Let Us Face the Present

THE nature of the Government's latest White Paper should not be judged from its curious title, "Statement on the Economic Considerations affecting relations between Employers and Workers," which is as misleading as it is uninviting. The White Paper is, in fact, a clearly and forcefully written statement of the economic predicament in which the country finds itself. It minces no words; the second paragraph begins: "The position of Great Britain is extremely serious," and there is a similar air of plain speaking about the whole document. Its theme is the imperative need for higher output, not only higher production in sum but, since there is no more manpower available, more output from each man and woman. The dangers of the present position can be seen most clearly in the field of foreign trade.

This country is still running into debt abroad. Each month our balance of overseas payments is still unfavourable.

But it is not in the balance of payments alone that difficulties arise. The output of consumer goods from domestic industries is still woefully inadequate. Many of the industries chiefly concerned are still very short of labour; fourteen industries specified in the White Paper, including several metal-working and all the textile industries, need 657,000 workers, an increase of 22 per cent on the present total, to regain their pre-war labour force. There is no source from which they can draw all the additional labour they need; indeed, the impending raising of the school leaving age is about to reduce the total labour force by 370,000 juveniles. Thus, an increase in output per head—production per man-year, not merely higher production per man-hour offset by longer holidays—is the only hope for increasing the supply of goods from home industry and the only hope for preventing a fall in the flow of imports as soon as the dollar loans are spent. Moreover, so long as £7,000 million of incomes (after tax) face only £6,000 million of consumer goods and services, the threat of inflation remains.

Not a word of this, of course, is new. Not a word of it but has been hammered home by every competent private commentator for eighteen months past. What is new is that the Government has at last been brought to admit the fix that the country is in and that the trade unions have endorsed the statement. There will, no doubt, be many attempts blandly to ignore the painful implications of the clear statement of facts. Trade unions will, no doubt, still prefer claims for 40-hour weeks and other forms of endowed leisure. But they will not, after this, be able to pretend that their claims are in the public interest or that they are anything more than unpatriotic exploitation of a temporary bargaining advantage. Nor will the Government be able merely to wave aside the Opposition charge that they are fiddling with nationalisation while Rome burns. Indeed, the Government seem to be swinging over from Pollyanna pretences to an almost exaggerated alarmism. The White Paper, with the week-end speeches of Mr Bevan and Mr Shinwell, and particularly with Sir Stafford Cripps' Cassandra utterance at Bradford on Wednesday, seems to be a concerted attempt to shock the country, and particularly the Labour movement, into an awareness of its position.

imports of some 20 million tons, 16 million tons were carried in Italian bottoms. In May, 1946, total tonnage had fallen to 579,301. Fifty Liberty ships are being added to this figure, and during 1947, the Italians should dispose of about 1,000,000 tons. But this reduction of the merchant fleet to nearly one quarter of its former size means that they will have to spend an extra \$110 million in freight charges. (The size of this figure is also due to the necessity of bringing coal all the way from America at a freight rate as high as \$12 a ton. Before the war, Italy bought coal only in Europe.)

The outcome of the war has further upset the Italian balance of payments by depriving them of their foreign assets, interrupting the flow of remittances from emigrants abroad, putting an end temporarily to tourist traffic, imposing a still unspecified lien on all Italian property abroad, and, in the shape of reparations, placing a burden on future current production whose effects cannot yet be measured. To these internal dislocations must be added the external dislocations of the world market. Italy's pre-war trade was to a great extent with Central and Eastern Europe. There the Italians sold the bulk of their processed foods, textiles and mechanical goods. Now Germany, the great food market, has disappeared. The Balkans have not recovered sufficiently to trade. The result of these limitations may not be felt immediately, for in the present seller's market, Italian industry can sell anything it produces. The immediate problem is the fact that the vital supplies Italy wants to buy in return for its exports—wheat, coal and oil—are in short supply and can on the whole be bought only with "hard" currencies. For instance, when the Italian Trade Mission visited London in December, their problem was not to boost the sale of Italian goods in Britain, but to find some British supplies upon which to spend Britain's accumulated debt to Italy of about £20 million. But coal, iron ore, timber, hides, alloys are as scarce in Britain as in Italy. The problem of foreign exchange, therefore, resolves itself inevitably into the problem of dollars, and the Italians find their short-term and their long-term interests in collision. In the long run they need to develop their markets in Europe and the Mediterranean, for the United States is directly competitive with them in industry and offers only a poor and jealous market for farm produce. But in the short run, the need for dollars makes it necessary to press every possible sale in America.

Confusion in Controls

Working in such an unfavourable atmosphere, the most efficient Governmental machine might falter. The Italian machine is not efficient for, like everything else, it is suffering from the consequences of war, liberation and a prolonged political purge. It is short of experienced men and the men with experience are often enemies of the whole idea of control. The point can be illustrated from the development of exchange control. Since the spring of 1946, exporters have been permitted to retain 50 per cent of the foreign exchange resulting from their transactions. The other 50 per cent is taken by the Government to finance essential imports. The consequence has been on the other hand a very rapid increase in exports, but the officials of the Government's exchange control complain that the private balance is used in part to import non-essential goods selling at a high profit in the restricted wealthy market and that its existence makes possible a steady flight from the lira. In this situation, the exporters demand the removal of all controls, the Government officials the introduction of complete control. The likelihood is that the present awkward system will be maintained.

Its operation might be simplified if there were not several rates of exchange for the lira. Hitherto the official rate has been 100 lire to the dollar. Exporters receive 225 lire for their foreign exchange from the Government, and the price of the 50 per cent retained by them has been roughly 600 lire on the free market. It appears, however, that the Italian Government is now on the point of devaluing the lira, and the new rate will reflect the lira's "free" value.

Given this background of confusion and uncertainty, it is not surprising that the Italians expect a serious trade deficit in 1947. Two sets of estimates have been prepared, by the Unrra Italian Mission and by the Italian Government. The Unrra estimate, being less optimistic, is probably the more reliable, but the divergence between the two is not very great.

The difference in estimating food imports is due to the Government's inclusion in the 1947 account of an earlier Unrra food programme for which neither funds nor grain may be available. The higher Government figure for industrial imports springs from a

more hopeful picture of the availability of such vital raw materials as lumber. More detailed examination of the Unrra figures reveals that the most costly import figures, including freight costs, are: Cereals (\$255,400,000), fats and oils (\$51,150,000), solid fuels (\$202,156,000), mineral oils (\$67,575,000), iron and steel (\$38,600,000) and raw materials and textiles (\$155,260,000). On the side of exports, the largest earnings are from the textile industry, with estimated exports valued at \$313 million, food processing at \$50 million, the chemical industries at \$20 million, and agricultural exports at \$44 million.

ESTIMATED ITALIAN BALANCE OF PAYMENTS IN 1947

	(million shares)			
	Unrra Estimates		Government Estimates	
	Payments	Receipts	Payments	Receipts
Food and agricultural imports	414	...	356	...
Industrial imports	719	...	949	...
Miscellaneous imports	109	...	190	...
Exports	...	505	...	520
Remittances, tourists, etc.	...	80	...	130
Shipping gains	...	45	...	129
Total	1,233	660	1,396	779
Balance	...	-603	...	-626

The Italian Government is left with a deficit of between \$603 million and \$626 million. The actual problem is probably more urgent than the figures suggest, since the most vital raw materials have in the main to be bought with dollars, and of the 19 billion lire which exports will earn in 1947, only about 5 billion represent dollar savings. True, 3.5 billion are hard currency in the shape of Swiss francs and 1 billion Swedish crowns, but nearly half the lire represent currencies which cannot be used for financing the most urgently needed imports. The Government's problem is thus more complex than the chart of estimated exports allows.

Hitherto the grave deficit in the Italian economy has been covered by direct external assistance, of which the Unrra programme has naturally been the most important. In 1945 and 1946, Unrra has spent on direct relief and the beginnings of rehabilitation about \$550 million. In addition, over the same period, the Allies (especially the Americans) have spent \$160 million under their military civil affairs programme and the so-called "Troop Pay Account," and a further \$100 million was spent by the American Foreign Economic Administration in 1945. In all, Italy has received nearly a billion dollars in outside assistance.

The core of the problem in 1947 is that the Italian economy has to find its balance without further direct relief. It is true that Unrra will continue to bring in wheat and coal for the first months, but these shipments have not been included in the Unrra estimates of the 1947 trade balance. The deficit of over \$600 million must be met either by credits or by increased exports. But the export estimate is already as optimistic as it can reasonably be made. The only hope of some balance in the country's external economy lies therefore in credits. The importance of the Italian Prime Minister's recent visit to Washington lay precisely in his hopes of receiving substantial dollar loans.

At a press conference, given on January 20th on his return to Rome, Signor de Gasperi was able to announce reasonably favourable results. A further \$130 million would be transferred to Italy under the Troop Pay Account. A credit of \$100 million would be made available by the Import-Export Bank. The Prime Minister admitted that some pressure had been needed to secure even this amount. As for the uncovered gap of about \$370 million in Italy's trade balance, he said that Italy would have to look abroad for further help and credits, but that these would not necessarily be forthcoming.

The kernel of the problem was whether our democratic system is stable or whether a return to chaos or to dictatorial conditions is to be feared. That is why we had to deal mainly with a question of confidence.

And this "question of confidence" in the present uncertain state of Italian politics is a very doubtful quantity. Most of the steps necessary to increase productivity at home or to create trust in Italian stability abroad demand a firm and vigorous administration, and this is the one thing which the Italian democratic system at the moment seems unable to provide.

THE BUSINESS WORLD

Unanswered Electricity Questions

AN established pattern can be discerned in the Government's nationalisation measures. First comes the Bill, with its Commission or its Board, its powers of Ministerial appointment and intervention, its niggardly compensation for existing owners, its aloof suspicion of the directors of the concerns which are to be taken over, and its vague principles and safeguards for the consumer's interest. Then follows the Second Reading, which ought to afford the opportunity to the Minister to expound the policy of the new authority and to demonstrate its technical advantages over private ownership cum public control, but instead is largely devoted to exposing the shortcomings of the past rather than the substantial promise of the future. Thirdly, the Bill is whisked upstairs to Standing Committee, where amendment and improvement rest not on the persuasion of logic but upon the temper of the Minister.

These are the stages which determine the pattern of legislation, for major changes on the Report stage or in the House of Lords have not, so far at any rate, been of importance. And of all these stages the Minister's Second Reading speech is of first importance. It cannot be said that Mr Shinwell made the best use of his opportunity to explain and justify the Electricity Bill on Monday. Parts of his case can be at once admitted. Legislation of some sort is needed for electricity, because many supply company franchises are expiring and, if local authorities exercised their rights of purchase, the electricity supply industry would undergo complete disintegration. Mr Shinwell made much—indeed, far too much—of the variety of charges and diversity of voltages and frequency. Progress in these things, he said, has been "much too slow"—which is a remarkable understatement of what has been achieved during the last twenty years. Again, different undertakings have different ideas about the design of their appliances and plant—engineers display great divergence of views in these matters—and in the end "it is the consumer who has to pay."

His opening, then, was a recipe for an integrated electricity industry with a stagnating technique allowing no room for the "divergence" of engineers' views. He went on to declare that the public electricity service must do "everything possible to rationalise its method of charging," and that prices for industrial and domestic use should be "strictly related to costs." These are the only references in his speech to charges, which are surely the most important aspect of the Bill, and its professed *raison d'être*. He dealt in two short passages with the responsibilities of the British Electricity Authority and its fourteen area boards, and noted—though he did not expand—the point that the Minister may give directions on matters of "national interest." Then followed the polemics, and in particular a lengthy passage to justify the Minister's determination to give the Authority and the Boards power to manufacture and install plant and fittings. The companies had either failed to do this satisfactorily, or had been in league with the suppliers of equipment. But the new Boards will be in a position to afford facilities like "major domestic electrical appliances" which Mr Shinwell believes to be beyond the reach of working-class families. Consumers will not be sold appliances "which are often unreliable and expensive."

Next, on compensation, Mr Shinwell—having dismissed the claims of local authorities for fair compensation ("local authori-

ties have always displayed a sense of public duty and will not wish to make any profit from the transaction")—admitted the complexity of the compensation problem for the supply companies. A company might have a number of franchises expiring at different dates, and the work of calculating net maintainable revenue for each portion of the undertaking for its unexpired franchise "would be so involved that in fact it is quite out of the question as a practicable proposition." Moreover, the companies were earning monopoly profits and paying dividends which were out of line with those appropriate to public utility undertakings—a charge which blandly disregards the effective capital invested in their businesses. Mr Shinwell concluded that in these circumstances compensation by reference to Stock Exchange values was "not only practicable but fair and even generous. . . . Too long has the electricity consumer been made the victim of financial speculation."

Finally, Mr Shinwell addressed himself to the programme of capital development, for which the Bill provides £700 million for the Central Authority and £100 million for the North of Scotland Board. It was remarked in these columns on January 18th that the setting aside of £800 million for electricity development suggested an intention to go forward with rural electrification on the grand scale. So it appears from Mr Shinwell's speech. Some £200 million will be required for power stations (earlier in his speech Mr Shinwell suggested that these would require such a high proportion of the national resources that, if only for that reason, one body must be responsible for their construction and operation), but no less than £400 million is earmarked for improvements in the distribution network, of which "a substantial proportion" will be used for rural electrification. And unless this rural programme is proceeded with quickly, Mr Shinwell sees no hope of checking the decline in the rural population.

Such is the Minister's plan for developing an industry in which progress has "too often been impeded by sordid financial considerations." It can hardly be described as convincing—indeed, it clearly failed to satisfy many Government supporters in its references to compensation for the local authority undertakings, of which some have considerable experience and a clear understanding. But there are far wider aspects of the case which have gone unargued in the Second Reading debate. Perhaps the most important issue is that of charges. Mr Shinwell devoted much of his time to attacks—some of which found their mark—on certain features of holding company finance in the electricity supply industry. But he does not appear to have appreciated the fact that under the Bill, and with his connivance, the capital accounts of the Area Boards could be so engineered that the grossest excesses of holding company finance would look like amiable borrowing. The charges which will be applied in any particular area will be determined in large part by the apportionment of the Authority's capital charges which it has to bear. These are the most important elements in the costs to which, according to Mr Shinwell, prices of electricity for industrial and domestic use are to be related. What are the public safeguards for seeing that each area bears its fair share, and no more, of those charges?

Again, the relationship between urban and rural electricity prices requires full elucidation. Mr Shinwell refused to be-

drawn on this question, but certain members argued that prices should be standardised so that country and urban consumers could enjoy "the same low prices," and crofters in the North of Scotland would pay the same as consumers in Hackney. How far does the Minister intend to support these claims? Will the £400 million or so to be devoted to rural electrification involve any subsidy from the urban consumer? These are real issues involving the consumer's interest under nationalisation, and they ought to be made quite clear at the outset.

With so many basic questions unanswered, the Electricity Bill now goes to Committee. Judging from experience over the Coal Nationalisation Bill, Mr. Shinwell is not the Minister who is likely to make concessions liberally. But will he at least be moved to offer a much fuller explanation of those clauses of the Bill that, in the long run, really matter? Can he for once drop the suspicions that belong to the past, and demonstrate instead what is in his mind, and ought to be in the minds of the Authority and the Area Boards, about development and charges? Will he explain in detail how far he is prepared to intervene in their policies? Will he offer himself as the Parliamentary spokesman for the new bodies, or will he act as their Parliamentary blanket—as he has recently appeared to do for the Coal Board? Would he be prepared to accept the view, which is widely and properly held, that the charging machinery

should be subject to closer public scrutiny than the Bill provides at present? How will he guarantee that the transfer of the undertakings takes place without dislocation—his claim, incidentally, that the Coal Board took over the mines "without the least dislocation" is surprising. What precise measures has he in mind to expedite development plans and to promote the speedy production of generating plant? Is this question to be left until the Authority is appointed, or is action being taken here and now? What support will the Minister bring to the Authority when it is involved—as it most certainly will be—in arguments and disputes with the Ministry of Town and Country Planning on the location of new power stations?

So the list of questions could be strung out, almost indefinitely. They show the scope for fuller explanation and amendment of many of the clauses of the Bill. On all these points the Government may, if it wishes, say nothing and do nothing. But if it is inspired by the urge to benefit the consumer, and if it has learned any lessons from the handling of the techniques of nationalisation during the past twelve months, it would do well to consider them fairly. The Authority and the Boards under the Bill are skeletons. It rests largely with the Minister whether they become monopolist monsters or efficient and progressive undertakings fired by regard for the consumer's interest.

Annuities and Taxation

SIDE by side with the major life assurance boom that is now in progress there is a minor boom in the sale of annuities. The plain man's argument that when the rate of interest falls below a certain level people will begin to consume their capital, is being demonstrated in recent insurance experience. In these days of ever cheaper money, many small investors are now resigned to the fact that the only way to increase their cash income is at the cost of consuming all or part of their capital. This, indeed, is the remedy which the Chancellor himself has recommended for railway stockholders.

Apart from the reluctance on the part of many offices to underwrite a large volume of annuities, there is one important factor which limits the expansion of this type of business. The man who lays out late in life a capital sum simply in order to secure a maximum return for the remainder of his years, finds that income tax is payable on the whole of the regular payments which he receives, although a portion of these sums represents a return of capital by instalments and only that part representing interest on the capital can be described as "income." The average annuitant fails to see the justice of this situation, which seems to make "income tax" a misnomer, and involves a hidden tax on capital.

It must, therefore, be emphasised that there are types of annuity in which the "capital element" is not taxable. A broad distinction has to be made between an annuity for a fixed term, say for 15 years, and one for a term equal to the remaining life of the annuitant. On an annuity for a term certain, only that part of the regular payments which represents interest on capital is subject to tax. But for an annuity payable during the lifetime of the annuitant, tax is deductible from the whole of each payment, capital and income together.

The insurance offices have now developed a type of annuity contract which combines an annuity certain with a life annuity. Various descriptions as a "capital annuity," a "capital and income" policy, a "split annuity," or a "capital protection" policy, this arrangement enables, firstly, a constant annual sum to be guaranteed to the annuitant over a fixed term of years, subject to income tax on the interest element only and, secondly, another constant annual sum to be receivable for the remainder of life if the policy-holder survives the stipulated

period. Thus, at the present time, for an outlay of £2,000 a man aged 60 could be assured an income of approximately £60 per annum for 12 years, the interest element (which would be subject to tax) being £12 7s. in the first year and then diminishing, and approximately £120 per annum for the rest of his life following the 12 years period, the whole of this sum being subject to tax.

"Split" policies of this kind carry with them no suggestion at all of tax avoidance. Clearly, it would be open to a person himself to separate his capital outlay into two portions, buying an annuity certain with one part, and a life annuity with the other. Recently there has, however, been a further development which has not this obvious claim merely to marry two well-established forms of contracts. The Wesleyan and General Assurance Society, having ascertained that there was no hope of altering the law of taxation in regard to life annuities, decided, to quote the Society's own words, "to put the matter right in its own way." In May, 1944, a certain Mr. Hart took out a policy with the Society under which, in consideration of payment by him of £500, the society agreed to pay him, first, an annuity of £7 11s. by monthly instalments of 12s. 7d., and, second, a payment at death of £4 14s. 8d. for each completed period of one month of borrowing, on a bond entered into, sums not exceeding the lump sum which would have been payable if death had occurred at the date of the loan. Any such loan was to be free of interest and was repayable at death by being set against the sum then due. In June, 1944, Mr. Hart elected to borrow to the maximum extent and then received monthly from the society 12s. 7d. less tax, plus £4 14s. 8d. as a loan, free of tax. The Inland Revenue contended that the sums paid under the bond were an annuity and were taxable, arguing that it was immaterial that they were described as loans. The Special Commissioners of Taxes took the Society's view; the first Court found for the Crown; the Court of Appeal reversed that decision, and it is now open for the Crown to appeal to the House of Lords, within the stipulated period of six months.

Whatever may be said about the merits of this form of annuity from the wider aspect of tax avoidance, it is undoubtedly

an ingenious form of contract; it has raised afresh the whole question of the taxation of annuities. It is certainly salutary that the Inland Revenue should be forced to examine the issue again. For the life offices collectively have so often protested against the existing state of the law in this matter that they can hardly regret the opportunity that has arisen in which a change might be achieved. Until the question of appeal to the House of Lords has been decided, and until their Lordships have decided the issue, should it go before them, the final legal position cannot be anticipated. But the Society's case, as it was presented in the lower Courts, appeared to be a strong one.

The taxation of the "capital element" in terminable and life annuities has long-established authority and has hitherto resisted the fiercest onslaughts. When Peel reimposed the income tax in 1842 he was urged to eliminate the tax on the capital element but refused. Many prominent public men appearing before the Select Committee of 1851-2 reiterated the plea for exemption of the capital element or for a lower all-round tax on annuities to produce the same effect, but in vain; the Committee was against any change, even though its Chairman agreed with the pleaders. Newmarch was quite heated in evidence, saying that not to differentiate between capital and interest savoured very strongly of the morals of Finchley Common, "explaining his meaning"—as the Inland Revenue put it before the Royal Commission of 1920—"by reminding the Committee that Finchley Common used to be the resort of a certain class of characters. The Committee found no difficulty in understanding the allusion." A Departmental Committee of 1905 refused to agree to arguments which were put forward by the life offices and actuaries for splitting the annuity into its two parts. They concluded that a man who buys an annuity deliberately sinks his capital and takes an income in exchange; they contended, that is, that there is really no capital element at all in an annuity. Secondly, as existing annuities had been created during the existence of the income tax, the Committee held that the contracting parties under subsisting policies had taken the tax into consideration and therefore had no equitable claim to relief.

The first of these arguments was, in logic, answered by the life offices before the 1920 Commission, when they put forward the case of the man who simply consumed his capital over his expected term of life, perhaps regulating his consumption of capital so as to give himself, with principal and interest combined, a fixed annual income of which the capital element was untaxed. Was an annuitant justly penalised simply because he took advantage of the law of averages and, in combination with others, enabled a life office to make an actuarial assessment of his expectation of life? The second argument of the 1905 Committee would not have prevented them from recommending that new annuitants should be given a taxation relief which would not extend to existing annuitants. It must, however, be admitted that such differentiation might well prove no less disagreeable in practice than the consequences of the existing

law; the state of mind of an existing annuitant when he entered into his contract perhaps many years ago is unlikely to be uppermost in his mind when he compares his present net financial position with that of annuitants whose contracts are more recent than his—which is the sort of comparison he would naturally make. At any rate, the 1920 Commission followed previous inquiries, and made no recommendation for a change in the existing law.

Even if the Wesleyan and General form of policy should be upheld by the House of Lords, the maintenance of the present system of taxing annuities would not thereby be justified. True, future annuities could—and presumably would—be written in the new form but this would still amount to discrimination in favour of new annuitants. If the Lords were to decide for the Society, reform of the law therefore would still seem to be necessary and if they decided for the Crown, the same remedy would be imperative.

Re-examination of the position, despite the many unsuccessful attempts to change it, is called for now, quite apart from the action of the Wesleyan and General Assurance Society in precipitating it. The policy of ever cheaper money has been catastrophic for the elderly and retired, the widow with limited capital resources and others with modest capital who form the main source of demand for immediate annuities. To these annuitants, the language of Newmarch may seem strong, bearing in mind that income tax in 1851 was a mere 7d. in the £. But with suitable geographical modification, it is singularly apt with a standard rate of 9s. in the £.

Nevertheless, the position of the annuitant is to some extent mitigated by the system under which the life offices are now assessed to tax in their annuity branches. Annuities paid out by them are taxed at source, either at the standard rate, or, where appropriate, at a reduced rate; the office, in effect, puts into an Inland Revenue Suspense Account the tax thus collected. But the ultimate liability of the office to the Inland Revenue may be either this figure or alternatively, if it is larger, the sum of the tax deducted (at source) from the office's investment income plus tax on the profits, usually comparatively small, earned upon its annuity business. If these latter items are smaller than the deductions made from the annuitants—which in view of the great growth of annuity business before the war is so in most cases—no tax is payable beyond that deducted from the annuitants. Thus if the office regards the annuitants as bearing the tax on their annuities, as in fact it usually does, it is in effect obtaining its investment income gross and free of tax. Clearly, if the offices were to suffer under some more onerous system of tax, the terms at which they sell annuities would be dearer. If, therefore, the Government were to allow only the interest element of annuities to be taxed but were simultaneously to seek to maintain total tax revenue by raising an additional levy upon the earnings of the annuity fund, the position of the annuitant would not be improved. by reduction in the combined tax liability of the office and annuitant and by adopting the principle that tax would be levied only once upon them in combination would the required end be reached.

It may be thought that the present Chancellor would be reluctant to make the necessary sacrifice of revenue. Yet perhaps he could be induced to face it by the reminder that total annuity payments by all the life offices in 1938 amounted to only £8 million of which a fair part was for payments under deferred annuities—to which the present arguments do not apply—and that of the remainder as much as 15 or 20 per cent probably represented interest and would therefore remain taxable. If he were reluctant to relieve from tax the capital element in life annuities, for fear of incurring opprobrium for failing to "soak" unearned income—though the typical annuitant has usually acquired a limited capital out of the savings of a lifetime's hard work from his own taxed earnings—he could simply impose a limit on the size of the annuity attracting a full capital exemption. Such a course might be somewhat illogical, since it would combine an admission that part of the annuity

was capital, and should not attract tax, together with a statement of intention to continue to tax the capital element accruing to the larger annuitants. But at least the illogicality of the present system would be modified in the right direction. There would, admittedly, be some difficulties of adjustment for annuitants under old contracts but these need not be overwhelming, and it is obviously desirable that any concessions should apply to old and new policy-holders alike. Perhaps the Wesleyan and General case may prompt the Inland Revenue to reconsider some of these broader issues. Under recent legislation wasting assets of several kinds are more generously treated for taxation purposes than ever before. The Board of Inland Revenue may remember that, in their evidence in 1920, they resisted a change of the law in regard to annuities, but they observed that "although it is considered that annuities are distinguishable from wasting assets used in production, the Board of Inland Revenue are disinclined to urge that the balance of argument is against making any allowance in respect of purchased annuities, if it be decided that other wasting assets should receive an allowance." Are they still "disinclined to urge" 27 years after?

