative candidate was successful in 131 of these. At the other extreme—in terms of sex composition—were the 68 constituencies—from St. Helens to Nuneaton, and Merthyr—where men outnumbered women; Labour gained 53 of these seats; from this handful of districts the Labour Party won half as many seats as it did in the remaining 547 constituencies where women were in a majority.

As a first approximation, then, it seems reasonable to conclude that women have a predilection for the Conservative Party, while men prefer the Labour Party.

One can go beyond this only by using the vital statistics prepared by the Registrar-General for mid-1935 and those collected in the 1931 Census. For the most part, however, these figures in detail relate to administrative areas whose boundaries rarely coincide with those of the parliamentary

was worsted largely owing to the opposition of other American companies, producing at high cost at home and interested in marketing in Europe.

Nor are economics the only complications involved in planning the future of Middle Eastern oilfields. The suggestions of Anglo-American rivalry which arose in connection with the Ickes pipe-line proposal were largely, but not wholly, unfounded, and Russia's diplomatic clash with Iran about the oil concessions in Northern Iran provides a warning that the development of Middle Eastern oil wealth is likely to raise complicated political problems for the post-war world. It is fully possible however, that the arrangements of the companies of various nationalities will fuse and dovetail as neatly as they do at Kirkuk, where the Iraq Petroleum Company is happily run by a combine of British, American, French, Dutch and local interests. Here is the course to set for the rest of the area.

constituencies. The best one can do is to group the "feminine-Conservative" seats into the Registrar-General's regions and to analyse those regions where they bulk unduly heavily (unduly in relation to population). Such regions were Greater London, the Rest of S.E. England and South-West England. Between them these three areas contained half the safe "feminine-Tory" seats but only one-third of the total population of Great Britain. In each of these regions, as in their individual constituencies, the excess of women over men was unusually large—respectively 21 per cent, 20 per cent, and 19 per cent; in the rest of Great Britain the difference was only 5 per cent.

What was the identity of this unusual female excess? In terms of age they were primarily women who had passed the prime of life, had finished their schooling in the 19th century and married and started their families in the Edwardian decade; in the three "feminine-Tory" regions women aged 45 and over exceeded men of the same age group by 30 per cent; in the rest of the country their proportions were practically identical.

The economic character of the bulge, however, was not constant. The suburban Home Counties and South-West England formed one pattern and Greater London another; both differed from the situation in the rest of the country.

The following figures relate to 1931:

Females, 14 and over	Feminine-Tory Regions		Rest of Great Britain
	Greater London	Rest of South	
Percentage unoccupied or retired . . .	60	71	66
Percentage of all occupied females:—			
In commerce and finance	19	16	12
In professions	6	8	3
In personal service	32	49	20
Managers or on own account	6	11	7

Thus, the common special characteristic of the female population in all feminine-Tory regions was the concentration of servants, shop assistants and professional workers (mainly school teachers and nurses); the added peculiarity of the "Rest of South England" was a high proportion of women who either ran their own business (mainly small retail stores and boarding houses) or who had retired completely from earning a living.

The recipe for a safe Conservative seat (under pre-1939 conditions) seems then fairly clear: take a constituency where women are in a substantial majority; part of this surplus is made up of middle-aged women living on an unearned income, on the profits of a small business or on a small salary—offer them protection against threats to private enterprise and against policies that might lead to inflation. But the bulk of the surplus women are servants and shop assistants—reserve for their special appreciation the assurance that only the rich or the glamorous are fit to govern.

As there is now a long waiting list for *The Economist*, subscribers who wish to renew their subscription are advised to do so immediately upon receipt of a renewal notice. If they fail to do so, their subscriptions will be automatically cancelled on the date of expiry, and this may mean a gap of many months before the despatch of copies can be resumed.

Means and Needs

One of the results of Labour's presence in the Government during the war is that the means test, which before 1939 was one of the bitterest points at issue, is not figuring in this election, although both Mr Bevin and his former Parliamentary Secretary, Mr Tomlinson, referred in their broadcast addresses to its "cruel operation" and the "humiliation" and "indignity" is imposed.

As soon as the Labour leaders entered the Government in 1940 they made it their first non-war object to have the household means test removed, and their efforts led to the Determination of Needs Act of 1941. This statute determines need in the case of persons applying for supplementary pensions or unemployment assistance. It removed the main grievance against the old means test, which was that a whole household's resources had to be aggregated and fall below a certain level before a member of it could qualify for assistance. The present test is based far more on personal needs. Assumed contributions from a non-dependent child to the expenses of an applicant's household are standardised, and inquiry into the resources of a householder, with whom an applicant is living, is very much reduced. Nor is an applicant allowed to be dependent on other members of a household for money to buy clothing or other personal necessities.

Nevertheless, though it has been watered down, renamed and the worst features removed, it is still not the personal needs test, pure and simple, that Labour used to call for before the war, and it is worth remembering that a Labour minority revolted against their leaders on this account when the Bill was given its second reading. If a Labour Government is returned, pressure may well be put on it for the removal of any trace of the old means test. All parties are committed to the Social Insurance White Paper, which rejects a subsistence basis for benefits and proposes national assistance, on proof of need, to bring insurance benefits up to the subsistence level, but how need will be determined was not specified. To ignore completely all third-party resources and to make no distinction at all between the different circumstances of applicants for assistance would certainly add another unknown, but considerable, factor to the Social Security Budget.

Second Thoughts on Syria

There are signs that internal politics in France are causing General de Gaulle's Government to see advantage in a move towards the settlement of its dispute with Syria. The turning point was the debate on the subject in the Consultative Assembly. This body is, as its name implies, without executive power, but no one present at its discussion could fail to note, first, that its mood was one of protest at past failure to pay attention to its advice, and, secondly, that Government spokesmen got no approval for intransigence or for blaming the whole sorry business upon British influence.

Monsieur Bidault is too good a republican to ignore such portents. Further, he has some weighty arguments to use with his more insensitive master. The elections are not far off. They cannot be postponed or they will happen in the winter's cold when human nature will out and the government's critics will be more numerous and more vocal. If, when they happen, the Syrian affair is not settled or shaping for settlement, it will be a gift to General de Gaulle's many critics in the Radical and Socialist parties—parties whose success at the recent municipal elections is not reflected in the composition of the present "caretaker" government.

Another reason for hastening a settlement in Syria is the internal situation in Algeria where Moslem tempers are on edge through the accident of a famine due to three of the worst drought years in living memory.

The first sign of a consequent shift in the Government's Syria policy is its silent abandonment of the strange idea of laying the dispute before the unborn Assembly of the new World Organisation. Instead it has proposed—through the mouth of M. Paul Boncour, to Mr Stettinius at San Francisco—that the World Organisation should send to Syria a fact-finding commission of three neutral states. This suggestion—though undoubtedly a good platform point at home—was turned down by Mr Stettinius on the obvious practical grounds that the World Organisation's Charter had not—at the time—even been signed, that no one yet holds the relevant powers of appointing commissions and that to take on such a job before the signatures are ratified is to invite hitches over ratification.

The French Government must therefore think again. Two courses are open to it. The first is to invite preliminary discussion in Paris between the three great powers principally concerned. The reasons why Britain, France and America are more closely affected than any other outside power are not simply the temporary considerations of the Far East War. They include other and permanent interests—particularly the common concern of British, French and American oil companies over security for their joint working of the Iraqi and Syrian oil fields and pipe lines. Another possible course of action would be to reopen direct diplomatic negotiations with Beirut and Damascus, though this would be even more difficult now than it was a month ago.

It goes without saying that a move along either line would cause enormous relief in London and earn a warm welcome from the British and American governments. But it also goes without saying that any such move would call for a real effort from the Syrian Government. At present, its statesmen are showing commendable moderation in their speeches, but there is every sign that they do not control their followers, particularly in the outlying centres—Homs, Hama, Aleppo, Deir es Zor—towns which have never cared for listening to Damascus. There are immense dangers in Arab over-confidence. It is a failing of the Semitic race. The Syrian premier must ward against it, for there is nothing to be gained by playing Shylock and demanding the full pound of Christian flesh. It behoves him to earn world respect by holding the extremists in check and by meeting any new French move in the spirit in which it emanates from some of Syria's old friends in Paris.

Anglo-French Relations

So much for the Franco-Syrian aspect of the crisis. As and when the situation improves upon that front, vigorous action must be taken by Great Britain to clear up the new misunderstandings that the affair has created in French minds about British motives and policy. A Foreign Office statement issued on June 22nd was, it seems, designed to do this job. It failed because it harped upon the theme that "the British authorities do not intend to prejudice" France's position in the Levant. This theme, once sincere, is now out-of-date and therefore open to charges of hypocrisy. Of course the spectacle of British troops shepherding Frenchmen out of Syria has prejudiced France's position in Arab eyes. To use wording which suggests otherwise provides M. Mauriac with grounds for writing, as he has written in *Figaro*, that "The England of the period of occupation disappears, giving place to the England we were too easily apt to forget although the face has been familiar to us for centuries." The old adjective *perfidie* peeps out of the wrapping.

The failure of the Foreign Office to forestall this charge is the more regrettable in that there is a good case for recent British action in the Levant:

(1) Britain in the Lyttelton-de Gaulle Agreement of 1941 recognised France's special position in the Levant. But it would be absurd to claim that this recognition bound the British Government to back France to the limit. That limit was exceeded when General Oliva-Roget ordered the bombardment of Damascus.

(2) British warnings that the landing of French troops, however few in number, would touch off an explosion were temperate, continuous and could not have been more insistently pressed. What more could a friendly Government do? It seems that nothing short of forcible stoppage in mid-Mediterranean—an unthinkable expedient—would have prevented the French Government from making the wilful and futile gesture which started the trouble.

(3) Once it had started, what was the alternative to intervention by British troops? The likely alternative would have been even more damaging to France than were the happenings of the last month. For into the secret sessions of the Arab League must be read a firm intention on the part of some of its members to march to Syria's aid. Both Iraq and Egypt have armed forces trained by British missions. Were the local British authorities to hold them down at home and so run the risk of riots and gunfire around all the foreign installations in the Middle East? Or were they to let them march, and be blamed by France for doing so?

These points are present not only in the minds of all informed British observers, but also in those of all Frenchmen in the Middle East outside Syria. They are realised, in particular, by the important French colony in Egypt. They must be brought home to, and thought over by, Frenchmen in France also, in order that the Syrian cloud may not mar the bright prospect of Anglo-French alliance.

Russo-Turkish Conversations

It seems that the Soviet Ambassador in Ankara has now outlined to the Turks the conditions in which Russia would like to discuss a new and improved Russo-Turkish treaty. When Moscow denounced the old treaty in March, the gesture was generally interpreted as a first step towards a request for revision of the Straits Convention. Current reports from Ankara suggest that not only was this forecast true, but that it is not the whole of the picture. The new Russian proposals are also said to cover frontier revision in Transcaucasia—to be precise: the return of the Kars and Ardahan districts ceded to Turkey under the treaty of October 13, 1921, between the Ankara Government on the one hand and the Soviet Governments of Georgia, Azerbaijan and Erivan on the other.

Either request might involve other nations. Kars is the fortress that commands the north-eastern escarpment of the Anatolian plateau, and is strategically as well as sentimentally valued by Turkey. What happens if the Turks call upon their British ally to remind Moscow of the pledge in the Anglo-Soviet treaty to the effect that neither party is "seeking territorial aggrandisement for themselves"?

Revision of the Straits Convention has even wider implications. For one thing, more powers are interested parties. The 1936 Convention was signed by nine states. But there is another and a more profound complication. All recent war experience has shown that the terms of any convention, however magnanimous, are in modern war a dead letter. To any Black Sea power which does not control the Aegean Sea and air bases. It appears that Russia has drawn this conclusion and is now demanding bases in the Straits. Such a proposal reopens the old "Eastern question" with a vengeance. It would surely be advisable to thrash the matter out at the Big Three Conference; otherwise there are possibilities of discord here almost equal to the Polish issue itself.

Local Authorities and Full Employment

Sir John Anderson's speech to the annual conference of the Institute of Municipal Treasurers and Accountants last week was a reminder that the local authorities will be the Government's agents for the execution of yet another, and the most important, part of domestic policy—the maintenance of employment. The Chancellor stated that he hopes soon to open discussions with representatives of local authorities

to see how far it will be possible to produce realistic forward plans of the capital works required, how far those works are such that they could be brought forward or put back as needs may dictate or how far they are of such urgent social value that their timing cannot be allowed to be influenced by the needs of employment policy. We shall also have to consider how far sanctions can be given ahead and plans prepared so that if it is decided to accelerate works we shall be in a position to start with a minimum of delay.

This is the first occasion, since electioneering began, on which a member of the Government, or any political spokesman, has taken full employment from its White Paper wrapping and attempted to give it some practical form. In pings and attempted to give it some practical form. But the such a barren election, this in itself is welcome. But the attempt did not go very far. Nor does it appear from the Chancellor's speech that the Government has advanced from the White Paper even on matters of theory. Its "minimum objective" must be "to maintain stability in the field of public investment." This alone would not prevent a depression, and though Sir John also said that, if possible, "we must go farther and so steer public investment that it commensates as far as possible for the ups and downs of private investment," he should have made this the minimum instead of merely a desideratum. And he appears as defeatist as the White Paper on the most important factor of all, whether any effective control can be placed on private investment. If all that can be achieved is stable public investment, with private investment fluctuating at will, there is little hope of a successful full employment policy when the war shortages have been made good.

Heavy Burdens

The financial problems which local authorities now face are complex and difficult—and potentially fatal to the local government system. The "block grant," which the Exchequer distributes among authorities according to

their need, will shortly be adjusted to take into account recent increases in their expenditure. But Sir John Anderson clearly intimated last week that the need to relieve the taxpayer of some of his burdens puts a strict limit on any extension of State aid; and that, this being so, such aid as can be given should be concentrated still further on relieving the poorest areas.

This eminently fair viewpoint does not, however, explain how the average authority is to discharge its burdens. The percentage increase in the education grant should soon be followed by parallel adjustments of other grants; but, on the most favourable view, these concessions will not suffice to ward off an average rate increase of the order of 40 per cent. It is doubtful if the small householder can afford to pay much more than he does now; and, hard as it will be for the Treasury to stomach, the only workable way may be to relieve local authorities of the whole cost of one major service—say, health.

Many local authorities, too, have special problems. The loans which some of them have received from the State in respect of exceptional wartime hardship should surely be partly cancelled. The financial difficulties of large and overcrowded cities were well analysed recently in a speech by Lord Latham, leader of the London County Council. Comprehensive replanning is handicapped by the fact that obsolete or "blighted" areas do not attract the grants available for redeveloping "blitzed" areas, which may in practice adjoin them. Removal of its surplus population inevitably leaves the authority with a top-heavy burden of public debt. Above all,

on the question of land policy . . . turn many of our financial as well as most of our planning problems.

Sites have somehow to be obtained and cleared in order to provide new schools, health centres, roads, and open spaces. It is hard to find suitable sites quickly without adopting the invidious method of removing existing houses; and at the same time to acquire sites in advance or to

Making the most of the NATION'S MILK

IN winter the supply of fresh milk falls, but in summer there is a surplus. This surplus can be conserved in a number of ways, one of which is to make Milk Chocolate. Cadburys Milk Chocolate retains the valuable milk solids (fat, protein and lactose). Only the water which comprises roughly 87 per cent. of the milk bulk is eliminated.

Milk Chocolate is a compact and highly concentrated food, easily kept and transported and requiring no elaborate packaging. It retains the full food value of the milk almost indefinitely without special storage or canning.

Cadbury means Quality

acquire too many sites may stultify private and commercial development and discredit the local authority.

Local authorities in this position must walk as delicately as Agag and with considerably more skill. But, however great their ingenuity, they cannot at present afford to undertake the type of bold replanning schemes which may well pay for themselves over half-a-century but which involve heavy losses in the immediate future. If the Government attends local authorities to do much more than rebuild their rateable value as quickly and as haphazardly as possible, it must afford more positive and practical help than exhortations.

Conference at Simla

This week opened in India with the first day of the Viceroy's Conference at Simla. On the 21 Indian delegates rests the heavy responsibility of considering Lord Wavell's offer of interim self-government and nominating the members of the Executive Council reconstituted on a representative basis. Mr Gandhi is not among them, but he has talked at length to the Viceroy and remains in Simla within call of the official Congress delegates, who include the political leaders in the Assembly and the Council of State and the party president, Maulana Abul Kalam Azad, who, paradoxically, is well known as a Moslem divine. Mr Jinnah and Mr Hossain Iman for the Moslem League, Rao Bahadur Sivaraj for the Scheduled Castes, Dr Bannerji for the Nationalists and Master Tara Singh for the Sikhs, complete the party representatives. Beside them, provincial premiers will lend the experienced judgment of elder statesmen.

It is significant for the work of the Conference that Indian press comment has been concerned far less with the amount of power to be transferred from the British Government than with its distribution among different sections of Indians. Expressions of uneasiness over the Viceroy retaining his right of veto have gradually paled before the mounting discussion of the proposed parity between Moslems and Caste Indians on the Executive Council. The exact interpretation of the British intention is still in doubt. The definition, indeed, may have been deliberately left vague to enable the Conference more easily to reach agreement on a compromise settlement.

In brief, Congress claims to represent all religions and to be a political rather than a merely religious and communal organisation, and would like its nominations to include Moslems and other non-Hindus. But the Moslem League will not accept a situation in which Congress nominates the whole of the Hindu half of the Council and part of the Moslem half as well. On the other hand, if seats for the non-Hindu Congress nominees have to be found out of the Hindu half, the principle of Hindu-Moslem parity will be upset. In short, it is impossible to reconcile Hindu-Moslem parity with Congress-League parity. The situation is further complicated by the very vocal claim of the Hindu Mahasabha (the strictly religious Hindu organisation) to participate in the nominations. But by excluding them and laying the full responsibility on Congress, Lord Wavell probably hopes to avoid widening even further the religious cleavage so hampering to Indian progress. In fact, the success of the Viceroy's conference will depend very much on the calm-

ness of the Indian leaders and on their efforts to produce a list of nominations in which both sides can feel confidence. But even then the balance is bound to be precarious.

New Cabinets in Holland and Norway

The new Norwegian and Dutch Governments have several admirable points in common. Both are all party. Both have pledged themselves to a progressive reconstruction programme. Both contain a high proportion of young men. Mr Gerhardsen, who is 48, is the youngest premier in Norwegian history. Both have filled all the chief offices to do with home affairs with men of the resistance who command the respect, and understand the emotions, of the men and women who stayed at home. Both have had the prudence to re-appoint as their foreign Ministers the men who represented them while in exile. M. van Kleffens and Hr. Trygve Lie will provide, in the foreign policy of their respective countries, an element of continuity which could not be compassed by men who have for five years been insulated from the main current of world affairs.

The balance which marks both sets of appointments is an advertisement not only for national commonsense and a sound constitution but also for two monarchs who are in tune with their peoples. Both King Haakon and Queen Wilhelmina displayed, in 1940, instincts which tallied with those of their nation. They well deserve the harvest they are reaping in the shape of good will and stability.

A World Farmers' Union?

Mr Turner, the president of the National Farmers' Union, has announced that an international conference of primary producers will be held in London this autumn. Its aim will probably be to encourage strong farmers' organisations in each country, from which can be drawn a world body with enough power and prestige to influence international agreements over food and agriculture. Mr Hudson has often declared that the movement by primary producers to obtain better conditions will upset Britain's terms of trade; but with this country apparently in the van of the movement, and with political parties outbidding each other in offering price guarantees to home farmers, it looks as if the new organisation would serve to boost British food prices quite as much as imported ones.

With the general case of giving food producers, both farmers and labourers, everywhere, a higher standard of living, the townsman has considerable sympathy, but this general argument does not affect the relative advantages of agriculture in different countries. Further, when particular disadvantages are considered, it is probable that even now the farm worker has as much leeway to make up to attain urban conditions in this country as anywhere else. This point is well brought out in a recent pamphlet by Mr David Eccles,* who points out that "cheap living" in the country is not a compensation for lower wages, but a direct result of them, and that low rural rents merely reflect abominable rural housing conditions. He argues cogently that, if urban unemployment can be avoided, the drift from the land will in future be not sporadic but continuous. The lesson to be drawn is not, however, that urban drift should be actively discouraged, but that only the labour force for which a reasonable scale of agriculture can provide a satisfactory standard of living should be encouraged to remain.

Dying Together

The decision of the House of Lords last week in the case of *Hickman and Others v. Peacey and Others* is a reminder that if the law becomes involved in metaphysics the results are not always unfortunate. The case turned on Section 184 of the Law of Property Act, 1925, which, summarised, declares that if two or more people die in circumstances which render it uncertain which died first there is a legal presumption that the elder predeceased the younger. Such a rule is arbitrary but convenient. But what happens when the evidence suggests that two people die simultaneously?

The facts in this case were that two brothers (with three others) were killed by the explosion of a bomb in the basement of a house in Chelsea during an air raid on Septem-

* "Wages on the Farm." Signpost Press. 1s.

ber 14, 1940. The disposition of the elder brother's property depended on whether his younger brother survived him or not. The question was whether the brothers died simultaneously. The bomb exploded in the basement and all the occupants were killed by blast, and the evidence suggested that the gap between any one death and another could only have been infinitesimal. But metaphysically time is infinitely divisible. If it could be taken as certain that the two brothers died at the same instant of time the section of the Act did not govern the distribution of the two estates, for there was no uncertainty as to the succession of deaths. But if the metaphysical view prevailed, it was always possible for the deaths to have been successive and so the rule created by the Act applied.

The Court of Appeal held that there was no succession of deaths, the deaths being simultaneous. By a majority, the Lords (the Lord Chancellor and Lord Wright dissenting) reversed that decision and declared that the section applied. Practically, the decision is to be welcomed, for there is no rule of law for dealing with the case of simultaneous deaths, but theoretically the issue remains open. It is still possible for a judge to hold that there can be, and, in the case before him, have been, simultaneous deaths, but the chances of that ever happening have been considerably reduced as a result of this decision. If a bomb in a basement does not kill all the occupants at the same instant of time, it is difficult to imagine anything that will.

AMERICAN SURVEY

Taxpayers' Lobbies

(From a Correspondent in Iowa)

AS soon as the war took a favourable turn in 1944, a flood of private plans to reduce taxes began to pour from press and mimeograph. The flood is still on, and has by now begun to erode official resistance.

Associations of taxpayers have become a major pressure group in the United States, mostly in the last ten or fifteen years, as watchdogs keeping an eye on the 175,000 taxing bodies. Most such associations are automatically against any proposed increases, and for reductions when no increases are proposed. As a matter of strategy, many take no stand on particular taxes (which would divide their following) but confine themselves to checking overall expenditures. So specialised associations spring up to combat certain taxes.

Back in 1924 an American Taxpayers League (first known as the American Bankers League), supported by Tax Clubs in various states, helped Andrew Mellon, the multi-millionaire Secretary of the Treasury, abolish the federal gift tax and drastically lower the death tax and individual income tax. These clubs are gone now, and the present ones stem mostly from the Taxpayers' Association of New Mexico, founded in 1915. State taxpayers' associations have multiplied (especially during the 1930's) until now 36 of the 48 states have them. The endowed Tax Foundation in New York fosters their growth and development, publishing a monthly magazine and helping them in other ways.

County and city taxpayers' associations, private Bureaux of Municipal Research, Citizens' Tax Surveys, etc., have proliferated during the same period in parallel and often interlocking growth. Thus New Jersey has a state taxpayers' association and over 200 local taxpayers' associations, most of them affiliated with it. Iowa has a state taxpayers' association organised in 1935 to watch both state and local expenditures. Des Moines, the state capital, has a much older Bureau of Municipal Research maintained by some of the larger taxpayers and a much younger Des Moines Taxpayers' Association, to draw in small and medium taxpayers.

In many areas these associations do much really constructive work. Typically, they have a paid staff headed by a professional secretary with some expert knowledge, financed and officered by dues-paying members. They analyse, compare, and criticise budgets, publishing their

Football Pools

A judgment of the King's Bench Divisional Court has put in question the wartime practice of conducting football pools through newspapers. An appeal from the contrary decision of the Bow Street magistrate was allowed on the grounds that the advertisement of prize money for which participants compete was a direct contravention of the Betting and Lotteries Act, 1934.

Since the peacetime methods of sending out coupons by post has come under the axe of the Paper Controller, pool promoters have resorted to buying advertising space in the newspapers in order to continue their business. The decision affects football pools only so long as they cannot be conducted by post, and turns not on the legality of pools as such, but on whether they are judged as competitions (rather than betting transactions based on skilled selection).

The question, therefore, is a legal one. Pools may be attacked on moral grounds as a form of gambling, or on ethical grounds that large profits are made out of human weakness. But so long as a large number of people get amusement out of betting (or "skilled selection"—it is the same for horses, dogs or pools) the state cannot effectively impose a general ban or fairly impose a particular one. And so long as the feeling persists that the state must not directly concern itself with gambling, private profit on organised betting cannot be avoided.

findings in time for people to do something about them, and work for procedural reforms. They work closely and often quite amicably with appropriating and spending bodies. Because taxpayers' associations tend to attract mainly large taxpayers, they have a distinctly class point of view, and contribute materially to the recent marked conservatism of state, local, and federal organs of government in the United States.

Closely related to the anti-all-tax movement is the anti-property-tax movement. This is the stock in trade of most of the local (as distinct from state and national) taxpayers' associations. The present demands of the anti-property-tax movement are chiefly for a greater share of the tax burden to be borne by the state governments, as distinct from the local governments and for new types of local taxes, chiefly sales and excise levies.

For some years now Mr Harley L. Lutz, professor of public finance at Princeton University and darling economist of the taxpayers' associations, has been conducting a one-man crusade against the principle of progressive income tax rates, for which he would substitute a flat, proportional rate and a stiff general sales tax. His full programme is generally admitted to be politically impossible, but it heartens others enormously in pushing for little steps in that direction.

Only the personal insistence of the late President Roosevelt and Mr Morgenthau, Secretary of the Treasury, staved off a federal general sales tax several times during the depression and the war. But the increase in progression in the federal income tax brought about by the New Deal's "soak the rich" programme has been to a considerable degree offset by new federal excise and payroll taxes and by new state sales taxes. Currently some New Dealers are beginning to feel that perhaps steep progression can be overdone, and that high risks to create high employment justify high rewards. And in spite of great howls by the professional spokesmen for the lower income groups, the "common man" has taken the sales taxes, excises, and payroll taxes of the 1930's and 1940's with surprising grace.

The chief concern of the more elaborate and comprehensive proposals for tax reform now being put forward is to achieve a tax system which will thwart neither the in-

centive of enterprisers nor the purchasing power of the masses, and yet raise twice as much in federal taxes as the federal government ever spent before 1939. The plans could be arranged in a neat continuum from those which put their main emphasis on mass purchasing power to those which emphasise mainly enterprisers' incentives. They can be split another way according to whether they think high corporation taxes or high personal income surtaxes are the biggest drag on enterprise.

The weirdest fiscal scheme to attract a large national following since the Townsendite heyday is the proposal, now happily waning, to limit federal income, gift and death taxes to a peacetime maximum of 25 per cent by Constitutional amendment, and make it hard to go higher in wartime. It got nowhere in Congress, so a never-used alternative procedure for amending the Constitution was attempted: getting the legislatures of two-thirds of the states to demand a Constitutional Convention to initiate the amendment. State Legislatures' memorials to Congress are easy to come by, being essentially heckling rather than responsible legislation; but it is very unlikely that enough will be forthcoming.

All these various plans form part of the whirlpool of influences in which American tax policies take shape. In 1938 the \$15 billion taken in taxes from the American people were collected by the Federal government (41 per cent), by state governments (26 per cent) and by local governments (33 per cent); after tax-sharing and grants-in-aid, the federal government got 35 per cent, the states 21 per cent, local governments 44 per cent.

The war has enormously boosted both the amount and the percentage taken by the federal government, and the more responsible plans call for a \$16 to \$25 billion annual tax bill for the federal government alone after the war. Meanwhile, the amounts spent by state and local governments continue their slowly upward course. Federal war spending, moreover, has brought such prosperity that state sales, excise, and income taxes have been bringing in embarrassingly large amounts, and even the cities, except those facing boomtown expenses) are faring better than usual. Most state governors told the 1945 legislatures that the war boom was levelling off, and urged no reduction in tax rates and caution in spending. But few legislators could resist the temptation to blow in the surplus.

Federal legislators are catching the same fever, in spite of large annual federal deficits every year since 1930. The 1943-44 congressional rebellion against requests by the administration for heavy new taxes was followed up in the summer of 1944 by setting the congressional tax experts to work drafting plans for post-war tax reductions. For some time, the Treasury Department sought to discourage such talk, but by this May, Treasury and Congressional tax experts had agreed on joint recommendations to President Truman for slight mitigations and prompter refunds under the excess profits tax starting in 1946, to be followed after the fall of Japan by lower excess profits, personal income, excise, and death taxes and, eventually, by complete repeal of the excess profits tax.

Congressional control over taxes is exercised almost entirely through the Ways and Means Committee in the House of Representatives and the Finance Committee in the Senate. Since 1926 the two committees have maintained a standing Joint Committee on Internal Revenue (i.e., all taxes except import duties) with a small paid staff of lawyers, statisticians, economists and clerks. Committee members never forget their particular home district, and it is a misfortune for a district to have no representative on either tax committee. In considering tax measures, high-minded men like Representative Doughton and Senator George (the respective committee chairmen) look out for the tobacco and Coca-Cola interests of their home states, North Carolina and Georgia, Senator Vandenberg for the automobile interests of Michigan, Senator Barkley for the whisky and horse-racing interests of Kentucky. That is what they are expected to do, and they would be blamed if they did not.

Out of this whirlpool of interest groups, congressional committees, and Treasury officials and their respective tax experts new federal tax policies are born, with the smaller

state and local whirlpools eddying roundabout. But while in much of the rest of the world the tax wheel is turning toward greater socialisation of wealth and income, the mighty United States whirlpool seems to be turning right, though probably not so far nor so fast as in the 1920's.

American Notes

Who Shall Succeed?

Mr Truman has officially raised the question of the succession to the Presidency. There have never been two deaths in a single term of office. But there might be, and Mr Truman himself will not have beside him, for almost a full four-year term, that peculiarly American institution, a Vice-President, without function save to be ready to accept the "powers and duties" of the Presidency in case of the President's death or removal.

The chief criticism of the Act of 1886, which at present governs the succession, is that it provides for succession by members of the Cabinet, who are appointed officers. In the present Administration Mr Stettinius, as Secretary of State, has hitherto been first in line, followed by Mr Morgenthau, Secretary of the Treasury. Neither of these men has ever been elected to public office. And the President, as Mr Truman has pointed out, is thus empowered to choose his own successor. Mr Stettinius has now resigned, to be appointed chief delegate to the new international organisation, and Mr Truman evidently finds it an embarrassment, in picking a successor, to have to keep his eye on the merits of the nominee as an eventual President. Party politics alone apart from personal considerations, would greatly complicate his choice, since a non-party man (such as Mr Stettinius himself), who might be an excellent Secretary of State, would be unthinkable as President, with all the powers of patronage and the duties of party leadership.

"In the interest of orderly, democratic government," the President has proposed to Congress the early enactment of legislation placing the Speaker of the House of Representatives, the legislative body most closely tied by electoral processes to the voters, first in order of succession. The President of the Senate would be next in line.

As the initial enthusiasm for this proposal subsided, political hazards and possible legal flaws in it began to appear. The constitutional qualifications of executive officers and legislators differ considerably (for example, a foreign-born American citizen can be Congressman, but not President); if the opposition were to win control of the House in mid-term elections, the Speaker would be of the opposition party; the one-party system in the South enables Southern Congressmen to perpetuate their own leadership, and both the present Speaker and the present President of the Senate are Southerners; thus a Congressman who was elected by a handful of voters in a poll-tax state could become President.

A Bill embodying the President's proposal has been reported to the House of Representatives by its Judiciary Committee. If the Presidency is vacated and there is no Vice-President, the Bill provides that the Speaker (and after him the President of the Senate) shall succeed, but that if the death occurs earlier than August in the second year of the term (1946, 1950, etc.), the Speaker shall serve only until the Congressional election of November in that year, when a new President shall be elected to serve out the rest of the original term. This change may be held to require a constitutional amendment. Some surprise has been occasioned by the fact that this Bill was approved by the Committee by only one vote. It appears, however, that the opposition was not to the substance of the Bill but to the haste of its passage. Mr Truman would like to get it through before he leaves for Europe—and presumably before he appointed a new Secretary of State. But if there is anything that Congress dislikes, it is being hurried.

Trade and Peace

As the San Francisco Conference drew to a close, the inseparability of world trade and world peace was emphasised by the passage by the Senate by 54 votes to 21, of the Reciprocal Trade Agreements Act. The Senate overruled its own Finance Committee by restoring the power to reduce tariff rates by 50 per cent of their present level, and the Bill goes to the President for signature short

of all crippling amendments. Thus the Senate, soon to be presented with the Bretton Woods proposals, has taken the first step toward relinquishing its power to return the United States to economic isolationism. And the President, who will present the United Nations Charter to the Senate on Monday, must certainly have felt that his presence and his words had a concrete meaning to the San Francisco Conference they could not otherwise have had.

The fifteen Republican votes in the Senate are significant not necessarily because, as some commentators have suggested, they indicate a lack of partisanship and a renunciation of sectional interest. An important branch of American industry, which formerly barricaded itself behind protective tariff walls, is realising now that its own interests lie not in avoiding competition, but in avoiding reductions in its own production. In an expanding economy, these sectional producer interests must have imports if they are to export.

Those in America who recognise that economic cure-alls cannot be found in Trade Agreements or in the Bretton Woods bank and fund, are keenly aware that about half the world's industrial capacity will lie in the United States after the war. Full employment would produce goods worth an estimated \$170 billion a year, at 1941 prices. A recent report by the Department of Commerce estimated that while full employment will require \$10 billion worth of exports, the United States could absorb only \$7 billion of imports. While this is double the pre-war figure, it creates an export surplus of \$3 billion which, since employment, not imports, is its object, might well be disposed of at prices set so low that other countries would be eliminated from the field. The management of this huge surplus market is, therefore, of the greatest concern to the smaller countries of the world—as it is, eventually, to the United States. For it could mean the difference between international economic co-operation and an even more extreme kind of chaos than existed before the war.

Full Employment

The United States, which has experienced full employment in a war economy, is now turning its mind to finding an equivalent of war to marshal its human and technical resources. Although the candidates for both major political parties in the last presidential elections advocated that the Government should create job opportunities if private industry does not provide sufficient employment, the decision about the means by which this is to be accomplished is expected to create a struggle reminiscent of the days of the National Recovery Act.

The Senate Committee on Banking and Currency is conducting hearings on the Full Employment Bill of 1945, the aim of which is stated to be full employment in a competitive economy through the combined efforts of industry, agriculture and labour, state, local and federal governments. The Bill provides that the President should transmit to Congress at the beginning of each regular session the National Production and Employment Budget. This budget would estimate the size of the labour force, the estimated volume of investment and expenditure, private and public, required to provide employment for the labour force and the estimated value of actually planned expenditures, private and public. If there were a deficiency between the volume needed to provide employment and the expected volume of expenditure, the Federal Government would submit a programme to encourage investment and expenditure by private enterprise and a programme for such Federal expenditures necessary to sustain what the Bill calls a full employment volume of production.

All this sounds very simple and scientific. But the question lies in whether American society is yet willing to incorporate into its structure the degree of central planning and control necessary to implement such a Budget: controls over investment of capital, over consumption, over the location of industry and to a certain degree over the mobility of labour.

American industry, which controls the most important ingredient if full employment is to be part of a competitive economy, apparently still believes that its investments will be most secure if government restrictions are removed. There is, however, a realisation among an increasingly influential segment of industry, represented by the Committee of Economic Development, that another period of unemployment could be fatal to the capitalist economy as it exists in America. The CED, along with the labour unions,

many government departments and private organisations, is among the sponsors of the Full Employment Bill.

A New Labour Bill

Three of the four Senators who achieved fame by their bipartisan advocacy of international co-operation, when that was still a contentious issue, have now turned their attention to labour relations. The new Hatch-Burton-Ball Bill is designed to replace the existing Wagner National Labour Relations Act, and the changes it suggests would seem to be in the direction of limiting the privileges that organised labour won during the Roosevelt Administration. The Bill seeks to preserve the right to strike, though it provides for compulsory arbitration of all disputes in public services and utilities and of all disputes arising out of conflicting interpretations of Labour-Management contracts. The Bill would ban unfair labour practices not only by employers, as the Wagner Act does, but by employees as well. The closed shop would be denied unless the union represented 75 per cent of employees, with a list of conditions so restrictive as to limit its practical extent. The scope of the existing Act would be further narrowed by provisions exempting small employers from obligations towards labour required of larger enterprises and by application of the Bill exclusively to employment directly affecting interstate commerce. Local labour relations would be left to the states.

While most of the press has joined together—some papers a little hesitantly, it is true—in acclaiming the Bill, the presidents of the three most powerful labour organisations have bitterly denounced it as an attempt to turn the NLRA into an instrument of oppression. Mr Murray, Mr Green and Mr Lewis are convinced that the Bill would be used to weaken the unions during the unstable reconversion period.

Furious debate is expected in Congress, for in addition to the above features the Bill would reconstitute the whole complex machinery of arbitration and mediation. A serious split in the Democratic ranks is seen as a distinct possibility.

THE WORLD OVERSEAS

Rebirth of a Republic

(From Our Special Correspondent)

Pilsen, June

PILSEN, the city of the Skoda Works, is a border town. A few miles outside it the American zone of occupation ends and the Russian begins. The visitor cannot fail to sense the peculiar atmosphere of subdued tension that hangs over the demarcation line between the two zones. The Czechs are more or less free to move between the zones; and with them vague hopes, fears and rumours float across the lines of the two Allied armies facing each other on Czechoslovakia's soil.

One's first impression of Czechoslovakia is relief at the absence of the ghost-like ruins that haunt one over vast stretches of the Continent. The economic problems of freed Czechoslovakia are accordingly less serious than those of nearly all the other countries of the Continent. The towns are more or less intact. Pilsen itself has suffered no destruction, though heavy air-raids were made on the Skoda suburbs late in April (according to the Czech Minister of Industry about 70 per cent of the plant has been destroyed, an estimate which in the light of a superficial inspection of the works seems to overstate the actual damage). The railways too have suffered only slight damage. Trains are running almost regularly from Prague to Pilsen and from Moravia, Ostrava to Prague. Traffic can be restored to normal within a few weeks. The bottleneck of distribution, so desperately serious in all other liberated countries, need not arise here. Nor is there a shortage of coal. During the years of the German occupation brown coal mining has been pushed ahead through the installation on a large scale of up-to-date equipment for open cast mining. This equipment has been left behind intact, and the Ministry of Industry looks forward to an immediate resumption of normal output. The coalfields of the Olsa area, annexed by Poland in 1938, are back in Czech hands, though it is not yet quite clear whether the Lublin Government will not claim back some of them. Officially this has not yet happened.

During the years of occupation the Germans have also developed here a large, well-dispersed aircraft industry and plants of synthetic oil. These have greatly increased Czechoslovakia's industrial potential, though they are likely to become surplus capacity and an embarrassment to the country's economy. Against these acquisitions must be set the dismantlement by the Germans of the Bohemia-Moravia textile plants and of the once highly specialised pottery and china industries which were important in Czechoslovakia's export trade. But, on the whole, the Czechs have every reason to be satisfied with the industrial balance sheet of the last years.

Difficulties in Agriculture

The agricultural position is certainly more difficult. A complete picture cannot yet be drawn. What is certain is that this year's sowing was carried out in the circumstances of an acute shortage of labour—Czech farm labourers had to go to Germany. There was also a shortage of seed. Convoys of Czech displaced persons are now arriving daily from the Reich, but it is still feared that the repatriation of farm workers will be too slow to meet the demand for labour by the time of the harvest. The crop is expected to be below last year's. Meanwhile, the food situation is fairly difficult and is certain to become worse. A special burden on Czech farming arises from the fact that the Russian army is living off the land. The horse is still the typical traction power of the Red Army, and it competes with farming for feeding stuffs. Quite apart from political motives, this is one of the reasons why the Czechs are anxious to see the occupation of their country, which is said to be planned for six months, come to an end as soon as possible.

The chief troubles that have beset the reborn Republic are not economic but social, political and diplomatic.

Liberation was an act of social as well as political upheaval. The Protectorate administration has been swept aside by the local committees of liberation, a rather diluted 1945 version of Workers' and Peasants' Councils. Representatives of four parties—Communists, Social Democrats, Benes's National Socialists and Catholics—sit on the committees. The Communists seem to predominate in the committees in the American zone to the same extent as they do in the Russian. In the streets of every town in the American zone, one finds the patrols and sentries of the Revolutionary Guard, the Czech FFI, whose members (in civilian clothes) are still armed and wear Red Star badges. In front of official buildings and the headquarters of the National Committees both the Revolutionary Guards and the ordinary police stand on guard, which illustrates the virtual dualism of power. There are no open signs of any hostility between the two, neither are there any signs of mutual friendliness.

A purge is being carried out of Hacha's followers and three of the pre-Munich parties which provided the greatest contingent of collaborators—the Agrarians, the Nationalists and the Artisans Party—have been outlawed. This seems to have aroused bitter opposition among the conservative peasants who used to cast about a million votes for the Agrarians and now feel to be deprived of their representation. But the working class feeling against the outlawed parties is running very high; the huge crowd of Skoda workers in the Market Square at Pilsen greets with loud applause the Government's statements that the outlawed parties will not be allowed to raise their heads again.

The Business Man's Fears

This is clearly a "people's spring" which inspires no confidence in Czechoslovak business circles. Industrialists and bankers choose their words with caution when they are asked about political and economic prospects. Hardly any enthusiasm for the resumption of normal business activities is noticeable, a fact which causes the Left to accuse business men of economic sabotage and to demand the nationalisation of industry. The Prague Government is doing its best to ride the radical tide and at the same time to reassure the frightened middle classes. Its members promise a "60-70 per cent" nationalisation of industry but appeal to the radical audiences for patience and confidence in the Government's good will.

Meanwhile, state control over "masterless enterprises" has been established under a decree of May 19th signed by Benes, that is, over enterprises owned by Germans, Hungarians and Czech collaborators. The measure has had no immediate practical meaning since such enterprises are anyhow controlled by workers' committees. What the Government is now aiming at is the reinstatement of the directors and managers who would share responsibility with the workers' committees. The decree is certainly equivocal. The working classes have tended to welcome the decree as a final act of socialisation, while the Government has been at pains to explain that state control is provisional and that the decision about ownership lies with the legislative bodies that are to be elected. That the state will eventually retain the ownership of many "masterless enterprises" goes without saying. (This will probably be the case with the Skoda Works, which had been part of the Hermann Goering concern. The Ministry of Industry has given an assurance that foreign shareholders of Skoda whose shares had been taken over by the Hermann Goering Werke will receive an indemnity if full nationalisation is decided upon.)

The social and political tension is complicated by the division of the country into two zones of influence. So far as can be ascertained from Pilsen, the Russian forces of occupation do not intervene in Czechoslovakia's domestic affairs. But their presence in the country, apart from being an economic burden, is, in combination with the strength

of the Communist party, a means of almost automatic pressure, especially in matters of foreign policy. Jan Masaryk's conception of Czechoslovakia as a "bridge between the east and the west," which was so violently criticised in Moscow some time ago, is now treated as a most unrespectable heresy, and the members of the Prague Government vie with one another in denouncing it at public meetings. President Benes is clearly going out of his way to allay Russian suspicions. He has subscribed to the exclusively eastern orientation which has hardly been part of his political outlook in the past, apparently hoping that by paying this ransom he will be able to preserve Czechoslovakia's independence and freedom from drastic Russian interference in her domestic affairs. He has apparently resolved to yield all ground in the diplomatic field in order to gain or maintain some ground in the social and political fields. It is perhaps too early to judge the result; but so far his policy does not seem to have been quite unsuccessful.

Education for Export in Eire

[FROM OUR DUBLIN CORRESPONDENT]

INCREASING attention has been aroused in recent years in the problems connected with the emigration of university graduates. The number of students in the Irish universities has grown remarkably in the last twenty years. There has been no corresponding expansion in the Irish demand for graduates. The older professions are overcrowded, the new type of industrial professional employment has not developed and a falling population does not require a growing number of teachers. In these conditions it is inevitable that among medical and engineering graduates. The emigration of professional men from Ireland is nothing new, but it has grown recently to an extent that has increased its significance. Many people are beginning to doubt whether education for export is not economically wasteful and unsound.

The cost of producing a qualified doctor or engineer is considerable and rising. All this cost is borne by somebody in Ireland, mostly by the students' parents and partly by public funds. One of the difficulties in the way of obtaining increased grants for the Irish universities is the objection that the taxpayer should not be expected to subsidize professional services in other countries. On the other hand, it must be conceded that the opportunity to emigrate opens careers to many young Irishmen, some, at least, of whom send remittances to their relatives at home or retire to Ireland to live on their pensions. The widespread diffusion of Irish doctors and engineers gives the Irish universities extensive reputations and connections. If it were not for the outlets abroad the professional schools would have too few students to justify the expenditure necessary for modern education. The emigration is a variety of dumping in so far as it keeps up the output of education to a scale where increasing returns operate. If it were not for the external demand for doctors, the Irish home market would be very inadequately supplied.

When all these considerations are taken into account, the emigration of graduates is seen to contain elements of gain as well as of loss. It is generally agreed, however, that the movement is on too large a scale and that it could be reduced with advantage. There are two ways by which it could be reduced. Additional employment could be found for graduates in Ireland or fewer graduates could be produced. The provision of additional employment would require a shift from the older to the newer professional schools. There is room for considerable development in agricultural and industrial research and for the employment of well-educated men in agriculture, industry and commerce. The Irish business men are behind the times in appreciating the value of a good general education. The Irish Government also appears to underestimate the part that highly educated labour can play in the agricultural and industrial revival. But, even if a complete conversion of the Irish market official opinion is assumed, the capacity of the Irish market to absorb graduates is rather limited. The question arises, therefore, whether fewer graduates should be produced.