Business Notes

"A Most Serious Situation"

There is no mistaking the gravity of the Ministry of Fuel and Power's statement on Wednesday that "a most serious situation" has arisen in coal supplies. The hard winter with its dramatic and far-reaching interruptions of supply has exposed the weakness of the coal position. Stocks are exhausted, or nearing exhaustion, and even the Cripps allocation plan was postulated on the hand to mouth delivery of currently produced coal. But pits are isolated, and transport by land and sea has been stopped or slowed down over a wide area. The six weeks' period of crisis, it is safe to predict, must now be extended into the early spring.

The present and future consequences for industry are indeed serious. The reduction of coal allocations by 50 per cent has not enabled industry to plan its production with any more certainty of deliveries than before and many firms with well-nigh exhausted coal dumps have had no alternative but to go on short time or close down altogether. Austin Motors head the long list of firms temporarily stopped in the Midlands and the Rolls Royce works at Crewe have introduced a shorter working week. About 8,000 workers are affected by the closing of Cadbury's Bournville factory for ten days. In Lancashire and Yorkshire continual snow falls have interrupted east-west communications over the Pennines. The wool textile industry had received a supplementary coal allocation of 15 per cent, putting it on the same basis as the cotton industry, but this piece of arithmetic will be meaningless until the transport situation improves and coal can be moved from the mines. Frozen dock installations in South Wales and the Tyne, and interruption of the regular deliveries of seaborne coal (which in particular feed public utility plants in London) have temporarily imperilled even 50 per cent allocations for consumers in Southern England.

Shortage of coal is affecting all parts of the industrial structure. Several thousand workers are idle, or on short-time, in the cotton and wool textile industries. There is already a sufficiently slender margin between consumers' requirements and output from the cotton and worsted spinners to put clothing supplies in jeopardy if production in these key sections of the textile industry suffers any prolonged interruption. But a temporary reduction in consumer goods supplies would be less serious than the snowball effect resulting from shut-downs in industries producing semi-finished industrial materials, components and capital goods. Iron and steel, chemicals, motor vehicles, railway wagons and rubber tyres are all adversely affected by lack of coal. Since most industrial systems as a whole particularly lack transport equipment, a decline in output in the first stages of production must affect the output of firms in the assembly and finishing industries almost immediately.

Two lessons emerge from this unhappy situation. The first is that only a comprehensive rationing scheme and a more detailed system of priorities offers any guarantee that the damage to industrial recovery caused by the coal shortage will be kept to the

minimum. The second is that, unless drastic control of supplies and a big expansion of production is secured during the summer, coal stocks at the beginning of next winter will be even lower than they were last October.

The Chancellor's Week-end

Mr Dalton appears to have convinced his audiences in the North last week-end of a number of propositions, some tenable and others more dubious. First, he demonstrated that there will be no financial crisis—which might be true if financial crisis is used in the 1931 sense. Granted the present controls, it is possible, no doubt, to go even further in the suppression of inflationary pressure as it is created. The dangers, as Mr Dalton emphasised, are of prospective shortages of many essential supplies, a further reduction in imports and the increase of money incomes unaccompanied by corresponding increase in production.

Of all the essential raw materials, coal is crucial. Mr Dalton declared that the present insufficient output, the exhausted level of stocks, and the out-of-date mining equipment were the responsibility of private enterprise, which the Government has now abolished in the coal industry. His remarks on this question should be quoted:—

The wretched private coal owners, before they flitted, left us with stocks of coal lower than ever before in our history. This winter we have had coal cuts and shed the electricity load. That is entirely the responsibility of private enterprise in the mining industry.

This can only be described as characteristic Daltonian invective. If blame for the low level of coal stocks is to be apportioned to the mistakes and shortcomings of the past, does the Coalition Government, of which Mr Dalton was a member—indeed, at one time the Minister responsible for coal—escape unscathed? Would any sober level of discourse which was concerned with the ills of the coal industry and their remedies talk in terms of wretched private owners flitting from the industry? How does Mr Dalton reconcile his statement that the electricity cuts are due to lack of coal with the repeated statements of Mr Shinwell that they are due entirely to lack of generating capacity? The Chancellor of the Exchequer does a grave disservice to the solution of Britain's economic difficulties by talk of this nature.

Nor was he on happier ground in his references to compensation on the basis of Stock Exchange prices. How is it relevant to the question of fair compensation for an industry on a going concern basis, to call in aid the method which the Inland Revenue Department uses for the assessment of Death Duties? It is astonishing that Mr Dalton should seek to compare the two cases, for they are utterly dissimilar. Securities held by the average deceased estate can almost always be realised at the prevailing market price; that is the justification for using Stock Exchange prices in such cases. But compensation by reference to market prices uses the values established by a comparatively small volume of marginal

sales as a method for valuing the current capital worth of an entire industry. If the totality of securities in a nationalised industry were to change hands during the particular days which were selected by the Government for the calculation of compensation terms, the method might have some economic logic. No doubt what it lacks in logic it makes up, in the Government's eye at any rate, by simplicity, cheapness and expediency. Why should not the Chancellor frankly admit that this is the case? He is tireless in demonstrating that the Transport Commission will earn a highly satisfactory surplus after meeting interest on its compensation stock. That is the consequence, and doubtless the intention too, of choosing market prices as a basis for compensation. To confuse this simple issue by dragging in the false analogy of Estate Duty valuations abates none of the criticism which has been directed against the Government's compensation policy.

The CWS "Bank"

The questions put to Mr Dalton a week ago about the practices of the Banking Department of the Co-operative Wholesale Society have focused attention upon a drift which as yet is chiefly of concern to the joint stock banks, but which, if accentuated, could become an issue of wide public importance. The Chancellor listed forty-eight local authorities—mainly small, and many in Wales, but including Gateshead, Newport, Pontypridd and Durham—whose accounts have been transferred from joint stock banks to the CWS "Bank"; and this list is not complete. He admitted that the "Bank," despite a reduction in rates twelve months ago, is offering local authorities 2 per cent interest on seven-day deposit balances and 1 per cent on current balances, whereas the joint stock banks are required to pay not more than 1 per cent on (14-day) deposits and allow nothing at all on current accounts. It is believed that these relatively high rates are also available for other accounts of non-members of the co-operative movement, while even more generous terms have been granted to members and especially for trade union balances. In some cases, too, it seems that the rates are fixed for long periods while yet leaving the depositor with an option to withdraw at short notice, subject to only a fractional interest abatement, or none at all.

Mr Dalton has said that he is looking into this matter. It certainly merits wide and penetrating vision—and last week's characteristic interplay in the House hardly suggests that that is the kind of scrutiny which is intended. Two aspects demand attention. First, from the standpoint of the clearing banks, it surely is a matter of common justice that constraints should not be put upon them unless they apply appropriately to their competitors, more particularly as the CWS can compete as a bank only by using the services of its own bankers—the clearing banks themselves. The CWS "Bank" functions partly through a handful of its own branches, but mainly through the agency of the local retail co-operative stores which have no facilities for performing most of the essential banking services, and therefore have to lean upon their clearing bankers. But, except on this issue of principle—the sheer equity of the case—the interests of the clearing banks are of secondary importance. Some of these municipal accounts might have been transferred, for political or sentimental reasons, even if the CWS rates had been less attractive; and it may be, too, that from a revenue point of view alone the clearing banks so far have scarcely been prejudiced.

The really important aspect is the interest of the CWS depositor. The truth is that the CWS "Bank," despite the clearing and other facilities which it secures from its clearing bankers without directly contributing to their cost, cannot possibly pay these attractive rates unless it has a very high proportion of high-yielding assets, which forces it into a condition of illiquidity which would be inconceivable for a normal "deposit" banker. The following note shows that, by any banking standards, its balance-sheet position is quite extraordinary.

A Question of Liquidity

The latest available annual balance sheet, dated January 12 of last year, showed total deposits of £226.67 million, plus £6.83 million of employees' thrift, pension and death benefit funds against which £10.08 million of investments were specifically lodged. If these pledged securities are excluded, the whole "backing" available for the deposits was as follows:—

Deposit Liabilities		Total Backing		% of Deposits
	£ mn.		£ mn.	
Current Accounts	34.35	Advances, etc.	3.04	1.3
Deposit Accounts	192.31	Investments	206.22	90.6
		Short-dated investments	8.51	3.8
		Cash Money	8.10	3.6
		Cash	1.43	0.6
		Land & buildings	0.01	...
	£226.66		£226.31	99.9%

Depositors can look with equanimity upon this investment balance sheet if a very high proportion of them regard their deposits as permanent or semi-permanent investments. It will be seen that 85 per cent. of the total comprises deposit accounts; and, of these, four-fifths are balances belonging to the CWS itself, which also holds a quarter of the current accounts. But the bulk of the CWS deposit balances is simply the counterpart of deposits lodged with it by retail societies, trade unions, clubs, and the like, and these bodies, in their turn, receive funds from sales of shares to, or loan account borrowings from, working-class members of the movement.

The base of this pyramid of liabilities is the thrift of the little man, individually or (as in the trade unions funds) collectively. Are these savings really so immobile and so free from the possibility of sudden movement as to justify a liquid ratio of 4.2 per cent (8 per cent if short-dated gilt-edged are included)? The CWS's current account of £8.55 million at the "Bank" is presumably the working cash balance for the whole of its ramified trading. What kind of cover does that require? If it needed 100 per cent, the residual liquid assets would be £1 million—under 4 per cent of the residual current accounts, though 37 per cent if short-dated gilt-edged securities are included.

Given the prospect of continued full employment; given family allowances and the whole structure of social insurance; given too the subsidising effect of PAYE when employment ceases suddenly, the management of the CWS may feel that there is sufficient immobility in these deposits to make this a tolerable assets structure. But others who survey it at a distance cannot help feeling that the very homogeneity of the deposit sources gives the minimum of risk-spreading. Mr Dalton may persuade the "Bank" to reduce its deposit rates again, and thus may help to redress the balance with the position of the clearing banks. Those banks, at the date of the above CWS balance sheet, were in effect obliged by the Chancellor's policy to keep 55 per cent of their deposits in cash or securities with less than six months to run, and on that 55 per cent they are able to earn on the average only 0.43 per cent.

But action on these lines would do no more than check the tendency for the CWS "Bank" to increase the proportion of its mobile deposits. It would not automatically reduce the illiquidity. And it would not answer the ultimate question—whether the existing deposits are sufficiently immobile to justify that illiquidity. It is no answer to say that depositors need not worry because gilt-edged securities are always saleable on reasonable terms since the Chancellor's cheap money technique stands ever ready to make them so. Nor is it an answer to say that the position of depositors in any large institution will always be safeguarded if need arises. On that argument, the clearing banks might well tender the whole £1,550 million of their Treasury deposit receipts in exchange for long-dated gilt-edged as soon as Mr. Dalton next opens a "tap."

First Report on l'Expérience Blum

The French Government have begun to talk of anticipating the second price cut of 5 per cent which was due to be put into operation on March 1st next. *L'Expérience Blum* is now meeting its first real difficulties. Strikes of civil servants and railwaymen have broken out as a result of dissatisfaction with the provisional increases in salaries granted last week. The strikers have been exhorted by M. Blum himself to return to work and not to jeopardise a plan which, if it fails, must endanger the value of any conceivable concessions they might wring from the Government at present.

Meanwhile the French Government has published a report on the first results of the price cut. The report covers the period January 1 to 15 and is admittedly too fragmentary to give a reliable overall picture of the initial response to the experiment; but at least it is the best available documentation of the results

Shock tactics are needed and will do good so long as the shock lasts. But by themselves they will not accomplish much. The obvious criticism of the White Paper is that, while it states the need for a sharp rise in productivity, it does not even hint at how it is to be achieved. The only statements in the White Paper that come anywhere near being declarations of policy are that the Government is "taking energetic measures" to remedy local unemployment, that it "is doing everything it can in the present international discussions" to reduce to a minimum the danger of importing unemployment from other countries' depressions (this should presumably be read as meaning that it is doing everything it can, short of annoying the American State Department) and that it "will maintain control" of prices. For the rest, the White Paper is content to leave

a great responsibility . . . on both sides of industry to play their full part in rousing the nation to an appreciation of the country's very serious economic position and in ensuring that there is such a large and sustained increase in production as will enable us to have sufficient goods to pay for our essential imports and to meet the urgent needs of the people at home

—in short, government by delegated exhortation.

To this criticism the official reply would doubtless be that the present White Paper was never intended to state official policy and that this will be done when Mr Morrison introduces his "economic budget" to the House of Commons next month. This, no doubt, is true, and Mr Morrison would be putting himself in a ridiculous position if he confined his "budget" to an allocation of the available resources without devoting any attention to how the resources themselves can be enlarged. But it is difficult, nevertheless, to avoid a certain scepticism, since some of the things that need to be done if the Government is now to play its full part in a campaign for high productivity would involve it in a change of policy fully as sharp as the change in tone of voice that is registered in this week's White Paper. It will, in any case, do no harm to set down some of the steps that a Government that was really in earnest would set about taking, whether the catalogue turns out to be an anticipation or a warning. None of the items in the list is any less familiar than the points in the White Paper's analysis; but apparently they are in equal need of repetition.

The first point in any productivity policy must obviously be an attempt to enlarge the total labour force. There are some small steps that could be taken at home. The efforts that have been made to persuade married women to stay in, or return to, work, for instance, have been rather half-hearted, and the recent increase in old age pensions, justified though it is, was so contrived as to induce the elderly to leave their work. There are a few score thousand extra workers who could be recruited by means of comparatively small administrative changes in the social services and the tax laws. But the only large addition that can be made to the labour force is by the recruitment of foreigners. At length, after monstrous higgling, the Government has secured the entry of a few thousand Poles into coalmining and agriculture. But why only a few thousand? And why only Poles? The French Monnet Plan, faced with a similar necessity, boldly legislates for the organised immigration of 250,000 foreigners. But in this country Mr Isaacs has, only this week, been turning down, without any sensible reason stated, a proposal to allow Italian ex-prisoners of war to return for work on the land. Why? Sometimes it is said to be the food shortage that interposes a barrier. But even as many as half a million foreigners would add only 1 per cent to the population. The real reason, of course, is that the trade unions would not like it. But if that is so, the duty of the Minister of Labour is to state the public interest clearly and let the trade unions feel the weight of public opinion, not to busy himself with finding excuses for them.

The second chapter-heading in a productivity policy should be to revise the whole system of direct taxation—not, indeed, to provide incentives to effort, for no taxation system can do that, but to reduce the very heavy deterrents that the present system imposes. The case against Pay-as-You-Earn as a deterrent to work and an incentive to leisure has been made with the greatest force by many people and on many occasions. It has never been satisfactorily answered. Attempts have been repeatedly made, in these columns and elsewhere, to show how a direct and progressive tax could be levied on all incomes and collected "as you earn" without this deterrent effect. These also have never been answered. No Government can claim to be taking seriously the need for stimulating productivity until it has either reformed the present system of PAYE or conclusively proved that it cannot be altered. Surtax is another levy that needs examining for its effect on productivity. Almost certainly, it has long since passed the point of diminishing returns. Not once since 1939 has it yielded as much as the Budget estimate, and the effects of leaving only moderately successful professional men with no more than a small fraction of their earnings can be seen by anyone who will look around. Mr Dakon believes in soaking the rich. Does he believe in doing so at the expense of economic activity?

The third direction of attack upon the problem should be the formulation of a consistent wages policy, related not only to the level of wages, but also to the method of paying them. It is a matter of record that the institution of guaranteed weeks and minimum wages or reductions in working hours usually (though there are exceptions) results in lower production, and that systems of payment by results lead to higher output. If productivity really is as desperately necessary as the White Paper says, it would use all its influence to promote payment by results. The Government itself, apart from a half-hearted attempt to postpone the demand for a general 40-hour week, has been neutral in these matters. But its Trade Union *alter ego* is strenuously pushing, without rebuke, just those claims that are most likely to be damaging to productivity.

Fourthly, if the tempo of economic activity is to be speeded up, there needs to be an overhaul of the whole apparatus of economic control. Some control there must undoubtedly be, but nobody could pretend that the present network of controls works very smoothly or very quickly. The basic trouble is that there is no Government mechanism of control, but a score or more Departmental systems. If the Cabinet want to help the people to get to work, they should set up some super-departmental Inquisition charged with the duty of abolishing those controls whose usefulness is smaller than the resources of time and labour they absorb, and with the further duty of so co-ordinating the remaining controls that the harassed business man can get permission for one simple operation by one simple application.

Here, then, is a four-point programme for greater productivity. The difficulty about it is that almost every item on it runs up against either trade union interests or Socialist doctrine. These recommendations, Ministers will say, are Tory policy. Very well, then; what is the Labour policy for quickly raising productivity? Exhortation, yes; but what else? Capitalist economics has several remedies to suggest for this particular disease. Labour economics has none—except more Socialism, and not even the fanatics could seriously claim that that would produce results as quickly as they are now needed. Let us, said the Labour Party at the general election, face the future, and it can fairly claim that it has done so in the eighteen months that have passed. But it has been a fairly remote future that has been faced. What Labour now has to face is the present.

Plans for Europe

THE work needed to transform the proposed Anglo-French Alliance from an aspiration into a concrete instrument of co-operation lies all ahead. Not only are the political auguries uncertain in France, but the Anglo-French Committee charged with formulating proposals for closer economic integration, having held one or two meetings, has found considerable difficulty in listing any concrete points on which both can agree. For instance, it might well be economically desirable to divide Anglo-French agricultural activity by concentrating wheat production in France and the manufacture of agricultural machinery, including tractors, in England. But the French Army argues that, in the interests of security, a basis for a tank industry must be kept on French soil. Again, there might seem to be no reason why a watch-making industry serving both countries should not be developed in France. But, in an emergency, the British would find themselves unable to manufacture precision instruments. In short, in most of the field in which rationalisation and specialisation offer openings for integration, national security obtrudes and the problem of Anglo-French co-operation ceases to be economic and becomes strategic. And, in France, strategy means one thing only—the problem of defence against German attack.

On policy towards Germany, the divergence between French and British policy has, up to the present, been great and growing greater. It is true that most Frenchmen probably now realise that the actual physical separation of the Ruhr and Rhineland from Germany is impossible. But they are all the more alarmed about the potential economic implications of British and American policy. In essence, the French want the restoration of German industrial power to be secondary and contributory to France's own recovery. The British and the Americans, on the other hand, wish to restore Germany's economic strength sufficiently to make it pay its way. But, by definition, a country of some seventy millions "paying its way" is bound to be economically more powerful than a country of forty millions. So long as the British and American Governments find no way out of this dilemma, the chances of a really concrete Anglo-French alliance seem remote.

It is, in fact, because every approach to European peace based on separate national sovereignties re-creates Germany as the most powerful nation, that many minds in the West are turning to the idea of an economic federation for Europe. The argument is that the Potsdam policy of de-industrialisation has already proved that it will be the ruin not only of Germany, but of Europe as well. A measure of German industrial recovery is inevitable and desirable, but with it is restored a potential war machine. But Europe's peacetime needs could absorb all Germany's production, provided methods were established to distribute the products over Europe and to do so under a strict form of international control. This can be done most easily, it is argued, by establishing an economic federation and planning German industrial recovery, not as part of a strictly national German economy, but as the core of a European commonwealth. And as a part of a larger European economy, Germany would no longer be economically preponderant.

This approach has received encouragement in recent weeks from the unanimous acceptance by the General Assembly of the United Nations of the plan to set up a European Commission—a proposal which had hung fire since August, owing to Russian opposition to it on the Economic and Social Council. The Proposal was that this Commission should act as a species of Planning board for Europe, as a channel for loans and, possibly,

as heir to various technical bodies, such as the European Coal Organisation, the European Emergency Committee and the European Committee for Central Inland Transport. The reason for the Russian *volte-face* is known to have been pressure from the governments in Eastern Europe who, seeing Unrra coming to an end and nothing taking its place, were anxious to leave a door open for further Western aid.

These little noticed moves in the direction of a more genuinely European approach have been accompanied by some better advertised activity in the political field. A week ago, Mr Churchill's campaign for a European Federation was launched in London and a few days later Senator John Foster Dulles, who has been nominated to succeed Secretary of State, gave his blessing to the idea of European federation in a speech which, he said, had received the approval of Governor Dewey and Senator Vandenberg. Both Mr Churchill and Mr Foster Dulles spoke of a federation of all Europe, but both probably regard that as an unattainable ideal and are thinking more of a smaller grouping of the Western European States.

What can be said of these projects—the wider European federation or the more modest plan for Western Europe? The case for wider integration in the economic field is so overwhelming that it need hardly be re-argued here. Nevertheless, during this century, one of the great obstacles to all ideas of economic fusion has been the difference in living standards between East and West, and the consequent danger that fusion might entail the flooding of Western Europe with cheap labour from Eastern Europe. To-day, the danger is not less; indeed, the devastation of Germany has brought "Balkan" standards to the Rhine and the pressure of surplus labour may come from them, not from the Slav peoples, but from the millions of dispossessed and uprooted Germans. If, however, plans for federation were elaborated to give the most backward and devastated areas priority in development, and fusion were evolved gradually as economic standards came more nearly to coincide, then the old barrier to federation might be removed. Nevertheless, it remains true that one of the attractions of the idea of a smaller Western federation is that the difficulty of unequal standards need not arise.

The real difficulties in the way of both a wider (or a narrower) European federation exist primarily in the political field. No amount of wishful thinking can banish the degree of solid Communist influence in Europe to-day. In Eastern Europe it is paramount, in Western Europe, strong. It follows, therefore, that any policy initiated in the West which has, or is believed to have, as its most important aim the checkmating of Russia and the reduction of Communist influence, has a formidable political fight ahead of it. And can it be doubted that the two most recent champions of European federation have this aim in mind? Mr Foster Dulles says so explicitly. Mr Churchill, it is true, has gone out of his way recently to stress the need for Soviet concurrence, and the presence in his committee of many well-known Liberal and Left-wing names might be held to give an assurance that European federation was being pursued as a thing good in itself and not as a "defence in depth" against Communism. But Mr Churchill's leadership of the committee gives it its decisive political stamp. Even if he has changed his mind since his speech at Fulton nearly a year ago, nobody in Moscow, and few people in Europe, will believe it.

162136

of the Government's initiative and, moreover, it has an air of complete candour and objectivity. The general verdict which follows a presentation of statistics of prices is that "psychologically the Government's move has rallied the nation; but this response has not been altogether uniform." With exquisite irony, the report points out that

consumers are unanimous in supporting the action of the Government and do so both by insisting on the application of the decreed reductions and by notifying any instances of resistance to the decree. . . . Wholesalers and producers show the same attitude when dealing with the people from whom they buy. . . . The agriculturalists are showing signs of some reticence. It would seem that almost everywhere the farmer would like to benefit from the 5 per cent reduction on what he has to buy before passing on the same benefit to the people who buy from him. . . . Throughout agriculture the situation is somewhat uncertain. Rural artisans whose prices are normally below the official prices are inclined to refuse the 5 per cent cut which, in turn, has unfavourable effect on the attitude of their agricultural clients. . . .

The report gives a number of examples of resistance to the decree and of action taken to overcome this resistance. It also complains that in many cases the 5 per cent cut was nullified by fraudulent writing-up of prices as soon as the intention of the Government became known. The general verdict seems to be that the experiment has succeeded so far as officially priced goods are concerned, but seems to have been largely disregarded in the free price sector of the market.

* * *

Argentine Wheat Deal

The January and February US grain allocations to the United Kingdom were rather lower than were expected and there was a serious doubt as to the maintenance of the bread ration. This, however, has been safeguarded at the expense of stocks which, it is suggested, may now be below 800,000 tons. The purchase of half a million tons of wheat from the Argentine for shipment during the first half of 1947, therefore, shows that energetic steps have been taken to avoid an emergency. Consumption of flour in the United Kingdom, even under rationing, is running about 10 per cent above the pre-war average, whilst imports of both wheat and flour during 1946 were 72 per cent of the 1938 total.

British commitments for 1947 have been given as 4.4 million tons, and available supplies are estimated at 3.9 million tons, leaving a gap of half a million tons. On the other hand, Argentina is expected to have an exportable surplus of wheat exceeding one million tons. With only a limited grain storage space and the prospects of a 6 million-ton crop, compared with 4 million tons last year, Argentina is doubtless willing to sell, provided that the buyer does not haggle over the price. From the British point of view, paying the Argentine piper will mean further worry for the Chancellor of the Exchequer and his policy of subsidising the cost of living.

In this particular agreement, however, price may not be of paramount importance. It has been suggested that an extra allocation of 1,600 tons of caustic soda and 3,900 tons of soda ash, equal to about half of one per cent of British annual output, was

U.K. EXPORTS OF CAUSTIC SODA AND SODIUM CARBONATES

	1938	1945	First Half 1946	Second Half 1946
Caustic Soda:—				
Total.....	cwt. 1,948,324	cwt. 2,987,133	cwt. 1,807,900	cwt. 1,294,445
Of which:—				
Argentina.....	112,164	279,780	223,268	77,588
Brazil.....	290,509	323,579	225,491	281,362
British India.....	492,816	685,325	374,530	381,792
Sodium Carbonates:—				
Total.....	cwt. 3,756,186	cwt. 3,898,325	cwt. 2,044,559	cwt. 2,164,293
Of which:—				
Argentina.....	265,481	367,408	170,033	307,133
Brazil.....	275,641	387,339	210,382	229,444
British India.....	1,242,413	943,227	348,914	508,583

the deciding factor which persuaded the Argentine authorities to agree to the wheat contract. This, no doubt, is something of an exaggeration. Exports of heavy chemicals have been restricted owing to the coal shortage, for one ton of caustic soda requires about one and a half tons of coal. Moreover, there is a world shortage of sodium carbonates due partially to the dislocation of German and Belgium production.

The British Government has shown itself reluctant to direct exports to a particular area, though it has doubtless provided guidance to exporters. Such advice should, and doubtless does, acknowledge the importance of ensuring that long-established

markets are kept as well supplied as possible and that the demands of customers which have something to sell in return are not. But lacking an export surplus of coal to use as a bargaining weapon, the Government must be sorely tempted to use any exportable commodity for securing adequate imports of foodstuffs and raw materials.