In so far as a diminution in the number of students is directed towards reducing emigration, the universities themselves cannot achieve the desired result. The universities cannot discriminate between students who will stay at home and those who will emigrate. Moreover, a student would

always, presumably, be free to change his mind. The mere indiscriminating reduction in the number of students admitted would do nothing to solve the problem. The proportion of graduates emigrating would increase, and there would be fewer well-educated people in Ireland. If the emigration of graduates is considered undesirable for national reasons, it should be regulated by the Government, which is the sole arbiter of national policy. The fact is that the Government has no considered policy in respect either of university education or of emigration or of the relations between them. Until some conscious policy is formulated the universities must continue to accept all students who meet the prescribed requirements, and every graduate who wishes to do so must be free to emigrate.

An emigration policy would need to take account both of the quantity and the quality of emigrants. In regard to the quality of persons emigrating there are two schools of thought in Ireland. It is argued, on the one hand, that the least possible outlay should be incurred on the emigrants. If the labour supply of other countries is to be subsidised, the cost of that subsidy should be minimised. The logical consequence of this policy would be that there should be two types of education for Irish children: an expensive education for children who would remain in Ireland and a cheap education for future emigrants. The conflicting opinion is that, if Irishmen are to continue to emigrate, they should be put in a position not to be mere hewers of wood and drawers of water abroad. If this view is correct, the emigrants should receive an especially good education so as to be able to start high up on the ladder in the countries of their adoption. The export of university graduates should, in this view, be not only tolerated but encouraged. A case can be made for either of these attitudes towards emigration. The existing arrangement under which the whole movement is entirely unregulated and uncontrolled is difficult to defend by purely economic arguments. It is defensible, however, on the ground of individual liberty, and any interference with it would meet with strong resistance. If *laissez-faire* is dead let *laissez-passer* survive, even if some of those who pass are those we can least afford to lose.

viding against losses by the public through stock market failures. The amount of these during the past quarter of a century has been small and could have been covered by a very modest annual levy on members. It is not certain, however, that the principle of compensating for every loss is good. It might be better to offer the assurance that no one dealing with London as a genuine buyer to hold, or a genuine seller of stock held, should be left without either stock or money.

*

Apart from such modest instalments of centralisation as may prove acceptable, there are a number of services which the Stock Exchange, as a central body, could render to its members, to other members of the profession and to the public. As a beginning, it is understood that there are plans to amalgamate the two lists published daily—the "Official" and the "Supplementary"—into one; to re-arrange them in a manner more readily intelligible, and to increase the information given. Similar plans are in being for the *Stock Exchange Year Book*. These are matters which are domestic to the Stock Exchange and which no one else can accomplish. So is the improvement of statistics of the actual turnover of the market. Nothing can be done in this matter until the marking of all bargains is compulsory, but that is, presumably, not an invincible objection. In any case it ought to be possible to publish the total number of bargains done and the total money involved for each main section of the list, setting out separately the figures for debentures, preference shares and those carrying the equity or any part of it.

A further service which would be extremely valuable would be the establishment of a central library and information section which would collect the mass of material which has an important bearing on securities dealt in but which cannot be handled by the normal services and which is too cumbersome to be collected by individual members. If the services of such an undertaking were made available to other institutions, including the press, the service would be all the more welcome and the cost be more widely spread. It is also the case that the Stock Exchange, in co-operation with the press and other users of the services, might well secure a further improvement in the cards on individual companies supplied by the two existing services and in the large volume of ancillary matter which ought to be in daily use in every broker's office.

Almost all these suggestions are designed to provide assistance to those who advise the investing public rather than to render service direct to the investor himself. It will be largely a waste of time to provide facilities and not to ensure that they are used intelligently and honestly. This remark can be applied to the press and to all agents as well as to actual members of the Stock Exchange fraternity. It has already been said that the London Council and its officers are doing their best to keep the press well informed; they have also

taken steps to exercise some supervision of such of their own members as contribute to the press. They have now to consider what training they are to demand as a preliminary to future membership of the House. This is a matter which cannot be discussed in detail here. Indeed, no one without a very long experience of conditions is competent to lay down a detailed plan. But the general outlines are clear enough. They are the same as for any other occupation which demands a practical understanding of affairs and a certain knowledge of the general principles of investment and the forces likely to affect the value of individual investments. It is no criticism of existing members to say that, if in the new context of a rising standard of educational qualifications in all walks of life, they do not insist on some improvement in the standards in their own profession, they will not attract the best men. True, these men must also have the other qualities which make a good broker or a good jobber, but that is true in any circumstances. What the formal education will give is breadth of outlook and an understanding that, in most human affairs, it is necessary to think in terms of years rather than to guess what will happen in the next six months.

In this connection it ought to be said once again that no efforts on the part of the present members of the profession will avail to attract good men, or to render improved service, while taxes are so burdensome that no broker or jobber can hope both to gain a fair return during his working life, and to pass on as high a proportion of what he makes, as if he followed another walk of life.

*

The above list by no means exhausts the reforms put forward by members of the profession, from whom most of the suggestions here advanced have come. The object has been to devise a general plan which will be helpful and, it is believed, practicable within the next ten or fifteen years, given normally prosperous conditions. To carry out this plan at all will call for a great deal of hard work, but the present machinery of a central council and numerous committees of its members seems adequate to the job. Possibly, additional assistance will be needed and this might be obtained by adapting the practice, already occasionally used, of calling on advisers within the Council, to co-opting to committees people outside the Council who are specialists, or particularly interested, in the matters under consideration.

None of these reforms will be of much avail without the co-operation of those in whose interests they are suggested: the investing public. Unless they realise that they have a duty, not only to themselves and to their families, but to the public, to take an intelligent interest in the investment of their savings and in what is done with them once invested, no efforts by anyone else can assure a good return either to the investor or to the country.

Housing Shares

IN this Election, in which candidates are having unusual difficulty in discovering what electors are really thinking, one thing at least is clear—constituents want houses. Of the triumvirate of post-war aims—homes, work and food—all are, or shortly will be, pressing, but in the electoral scale of priorities homes come easily, and quite properly, first. That this would be so has been evident for a long time, and not least to investors. Buying of the shares of companies with a stake in the post-war house building and repairing programme started anything up to three years ago, and to-day there are few sections of the Stock Exchange in which "recovery" prospects have been better discounted. Up to now, however, the buying has been general rather than closely selective. It is obvious that certain companies will be called on to play an indispensable part in the national rehousing effort, and that for some years to come, consequently, their available productive resources will be fully—and probably very profitably—employed. To that extent, their current earnings level is largely irrelevant to any estimate of the investment merit of their shares, and dividend yields have less than normal significance.

It is generally realised, however, that, once the Election is over and the next Government settles down to its job of carrying out its undertakings, the time will have arrived for giving much greater precision to contemporary ideas of the relative worth of "housing" shares. For one thing, the list of companies which, in one way or another, will be catering

for a housing programme is lengthy, and the activities they cover are wide. Again, not all of them have enjoyed the same wartime experience. Some have been actively engaged in the war effort, turning out their own products. Others have been equally busy, but have been producing different goods from those of peacetime. Others, again, have been unable to make the necessary metamorphosis, and their resources have been largely under-employed, particularly during the later years of the war. Their prospects, to-day, may be bright, but their immediate working capital position (and their prospective opportunities of replenishing it later by way of EPT refunds) may not be on quite the same footing as that of the companies which have been able to maintain, and even increase, their earnings power during the war years.

How wide disparities between the wartime experience of different companies have been may be inferred from the figures given in the table at the foot of the next page, which epitomises the financial results achieved by ten leading concerns whose products are extensively used, in peacetime, either outside or inside the homes of the people. The table shows profits, ordinary share earnings, dividends, and prices and yields for a pre-war year and for financial years ending at balance-sheet dates in 1942, 1943 and 1944. Supplementary figures at the foot of the table show how net liquid assets have varied during the last three years. It will be observed that the companies fall into two

sharply defined groups. Some have been extremely prosperous during the war; others have had quite a severe setback in earning power. The earnings of a number of companies have actually been running at a higher rate, in recent war years, than in 1938—on a gross basis, at least, before allowing for taxation. In virtually every case, these are companies whose products have been adaptable, with a minimum of alteration, to meet wartime demand. Striking examples are the cast-iron and other products of Allied Ironfounders, the heat-resisting materials produced by General Refractories, the paints, enamels, etc., of Pinchin Johnson, and the specialised but readily usable metal products of Crittall. At the other extreme is London Brick, which, once the urgent demands of shelter-building were satisfied, saw its sales decline to a disappointingly low level, owing partly to the cessation of new building, partly to labour difficulties, and not a little to the effects of a strict "zoning" system of distribution of brick supplies, which has borne especially hard on an undertaking whose sales were formerly nation-wide. The cement industry (represented in the table by the biggest producer, Associated Portland Cement) has had a less unfavourable wartime experience, because its output has obvious military usefulness under modern war conditions. But the rate of earnings on its ordinary stock has been at least halved since the war. Another inevitable sufferer has been Eastwoods, whose output of builders' materials has been directly affected by the stopping of normal building operations. The same applies, in greater or less degree, to those companies whose output normally goes inside houses when the roof is on—Wall Paper Manufacturers, Barry and Staines Linoleum and Twyford.

Almost without exception, however, whatever their earnings record during the war years, the companies in the housing group have followed a conservative financial policy. As many as eight of the ten shown in the table are paying lower dividends now than in 1938, and of the others one, General Refractories, was on an abnormally low earnings basis in that pre-war year. The companies which have been prosperous during the war have conserved their resources by deliberate choice, the others more of necessity, but the same element of prudence has been evident everywhere. In some instances, ordinary payments have been less than half or even one-third of the disclosed rate of earnings. Only one company, London Brick, drew on past earnings for part of its last ordinary dividend, and that can be accounted an act of courage, seeing that the chairman believes that the company will be fortunate if a full programme of construction is reached in less than two years. By contrast, Wall Paper Manufacturers have sharply cut dividends to a third of their wartime rate, despite the partial recovery of earnings after a severe setback at the beginning of the war.

What the bearing of this has been on the all-important

question of availability of working capital for peacetime demands it is not easy to say. Generally, the companies which have fared best under wartime conditions, like Allied Ironfounders and Crittall, have shown a gratifying recent increase in net liquid assets. Both the Crittall balance-sheet and the consolidated accounts of Allied Ironfounders disclose a 40 per cent rise during the last couple of years. Other companies have maintained, or slightly increased, their liquid resources, and even the concerns whose profits have been most significantly reduced during the war have apparently avoided any really dangerous drain on their working capital resources. That is reassuring so far it goes, but whether unconsolidated holding company balance-sheets, which are all the investor has to rely on in some cases, tell the full story, and how adequate existing resources will be to take the impact of post-war demand, on a price level anything, say, from 50 to 100 per cent above that of 1938, are questions on which the available evidence is far from conclusive. Presumably, some companies will have EPT refunds coming to them, but these, for the most part, are concerns whose liquid capital position ought, *prima facie*, to be already better than most.

On the other hand, under the new terms of reference of the Capital Issues Committee, the capital requirements of companies catering for the housing programme enjoy priority. The record and status of representative concerns in almost every branch should ensure public subscription of any offers of new shares needed to supplement existing working resources. The medium-term outlook for housing companies, all in all, is probably at least as satisfactory as that of any other section of the industrial field. Some of the companies, moreover, have important interests in the coming export campaign. On this argument, the existing level of equity share prices may not be excessive, and relative yield figures, based on wartime rates of dividend, may assume a different complexion if and when something nearer the pre-war level of distributions is restored.

A more immediate question is the extent of the change-over from war to peace production necessary in different cases, and the varying length of the interval before demand from the housing programme can take full effect. Obviously, in these respects, every company will have to be taken on its individual merits. A certain amount of guidance—but not a great deal—has been given to investors by different chairmen. Eastwoods, having suffered little main disturbance of its major interests, is described as having a very large unused manufacturing potential and as awaiting only essential labour and materials for reconditioning its works for early reopening. General Refractories has strengthened its strategic position during the war. Outside this country, its assets in former occupied territory have suffered comparatively little damage. On the other hand, the chairman of Twyford a year ago found it impossible to make any reliable forecast about future trading results, given prevail-

low-grade ores. This policy would involve the replacement of inefficient plants, and it might also lead to considerable social changes and migration of labour. The union states that its aim would be ultimately to produce 18 to 20 million tons a year, compared with an annual output of 10 to 12 million tons (on a nominal capacity of 15 million tons) which the union believes the British Iron and Steel Federation would support.

The union's main argument for nationalisation of the industry, in order to achieve maximum efficiency and modernisation, is that only the state could find the necessary finances. The Federation, as *The Economist* has frequently pointed out, exercises a restrictive monopolistic control over the industry, but whether the substitution of a state monopoly, as proposed by the union, would in fact produce the desired result of expansion and cheapness, has not yet been demonstrably proved.

Plan for Cotton Merchants

In his farewell address as chairman of the Cotton and Rayon Merchants' Association, Mr E. A. Carpenter put forward some suggestions for the improvement of merchandising in the cotton trade. Mr Carpenter rejects any plan either for vertical combination or for compulsory concentration in the industry and pins his faith on closer association between manufacturers and merchants and a greater knowledge by each of the work and possibilities of the other. He says that many merchants have never seen the inside of a mill and that many manufacturers have a totally wrong conception of what a converter merchant does. If Mr Carpenter's statement means that the merchant has no detailed familiarity with the produce of the manufacturers, a doubt necessarily arises whether he is infallible when it comes to deciding what his customers really want. In fact, is the atomisation of orders really necessary to ensure sales?

The converter merchant does not handle the whole of British cotton exports, but their number was recently given as 1,210 handling 1,050 million square yards of exports. Of these no fewer than 436 handled only 50,000 yards or less. It is very easy to underestimate the number of merchants required to cover the markets of the world, but it is also difficult to believe that all these firms are capable of providing really efficient service, or that it could not be improved by a measure of consolidation which would enlarge their scope and, incidentally, strengthen their financial position. In any case, what is required of the cotton trade is that all sections pull together to see that the overseas buyer is supplied with what he wants. If the present very complex machine, evolved to meet quite different conditions, can discover and create new markets, well and good. If not, then some new measures, whether of vertical combination, or the development of new and more energetic merchandising, or some other means, will have to be found. Mr Carpenter's suggestion may be a helpful step in that direction, and he does not claim more for it than that, but it is only one of several changes needed in the chain of processing and distribution.

French Railway Payments

The announcement, towards the end of last week, that the French Government is resuming service of the three blocks of sterling Railway bonds and of the Department of the Seine issue was in accordance with expectation. Since 1943 the Société Nationale des Chemins des Fer Français has been sole debtor in respect of these obligations. In the case of Seine and Nord issues, drawings have continued during the occupation and these drawings will be considered effective as from September 1, 1945, interest in full being paid on that date. On the Midi and Orleans issues, arrears of sinking fund will be made good on the same date. The following table sets out the amounts, prices and yields of the stocks concerned. It will be seen that, including bonds drawn during the occupation, the total involved exceeds £10 million.

Stock Amount	Final Date	Current Price	Net Price	Flat Yield
Midi 4% £3,068,000...	1975	104	94	4.255
Orleans 4% £1,990,000	1975	104	94	4.255
Nord 6% £3,206,000...	1950	121½	106½	5.629
Seine 4½% £1,818,900.	1952	107	95½	4.700

The three railway stocks are redeemable in whole in advance of the due date at 103. This right is not likely to be used in the case of Nord, and for Midi and Orleans

it runs until 1960 after which redemption may be effected at par. Until the net amount of stock after wartime drawings and those of the current year is known, it is difficult to calculate even a theoretical redemption yield. But it is evident that the current returns make considerable allowance for political risks. In the case of the Seine loan, the right of prior redemption has been waived. The yield in this case appears low as compared with Nord, which has a life only two years less to final repayment.

French investors will also be pleased to learn that any "rights" accruing to them to take up shares have been preserved by a special Act. When arrangements for making francs available have been completed, the newly issued shares and dividends upon them can be obtained on payment of the original issue price plus interest at 6 per cent.

Harland and Wolff Distribution

The preliminary statement of Harland and Wolff for last year shows a rise in profit for the current period of some £130,000 to £1,365,018, but a fall of almost £104,000 in profits from earlier periods brought into account at £276,158. With other revenue virtually unchanged, the total is £1,657,111, against £1,630,878, and almost the whole of the increase is absorbed by raising the tax provision from £696,715 to £715,580. All major appropriations are unchanged at a total of £700,000, and the amount available for dividends is £228,521, against £221,224.

In September last a scheme was put forward, and subsequently adopted, to split the £5,200,000 "A" ordinary capital into equal parts of 4½ per cent cumulative preference and new ordinary shares, while the "B" ordinary were converted into new ordinary, share for share. It was part of the scheme that the dividend on the new preference should run only from July 1st. After paying that dividend, the directors recommend a distribution of 7 per cent on the new ordinary, against 6 per cent last year on both classes of capital. It results from this that the old "B" holders receive an increase in distribution, while the old "A" holders have only half of 2½ plus 7—that is, 4½ per cent. Next year they will receive the full preference dividend, but even then the ordinary distribution must be raised to 7½ per cent if they are to receive the 6 per cent distributed to them in each of the five years 1939-44. Largely owing to the non-payment of six months' preference dividend, which calls for £29,250 net, there is an addition to the carry forward of £41,158. The preference shares stand at 18s. 4½d. ex dividend and the ordinary at 17s. 10½d., to yield £4 17s. 6d. and £8 2s. 4d. respectively.

Training for the Cotton Industry

In common with coalmining and agriculture, the cotton industry faces a very serious recruitment problem, and unless the measures now being planned to increase the intake of juvenile labour are rapidly extended the industry may well be faced with a prolonged manpower shortage. Quite apart from the depressed state of cotton during the interwar period and the relatively low wage level and unsatisfactory working conditions prevailing in many Lancashire mills, the main factor which deterred recruitment was the lack of prospects and in particular the absence of any systematic training for new entrants.

The problem of training is being remedied to some extent by the Cotton Board's special recruitment and training department, which has initiated training schools at a number of the more enterprising mills. The department has just issued an attractive booklet, on "Juvenile training in the cotton weaving industry," describing the courses provided by a number of different firms. These courses consist in part of theoretical and in part of practical instruction, and aim at training a juvenile as a fully skilled weaver within 6-9 months. There is a minimum wage for age scale, starting at 20s.—22s. and rising to about 40s. weekly on the completion of the training period.

It is indeed to be hoped that young workers will take the opportunity of attending these training courses and that similar schemes will be adopted by other firms in the industry. Quite clearly, if the cotton industry is to be modernised and reorganised as recommended by the Platt report, it will need a skilled and adaptable labour force. Hitherto, juveniles have had to pick up the technique as best they could from the older workers, with unsatisfactory results. As Mr Andrew Naesmith, the General Secretary of the

Amalgamated Weavers' Association, points out in an introduction to the pamphlet, the lack of systematic training in the past has resulted in "low operative efficiency and discontent. We can no longer disregard what is, after all, the fundamental basis of successful industrial activity... human skill and efforts."

Dock Labour

The annual meeting of the National Dock Labour Corporation this week provides an occasion for a review of the wartime schemes for decasualisation and a consideration of their future. It will be generally agreed that, on balance, the schemes have been beneficial to the dockers. They have gained by continuity of employment and the guaranteed week, even if, as was shown in the recent London strike, they have resented the degree of control over their movements and what they regard as interference with their personal freedom.

From the point of view of the public, it is no exaggeration to say that the shipment of food and war supplies to and from this country could not have been maintained without the emergency organisation of the Corporation. Its main object throughout has been to maintain the minimum labour force required to secure a quick turn round of ships, and to provide a readily available and mobile supply of labour. It should further be recorded, as Lord Ammon, the chairman of the Corporation pointed out, that the dockers have worked in great physical danger through air-raids, and if they have earned high wages (the average in Corporation ports from April 1944 to April 1945 was £8 1s. 11d. a week, less an average income tax deduction of 25s. per head per week) they have merited them.

It is, therefore, not surprising that proposals for the continuation and extension of these schemes into the post-war period should be under consideration, though nothing has yet been decided. Mr Bevin, who was responsible for their initiation in 1940, said at the annual meeting on Tuesday that he hoped there would be a national scheme for pooling dock labour, which would be necessary in the interests of national defence. At present, the Corporation organises the supply of 44,500 workers and operates in most British ports, except for Merseyside and Clydeside, which have their own schemes for the 29,000 workers they employ.

In any post-war scheme for the organisation of dock labour, however, it is important that the existing machinery for dealing with disputes should be overhauled. One of the recommendations put forward in the recent report of the Committee of Enquiry into the London strike was that there should be more decentralisation, more joint consultation and suitable appeals machinery. Indeed, unless the more severe disciplinary features of the scheme which were criticised by the Committee, as they applied in the Port of London, are modified, it is doubtful whether it would be acceptable to the dockers, who are a traditionally individualistic body of workers.

End-June in Lombard Street

The incidence of the calendar this half-year-end, as in December last, has not been kind to the money market. On both occasions the banks' half-yearly balance sheet date has fallen on a Saturday, so that it has been impossible for the market to prepare itself for "window-dressing" pressure for funds by postponing payments for part of the week's issue of Treasury bills until early July. A situation such as this, however, has long since ceased to hold any terrors for the discount houses, thanks to the liberal facilities afforded by the authorities. Not since June, 1943, has there been any offer of TDRs in the last week of a half-year, so that in the past three half-years the final week has been bare of maturities as well as issues. This week, however, there was again a net increase of £20 millions in the volume of "tender" bills, and although the authorities may have participated at the tender, the discount market syndicate secured a large allotment. In consequence, the market's sales of bills to the official buyer for the week as a whole are likely to prove abnormally heavy—some guesses put the figure as high as £100 million.

These operations began on Monday and have continued daily. Their extent up to Wednesday is shown in the Bank return by a jump in Government securities by no less than £52 million to £301 million, which is only £4 million short of the peak figure reached last December. In addition, "other" securities have risen by £10 million, which roughly offsets a further sharp rise in the note circulation.

Bankers' balances have, therefore, leapt by £52 million

to £262 million, which just surpasses the previous record figure reached at end-1944. Even this expansion does not, however, fully reflect the preparatory arrangements that have been made, for market payments for Treasury bills were concentrated in the early part of the week. Two years ago, when the Bank return was made up on June 30, bankers' balances stood at £238 million. Since then bank deposits have expanded by some £1,100 million, and, as till money holdings have been virtually stationary, that portion of the banks' cash which is held at the Bank of England will need to rise by the end of this week to between £340 and £350 million. That figure will not, of course, be shown in the Bank return, but it is probable that next week's return will reveal a further substantial rise—unless it should happen that the special buyer acts "in reverse" early next week.

Autumn Savings Drive

It has now been definitely announced that this year's savings drive—twice-postponed, first to await VE-day and then because of the election—will be launched in the autumn. There was a suggestion at one time that the organisers might depart from their customary practice, and would open the campaign in the provinces, but it has now been decided that London will again set the ball rolling with its "week" beginning on September 15th. The theme this year will be "Thanksgiving," which it is hoped will produce a record response. Certainly, the six months' delay will cause an abnormal accumulation of cash in the hands of the public—an accumulation which has its counterpart in the accelerating rise in bank deposits and in the note circulation, to which attention was drawn last week. But whether the increased money holdings produce correspondingly larger subscriptions to savings securities in the autumn will mainly depend upon the summer's counter-attraction of holidays, pleasure motoring and other widening opportunities for spending.

Distillers Higher Dividends

During the past year there has been a very general assumption that the increase in profits shown by the Distillers Company during 1943-44 would be continued for the year to May 31, 1945. On the basis of the preliminary figures, this estimate has proved correct, for the profit is up by some £71,000 against a rise of £91,000 odd a year ago, and the total distribution, raised from 16½ per cent to 18½ per cent at that time, is now increased to 20 per cent. The rise in retainable profit is probably a better index of funds engaged in the business than of actual gross earnings or of turnover even of the parent company. Distillers is one of those concerns which publish no consolidated accounts and disclosed profits are largely a matter of policy. It is to be hoped that the report of the Cohen Committee, whose appearance ought not now to be delayed for more than a matter of weeks, will remedy this state of affairs. Meanwhile, the shareholder must exercise what patience he can. The price of the stock was quoted ex dividend at about 100s. 6d. a year ago. At the time of this year's dividend announcement it had been run up to 118s., but has since fallen back to 114s. 9d. ex dividend, at which it yields 33.9s. 4d. per cent against a return of 33.14s. 6d. in mid-July of last year. Since the yield on both general industrial equities and on breweries and distilleries is higher now than it was at that time, shareholders in this company have done very well in the way of capital appreciation, even after the recent decline. The excellent experience of the company owes a great deal to its interests in non-potable products.

Tin Developments

Ever since Japan overran Malaya and the Dutch East Indies in 1942 much of the Allies' tin supplies have had to be obtained from Nigeria. The production of Amalgamated Tin Mines of Nigeria expanded to 9,110 tons of concentrates in 1943-44, an increase of more than 50 per cent over the company's pre-war quota under the International Tin Agreement, although output has fallen back slightly for the past year to 8,665 tons. In order to expand output quickly, richer grades of ground have been worked, and in consideration of this fact the company is to receive gross compensation payments of £76,000 for 1942-43 and £225,000 for 1943-44. Nevertheless, Nigerian tin producers have not

received the large wartime price increases conceded to Bolivian producers, and they must face a future in which both working costs and wages will be higher than before the war.

With much of the more easily accessible supplies worked out, Amalgamated Tin Mines is prospecting for new sources. Among other activities, the company acquired in 1943 the Keffi Tin Company, which yields at present some 250-300 tons a year; and it is now proposing to subscribe a majority of the share capital for a new concern, which is to investigate and develop a new area in which indications of lode development have been found. Dredging should also enable much low-grade ground in existing concessions to be worked at a profit.

There are indications that Nigerian producers hope to maintain production in competition with the Eastern tin-producing areas when they are liberated. In default of special subsidies, the economic prospects for Cornish tin mining are less favourable. The East Pool and Agar mine has already ceased operations on termination of its contract for black tin, but the Ministry of Fuel and Power has appointed a Technical Committee to investigate the case for subsidising underground exploration at this mine. The Committee will take into account postwar economic circumstances, and it is clear that its appointment comes too late for military needs to bear much weight. But its findings should help to determine whether there is any case for setting up in this country the Metalliferous Mines Commission, with power to make grants in approved cases, whose formation was urged over a year ago.

Electricity Supply in South Wales

In a report by a sub-committee of the National Industrial Development Council of South Wales and Monmouthshire on electricity for industry and agriculture in South Wales, some doubts are expressed about the expediency of proceeding with the Severn Barrage. The committee states that it may be right from the national point of view to proceed with the scheme if and when it would be possible to put electricity into the national Grid more cheaply than can be done by the coalfields stations and without seriously hampering the latter, but it emphatically expresses the opinion that, "in the absence of a complete change in the legislative position, the erection of the barrage could not lower the cost of electricity in South Wales by one iota."

It is pointed out that only 25 per cent of the energy generated under the proposed scheme would be allocated to the whole of South Wales and South West England, that such supply would be both variable and intermittent, and that generation costs in South Wales are already substantially below the Grid tariff.

On the general question of the supply of electricity for industrial purposes, the committee admits disparities in the prices charged during the war period, but contends that these were inherent in the disadvantages of short-term compared with long-term agreements, and recommends development on the lines of long-term supply contracts and planned compact industrial areas. So far as the electro-chemical industries are concerned, the committee expresses the opinion that this country is unlikely ever to be able to generate electricity from coal or water-power as cheaply as by the large hydro-electric schemes in operation in Canada, the United States and Scandinavia. It states that "the best promise of competing with Canadian and Norwegian water-power figures probably lies in integrating the manufacturing processes with waste heat utilised for generating a portion of the power required." The committee considers the development of an export trade from South Wales in coal-derived electricity "as a natural and inevitable future line of evolution," recommends a reconsideration by the Great Western Railway Company of railway electrification in South Wales, and suggests pressure on the Ministry of Agriculture to evolve a scheme for facilitating agricultural land improvements, in which electricity would be an integral part.

The Development of Tourist Traffic

It is interesting to learn, from the reports of the annual meeting of the Travel Association last week, that the schemes for developing Britain's tourist industry after the war are progressing satisfactorily, if slowly. The Association, which has been asked by the Government to undertake preparatory work and to investigate the possibilities of

post-war tourist traffic, has now set up a board of management, representing all the interests concerned.

The Travel Association will, presumably, work in close co-operation with the Catering Wages Commission, which is the statutory body responsible for promoting tourist trade in England and Wales, and with the body which has equivalent responsibilities for Scotland. It has not yet been decided—and this will be a matter to which whatever Government is returned will have to pay early attention—whether or not a public corporation will be established, as suggested in the Catering Commission's preliminary report. But it is obviously desirable that the Travel Association, with its previous experience of organising the trade and arranging national publicity, should be closely associated with every stage of development.

Tourist traffic, as Sir Douglas Hacking pointed out, is an important invisible export, which should confer considerable direct and indirect benefits to trade. But his estimate that the traffic might be developed to yield £100 million each year would take a long time to reach. The expenditure of visitors between 1926 and 1938 fluctuated between £24 and £33 million each year, reaching its peak of £33.3 million in 1937. The expenditure of visitors in the Coronation year will have to be trebled if this target is to be reached.

It cannot be too strongly emphasised that no drive to encourage tourists to visit Britain will succeed unless real efforts are made to welcome them once they have arrived. The British tend to adopt an attitude of amused tolerance rather than of welcome to foreigners, and in wartime hoteliers and bar-tenders have had more experience of driving away custom than of attracting it, while their profession has always tended to be looked down on. Now that the Catering Commission is there to regulate wages and working conditions, there should be no reason why it should not be regarded as an honourable and nationally important occupation.

ABDULLA No. 7

G.E.C. In war or peace - at the service of the Empire

An important example of how electrical inventiveness has served the urgent needs of war — afterwards to become of great service to industry generally, when the war is won — is the Mobile Rectifier Substation.

This is transported by road or by rail to wherever it may be required and, for example, provides direct-current supply to building sites; or to docks where ships are being loaded, unloaded, or undergoing repairs; to centres where it will be available for traction purposes; or to a position adjacent to a permanent substation that is temporarily out of action.

In surmounting the innumerable problems that have arisen in all applications of electricity, including the important one of electronics, the technical experience and scientific advancement of the G.E.C. — the largest British electrical manufacturing organization in the Empire — have been enriched to a degree that will be of incalculable value to all electrical services after the war. Then, just as the resources of the G.E.C. have been available for the war effort, they will be at the disposal of all concerned with reconstruction in any part of the world.

Electrification Schemes

G.E.C. Electrification Schemes have been applied to all industries, including: Aircraft Factories; Chemical Works; Collieries; Food Factories; Gold Mines; Iron, Steel and Copper Works; Locomotive and Railway Carriage and Wagon Works; Motor Car Works; Oil Refineries; Ships and Shipyards; Textile Mills, etc., etc.

THE GENERAL ELECTRIC CO. LTD., MAGNET HOUSE, KINGSWAY, LONDON, W.C.2

What is the best chocolate being made today?

IT'S a tough job to make good chocolate now. There is little milk. Sugar is short. Cocoa beans are of mixed quality. Skilled craftsmen are mostly on other work.

All the same, by refusing to be discouraged, we have been able to make

the remarkably good Rowntree's Blended Chocolate. It is not as good as the finest pre-war milk chocolate; it contains the same amount of milk, but it is not full-cream milk. We are satisfied that no better chocolate can be made in this country today; and what is more important, those of you who have eaten it are satisfied too.

No mean achievement, this! We claim a spot of credit for a painstaking piece of work.

ROWNTREES

For the present—but we hope not for long—there are large parts of the country where Rowntree's Chocolate cannot be sold

3d. (2 points)

The new issue of 2½% NATIONAL WAR BONDS

1954 - 1956

Now "on tap"—No limit to holdings

A Full Trustee Security repayable at par on the 15th August, 1956, the Treasury reserving the right, on giving three months' notice, to redeem at par on or after the 15th August, 1954.

- Price of Issue, £100 per cent.
- Payment in full on application.
- Subscriptions will be accepted in any amount, not being less than £50.
- Interest 2½% per annum payable half-yearly on the 15th February and 15th August. First Interest payment on the 15th February 1946.
- Interest accrues from the date of purchase.
- Income Tax is deducted at the source from Interest payments of more than £5 per annum.
- Bonds are transferable free of Stamp Duty.

PROSPECTUSES AND APPLICATION FORMS OBTAINABLE FROM ALL BANKS AND STOCKBROKERS.

There are also for this Security a Post Office Issue and a Trustee Savings Bank Issue, of which full details can be obtained at any Post Office or Trustee Savings Bank, respectively. Subscriptions for the bonds must be for amounts of £5, or any multiple of £5, subject to a minimum of £10 for the first subscription. Maximum subscription £1,000. Income tax not deducted at source.

Issued by the National Savings Committee

POWER SUPERSEDES HUMAN EFFORT

IN ancient Egypt man raised a mighty monument to human effort when he built the Pyramids. Even in this present age of electricity it would have been a remarkable achievement. But twentieth century civilization utilizes new and more efficient ways of performing tasks previously so costly in energy and man-power.

BRUSH ELECTRICAL installations are part and parcel of the service which electricity renders to us to-day. In every phase of daily life—helping to feed, clothe, light and simplify every moment of existence—BRUSH are playing a vital part. Whenever you think of things electrical they are invariably associated with the reputation built around the name BRUSH.

COMPANY MEETINGS

UNION CORPORATION, LIMITED

MR P. M. ANDERSON'S ADDRESS

The ordinary general meeting of shareholders of the Union Corporation, Limited, was held in Johannesburg on the 29th ultimo, Mr P. M. Anderson presiding.

The Chairman, in the course of his speech, said: The net profit for 1944 amounted to £701,344, after providing for all outgoings, including contingencies, as well as taxes. Two dividends for the year, totalling 8s. per share, absorbed £616,000 and exploration reserve account was credited with £75,000, leaving £10,344 to the credit of profit and loss account, which now stands at £126,306.

Our income from investments was less than for 1943, but profit on realisation of certain of our holdings was greater.

Our cash assets show a satisfactory surplus over liabilities. It is proper to point out that arising from wartime restrictions such assets and liabilities are both equally swollen by an abnormal accumulation of unpaid dividends as yet unclaimed by holders of Bearer shares of the corporation and of associated companies whose surplus funds are on deposit with the corporation.

The question of adequate relief from the burdens of double taxation is being taken up by the United Kingdom Government. In his Budget Speech in the House of Commons on April 24th last, Sir John Anderson recognised the ill-effects of double taxation on the trade and prosperity of the countries concerned, and was able to announce a treaty with the United States of America under which, through reciprocal concessions, double taxation is practically eliminated. Sir John Anderson added: "First and foremost, we desire to come to an arrangement with the Dominions which in place of the existing partial relief will give complete relief from double taxation within the Empire." If and when that comes about, it will be a great step forward and one most helpful to the Union of South Africa, which will require much overseas capital for expansion in its mining and industrial fields.

TAXATION

Mr J. H. Hofmeyr in his Budget speech in the Union House of Assembly on February 28th last announced the intention to appoint an interdepartmental committee to investigate the system of gold mining taxation. War-time taxation, coupled with the many indirect charges which the gold mining industry has been called upon to bear, has reached such a level that the industry is in danger of losing its attraction to that class of investor who acquires shareholdings to lock up with the object of receiving regular dividend income. In the long run, it is on this class of investor that the industry is mainly dependent for capital.

So far, these investors have been content to bear this heavy tax burden as a contribution to the war effort, but when that consideration ceases to apply, they will expect some relief. In addition, overseas investors are particularly apprehensive over the imposition in the Union of the non-resident shareholders' tax, Mr Hofmeyr has explained that this tax is not intended to discriminate against overseas shareholders, but to impose an equivalent of supertax on them. This overlooks the fact that there is a majority of overseas shareholders who, for one reason or another, would not be subject to Union supertax, even if they were resident in the Union. It is to be hoped that ways and means will be found to eliminate this tax altogether in the near future.

WITWATERSRAND

In his review of the Witwatersrand gold mining industry, the Chairman said: Now that the European war has ended, it may be appropriate to review the effect it has

so far had on the industry, which can count itself very fortunate that the effect was not much more severe. There was an appreciable time lag, so that it was only after 1941 that contraction became apparent.

The figures of contraction between 1944 and 1941 give a good indication of the extent of the contraction that has taken place, but which was inevitable in wartime. The output was reduced about 14 per cent., but owing to increased costs dividends to shareholders fell 30 per cent. and direct Government revenue 33 per cent. A return to more normal conditions may take some time, and progressive improvement in the industry's scale of operations may therefore be a gradual process. The ore that it is profitable to mine at the present level of working costs is becoming exhausted in a number of the older mines, and if there is to be expansion in the industry new areas will have to be brought into commission. The opening up of such new areas will, however, have to wait until war considerations permit of the existing restrictions on capital funds and equipment from overseas being modified or removed. The industry is awaiting the return from active service of nearly 9,000 of its European employees, and in addition it can play an important indirect part in increasing the scope for employment in the Union in the post-war period. It need hardly be stressed that the sooner it can increase the scale of its activities the greater will be the benefits accruing to the country as a whole.

OTHER INTERESTS

The Chairman, having reviewed the operating results of gold mining companies on the Witwatersrand under the administration of the corporation, continued:

Bay Hall Trust increased its net profit from £84,725 in 1943 to £89,454 in 1944, and the dividend was raised from 7 per cent. to 7½ per cent. The trust's holdings at the end of 1944 had an aggregate value of £2,675,596, which exceeds book value by £701,497.

At San Francisco Mines of Mexico operations continued at full capacity to supply metals needed for war purposes, but a workmen's strike, some flooding and increased taxation resulted in last year's profits being substantially reduced. After providing for a taxation liability of £200,696 and again placing £50,000 to exploration reserve, net profits were only £36,404. The dividend was limited to 6d. against 3s. per share in the previous year.

The South African Pulp and Paper Industries, Limited, made a net profit of £100,352 and declared a dividend of 7½ per cent. The capacity of the mill for producing printing and writing papers was fully employed, and sales of chemicals, such as hydrochloric acid, bleaching powder and liquid chlorine showed a substantial increase.

Last year I mentioned that the number of directors serving on your board had dwindled. The position has now been strengthened by the appointments to the board of Mr E. Fraenkel, Colonel C. E. Temperley, OBE, MC, and Lord Harlech, PC, GCMG.

Mr H. R. Hill, one of the managers of the corporation in Johannesburg, retired at the end of last year. The following appointments have been made: Messrs S. T. Amner and C. D. Pott as managers in London, and Messrs C. B. Anderson, T. P. Stratten and J. S. Walker as managers in Johannesburg. Mr A. R. Mullins succeeds Mr Stratten as consulting mechanical and electrical engineer.

A copy of the full report of the above proceedings is available for inspection at the London office.

LONDON AND MANCHESTER ASSURANCE COMPANY, LIMITED

INCOME EXCEEDS £5,500,000

The seventy-sixth ordinary general meeting of the London and Manchester Assurance Company, Limited, was held, on the 20th instant, in London.

Mr A. H. Dawes, the chairman, said that although last year was a very difficult one for their business, he was able to report good progress. The total income exceeded £5,500,000, while the total assets had reached £29,500,000. The new business in the ordinary branch was £2,781,655, being slightly more than that issued in the previous year. The premium income had advanced by £102,158 to £1,832,543. Claims by death, including war claims, amounted to £284,956 and compared with £248,666. Expenses and commission had absorbed 12.47 per cent. of the premium income, as compared with 12.77 per cent. The ordinary branch fund had increased by £845,423 to £16,265,930.

INDUSTRIAL BRANCH

The premium income in the industrial branch amounted to £2,410,946, an increase of £81,353. Claims by death, including war claims, amounted to £784,119, exceeding the previous year's figure by £15,274. The expense ratio had fallen below 30 per cent. of the premiums for the first time, being 28.6 per cent. The continuing fall in the expense ratio was indicative of the conduct of the business under modern conditions. The fund at the end of the year amounted to £11,822,168, an increase of £1,084,081.

The valuation of assurances had again been made on a basis of 2½ per cent. interest throughout coupled with the most modern tables of mortality. The surpluses disclosed, apart from the interim bonuses allowed during the year, were in the ordinary branch £1,523,986 and in the industrial branch £668,502. The consideration of a vesting bonus in the ordinary branch had again been postponed, and for another year interim bonuses would continue to be granted on participating policies which became claims by death—except policies less than one year in force at date of death—or survival at the rate of £1 per cent. on the sum assured in respect of each year's premium paid due between March 24, 1939, and March 24, 1945. It was hoped that by 1946 the financial outlook would be sufficiently clear to enable them to deal with the relatively large surplus carried forward in the ordinary branch.

FIRE AND GENERAL

With regard to the fire and general branch, the premium income had advanced from £86,713 to £98,721. A profit of £5,445 had been carried to profit and loss account. The balance standing to the credit of profit and loss account was £88,253, out of which a dividend of 6s. 6d. per share, free of tax, was recommended.

In regard to the company's activities in connection with the National Health Insurance, he had to report that during the year 1944 the company's representatives, in the course of their ordinary insurance duties, had paid out on behalf of the National Amalgamated Approved Society to "London and Manchester" members in sickness, disablement, and maternity benefits the sum of £293,435. As shareholders probably knew, the Government wished to abolish the approved society system and substitute a network of local offices working under the new National Insurance Department. What would be the cost of that had not been disclosed. The existing system had always worked smoothly; it was economical and efficient; and, in the directors' opinion, would be of the utmost assistance in the launching and successful administration of the new National Insurance scheme.

The report and accounts were adopted.

WHITEHALL ELECTRIC INVESTMENTS, LIMITED

The twenty-third ordinary general meeting of Whitehall Electric Investments, Limited, was held, on the 27th instant, at Winchester House, E.C. 2.

The following is a summary of the report for the year to March 31, 1945:—
The consolidated gross income amounts to £263,815.

After charging expenses £16,958, loss on realisations £65,756, and transferring £32,284 to reserve account, there is a balance of	148,817

Greece, occupied by the enemy and severed from this country for three and a half years, was liberated in October, 1944. The Athens electricity and transport companies immediately reappointed Mr L. C. Kemp as managing director, who found the organisation to have survived with nearly all the senior Greek staff still at their duties. The companies had suffered financial losses during the war from reduced activities, increased costs, and the ruin of the currency; and the installations had sustained some serious damage from inadequate maintenance. Yet the main items of equipment, other than rolling stock, remained intact.

The disturbances of December and January caused more destruction than the years of war, but energetic action has gone far to re-establish the services. Electricity supply has grown in recent months on an encouraging scale and amounts to approximately 60 per cent. of the pre-war figure. There are about 160 transport vehicles in operation, compared to about twice that number in pre-war days, and the demand for transport considerably exceeds the capacity of the vehicles available.

The social and economic recovery of Greece calls for generous help and understanding, and all the wisdom and energy of the Greek people. The future depends upon how world conditions may develop; and ultimately upon the balance of trade. In regard to the company's investment in the Athens electricity and transport undertakings, it is too soon to form an opinion of the financial prospect.

The West of England undertakings in the ten years to 1939 had raised the number of units sold from 5 million annually to 26 million and in 1944 units sold reached 57 million.

A post-war programme of extensions involving a large expenditure has been prepared, and work will begin as soon as conditions permit. The programme is designed so that all, except the most remote and isolated districts, will be served.

The directors record with profound regret the death on April 17th of their colleague, Sir Gerald E. Talbot.

DERBYSHIRE STONE, LIMITED

IMPROVED OUTLOOK

The ninth ordinary general meeting of Derbyshire Stone, Limited, was held, on the 21st instant, at 58, Victoria Street, S.W.

Mr John Hadfield, M.Sc., A.R.I.C. (chairman and managing director), in the course of his speech, said: The combined profits of the Derbyshire Stone group of companies, including £27,555 excess profits tax recoverable, amounted to £87,805. Your directors recommend that there should be paid a dividend at the rate of 10 per cent. on the Ordinary shares, absorbing £21,300, leaving a balance to carry forward of £75,051.

In 1943 the sum of £2,000 was appropriated for staff benevolent purposes. This has been followed in 1944 by the institution of a staff pension scheme, to which the company and the staff contribute approximately in equal proportions.

LABOUR AND TRANSPORT DIFFICULTIES

1944 was a year which was not without its problems, for although we were busily engaged in supplying raw materials for chemical, metallurgical and agricultural purposes, the demand for tarmacadam and roadstone fell off very appreciably as compared with earlier years, and our tarmacadam output in particular was greatly below our annual pre-war level. This was principally due to the movement of those Government activities which demanded a supply of road materials from the area in which the company was able to operate to areas further afield which could not be reached by our transport system, shackled as it was, and is, by war-time controls. Labour problems, transport difficulties and great periodic fluctuations of demand were features of the year.

The shortage of man-power compelled us to reduce output considerably in the section of the quarries operated by Hopton-Wood Stone Firms, Limited, which produces building, decorative and monumental stone, and during the latter part of the year our basalt quarry at Taddington, near Buxton, was closed with a view to the reconstruction of the plant, so that the unit might be adequately equipped to meet the post-war demand which we anticipate, will be placed upon it. In due course the unit will undoubtedly meet those demands in a satisfactory and profitable manner.

CURRENT YEAR'S PROSPECTS

In so far as our prospects for 1945 are concerned, the directors cannot find any reasons for assuming that the position will be better than it was in 1944. The course of war-time trading, however, is dictated by such abnormal factors that it is difficult to regard such trading as a reasonable indication of the prospects which lie in peacetime trading, and although your directors do not wish to appear unduly optimistic about the company's 1945 activities, they believe that the not-distant future and long-term prospects are excellent.

The post-war period will probably be one in which competition, and very keen competition, will play an important part. Nevertheless, your directors anticipate that your company will be able to take its fair share of business in connection with the road-building and house-building programmes of the country, and Hopton-Wood stone and Hopton-Wood marble will, doubtless, be in great demand for the highest types of internal decorative work and architectural work.

As your company has been a weapon in the hands of the Government during the waging of the war in Europe, so we believe that it will be equally useful as an instrument in national affairs during the reconstruction programme which lies ahead.

The report and accounts were unanimously adopted.

EAGLE STAR INSURANCE COMPANY, LIMITED

FAVOURABLE RESULTS

The annual general meeting of the Eagle Star Insurance Company, Limited, was held on the 26th instant, in London.

The following is an extract from the statement of the chairman, Sir Edward M. Mountain, Bt., circulated with the report and accounts:—The net new life sums assured at £16,631,021, compared with £14,309,817 in 1943, show a substantial increase. The net rate of interest earned on our combined life and annuity funds was £3 12s. 6d. per cent.