Repaying TDRs

The banks, in these days, have certainly no reason to complain about the flexibility of their assets structures. In 1945, before the abnormal expansion of bank deposits began, there were many grumbles about the preponderance of the relatively inflexible Treasury deposit receipt, which at once time accounted for over 41 per cent of bank resources, while the most flexible earning assets—bills and call money—stood at 7 per cent or less. Now, despite the huge creation of new deposits against Government borrowing, and despite the big expansion in bank investment portfolios, the growth of money market assets has more than kept pace with that of total bank resources. In the middle of January, money market assets reached the huge total of £1,052 million—nearly £10 million above the record level of end-December. They now represent 18.7 per cent of deposits, the highest ratio since 1940 and roughly equivalent to the average for the year 1938. Meanwhile, despite the increase in official borrowing on Treasury deposit receipts in the second half of last year, the TDR ratio now stands at only 27.8 per cent.

These tendencies, moreover, are likely to be further accentuated in the coming weeks. Not only is the Treasury deposit receipt still regarded as the variable element in floating debt, but the authorities seem to be taking every opportunity to increase the proportion of tender Treasury bills. Thus in the past five weeks the main impact of the seasonal decline in floating debt has fallen upon Treasury deposit receipts, the total of which will by the end of this week have been reduced by nearly £90 million, whereas the tender issue of Treasury bills will be only £15 million below the record level of £2,150 million reached early this year. In the corresponding period of last year the reduction in debt was more evenly divided between the two elements, and in the first nine weeks of the year the whole £130 million of tender bills seasonally created in the previous autumn was allowed to run off. Last autumn, despite the interruption of the seasonal pattern by the launching of the tap loan, an additional £200 million of tender bills were created, the largest autumn increase yet made.

But, despite this abnormally large expansion, and despite the stronger seasonal influences of the Budget in this current "revenue" quarter, there is a chance that this time some of the bills may remain outstanding. Next week nominal maturities of TDRs will be large, so that a fresh TDR issue is inevitable; but, instead of arranging for the whole of its finance by this means, the Treasury raised the offering of bills for yesterday's tender to £170 million, or £10 million more than the nominal maturities. The bankers' pleas for more flexibility in their liquid assets structure have certainly not gone unheeded.

* * *

A 91-Day Treasury Bill?

Since the authorities have obviously been at such pains to ensure an ample supply of these most liquid assets, it is to be hoped that steps will also be taken to ensure a more even flow of maturities than has been available in the past. One of the consequences of the abandonment of window-dressing and of the adoption of the principle of a stable day-to-day cash ratio is that the banks need, more than ever, a substantial volume of bills maturing on every working day. This, however, is at present an unattainable ideal because Treasury bills have retained the form originally adopted in 1877 when, on Bagehot's advice, they were modelled on the commercial bill. The life of a Treasury bill is always expressed in calendar months (though without days of grace), so that, unless any given three-month period contains exactly thirteen weeks—i.e. 91 days—there can be bill maturities on only five days out of the six, because there is naturally no issue of bills on a Sunday. The incidence of the calendar thus produces many Mondays in each year in which there are no Treasury bill maturities, just as there are normally no maturities on the last day of each year (because September has only thirty days) or on the last three days of May. Other anomalies arise from the incidence of public holidays—on which, of course, no bills are issued.

From time to time various means have been suggested of the way in which this odd situation could be corrected. A few weeks ago attention was again drawn to the matter by a suggestion in *The Banker* that it was time that the impact of the vagaries of the calen-

The word 'dollar' is a corruption of the German 'Joachimsthaler' or 'thaler,' the name given in the 16th century to coins from the silver mine of Joachimsthal in Bohemia.

For many years Barclays Bank have fostered the growth of Anglo-American trade by providing a comprehensive foreign banking service re-inforced by the establishment of a Representative's Office in New York. Today, when the expansion of our export trade is vitally important, Barclays Bank offer a complete foreign service, together with such other banking facilities as customers may require.

LIMITED
54 LOMBARD STREET, LONDON, E.C.3.

NARRATIVE ARITHMETIC

So involved do the social and political effects of economic policies and practices become that the necessity of working out arithmetical sums in narrative form is forced upon all of us. *THE BANKER* makes no apology for doing it again in argument which refuses to be side-tracked on subjects of considerable moment. In the February issue we have:

"BANKERS AND CHEAP MONEY"

in which previous explorations are brought up to date and previous contentions confirmed.

By Victor Morgan, Professor of Economics, at Swansea, an article looking towards

"A RATIONAL PLAN FOR WAGES"

shows the ratio of theory to practice in a new light and performs a very salutary mind-clearing.

Also in this issue are:

"THE COST OF GERMANY"
"IRISH BANKING CONTROVERSIES"
"INDIA'S STERLING BALANCES"
"THE BANKS IN 1946"
etc., etc.

THE
BANKER
for February

February

"Towards the end of February we are so busy handling documents relating to fish shipments that our Department might almost be part of Billingsgate itself". So writes an official of the Overseas branch of the Midland Bank at 122 Old Broad Street, London. Every month shipments are financed by credits arranged through London, but exceptional activity during this month arises from European countries preparing to import fish from Newfoundland and Northern waters for consumption in Lent. The business of the Bank's foreign branches in Birmingham, Bradford, Liverpool and Manchester similarly reflects interesting seasonal variations in the flow of goods through the world's markets.

MIDLAND BANK LIMITED

ment of working-class consciousness and solidarity among the still backward masses. But, in fact, propaganda goes much farther than this. Great emphasis is laid on foreign affairs, and trade union meetings are used for violent hate propaganda against Britain and the United States. The Danubian workers are given long lectures on Indonesia, Trieste, Greece and China. Often these are based on the most absurd oversimplifications or distortions. This is the feature of working-class activity which least pleases the Western visitor, but it should not obscure the constructive social achievements.

It must be stressed in conclusion that workers' organisations in the Danube countries are developing on different lines from those in the West, because the circumstances are different. The Western worker would probably resent the close connection of the unions with the State, the direction of labour and the constant interference with private life—even though all

these things are making their appearance in Western countries too. Probably some Danubian workers do resent them. Though it is very hard for outsiders to estimate Danubian working-class opinion, there is some evidence of a popular reaction away from the Communists towards the Socialists, not only in Hungary where the Socialists were always strong, but in the other countries where they were weak and somewhat despised. But this is not very important. The paramount importance of restoring production makes some such policy as the present inevitable. And there is no doubt that those who have first priority in the sharing of the much reduced national resources are the workers. The situation of the poorer workers is materially better than before; that of the skilled workers may be materially worse, but is relatively better in comparison with other classes. Most of the workers realise this, and are likely to remain loyal to the new regimes.

Twilight of Ministers

(By a Correspondent)

By kind permission of the publishers, the Stevenage University Press, we are privileged to print the following extract from a forthcoming book, to be published early in 2048, by the Silkin Memorial Professor of Political Mechanics.

THE principle of complete royal subjection to ministerial control was firmly embedded in the British Constitution in the course of the nineteenth century. Though theoretically all-powerful, the Monarch had, by the end of Queen Victoria's reign, completely accepted the position that he could do nothing without ministerial advice and, indeed, that he could not refuse to do anything that his Ministers advised him to do. The outstanding precedents of the early twentieth century serve merely to formalise and codify what was already implicit. Thus the events of the year 1910 established that the King could neither refuse to create peers in numbers sufficient to swamp the House of Lords, nor to dissolve even a newly-elected Parliament—or, at least, that he could not refuse both together. A precedent of 1923 made it clear that the King was no longer free to choose a Peer for his Prime Minister, and the abdication crisis of 1936 laid it down once and for all that the sovereign has no private life—or, rather, no life at all beyond the reach of his Ministers' advice. By these last nails in the coffin of royal power, Ministers seemed to have established a position of unchallengeable supremacy.

But there is no such thing as finality in human development. The Cabinet had no sooner removed the last formal checks on its power than it, too, began to be something of an outward show and the reality of power began to move elsewhere. Ministers, in the middle of the twentieth century, were subject to three pressures which together made it impossible for them to fulfil the role that the Constitution, as then understood, assigned to them. In the first place, with the advent of Socialism, the subject-matter of state action was enormously extended. Secondly, the subject-matter of public affairs became much more technical and difficult and this, coinciding with the growth of the belief that it was a positive advantage for a politician to have spent his formative years in the mine or at the bench, made it a rarity for a Minister to be able to understand the papers that were put before him, even if he had time to read them. Thirdly, the number of personal appearances required of a Minister—in Parliament, at conferences, and at luncheons, dinners and meetings of all kinds—increased so greatly that even these activities, hitherto pre-eminently those of the Minister himself, came to be beyond the powers of a single man, except

with the assistance of a Public Relations Officer. Under these pressures, the Minister gradually became a figure-head. Even as early as Mr Attlee's first Administration, formed immediately after the end of Hitler's war, only those Ministers who combined the most forceful personalities with a willingness to work cruelly long hours could really be said to be responsible for their own words and actions, let alone those of the Departments they nominally controlled.

But this gradual change was not apparent for many years. The permanent civil servants, while engrossing more and more of the reality of power, studiously preserved the outward forms of Ministerial supremacy—as, indeed, Ministers in their turn did towards the King. Just as laws were still enacted “by the King's Most Excellent Majesty,” and Ministers spoke of their “loyal duty” to the Crown, so also the most eminent and powerful civil servant would still refer to his Minister as “my master,” and would begin his letters, “I am directed by the Secretary of State. . . .”

This typically British situation of a complete divergence between outward form and reality might have continued indefinitely without any attempt to intrude logic into it, had it not been for a number of incidents arising either from excessive stupidity or from unscrupulous ambition on the part of those who had to work the system. It would be foolish to regret these incidents, since it is only by the precedents they create that any certainty can creep into British constitutional practice. For example, it had long been apparent that, since a Minister was incapable, without official advice, of taking into consideration all the factors involved in a matter, no importance should be attached to his chance remarks. But the actual precedent was not created until 1958. In that year, when speaking in the House of Commons on the compensation clauses of the Costermongers Nationalisation Bill, the Minister was stung by an interruption from the Opposition to depart from his manuscript and to assure the honourable member that every effort would be made to do justice. Since this was manifestly contrary to the main purpose of the Bill, which was urgently required to put a stop to sabotage of the National Retail Board, a serious position immediately arose. Ministers, while fully recognising the difficulty, argued that if they were never, in any circumstances, to interject a word of their own, it would detract from certain ceremonial formalities, known as “the cut and thrust of debate,” which were not only of great antiquity but commanded considerable weight of sentimental attachment. A compromise solution was assisted by a fortunate

coincidence. Owing to the three-day week in the printing trade, it had for some time been the custom to have Ministerial speeches set up in type for “Hansard” before they were delivered—indeed, usually before the Minister saw them. It was, therefore, easy to arrange that only this printed record was official. The Opposition applied to have the same facilities extended to them as to the Government. Since then, speeches on both sides have been prepared in the Departments and the cut and thrust of debate has been entirely devoted to the purposes for which it is most appropriate: that is, for occupying the time of Members of Parliament and providing a harmless outlet for the grievances and desires of the public.

The next important precedent was set in 1973. Some difficulty had been experienced before then in drawing the exact line between what a Minister could and could not do without advice, and the sheer pressure of necessity had led to a progressively greater invasion of what had hitherto been regarded as Ministers' private lives. This applied particularly to the company they kept, by which their confidence in their official advisers might possibly be affected. Ministers' wives could hardly be selected for them by their Departments, since most of them had acquired a wife by the time they arrived at office and the Civil Service could therefore merely insist that the wives should share their husbands' willingness to lead a useful life in the public eye without ever giving evidence of any opinions that differed from those of their husbands' advisers. Whether, if a Minister's wife did not observe these limitations and the Minister was officially advised to divorce her, he would be constitutionally bound to accept advice so rendered, is an interesting speculation for which, happily, no precedent gives a clue to the answer. But with more casual acquaintances the case was obviously different, and the matter came to a head in 1973 when the Permanent Secretary to the Ministry of Books and Publications was compelled to take formal notice of the fact that his Minister was seeing altogether too much of a young woman who was not an Established Civil Servant, and had actually induced him to read a book which had not reached him through official channels. The Permanent Secretary was deferential, but firm, and was supported by his colleagues. The Minister did, for a brief moment, contemplate carrying on without advisers, but this, through sheer shortage of personnel, might have involved all the hideous dangers of permitting the newspapers to appear without a competent prior censorship of their contents, since they could hardly be kept waiting more than the customary ten days. It was, therefore, an easy task for the aged Duke of Montgomery (who, with a quarter-century of political experience added to his military fame, was by now the elder statesman of the country) to convince the Minister that he had no alternative to capitulation. This affair, as if to emphasise the continuity of British traditions, has become known as the Second Bedchamber Crisis.

Since then, relations between the real rulers of the country and the Ministers in whose name everything is still done have been smooth and happy. In the earlier years of the transition, alarm was sometimes felt by the public at the very low intellectual capacity of some of the men appointed to be Ministers. It has now come to be appreciated that the personal qualities of the Minister are more or less irrelevant, provided that he will always do as he is told. Indeed, it is permissible to go farther. Just as the advent to the throne of a really dominating personality might upset the delicate balance of the British Constitution, so it can be said with some truth that it is a positive advantage in a Minister to be a nonentity. By one of those historical parallels that abound in this subject, it was the accident of a female sovereign at the critical time that smoothed the transition to a powerless monarchy, and it was the accident that the early Labour Prime Ministers were compelled to recruit at least half of their Governments from elderly

trade union officials that made it possible for the transition to ministerial nonentity to be accomplished with so little open conflict. It is many years now since there has been any formal complaint about the wisdom of the arrangements made by the Permanent Secretaries for an appropriate alternation of majorities between the parties in the House of Commons.

Only one more date needs to be inflicted upon the student to bring this story of gradual change and development “broadening down from precedent to precedent” to the present time. The concentration of power in the hands of the Civil Service naturally directed attention to the methods of appointment. Appointments to the Civil Service had long been provided for far beyond the reach of Ministerial interference (see the present author's article, “Further Evidence on the Conflict between the Spoils System and the Schools System”). But promotion within the Civil Service, and especially appointments to the highest offices, remained for some decades within the range of matters on which Ministers, or at least the Prime Minister, had to be consulted, even if only as a formality. The greatest care, as always, has been taken to preserve the forms. Announcement is still made in the traditional formula, “The King has been pleased, on the recommendation of the Prime Minister, to appoint . . .”, but, as everybody knows, both the ministerial recommendation and the royal appointment are no more than a *congé d'élire* and the real decision is taken elsewhere. It was not until 2013 that an Act was passed formally legalising the position that the real nomination lies with the Committee of the Athenaeum. This happy blend of classical learning derived from Greece, of a self-perpetuating Soviet derived from Russia, and of the mandarin system imported from China, illustrates the flexibility and adaptability with which the British Constitution has evolved through so many centuries without any of those forceful revolutions that have brought so much tragedy to less fortunate peoples.

Records and Statistics

In addition to the short “Statistical Summary” which appears weekly in *The Economist*, a full service of statistical and factual information appears weekly in

Records and Statistics

Supplement to *The Economist*

Records and Statistics is a separate, self-contained weekly publication of from 16 to 24 pages. It includes not only many statistical tables but also factual records of public affairs, including Parliamentary activities and digests of state papers, and industrial and commercial reports from home and overseas. It is believed to be the most comprehensive statistical and factual report appearing weekly anywhere in the world.

The *Records and Statistics* Supplement to *The Economist* is available by postal subscription only. The subscription, which may be sent direct to this office or through a newsagent is 30s. per annum. For those who are already direct postal subscribers to *The Economist*, the economy of posting both publications together makes it possible to quote a combined subscription of £4. Subscribers to *The Economist* who wish to receive *Records and Statistics* should notify this office as soon as possible, but are asked not to send any money until an account is rendered. It is regretted that it is no longer possible to supply back numbers of *Records and Statistics* or to date subscriptions back.

Paper shortage also makes it impossible to supply sample copies. For a limited time, however, subscribers to *Records and Statistics* will be allowed, if they wish, to cancel any unexpired portion of a subscription.

THE ECONOMIST, BRETTENHAM HOUSE, LANCASTER PLACE, LONDON, W.C.2

dar upon the money market should be ironed out by the expedient of prescribing each week a Treasury bill adapted to the needs of each three-months period in question. Most of the anomalies would, in fact, be removed by adopting simply a 91-day life as standard for all tender Treasury bills. The suggestion has been actively discussed in money market and banking circles recently and appears to be attracting a good deal of support. After the experience of the greater jerkiness which the new cash ratio technique of the banks has produced in the short loan market, even the more conservative members of the market seem likely soon to sink any prejudices they may have against a change in traditional practice—for this particular change can only make for smoother running of the credit machine as a whole and for the particular convenience of the discount market.

Steel Company of Wales

The announcement by Mr. E. H. Lever, the chairman of Richard Thomas and Baldwins, in South Wales on Thursday of the formation of the Steel Company of Wales, marks an important new stage in the development of the South Wales steel strip and tin plate industry. The new company is the logical outcome of the modernisation schemes submitted by the Iron and Steel Federation to the Ministry of Supply last summer and of the recent announcement by the leading steel and tinplate companies concerned of their intended amalgamation. The whole project, however, has still to be approved by the Steel Board.

It is proposed that the Steel Company of Wales should take over the Port Talbot and Margam works of Guest Keen Baldwins Iron and Steel Company (these will form the basis of the hot strip plants), the old type tinplate works of Richard Thomas and of Llanelly Associated Tinplate Companies and the Newport sheet works of John Lysaght. The Ebbw Vale plant of Richard Thomas and Baldwins stays outside the scheme. Cold reduction mills will be erected, one in the Swansea district and one in the Llanelly district. This is in accordance with the Government's policy—which was also implicit in the Iron and Steel Federation's plan—of causing the minimum dislocation of labour by bringing work to within travelling distance of the workers' homes. A third cold reduction plant will be put down at Newport or Port Talbot. If, in fact, it is installed at Port Talbot, it might conceivably be put alongside the hot strip mill—which is to be expanded—with an economy in transport. The hand mills belonging to the companies will be retained by the new company for use as marginal capacity and for special products.

Assets taken over from the constituent companies by the Steel Company of Wales will be assessed by an independent valuer. It is understood that the scheme will require some £50 million of new money—a considerable increase on the £35 million estimate which appeared in the Federation's plan last year. It has yet to be decided how the money is to be raised, and in what proportions it will be held by the interested companies. Mr. Lever referred, in his address, to looking "hopefully to the Treasury" and it may be that assistance from the Industrial Finance Corporation may be necessary.

If the scheme goes forward—it will take 4 to 4½ years to get the plant into operation on the most optimistic assumptions—South Wales steel sheet capacity will be expanded to produce a wider steel sheet at a rate of production considerably above that achieved at Ebbw Vale. The new capacity will be oil fired, and some American plant is absolutely essential for the project. The immediate placing of orders in America for key plant while the American manufacturers still have capacity to fulfil orders will clearly be necessary if the timetable is to be achieved.

* * *

Freer Silver Market

A further step towards the complete freeing of the London silver market was taken last Monday when Bank of England control of the price at which silver could be sold to authorised users disappeared. The event was signalled by a fall in the fixed price from 55½d. at which it had stood since last August, to 44d. per ounce. The price at which silver has been fixed since last Monday corresponds to the New York parity, taking the free New York price of 70½ cents and allowing for shipping costs to Britain. Henceforth, London bullion brokers will be allowed to buy the silver required to satisfy the needs of authorised users (industrial users and manufacturers of silver ware for export) in the cheapest available market, and the London price will thus vary with the lowest quotation from the available sources of supply. London

brokers will be provided with the necessary foreign exchange to finance their purchases, subject to certain restrictions—namely that the silver is required for authorised purposes and that it is being bought in the cheapest market. Last November the Bank of England withdrew from the market as an active operator and left the responsibility for purchasing silver to the approved firms of London bullion brokers. These firms then bought on a fairly large scale in New York with a view to satisfying the authorised domestic demand at the then fixed price of 55½d. After these private purchases had been made, the silver price in New York broke sharply from around 90 cents to 70½ cents per fine ounce. The London price should have followed this movement immediately and would have done so had it not been for the virtual assurance that had been given to the London market, that it would be allowed to resell the metal imported from the United States at the then official price. For a time, therefore, authorised users of silver in Britain have been compelled to pay more than the New York parity for their metal. Now that this rather expensively acquired silver has been reduced to small proportions, consumers are at last being given the benefit of the fall in the dollar price of the metal and arrangements have no doubt been made to take care of the residuary loss.

The adjustment of the London price to the lowest effective overseas parity is, however, no more than a small step towards the restoration of a really free market. The restriction of sales to authorised users remains. Other users of silver—for example, the jewellery trade in respect of the manufacture of articles for the domestic market—will still have to satisfy themselves from the supplies of "free silver" which, in the main, are fed by melted scrap and metal emerging from domestic hoards. The free silver price continues to move closely with the Bombay parity, since holders in London have the option of selling it as free silver here or shipping it to India. Nor do the new arrangements for fixing the price affect the arrangements by which dealers are authorised by the Bank of England to buy silver in certain countries for sale in other countries. The time is, therefore, still far distant when the silver quotations even in one market are unified; the return to a single world price for the metal is more distant still.

* * *

Polish Labour for Wool

The National Association of unions in the textile trade have agreed this week to the employment of Polish labour in the wool textile industry, on certain conditions, which appear to be reasonable—or at least understandable. All Polish labour is to be recruited through the Ministry of Labour and all the conditions of Union agreements are to be fully observed.

This attitude on the part of the woollen trade unions is commendable if rather belated. The number of persons employed in the woollen and worsted industry in June, 1945, was 129,800. This figure increased to 159,700 by November, 1946, but it was still 47,900 less than in June, 1939. An ample stock of wool is held in this country, although some of the finer types are in short supply. The problems of the moment are to ensure sufficient fuel to keep the mills going and sufficient new labour to enable the industry to expand its scale of production. Reports from Yorkshire give accounts of mills closing down or running only for a part of the week. It would be most regrettable if, at the moment when Polish labour was about to be recruited, the wool textile industry had insufficient fuel to keep its present labour force fully occupied.

* * *

Resistance to Cheaper Money

Evidence of the growing resistance to cheaper money continues to accumulate. In the early weeks of this year seasonal forces have neutralised the upward impetus of the volume of money—but only just. On January 15th—the new-style monthly statement of the clearing banks this time falls at mid-month, because New Year's Day was a Wednesday—"gross" bank deposits dropped by £56 million, their first decline since last February. But this movement was wholly due to the usual deflation of items in course of collection after the turn of the year, so that true deposits are £1.2 million higher than at the year-end, at £5,439.9 million. This fractional increase compares with an average rate of growth of well over £90 million per month since last March, but contrasts with declines of £73 million and £40 million in the similar month of 1946 and 1945 respectively. Thus the steep decline in Exchequer expenditure, by comparison with last year, has had no visible effect upon the banking position. In the first eighteen days of January there was an "ordinary" surplus of £90½

million, compared with £19½ million a year previously. Rather more than half this surplus was absorbed by "below-line" expenditure and net repayments of tax reserve certificates. On the other hand, nearly £100 million of finance was ostensibly provided by large and small savings and drafts upon the North American credits.

At first glance this disparity between the movement of net Exchequer outgoings and of bank deposits appears to be reconciled by the repayment of the unconverted portion of the Local Loans, but it can surely be taken for granted that a proportion of the maturing stock was already in official hands, so that, to this extent, redemption involved nothing more than a cross-entry in the departmental books. If the figures for early January are joined to those for the previous three months—discussed in these columns three weeks ago—thereby eliminating the distorting effects of the Locals repayment, the conclusion still must be that in this period upwards of £250 million of money has been created which cannot be accounted for by the visible requirements of Government or industry's direct demands for bank credit. This calculation, moreover, assumes that in the 3½ months the Government secured only £100 million of effective finance from external sources, whereas over £150 million was actually drawn on the American credits. It is very evident that, despite the demand for dated stocks, the public still has a very large appetite for liquid cash.

Marketwise, an even more striking pointer to the investor's mood is the result of the recent local authority conversion operations. The success of the Ayr issue four weeks ago, when the 2½ per cent, 1970-75 stock at par was fully subscribed, suggested that these terms had become quite firmly established for Corporation issues. And the new filip to the demand for dated stocks which has been given by the bankers' speeches might have been expected to consolidate the position. Yet this week the Hastings, Ipswich and Southampton issues, offered on the same terms, all closed with 30 per cent or more to be taken up by the usual official underwriter. A 28-year life to final redemption is admittedly long, but, in view of the shortage of dated stocks, it was hardly to be expected that investors would be so selective. It seems that recent questionings about the future of cheap money have underlined the value, not only of a date, but of one in the relatively near future.

* * *

Linseed Oil and Substitutes

The sudden increase in the price of linseed oil, briefly noted in last week's issue of *The Economist*, has caused great concern to paint manufacturers. There is no complete substitute for linseed oil, although a number of materials have been developed which can be used with linseed oil so as to stretch its supply. These include an aromatic petroleum extract, obtained from the refining of lubricating oil, which is relatively cheap, and which is available in adequate quantity. Its use is limited, however, since it can only be substituted to the extent of one part to three of linseed oil.

Last week Lewis Berger and Sons, the paint manufacturing concern, announced that they had successfully evolved a substance known as styrene co-polymer, a plastic base for which the claim is made that it can be used to reduce the consumption of linseed oil in paints by 40 per cent or more. Styrene itself is in free supply but the principal source is the United States; it provides a substitute for linseed oil, that is, only at the expense of dollars. During the war the Germans developed thio-cyanates as synthetic substitutes, but their commercial application is doubtful since they are based on a dangerous poison which is harmful to touch. De-hydrated castor-oil and various fish-oils have also been used in certain paints.