Our home fire loss experience was favourable compared with the estimated increased fire loss of Great Britain. In the United States of America the general trend of results showed no prospect of improvement; therefore we decided to cease operating in respect of fire and allied insurances, and reinsured all our outstanding liabilities with a leading company in America.

The marine fund at the end of the year is £816,321, which equals 106 per cent. of our premium income.

From the life department, in addition to the transfer of £26,342 arising from the current life series, there is a transfer of £7,803, representing the shareholders' proportion of the profits of the Sceptre Fund. The transfer from the fire department at £31,000 is less than that in the previous year, owing to the cost of reinsuring our business in America. Transfers from the accident and motor departments total £212,000 and £150,000 has been transferred from the marine account.

In view of the all-round improvement in Stock Exchange values we have decided that certain reserves held against investments to the extent of £350,000 are no longer required for this purpose, and their release has enabled us to increase our general reserve by £500,000. The carry forward in the profit and loss account is increased by £23,637 to £727,217.

FORSTER'S GLASS COMPANY, LIMITED

INCREASED PROFIT AND TURNOVER

The twenty-sixth annual general meeting of Forster's Glass Company, Limited, was held, on the 26th instant, in London. Major A. C. Bonsor presided in the unavoidable absence of the chairman, Col. Charles E. Ponsonby, T.D., D.L.

The following is an extract from the statement circulated with the accounts:—Last year I opened my remarks by explaining the decline in trading profits. During the past year this falling off has been retrieved, and we show an increased profit which is the result of an increased turnover. By reason of course of the incidence of taxation, the effect on the net profit is not considerable. In the opinion of your directors, however, the result of the year's working is satisfactory, especially in view of the difficult trading conditions which have prevailed. The profit for the year, before providing for income-tax, amounts to £64,338 which compares with £37,095 last year. The net profit is £36,513 as against £33,970. Your directors propose paying a dividend on the ordinary shares of 10 per cent. and a cash bonus of 5 per cent., making a total of 15 per cent. for the year. The balance sheet as a whole reveals a very satisfactory liquid position.

As in the last war, we started off by the manufacture of H.E. shells. Several hundred thousands of these were made, of various kinds. From H.E. shells we went on to various kinds of armour-piercing shot, including the famous 17-pounder.

In our ordinary line of business, we are engaged in the manufacture of containers for food, and the quantity produced during the past year has been very large. Practically the whole of this output is prior work for the various Ministries, and it leaves us with a very small margin to distribute between our ordinary customers. The report was adopted.

MARKS AND SPENCER, LIMITED

LARGER TURNOVER

The nineteenth ordinary general meeting of Marks and Spencer, Limited, was held on the 19th instant, at Michael House, 82 Baker Street, London, W.

Sir Simon Marks, D.Sc. (chairman and managing director), presided.

The following are extracts from the chairman's statement circulated with the report:—The net profits for the year are £1,916,487, compared with £1,574,029 last year. This increase has arisen from a larger turnover, particularly in the catering department. Supplies have not kept pace with sales, and this is reflected in an appreciable fall in our stock, £861,879, against £1,139,436 a year ago. The replacement of stock has been restricted by the continued heavy curtailment of supplies for civilian needs. Provision for taxation, including excess profits tax, amounts to £1,100,000, which compares with £790,000 last year.

Our profits are determined after making allowances for depreciation for properties and fixtures at our usual rates, and after the allocation of £100,000 to deferred repairs reserve, which now stands at £350,000. The total available for distribution is £1,831,339, including £1,024,852 brought forward. The directors propose that this year our final dividend on the ordinary and "A" ordinary share capital should be 25 per cent., making 40 per cent., compared with 35 per cent. for last year, leaving £1,314,391 to be carried forward. Our reserves and surplus total £1,042,291, compared with £3,636,152 last year.

SHORTAGE OF SUPPLIES

All the material requirements of our civilisation—housing, foodstuffs, clothing, amenities—are short in supply and heavy in demand. The nation is hungry for them, not only in quantity and quality but, above all, at a price it can afford to pay. But if the needs of the people are to be satisfied in the necessary quantities quickly and at reasonable prices the methods and techniques learned in the war will have to be applied and even improved. Producers must continue that partnership with science and technology so widely applied and developed during the stress of these fateful years.

The vital war needs of this country called for speed, quality and quantity, a revolution in production and production methods. It was achieved by devoted co-operation between scientists, manufacturers and workers. New, difficult, and urgent problems were solved in months instead of years by this partnership of minds and experience, pooling their knowledge in the fullest measure. Such teamwork and co-operation have set a pattern of practical collaboration rich in promise for the future and can continue to give to industry splendid opportunities.

NEW MATERIALS

Science is producing new raw materials and new processes as well as improving existing materials. In our own field new synthetic fibres and plastic substances are being created which will generate additional demands and wants by the public. Some of these inventions are not mere substitutes but original products which open up new fields of application and manufacture. We are closely watching the developments of such research in order to widen the range and improve the quality of the goods we sell.

The progress of our business amply demonstrates that there is a vast market which can be reached only by the creation of the maximum value in goods to fit the purse of the great majority of the public. We have maintained, and in some cases expanded, our welfare service. It is the policy of the board to continue the upward review of wages, to develop further the Marks and Spencer pension scheme, and to build up steadily the Marks and Spencer benevolent fund.

The report was adopted.

SCAMMELL LORRIES, LIMITED

ALL PREVIOUS RECORDS SURPASSED

The twenty-second ordinary general meeting of Scammell Lorries, Limited, was held on the 21st instant, at Watford. Mr Albert I. Belisha presided in the absence of Mr R. P. Brousson, O.B.E., who was unable to attend owing to illness.

The following is an extract from the chairman's statement, which was circulated with the annual report and accounts:—

Shareholders will have seen from the reports of the directors that last year we surpassed all previous records of output. Reports which we have received from every active theatre of operations confirm that our vehicles and auxiliary equipment have proved invaluable in service under the most arduous and varying conditions and as a result the company's reputation for sound design and high quality has been still further enhanced both at home and abroad.

HANDICAP OF TAXATION

Despite a considerable increase in gross profit (of £31,988) and in net profit prior to taxation (of £23,592), almost the whole of the increase in profit has been absorbed by additional taxation (£233,500 against £211,750), so that the final net profit at £24,025 is £1,842 higher than last year. As has been pointed out in previous statements by the board, Excess Profits Tax on the existing basis represents an extremely heavy handicap, though in view of the latest assurances of the Chancellor of the Exchequer, we shall, in due course, be enabled to utilise the credits arising therefrom in meeting the capital expenditure of the post-war period.

With regard to the future, in addition to giving full attention to H.M. Government's continued requirements, your company is now able to fulfil civilian and export demands to an increasing extent, and your directors feel that with the return to more normal trading conditions, the prospects for the company appear to be by no means unfavourable.

It is with much regret that the directors record the resignation through illness of Mr R. P. Brousson, who has been chairman of the company since 1942.

MANAGING DIRECTOR'S REMARKS

Mr A. P. Fox (managing director) said: The designing, development and supply of special war-type vehicles and equipment by the company for the specific use of H.M. Services made very heavy demands upon our organisation. This task was undertaken with enthusiasm by our employees and also by our suppliers, to all of whom I am glad to have this opportunity to express our gratitude.

During the period of actual hostilities in Europe, the output of the company in finished vehicles and equipment, excluding spares, amounted to over 63,000 tons, equivalent to 37 tons per working day. 53,000 tons of this output, which included vehicles and equipment ranging from tank transporters weighing 21 tons to portable fire engines weighing one hundredweight, was delivered direct to the Services, and the remaining 10,000 tons was supplied to the railway companies, Petroleum Board and to road transport companies and industries of high priority.

The working area of our factories, stores and offices has been increased during the war by only 40 per cent., whilst the output by weight has expanded by 320 per cent. since the first year of war. I am pleased to say that the performance of our vehicles and equipment has proved highly satisfactory and has done credit to the company and to all the employees who participated in the success which has been attained.

The company can face the future with confidence, and we do not anticipate any great difficulty in turning from war production to a full peace programme, as circumstances permit.

The report and accounts were unanimously adopted.

CABLE AND WIRELESS, LIMITED

(The Operating Company)

WAR ACTIVITIES

The following is an extract from the speech by Sir Edward Wilshaw, chairman of Cable and Wireless, Limited, at the annual general meeting of the company in London on the 28th instant.

The profit for 1944 shows a small increase of £8,865 at £1,237,757.

In the following brief review I can, I hope, show you some part of the contribution which your company has made to the common victory. In May, 1941, our Central Telegraph Station in Moorgate, with much valuable equipment, was destroyed by fire caused by enemy action. Due to forethought and careful planning, it was possible to transfer our activities to our present headquarters in Electra House, Victoria Embankment, and the flow of traffic was never seriously dislocated. Throughout all the periods of air-raids messengers, in cars and on bicycles, continued to deliver messages, and I know no case where a message failed to be delivered owing to an air-raid.

Abroad, on Italy's entry into the war, all the cables west of Malta were cut by the Italians. In the Far East the Japanese, on their entry into the war, over-ran all our cable and wireless stations in that area, depriving the company of the best and fastest route to Australia and New Zealand. Despite the heavy losses of equipment and the necessity for expanding our services to meet war-time demands, we have had the utmost difficulty in obtaining supplies and transporting them to distant stations.

Nevertheless, the services have been maintained; 47 new wireless circuits have been opened since September, 1939; the total traffic carried in 1938 comprised 231 million words against no fewer than 705 million words in 1944; whilst we have expanded our phototelegraph services until we are now handling as many as 2,000 pictures a month compared with 100 before the war.

Recovery of the Far Eastern circuits will throw a great strain on the company, which can be met only if we have the men and the equipment.

We have emerged from the war strengthened by the thought that by drive, initiative and foresight we have surmounted great dangers and formidable difficulties. We have shown that private enterprise in the right hands can achieve much. Experience has shown that the present system offers the merits of Government control without its disabilities. If left to our own resources and given reasonable encouragement and goodwill by the Governments, we and our associated companies overseas can continue to keep abreast of developments and to offer cheaper and extended telegraph services without adding to the taxpayer's burden.

RIO DE JANEIRO CITY IMPROVEMENTS COMPANY, LIMITED

The eighty-third ordinary general meeting of this company was held, on the 27th instant, in London.

The following is an extract from the chairman's circulated statement:—

Once again we were able to make satisfactory remittances from Rio, as may be deduced from our increased investments and our strong cash balance in London.

Regarding the termination of the company's concession in April, 1947, the Government has so far given no indication of its policy as to the future of the Drainage Services, and it is thought unlikely that any pronouncement will be made until after the Brazilian elections.

We recommend a dividend of 3½ per cent. free of income tax.

The report was adopted.

BRITISH ELECTRIC TRACTION, LIMITED

WAR-TIME ACTIVITIES

The forty-ninth annual general meeting of this company was held, on the 22nd instant, in London.

Mr Richard J. Howley, C.B.E., the chairman, said that they were largely interested in the provision of road passenger transport and in the supply of electricity. Both those public utility services had been of major importance during the war, and in the aggregate their associated companies had played a not unimportant part in the successful prosecution of the war. The omnibus undertakings now operated just over 9,000 public service vehicles, which during 1944 had run approximately 240 million miles and carried 1,500 million passengers, the gross receipts amounting to £21,500,000. The figures had been much the same during the other war years and illustrated the magnitude of the transport services which they had been able to provide for the general public and, in particular to meet the needs of the large number of workers engaged in vital war-time production.

Throughout the war their associated electricity supply companies had provided electricity for many essential war-time purposes and during 1944 had sold a total of close on 330 million units.

While he was able to give a good report of their various activities during the war, he was not unmindful that they were about to

face a difficult and anxious time in settling down to peace conditions. The industry had to find new levels of receipts and expenses which would be reasonable for those engaged in it and for the public. Those changes could not be accomplished without close co-operation between employers and employees. They could not be carried through merely by changing a Government and, least of all, by turning our social and economic life topsy turvy.

The report was adopted.

VENEZUELAN OIL CONCESSIONS, LIMITED

INCREASED PRODUCTION

The twenty-ninth ordinary general meeting of this company was held, on the 25th instant, in London, Sir Andrew Agnew, C.B.E. (the chairman), presiding.

The following is an extract from the chairman's statement circulated with the accounts:—

After making provision for certain reserves the profit for 1944 at £688,000 is higher by £196,000 than the profit for 1943. There has been some increase in production and in the revenue therefrom and these factors have served to offset the substantially increased production and surface taxes. Our plans for developing our new concessions envisage a heavy exploration programme in the near future and, as a contribution towards this, £250,000 has been added to the exploration and general

reserve, which now stands at £1,400,000.

As regards general operations, the company has, since the outbreak of war, directed its maximum efforts towards fulfilling the important part it has been called upon to play in supplying the oil requirements of the Allied Nations. In recent years the increasing demand for aviation gasoline and other light products has required the company to concentrate on the production of all available grades of better quality crude oil and our drilling activities have been governed accordingly. This has necessitated exploration on an increased scale, involving slow drilling and a higher proportion of deep wells. The reduced totals of completed wells and footage drilled in 1943 and 1944 are due primarily to this, although it was also necessary during those years to reduce the total number of drilling strings operating, pending discovery of additional reserves of the required type of crude oil. Now that this objective has to a considerable extent been achieved by the discovery of the Pueblo Viejo field and the deep production at La Paz—two additional sources of production—we are able to increase our exploitation drilling programme to an appreciable degree.

The scale of our operations in recent years has also been influenced by the supply of equipment and materials. Despite the assistance afforded by the authorities, both here and in the U.S.A., it was only to be expected that this would constitute an important limiting factor.

The report was adopted.

FINANCE AND BANKING

THE MONEY MARKET.

The market this week has naturally been dominated by preparations for the half-year-end, which are discussed in a Note on page 901. No fresh TDRs were issued, and none matured, but the volume of tender Treasury bills was again increased by a net £20 million. Some part of this addition appears, however, to have been taken by special quarters, for although total applications declined, the average allotment rate dipped fractionally below 1 per cent. The discount market, nonetheless, secured only a slightly smaller quota than in the previous week—36 per cent, or nearly £47 million.

Apart from the movements discussed on page 901, the principal change shown by the Bank Return is a further large increase in the note circulation, which has risen by £7.7 million, compared with an increase of only £2.2 million in the similar week last year. A further increase in the fiduciary issue seems almost certain before the August holiday.

MONEY RATES, LONDON.—The following rates remained unchanged between June 20th and June 27th:—

Bank rate, 2% (changed from 3% October 26, 1939). Discount rates: Bank Bills 60 days, 1½%; 3 months, 1½%; 4 months, 1½-1¾%; 5 months, 1½-1¾%; Treasury Bills: 2 months, 1½%; 3 months, 1½-1¾%. Day-to-day money, 1-1¼%. Short Loans, 1-1¼%. Bank deposit rates, ½%. Discount deposit at call, ½%; at notice, 1%.

Exchange Rates.—The following rates fixed by the Bank of England remained unchanged between June 20th and June 27th. (Figures in brackets are per of exchange).

United States, \$ (4-88½) 4-02½-03½; mail transfers 4-02½-03½. Canada \$ (4-88½) 4-43-47; mail transfers 4-43-47. Switzerland, Francs (25-22½) 17-30-40. French Empire, Francs 1936-2004, Syria, p. 8-81-85. Sweden, Krona (18-189) T.T. 16-85-95. Dutch West Indies, Florin (18-11) 7-58-02. Portugal, Escudos (110) 99-80-100-20; mail transfers 99-80-100-30. Panama, 100-00-00; mail transfers 4-02-04. Brazil, 84-56½ cr. (buying). Uruguay, 7-6597 p. (buying).

Fixed Rates for Payment at Bank of England for Clearing Offices. Spain, Pesetas 44-00. Turkey, Piastres 520. Italy, 71-25 lire.

Market Rates.—The following rates remained unchanged between June 20th and June 27th.

Egypt, Piastres (97½) 97½-1. India, Rupee (18d per rupee) 17½-18½. Belgian Congo, Francs 176½-2. China, National 35-3½. Iran, R.L. 128-130.

Special Accounts are in force for Chile, Peru, Bolivia and Paraguay, for which no rate of exchange is quoted in London.

GOVERNMENT RETURNS

For the week ended June 23, 1945, total ordinary revenue was £40,960,000, against ordinary expenditure of £117,402,000 and issues to sinking funds of £160,000. Thus, including sinking fund allocations of £2,136,993, the deficit accrued since April 1st is £679,047,000 against £800,709,000 for the corresponding period a year ago.

A change has been made in the method of showing an excess of Post Office Expenditure over the Post Office Revenue. Such excess is now included as ordinary expenditure under "Total Supply Services" instead of being shown, as up to July 24, 1943, inclusive, as a deduction from ordinary revenue.

After increasing Exchequer balances by £985,658 to £3,691,850, the other operations for the week (no longer shown separately) increased the gross National Debt by £77,545,207 to £23,061 million.

Industry and Trade

DURING the year 1944 the fully-mobilised British war economy continued to go "all out": some 5,000,000 persons were engaged in the Services; even more laboured to keep them supplied with munitions and stores, and a mere "garrison" was occupied in meeting the minimum needs of civilians.

The war production programme was adjusted to meet the changes in the military campaigns; civilian production remained low and the stocks of durable consumers' goods continued to run down; the output of food, in contrast, was maintained at a high level. The sore spot in production, as in the year before, was coal; in spite of all efforts output continued to shrink.

Overseas trade, inevitably, remained at a minimum; the volume of exports was again barely a third of the pre-war level. After the successful liberation of France the probability of the conclusion of large-scale military operations in Europe in 1945 underlined the pressing need for preparing for the change-over to a peace economy.

The Government issued plans for the partial demobilisation during the interim period between the defeat of Germany and the defeat of Japan. High priority will have to be given during this period to the expansion in exports as a means of paying for necessary imports of food and materials, and for the relief of the housing shortage, the acuteness of which will be revealed as soon as demobilisation gets under way.

Individual industries have also begun to look ahead and to prepare plans for re-conversion. Most of them have drawn up plans and submitted them to the Government departments concerned. Very little was done in 1944 towards the physical preparations for the switch-over, chiefly because the necessary designers, technicians and workers could not be spared for this purpose. Equally, very little could be done to carry out the repairs and replacements of plant and machinery made necessary after 5½ years of continuous running.

In the wide sphere of economic reconstruction the Government published a statement outlining a policy designed to ensure the maintenance of a high and stable level of employment; but, in general, Britain was still too much pre-occupied with the war to clarify in detail the problems of reconstruction.

Agriculture

THE publication of agricultural statistics was resumed in 1944, and a summary of those relating to the war years is given on page 11. In accordance with the "four-year-plan" announced in 1943, the total area under tillage and under corn crops was little altered between 1943 and 1944; this stable total was obtained by ploughing for crops some 370,000 acres of permanent grass, while the area of temporary grass increased by about 540,000 acres. Producers of milk, fat cattle, calves, sheep and lambs were guaranteed, from July, 1944, for four years, an assured market for their whole output of meat and milk at prices not less than those then current (excluding the temporary milk

bonus paid in 1943-4). Actual prices for fat stock for the year 1944-5 were to be considerably above these minima; a review of costs and prices would take place every February on the basis of which the actual prices to be paid for these and other products would be settled for the next season. At the end of the year, the Agricultural Wages Board recommended an increase from £3 5s. to £3 10s. in the minimum weekly wage for adult male workers in agriculture, with corresponding adjustments in their overtime rates; no increase was awarded in the rates of pay for women and juveniles.

Manpower and Labour Conditions

AN overall shortage of labour was the dominant feature of the manpower situation throughout 1944, and though industry continued to absorb men and women who could be spared from the Armed Forces, military requirements became increasingly pressing with the development of the Western offensive. The scale on which the national manpower was mobilised was disclosed in the White Paper on the War Effort, which gave the statistics up to mid-1944. Later figures were published subsequently by Sir Godfrey Ince, and the table below gives a complete record of the numbers engaged in the various sections of the war effort from 1939-1944. One of the most significant features of this table is the extent to which the less essential industries were progressively denuded of their labour force,

(000's omitted)

Mid-year	Armed Forces	Civil Defence	Industrial Groups			Unemployed	Total Population of Working Age
			I	II	III		
1939—Men	477	80	2,600	4,688	5,798	1,043	16,010
Women	...	...	506	852	3,479	302	16,040
1941—Men	3,271	324	3,140	4,264	4,116	158	15,977
Women	103	59	1,100	1,269	3,479	146	16,030
1942—Men	3,785	304	3,285	4,154	3,553	103	15,934
Women	307	80	1,705	1,496	3,301	59	16,030
1943—Men	4,284	253	3,305	4,040	3,093	76	15,921
Women	461	70	1,928	1,592	3,186	36	16,020
1944—Men	4,502	225	3,180	4,051	2,905	71	15,910
Women	467	56	1,831	1,635	3,103	31	16,020
1944: Dec.—Men	4,526	173	3,071	4,066	2,935	86	...
Women	457	40	1,687	1,619	3,139	44	...

which in fact suffered a decline of one-third since 1939. The last six months of 1944 showed a slight reversal of this trend. The manpower of the basic industries was well maintained, but the numbers engaged in munitions production actually declined from the peak of 1943, the decline being the most marked in aircraft production, which was no longer given the overriding

priority in labour it had enjoyed in the previous year. In view of the continuing strain on manpower resources, it is not surprising to find that unemployment in mid-1944 was the lowest of the war, though it rose slightly during the last six months of the year, as a result of temporary dislocation due to production changes and not to any shortage of employment.

There were more industrial disputes in 1944 than in any other year of the war, and the number of working days lost (3.7 millions) was nearly three times as great as in 1943 (1.8 millions). For this, the coal-mining industry was mainly responsible, with prolonged stoppages in the spring in South Wales and Yorkshire over the terms of the Porter wages award, which lost 550,000 and 1,000,000 working days respectively. The metal, engineering and shipbuilding industries accounted for about one quarter of the total number of working days lost. Many of these strikes were due rather to a cumulation of factors such as growing war-weariness, rather than to grievances about wages or conditions. There was considerable evidence of instigation, particularly in the engineers' strikes on Tyneside. In order to reduce the danger to the war effort the Minister of Labour in May introduced a new Defence Regulation (IAA) directed against fomenters of strikes.

Many wage claims were presented during the year and most unions succeeded in securing some advances, whether by negotiation or by reference to arbitration. By July, 1945, the Ministry of Labour calculated that wage rates in July, 1944, were 35.36 per cent higher than in October, 1938, though earnings increased during this period by as much as 82 per cent. The chief industries to benefit from wage increases were agriculture, coal mining, transport, engineering, textiles and building. The agricultural minimum was raised to 65s. a week at the beginning of the year, and in December the Central Wages Board recommended an increase of a further 5s. The Porter Tribunal in the mining industry awarded in January a weekly minimum of £5 for face workers and £4 10s. for surface workers. The new level of mining wages was stabilised until 1948 under an agreement concluded in April between owners and miners. Adult male engineers were awarded an increase of 4s. in their national bonus in April (the unions had asked for a 10s. weekly increase); this was followed by an increase in the wages of women engineers in July. Adult cotton textile workers were awarded a 4s. increase in January and various increases were granted to woollen textile workers later in the year. Railway workers, builders' craftsmen and labourers, distributive workers, clothing, food, drink and tobacco employees also received higher wage rates during the year.

On January 1, 1945, the cost-of-living index stood at 102 per cent above July, 1914, compared with 99 per cent in January, 1944. The Chancellor of the Exchequer stated in April that while the policy of subsidising essential foodstuffs would be continued, the index would be allowed to rise slightly. This decision led to renewed pressure, mainly from trade union organisations, for a revision of the basis of calculating the cost-of-living index.

The Government's policy of raising the standards of the lowest paid industrial workers and encouraging joint consultation throughout industry was developed throughout the year with marked success. The Catering Wages Commission, originally so vigorously opposed, made recommendations for the establishment of Wages Boards in many sections of the catering industry. A committee was appointed by the Ministry of Labour to investigate the conditions of domestic service and efforts were made to organise schemes for home helps under the local authorities. The number of joint Industrial Councils continued to increase. Most of the wartime advances were incorporated in the Wages Councils Bill which Mr. Bevin introduced in December, 1944, and which was designed to turn Trades Boards into Wages Councils, with a corresponding improvement in the status of Trade Board workers, and to encourage collective

bargaining. Part III of the Bill, designed to make bona fide agreements binding on employers, will run for four years and is intended to facilitate a smooth transition from war to peace.

As the end of the war approached, increasing attention was paid to the problems of resettlement and of achieving the orderly demobilisation of the highly mobilised manpower. The White Paper on demobilisation at the end of the German war, published in September, established the formula of release

WAGES AND COST OF LIVING

* Revised Index.

according to age plus length of service, with a priority of release for a limited number of men (Class B) urgently required for building and key reconstruction work. This scheme was followed by a further White Paper on the reallocation of civilian manpower, which laid down the order of release for workers from munitions and their transfer to other forms of production. The adverse military situation in December, however, caused many of the reconversion activities which had already been set in train to be postponed.

Commodity Prices

PRICES continued to rise during 1944, but the rate of increase was smaller than during the preceding war years. During 1914-18, by contrast, the rise gained momentum from year to year. Broadly, the reasons for the slower rate of increase during the present war are the more efficient control at home and abroad (the latter slowed down the rise in import prices).

Wage rates, as is shown in the preceding survey, continued to advance, though slowly; the pressure for higher wages continued but, with a few exceptions, as in coal-mining, gains were smaller than in preceding years.

The Ministry of Labour's index of the cost of living again remained almost unchanged, though at the price of some increase in subsidy payments.

The *Economist's* index of wholesale prices, given in detail on page 16, again showed only a slight rise; coal prices, exceptionally, again rose sharply, for the increase in wage rates was not accompanied by a rise in productivity.

The rise in the average price of manufactured goods, as reflected in the export trade returns (publication of these was resumed in 1944), was comparatively slight; in 1943, average export prices were 75 per cent higher than in 1938; in 1944 they were 82 per cent higher.

Finance and Investment

The Stock Exchanges

THE year 1944 was again a period of rising prices for industrial equities, but again these closed the year below the best touched. Within the very narrow limits of their movement, fixed interest stocks also improved, and they recovered a substantial part of the fall which occurred in 1943. But the rise in the general body of these securities was caused by improvements in industrial debentures and preference stocks. Despite the figures of the accompanying table, the indices show a fall in the value of gilt-edged, although a very small one.

The improvement in fixed interest stocks was fairly steady, but there were the usual fluctuations in ordinary shares. A slightly rising trend until mid-March was accentuated thereafter and continued at the increased rate until mid-August, when there was a sharp reverse to approximately the end-May level. After that a rather tentative recovery set in, but at the end of the year prices, according to the index of *The Financial News*, had only regained about half the ground lost in the month mid-August to mid-September. At the end of the year the investor was still more uncertain as to the post-war plans of the Government than about the progress of the war. There were, however, beginning to be some indications as to the general outline of the reconstruction period.

New Capital Issues

THE see-saw movement in the total amount raised from the investing public, other than at short term, continued in 1944. The whole scene is, of course, dominated by Government borrowing and there was a recession of some £130 million from the 1943 peak figure of £1,586 million odd. It need hardly be said that total Government borrowing has not declined, but it has proved to be in line with general policy to raise more by the issue of Treasury bills and deposit receipts.

With the exception of Empire borrowing all operations involving new money show a further decline, there having been no operations to record in several categories. Conversions, however, show some increase. This must be due mainly to the accident of maturity dates, but it may owe something to the recovery in fixed interest prices.

Industrial Profits

THE very slight improvement which occurred in the published profits of companies during 1943 was somewhat accentuated during last year. The re-calculated gross profits fully confirm the showing of the published figures. There have been numerous increases in individual dividends, but it seems probable that at least as high a proportion of the amount earned for ordinary capital has been appropriated to free reserves as in recent years. The reasons for such increases in reserves as have occurred seem to be mainly two. In disclosed profits as have occurred of selling prices, a reduced cases where there is no tight control of selling prices, a reduced turnover in material terms has not uncommonly meant a larger cash profit. This accounts for one set of rises. The other is mainly not concerned with true earnings, but with adjustments in EPT or with reductions in other specific provisions which directors have felt it incumbent upon them to make, although they may not have disclosed them.

The Money Market

BANK rate remained at 2 per cent during the year 1944, and the open market rate for three months' bills averaged £1 0s. 8d. for the fourth year running. The background for developments in the London money market, therefore, remained rigidly fixed. The year saw no new developments of open market technique. The turnover of funds was probably greater last year than in any previous comparable period, and the main task of the authorities was that of seeing that this turnover caused the smallest possible immobilisation of funds. This was achieved by further refinements of the open market technique which enables the market to have access to special assistance without having to be penalised by high rates. At the slightest evidence of stringency in the market the required help has been made available through official purchases of short-dated bills. When the necessary short maturities have not been available in the discount market, the authorities have acquired them from one or other of the clearing banks with the understanding that the selling institution would then help the market by buying from it longer dated paper. Reverse operations have also taken place on a considerable scale, and some of the bills bought from the market at times of stress have been resold when the pressure on credit has disappeared. Thanks to this technique of open market operations the seasonal pressures of the end of the year and half-year were passed without any borrowing at Bank rates from the Bank of England.

Clearing bank deposits in 1944 averaged £4,153 million, as compared with £3,677 million in 1943. Of the increase, £210 million was accounted for by current accounts and £166 million by fixed deposits. The bankers' clearing house handled an average of £204.7 million of cheques on each working day last year, as compared with £186 million in 1943 and £158.5 million in 1942. Provincial clearings added a further £3.68 million to the daily clearings last year as compared with £3.8 million in the previous year. The comparative and absolute decline in provincial clearings was due to the fact that an increasing number of cheques previously handled in these local centres were last year forwarded to the central bankers' clearing house.

Foreign Exchanges

THE control of the foreign exchange market underwent no important change during the year 1944. The only developments of note were connected with the liberation of various European countries, the negotiation of financial and payments agreements with them and the admission of their currencies to quotation in the London market. In February, 1944, a preliminary Anglo-French agreement provided for the unification of the rates of exchange of the de Gaulle and North African francs, the sterling value of which was fixed at 200 francs to the pound. With the liberation of France the rate of exchange of the metropolitan franc

was fixed at the same figure. Although in the initial stages of the invasion the Allied armies used military franc currency printed for this purpose in the United States without authorisation of the provisional French Government, they soon abandoned its use and began to utilise normal Bank of France notes. In October a monetary agreement was negotiated between the United Kingdom and Belgium. The rate of exchange was fixed at 176½ Belgian francs to the pound, this being the figure at which the Belgian Congo franc had previously been stabilised in terms of sterling. The Anglo-Belgian monetary agreement provided for clearing machinery to finance trade between the sterling area and the currency area comprised by Belgium, Luxemburg and the Belgian Congo.

One of the more interesting monetary experiments of the year was the arrest of galloping inflation in Greece following the liberation of that country and the introduction of a new and stable drachma. Unfortunately, the introduction of the new drachma was quickly followed by the opening of the civil war in Greece, and under these conditions the new currency was given a somewhat unpromising start. With the arrival of more abundant supplies of foodstuffs and other consumer goods this initial handicap was fairly rapidly overcome.

With the Allied invasion of Germany a rate of exchange had to be fixed for the reichsmark. After considerable and at times acrimonious debate between the principal Allies, the rate was fixed at the level desired by the Americans, namely, 40 marks to the pound and 10 marks to the dollar.

The Bullion Market

The gold market remained rigidly controlled throughout the year 1944. The sterling price was held at 168s. per fine ounce. The activity of the London gold market was largely confined to the liquidation of certain pre-war holdings of non-residents. These were made with the consent of the Custodian for Enemy Property, and the metal in question was, in accordance with the Defence Regulations, sold to the Bank of England. A few sovereigns and half-sovereigns also found their way to the market out of domestic hoards and were disposed of to the Bank. On the other side of the trading account, small amounts of gold required for approved industrial purposes were made available by the Bank of England during the year.

The most interesting and important open gold markets during the year were those that continued to function in India and

the Middle East. In all these countries the gold markets were fed by official sales designed to provide local currency to meet Allied military expenditure and to act as an anti-inflationary solvent. In India the sales, made through the Reserve Bank, are estimated to have amounted to 11,700,000 tolas, or 4,390,000 ounces over the whole year. The peak price of Rs. 79 per tola, or £15 16s. per ounce, was reached on March 29th, and the lowest quotation of the year was Rs. 61 per tola, or £12 4s. per ounce, reached on November 1st.

Throughout the year the London silver quotation remained unaltered at 23½d. per ounce standard for both cash and two months' delivery. On December 29th, however, it was announced that from the beginning of 1945 bar silver would be quoted on the London market in pence per ounce Troy .999 fine instead of per ounce standard, i.e., per ounce Troy .925 fine. The price of 23½d. per ounce standard is equal to 25.38d. per ounce .999 fine. In making the adjustment the new quotation was rounded off to 25½d. Normal silver imports into Great Britain were small, and most of the silver made available to the market for approved industrial purposes consisted of metal obtained on Lend-Lease terms from the United States and Canada.

As in the case of gold, the most interesting manifestation of a true market in silver was to be found in India. In March the India authorities obtained 16 million ounces of silver from the National Bank of Iran. With this and silver obtained on Lend-Lease from the United States, the Indian authorities began to make official sales of silver early in August, and by the end of the year had sold about 17 million ounces of the metal. The rupee silver quotations touched their high of Rs. 143 per 100 tolas on April 24th, the lowest price being Rs. 113/12 recorded on November 3rd. The sterling equivalents of these two quotations are 63½d. and 50½d. respectively per ounce standard, so that, as in the case of gold, silver in India has remained very appreciably above the parity indicated by the official prices quoted in Great Britain and the United States.

The world production of gold in 1944 is estimated by the Union Corporation to have amounted to 27,500,000 fine ounces, compared with 29,700,000 ounces in 1943 and the peak figure of 40,810,000 ounces for 1940. No complete estimates have yet been made for silver output, but the trend has been sharply downward in most producing countries. Mexico last year produced 63 million ounces against 87 million. In the US the drop was from 44,800,000 to 34,500,000 ounces and in Canada from 18,200,000 to 14,600,000 ounces.

Overseas Countries

United States

In 1944 economic activity in the United States continued at a high level under the stimulus of military demands. The gross national product, which includes all Government expenditures for goods and services as well as private expenditures, totalled about \$197 billion, compared with \$187 billion in 1943 and pre-war figures of less than \$100 billion. To a considerable extent the increase over 1943 represents larger expenditures for pay of the expanded armed forces and higher prices, but the physical volume of output of goods and services by American industry, commerce, and trade continued at a high level notwithstanding the reduction in the available labour force.

Prices continued firm during the year, with available indices showing little further rise. There were indications, however, of some deterioration in the goods and services available and of various types of higher costs which are not reflected in the indices. Towards the end of the year pressure for upward prices and wage adjustments became greater.

Government Expenditures.—Total outlays by the Federal Government in 1944 amounted to \$97 billions, of which expenditures for war purposes accounted for \$91 billion, compared with \$85 billion in the previous year. There were reductions in expenditures for some items in the course of the year, but increases in others, especially those for newly developed military weapons and supplies. These war expenditures by the Federal Government included Lend-Lease aid to Allied Nations, which continued at the high level reached in the previous year, amounting to \$11 billion, compared with \$10 billion.

Total expenditure, together with an increase of \$10 billion in the Treasury's cash balance, were financed to the extent of \$44 billion out of tax revenue, of \$40 billion by individual and corporate savings, and of \$23 billion by borrowing from banks.

Civilian Supplies.—Consumer expenditures increased throughout the year 1944. In the last quarter of the year they reached an annual rate of about \$100 billion, and for the year as a whole amounted to \$97 billion compared with \$91 billion in 1943. Notwithstanding the growing pressure of war demands and a highly successful war loan drive in November and December, the Christmas retail trade was the largest on record. It appears likely that a good part of the increase in the dollar amount of trade represents higher prices for poorer quality of goods. The larger volume of consumer expenditures, therefore,

represents to a considerable extent the spending of increased incomes upon anything available rather than an improvement in living standards.

Agriculture.—The physical volume of production of crops and livestock continued to increase to new high levels in 1944. The total was about 3 per cent higher than in the previous year and 33 per cent above the 1935-39 level. The number of farm workers has declined by about 6 per cent from the pre-war level, while the total land area in farms has changed very little. This achievement of increased production on the same land and with a decrease in the labour supply has been due to many factors, including good weather, but technological advances have been of major importance. Government policy has relied on three main methods to stimulate and direct agricultural production into the desired channels—prices of farm products have been allowed to rise, guaranteed price floors have been established, and the co-operation of farmers has been secured to meet the county allotments of national production goals determined for each year. The higher prices paid to farmers resulted in a rise in food costs to consumers, but the subsequent use of subsidies partly reduced this increase in the cost of living.

Foreign Trade and Balance of Payments.—Exports of goods from the United States, other than through Lend-Lease, increased to about \$3 billion in 1944 from \$2.6 billion in 1943. The 1944 figure is about the pre-war average value, but, in view of the increase in prices, is much less in physical volume. Imports increased to \$3.9 billion in 1944 from \$3.4 billion in 1943, reflecting in part higher prices and in part increased quantities. These imports compared with a pre-war average value of about \$2.5 billion a year. Most of the increase both in imports and in exports occurred in trade with Latin America and Canada.

Large US Government payments for expenses abroad not covered by reverse Lend-Lease, together with the excess of imports over non-Lend-Lease exports, has placed the United States in an unfavourable balance of payments position during the war. The balance on current transactions amounted to somewhat more than \$2 billion in 1944, compared with less than \$2 billion in 1943. In both years the balance was met largely by an increase in foreign assets in the United States and by loss of gold. The gold loss was a much larger factor in 1944, amounting to \$1.3 billion compared with \$700 million in the previous year, when the building up of foreign short-term balances in this country was a more important factor.

National Income and Savings.—Individual incomes, including the pay of the armed forces, increased to \$156 billion in 1944 from \$142 billion in 1943. Personal taxes, which had increased sharply in 1943 to the total of \$18 billion, rose further to \$23 billion in 1944. With consumer expenditures at a level of \$97 billion, individual savings continued in large volume, amounting to \$36 billion, compared with \$33 billion in the previous year. Nearly half of the savings of individuals was retained in cash forms—currency and bank deposits.

Corporate savings continued at a high level in 1944, but were not quite so large as in the previous year, largely because of the further increase in tax payments.

Banking and Credit.—Banking developments were largely determined by Treasury financing and a continued drain of currency into circulation. Commercial banks and the Federal Reserve Banks together added about \$23 billion to their portfolios of Government securities, and mutual savings banks obtained an additional \$2 billion. Bank deposits increased by about \$23 billion, currency in circulation increased by over \$5 billion, and the monetary gold stock declined by over \$1 billion.

The increase in total deposits and currency of \$28 billion was somewhat larger than that shown in 1943, but the 1944 growth included a \$10 billion increase in United States Government deposits, compared with \$2 billion in 1943. This difference reflects in large part the timing of the three war loan drives in 1944 as contrasted with the two drives in the previous year. Additions to demand deposits, other than those of the Federal Government and of banks, declined from \$12 billion in 1943 to \$6 billion in 1944; this difference reflects to a considerable extent the smaller accumulation of corporate cash balances, and is due in part to the timing of war loan drives. Demand deposits of individuals and currency, which is largely held by individuals, continued to increase by almost the same amount as in 1943, while the growth in savings deposits increased to \$7 billion in 1944 compared with \$4 billion in 1943 and smaller amounts in earlier years.

With the continued currency drains, the loss of gold, and the deposit expansion, the Federal Reserve System was called upon to supply additional reserve funds to banks in 1944, as in previous war years. To meet these demands its portfolio of Government securities was increased by \$7.3 billion in the course of the year compared with an expansion of \$5.4 billion in the previous year. The banks' reserve needs fluctuated widely in the course of the year because of the arrangement whereby the proceeds of purchases of Government securities made through banks are credited to the Treasury on war loan deposit accounts at banks, which accounts are exempt from reserve requirements. During war loan drives funds shift from deposits against which reserves are required to reserve exempt deposits and between drives there is a reverse flow.

Canada

The managers of Canadian war production programmes maintained the physical volume of output during 1944, with important changes in detail. They had to accept a postponement of plans for early conversion to civilian items. During 1944 curtailments occurred in the production of cargo ships, guns and small arms, but increases occurred in mechanical transport, instruments, signals equipment and, in view of winter developments in the war, a sharp resurgence of ammunition production in which many new American orders were placed in Canada. Virtually no additional construction of industrial facilities took place in 1944. Munitions and supplies ordered since 1939 reached a grand total of \$10.255 million. The Department of Munitions and Supply spent an average of \$8,000,000 a day in 1944, compared with \$9,000,000 in 1943. The difference was ascribed to completion of construction and increased efficiency in production. There was no sign of any substantial slackening.

Production.—If the Canadian economy is taken as a whole, in 1944 the volume of production exceeded all past records. On the basis of 1935-39 = 100, the Bureau of Statistics reported its index of physical volume of production at 228 at the end of October.

Man-power.—Canada's working population, including persons of 14 years of age and more, numbers 8,865,000. In this group, the Department of Labour reported, 5,016,000 persons were gainfully employed or in the armed services. This figure showed a slight increase over 1943 and, representing 56 per cent of the adult population, was taken as a maximum. The armed forces of Canada comprised 784,000 persons. Chief changes in distribution have been an increase of 650,000 persons in new industrial employment since 1939 and a decrease of 250,000 persons in agriculture.

Exports.—War production was the main source of exports in 1944, supplying about 75 per cent of an unprecedented value of \$3,500 million, excluding \$100 million in gold. The 1943 figure was \$2,971 million. In 1944 Canada was second only to the United States as an exporting nation, but the predominance of war items indicated the technical and temporary character of the resulting enormous favourable balance of trade. The export of agricultural products, including vegetable and animal products, accounted for \$1,100 million.

Agriculture.—Although the character of Canadian agricultural production has changed greatly during the war, the crop year

of 1944-45 brought wheat back to its traditional pre-eminence in production and export. Overall farm production has increased by 40 per cent in Canada during the war. With the 1944 wheat crop of 453 million bushels, Canada has a surplus of 648 million bushels for export.

Banking.—Canadian chartered bank figures at the end of October, 1944, were:

	Millions \$	Change from Previous Year
Canadian —		
Deposits—Demand	2,144	+317
Time	2,489	+528
Others	323	+ 4
Foreign deposits	4,966	+849
Assets—Securities	729	+128
Loans—Canada	3,622	+752
Abroad	1,048	— 28
	229	+ 62
	4,899	+786

National Income.—The national income of Canada, estimated at \$8,724 million by the Bureau of Statistics in 1943, rose by about 6 per cent in 1944, or to \$9,281 million. The most important gain took place in agriculture. The official cost of living index receded fractionally during the year, about half a point, leaving the war-time increase in the neighbourhood of 19 per cent. Inflationary pressures on the price ceiling were by no means less during the past year, as war expenditures remained at a high level and restrictions upon civilian goods and services were not relaxed. Mr. Ilsley reported that his Budget estimate of Federal expenditures of \$6,000 million for 1944-45 would be realised, and tax returns were slightly better than his estimate of \$2,617 million. Sales of Victory Bonds during 1944 amounted to nearly \$3,000 million, of which \$1,400 million were individual purchases. The seventh Victory Loan in November yielded \$1,517 million.

Raw Materials.—Though base metal production in Canada was well maintained in 1944, mineral production as a whole showed a slight recession, owing to the man-power shortage. Coal production, at 13,168,000 tons in nine months, declined a little. In 1944 Canada produced 4,700 million board feet of lumber, of which 43 per cent was exported. Steel production was 2,560,000 tons compared with 2,543,771 tons in 1943. Newsprint output increased slightly to 3,000,000 tons. Hydro-electric power installations in Canada now total 10,215,000 horse-power, with production in 1944 at the rate of 40,000 million kilowatt hours annually. Synthetic rubber production, a new item for Canada, has reached 85 million pounds. Despite the labour shortage, building construction contracts in 1944 totalled \$260 million, compared with \$180 million in 1943. Incomplete figures showed that railway passenger traffic has quadrupled since 1939, while the tonnage of freight carried increased by 122 per cent and the ton-mileage of freight hauled increased by 167 per cent.

Australia

(Currency figures expressed in Australian pounds unless otherwise indicated.)

Finance.—The total expenditure of the Commonwealth Government in the financial year 1943-44, amounted to £682 million, including £545 million for military and £142 million for non-military purposes; this compares with an original Budget estimate of £570 million military and £142 million non-military expenditure. The Budget for 1944-45 provides for a further reduction in military expenditure to £505 million (of which £53 million is overseas expenditure), with a slight increase in non-military expenditure, which is estimated at £145 million. Of the military expenditure of 1943-44, 20 per cent was accounted for by reciprocal lend-lease deliveries. The Commonwealth revenue (excluding certain self-balancing items) was £310 million last year (i.e. £2 million less than the estimate), and a revenue of £325 million is estimated for the current year. Deposits in Australian cheque-paying banks increased from £616.4 million in the second quarter of 1943 to £684.5 million in the second quarter of 1944; savings banks deposits rose from £392.1 million in 1943 to £500 million in September, 1944; and subscriptions to war savings certificates from £37.1 million in September, 1943, to £45.8 million in September, 1944.

Industry and Trade.—Australian industries started producing Beaufighter and Mosquito aircraft and torpedoes. The number of internal combustion engines produced in Australia is now 25,000 per year, compared with less than 6,000 before the war. Employment was kept on a very high level, though the number of employees in factories in August, 1944, had fallen to 728,200, compared with 746,400 twelve months previously. The strength of the Australian Army has had to be reduced during the year in order to procure the manpower wanted, particularly for primary production. The value of non-Government building operations in the six State capitals was £299 million in 1943-44. Post-war planning received much public discussion, but a Bill which should have given the necessary power for such planning to the Commonwealth Government was rejected in August after a referendum. It was announced that a Government-owned statutory authority is to take over, operate and maintain all inter-state airlines.

Price Policy.—The price stabilisation measures which were introduced during 1943 have proved an effective instrument in checking the upward trend, particularly in respect of prices on the home market. The following price indices are all based on the average of the three years ended June, 1939, which equals 1,000:—

	Export prices	Primary production prices	Wholesale prices	Retail prices
September (for retail prices July-September) 1943	1,152	1,199	1,402	1,278
September (for retail prices July-September) 1944	1,214	1,221	1,402	1,273

An index for "real" weekly wage rates of male workers (based on the average for the three years ended June, 1939=1,000), rose from 1,016 in the second quarter of 1943 to 1,046 in the second quarter of 1944.