But the problem of finding a complete substitute for linseed oil still remains. The question is important not merely because of the present high price for linseed oil but also because the exportable supplies are concentrated in a few countries, the chief of which is Argentina. It is fairly certain that the recent British purchase of 100,000 tons of linseed oil on behalf of the International Emergency Food Council conceded the price demanded by the Argentine negotiators, who held that the price was "substantiated" by an estimate of a lower prospective output for 1946-47. The price actually paid would have encouraged production and assisted the long-term supply of linseed. But in fact the Argentine Government last November reduced the buying price of No. 2 grade flaxseed from 35 pesos to 30 pesos per 100 kilograms. Thus the price obtained by Argentina for linseed oil on the world market bears little or no relation to the return allowed to flax producers in that country. Only the Argentine Government, it seems, is to exploit the seller's market.

The US Department of Agriculture has estimated, the world production of linseed for 1946 at 132.3 million bushels compared with 135.1 million bushels for 1945, and an average 136.8 million bushels for 1935-39. The decline has been due mainly to reduced output in the United States and India which has been partially offset by increased production in Canada and South America. The Argentine Government's first official estimate for linseed acreage in 1946 was 5,036,000 acres, compared with 4,558,000 acres in 1945 and an average for 1936-40 of 6,909,000 acres. It would appear that Argentina should have large supplies of linseed and oil available, for neither has been used locally as fuel since early 1945. Yet the Government seems determined to take advantage of the world shortage of fats and oils and obtain the highest possible price from its purchasers. Such a policy is an open invitation to consumers to pursue their researches to discover a complete substitute if this is technically possible.

* * *

International Shipping Conference

The scope and shape of a permanent international organisation for shipping has been under discussion for many months on both sides of the Atlantic. This question is bound to inform much of the proceedings at the first post-war meeting of the International Shipping Conference, which meets in London next week when representatives of shipowners will attend from twelve maritime countries—Australia, Belgium, Denmark, Finland, France, Greece, India, the Netherlands, Norway, New Zealand, Sweden, the United States, and the United Kingdom. As the Conference has not met since 1928, its main task must be to review its functions in the post-war world. Before the war the Conference secured an important measure of agreement on regulations governing the safety of life at sea, the use of radio frequencies, tonnage measurement and loadline regulations. These matters are all due for revision; what is less certain is how such agreements can be made effective unless non-members can be encouraged to co-operate. Only by Government enforcement can internationally-agreed regulations be implemented, and the Conference will have to consider how its work can be aligned with the international maritime authority which was proposed at the last meeting of the United Maritime Consultative Council.

On the other side of the Atlantic the proposed international consultative and advisory shipping organisation is being discussed by the 15 members of the United Nations Transport and Communications Commission, which includes other maritime nations such as Brazil, China, Yugoslavia, Poland and South Africa. The new organisation is not expected to have any executive powers, but it will provide machinery for inter-Governmental co-operation in obtaining the universal adoption of maritime regulations and standards. Among its main functions would be the "removal of discrimination and restrictions." Any success in this direction, it may be noted, would depend to a large extent on a distinct change in the maritime policies of such nations as the United States, Soviet Russia, South Africa and the Argentine.

It seems likely, therefore, that while the International Shipping Conference may safely adhere to the United Nations organisation as far as technical matters are concerned, its greatest value may lie in international co-operation to protect its members from the effects of uneconomic subsidies or nationalist shipping policies. The success of the various liner conferences and of the International Tanker Pool may well encourage member shipowners to work out details of a plan for an international minimum freight scheme or some other form of mutual "insurance" in tramp shipping. This possibility was already being discussed on the outbreak of war, and the Policy Report of the General Council of British Shipping in September, 1944, urged that "any system to prevent tramp freights falling below the cost of efficient operation of shipping services must necessarily cover foreign as well as British vessels." No far-reaching conclusions can be reached in the first three-day meeting for 19 years, but the question may well be delegated to a special committee. The main object of the London Conference will be to clarify its status, aims and methods.

* * *

The Bondholders' Fate

In their 73rd Annual Report, the Council of Foreign Bondholders draw a comparison between the prospects for foreign bondholders after the two wars. It is a breath from another world to learn that the Council were able to state in their Annual Report for 1918 that "the settlement of the external obligations of the Central Powers and their Allies will form part of the

NOTES OF THE WEEK

The Fourth Republic Begins Work

For a week now the inauguration of a new phase in French parliamentary life has been going on in an atmosphere of encouraging and unusual moderation. In the election of a President both for the new Republic and for the National Assembly and in the choice of a Prime Minister, success has gone to men of the Centre. M. Vincent-Auriol, a skilled parliamentarian with a record of distinguished service in Algiers as well as Paris, belongs, on the whole, to the conservative wing of the Socialists. He was not, for instance, a supporter of fusion with the Communists. M. Ramadier, his choice for Prime Minister, is less well known among the Socialist leaders, but also has the reputation of a moderate. And the new President of the Assembly, M. Herriot, is in a sense the visible embodiment of the political Centre in France.

This team of representative and sensible men gives some hope that the new Republic's political life will open in an atmosphere of sobriety and responsibility. M. Ramadier has had, it is true, to bargain hard for his Cabinet. The obstacle was inevitably the other parties' distrust of the Communists; the MRP even threatened for a time to stay out, if the Communists received the Ministry of Defence—their only condition for participation. But M. Ramadier finally overcame MRP resistance—and has now assembled a Cabinet which includes Socialists (with 9 seats), Communists and MRP (with 5 each) as well as Radicals and Moderate Conservatives.

What has induced this new spirit of sweet reason, after so many months of reckless partisanship and parliamentary deadlock? It is, of course, possible that all parties with a genuine democratic intent have learnt the lesson of the last referendum in which the ordinary men and women of France gave evidence of considerable weariness and disillusion with the whole political process. At the same time, General de Gaulle made so very evident the potentially unconstitutional character of his opposition to the parties, that even the MRP could not go along with him. The Communists seem, in an especial way, to have seen the red light. They have bargained with discretion and have made considerable concessions, for instance, abandoning their claim—as the largest party—to the Premiership and demanding the Ministry of National Defence largely, it appears, as proof of their complete patriotism and respectability. In recent speeches on the anniversary of the death of Lenin, both M. Thorez and M. Duclos went out of their way to say that Marxism was not a rigid dogmatism and that policy should be adapted to suit different circumstances. Certainly in their present approach to Cabinet making they have shown a most flexible abnegation.

But the new mood in the Assembly and the predominance there of the Centre in general and the Socialists in particular, are above all the work of M. Blum. His attack on inflation, the adoption of the Monnet Plan, his visit to London have all given the impression of firm government. For the first time an incoming Cabinet feels that it inherits something valuable from its predecessor. By breaking the deadlock in policy-making, the moderate Blum administration helped to create a new belief in the possibility of combining moderation and effective government. This belief will be seriously tested during the coming session, but its existence has at least given the new Assembly a reasonable start.

General Smuts Puts the Clock Back

Dr Malan's views on the colour problem are no secret. Fortified by his recent success in the Hottentots' Holland by-election, he was bound to try to capitalise the resentment of all South Africans at Uno's strictures upon the Union's colour policy. Accordingly he introduced into Parliament this week a motion that Uno be flouted, that South West Africa be forthwith incorporated in the Union, and that the Indian question be solved either by withdrawal of communal franchise privileges or by deportation. Clearly, he hoped to split the United Party ranks. But before he could do so, his fangs were drawn by General Smuts, and in a manner that will surprise many of the latter's admirers in this country. General Smuts's answer was that the Government did not intend to carry out the requests made in Uno resolutions either as regards the Indians in the Union, or as regards South West Africa.

In view of the by-election already mentioned, this reply may be an adroit manoeuvre at home. But it is fraught with the very

gravest consequences abroad. General Smuts argues that he has not torn up the United Nations Charter; to do so would be "provocative." The Union, he says, is ready to go on administering South West Africa under the old mandatory rules (which means to submit reports about it, but not to admit inspectors). It is also ready to review its Indian policy, but as a "purely domestic concern." But, whatever the domestic interpretation of these statements, they in fact knock a very large hole in Uno's frail structure. That hole is of the kind that others can only too easily enlarge. If South Africa can turn a deaf ear to the voice of the majority, why not also Albania, and, later, Ruritania? The second consequence of his speech is to split Uno into two camps, one white, and one coloured, one reactionary and the other eager for change and a readjustment of values. This deplorable division was already discernible at the First Assembly, where Russia and India took it in turn to lead the innovators. The rift is now bound to increase because John Bull—who is, to far too many of the world's peoples, from his topper downwards, an out-dated reactionary—has begotten a son who stops his ears and covers his eyes and refuses to look ahead.

White Men and Africans

General Smuts's retrograde move affects all white nations. But it has a special consequence for white men who inhabit Africa. It will adversely affect all the three big groups of these—in the Union itself, the British settlers in Kenya and the French *colons* in Algeria. Of these three the Union, in particular, claims a leadership in African affairs. And to this it clearly possesses a title on both economic and strategic grounds. But it has now jeopardised its claim to political supremacy.

All but three million of Africa's 150 million inhabitants are coloured. The continent is within the next half century bound to undergo many of the developments that Asia has seen in the last. If General Smuts were to read the omens now apparent everywhere from Karachi to Manila, he would move with the times and not against them. Each of the three big white groups in Africa—South African, Briton and Frenchman—has in its hands the chance to shape the relation of white minority to coloured majority along lines different from those which Europeans shaped for themselves in Asia. Two out of the three groups offer small grounds for hope; like the average South African, the average Kenya settler prefers to reserve highlands for white settlement and to hope that a life "like old times" will outlast his day.

If South Africans are now to take a step backwards, the third party—the Frenchman in Algeria—offers the more grounds for hope of progressive behaviour. He allowed himself some lapses during the war years, but he has since made amends with an enlightened new Statute for the territory and has been rewarded during 1946 with a series of votes in the national elections which display that Algerian Moslems want to remain within the French Union; in November, 1946, they returned to the Chamber a majority of the party that wishes Algeria to be a decentralised part of France. True, Algerian Moslems are more easily assimilable than Indians, but Frenchmen are anxious to apply the same policy farther south. To do so would be to reduce, instead of magnifying as General Smuts has done, the chances of eventual race war.

The Strikers' Truce

The strike of the London road haulage workers, and of the market workers, dockers and provincial haulage men who came out in sympathy, was brought to an abrupt end at the end of last week, when, after a further meeting with the Transport Workers' Union officials, the strikers agreed to return. But even if the men are back at work, the atmosphere is still electric, and the position is one of truce, rather than of peace. It was officially denied that the men had returned because they had been told of an offer by the employers. No doubt this is literally the case, but it is difficult to resist the impression, which rapidly gained currency, that after their stubborn refusal to return on Wednesday and the evidence that tempers were exacerbated by the use of troops, the strikers would not have surrendered in such a lamb-like way on Thursday, unless they had at any rate been given to understand that their claims would be favourably considered. The newly-

formed Joint Industrial Council, after meeting for several hours on Sunday, failed to reach agreement, and the whole dispute was referred by Mr Isaacs to a special Committee of Inquiry, under the chairmanship of Lord Terrington. The Committee's findings were published too late for comment in this issue.

Even if this particular issue can be satisfactorily settled, there remains the wider question of how similar outbreaks can be prevented in the future. The Prime Minister was asked in Parliament on Tuesday by one Member whether he would appoint a select committee to examine the negotiating machinery, and by another to set up a Royal Commission to investigate trade union structure and organisation with a view to removing any defects in the negotiating machinery. The second suggestion, involving all the paraphernalia of a Royal Commission, would obviously lead nowhere, but the first certainly merits consideration. Indeed, although Mr Attlee said that the prompt and effective settlement of industrial disputes was a matter for each industry to decide, he admitted that the Government was "examining the adequacy of the existing arrangements." This is certainly an advance on the previous Pontius Pilate attitude which the Government has tended to adopt on industrial relations generally, and still clings to in relation to a wages policy. The fact that the Minister of Labour has discussed with the TUC leaders how the machinery can be speeded up is a hopeful sign of official activity.

The Trade Union Underdog

The rebuke administered last week to Sir Stafford Cripps by the Bristol Trades Council has its comic side. Sir Stafford, addressing his constituents on October 27, 1946, was reported to have cast aspersions on the ability of Trade Union members to undertake large-scale managerial and administrative jobs. After the Press had been accused of misrepresentation (always a good first move) he was asked to explain what he really did say. In a letter of reply he pointed out, all over again, the obvious facts that whatever a man's innate qualities or success in his own sphere, they do not qualify him for complex activities of a kind for which he is totally untrained; that the Trade Union movement has not, in the nature of things, been able in the past to provide for its members training of the necessary kind; that he himself had had the utmost difficulty in finding enough Trade Union members of the right calibre for his working parties; and that workers' participation in problems of production and management would have to grow gradually, as training and experience made the right men available. The Bristol Trades Council, describing Sir Stafford's letter variously as "an insult" and "apple-sauce," declined to accept it—a refusal raising interesting procedural queries. Did they return it to the sender, put it in the wastepaper basket, or relegate it to some special black-labelled file?

Comedy apart, however, the episode is frankly discreditable to the good sense and realism of the Trade Union movement, which needs both in full measure. No trade unionist would expect or allow a greaser, however superlatively he might grease, to drive the Flying Scotsman. The notion that business administration and policy-framing are infinitely easier than any skilled craft, so much easier that they can safely be handed over to any amateurish commissar who can produce a suitable trade union card, shows either an appalling ignorance of the economic world or a degree of pure unreason more appalling still. Unreason of this kind is one of the hallmarks of the underdog mentality, along with suspicion, a habit of imputing motives, and an ineffaceable sense of grievance. Such symptoms are not confined to Bristol. That they should so long have darkened trade union relations is, considering their history, hardly surprising; but for the sake both of the trade union movement and of the national welfare it is high time that they were outgrown.

Tariff Preliminaries

Preparations for the Geneva negotiations on tariffs and preferences are now in full swing. The representatives of the 17 nations which attended the preparatory committee's meeting in London last November will meet at Geneva on April 8th to begin the hard process of reciprocal tariff negotiations. Some of the preliminaries have to be completed within individual countries. Such, for example, are the public hearings on the schedule of United States tariffs, which are now proceeding in Washington. In these hearings the strident and divergent voices of vested interests are making themselves heard in unmistakable tones. That was to be expected. The one man who will be hurt by a tariff cut will create far more

noise than the thousand who may benefit. Of comparable domestic character are the preliminary talks which the Commonwealth countries will probably hold before the Geneva meeting opens. There were such inter-family talks before the London meeting of the preparatory committee, and they bore good fruit. Similar exchanges of views between the members of the Commonwealth family will be all the more important before the actual bargaining begins. Some of the Western European countries have also been discussing the methods of negotiating tariff concessions. If each country is separately to conduct concurrent negotiations with each of the other 16 participants and the resultant agreements are then to be "multilateralised" by the application of the most-favoured-nation clause, the Geneva negotiations may well outlast the present year. The whole process might be considerably simplified by grouping certain countries in negotiations with the really crucial participants.

In addition to these "domestic" preliminaries, the various participants in the tariff talks have been putting forward requests of what they will expect from each of the others. The United States appears to have taken the lead in this as in other aspects of the trade discussions and the requests to the Commonwealth countries are said to envisage a complete elimination of Empire preferences. Comment on this must be reserved until more is known of the concessions which the United States are prepared to offer, but it may be that even the full utilisation of the executive power to cut US tariffs by 50 per cent might be insufficient to justify the response of a complete elimination of Empire preferences.

Another item on the time-table is the preparation of the definitive charter. This is being undertaken by a drafting committee which began its labours in New York this week. The ITO time-table is beginning to lengthen out unpromisingly into the "close season" of the conventions that will nominate the candidates for the United States presidential elections of 1948. There is now little hope of calling the full United Nations Conference for implementing the ITO's charter until the late autumn of 1947 and the preparation and submission of the relevant legislation to the US Congress will have to be undertaken with great speed if the whole matter is not to be overtaken and swamped by the far more engrossing topic of the political conventions of the summer of next year. In view of this it may appear advisable to the nations to conclude an interim agreement on commercial policy which might, as a stop-gap, freeze existing arrangements.

More Production in Germany

Whatever other delusions still persist about the advisability and practicability of the Potsdam settlement, one at least is fast disappearing from the victors' minds. The Level of Industry Plan is virtually dead and the occupying Powers are concentrating more and more on the problem not of curtailing German production but of bringing it up to a level at which the Germans can at least live.

The latest news from the Zones is not uniformly discouraging. In spite of the inhuman conditions in the British Zone, coal output is rising again and has reached a new high level at 210,000 tons a day. This increase appears to have been secured by at last making coal the real first priority in the Zone. Since last autumn, a special coal committee has been at work and by decreeing a rise in wages and rations, the rapid repair of miners' houses, the import of Nissen huts and the rectification of a number of the miners' grievances, it has succeeded in stimulating production. Incentives may be still further increased when more consumer goods are made available to the miners under a special priority scheme which has been made possible by a modest but definite increase in the Zone's general level of production.

Among other hopeful signs from the Zone is the appointment of Dr Victor Agartz to the head of the Joint German Economic Agency in charge of the British and the American Zones. As a socialist he represents the trend of German opinion which is anxious to achieve the widest measure of economic fusion, and he replaces Dr Mueller, who was held by many to be sympathetic to the economic separatism of the Southern Linder. Dr Agartz also proved himself an efficient planner and honest administrator in his earlier post as head of the old German Economic Advisory Board for the British Zone. Since Germans are now to control all economic activities, including even the internal allocation of coal, the appointment of a man of Dr Agartz's experience and outlook may make all the difference to the possibility of organising a genuine production drive in the Western Zones.

The Russians, too, seem perturbed by the impact of their economic policy on their Zone. Last week they were partners in an interzonal trade conference at Minden which ended in an

Peace Treaty and the Council have been assured that the interests of the bondholders will be properly protected." Conditions are very different to-day. Indeed, the Council frankly state that no marked progress can be recorded towards a resumption of payments by any enemy debtors; and they underline the obvious fact that the resumption of payments would in any case depend, particularly during the next few years, on an agreed Allied policy "which cannot at present be discerned." Meanwhile, they do not pretend to be satisfied with the present indications of policy so far as these affect bondholders' claims.

Some progress, nevertheless, has been made during the last year. It is true that enemy debts represent more than half of the total of nearly £500 million of foreign issues which are in complete default, and more than half of the remainder is owned by countries, including China and Greece, which have suffered severely from the ravages of war. But the European settlements—with Czechoslovakia, Denmark and certain Norwegian municipal borrowers—have at any rate been encouraging. Salvador has ended a default which had persisted since 1937; and Siam has undertaken to pay off arrears and resume current service on the external sterling debt, though this undertaking is at present held up because the Government are retaining the necessary funds until agreement is reached with the Siamese Government on other issues.

The Report refers to correspondence which the Council has been conducting with the International Bank for Reconstruction and Development. The Council, very properly, have expressed their hope that the Bank, when it is considering applications for assistance from countries which are at present in default on their external debts, will require assurance that these debtors are taking all possible steps to resume payments on their existing obligations in negotiations with the bondholders' representatives. This is a general principle which is clearly reasonable. The Report lends particular point to the principle by noting that the Council, on hearing that the Chilean Government proposed to apply to the International Bank for assistance, took steps to remind the Bank of the unredressed grievances of the holders of Chilean external bonds.

Anglo-Danish Food Contracts

The Anglo-Danish food talks have ended, but there has still been no announcement of the decisions taken. It appears, however, that agreement has been reached about additional supplies of butter, bacon and eggs from Denmark, and that the United Kingdom has been forced to meet the Danes by paying higher prices. Publication of the agreement will no doubt be delayed until the Danish delegation has reported to its Government.

Before the war a very high proportion of Denmark's exports of butter, eggs, preserved milk and bacon found their way to the British market. The restoration of these supplies has been affected by two factors: the condition of Danish dairy farming and the question of prices. German occupation did not leave the Danish cattle population in such a ravaged condition as was at first expected. The total number of dairy cows in 1946 was 1,567,000, compared with 1,613,000 in 1939; but milk production declined more than proportionately owing to the lack of imported oil cake and meal.

Under the long-term contract signed last summer, the United Kingdom was to purchase 43,000 tons of butter plus 90 per cent of the exportable surplus over 77,000 tons. Danish exports in 1946 amounted to 76,500 tons, or 50 per cent of the pre-war level, whilst production totalled some 138,000 tons, or 77 per cent of the 1935-39 average. This discrepancy was due to the Danes consuming butter instead of margarine during the war. If, therefore, larger butter exports are required, it will be necessary to make available to Denmark sufficient oils to enable its margarine production to be increased. Denmark's other markets before the war were Germany and, to a much smaller extent, France and Belgium. Although future exports to Germany will be restricted, there will undoubtedly be increased shipments to other European countries, and possibly even to the USSR. The Danish fowl and pig populations are about 55 per cent of the pre-war level. It should be possible to expand production of both eggs and bacon considerably within a relatively short time, so that increased supplies could be exported.

The question of prices is indeed difficult. The United Kingdom has to consider not only the desirability of keeping food subsidies as low as possible but also the practical limits of paying Denmark higher prices than the Dominion producers receive for similar commodities. The Danish case is that if agricultural production

is to be increased the farmer must be given a fair return for his produce. The Ministry of Food contract price of 220s. per cwt. for Danish butter is said to be less than 90 per cent of an economic price based on production costs; accordingly the Danish Government is paying an equivalent subsidy to the farmers. But the British contract price for Dominion butter is 175s. per cwt.

The obstacles in the present talks proved not to be insuperable. The Danish Government, expecting a trade deficit for 1946 of about 1,160 million kr. (or £60 million) must either increase Danish exports or reduce imports. If Denmark's exportable surplus of dairy produce is to be increased, however, it may well mean that the United Kingdom may be called upon to help in supplying oils for margarine production or concentrated cattle foods or both.

Welfare in the Brickworks

It is regrettable and perplexing that the report of Sir Wilfrid Garrett's committee on amenities in the brick industry—which was appointed nearly a year ago and completed its work last August—should have taken six months to make its appearance. No time should now be lost in giving effect to its recommendations for modernisation and improvement, so that the industry as a whole can be brought up to the standards which have long been accepted by other industries. Modern brickworks, where production is on a large-scale, are highly efficient and provide good amenities for their workers. But large-scale units, despite the trend of recent years, are still not typical of the industry. Of a total number of 1,358 works, over 1,000 employ fewer than 50 men, and 450 of these employ fewer than 20.

In these small and usually isolated works, conditions are often deplorable, and methods of production antiquated. Elementary washing and sanitary requirements, which ought to be taken for granted in the 20th century, are often lacking; in fact, in many respects, this essential industry seems to have been by-passed both by the Factories' Act and by Mr Bevin's wartime legislation. It is not surprising that ex-brick workers have not been anxious to return to an occupation which is both arduous and uncongenial.

The committee makes a number of recommendations both for increased mechanisation, which would lead to greater production, and for improved amenities, which would encourage recruitment. They are surely particularly applicable to conditions in small rural brickfields. Increased mechanisation is urged for extracting the raw clay and transporting it to the kilns; more modern methods of floor-drying, covered tops for semi-continuous and continuous kilns, and covered ways from the presses to the kiln mouths are needed. Among the welfare recommendations are: modern sanitation; installation of wash-basins and showers; shelter huts with facilities for drying clothes; issue of protective clothing; provision for first aid; canteens in works with more than 50 workers and proper messrooms in works employing fewer than that number.

The committee was precluded from discussing wages and terms of employment—though they have a direct bearing on output and recruitment—nor did they consider in detail the question of incentives to encourage higher production. Presumably, the special committee which has been investigating technical efficiency will report on this point. It may also be relevant to consider whether it would promote efficiency to reduce the present number of small local works and to concentrate production on the most efficient units. The answer to this question is not simple, for concentration would involve increased transport costs, and dislocation of labour forces and local building operations. Yet some measure of concentration seems desirable if labour is to be utilised economically and backward sections of the industry are to be properly re-equipped.

Hours and Wages in 1946

The January issue of the *Ministry of Labour Gazette* contains a full statistical analysis of employment, remuneration, hours, and working conditions during 1946. Details are given in the *Records and Statistics* supplement to this issue. The most interesting section of this review deals with wages and hours. By the end of December, the level of weekly wage rates was about 65 per cent above that of September, 1939, and 8 per cent higher than at the end of 1945. Hourly wage rates increased by slightly more, being 68 to 69 per cent higher than in September, 1939, and 10 per cent higher than in December, 1945. The weekly increases in wage rates represented nearly £2.8 million and affected 7,850,000 people. The industries principally involved in these

AUDITORS' CERTIFICATE AND REPORT.

We have to report to the Shareholders that we have examined the Books and Accounts of THE CLYDESDALE BANK LIMITED, at 31st December, 1946, and that we have also examined the Securities representing the Investments of the Bank, and the Treasury Deposit Receipts, and have verified the Balances with the Bank of England and the Bills Discounted and Cash Balances in Glasgow (Head Office), in London (City Office), and in Edinburgh (Chief Office). We have obtained all the information and explanations we have required, and, in our opinion, the foregoing Balance Sheet is properly drawn up so as to exhibit a true and correct view of the state of the Bank's affairs according to the best of our information and the explanations given to us, and as shown by the Books of the Bank.

W. M. MILLER, C.A., Auditor.
R. G. SIMPSON, C.A., Auditor.

8th January, 1947.

agreement to expand the exchanges between the zones considerably. The Russian Zone is to receive goods and materials to the value of 105 million marks and to deliver goods of equivalent value to the British-American area.

That the Russians may be anxious to improve standards in their zone is also suggested by a recent statement on Russian policy issued through the Socialist Unity Party. This statement, which, broadly speaking, repeated an earlier private declaration made by Marshal Sokolousky to his German administration, laid it down that the Russians would dismantle no more factories (with a few vital exceptions), would reduce deliveries to Russia from current German production and would raise the level of output in the Zone "two or three times."

Can it therefore be concluded that there is a general movement of thought and policy among the Allies in the direction of higher output and an agreed higher level of industry? Unhappily this possibility does not necessarily follow from the recent moves. For one thing, no concrete statistical backing was given to the Russian statement. Its true significance can therefore only be guessed at, and it is a reasonable guess that the Russians have political, not economic, ends in view. The statement aims at reassuring the German people and also at disparaging Anglo-American policy. For instance, in a speech accompanying the statement, the Communist leader, Ulbricht, accused the British of taking Ruhr coal not as genuine exports nor even as reparations but as sheer "war booty."