Foreign Trade.—Australian imports have been smaller in recent months, both in value and in volume, than at any other time since the beginning of the Pacific War, apparently because the Commonwealth industries are now in a position to provide a larger proportion of the country's needs. The adverse balance of trade, which has been a wartime phenomenon, has therefore been greatly diminished, especially since Australia has kept her export of primary goods on a comparatively high level, largely because of the agreement with the United Kingdom. The Trade figures for 1943-44, so far as they are available, were as follows:

In million £ sterling	Imports	Exports
January to August 1943	153.5	68.3
January to August 1944	126.3	74.9

Agriculture.—A long drought has had a disastrous effect on the wheat harvest, which will probably be the smallest since 1919, and on other branches of agriculture. Compensation schemes for the farmers affected have been worked out, and all wheat exports, except to the United Kingdom, will probably be cancelled.

New Zealand

(Currency figures expressed in New Zealand pounds unless otherwise indicated.)

External Trade.—Recent variations in trade returns appear to be due rather to war conditions than to changes in production or markets. Prices of both exports and imports have risen since 1939, exports by 27 per cent and imports by 66 per cent, according to local index numbers. A moderate decline in the volume of exports of farm products, partly resulting from shortages of labour, materials and fertilisers, has been largely offset by special wartime exports of manufactured goods. Normal consumer imports have been in short supply, but have increased during the past year, and large quantities of defence and Lend-Lease materials are included in the import figures. This inclusion of items not paid for at present probably accounts for the wide disparity between the trade returns and the movements of exchange funds held abroad. The trade figures show an excess of imports of £18,900,000 for the past year, when exchange funds increased by £11,700,000. The recorded trade figures for the past six years are as follows:—

EXTERNAL TRADE
(£ millions)

Year ended Sept. 30	In New Zealand Currency		In Sterling	
	Exports	Imports	Exports	Imports
1939	57.7	53.9	46.2	43.2
1940	68.0	47.6	54.4	36.1
1941	68.6	46.3	54.9	37.1
1942	82.5	51.8	66.0	41.4
1943	66.3	90.3	53.0	72.2
1944	75.1	93.9	60.1	75.1

Banking.—Mainly owing to an active balance of payments, the expansion of money continued during the year ended September, 1944, though at a much reduced rate. During the year, bank credits to the Government increased by only £1,400,000, while private advances increased by £4,900,000 and net overseas funds held by the banks by £11,700,000. Total notes and deposits expanded by £18,100,000 to a little more than double the pre-war level. But in October Government advances from the Reserve Bank were reduced by £11,700,000, mainly from the proceeds of a war loan, and there appears to be an attempt to check the inflation that has marked recent years.

Though the stock of money is large, the active circulation, as indicated by bank debits, has increased much less. Large amounts of money are obviously held out of circulation, and the price-stabilisation policy applied as from the end of 1942 remains reasonably effective, with wholesale prices about 45 per cent above the 1939 level. Both import and export prices continue to rise, but local prices of exportable goods are controlled, as are wages and most of the cost-of-living index items, while a limited amount of rationing assists in fairly equitable distribution.

Recent changes in the major bank figures are as follows:—

COMBINED BANK RETURNS

(£ millions)

	End of September	1939	1943	1944	War Increases or Decreases
Liabilities:					
Note circulation	13.4	29.1	34.6	21.2	
Total deposits	68.9	119.6	132.2	163.3	
	82.3	148.7	166.8	184.5	
Assets:					
Investments, Advances to Government and Securities	35.2	54.1	85.5	150.5	
Other Advances	53.6	42.1	47.0	6.6	
Net Overseas Funds	8.6	35.1	46.8	38.2	
	97.4	161.3	179.3	181.9	

Finance.—Public finance shows little change. For the financial year ended March, 1944, total Government receipts, including taxation £100,800,000, loans £66,500,000, Lend-Lease £32,500,000, and other items, amounted to £213 million, while expenditure totalled £211,500,000, of which £152,900,000 was from the war expenses account. For 1944-45 the estimates of taxation and loans are similar to last year's receipts, while Lend-Lease receipts are expected to decline, making total receipts £204 million. War expenditure is expected to be £20 million lower at £133 million, but ordinary expenditure is estimated to be somewhat higher, making total expenditure £205 million.

South Africa

Trade.—The volume of overseas trade continued to be limited by war conditions and the availability of shipping. War requirements, mainly minerals, received preference over other commodities such as fruit, wool and wine. The shipments of citrus fruit remained, in consequence, at the same low level as the previous year, but on the other hand shipments of preserved fruit in the form of jam and marmalade were more than doubled. Other produce shipped in fair quantity included sugar, wattle-bark and wattle-extract, and mohair. Wool continued to be sold under the British-South African Wool Agreement, but shipments were limited.

There was a great expansion in imports from the United Kingdom, the United States and India and a sharp decline in imports from Argentina and Brazil. Imports from the United Kingdom increased in value from £19 million in 1943 to £24 million in 1944, from the United States from £12 million in 1943 to £18 million in 1944, and from India from £8,000,000 in 1943 to £11 million in 1944. Import values from Argentina, on the contrary, declined from £9,000,000 to £4,000,000 and from Brazil from £6,000,000 to £4,000,000.

Imports for 1944 reached the value of £85 million, an increase of £7,000,000 on the previous year's figure. Exports, other than gold and wool, amounted to £39 million, an increase of £1,000,000. Gold sales are estimated at £68 million and wool sales at £16 million. Total exports, therefore, were £123 million.

Agriculture.—Production again suffered from one of the Union's recurrent droughts, in consequence of which a smaller wheat harvest was gathered and maize plantings for the season 1944-45 were hard hit. Production has also been affected by diminished supplies of imported fertilisers and machinery, but in the course of 1944 some improvement became noticeable. Imports were increased, and home production has been encouraged to produce about 10,000 tons of agricultural implements, or 38 per cent of total requirements.

Industry.—Secondary industry has continued to make progress, although the emphasis has naturally been on the production of war material. In this field pride of place belongs to the Union's steel industry, more particularly to the South African Iron and Steel Industrial Corporation briefly known as Iscor. This organisation's annual output has shown a steady increase, from 316,991 tons in 1941 to 466,216 tons in 1944.

In general, industry was handicapped by a scarcity of materials and fluctuating shortages of skilled labour. Nevertheless, industry had a busy year and its labour supplies increased as the year progressed. Thus in January, 1944, the labour index (basis July, 1935 = 1000) was 1796, compared with the average of 1806 for the year 1943, but it gradually rose to 1846 for the ten-month period ending October 31, 1944, as compared with 1831 for the corresponding period of 1943.

An interesting Government decision was announced by the Prime Minister towards the close of the year. Under the auspices of the Industrial Development Corporation, a woollen textile factory is to be erected at the cost of £650,000. Another important decision is to permit the manufacture of margarine. Three special factories are expected to produce 15,000,000 lb. of margarine per year. The margarine will be produced for supply to the lower income groups under Government control, and dairy farmers have been given assurances that their industry will not be permitted to suffer from the competition.

Finance.—The Government's Budget for 1945-6 contained only minor changes in the structure of the Union's finance. After a series of big jumps in the past five years, national expenditure is now estimated to take a downward turn, from £180 million

estimated for 1944-5 to £123,881,680 for the coming year. Of this, only £82,500,000, instead of £102,500,000, is to go for defence. With this decline in Government spending, Mr Hofmeyr expects to be able to provide 55 per cent from revenue, instead of 50 per cent. A 3 per cent Victory Loan, announced in the Budget speech, is expected to provide the Government with long-term credit for housing, demobilisation and public works.

India

Foreign Trade.—For the first half of 1944-5, both imports and exports show an appreciable rise, imports at Rs. 93.90 crores (1 crore = 10 million), being Rs. 41.68 crores greater than in the same period of 1943-44. A great part (Rs. 27.00 crores) of this increase is attributable to increased imports of raw materials, chiefly oil and raw cotton. At Rs. 28.21 crores, imports of manufactures were greater by Rs. 8.69 crores; higher imports of chemicals, drugs and medicines accounted for almost Rs. 3 crores. Total exports for the first half of 1944-45 amounted to Rs. 114.32 crores, against Rs. 96.74 crores in the corresponding period of 1943-44, an increase of Rs. 17.58 crores, in which exports of manufactured goods were prominent. For the half-year exports of manufactured goods amounted to Rs. 62.68 crores, an increase of Rs. 11.38 crores, to which large exports of jute and cotton manufactures made the chief contribution. While imports from non-Empire countries have increased, exports to them have not risen correspondingly. The total visible balance of trade in private merchandise in favour of India declined in the first half of 1944-45. It amounted to Rs. 44.52 crores in the first half of 1943-44 and to only Rs. 20.42 crores in the corresponding period of the current year.

Finance.—Notes in circulation on December 29, 1944, amounted to Rs. 1,009.60 crores against Rs. 840.16 crores at the beginning of the year, while sterling securities held by the Reserve Bank of India at the end of 1944 amounted to Rs. 904.32 crores against Rs. 734.83 crores on January 1st. Regular sales of gold throughout the twelve months, as one of the chief anti-inflationary measures, produced very little change in the price of the metal, which stood at Rs. 74 per fine tola at the end of the year against Rs. 73 at the beginning. It is a tribute to the efficient technique of the Reserve Bank authorities that gold sales have been maintained at rates which have achieved the bank's purpose and given so little scope to the speculator. In pursuance of its anti-inflationary policy, the Government of India has continued throughout the year to enforce both physical controls and direct monetary regulations as well as to popularise the idea of "save and lend." Government loans have been well supported, and the small savings movement has been more successful in the fifth year of the war than at any previous time. Between January and October, 1944, *Capital's* index of Indian industrial activity (base 1935) rose from 111.7 to 126.6. Jute, steel, iron and paper production showed the chief gains, while coal output declined, and this had the effect of detracting from industrial output as a whole. Post-war planning and the development of Indian industry received a great impetus during 1944 by the setting up of a special department of the Government of India for the purpose. The situation in respect of consumer goods improved during the second half of 1944, but there is still much leeway to be made up and ample scope for imports of all kinds.

Eire

Agriculture.—The area under crops increased from 2,459,909 acres in 1943 to 2,567,143 acres in 1944. The area under wheat increased by 26.2 per cent to 642,487 acres. Livestock increased in numbers, except pigs, which decreased by 12.3 per cent. Horses increased by 1.1 per cent, cattle by 2.6 per cent, sheep by 4 per cent, and poultry by 7.2 per cent. The value of the gross agricultural output in 1943-44 was estimated at £95,496,000, compared with £86,203,000 in 1942-43 and £53,481,000 in 1938-39. The changes in the volume of production have been distorted by the rise in agricultural prices. The index number of the volume of the gross agricultural output (1929-30 = 100) was 97 in 1938-39, 89.3 in 1942-43 and 87.1 in 1943-44.

Trade and Industry.—The index number of the volume of production of industries producing transportable goods (1936 = 100) was 84.6 for the September quarter 1944, compared with 81.2 for the same quarter in 1943. Imports increased from £26,087,107 in 1943 to £28,243,714 in 1944 and exports from £27,479,796 to £29,610,274. The balance of trade was favourable to the amount of £1,366,560. The balance of payments was very active owing to the growth of remittances from Great Britain.

Finance.—The note circulation and bank deposits continued to advance during the year owing to the growing accumulation of net sterling assets, which increased from £114,491,084 in the December quarter of 1943 to £130,856,277 in the same quarter of 1944. The total monetary circulation was £39,593,839 in December. Both expenditure and revenue continued their upward trend. In the first nine months of the financial year 1944-45, expenditure rose by £1,546,937 to £33,407,867 and revenue by £1,171,642 to £29,401,428. Excise duties increased by £686,000 and income tax by £394,000, but customs decreased by £227,000. The

Transport Act creates a new company with a capital of £20 million to take over the Great Southern Railways and the Dublin Transport Company. The cost of living index number (July, 1944, = 100) rose from 294 in November, 1943, to 296 in November, 1944.

South America

As in 1943, features of the major republics' foreign trade were their growing export surpluses (revealed by the accompanying table) and the predominance of their inter-American trade, principally with the United States, whose imports from and exports to Latin America for the first half of 1944 were respectively, at US \$823,300,000 and US \$503,500,000, 36 per cent and 29 per cent more than for the first half of 1943. Total South American imports from the United Kingdom shrank from £21,300,000 in 1943 to £10,100,000 in 1944. The margin between import and export values reflects the persistence of import shortages and increasing export of manufactures and semi-manufactures. Inflation has been an important factor in higher trade values. In fact, in Brazil's case, 1943 volumes of both imports and exports were barely two-thirds of 1939 volumes. Its industrial production for 1943 was valued at US \$1,565,000,000 (56 per cent more than in 1938).

(000 omitted)

	Imports		Exports		Export Surplus

* Jan.-Dec.

† Jan.-June.

These trends are general and continue. Import shortages, stimulating local industries and adding to dollar and sterling balances, have forced up prices in spite of anti-inflation measures. Argentina and Brazil introduced excess profits taxes and price control has become general. Increased freedom of the Caribbean and sustained quota shipments from the United States have alleviated food problems in Venezuela and Columbia, where need was greatest. Argentina has suffered most from fuel shortage. Its 1944 fuel imports were a million tons (including 400,000 tons of petroleum) against 5 million tons (2 million of petroleum) in 1938. Its fuel rationing is necessarily strict.

Most republics rely on new industries to offset the effect on their economies of reduced strategic exports and lower export prices after the war. Industry rather than agriculture has benefited from United States financing. By June 1944, Lend-lease disbursements throughout Latin America totalled US \$172,000,000 and Export-Import Bank disbursements over US \$200,000,000 (loaned for periods up to 16 years). The Metals Reserve Company and the Rubber Reserve Corporation have also undertaken substantial commitments.

ARGENTINA

The above trends marked an economically prosperous year. On October 31st disposable grain surpluses were: wheat (after earmarking 156,958 tons for war relief and 873,969 tons for Spain) 4,334,090 tons; linseed 83,845 tons (1,500,000 tons earmarked for linseed oil as fuel substitute) and maize 3,364,045 tons. Coming crops are estimated (in tons) at:

	1943-4 harvest	1944-5 harvest
Wheat	6,800,000	4,537,000
Linseed	1,573,000	841,500

Foreign Trade.—The United Kingdom has dropped from first place in 1943 (21 per cent) to third in 1944 (7.6 per cent) as Argentina's supplier, following Brazil (34.1 per cent) and the United States (14.8 per cent). Post-war imports for replacement of industrial equipment are estimated to require about 4 million pesos.

BRAZIL

Drought and frost account for an estimated 1944-5 coffee crop of 4,500,000 bags, against twice that amount in recent years. In 1944 coffee still represented 36 per cent in value and 30 per cent in volume of Brazil's total exports. Rubber yield rises very slowly. Manaos entries for 1944 were 18,043 tons, against 16,067 tons for 1943. Iron and steel production in the first half of 1944 was: pig-iron, 129,469 tons; steel ingots, 99,379 tons; rolled steel, 78,894 tons; respectively 67, 81 and 66 per cent more than in the first half of 1939. In Sao Paulo, whose cotton piece-goods output for 1943 equalled Lancashire's, electrical and rubber industries have also developed. In October President Vargas set up an Economic Planning Committee to coordinate industrialization.

USSR

LITTLE news about the economic situation in Russia was released in 1944. The dominating feature was the liberation of all Russian lands from German occupation. Industry and agriculture in the liberated areas were found to be utterly devastated, and much effort was devoted to their reconstruction; but priority was still given to war production in the areas that had not been overrun by the enemy. Out of the budgetary allocations for capital construction 29,000 million roubles were set aside for construction in those areas and only 16,000 million roubles for the rehabilitation of the liberated territories.

Industry.—Industrial output in the "safety zones" on the Volga, in the Urals and in Soviet Asia was maintained at a high level. Industries previously evacuated from the western provinces were, on the whole, not re-transferred to their old sites. They continued to operate in the east, though some difficulties seem to have arisen because the evacuated workers tended to rush back to their homes after the expulsion of the Germans. In the liberated areas, the economic departments were chiefly occupied in restoring the flooded coal-pits of the Donetz basin and the metal industries of the Ukraine. No over-all indices of output were published, but such fragmentary data as are available suggest that the output of coal and iron and steel in 1944 was only about 10 per cent of the total production before the invasion. Most of the towns in the freed areas were destroyed and depopulated.

Agriculture.—The state of agriculture in the liberated areas was relatively better. The All-Union plan for sowing in 1944 provided for an increase in acreage of 7.5 million hectares compared with 1943. The planned increase amounted to about one-third of the normally cultivated area in the provinces concerned. The plan seems to have been carried out. Simultaneously, some of the emergency measures that had been adopted in Soviet Asia after the loss of the agricultural areas in the west were wound up in 1944. The cultivation of cotton was resumed on cotton land that had been turned into rice-producing areas in 1942 and 1943. The emergency switch-over from spring wheat to winter wheat in Siberia was stopped, and farms reverted to more traditional methods of cultivation. However, the whole of Soviet farming continued to labour under the severe wartime losses of machinery and cattle. The shortages of agricultural implements and spare parts to which some sections of munition factories were converted. A redistribution of cattle also took place which provided farms in the liberated areas with small numbers of animals. A full replenishment of agricultural stock will require enormous imports after the war.

Finance.—The table below gives the Budget estimates for 1943 and 1944. No data about the actual revenues and expenditures were published.

(In milliard roubles)

	1943	1944
Revenue	210.0	245.6
Turnover tax	71.0	80.2
Expenditure	210.0	245.6
Defence	124.7	128.4
National economy	31.1	44.7
Social and cultural development	37.2	51.4

Lend-Lease deliveries (especially from the USA) reached their peak in the past year. Some additions to Russia's war reserves accrued from the capitulation of the satellite countries. Rumania, Finland and Hungary undertook to pay reparations to Russia (£75 million each) in the course of five years.

Switzerland

THE liberation of Western Europe from German occupation brought no relief to Switzerland's economy. The mobilisation of an additional number of civilians for the army and the virtual standstill of trade with overseas countries imposed new burdens. At the end of the year, Switzerland was still isolated because of transport difficulties in France.

Agriculture.—During the 1943-44 agricultural season the acreage under cultivation increased by 100 per cent compared with 1934. Potato and vegetable crops showed the greatest expansion, and in 1944 a considerable effort was made to increase the acreage under oilseeds. A record crop of sugar beet was lifted in 1944. The milk and butter production remained satisfactory and has become more valuable than ever before.

Industry.—The most characteristic feature of industrial activity, particularly during the second half of the year, was the growing shortage of raw materials, particularly coal, iron and steel and chemicals. Some of the big towns, such as Zürich, received their last coal supplies from Germany in November, and during the cold spell considerable economies in the use of fuel and gas were necessary. Switzerland's export industries were forced to put current production into stock, awaiting facilities for export.

Foreign Trade.—The impact of the war is shown in the following figures:

(In thousand metric tons and million francs)

	Volume		Value	
	Imports	Exports	Imports	Exports
1938	7,379	611	1,607	1,317
1943	3,970	366	1,727	1,629
1944	2,623	305	1,366	1,132

In other words, imports in 1944 compared with 1938 had decreased by two-thirds in volume, but by only 15 per cent in value. Over the same period, exports fell by 50 per cent in volume and by 13.3 per cent in value. The volume of imports during December 1944 reached its lowest level for the whole war at only 10 per cent of the average monthly imports in 1938.

Finance.—The ordinary budget estimates have been as follows:

(In million francs)

	Revenue	Expenditure	Deficit
1943	364.4	508.0	143.6
1944	389.3	512.6	123.3
1945	407.5	582.5	143.6

The main financial costs of the war were carried in an extraordinary budget for 1945. This estimated revenue of 385 million francs and expenditure of 1,825 millions. The total deficit for the financial year 1945 will therefore amount to 1,614 million francs. The total national debt will thus have increased to roughly 6,500 million francs. In spite of stable wages and slightly rising prices, and in spite of increased taxes, savings accounts showed a further rise. Notes in circulation increased from 3,006 million francs at the end of 1943 to 3,550 millions on December 31, 1944.

Palestine

(All currency figures expressed in Palestinian pounds unless otherwise indicated.)

PALESTINE continued during 1944 to enjoy prosperity, and at the same time to suffer from an abnormal economy and a rising cost of living. The industries fostered by the war were still in full operation, although the tide of war receded from the Middle East. An estimate of the national income, made in 1943, showed that it had trebled since 1939, from £30 million to £90 million. The income per head had increased in that period from £21 to £56. That was not due simply to increased costs; there was an increase of one-third in the volume of production of goods and services. The cost of living and wholesale and retail prices reached a level slightly higher than those of the previous year. At the same time, the amount of currency in circulation and of bank deposits also reached a fresh peak: at the end of November the currency amounted to £41 million, and the total deposits held by banks and credit cooperative societies reached £71½ million.

Finance.—The finances of Government were complicated by the policy of granting large subsidies in order to keep down the price of the essential foodstuffs, particularly flour, bread and meat, with a view to checking a further rise in the cost of living. The subsidies amounted to about £5,000,000 during 1944. Another £1,500,000 was paid by Government as cost of living allowances to its officers. The expenditure for the financial year 1943/44 showed a deficit of over £3,000,000, mainly on account of this extraordinary subsidy, and the estimates for the current financial year 1944/45 showed a deficit of £3,500,000. The Government has, indeed, raised taxes substantially, particularly the income tax; and the tax revenue is expected to be £6,750,000, against £5,000,000 in the previous year. The yield of income tax in 1943/44 was £2,117,000 against £900,000 in 1942-43.

Population.—The population has now reached 1,750,000. The increase during the year was mainly due to the higher birth-rate, particularly among the Arab population. Among the Moslems, the rate is over 50 per 1,000. Immigration is still restricted, but was on a rather higher level than in 1943. The figure for the first ten months of 1944 was 12,500, against the total of 10,000 for 1943.

Foreign Trade.—The foreign trade figures are not published, but exports are in the neighbourhood of £11 million, and imports are about £28 million. The export of citrus fruit, which before the war was by far the most important item, is still very restricted. The principal items are diamonds, of which the value is nearly £3,000,000, and potash and other minerals from the Dead Sea, to an amount of about £1,500,000. Textiles and other manufactures are mainly consumed in the home market. In food production there was a notable increase in the quantity of fish caught both in the sea and the lakes.

Sweden

Foreign Trade.—Foreign trade relations with Germany were suspended and the first results can be seen in the following figures:

(Million Kronor)

	Imports	Exports
1938	2,068	1,839
1942	1,770	1,313
1943	1,818	1,151
1944	1,664	830

The volume of imports and exports decreased more sharply in October and November 1944. Imports were only two-thirds of the volume for the same months of 1943, and exports dropped by 12 per cent.

Industry.—The typical export industries were to some extent forced to put manufactures into stock, especially in the wood pulp mills. From January to September 1944, the official index of production remained slightly below the figures for the same months of 1943. In October 1944, it rose to 110 (1935=100) against 108 in October 1943. Unemployment, expressed as a percentage of the total membership of the trade unions, stood at 3.3 per cent in October 1944 against 4.5 in October 1943. Production and employment thus showed hardly any change during the year.

Finance.—Budget expenditure during the five years from July 1939 to June 30, 1944, amounted to Kr. 19,615 million. This is an annual average expenditure of Kr. 3,923 million. Total revenue during the same five years amounted to Kr. 11,964 million. Borrowing on a large scale was needed to cover the deficit, and the national debt rose from Kr. 2,634 million on June 30 1938 to Kr. 10,495 million at the end of 1944. If capital expenditure is excluded, revenue and expenditure were as follows during the last two financial years:

(In Million Kronor)

	Revenue	Expenditure	Deficit
1942/43	2,704	4,037	1,333
1943/44	3,106	4,072	966

Capital expenditure amounted to Kr. 375 million in 1942/43 and Kr. 461 million in 1943/44.

The wholesale price index advanced over the whole war period by roughly 79 per cent and the cost of living index by 44 per cent. Bank deposits increased during the period from January 1939 to November 1944 by roughly Kr. 4,000 million to Kr. 6,112 million. Notes in circulation advanced correspondingly from Kr. 1,061 million at the end of 1938 to Kr. 2,375 million at the end of 1944.

Belgium

ON September 1, 1944, Allied spearheads crossed the Belgian frontier and by the end of the month the country was virtually liberated from German occupation. The port of Antwerp was opened for traffic some two months later. In December, however, the German counter offensive again turned the Ardennes into a theatre of war. Fighting on Belgian soil was still in progress at the end of the year.

The last months and weeks before the liberation saw an acute shortage of foodstuffs and a general decline in economic activity, particularly because of the big evacuation from coastal districts and the continued deportation of civilians to Germany. Roughly 700,000 Belgians, among them 62,000 prisoners of war, were employed in Germany at the time of the liberation. In spite of a considerable increase in the acreage under cultivation, the food situation deteriorated again during the spring and summer of 1944. Nominal food rations in July, 1944, and at the beginning of 1945 were as follows:

(In Grammes)

	July, 1944.	Beginning of 1945
Bread per day	250	350
Margarine per month	50	150
Dried vegetable per month	none	500
Potatoes per month	9,000	12,000
Sugar per month	1,000	1,000
Coffee substitute per month	100	150

Total imports of all materials into Belgium amounted to 4,000 tons in November and 12,000 tons in December, 1944. Before the war, the monthly average of imports amounted to 2½ million tons. According to *Populaire* the monthly average during the occupation amounted to 350,000 tons.

Finance.—At the end of 1943, German debts, that is, the costs of occupation and the clearing debts, carried by the *Banque d'Emission* had increased to 48,744 million francs. At the end of the occupation, the notes in circulation had reached the record figure of roughly 100,000 million francs. The Budget estimates prepared under German occupation for 1944 set against a revenue of 16,737 million francs expenditure of 20,573 millions. By its deflationary policy the Belgian Government made a clean break with this financial result of the German occupation. The notes in circulation were withdrawn and replaced by new ones, and the first return of the National Bank of Belgium relating to January 11, 1945, reveals that the notes in circulation stood at 42,713 million francs against 29,776 millions on May 9, 1940, the day before the German attack. A difficult problem which could not be settled immediately is the taxation of war profits made under German occupation. The new exchange control system requires all Belgian nationals to declare their foreign assets, but there is no compulsion to sell them to the Government. Monetary agreements were signed with Great Britain, France and Holland.

France

ECONOMIC conditions during the past year were chiefly determined by the resumption of hostilities on French soil after the Allied landings in Normandy in June. The immediate effect of the hostilities was to aggravate the economic plight into which France had been plunged during the German occupation. In spite of the quick liberation of the country, such improvement as took place did so slowly, and in many respects the situation deteriorated gravely towards the end of the year. Disruption of transport and shortages of coal and of raw materials were responsible for an acute paralysis of production and distribution. In addition, 1,200,000 houses had been destroyed in France from the beginning of the war to the end of 1944.

Transport.—In September, only 2,000 locomotives were in service, compared with 16,000 in normal times. Towards the end of the year the number of locomotives in use rose to 6,000, but a very high proportion of these were used for military purposes. The total number of civilian lorries decreased from 520,000 before the war to 192,000 in 1944; and most of these were worn out or not used because of the lack of tyres. The tonnage of the French merchant fleet dropped from 2,900,000 before the war to 850,000. Destroyed railway lines, bridges and roads completed the picture of transport disruption.

Industry.—It is estimated that about 75 per cent of French industrial capacity was left intact, though even "intact" industrial equipment was naturally worn out. But actual output was, on the whole, only a small fraction of the pre-war totals. Coal was output, extremely low immediately after the liberation, was stepped up to about 25 million tons in December, but about one-third of this was used for military purposes. The motor-car third of this was used for military purposes. The motor-car industry worked at very low pressure, producing less than 2,000 cars in December, though a rapid expansion of output was being planned for 1945. The production of armaments was resumed on a very limited scale. The output of steel in December was about 8 per cent of normal. The situation in the light industries was illustrated by the fact that the total textile output in 1944 was 27,000 tons, compared with 270,000 before the war; there was a complete lack of raw materials and the textile industry used substitutes almost exclusively.

Agriculture.—Farming suffered less than industry, though the cattle population decreased and agricultural machinery was worn out. There was also an acute shortage of fertilisers. Even so, the wheat crop in 1944—6.5 million tons—was higher than in previous years, although it was still about 25 per cent below the pre-war average. Food stocks were almost completely exhausted. The serious food situation which prevailed in some parts of France was caused not by any real food deficit in the country as a whole, but by the insuperable distribution difficulties and by the disappearance of large quantities of food into the black market.

Finance.—The rate of exchange was fixed at 200 francs to the pound and at 15 francs to 1 Reichsmark (in Alsace-Lorraine). The currency in circulation increased from 572 milliard francs in the beginning of the year to 640 milliards in October. By the end of the year it fell back to 572 milliard francs. It was estimated that nearly one-third of the banknotes was hoarded, chiefly by peasants. The Government undertook no drastic deflationary measures. The one large financial operation that was undertaken—the 3 per cent Liberation Loan—was over-subscribed and brought in 162 milliard francs. No total figures about the Budget for 1944 were published.

Wages and Prices.—Prices continued to show a sharp inflationary trend, but no precise indices were available. The wages of manual workers were increased by 40 per cent soon after the liberation. The salaries of civil servants were increased by 30 per cent. Compared with 1939, wages were nearly doubled, but the rise in wages was much smaller than the rise in prices.

Germany

By the end of 1944, southern Italy, France, Belgium, southern Holland, the north-eastern tip of Norway, Greece, Bulgaria, Rumania, the greater part of Hungary, the western Russian provinces, eastern Poland and Finland were lost to the German war economy. Sweden suspended exports to Germany and activity over Germany, particularly near the western frontier, grew in intensity. The successive territorial losses and the fact that virtually the whole of Germany had come into the effective bombing zone enforced radical restrictions in Germany's war economy. After the abortive conspiracy of generals and officers of the Wehrmacht and the attempted assassination of Hitler on July 20, 1944, a comprehensive political purge was carried out. Dr. Goebbels was appointed Reich Commissioner for total mobilisation for war. At short intervals the civil and military administration of Germany was severely reduced. Compulsory labour service was extended to the older groups of women and men; and under a new service decree the auxiliary services in the Wehrmacht employed girls. Civilian life came virtually to a standstill, and the proclamation of the *Volkssturm* put the entire male population under military discipline. There were long periods of chaotic conditions behind the various fronts and

The rubber prices, both in this country and in the United States, remained unchanged throughout the year. The international rubber regulation agreement, which terminated at the end of April, 1944 (after a temporary extension for four months from the end of 1943), was not renewed. In the autumn a Rubber Study Group was formed by the Governments of the United States, Great Britain and Holland. It held its first full meeting in Washington in January, 1945, when it arrived at the conclusion that within three to four years after the liberation of the Eastern producing areas, production of crude rubber would be raised to 1,500,000 tons per annum. Synthetic rubber capacity after the war is expected by the Group to be 1,333,000 tons per year, while its estimate of potential maximum consumption of crude and synthetic combined in the early post-war years does not exceed 1,500,000 tons. Some preparations for the early restarting of production in liberated Eastern producing areas—including the accumulation of materials for rubber planters—were made in 1944.

The export trade in metal goods showed some expansion during the past year:—

	Exports of Metal Goods			Index of volume (1938 = 100)	
	1938	1943	1944	1943	1944
	Value £'000	Value £'000	Value £'000		
Iron and steel ..	41,556	6,054	8,503	10	14

Cotton Textiles

By the end of 1944 cotton spinners' and manufacturers' order lists were larger than at any period since the beginning of the war. The industry continued to operate under a strict measure of control. To a greater extent than ever it was necessary to establish priority claims upon production for all consumption related to the war effort.

The price of raw cotton to spinners was raised by 4½d. per lb. in April to bring values in Lancashire more in relation to world prices. Prescribed prices for yarn and cloth were advanced, but arrangements were made to keep prices of Utility fabrics stable.

The year was notable for the attention given to post-war problems. The report of the Cotton Board Committee on Post-War Problems was published. It dealt with the future size of the industry and made recommendations with regard to price management, elimination of redundant plant, re-equipment and modification of trades unions practices. Later in the year the President of the Board of Trade put forward the following five points for the industry's consideration: (1) amalgamations, particularly in the spinning section, (2) re-equipment, (3) overhaul of the merchandising organisation, (4) modernisation and simplification of the wage structure, and (5) extension of double shift working. Sir Raymond Streat, Chairman of the Cotton Board, countered with these five points of his own, namely: (1) the trade must be allowed to make profits and taxation relief must leave the industry enough to invest in modern equipment; (2) the Government must make suitable agreements for foreign and Empire trade and give early allocations to start the flow of business; (3) the Government must clear the way for the return of munition workers and members of the Services to vital post-war industries like cotton; (4) machinery makers must be given materials and labour to start work on Lancashire's needs; (5) licences for repairs and extensions and new buildings must be granted where necessary.

The report of the textile mission to the United States, led by Sir Frank Platt, the Cotton Controller, caused widespread discussion and controversy. The report contained information on American conditions, and the conclusion was reached that the British cotton industry was less efficient than that of the United States.

A special committee on deconcentration in the spinning branch of the industry, under the Chairmanship of Sir Raymond Streat, recommended that at the earliest opportunity made possible by the labour situation a date, to be called the appointed date, should be fixed by the Board of Trade, after which all spinning mills should be allowed to reopen.

An unfavourable factor was a tendency for the labour situation in Lancashire to become worse. A few more juveniles entered the mills, but more of the older operatives left. Numerous millowners took measures to make mill life more attractive by better welfare, providing canteens and other amenities.

The workpeople in both spinning and weaving branches of the industry put forward a claim for a flat rate increase in wages of 11s. a week for adult occupations and 5s. a week for juvenile occupations. Negotiations between the employers and the trades union officials are now proceeding.

Trading results of Lancashire cotton firms in 1944 showed that the average profit of 63 spinning companies was £8,490 as compared with an average of £7,959 for 62 companies in 1943. The average dividend of 101 spinning mills was 11 per cent, compared with 10.28 per cent in 1943. It was the highest figure since 1920.

Exports of piece goods in 1944 were 434,135,000 square yards, the value being £24,159,993, compared with 374,273,000 square yards at a value of £20,279,765 in 1943. Shipments of yarn in 1944 were 19,618,400 lb., the value being £3,286,395 compared with 19,216,800 lb., at a value of £3,342,329 in 1943. In 1939 the United Kingdom shipped 1,393,375,000 square yards of cloth, the value being £31,982,988, and the exports of yarn in the same year were 113,661,700 lb., at a value of £8,946,246.

Wool Textiles

DURING 1944 production on Government account, although irregular in volume, again took first place. There was pressure for additional khaki towards the close of the year, as optimism declined about the end of the war in Europe, so that in addition to considerable weights of jungle blankets and other tropical war textiles, mills had to revive production of greatcoating and khaki serge.

Export trade in both fabrics and yarns fell below that of

1943, though small shipments—taken weights—were allowed to a few countries, including the United States and South America, for which export licences had not been available through 1943 and the first half of 1944. A raw material ration so small as to be negligible has been issued for making patterns of goods for post-war export trade.

Pressure for output of utility fabrics for home trade increased and no rations of raw materials were granted in the West Riding during 1944 for home-trade non-utility fabrics. The worsted spinning section still seems to be the bottle-neck and is quoted as a reason for the short supply of knitted wool goods. The extra emphasis on utility goods is further shown by the Wool Control's veto, announced in November, on the consumption of power and labour by wool machinery in the processing of unrationed non-wool fibres. On the other hand raw material rations have been increased to those mills that can put them into additional yardages of utility cloth, thereby removing one of the incentives for using unrationed material—to fill up machinery for which wool fibre was unavailable and to avoid compulsory payment to workpeople for doing nothing.

The industry has lost no more labour to the forces and munition factories—in fact in some areas there are more operatives owing to the closing down of munition factories. The industry is estimated to have 140,000 employees—half the number in 1938. Much of the labour is inefficient and much is ageing.

At the close of 1944 the carpet industry again received rations of wool and a small ration of jute. It works under Board of Trade production permits and price scale for finished goods. Its activity is now estimated to be 25 per cent of capacity compared with 10 per cent or less for the years 1942, 1943 and most of 1944.

During the wool year ending June 30, 1944, the Australian clip was 3,708,212 bales compared with 3,591,457 for the previous season, whilst the New Zealand clip was 943,283 bales compared with 962,359 bales. It is not known whether shipments to this country were greater than in 1943, but stocks must be reasonably good and prospects of improved supplies at the close of hostilities must be considered better in view of the Wool Control's permission to the industry to take up a part of its shoddy ration in crossbred wool. Furthermore, substantial supplies from Britain's stocks were allocated to France and Belgium. States. While the British strategic reserve stock of Colonial wool in the United States is still large, the United States Government sold its own holding of Colonial wool to its mills and dealers during 1944.

The wool combing industry continues to operate on a commission basis for the Wool Control at fixed processing charges per lb. Late in the year conversion costs for all sections of the industry were published as fixed and permitted by the Wool Yarn and Wool Cloth Maximum Prices and Charges Order. During the year yarn prices in crossbred qualities were unchanged to a penny higher but in botanics the rise was 2d. to 3d. in the finer counts, which counts spinners generally were reluctant to sell because of the irregularity in the standards of tops available from the Wool Control and the very large amount of additional labour required for fine spinning.

Rayon

PRICES of rayon filament yarn remained stable throughout the year, a remarkable achievement in view of increased costs, and of great assistance in keeping down clothing and living costs. In the case of staple fibre there was actually a decrease of 3d. per lb.

During the year demand was in excess of supply, but the close control exercised averted any serious difficulty. The allocation for utility cloths was increased because of the serious shortage of cotton goods and Government demands were increased, particularly for the high tenacity yarns now used in place of cotton in the tyre cord fabrics. The future will probably bring a greatly increased use of rayon in peacetime tyre fabrics and for other industrial purposes, especially where high insulating properties are required, and in conjunction with plastics. More latitude was allowed to manufacturers to produce non-utility fabrics for post-war development, but the facilities granted were little used because of labour shortage.

Home claims on the industry reacted on the export trade, but even so returns for 1944 show a larger export business than before the War. It was lower than in 1942, but well up on 1943.

The industry protested against the Cotton Board Post-War Committee's suggestion that rayon should, over a large section of its work, be statutorily connected with cotton. The British Rayon Federation and Courtaulds, Ltd., both emphasised that rayon would be seriously prejudiced by any such action. No final decision has been arrived at.

Machinery re-equipment is a problem of major importance even in this new industry. Of several developments perhaps the most interesting is the introduction by a subsidiary of Courtaulds, Ltd., of a new warp knitting machine with twice the speed of the best of the present machines. Instructions regarding the use of nylon have been issued to the trade but it will be some time before the product is ready for peacetime use.

Retail Trade

AVERAGE DAILY VALUE OF RETAIL SALES AND STOCKS IN GREAT BRITAIN IN 1944, COMPARED WITH 1943

PERCENTAGE CHANGES

(a) By Commodities

	Sales Year ended January, 1945	Stocks (at Cost) End of January, 1945
Non-food merchandise:—		
Piece goods ..	+10.2	-13.7

Men's and boys' wear ..	+27.8	-27.1
Footwear ..	+4.7	-14.7
Furnishing departments ..	+0.2	-18.8
Hardware ..	+3.7	-1.2
Fancy departments ..	+13.4	-9.6
Sports and travel requisites ..	+5.5	-17.9
Miscellaneous ..		
Total ..	+9.1	-12.9
Food and perishables ..	+5.4	-13.4
All departments ..	+6.9	-13.4

(b) By Districts

Scotland ..	+7.5	-15.6
North-east ..	+8.8	-16.7
North-west ..	+8.7	-16.3
Midlands and South Wales ..	+8.1	-15.9
South of England ..	+8.7	-15.5
Central and West-end London ..	+1.1	-22.6
Suburban London ..	+2.4	-0.2

The retail year was perhaps most notable for the steady decline in stocks which took place. Turnover was at a higher level than in 1943, but new production did not keep pace with it. A drop in production was only to be expected in the year of the European invasion, and it was intelligent, as mobilisation for war reached its peak, to take advantage of the cushion of consumer goods stocks. Nonetheless, the deflation of the cushion proceeded at a rate which was, by the end of the year, felt to be verging on the unsafe. In apparel it was particularly true, although the clothes ration has been maintained at the rate of four coupons a month since 1942. Whether this rate can be continued into the autumn of 1945 is a matter of doubt.

In October it was announced that the making-up trades would have restored to them the cuts in their approved labour force (that is, the number employed at June, 1942) made at the beginning of the year. In addition, a month later, it was decided to increase the approved labour force from 100 per cent to 110 per cent in infants' wear and from 75 to 95 per cent in tailoring firms. It was not until March, 1945, that special measures were announced by the Minister of Labour as being "in preparation" to increase the number of operatives in cotton spinning, where the low output threatened a severe shortage of yarn for clothing textiles and household fabrics.

The index numbers of apparel stocks (1942 = 100) were as follows (both 1943 and 1944 are given for comparison):

	Dress Materials	Women's Wear	Men's and Boys' Wear	Boots and Shoes
1943 ..	99	107	110	79
1944 ..	75	86	93	75

The drop in stocks in all departments can be seen in the comparative table of sales and stocks on this page.

An interesting indication on the drop in supplies of goods for civilian consumption is given in the "White Paper on the War Effort (Cmd. 6564). Some of the figures are worth repeating here. Although 1944 figures are not available, in a good many cases they are likely to be roughly the same order as in 1943. The most notable exception will probably prove to be apparel, for which, judging by the retail trade index, the index below is likely to rise to the 1941 or 1942 level.

PERSONAL EXPENDITURE ON CERTAIN CLASSES OF CONSUMERS' GOODS AT 1938 PRICES

(1938 = 100)

(Contd.)

	Clothing and Dress Materials	Boots and Shoes	Furniture and Furnishings	Hardware	Private Cars, Bicycles, etc.	Other Goods (excluding Food, Drink and Tobacco)
Actual expenditure in 1938 ..	574	73	147	82	62	306
1938 ..	100	100	100	100	100	100
1939 ..	99	104	94	91	82	100

1943 ..	55	75	23	35	11	52

* Furniture, furnishings, household textiles, floor coverings, musical instruments, wireless sets, gramophones and accessories.
† Pottery and glassware, ironmongers' goods, electrical goods, heating and cooking appliances and perambulators.
‡ Chemists' wares, stationery, books and newspapers, fancy goods, jewellery, etc., travel goods, toys and sports goods, petrol and oil, soap, polishes, candles and matches.

During the year ending January, 1945, compared with the year before, retail turnover as a whole rose by 6.9 per cent, as can be seen from the table. This made the index number of retail trade (1942 = 100) 105, compared with 98 in 1943. The rise in turnover was most marked in the apparel section, where the index rose from 88 (its lowest wartime level) in 1943 to 102 in 1944. The household goods categories fell slightly from 99 to 87, their lowest level so far. The index for non-food merchandise as a whole rose from 93 to 101, and the food index rose from 102 to 105. It should be here recorded that the base of retail trade index, compiled by the Bank of England and published monthly in the *Board of Trade Journal*, was changed in April from 1937 to 1942. The opportunity was taken to introduce some improvements.

The flying-bomb campaign, which began in June, had a depressing effect on retail sales in Southern England, and particularly in London. At its height, in July, central London sales dropped by 30 per cent compared with the same month the year before. Other regions gained to some extent from the shifts in population caused by evacuation.

Another factor during the year was the exceptionally large Christmas trade. Daily sales during December were 9.0 per cent above those of December, 1943. For non-food merchandise the rise was 13.6 per cent and for food 6.0 per cent. Changes in price during the period had been in the main negligible, so that the rise represented almost entirely the purchase of a larger volume of goods.

Furniture continued to be dominated by utility production and the rationing system for its disposal. From August 1st the allowance, which had been cut in 1943, was restored to 60 units, and the larger ration applied to those who had previously had to make do with the smaller one. Although the output was increased, it was still far from being adequate to satisfy potential demand, even among the priority classes. Consequently there was an increased demand for second-hand furniture. Prices had been rising to phenomenal heights, and on August 28th an Order came into force prescribing ceiling prices. The scheduling of a class of goods in which the variety is almost limitless was no mean achievement; the Board of Trade had the assistance of the trade in working out the scheme. Furniture (except antiques) is classified according to type of wood and measurement. For example, no fewer than fifty-four classifications are laid down for wardrobes, with a price range from £6 10s. to £58 10s. Although a substantial reduction in current prices was achieved, the object of the Order was to arrest the continuing rise in prices while in no way drying up the supply of second-hand furniture.

During the year the Board of Trade promised that a census of distribution would be taken after the war. Meanwhile, the institution of clothing coupon banking accounts in 1942 provided material for the compilation of statistics dealing with retail outlets for rationed clothing, footwear and textiles. These were given in the *Board of Trade Journal* of June 3rd. At the middle of 1942 there were 86,150 retail shops with coupon accounts, of which 81,000 were primarily engaged in selling rationed goods and the rest only as a side-line. It was estimated that about 10 per cent of shops mainly or wholly selling rationed goods did not, because of their smallness, open coupon banking accounts. The following table, compiled from the *Journal's* article, classifies shops according to money and coupon turnover:

Turnover per annum	Approx. Weekly Coupon Turnover	Percentage of Total Shops	Approx. Percentage of Total Sales
Under £2,500	Up to 300	48	Under 10
£2,500 to £12,000	300 to 1,500	43	About 25
Over £12,000	Over 1,500	9	66½

A classification of shops by economic type revealed that multiple shops (firms with five or more branches) accounted for 8,250, or 10 per cent of the total; co-operative stores, 2,460, or 3 per cent; independent shops dealing mainly or wholly in rationed clothing, 70,440, or 81 per cent; other independent shops selling rationed goods as a sideline, 5,000, or 6 per cent of the total. A breakdown of shops according to their general description was compiled from a sample analysis. The margin of error is given in parenthesis. Drapery, 35,800 (± 1,800); outfitting (men's and/or women's), 15,900 (± 1,400); footwear, 11,700 (± 1,200); tailoring (men's and/or women's), 5,500 (± 900); wool, 2,500 (± 600); costumiers and gown shops, 1,900 (± 500); variety chain stores, 1,500 (± 500); department stores, 300 (± 200); co-operative stores, 2,300 (± 600); other: wholly or mainly clothing, 3,600 (± 700); other: not wholly or mainly clothing, 5,200 (± 800). Despite the width of the margin of error in some cases, on the whole the figures are reasonably accurate. For example, the number of footwear shops and co-operatives compares well with the known actual figures, which were 11,950 and 2,460 respectively.