It is this propagandist twist to the Russian declaration that makes it a doubtful pointer towards a new Allied unity on the question of German production and the level of industry. The victors may reach agreement later in Moscow, but their policies in Germany itself are still separate and confused.

M. Bierut and the British Council

An article by a correspondent on the Polish elections appears on page 148 of *The Economist* this week. Not directly connected with the elections, but very interesting as a minor episode in Anglo-Polish relations, was the recent occupation of the premises of the British Council in Warsaw by armed Security Police sent under the direct orders of M. Bierut, the President of the Polish Republic, to requisition the building for the Polish Conservatory of Music. The incident had a fine dramatic quality. It is well known that the branches of the British Council in freedom-loving countries are nests of reaction, well stocked with arms and explosives and defended by desperate men recruited from among ex-commandos. A less stout-hearted man than President Bierut might well have hesitated to attempt the seizure of such a stronghold without strong support from tanks and artillery, but his forces carried out this hazardous venture with no weapons more powerful than sub-machine-guns. The British garrison, confronted with the moral force of an Eastern democracy, offered no resistance, and its alleged attempt to corrupt the minds of the policemen with British Council literature does not seem to have deflected the new Poland from its way and purpose.

The affair displayed M. Bierut on the eve of the election in the attractive rôle of a Polish patriot with a care for the national culture. It is perhaps not ungenerous to suggest that on his record he was rather in need of some such advertisement for the strength of his patriotic sentiments. For his past career has not been free from a certain ambiguity of allegiance which causes some Poles to raise their eyebrows. Bierut, like Dzerzhinsky and Menzhinsky, was one of the Poles who took part in the Russian Revolution. In 1923 he came from Russia to Poland as an organiser of the Polish Communist underground movement, but soon had to flee from the country and spent several years in Austria and Czechoslovakia. Returning to Poland in 1932 with a Soviet passport, he was arrested and sentenced to a long term of imprisonment, but, claiming Soviet citizenship, he was exchanged for a Polish political prisoner held in the Soviet Union. Subsequently he held an important post in the NKVD, the Soviet political police, and when the Soviet Union annexed the eastern half of Poland by agreement with Germany in 1939, Bierut not only approved the annexation of the eastern provinces and the extinction of the Polish State then proclaimed by Russia, but also took an active part in the killings and deportations designed to crush all resistance to the Ribbentrop-Molotov partition. There are Poles who infer from this record that he is not single-hearted in his devotion to his own country—and how can he better disarm such suspicions than by bold action to check the menace of the British Council to Polish independence?

Malta's Constitution

How can a politically advanced people like the Maltese be given responsible government when their territory is of such importance to the defence of the British Empire? This question was asked after the first World War. It has been asked again in the last few years, ever since the siege of Malta was lifted. On each occasion the same answer was given. Government in Malta must be a dyarchy; the Maltese should be given full responsibility for their purely local affairs, but to the Maltese Imperial Government should be reserved all matters arising out of the position of Malta as a strategic centre. Clearly this sort of rule is always open to the danger of a clash between the two sides, and when a clash comes someone has to be top dog in order that law and order can be preserved. Thus, in 1930, the power given under Section 68 of the Constitution was stretched to enable the Maltese Imperial Government, through the Governor, to have unlimited authority in Maltese affairs.

It is clear from the account of Sir Harold MacMichael's discussions with the Maltese given in his report (Colonial No. 207) that this method of suspending the constitution has rankled. The Maltese would consequently prefer that any amendment or suspension, as well as revocation, of the new constitution now offered to them should take place only by Act of Parliament. To this the British Government cannot agree. Power for the Governor to exercise full legislative authority in an emergency is to be retained, although it remains for the Maltese to decide what legislative form they would prefer this power to be given.

Is this new dyarchy, in which ultimate power is again retained by the Imperial Government, any more likely to succeed than its predecessor, which so rapidly came to grief? There are several reasons for an optimistic view. First, in its statement of policy on constitutional reform (Cmd. 7014), the Colonial Office has made it clear that on some points—for instance, the appointment of judges—it is willing to defer to the wishes of the Maltese. Secondly, the Nationalist party, based on a pro-Italian faction, disappeared with the war, and there is a chance of more straightforward political splits between Conservatism (the Constitutional Party) and Labour. Thirdly, and perhaps most important, the language question has been settled by the recognition of Maltese as an official language with English. Fourthly, it is possible that the strategic importance of Malta will diminish, which will enable the Imperial Government to view with greater equanimity the islanders' attempts to work out their own destiny. Fifthly, the Maltese wish to remain within the Empire. But it should be emphasised that a people's chances of making a success of responsible government are gravely hampered so long as it suffers from the poverty that prevails in Malta. The grant of a new constitution must be accompanied by vigorous measures to raise the standard of living of the Maltese if they are to live up to the responsibilities it will give them.

Foreign Labour for Britain?

The miners' decision to accept Polish labour for the pits represents a welcome change of attitude after their previous intractability, although it comes too late to make any practical difference to the coal situation this winter. In any case, the numbers involved are very small. It is estimated that not more than 170 Poles are available for immediate work in the mines, with the prospect of a further 226 later. But the effective number could be increased by training and by using foreign unskilled labour on surface and development work, thus releasing other miners for productive work. Three conditions have been laid down by the National Union of Mineworkers—the local branch or lodge must agree; the Poles must join the union; and they must be the first to be discharged if there is any redundancy. It remains to be seen whether local opposition, based either on prejudice or on practical housing difficulties, will present a further barrier, now that the major obstacle of the Union's objections has been overcome.

In the meantime, negotiations for the absorption of Poles in other industries and in agriculture are proceeding, although very slowly. Of the 76,000 Poles who have been declared eligible for the Resettlement Corps, 45,380 have been definitely enrolled, but by the beginning of this month, jobs had been found for only 1,750. The Poles are working on a dispersed basis in a wide variety of industries, and not necessarily in those industries which are most short of labour. From the somewhat partial records that are available, it appears that the greatest number of Poles in any single industry is in building, with 178. There do not appear to be any in foundries or in textiles, while there

are only 18 in brick-making and 27 in farming and forestry. Yet, as nearly half the total number of men in the Resettlement Corps are under 30 years of age, there seems no reason, once the principle has been accepted, why they should not be rapidly absorbed in the mines, farms and foundries.

At the present moment, in addition to these Poles, there are a few thousand Belgians and about one thousand Baltic Displaced Persons doing domestic work in hospitals and institutions, while the scheme to bring 2,800 Italians to work in the iron foundries is making slow headway. German prisoners, of whom there are 255,000 working for different Government departments, are leaving at the rate of 15,000 a month, and although at this rate their departure will be a long process, the deficit will have to be filled somehow.

Conflicting Claims for Emigrants

The restatement of the nation's manpower difficulties given in this week's White Paper gives an added point to the warning of the British High Commissioner to the Ministers of States in Australia that Great Britain cannot afford to release only her highly trained specialists from essential industries, and that the Dominions must be prepared to take a fair cross section of the population. The High Commissioner also added that there are a large number of Poles unwilling to return to their own country, for whom opportunities for emigration are required.

Such a statement was needed, for the other Dominions are also looking for trained operatives, particularly for the building trades, and wish to draw on just those reserves of skill which are in shortest supply here. It is tragic that in this fierce competition for British men there appears to be no sign of a broader approach to the question of foreign labour. It is always British stock which is demanded, and apparently neither the existence of unemployed men of other nations, nor the miserable conditions under which they are living have served to budge the Dominions' attitude. Yet moved it must be, for if full employment is maintained, even a modest stream of skilled emigrants could be highly embarrassing to Great Britain. There is no justification for interfering with the liberty of individuals to emigrate as they wish, but there is a case for re-emphasising that the burden of peopling the Dominions should be more equally shared, and that Dominion Governments should concentrate more attention on other sources of supply. The Poles are the most obvious one: but it would be easier to push for their acceptance elsewhere, if the British trade unions had been more willing to accept them here.

At present an even more effective check to movements of population is the shipping shortage. Instead of a programme of 35,000 immigrants for this year Australia expects that only 6,000 immigrants will find shipping to take them. It is therefore perhaps premature to be worried about severe losses of manpower from Great Britain. On the other hand it will take a long time to persuade the Dominions to alter their attitude.

Manpower in November

The Ministry of Labour's employment figures for November, 1946, show little change in the trends which have been developing throughout the year, and which are illustrated in the accompanying chart.

The general significance of the manpower situation is the subject of comment in an article on page 129 and details of the employment and unemployment figures are given in the *Records and Statistics Supplement*. Some encouraging features of the returns are, first, the increase in November of 23,000 in the numbers of women employed in industry, bringing their total up to 5.6 million; secondly, the continued reduction in the numbers engaged on the manufacture of equipment and supplies for the Services, now down to 474,000 or 37 per cent of the 1939 figure; thirdly, the increase in the numbers engaged on production for the home market and exports, which stood in November, 1946, at 111 per cent and 145 per cent respectively above the mid-1939 level. Building is still 5 per cent below its prewar labour strength, and distribution 20 per cent.

The slight drop in the unemployment total is also satisfactory—the figure on December 9th being 362,976 compared with 366,531 on November 11th. Slight decreases in the "danger zones" of Wales, and the North are reported, although there was an increase of less than 1,000 in the Scottish total. However, the proportion of unemployed to the insured population of these regions (7½ per cent for Wales, 5 per cent for the Northern and 5 per cent for the Scottish regions) is high in relation to

the national average of 2½ per cent. It is too early to expect the Government's schemes for the Development Areas to be taking full effect, but unless there is a substantial drop in their unem-

ployment totals by the middle of this year, when the major part of the building programme should be complete, there will be a certain amount of scepticism about the idea of Full Employment.

Demand for Juveniles

Before the war competition to enter the civil service was so acute that the authorities never had to worry their heads about recruitment except as an *embarras de richesse*: the problem of the recruit who was too good for a routine job was much more acute than any shortages. Now the boot is on the other foot, and the difficulties have been so severe that the Government's Social Survey was set the task of finding out why people did not now want to enter the civil service.

The results of the survey, which have just been published, are interesting but also inconclusive. Unfortunately the questions asked were necessarily matters of opinion, and are susceptible of very different interpretation by different individuals: in addition a very high proportion of the people, when asked what they thought about the civil service, inevitably knew too little about it to answer. For instance, 44 per cent of those questioned had no opinion about whether pay in the civil service was satisfactory.

Careers	Schoolchildren		Parents
	Prefer	Expect	Expect
Civil Service (Home)	8	7	7
Civil Service (Foreign and Colonial)	3	2	1
Teaching	24	23	23
Engineering	7	6	7
Forces and Civil Aviation	4	4	2
Other Professions	33	26	25
Business	4	3	3
Clerical Work (not C.S.)	5	5	7
Unspecified Job Overseas	1	...	...
Miscellaneous	2	1	1
Don't Know	9	22	26
Sample	971	971	718

It is thus not possible to lay great stress on the replies. Some of the opinions revealed are, however, of general interest outside the service. Roughly 1,000 school children in the school certificate and post-certificate forms of secondary schools and their parents were asked to say what careers they wished and expected to follow. The answers are shown above.

This table throws up the immense popularity of teaching at the

COMPANY MEETINGS

THE CLYDESDALE BANK LIMITED

RECORD FIGURES

SIR HAROLD YARROW ON THE OUTLOOK

The 109th general meeting of the Clydesdale Bank Limited was held at the head office, Glasgow, on the 5th instant.

Sir Harold E. Yarrow, Bt., C.B.E., the chairman, in the course of his speech said:

Our Balance Sheet totals are now £98,557,366, and constitute an easy record in the history of the Bank. The large increase is attributable mainly to the unprecedented rise of £15,643,589, in Current, Deposit and other Accounts with Credit Balances, which now stand at £84,880,053. This rise is a reflex of Bank Deposits in general, and our figures disclose that we have participated in no small measure. There would appear to be a marked tendency on the part of the public to retain a larger proportion of their resources in the form of Bank Deposits rather than accept the meagre return now obtainable on investments and run the risk of capital loss.

Our Acceptances and Engagements on account of customers, at £1,788,220, show a welcome expansion of over £800,000. The Note Circulation of the Bank has increased during the year by £889,204, and now stands at the record but the rather disturbing figure of £8,162,748, which compares with the pre-war total of £3,013,187.

EXTREME LIQUIDITY

A position of extreme liquidity is disclosed. Cash, balances with the Bank of England and other banks, cheques in course of collection, and money at call and short notice total £28,130,360, while in addition we hold £11,000,000 of Treasury deposit receipts with an average maturity date of three months. These liquid resources, amounting in all to over £39,000,000, represent about 42 per cent. of our deposits and notes in circulation. Our investments, at £45,539,310, record a moderate rise on the year of £2,114,053, and due to the substantial appreciation in Gilt-edged Securities, the market value is considerably in excess of the figure at which they appear in the balance sheet.

Advances to customers show an increase this year of £1,168,725, and while we should prefer to see this item standing at a much higher level, it is satisfactory to note the upward movement. Our resources place us in a favourable position to meet the demands of expanding industry, and no applications for advances which are at all reasonable will be declined.

DIVIDEND OF 16 PER CENT.

The profit for the year amounts to £354,412, and shows an increase as compared with the previous year of £11,384, which I am sure you will regard as satisfactory. Adding to the profit the balance of £105,533 carried forward from 1945, there is a total of £459,945, and the Directors recommend the following appropriations, viz.: in payment of a dividend of 16 per cent. per annum, £208,000; to Staff Widows' Fund, £20,000; to Deferred Repairs Account, £20,000; to Superannuation and Allowances Fund, £50,000; to Reserve Surplus Fund, £50,000; leaving £111,945 to be carried forward to 1947. The proposed allocation of £20,000 to the Staff Widows' Fund is, of course, in addition to the annual contribution of £9,000 presently made by the Bank.

NEED FOR INCREASED PRODUCTION

That the country is enjoying full employment at the present time is reflected in the volume of business undertaken by the Bank last year, but it is necessary to keep in mind that, due to the present world shortage of goods, we are operating in a seller's market. This state of affairs will come to an end

sooner or later, perhaps sooner than we like to believe, and we shall then be faced with serious competition from abroad. Many countries, which hitherto have been ready purchasers of our goods, will in the years ahead manufacture all they can in their own countries. Customers of yesterday will be competitors tomorrow.

Only by increasing production per head of the population, in spite of the shorter working week now general in so many industries, by enjoying a freedom from labour disputes and by maintaining the most modern and up-to-date plant in our various industries, will it be possible for us to hold our own in world trade? At the present time, when there is plenty of work for everyone, it is easy to forget that less happy conditions can exist, but there can be no doubt that as soon as the abnormal demand for goods has been satisfied, we shall be confronted with some very grave problems.

At home, the Government's policy of nationalisation is bound to affect our future prospects one way or the other. It has yet to be proved that the nation will enjoy better services without increase in cost, or the same services at a lower cost, for this will be the test as to whether this far-reaching change in administration is in the national interest.

Apart altogether from the merits or demerits of nationalisation, how is Scotland likely to be affected? In past years we have seen that administration from London has operated in many instances to the disadvantage of Scotland, and with the extension of control it seems probable that our position will be still further adversely affected. Although regional boards will be set up in different parts of the country, virtual control will continue to be administered from London.

VITAL EXPORT TRADE

It may be thought that in drawing attention to the dangers ahead I am taking a somewhat gloomy view of our future prospects, but it serves no good purpose to shut our eyes to economic facts and to live, as I think many of us are doing at the present time, under a false sense of security. The skill and enterprise of our people are well known, and we enjoy a good name throughout the world for giving a straight deal in our business transactions, but these advantages are not enough unless we can produce more goods at reasonable prices, thus increasing our vital export trade and securing for the future our share of overseas markets. This can be achieved only if everyone is prepared to work, and to work with a will.

The Clydesdale Bank, as well as the other Scottish Banks, will certainly do their utmost to promote industrial development and agriculture in Scotland, and will co-operate with any organisation, whether it is nationalised or otherwise, to support any scheme which will be to the benefit of the country.

HELP FOR SMALL TRADERS

I am glad to say that this Bank has given financial assistance to a large number of small traders, involving somewhat greater risk than banking prudence normally dictates. The Board feel that every possible encouragement should be given to them to resume business or embark on new enterprises.

So far as agriculture is concerned, we have a large number of farmers' accounts, and we value this connection very highly and do all we can to assist farmers in their present drive to increase the food supplies of this country, so vital at the present time.

The report was adopted.

LAW DEBENTURE CORPORATION, LIMITED

INCREASED REVENUE

The fifty-seventh ordinary general meeting of the Law Debenture Corporation, Limited, was held on the 31st ultimo, at Winchester House, Old Broad Street, London, E.C.

Mr Robert R. J. Turner, O.B.E., a director of the company, who presided, said:—My colleagues have appointed me acting chairman of the corporation in the absence of Lord Greenwood, who has recently sailed on a business mission to South Africa, and before he left he asked me to convey to you his apologies and regret at being unable to address you today when the accounts are submitted for the first time since our capital reorganisation scheme became effective from January 1, 1946.

14 PER CENT. ON HIGHER CAPITAL

Before calling your attention to the changes necessitated by that scheme, I will refer to the accounts for the past year, for which we are proposing again to pay a total dividend of 14 per cent. but on the increased Ordinary share capital.

The balance sheet and the profit and loss account figures for the year 1945 are printed in italics, but have been adjusted to enable comparison to be made with those for 1946, now under review.

Taking first the profit and loss account, interest and dividends at £80,327 gross are higher by £11,325 than in 1945.

This large increase—over 16 per cent.—is accounted for under three heads; first, as to £6,500 earned on the securities held at December 31, 1945, in the Ordinary Shareholders Dividend Fund, which under the capital scheme are now merged with the investments of the corporation; secondly, as to £3,300 arrears of interest accrued during the war years on 14 separate securities in our portfolio, and lastly, as to £1,500 from additional investment interest earned in 1946.

The next item—Commissions and Fees, £4,322—an increase of £1,582 over 1945—is a satisfactory indication of our participation in the expansion of business which has been so marked a feature of the past year.

Fees as trustees, £40,550, are £989 higher than the previous year, due to receipt of arrears of fees from companies which, during the war, were unable to remit the amounts owing.

PROFIT ON REALISATIONS

Profit on realisation of securities is £5,362. This compares with a loss of £2,178 in 1945. To some extent this substantial profit has arisen from the redemption of securities in respect of which provision for depreciation in former years had been made out of profits of those years.

With a small addition for transfer fees the total of £130,607 on the credit side of profit and loss account compares with £111,331, or £19,276 more than 1945.

Now let me refer briefly to our capital reorganisation scheme, which was sanctioned in the early part of last year. Upon the passing of the resolutions the directors were authorised to capitalise £148,000 of the general reserve fund and to allot that amount in the form of Ordinary shares to the holders of the Founders' shares.

The latter shares were at the same time converted into 2,000 Ordinary shares of £1 each fully paid, making a total addition of £150,000 to the Ordinary share capital. The then outstanding total of 450,000 Ordinary shares of £1 each were converted into stock transferable in units of £1. These transactions were duly carried out.

The report was adopted.

JUTE INDUSTRIES, LIMITED

CONTRACTS FOR NEW MACHINERY

MR. J. ERNEST COX'S STATEMENT

The twenty-sixth annual general meeting of Jute Industries, Limited, will be held, on the 13th instant, in the board room of the Association of Jute Spinners and Manufacturers, 5, Cowgate, Dundee.

The following is the statement by the chairman (Mr. J. Ernest Cox), which was circulated with the report and accounts for the year ended September 30, 1946:—

It is my sad duty to refer to the death, on August 22nd, of our esteemed vice-chairman, Mr T. H. H. Walker's entire business life was spent in the industry, to which he brought to bear a sound judgment, combined with a genial disposition. His absence from our deliberations will be much missed. Mr H. Giles Walker has been appointed vice-chairman in his place.

Three new directors—Mr W. G. N. Walker, Mr R. S. Walker and Mr James Strachan—have been appointed. The first two entered the business in 1927, and but for their war service, would have been offered seats on the board before now. Mr Strachan has been with us for 31 years, and was head of our costing department.

The profit, after making provision for taxation, is £168,937, compared with £137,885 last year. Production was somewhat higher, but there has been, and still is, a considerable shortage of operatives. On account of the number of new concerns which have been attracted to this district, competition for labour will be acute for many years to come.

FIVE-DAY WEEK

In view of the recent reductions in working hours, accepted in the engineering industry, in the cotton, wool and other textile trades, the jute trade has agreed to adopt, as from January 8th, a 45-hour working week of five days, with Saturday free, but with pay as for the former 48 hours. Whatever can be said, in theory, regarding the merits of this departure, we feel compelled to state that, in our opinion, the time is ill-chosen for such a step, involving, as it must, a drop in production and a serious increase in manufacturing costs. It is only fair to say that, in return, the trades unions concerned have agreed to do all they can to reduce absenteeism, and have promised not to put difficulties in the way of new methods designed to improve the output per operative.

Your directors are convinced that the only means by which production can be materially increased is by the further installation of modern and labour-saving machinery in both the spinning and weaving sections of the trade. We were one of the original pioneers in introducing automatic doffing high speed spinning frames, as long ago as 1930. We were also the only firm in Dundee to equip a mill with sliver spinning machinery before 1939. Today a large proportion of our fine and medium yarns is produced on modern machinery, and as I told you last year, our scheme of modernisation, but for the war, would have been even further advanced than it is.

Provisional contracts have been placed for some £400,000 of machinery for delivery in 1947, 1948 and 1949, to which must be added

NOTICES

ASSISTANT COMMERCIAL MANAGER required, possessing degree Lond. Sch. of Econ. or equiv. Alert mind, sound judgment, initiative and tact essential. Quick promotion certain.—Box 420.

GENERAL SALES MANAGER.—Important group of Electrical Manufacturers require Chief Sales Executive to control all home market sales. Applicants must possess extensive commercial and organising experience and have held similar appointment with large organisation. Headquarters of group are in London. Salary for successful candidate, age about 40, is commensurate with responsibility of the appointment. Write, giving fullest details of personal, educational, business record and salary.

expenditure of erection, and alteration to buildings. The installation of this machinery, is vital if we are to meet the labour problem, and to keep our cost of production at a reasonable level.

Modern machinery by itself will not, however, attract labour unless it is accompanied by the appointment of personnel and training officers, the provision of canteens, accommodation for clothing, and other amenities, all of which entail considerable expenditure.

INCREASED DIVIDEND

This leads up to the question of the application of the year's profits, and in spite of the large sums required for modernisation, your directors feel that stockholders are entitled to participate in the increased profit and accordingly recommend a dividend on the Preference stock at the rate of 7 per cent. in place of the 6 per cent. paid last year. Out of the profit we have placed £60,000 to depreciation and obsolescence and £50,000 to reconstruction of buildings and modernisation of plant; the carry-forward has been increased by £1,100.

In the balance-sheet, I would direct your attention to the increase in the amount for plant and machinery, which is due to the installation of the spinning machinery to which I referred last year. The investments in Government securities made in response to the appeal for support for the war effort have been sold and the profit added to investment reserve.

PRICE AND SUPPLIES

The Jute Control is still in operation and prices are regulated by it. Recently the price of jute has been advanced by approximately £26 per ton, with corresponding advances in yarn and cloth prices. Owing to the necessity for concentration in India on the production of rice, it is likely that our raw material will be in short supply. We understand, however, that a sufficient quantity has been secured to meet the demands of the trade for a considerable time. The working party has not yet issued its report, which is awaited with considerable interest.

In conclusion, I may say that the profit for the first three months of our financial year has been maintained, and that our order book is well filled. More business could be secured if we were able to increase our labour force, and every possible effort is being made to that end.

LLOYDS BANK LIMITED

ANNUAL GENERAL MEETING

The eighty-ninth ordinary general meeting of Lloyds Bank Limited was held on the 31st ultimo, at the Head Office, 71, Lombard Street, London.

The notice convening the meeting and the auditors' report having been read, the chairman, the Rt. Hon. Lord Balfour of Burleigh, D.L., said that he assumed that the report and accounts, which had been circulated, would be taken as read and that, as his statement to members had also been circulated, he did not propose to take up the time of the meeting by reading it.

The report and accounts were adopted and the usual business transacted.

Votes of thanks were passed to the chairman and directors and to the staff.

THE NATIONAL BANK LIMITED

ANNUAL GENERAL MEETING

The one hundred and twelfth annual general meeting of the proprietors of the National Bank Limited was held on the 30th ultimo at the Head Office, 13, Old Broad Street, London, E.C.

Mr Michael J. Cooke, the chairman, presided.

The secretary read the formal notice convening the meeting and the report of the auditors.

The report and accounts, which had been previously circulated, were—with the approval of the proprietors present—taken as read, and the chairman reviewed the figures of the balance sheet and referred to the payment of the dividend at the rate of 10 per cent. per annum and the transfer of £10,000 to both the reserve and the premises accounts, which left £57,574 carried forward.

The chairman moved: "That the report and balance sheet to 31st December, 1946, be adopted by the meeting and entered on the minutes."

Sir George F. Murphy, Bt., seconded the motion, which was carried unanimously.

The retiring directors, Rt. Hon. Sir Thomas F. Molony, Bt., P.C., Mr Hubert Briscoe, and Mr Edward H. Walpole, were re-elected, and the auditors, Messrs Peat, Marwick, Mitchell and Company, and Messrs Stokes Brothers and Pim, were re-appointed.

RIO DE JANEIRO FLOUR MILLS AND GRANARIES, LIMITED

SATISFACTORY RESULTS

The sixty-first ordinary general meeting of the Rio de Janeiro Flour Mills and Granaries, Limited, was held, on the 30th ultimo, in London.

Mr S. C. Sheppard, the chairman, in his circulated statement, after referring to the accounts for the year ended September 30, 1946, said that the Board's recommendation of a final dividend of 1s. per £1 unit of stock, less tax at 9s., making a total dividend for the year of 8 per cent., less tax, was amply covered and the carry-forward was increased by £2,361 to £67,369.

After referring to the suspension of wheat shipments from Argentina during the year, he paid tribute to the Brazilian Government for their assistance in the emergency which had confronted the country's milling industry.

He referred to the 1946-47 Argentine wheat crops and said that the reports he had were of a reassuring nature.

Regarding the future, the chairman said it appeared to be more difficult than ever to say much, but he thought that the company should have a secure future. The company had a good organisation and was in a sound and liquid financial position.

At the meeting the chairman said that a cable had just been received from the Rio management reading as follows:—"Hopeful of obtaining reasonable supplies of wheat during this calendar year. General trading conditions continue difficult on account of the increasing local cost of production although the demand for our products is satisfactory."

The report and accounts were adopted.

At the extraordinary general meeting which followed, new articles of association of the company were adopted.

THE CHARTERED INSTITUTE OF SECRETARIES.—Employers requiring the services of CHARTERED SECRETARIES to fill secretarial and similar executive posts are invited to communicate with the Secretary of the Institute, 16, George Street, Mansion House, E.C.4.

SALES PUBLICITY MANAGER.—First-class man required by large industrial group. Candidates should be experienced in Electrical Manufactures and be capable of handling the National Sales Promotion Publicity programme for home market. Preference will be given to high-grade Executives with similar experience with leading concern. Head Office in London.—Applicants, age about 40, should write, giving fullest details of personal, educational and business record, and salary required, to "P.M. Confidential," Box 401.

present time, and the unpopularity of business. The civil service is now employing some 340,000 in the executive and clerical grades, and wishes to recruit about 8,000 a year for the next few years. Some 81,000 boys and girls left grant-aided secondary schools in 1937-38, of which only a proportion were of school certificate standard. If only 11 per cent of these now wish to enter the civil service, including the overseas service, and a still smaller proportion can pass the entrance examinations the prospects are not rosy.

The recruiting troubles from which the civil service is suffering are of two kinds: the particular ones are due to its being the constant butt of newspapers and politicians, so that the worthwhile aspects of public service are overshadowed. This can be partially remedied by more information for the schools about what the civil service does and the prospects of reaching positions where the work is more than just routine hacking. The second difficulty is common to the country as a whole and is due to the absolute shortage of juveniles for all demands. If the civil service receives more than its share, then other employers must suffer. It is, indeed, up to the civil service to show how economies can be made in the employment of the young, by the permanent use of part-time labour on semi-automatic clerical jobs, by the retention of willing people beyond retiring age in dead-end occupations and by the utilisation of the young on work for which their education and scarcity fit them. Cheap and plentiful juvenile labour is a thing of the past.

The Future of the ICS

The Under-Secretary of State for India, Mr Arthur Henderson, left Delhi on January 21st to return to London after conferring with members of the Indian Interim Government about the future of British members of the Indian Civil Service and officers of the Indian Army. No agreement has so far been reached on compensation for those who wish to leave these services on the final termination of British authority in India.

Two questions of principle are involved: the first, whether those who wish to resign now from the Indian services have any valid claim to compensation for interrupted careers as well as to proportionate pensions, and the second, whether there is any legal or moral obligation on them to remain in the services after the final transfer of power. On the first point, it must be admitted that the claim is a strong one, for an Indian civil servant or officer has had to qualify himself in a highly specialised profession, including knowledge of Indian languages, law, local customs and so forth, which are unlikely to be of value for obtaining other employment at comparable remuneration elsewhere, and in any case such employment is scarce, as many demobilised officers from the war-time Services have found during the last two years. It may be said that, as Indian self-government has been a declared goal of policy for two decades, British entrants to the Indian Services must have known that sooner or later the British control would come to an end; on the other hand, recruiting for the Services has been sustained by repeated assurances that the British Government would look after the financial interests of officials if the existing conditions of establishment were fundamentally altered. The British Government appears to have an obligation in this matter, whether it can persuade the new India to accept any liability or not.

It is clear that it would be of great advantage to the new India to retain the services of a number of expert administrators and army officers with long experience of India, and habits of loyalty to "the Government," conceived as a supreme, impersonal, almost supernatural, authority. But the value to India which these trained public servants represent unfortunately offers no guarantee that they would receive the kind of fair treatment to which they have been accustomed. It is not a racial question, for it affects also Indian officials who share the "non-political" tradition of the services. The prospect is that the intensity of party strife in India will "politicise" all branches of State service. This has already come about to a great extent. There may still be careers for foreigners under such conditions, but they require qualities of a kind which the British Raj in India in the last eighty years has not encouraged in its servants. The British nation has no right to press men to enter the service of a foreign state for whose probable administrative methods their training has not prepared them.

Key to the Public Boards

The publication of the Electricity Bill completed the list of nationalisation proposals promised for this session, and it may be

an appropriate moment to summarise the astonishingly diverse functions and organisation of the new bodies to be set up. Perhaps their most confusing feature is the extraordinary differences in name. The National Coal Board, the British Transport Commission, and the British Electricity Authority, have similar status, power and authority. Why, in that case, must one be a commission, another an authority, and the third a Board? And why dub two of them as British?

To take the new authorities in the order in which legislation was introduced, there was first the Coal Industry Nationalisation Bill to set up the National Coal Board, with its headquarters, eight divisional boards and 48 area sub-boards. Secondly there came the Civil Aviation Bill, which did not set up any non-ministerial central board, but established three corporations to operate air services in different parts of the world, the British Overseas, the British European, and the British South American Airways Corporations. In the absence of a central board the Minister of Civil Aviation controls policy directly. Third came the Cable and Wireless Bill, under which the directors of the existing operating company have been replaced by a board consisting largely of ex-Post Office officials. This board is a modest affair compared to the new coal, transport or electricity authorities, and is closely linked to the Post Office, the Postmaster-General being answerable for it to Parliament. All these bills were passed during the 1945-46 session.

With the new session came the fourth proposal for complete public ownership with the bill for the nationalisation of transport. A small British Transport Commission is to operate the road, rail, inland waterway and dock services through four corresponding Executives; no regional organisation is proposed. Fifthly, a Land Commission is to be set up under the Agriculture Bill. This is not first and foremost a nationalisation bill, but it is intended that any agricultural land which is taken over by the nation should be administered by the Commission, and it is possible that the Commission will also manage the large amount of agricultural land taken over by the Coal Board, and the land surrounding new towns. Sixth in order is the Central Land Board to be set up under the Planning Bill; it is to control, under ministerial direction, the payment of compensation and of the assessment of development rights. This is primarily a financial and quasi-judicial authority and has only incidental administrative or management functions in relation to land. Finally, there is the seventh proposal, under the Electricity Bill, for a British Electricity Authority which is to be a full-blooded public undertaking responsible for the generation and transmission of electricity in bulk; current will be retailed to consumers through fourteen area Boards. As with coal and transport, the Minister has wide powers to issue directions on specific points and in matters affecting the national interest. Within this context of Ministerial control, the day to day administration of the Authority and Regional Boards are to be more or less independent.

Shorter Notes

The Postmaster-General appears to have beaten a retreat from his earlier stand against the closed shop, which was recorded in the issue of January 4th. At that time he refused to withdraw recognition for purposes of negotiation from a number of smaller unions in favour of the large Union of Post Office Workers. Now he has modified his policy by saying that official recognition will only be given to unions who represent 40 per cent or more of the staff for whom they cater, and that recognition will be withdrawn from those who now cover less than 33½ per cent. This is tantamount to a withdrawal of recognition from most of the smaller unions, and must be taken as a victory for the closed shop in practice if not in principle. The adoption of this line of policy in the Post Office will presumably be followed in the civil service generally.

*

During the hearing of evidence last week by the Home Office committee of inquiry into the health, welfare and safety of employees, it was stated that about half the offices in London and other parts of the country are unsatisfactory by reasonable standards of conditions. This may well be true; but can the poor employer be blamed for it at the present time, when he is lucky if he can accommodate all his staff under one roof, when he cannot find less crowded quarters or, if he does, is not allowed to take possession of them, and when he has a long struggle with bureaucracy before he can improve conditions by alterations and

Letters to the Editor

Planning Bill, 1947

SIR,—In your article in the January 11th issue on the New Planning Bill you criticise the compensation fund of £300 million as "far lower than the kind of figure which both the Barlow and Uthwatt Committees had in mind as reasonable." What are the facts?

The Barlow Report itself contains no suggestion of a reasonable figure. In a separate Note—thus segregated at the bottom of the page—the Committee state that they have been informed by the Chief Valuer that "preliminary calculations" led to a figure "somewhere in the region of £400 million." The Committee add: "This figure should be regarded as an intelligent guess." The evidence of the Barlow Commission has never been published, nor have the methods and data used by the Chief Valuer in his "preliminary calculations." The figure in the Bill is lower than a preliminary guess submitted to the Barlow Commission and mentioned by them in a separate note without either approval or disapproval. That is all. I submit that you have gone beyond the evidence in saying that this is the figure which the Commission had in mind. And if you suspect "hasty and tendentious calculations," why suspect the Bill more than the Chief Valuer, since both workings have remained secret?

The Uthwatt Report mentions no capital figure at all but an annual figure of £9 million, which is "regarded as a shot." If we generously assume this figure to be a perpetuity and not a terminable annuity, and if we reckon 20 years' purchase (this again is generous, since development rights are a risky asset to the individual owner), we obtain £180 million. This would leave £120 million to cover the development rights in respect of the redevelopment of previously developed land (not covered in the Uthwatt figure). What reason is there for thinking that this is an unreasonably low proportion?—Yours faithfully,

The University, Glasgow

H. W. SINGER

SIR,—In your healthily critical leader on the Planning Bill, 1947, it is implied that the need to obtain the consent of local authorities for a change of land use is a new and somewhat intolerable restriction of the liberty of the individual. This obligation has, however, existed ever since the 1932 Act came into use. The change lies only in the new powers intended to make that control effective.

The 1932 Act intended to create effective powers by means of "compensation and betterment," and it was not realised at that time that these weapons would crumble in use. The majority of thinking citizens have often agreed that certain development was against the general interest of their town as a whole, but that, under the law as it stood, it could only be checked by the payment to the owner of a sum based on the speculative value of that land if it were developed in the most profit-making manner. The conflict has arisen most often over the choice between using a site for public recreation or open space, neither of which brings in revenue, or for a block of commercial offices or high-density flats from which a considerable income could be expected. The new Bill should enable this type of argument to be discussed on its merits in relation to the general well-being and prosperity of the town as a whole, and thus, for the first time, make it possible for democratic control to become effective.—Yours faithfully,

J. TYRWHITT,

for Association for Planning and Regional Reconstruction.

34 Gordon Square, London, W.C.1

The Teaching of Economics

SIR,—May I comment, from the student's point of view, on the article by a correspondent in your issue of January 4th? Recent experience of a first-year course suggests that the social accounting approach which your correspondent recommends can be quite as perplexing as the orthodox approach.

At the end of last term two fellow-students approached me and said they were in trouble about their economics. Their course consisted of a series of lectures on supply and demand under "free market" conditions and a parallel series of lectures based upon Professor Hicks's "The Social Framework." Both these

students had mastered the material in the first series of lectures, but they had few clear ideas on national income and were sorely perplexed by the problems of its evaluation and comparison. Yet they were intelligent and interested. Students are not perplexed by abstract theory, so long as it is developed logically, as much as they can be by the most "realistic" conceptions when these conceptions are qualified by such numerous reservations as must be applied, for instance, to methods of comparing national income and cost of living in different years. Once he has understood the reasons for all these qualifications, the beginner is still faced with the very difficult task of deciding upon their relative importance.

I do not wish to deny the usefulness of the national income approach, but I submit that it is slower and more difficult than your correspondent seems to imply. No doubt as information about the national income becomes more complete and more reliable this path will become broader and smoother. Perhaps an annual census of production will alter the picture. Finally, your correspondent is over-optimistic in believing that this approach makes the "essential unity of economic studies" obvious. The hill of national income problems stands between the student and a view of the whole land. It provides a stiff and obstinate climb.—Yours faithfully,

D. L. RYDZ.

Dalton Hall, Victoria Park, Manchester, 14

SIR,—Your correspondent's criticism concerning the unreality of much current economic teaching was significantly restricted to this country. In large measure this atmosphere of unreality surrounding so much economic theory results from the unnatural divorce between economics and economic geography, a separation which, though rarely complete on the Continent, is in Britain normally regarded as absolute and irrevocable. Personal contact with foreign, notably Dutch, economists, whom I have been fortunate in meeting during the war years, invariably revealed their amazement at the woeful ignorance of economic geography displayed by their British colleagues. At present it is possible in most British universities for a student to obtain first-class honours in his economic geography paper without knowing the meaning of Gresham's Law or comparative costs, and at the same time for economists to graduate with like distinction, yet ignorant of the half-dozen leading exports of Britain, France, the USA and the USSR.

It is, unfortunately, true that only a small proportion of educated Britishers have any idea of what constitutes modern geography, though there are welcome signs, especially in the field of town and country planning, that its contribution is at last receiving recognition, and certain universities appear now to be regarding it as a possible link between the social sciences. During the twentieth century, in the period when economics has tended to become increasingly theoretical, geography has steadily developed what has come to be called its "human side." This somewhat diffuse, but very active, branch of learning, whose prophets are constantly accused by economists, historians and sociologists of trespassing, has largely filled the vacuum which was created when political economy became economics. To define economics as "the study of market processes," or something equally technical, may be sound enough, but somebody or other, it is felt on all hands, should study the wealth of nations.

Your correspondent's suggestion of the national income as a suitable starting point for study is excellent. But a true understanding of the enormous variations in scale and content of different national incomes, and of the extremely abnormal nature of our own in particular, implies a sound knowledge of both economic history and economic geography.

I agree entirely that "it is imperative that the student should start off with his two feet on the ground." To bring economic theory down to earth, literally and metaphorically, is precisely the aim of the modern economic geographer. Barbara Wootton has written entertainingly of the "apple-pie world" of certain economists. In the main the economic geographer concerns himself with a very real world, full of variety, teeming with problems awaiting research, and capable of providing endless examples to prove or damn so many well-worn theories, and, by and large, it is surprisingly devoid of desert islands.—Yours faithfully,

C. A. FISHER

Statistical Summary

GOVERNMENT RETURNS

For the week ended Feb. 1st, 1947, total ordinary revenue was £132,743,000, against ordinary expenditure of £100,601,000, and issues to sinking funds £110,000. Thus including sinking fund allocations of £12,365,356, the deficit accrued since April 1st is £424,515,618 against £2,009,958,000 for the corresponding period a year ago.

THE MONEY MARKET.—Though the floating debt position this week involved a substantially larger net release of funds to the market than the banks, the short loan market appears to have been working on an even narrower margin of cash than in the previous week. There was again no call for fresh money on T.D.R.s, and maturities in the hands of the clearing and Scottish banks amounted to £33 million, compared with £23 million last week. The issue and maturity of bills again nominally balanced at £160 million, but a much larger proportion of the tender offer was evidently absorbed by the authorities, so that total applications rose steeply, from £277.2 million to £303 million, and the market quota dropped to 37 per cent. compared with an effective 50 per cent.

At the end of last week, the market needed official aid (given both directly and indirectly) both on Thursday and Friday (making three successive days) but credit supplies on Saturday, though they had to be strenuously sought, proved just adequate. Conditions were similar on Monday, but in spite of substantial payments for Treasury bills and tax transfers, no official assistance was required, while on

Tuesday credit supplies were quite plentiful. This relief, however, was wholly due to the fact that the market had not tendered for the Tuesday bill, since this is an 88-day maturity; on Wednesday, when payment for bills was resumed, there was a hurried search for funds, and a small amount of official assistance had to be sought. This week's experience is, indeed, a good example of the advantages that would accrue from adoption of a standard 91-day Treasury bill, the possibility of which is discussed in a Note on page 254.

The Bank Return shows an unexpectedly large end-month expansion of the note circulation, but this may be associated with the bad weather and the difficulties of transport. It has obviously contributed to the shortage of credit supplies, which have also been disturbed by the withdrawal of part of the large funds held on the market in connection with the Dobbie issue. At the moment of the Return, a considerable amount—£7 million more than last week—was also immobilised on public accounts, and bankers' balances have dropped to £281 million, their lowest level since the abandonment of window-dressing.

The Miners' Pin up

SIR,—Your article "Labour and the Nation" when read in conjunction with your note on "The Miner's Pin-up" makes it clear that an economically sound distribution of the labour force is one of the most imperative tasks of the post-war reconstruction period. "Freedom of Choice" should be written in golden letters over the labour market. It forms an inalienable principle of British democracy and economic liberalism. It is surely a fundamental incentive to work. Yet, to make labour more productive it may be necessary not only to increase general incentives but also to provide that less useful occupations should not draw away labour from more useful channels.

There are a good many occupations which consume labour for purposes which in our days have little justification when compared with genuinely productive employment. Mr. B. Seeborn Rowntree has stated in two letters to the *Times*, which both make most interesting reading, that between 300,000 to 400,000 people are gainfully employed in the betting trade. The leading journal of the shop assistants union told recently its readers that 80 per cent of the most prominent companies in the check trading business employ approximately 250,000 agents. If it should be really desirable to induce the poorer classes to buy their clothing and other goods on the credit trading system there ought to be other means of providing the necessary credit for them without employing agents and canvassers, just as we shall avoid in the future the wastage of thousands of competitive Approved Societies and their exaggerated numbers of staff.

Before the war the total number of full-time agents employed in Industrial Assurance was about 65,000 (see Beveridge Report, I, page 250). With burial benefit included in the new social insurance scheme agents and canvassers of this type should become purposeless, but it seems that insurance offices will be anxious to heap industrial life assurance policies of another type on the poorer classes and thus retain the vast army of employees in this business. The danger that more people than economically desirable are drifting into these and similar trades increases with demobilisation as many ex-soldiers prefer the so-called "independence" of an agent to work in a factory or shop. Should it not be here that with all deference for free choice of the job some restraint should take place until we have reached once more normal productive conditions?—Yours faithfully,

149 Lichfield Court, Richmond Surrey HERMANN LEVY

Armenian Exodus

SIR,—I have read with interest your note on Armenian Exodus in your issue of the 11th. I was in Armenia this summer and able to make a close study of the matter on the spot, and would like to offer corrections to one or two of your statements.

First, "the Russian Government's drive to repopulate the highlands of Soviet Armenia with returned immigrants" is not in my view quite a fair description. The drive in the first place comes from Armenians outside Armenia, and, in the second, is a matter for Soviet Armenia rather than for the Government of the USSR, which is concerned merely to consent to adding citizens to USSR.

Nor is it true that the drive is to repopulate the highlands. A large number of the repatriates are in the capital, Erevan, and large numbers of others in rich collective farms in the valleys. The "more than half" registered for repatriation is in fact 80 per cent. Those already resident in USSR are not 2,000,000 but 1,500,000.

It is true in a sense that those who want to go are mainly the very poor, because those who are expatriate Armenians are mainly very poor; but when I was there in September already 260 intelligentsia had arrived, and I saw a few others who could not be called the very poor.

With regard to the new arrivals settling down, all I saw as well as all I heard of were settling down very well and receiving a magnificent welcome, being lent, for example, housing space and furniture by people very short of these kind of advantages. It was obvious in respect of nearly all I met that the shortages and difficulties of life in Soviet Armenia—which are relatively small—did not seem to them to be shortages or difficulties at all.

The statement in your article to which I take most serious objection is that the grant for a house is valueless because there are no building materials for the money to buy. The repatriates have priority for building materials. I saw with my own eyes in different places hundreds of houses being built for them and by them. I had no reason to disbelieve the statement given to me that 1,200 were being built in Erevan alone; and in truth and in fact the whole movement is really very heartening, and pretty well managed.—Yours, etc.,

Principles of Compensation

SIR,—The proposal in the Government's Electricity Bill to value the private holdings in concerns to be nationalised by reference to Stock Exchange prices will add fuel to the flames already raging over the similar provision in the Transport Bill. The arguments against this method can, perhaps, best be summarised in a phrase from *The Times*: "compensation on this basis can never be fair in principle and can seldom be fair in practice." This contention is not surprising; what is surprising is the poverty of the arguments used by Government spokesmen in defence of their original plan. These seem, reduced to essentials, to amount to no more than a claim that this method of valuation is practically just as fair as that of independent valuation. But surely there is something to be said for the argument that valuation by reference to the Stock Exchange is the only method by which a figure fair to both community and private owner can be reached?

The basis of valuation by an independent tribunal is that the transaction should be deemed to be one between a willing buyer and a willing seller. The tribunal must take into account all the facts relevant to the supposed decision by either side; the physical state of the assets, their likely length of life, and of earning power, the circumstances that will influence the industry in particular and trade in general, everything, in fact, that can affect the amount of money that these assets will bring in to their owner over the years. But the one thing that the tribunal must apparently leave out is the political atmosphere in which those assets work. Why? Is not that a relevant fact, too? Can it be said that gold mining shares should be valued without reference to whether or not there is any likelihood of the world in general going back to a physical gold currency? Can uranium be fairly valued to-day by ignoring the fact that its ownership has certain political implications? In short, why should industrial shares be valued in a kind of vacuum from which politics are excluded?

Yet there is one system of valuation of industrial holdings which does take every relevant factor, political as well as economic, into account. It is the Stock Exchange. Brokers may sigh when political influences do depress—or raise—prices, but the prices do move in response, just as our individual actions do under the same stimuli. Surely it is arguable that if there is one true mirror of our times, so far as economic activities are concerned, it is the Stock Exchange. It reflected political sentiment when the holders of electricity shares bought. Maybe their judgment of the future was faulty then (or whenever they decided not to sell) and they may be excused annoyance now. But does that justify them in denying the entire validity of the measuring rod they have so habitually used in the past?—Yours faithfully,

ERNEST WATKINS

6a Frederick Mews, Knightsbridge, S.W.1

From The Economist of 1847

January 23, 1847

Some men of all parties complain of the profits of traders. The several legislatures of Europe, as well as our own, persisted for a long period in maintaining laws which made food scarce, with a view of securing a high price to those who grew it. The scarcity they promoted has arrived, the price is high, and the protectionists of England now complain bitterly of those merchants and dealers, who take advantage of the artificial scarcity, and act on their own principles. We never heard from them any complaint of the high rents of landlords, or the profits of farmers, when corn was at a much higher price even than at present. Certainly the profit is now made by a different class of men—a class with whom the mere landlords have an hereditary grudge, and we attribute their complaint as much to old prejudice and envy, as to a sense of justice, and what is due to the suffering consumers. Such a circumstance is calculated to excite regret and alarm. It is clearly by the operation of commerce . . . that calamities like the present can be lessened, and the errors of legislators be partially retrieved. Should the power of legislation, then, remain in the hands of those who are envious of commercial gains, who look on society as a clan, and would regulate it on the patriarchal principle of a great man's household, what can we anticipate but a continued hostility, evinced in the corn laws, between legislation and the progress of society? The expressions of animosity . . . against those who . . . gain the ordinary profits of trade, and the force given to individual crotchets, by the breaking up of parties, are the unfavourable circumstances we record on this otherwise auspicious . . . opening of Parliament.

Books and Publications

Economic Harmony?

"International Implications of Full Employment." By A. G. B. Fisher, Royal Institute of International Affairs. 202pp. 15s.

ANY present-day Government of this country, whatever its political banner, is bound to pursue two main economic objectives. One of these, passionately endorsed by the people, is full employment; the other is the freeing and expansion of international trade, an aim having, to say the least, considerably less emotional steam to back it, but to which we are committed by international agreements. Professor Fisher's task is to examine the mutual relations of these two aims. What policies designed to bring about full employment will harmonise, and which clash, with the development of an "open" and expanding system of international trade? Which systems of international trade will be most favourable to the maintenance of full employment?

He sets about his task with an admirable blend of caution and firmness. He is careful of his terms, quoting a number of definitions of the state of full employment and plumping in the end for one likely to madden the purist but to commend itself to common sense; that level of unemployment which will not "provoke an inconvenient restlessness among the electorate." This is very typical of his general treatment; at every point he keeps firmly in mind that it is practical and immediate policy in a democratic state which is being discussed, and that a well-established popular state of mind is, therefore, a fact to be treated with as much respect as the figures of the balance of payments. Similarly, what he prefers to call the "open" international system is less defined than, after considerable discussion, indicated, as one respecting the right of consumers to buy from low-cost producers.

From an argument too close for casual summary there emerges a main conclusion not altogether comfortable for the uncritical advocates of "security first." The requirements of the open international system and the aims of a full employment policy can be harmonised only by a constant, unremitting maintenance of maximum efficiency and maximum mobility. To envisage full employment as a prescriptive right, on the part of every worker, to his present job; or to try to attain it (as most countries did in the 1930's) by exporting unemployment elsewhere; or to temporise with adjustments by subsidies, inflation, or other jiggery pokery, is to make the "open" system finally impossible.

For those who argue that, in this case, it is the open system rather than the handy if internationally regrettable weapons of full employment policy which should be jettisoned, Professor Fisher has his answer. The argument might conceivably hold good for a country like the United States, which would not be ruined, though seriously inconvenienced, if its foreign trade were utterly abolished. But Great Britain's dependence on imports, statistically striking enough, is even greater than statistics indicate, because it is precisely those goods on which the whole structure both of production and consumption rests—food and raw materials—which she is incapable of producing in adequate quantities. To obtain these goods, as well as to pay off past obligations, she must export on a larger scale than ever before. To attempt to carve markets, on this new and larger scale, out of a total of world trade no larger than that remaining after the abandonment of the "open" system, is manifestly hopeless. The total of world trade must expand if Great Britain's economic needs are to be met—including her need for full employment; so far from the two major aims being incompatible, the second is essential to the first.

Professor Fisher would agree, however, that one cannot simply write QED and leave the matter there. World trade is necessarily, for as far ahead as one can see, dominated by the United States, and the economy of the United States appears, on its past record, both to be subject to epileptic convulsions of extraordinary violence and to be guided by individuals singularly unconscious of their responsibilities towards the stability and prosperity of the outside world. Has Great Britain, in fact, a choice (treaty obligations apart) between an open world economy and a system of bilateral agreements and blocs? Is not the choice rather between a system of the latter kind, built up far-sightedly and calmly to achieve as many as possible of the advantages of the open system, and a chaos of the 1929-39 variety? Professor Fisher admits the formal possibility; but he argues, with some evidence, that the United States is not incapable of learning, has every intention of maintaining full employment, and has through the escape clause of the Loan Agreement and the "scarce currency" clause of the Bretton Woods pact provided a con-

siderable safeguard against her own possible shortcomings as a partner in world trade. Even given the doubts felt as to the United States' influence on world stability the balance of advantage remains, he holds, heavily in favour of the "open" system.

Bretton Woods

"Bretton Woods for Better or Worse." By R. G. Hawtrey. Longmans. 142 pages. 7s. 6d. net.

FOR many years Mr R. G. Hawtrey has consistently held the view that the prime object of monetary policy should be the stabilisation of the purchasing power of money. For that purpose it is necessary to ensure an equable flow of money so as to prevent either a shrinkage of the flow which is inevitably followed by trade depression, or an undue expansion which invariably leads to a boom, and in turn is the prelude to deflation and depression.

The best available measure of the flow of money is the wages level, and the theoretical aim of policy is so to regulate the flow that no change in the average wage level is ever called for. In practice wage index numbers would not give a sufficiently precise guide to action, and central bankers in charge of credit control would pay attention chiefly to the returns of unemployment, making due allowance for any special unemployment due to non-monetary causes. Mr Hawtrey is an unrepentant believer in Bank Rate as an instrument for controlling the flow of credit, and has little belief in any of the modern devices.

It is in this context that he writes of Bretton Woods. And it is because, in his belief, Bretton Woods—that is the International Monetary Fund—fails to provide an effective mechanism for the control of the flow of money along these lines, that he is inclined to condemn it. The basic defect of Bretton Woods is in his view two-fold. It provides no safeguards against general expansionism. And by reason of the restrictions it imposes on the alteration of exchange parities it does not cater satisfactorily for a member country which desires to contract out of either a general inflationary or a general deflationary movement. Mr Hawtrey bluntly asserts that "a country's right to alter the par value of its own currency should never be parted with"—which seems to be going pretty far towards denying any value to international co-operation in the monetary sphere.

Mr Hawtrey leaves it in no doubt that he would at the present time favour much higher Bank Rates in Britain and in the United States than now obtain. As a means of reviving London's position as an international marketing and financial centre he also urges that sterling exchange control should be abrogated and treated "an emergency measure only to be reimposed if at some future time the country's reserves are imminently threatened with exhaustion." It will be seen, therefore, that Mr Hawtrey, who marshals his argument with all his accustomed force and brilliance, stands well outside the main current of contemporary economic opinion.

Blackwell's Political Texts

MILL: "On Liberty" and "Representative Government." Edited by R. B. McCullam.

LOCK: "Second Treatise of Civil Government" and "A Letter Concerning Toleration." Edited by G. W. Gough.

HOBBS: "Leviathan." Edited by M. Oakeshott. Cloth, 8s. 6d. net. Paper, 7s. 6d. net each.

At a time when the English political scene is changing rapidly, and Parliament itself and other representative institutions are in a steady process of transformation, it is no bad plan to re-examine the account of the genesis and the functions of the State given by three of the foremost English political thinkers of the past. These first three volumes of a new edition of political texts are equipped with long and valuable introductions. Particular mention needs to be made of Mr Oakeshott's erudite yet forceful introduction to the *Leviathan*, which comes closer than seemed possible to vindicating Hobbes's hoary account of human nature and to sustaining the writer's claim that this work "is the greatest, perhaps the sole, masterpiece of political philosophy written in the English language." Indeed, Mr Oakeshott outshines Hobbes in standards of logical construction.

Hobbes, Locke and Mill are a well-assorted trio. They were all strongly influenced by the circumstances of their age—Hobbes

preaching unconditional obedience to the State amidst the tumults of the Civil War, Locke seeking to justify a limited right to rebellion after the peaceful revolution of 1688, Mill arguing for the maximum development of individualism among a generation which feared society more than the state—yet each contributed something of permanent significance to political theory. Further, all three of them are at one in a peculiarly English rejection of romantic and idealist theories of the state. The state is there to serve the individual, not the individual the state. Moreover, the state, however it is constituted, acts always in a representative capacity—it is incapable of expressing a unanimous "general will," as Rousseau thought, or of automatically acting rightly, as Hegel sometimes seemed to believe. It follows that the state may sometimes act stupidly and unjustly, may be a vehicle for the selfish aims of individuals or groups. Even Hobbes had few illusions about his Leviathan, whose complete authority was necessary rather than desirable.

Nevertheless these three thinkers were far from agreed on the powers which the State should possess. Hobbes was perhaps the first great theorist to realise that sovereignty must be indivisible, that there can be only one ultimate source of power and authority in the state if chaos is to be averted, and that no bill of rights or separation of powers can ultimately bind or limit this sovereign authority. Hobbes's theory is good law in most countries, Britain included; and whereas in the United States, the position is less simple, the ability of the past to bind the present remains something of a miracle. But even a sovereignty that is legally absolute, such as the King in Parliament, is no stronger than the human will that sustain it in being. It is this fact that, contrary to Hobbes's precepts, brings about rebellions and, contrary again to Mill's wishes, makes impossible any permanent guarantee of individual liberties. All that is good in a political constitution, however hardly won, however firmly grounded, can be kept in being only by a continuous will and effort that must be made afresh by each generation.

Documentary Film

"The Factual Film." A Survey by the Arts Enquiry of PEP 250 pages. Oxford University Press. 12s. 6d.

THE social, educational and commercial importance of the film makes the appearance of this 250-page survey most opportune, for it is from the achievements of the documentary movement that British films derive their peculiar virtues. This book, like the documentary film itself, combines realism with vision and projects the whole subject in proper perspective.

The history of the documentary and the development of non-theatrical distribution are faithfully traced, before and during the war; the news film and the record film are examined; and the international use of the factual film is briefly explored. The section on "Films and the Public," read in conjunction with the appendix on "The Development, Structure and Economics of the British Film Industry," shows why the best in public taste is rarely encouraged, and suggests a remedy in the creation of a public film institute, free from the financial and constitutional handicaps of the British Film Institute and powerful and independent enough to safeguard the public interest. The other appendices on "Film Censorship in Great Britain," "The Educational Film Movement in Scotland" and "The National Film Board of Canada" throw interesting sidelights on the central picture.

Special attention is devoted to the use of the film in education. The scarcity of projectors, the lack of interest often shown by teachers and the absence of a working relationship between teachers and producers during scripting and production, are among the reasons for the present highly unsatisfactory position. Government finance and the specialist services of a public film institute are essential if the potential benefits of the film in education are to be realised.

The recommendations of the anonymous experts who have prepared this report under the auspices of Political and Economic Planning (PEP) deserve the close attention of educationists, Members of Parliament and indeed of all responsible citizens concerned with the future of the film; and the drastic reconstitution of the British Film Institute, the need for which has now been convincingly demonstrated, should be undertaken without delay.

Wilderness of Marxists

"The Theory of Capitalist Development." By Paul M. Sweezy. Dobson. 398 pages. 18s.

THE ghost of Ricardo still haunts the world in a state of split personality; a feebly gibbering Jekyll, Henry George, and an

apparently inexorable Karl Marx. Hence Dr Sweezy, who makes a determined attempt to get back to Ricardo and to prove that in Marx and Marx alone is to be found the properly developed economic truth. This attempt, one may as well say at once, does not come off. It simply is not possible, in this day and age, to present the notions of socially necessary labour time, surplus value, and so forth, so as to convince anyone not already prepared to supplement reason powerfully with faith; and the laborious following-out, through diagrams, algebraic formulæ, and ponderous logical sequences, of all the implications of Marx's original errors, and all the glosses put upon them by the faithful, seems a pointless misuse of time and energy. Dr Sweezy's publishers claim that the general reader, as well as the economic specialist, can readily follow his arguments, but this claim can only be described as touchingly optimistic.

Dr Sweezy's later chapters, in which he deals with crises, depressions and the "breakdown theory," have a certain interest in that they link and compare the Marxian and Keynesian analyses of the inherent contradictions of capitalism. Indeed, he comes near—perilously near from the standpoint of Marxist orthodoxy—to endorsing Lord Keynes and agreeing that capitalism can, after all, be made viable. He concludes, however, that submission to Keynesian remedies, including a vanishing rate of interest and redistribution of purchasing power to the benefit of the Propensity to Consume, is something not to be expected of any governing class, whatever the nominal complexion of the government in power. His hopes, such as they are, for the comparatively peaceful achievement of Socialism rest rather on the example which he sees the USSR setting, in the future, to the workers and middle classes of other lands. In the light of this opinion one need hardly add that *The Theory of Capitalist Development* was written well before the end of the war.

A Classic Revised

"A Study in Public Finance." By A. C. Pigou. 285 pages. Macmillan. 16s.

PROFESSOR PIGOU'S *Study in Public Finance*, a classic for the last nineteen years, has been considerably modified in this, its third, edition. Some chapters are omitted as now irrelevant; others, borrowed from *The Political Economy of War* while this was out of print, were reincorporated in its 1939 edition. Instead, three chapters have been added on the mechanism of reparations transfers (an analysis strangely applicable to the repayment of the American loan) and an entirely new section on Public Finance now concludes the book.

This final section, methodically scrutinising all those means—taxation, subsidy, modification of insurance contributions, public works, and monetary manipulation—by which the fiscal and financial authorities can influence the volume of employment, ends on a note of warning on the dangers of inflation inherent in a Keynesian policy. To Professor Pigou, it appears inevitable that a demand for higher wages should follow on the heels of any increase in the total wages bill. He enters into no controversy, draws no morals, never even mentions the name of Lord Keynes; no one, in fact, could be much further above the battle than he. But current events give to his thesis a sinister topical quality.

Shorter Notices

"Food, Famine and Relief 1940-1946." League of Nations Publications. Obtainable from Allen and Unwin. 159 pages. Paper bound: 6s.

This book is an analysis of the causes underlying the present world food crisis. War and post-war scales of rations, rationing systems and food consumption levels are examined, and international relief activities and the state of the public health are reviewed against a background of comprehensive statistical information. Valuable material has thus been made accessible, which must be essential for any successful remedying of the present tragic world food situation.

"Documents on British Foreign Policy 1919-1939." Edited by E. L. Woodward and Rohan Butler. Second Series: Vol. 1. His Majesty's Stationery Office. 603 pages. 21s.

The first instalments of a collection of Documents on British Foreign Policy from 1919 to 1939, promised by Mr Eden in Parliament in March, 1944, are now beginning to appear. The present volume covers a period from 1929 to 1931 dealing with Naval Disarmament, Relations with Germany from the formation of Dr Brüning's administration to the announcement of the Austro-German proposals for a Customs Union, and the attitude of HM Government in the question of international co-operation within the framework of the League of Nations.

AMERICAN SURVEY

Army-Navy Merger

(From Our US Editorial Staff)

THE announcement that the Army and Navy have arrived at a compromise unification plan satisfactory to both services as well as delightful to President Truman would be more pleasing to the rest of the country if there were more evidence that the basis of the struggle has merely been transferred from principles to details, its locale from the public prints to the whispering corridors of Washington. The plan itself bears a sufficiently striking resemblance to those adopted on several occasions during the war, when it became necessary to reconcile the objectives of irreconcilable agencies, whose areas of authority overlapped—the plan of leaving both agencies intact, but setting up a third, super-agency embracing both the others. The notable case at that time was the creation of the Office of War Information, which was to be a policy-making body in the field of public information, but which turned out to be an executive institution for policies determined everywhere else; and policies often mutually contradictory.

The new plan for the Armed Services does not promise much better. One of the Navy's leading objections to previous plans was that it was deprived of a voice in the Cabinet. The Army Air Force's chief desire was to obtain such a voice; and that of the Army General Staff was to have a Cabinet officer who should be above all the services. On this plane, the new plan provides for giving everything to everybody, so that the United States will have not a single Secretary for all the armed services, but four such officers—one for each of the three services, with the new Secretary of National Defence as arbiter. It will be interesting to see who draws this extraordinary assignment, which would seem to call for the combination of Talleyrand and King Solomon—if the plan goes through.

Under it the Army and Navy are to retain their own tactical air forces, while the Air Force operates in the strategic domain. But who decides where the boundaries of this domain lie? The new Secretary? His Staff? Or the Army's General Staff, which apparently wishes to be a Great General Staff on the German model? The Secretary of National Defence is to be the judge, and he is to be a civilian, that is, a man fundamentally ignorant of the subject on which he is arbitrating. It is hard to see in this part of the proposal anything but a victory for the most extreme Army point of view, and in this sense, it is no surprise that the proposal should be delightful to Mr Truman, the ex-artilleryman who seldom saw water in anything larger than a bath-tub before he became President.

But the whole thing is at present merely a proposal, an agreement, whose very approval by the President is not unlikely to make it unpalatable to a Congress acting on the principle that it is sound politics to answer No to any request that Harry Truman makes. Only the Congress can establish the necessary two new Cabinet posts; or alternatively disestablish the present Secretaries of War and Navy in favour of a new single Secretary for National Defence.

Congress—at least the controlling sections of Congress, which are the new Armed Forces Committee of House and Senate—evidently wants nothing to do with the matter at present. The Senate Committee is mute; Mr Andrews, the Chairman of that

in the House of Representatives, issues a statement which presents an excellent imitation of a man holding a hot potato and looking for a place to put it down. Any Bills on the subject of unification (which he prefers to call "integration," apparently failing to realise that it is the stronger word) will be routed, he says, not through his committee but through the rather obscure Committee on Expenditures in the Executive Department. The reason is, once again, that this Committee would be a disinterested umpire—that is, it would be ignorant of what it was dealing with.

The remainder of Mr Andrews's statement, which footnotes and underlines all the hearts and flowers in the official announcement, demonstrates how real the conflict between the services still is, and why he is so anxious to drop the potato. He proposes that Mr Truman shall "gag" Army officers with regard to unification, as he has already forbidden Navy officers from speaking on the subject. The idea may be dismissed as Republican party politics, but it is, beyond this, evidently a bow in the direction of the Navy. Few Navy officers have been able to avoid the opinion that the reason they were put to silence was that the arguments against the unification proposals they advanced were unanswerable.

Mr Andrews proceeds to say that there is no real difference in the viewpoints of the two services, and this is a bow to the Army. There is a very real difference; the question is fundamentally the adoption or non-adoption of the ideas of the Army General Staff, which believes that it should make all large decisions in war, which believes in universal conscription, which believes that there should be no such *corps d'élite* as the Marines, sustained by voluntary enlistment, while the ordinary citizen has no choice of the branch in which he will serve. Either the Army will attain the objective of making the branch of service a matter of direction from higher authority or it will not; but this is the question both Mr Andrews and the "merger" plan that so pleases Mr Truman carefully avoid.

Mr Andrews adds a few cupolas of his own to the remarkable structure of the agreement which conceals so many disagreements. He proposes to set up within the Armed Forces Committee a series of sub-committees of which he himself will be an *ex-officio* member, along with Mr Vinson, the senior Democratic member. These sub-committees will deal with such subjects as (his words) aviation, heavy ordnance, and personnel. They will have their own staffs of independent experts, connected neither with Army nor Navy, and the liaison officers from those departments will be "just that," which apparently means gilded messenger-boys.

It is an interesting picture. Who will those civilian experts in, for instance, heavy ordnance, be, who know so much more about the subject than the officers of the armed services, yet can afford to desert the high salaries industry would offer for the very low ones that the Congress would supply? There is a good deal of opinion, even in the tightest Army circles, that heavy ordnance in land warfare has become obsolete. Its mission is long-range fire, and it moves too slowly, offers far too attractive a target for minor weapons, to serve effectively in this capacity. Heavy ordnance at sea is in a far different position. It is mounted on an active platform and can obtain surprise.

For that matter, how heavy is heavy? The Army considers a 155-mm. gun as heavy; it is almost exactly the calibre of the 6-inch gun which is the standard light weapon of naval war. The conclusions seem unavoidable that the new Congress has not studied the question at all; that the military departments have studied it, and have reached an agreement, not to agree, but to continue the debate behind the scenes, where beneath a surface appearance of accord, they can continue the process of playing for position as grand masters do in modern chess.

"AMERICAN SURVEY" is drawn from three sources. Articles described as "From Our US Editorial Staff" are the work of a small group of regular correspondents, resident in the United States. Articles with some such attribution as "From An Industrial Correspondent" or "From A Correspondent in Ohio" are from outside contributors. Everything printed without attribution is prepared in London.

Paralysis Or Partition?

THE Bevin attack on the Palestine problem has reached and passed its climax during the last ten days. When launched in November, 1945, it was planned as a combined operation with the Americans. But no sooner had the Anglo-American Committee of Inquiry presented its report last summer than President Truman fired some stray shots into the British camp and left the Foreign Secretary and the Colonial Secretary with an exposed flank. At this flank Jews in Europe, Jews in Palestine and Jews in the United States have been hammering away for nine months with their demand for the immediate admission of 100,000 immigrants to Palestine. On the other flank the Palestinian Arabs, with the Arab States in reserve, have been stubbornly defending a position they first took up twenty-five years ago.

Then recently the British ranks have been divided. It is an open secret that there are two schools of thought within the Cabinet. One school, to which the Colonial Secretary belongs, wants to cut the Gordian knot by partitioning Palestine into a Jewish State and an Arab State; whether or not these States were given their sovereign independence at once, they would at least have control of their own internal affairs and, in particular, the Jewish State would be free to make its own decision about the number of immigrants that it would receive. British responsibility for internal law and order would be vastly reduced and might be limited to securing the frontier between the two States; and the British Government would cease to be the butt of violent pressure from both sides on the immigration question. The other school of thought, of which Mr Bevin is the leader, is reluctant either to partition such a tiny land or to incur the Arab hostility that would be aroused by conferring on the Jews the right to determine their own numbers. They would make one more effort to preserve some unity in Palestine by making a federal experiment along the lines of the so-called Morrison plan. They hope that the probationary self-government given to Jews and Arabs within such a federal plan would, in five years' time, lead to such a growth of responsibility and statesmanship that the vital functions of preserving law and order and controlling immigration might then be handed over to a federal government. For the meantime, however, the responsibility for both would necessarily continue to rest on the British administration. The first group in the Cabinet thinks it necessary to come to terms with the Jews of the world, which would necessarily involve some appeasement of the terrorists in Palestine; the second wishes above all not to strain to breaking-point the ties of British policy with the Arabs of the Middle East and the Moslems of the British Commonwealth. Both want peace in Palestine and a cut in the huge expenditure of men and money on administration of the Mandate. Both recognise the vital and legitimate British strategic and economic interests in the area. They disagree about the best method of preserving them.

Fundamentally the two groups are divided by their different estimates of the risks involved in deciding the future of Palestine now and not later. Mr Bevin's supporters seem to think that in five years or so the Arabs and Jews might be disposed to agree about their future status and relationship if those years were spent in admitting a larger but limited number of Jewish immigrants and in testing, with British control at the centre, the Jewish and Arab capacity for self-government and co-operation with minorities. They would also be used—if the Americans agreed—for a British-directed effort at economic development, especially among the Arabs, which would spread more evenly over the country the seeds of future prosperity. It is further argued, by the strategically minded, that during these five years one of two things is likely to happen: either

Uno will develop some efficient substitute for the security provided by national armed forces or it will be much clearer than it is to-day that there is no hope for effective collective security. That is to say, British bases in the Middle East will either become unnecessary or more necessary than ever. Positions abandoned now could not be reoccupied later. Therefore, while the United Nations are making their choice, it would be useful to have British forces sitting in Palestine—instead of in Egypt—and keeping the Arabs sweet even at the risk of embittering the Jews.

The other group argues against Mr Bevin that there is no evidence at all that in five years' time Arabs and Jews will be more co-operative than they are now. Five years hence the British Cabinet will be faced with the same difficult choice that faces it now. By that time conditions, both local and international, may be less favourable than they are now; just as they are far less favourable now than they were ten years ago, when the Peel Commission declared the Mandate unworkable and recommended partition. British military and economic planning must not be distorted and complicated by a liability which represents sheer waste of a large part of the regular army. Prestige will suffer from the world's misunderstanding of British restraint and humanity; and the relief of hundreds of thousands of European Jews will be delayed.

Each party can claim that its policy respects British obligations under the Mandate, so that neither group can embarrass the other or rally waverers by sounding the call to conscience. In such a deadlock of argument the best that can be done is to retrace the steps in the debate and find one argument that one side had not convincingly answered. One such is outstanding: the argument of Mr Bevin's opponents, or Mr Creech-Jones's supporters. This is that there is just a glimpse of common ground between the Jews and Arabs where the argument is fiercest—over Jewish immigration. The Arabs fear reckless, uncontrolled immigration, forced on by Jewish extremists. The moderate Jews want immigration under their own control but kept within limits that would not wreck the economy of their special areas. If, therefore, control of immigration could be assured without direct British interference, some on both sides would be happy. This could only be achieved by partition. Partition would give the Jews control of immigration into their part of Palestine and also the responsibility of settling the immigrants; while a British—or international—guarantee of its frontiers would amount to a check on any overflow of immigrants into the Arab part. By such a solution, carried out now, every party to the dispute, not least the British, would gain something. So, approximately, runs the argument.

There is reason to believe that the Arab States—or some of them—would accept partition as a basis of discussion, and that they see the appeal that it might make if the Palestine problem came before the United Nations. Even if the proposed frontiers were not entirely satisfactory the Jews, too, might accept this basis of discussion, which concedes their principal demand of Jewish control over immigration. There is no reason to believe that effective British public opinion would reject it, unpopular though the Palestine Jews have become.

There are, of course, risks, even if partition did not mean immediate withdrawal of British administration and troops. The Jewish Labour Party and the moderate Zionists might be unable to control the flood of immigrants now pent up in Europe or to keep their extremists in check. There might be a struggle for power in the Jewish State between moderate influences and the revolutionary traditions of eastern Europe, to which the British Government could not remain indifferent.

Minority difficulties might lead to border incidents or to Arab terrorism. These risks would have to be recognised and guarded against. But what reason is there for thinking they would be any less serious five years hence, or any more serious now than the risks which face the British administration while the present paralysis of Palestine continues? That is the chief question that the opponents of partition have to answer.

*

The door having been again slammed in his face by Arabs and Jews, Mr Bevin has to secure from the Cabinet this week-end a final decision about his next step. He appears to have the choice of recommending either persistence in the modified Morrison plan, with its offer of five years of semi-autonomy to Arab and Jewish areas and of 96,000 immigrants in two years; or the revival of partition plans; or the abandonment of all specific plans and reference of the whole issue to the United Nations. The second of these alternatives is the most statesmanlike, but it would mean yet another effort of negotiation, particularly with the Arabs. Mr Bevin should pursue it vigorously before he leaves for Moscow and not leave Palestine in a state of paralysis during the many months which would pass before an international verdict could be secured. Better still, he should spare himself and leave the pursuit to Mr Creech-Jones. For the Colonial Secretary is less likely to be dogged by those traditional strategic considerations which haunt the Foreign Office and more likely to be free to follow any chance of settlement through to the end. To the Foreign Office falls the very important secondary task of persuading the governments of Europe and the Americas that each should admit some small quota of Jewish immigrants to assist their resettlement in parts of Europe where they can be sure of toleration and oppor-

tunity. For even the drastic remedy of partition might fail if Palestine could be represented by the zealots of Zionism as the only land promising a future for European Jewry.

The British threat to appeal to the United Nations does not seem to have impressed either Jews or Arabs. Some of them doubtless recall how the Permanent Mandates Commission used to hand back the problem to London with rather aloof exhortations to do better next time. One cannot imagine the Security Council, for example, soberly and disinterestedly pondering Britain's most perplexing administrative problem. Nor can one imagine that there is any desire to encourage the Soviet Union, or France, or any other Power, to take over the British position in Palestine. Nor, again, is it likely that a Uno committee would hit on any solution of the problem which has not already been examined and rejected during the inquiries of the last twenty years. If, on the other hand, it is Mr Bevin's idea to submit a workable plan to the United Nations, to say that the British Government are determined to carry it through, then the favourable verdict of the Assembly nine months hence would be well worth having and waiting for. If that is the idea, then it is surely clear that a federal plan which maintains British control at the centre of Palestine for several years to come without the promise of a final settlement would be bitterly opposed by the Soviet voting bloc and even by well-disposed governments. But a plan of partition, with its promise of diminished British forces and greater Jewish and Arab independence, would have a reasonable chance of acceptance. And acceptance by Uno would make it far easier for the United States Government to take in Palestine as a whole the political and financial interest which has been so far concentrated on the Jews. If Mr Bevin still believes in his original Anglo-American plan, here is the way to revive it.

A Food Policy

BRITAIN has been committed, almost unawares, to an important set of proposals on world trade in foodstuffs which were debated in the Commons last week shortly after their publication in this country. These proposals are contained in the Report* of the Preparatory Commission appointed by the Food and Agriculture Organisation of the United Nations to consider the suggestions for a permanent executive World Food Board put forward by its Director-General, Sir John Boyd Orr, at the Conference at Copenhagen last year. The Orr plan has been scrapped for the reasons that it would involve more international control than some nations, particularly the United States, will stomach, and more international finance than other nations, such as Britain, can afford. But this new report does not merely give the Orr plan, as Mr Richard Law put it, a decent burial. It envisages in its stead a high degree of international control over world trade in foodstuffs and in other primary products such as cotton and timber as well, with the important difference that the plan of control, though drawn up by an international body, will fail to be implemented by individual action of the nations concerned. It is thus of first importance to Britain's trading future and to domestic agriculture and food supply.

Nothing is easier, where world food supplies are concerned, than to get lost in a maze of sentimental aspirations. It is desirable to prevent disastrous fluctuations in world food prices, to provide stability and prosperity for primary producers and to raise the deplorable nutritional standards of backward nations. These are the aims which the new food plan sets

out to achieve, and it points once again to some of the measures essential to their realisation, such as frequent international consultation over production and consumption (to be carried out through the medium of a World Food Council) and the provision of international finance on a much larger scale than at present for development schemes in backward areas. But any scheme needs to be judged, not by its intentions, however good, nor by the quality of its advice, but by what is likely to be the actual effect of such practical recommendations as it embodies. On this test, the new FAO proposals warrant, at the best, only a cautious and qualified approval.

The hard core of the new proposals—the section which is capable of being translated into practice at an early date—is the formulation of international commodity schemes. The idea in most cases would be to fix a floor price and a ceiling price for the commodity in question, and to keep the actual price within this range by a system of Government-held buffer stocks. The world price would be prevented from falling through the floor by purchase of stocks at the floor level, in the first place by exporting nations, and later, if necessary, by importing nations as well; and these stocks would be sold if the world price threatened to rise too high. Some limit would be placed on the size of the buffer stock which any nation would be required to accumulate. If, however, as is anticipated, there is a persistent tendency for supply to outrun demand, it is proposed that exporting nations should be encouraged to sell their surplus stocks at specially low prices to needy nations for nutritional projects that have received the prior sanction of FAO.

The attractions of this scheme, at least in theory, are obvious.

Community-Property Taxation

(From a Correspondent in Colorado)

THE principle of taxation which says that taxes should bear equally upon members of the class taxed has been split right down the middle by the community-property laws of a group of Western States, under which different and preferential federal treatment has been accorded members of the same class of tax subject, because of their residence. When the United States took over territories from Mexico the property laws were left unchanged in those territories and in the states which grew out of them; and in states formed from neighbouring territories the Spanish law was likewise followed. As a result, at the time of their being received into the Union eight states had what is called the community-property law in regard to the property acquired by married people—that is, it was owned in common, and the manager was legally responsible to the other party. If the marriage split up, half the communal property went to each spouse.

When the federal amendment authorising the graduated income-tax was adopted in 1913, lawyers and officials of the so-called community-property states contended that their system permitted married persons likewise to split their income up into two halves for the purpose of paying federal income tax, and thus to pay on two smaller incomes rather than on one larger one, with a consequent saving. The Treasury dissented, but in test cases the contention was upheld by the Supreme Court.

So for many years married couples in these eight states, Louisiana, Texas, New Mexico, Arizona, Nevada, Idaho, Washington and California, have been enabled to pay federal income-tax on a different and less burdensome basis than have those in other states. Their savings and the added burden thrust on to taxpayers elsewhere, did not amount to much in the days of lighter income-taxes, but in the past five or six years the disparity has been very great indeed. It has been somewhat blunted by certain provisions regarding the reporting of earned income and by the fact that many other states have provisions which enable some saving to be made by married people who derive their income largely from property. But it has become increasingly desirable to be spouses in community-property states.

Senators and other officials from the community-property states have always contended that it would take a constitutional amendment to remove this privilege, but they have never consented to Congress putting the question to a test by inserting in the federal income-tax law a stipulation that all property income of a couple should for income-tax purposes be considered the income of one. They have filibustered whenever this proposal has been brought up. Such paladins as Senators Connally of Texas and Johnson of California may have differed on every other subject under the sun, but on this they stood as one.

The last time the attempt was made in the Senate was in 1941, just before Pearl Harbour, and when, on that occasion, it became apparent after some days that no business would be done for months if the provision were pressed, its sponsors reluctantly withdrew it. One of the claims of the filibusterers has always been that the provision promotes stability of the married relation and that the attackers therefore were attacking marriage. As a matter of ironic fact the divorce rate in the eight states with community-property laws is much more than twice the national average; climate, custom and character seem to have a great deal more to do with stable marriage than money. In any case, the savings are so small in the lower income brackets as to be negligible.

But the situation has had one striking effect. If a man who is preparing to retire in New York or Ohio, say, on an income of \$25,000 yearly, is shown by lawyer-friend that by moving to California he and his wife can save \$2,622 yearly, the attractions of the famous climate are likely to become so impelling as to cause the move to be made. Then, too, a glance at the map shows certain states that are in effect islands among community-property neighbours. One of them is Oklahoma and one is Oregon—the latter is entirely surrounded. Exploitation of Oklahoma's oil and

other natural resources has developed many large fortunes and incomes in that state. But just across the border in several directions lie fair provinces where federal income-taxes are much less onerous. The same is true in Oregon.

In recent years both states have grown restive under rapid and continuous loss of wealth taken away by departing couples. In 1939 Oklahoma passed a state law which gave married couples the privilege of entering the community-property status if they so desired. The Federal Government resisted the application of this act to the payment of federal income-tax. The Supreme Court held in effect that such an act was not a true community-property act, since the community-property status was not mandatory on all married couples in the state. If Oklahoma desired a community-property act, the Court said, it must pass a real one.

Oklahoma in 1945, therefore, passed a mandatory act, and the Treasury threw up its hands and conceded that Oklahoma couples are hereafter may enjoy the benefits of community-property. So the way is now legally open for other legislatures to act. Most of them meet in 1947, and all that are not in community-property states will be open to the pressure from wealthy couples that caused Oklahoma to act. (Oregon passed a law in 1943, but repealed it when the original Oklahoma statute was struck down. Now a fresh start is in order.) How long, in particular, should the legislatures of such wealthy states as New York, Massachusetts and Illinois be expected to resist? There is a kind of Gresham's law in taxation as well as in coinage, and a lenient tax situation will always drive out a more stringent one.

Mr Stanley T. Surrey, tax legislative counsel of the US Treasury, has proposed—as an individual suggestion and not as departmental policy—another approach. Since it seems impossible to equalise the situation by the remedy heretofore sought, Mr Surrey would permit married couples anywhere to report their taxes in joint form, but to pay tax at the rates which would prevail were the incomes to have been earned separately, a close approximation of the community-property result. For the first time he gives estimates of the savings made by couples in community-property states. Nothing is saved yearly at an income below about \$3,400. Then the savings are as follows:

Net Income Before Exemption, Married Couple with no Dependents	Total Tax, Community-Property States	Total Tax, Other States	Saving	Percentage of Saving
\$	\$	\$	\$	
5,000	760	798	38	4.8
10,000	1,843	2,185	342	15.7
15,000	3,154	4,047	893	22.1
25,000	6,460	9,082	2,622	28.9
50,000	18,725	24,795	6,070	24.5
100,000	50,274	63,128	12,854	20.4

Mr Surrey also calculates that in the 10 years 1937-46 couples with an average yearly income of \$5,000 would have saved \$320 in all; those with \$10,000, \$2,864; those with \$25,000 would have saved \$20,633; those with \$50,000, \$53,144; and those with \$100,000, \$132,187, by residence in a community-property state. (Since tax rates in the earlier years were lower, the savings in the table above would not have applied throughout.) He says that under present rates, wealthier married couples "get a tax holiday every five years." He figures that his suggested change would mean a \$900,000,000 yearly loss to the Treasury. (No one has estimated the actual saving to taxpayers in community-property states and corresponding loss to the Treasury under the present situation.) With the Republicans promising a 20 per cent overall cut in income-tax, the community-property amendment, as proposed by Mr Surrey, is sure to come in for a great deal of discussion in Congress. It is, however, politically touchy in that it is an amendment for the rich—to 99 out of 100 American married couples it would have no meaning whatsoever.

American Notes

Ford's Diagnosis—

The Ford Motor Company last week-end made a determined and courageous bid to end the wage-price spiral by reducing prices for current models by \$15 to \$50. These reductions are, perhaps, modest enough on a price-list ranging from \$1,200 to \$1,600, but they have been made at a time when the rest of the industry has posted a sharp advance on general list prices, and when the Ford Motor Company itself has been rather gloomily assessing the probable inevitability of a further upward move. In his statement to dealers and purchasers, Mr Henry Ford Jr. declared that the company had made very heavy losses over the first year

of post-war operations, but that these losses would be written off as "a down payment towards a continuing high level of production and employment." The price policy was also declared to be "shock treatment" directed against an "insane spiral of mounting costs and rising prices."

Mr Ford's statement showed that he was not altogether certain of the final success of this treatment, however accurate the diagnosis may be. But he has certainly gained a very considerable success in giving a sharp jolt to a community which was already beginning to realise that the price gains of the last six months could not continue for very long without some very damaging repercussions. Most of the publicity attaching to price reductions over the last month or so has centred upon such luxury items as furs, jewellery, and luxury products. Retail food prices, however, have also shown a declining trend since the Christmas buying peak, and predictions of a wider decline in consumer goods items are now general.

Beyond this there is now evidence that a more cautious mood is spreading through the whole industrial community. There is far more concern about the level of inventories, the possible duplication of orders, the development of "sales resistance," and the growing reluctance to accept "price escalator" clauses in longer-term contracts. All this does not, of course, mean that the United States is heading for the depths of depression. Indeed, it seems more than probable that over the next month or so the pace of industrial activity will quicken as manufacturers urge shipments forward against the possibility of deadlocks in wage negotiations. Beyond then, however, is the certainty of a slower pace in re-stocking, the probability of a pause in plant and equipment orders, and the prospect of a decline in farm incomes through 1947.

If such a setback begins to develop, it will almost certainly be greeted with prophecies of impending doom. In the last quarter of 1946, gross national product was running at a peak annual rate of \$205 billion with civilian employment, at 58 millions, more than 10 millions higher than in 1940. It needs no special gift of imagination to predict that a decline in industrial production of only 15 per cent (to the highest pre-war level of 1941) would bring a very rapid rise in unemployment figures, since in that year the number of workless averaged about 5 millions. The actual decline in activity may well exceed 15 per cent, though fortunately, there seems no reason to believe that it would be prolonged for more than a few months.

—And Wage Negotiations

In any event, Ford price policy brings a new factor into current wage negotiations, and Mr Ford himself was careful to add that his company was well aware of "the great interest taken by the United Automobile Workers in lower prices." So far, the UAW delegates, who are now engaged in bidding for better terms from Chrysler, have been the most determined advocates of specific wage claims. Their demand is for an increase of 23.5 cents an hour, plus insurance and pension funds, and other concessions which are said to total an advance of more like 30 cents.

A year ago, with the whole weight of the Government on the side of the unions, employers in major industries were forced to accept substantial wage concessions. This year, with only a mild blessing from President Truman on the justice of wage concessions "in some cases," organised labour is facing the same stubborn resistance from employers in an atmosphere which does not promise similar successes. Most of the unions concerned in wage negotiations over the next few months have been content to lodge new claims without making specific demands, although the general attitude of organised labour has been strengthened by the recent declaration of the Congress of Industrial Organisations, that wage rates could be raised by 25 per cent, without price adjustments.

The CIO delegates have made no public retraction of this claim. But over the last few weeks there does seem to have been a growing realisation that CIO claims, based upon 1946 price levels, were not too soundly based, and that the 1936-39 yardstick for corporate profits—based on an average return of less than 3 per cent on the "net worth" of all corporations—is a standard which would not support business activities at the high level now needed to sustain full employment. There seems to be a growing impression that CIO leaders would now be willing to settle outstanding claims on a much more moderate basis.

If this be true, the problem for CIO leaders is now to convince the rank and file that 1947 is no year in which to press full claims regardless of consequences, for the one certain factor in the wage equation is the general unwillingness of industry to concede wage

It is designed to impart stability to world trade at its most vulnerable point and also to raise the living standards of backward peoples. On the need for preventing excessive fluctuations in world prices of primary products there is little need to expatiate, and on the desirability, on humanitarian grounds if no others, of feeding the hungry, still less. There are, it is true, limits on what can be done by international means. There are so many needy persons in the world—some 800 million of them in India and China alone—that their diet will benefit in very small degree from the food available, and any appreciable improvement can only be brought about, if at all, by an agricultural revolution on their own soils. Moreover, there are grave technical difficulties in assessing need and in ensuring that the cheap food really does reach the persons for whom it is intended and is not resold on the commercial market. But at least this project, even carried out in a rough-and-ready way, is capable of alleviating the worst distresses of a hungry world.

*

Despite these attractive features, the new FAO scheme contains at least three serious dangers, the cumulative effect of which may strongly work to Britain's disadvantage. In the first place, it will have a strong tendency to keep the average commercial price of food well above its free market level. Theoretically, floor and ceiling prices could be fixed which did no more than iron out seasonal or cyclical fluctuations in price in order to provide stability. But the political pressure from exporting interests to obtain a price which they regard as "fair" and "reasonable" (e.g., one that is well above the economic price) will be too strong to be wholly resisted. Again, in theory, any loss on the special price sales to needy nations is intended to be borne by the tax payers of the exporting nations; but, in practice, this heaven-sent opportunity of dumping food surpluses in a humanitarian cause cannot but make it easier to fix and maintain artificially high prices for normal commercial transactions. In consequence, commercial importers, which means first and foremost the British nation, will be subsidising the special sales to needy nations quite as much as, or more than, the exporting nations. Between the exporters, who will want a high commercial price to cover their losses on the subsidised exports, and the needy nations, who will want it so as to create a large "surplus" for subsidised export, the British delegations to the price-fixing conferences will find themselves, as they did at Washington, in a minority of one, and it would take the stubbornest bargaining to secure reasonable prices.

It is as well to be hard-headed on this issue. The war has so upset Britain's balance of trade that her only hope of attaining equilibrium lies in a policy of buying in the cheapest market and selling in the dearest. Yet at the moment the world, under American leadership, is expecting her to do exactly the opposite. The price of all her principal imports—namely, foodstuffs and raw materials—is to be stabilised in the joint interest of producing nations and needy nations. But, at the same time, no such "stabilisation" is proposed for Britain's manufactured exports. The principles of free multilateral trade and hard bargaining on the world's markets are to be departed from in the one instance but not in the other. However desirable in some respects, a policy of this sort is inevitably cruel to Britain in her present undeserved embarrassments and, unless pursued with great care and consideration, is capable of driving this country to making drastic cuts in its imports in a desperate effort to balance its accounts, which would defeat the ends of the whole scheme by wiping out the one and only big commercial market for primary products.

The second danger in the FAO scheme, and indeed one that resides in every scheme of commodity control that has so far been propounded, is that it may leave the door wide open to

restrictive practices. The report envisages that for certain commodities, such as wheat and sugar, the effective demand—even with the aid of special price sales—may be too small to absorb the export surplus that is likely to come forward. Although some foodstuffs, such as butter, may be in short supply for many years, this general prophecy is firmly based. Under war-time pressure, food production outside the invaded areas has been rapidly expanded—by 30 per cent in North America, for instance—and contraction to a lower level would in many cases be uneconomic as well as difficult and wasteful. But who is to buy the enlarged export surplus? Europe, which imported a high proportion of its food before the war and is the only continent that was a net importer of food, faces the future with a reduced purchasing power on the world markets. It is not surprising that the FAO report gives a qualified blessing to restrictive practices by stating that

it is our view that subject to adequate safeguards quotas can be usefully written into international agreements for certain types of agricultural products.

The United States Government has made no bones about its satisfaction that these proposals leave the way wide open to restrictions on production. There are products for which world demand is so inelastic that restriction of their production is unavoidable. For one or two products, such as sugar, the blame lies on the stupid fiscal policy of importing nations. But economic restriction is always undesirable in principle, and applied to a wide range of commodities would be pernicious. Perhaps restrictive agreements for certain commodities, such as wheat, were inevitable in any event, and the present FAO scheme may serve to postpone and to modify a ganging-up of the large wheat producers to parcel out the market. But this is not certain, and in any case the "non-discriminatory" principles that have been firmly written by an American hand into the new FAO scheme will penalise Britain, by making it difficult under any quota scheme to obtain maximum supplies of a foodstuff from its most economical source of supply and by prohibiting any long-term contract, such as the present wheat agreement with Canada or egg agreement with Eire, which purchases the whole of some nation's exportable surplus.

The third danger attaching to the FAO scheme is the very real one that it may not work at all. Commodity schemes will only be adopted after a review by a study group and will be set up, as the Americans insisted, under the aegis of the International Trade Organisation, when it is formed, with FAO in no more than an advisory position. But if many schemes for individual commodities are drawn up in this way—and present intentions extend to wheat, sugar, rice, salted fish, and some livestock products—then the lack of a close co-ordinating policy may have awkward repercussions on the supply of products which are closely interrelated. A system of international commodity regulation will only work in a context of multilateral trade and freely convertible currencies, which has still to be created. And even in these conditions the particular scheme propounded by FAO presupposes that each individual government will faithfully do what it is told—as regards fixing prices, maintaining stocks, complying with export quotas and so on—by an international agency that is only advisory. In view of recent experience, these assumptions are not a little optimistic.

In sum, the danger is that commodity controls, if they work at all, may severely penalise nations importing food on a commercial basis. This is an alarming prospect for Britain, which normally purchases 80 per cent of the meat, butter and eggs, and a large proportion of grains, that enter into world trade. A lot has been heard about the distresses of primary producers, but it is necessary to remember that it is Britain's principal suppliers which will be creditor nations in the future and it is this country that will be the debtor nation, struggling hard to keep alive in a world where the dice are already heavily loaded against her. Most of the main exporting nations now have

the means to subsidise, if they so desire, their own food producers in the same way as Britain is now doing. To pass the buck to this country is to risk killing the goose that lays the golden eggs. For, if Britain defaults on her international obligations and is then duly relegated to the ranks of the "needy" nations, then the only important channel of regular commercial trade in foodstuffs will be dried up, and the elaborate bulwarks for giving stability and prosperity to the primary producers of the exporting nations will be demolished.

No doubt these views are unduly alarmist, yet they may at least serve as a corrective to the too easy acceptance of world food plans, whose surface appearance is all towards good results and whose hurtful effects, like the dangerous part of an iceberg, are hidden from view. The debate in Parliament last week showed only too clearly how many sentimentalists there are who will vote without thought for anything that

NOTES OF THE WEEK

The Peace Treaties Signed

The treaties with Italy, Hungary, Rumania, Bulgaria and Finland have at last been signed, seventeen months after the first discussions on their content began. All the victors concerned and all the vanquished have put their signatures to the documents, although, in the case of Yugoslavia, the delegates went on proclaiming their determination not to sign until the last possible moment. But this general concurrence is more apparent than real. Each defeated Power has signed with some reservations and only Finland has kept the reservations to itself—naturally, since only in the case of Finland would revision be all at the expense of a single and neighbouring Great Power. The other Powers have either voiced their protests or handed in formal memoranda requesting early revision. It does not follow that revisionism will be as disruptive a force in Europe after this war as after the last. But it is certain that the continent will still contain faults in its political crust through which new volcanoes of destructive nationalism may erupt from time to time. One such fault runs from Trieste along the frontiers of Italy and Yugoslavia, doubles back across Carinthia, skirts the frontiers of Hungary and Slovakia and ends in the mountains of Transylvania. Along this line the slightest shift in the European balance is likely to produce a recrudescence of revisionist activity.

However, it is not in Danubia but in Italy that the chief pressure for revision may grow. Of all the satellites, Italy had the best claim to the title of "co-operator" and it can be argued, as the Italians do argue, that of all the satellites, Italy bears proportionately the greatest burden. Count Sforza, the new Foreign Minister, in a statesmanlike interview with the British press, disclaimed revisionism and wounded nationalist reactions, but he equally admitted to the Italian Assembly that the Treaty had roused little but resentment in Italy as a whole. On two points, in particular, passions are strong—the virtual destruction of the Italian Navy and the loss of sovereignty over all the Italian colonies, including those acquired before Fascism. The British Foreign Secretary, who with or without Count Sforza's expressed desire to improve Anglo-Italian relations, must at some point consider his country's future ties with Italy, would do well to remember that Italian public opinion will lay the punitive naval and colonial clauses in the Italian Treaty at Britain's door. It is therefore fortunate that Sir Noel Charles has been able to assure the Italian Government that the British Government are ready to consider such modifications of the Treaty as it lies within their competence to propose.

Skirmishing Before Moscow

The empirical, not to say contradictory, character of Russian diplomacy has been more apparent in recent weeks than perhaps at any other time. At one time, agreement and understanding appeared to be the basis of Soviet diplomacy. The Russian concessions on the satellite treaties, the agreed agenda for Moscow, the series of interviews given by Mr Stalin to the Press, all couched in conciliatory terms, have not only broken the prolonged diplomatic log jam of 1946; they have even led to better hopes

sounds like "the marriage of nutrition and agriculture," and how many Socialists there are who will accept any proposal to plan what was previously unplanned. That there is much good in the operations and the proposals of the Food and Agriculture Organisation it would be churlish to deny. That the British delegation to Washington was able, against heavy odds, to make a number of improvements in the original proposals is apparent. Regular food consultations, the creation of famine reserves of foodstuffs, technical assistance to backward areas, and (despite its dangers) the stabilisation of the prices of some commodities—these are all good works; but their praises have been sung elsewhere and it is desirable to stress for a change the one big hidden danger. This is, that in rushing forward with arms outstretched to assist the primary producer, his chief customer may be further deprived of the wherewithal for buying his food.

for agreement over the most difficult and involved of the issues still outstanding—the settlement with Germany

Yet in recent weeks it is precisely over the settlement with Germany that the other face of Russia's Janus head has pulled its worst grimaces. Only those whose melancholy duty it is to follow the outpourings of Russian press and radio can have any conception of the heights and depths of vituperation that have been reached. The chief target of the Russian outburst is Anglo-American policy in the Western Zones. The authorities there are being accused of every villainy—from "looting" Ruhr coal to conscripting German slave labour for the colonies—but the underlying criticism is the same: that the "Anglo-Saxons" are building up the Junkers and the industrialists and restoring the military potential of Western Germany. It was agreed in New York before Christmas that the Control Commission should report to Moscow on the achievements of disarmament and denazification in the four zones. The Russian campaign reached a new pitch of fury when the Russian representative on the Control Commission accused his colleagues of sabotaging the proposed report. Since the Russians had steadfastly refused to divulge any information about the dismantling of war factories in their own zone, Sir Brian Robertson's formal rebuke to his Russian colleagues can hardly have caused them much surprise and should certainly have caused them no resentment.

It is usually fruitless to ask what are the aims behind any given phase in Russian diplomacy. Part of the attacks on the Western Powers probably spring from genuine fear. Some of the old centres of economic power in the West have not been destroyed and the decision to make credits available for German reconstruction could lead to a restoration of their old predominance. But the chief reason for Russian outbursts is probably a manoeuvring for position before the Moscow Conference opens. The more the German people can be induced to distrust Anglo-American motives, the more they may overlook the fact that on almost every point—reconstruction, foreign trade, economic unity, frontier revision—the Western Powers have something substantial to offer and the Russians have not.

* * *

M. Ramadier's Prospects

M. Ramadier's Coalition faces problems intractable enough to bring down more solidly united Cabinets. In the domestic field, a cross between a tug-of-war and a balancing act is going on in the field of wages and prices. The trade unions have, it is true, decided for the time being not to press for the complete realisation of their minimum wage programme. In return, the Cabinet has decided to follow up the first price cut of 5 per cent with a second. On the other hand, a certain flexibility has been introduced. Meat prices have risen—unofficially—with the result that meat is again obtainable in Paris for the first time for many weeks. But the unions may be compensated for this breach in price control by the Government's hint that some wages may be allowed to rise. The danger of the situation lies in the continuing lack of balance between purchasing power and output—of which the meat crisis is a typical example. The unbalance also shows itself—ominously—in the necessity of introducing an extraordinary Budget to cover special costs, such as reconstruction, while the

advances of 20 to 25 per cent. The Ford price decision will strengthen that attitude, while recent evidence of a decline in foods and other consumer goods prices may assist union leaders to "sell" a peaceful settlement.

Margins on Wall Street

After more than a year of strictly cash dealings, Wall Street has this week expressed qualified satisfaction with the Federal Reserve Board's decision to reduce margin requirements to 75 per cent of purchase prices. The new terms will be effective from February 1st.

This relaxation of margin requirements was by no means an unexpected move. Throughout the latter half of 1946, when security values were slumping, there was a general demand for revision, and Mr Marriner Eccles, the chairman of the Reserve Board, declared many weeks ago that action would be taken so soon as it became clear that the country had passed through the dangerous phase of post-war inflationary pressures. A few weeks ago, credit facilities were restored for stockholders enjoying subscription "rights" to new issues, and there was a simultaneous—though modest—relaxation of terms for consumer (hire purchase) credits. The significance of the new move is that Mr Eccles, who has taken a very cautious view of probable price movements, now believes that the productive capacity of industry will from this point be sufficient to prevent any runaway price movement.

Mr Emil Schram, as president of the New York Stock Exchange, believes that a further reduction in margin requirements is now justified. Certainly, there seems to be little danger of any undue speculative movement on Wall Street for some way ahead. The investment community is at present far more concerned with the probability of a setback in industrial activity some time this year, than with the relatively good profit records of the third quarter of 1946—profits which will be sustained and enlarged so long as activity continues at about current levels. An early settlement of outstanding labour claims could bring a substantial rally, but altogether the odds would seem to be against any early movement that would carry the Dow-Jones Industrial average (now 174) beyond the 1946 peak of 212.50.

Governor for Georgia

The struggle for succession to the Governorship of the State of Georgia has this week brought scenes of violence and civil dis-

turbance fully reminiscent of those earlier days when physical possession of office, and the presence of an adequate guard of State troopers, tended to outweigh rival claims based upon a strict interpretation of constitutional law.

In Georgia, the death of Governor-elect Gene Talmadge last month brought a legal problem which was generally expected to arouse a storm of controversy. In drafting the State constitution, lawyers had expressly denied the right of re-election (in this case to Governor Ellis Arnall) and made due provision for the exercise of executive power following upon the death of a Governor; but they gave no clear directions about the course of action to be taken when—as in this case—death intervened between the declaration of victory, and the formal acceptance of office.

From this distance, it seems quite clear that any sensible interpretation of the constitution could have brought a rapid solution, either by the appointment of a junior officer to hold office pending a new election or by continuance in office of the former Governor, or, as Mr Arnall claims, by the succession of the newly-elected Lieutenant-Governor. The constitution does in fact provide that any Governor shall "serve until his successor shall be chosen and qualified."

The Talmadge forces, however, who controlled the legislature, moved that body to "elect" Mr Herman Talmadge, son of the dead Governor-elect. And when Governor Arnall refused to recognise this title they proceeded to reinforce their claims by a direct assault upon the State Capitol, and the forcible ejection of officers to the accompaniment of the usual scenes of mob disorder. For a few days, the rival Governors both issued their commands from the State Capitol, until Mr Arnall resigned his side of the contest into the hands of the Lieutenant-Governor.

Meanwhile Mr Talmadge awaits a Court ruling on the legality of a vote by which the State legislature "approved" his claims to office. Rival claims for governorship are by no means a novel feature of American political life. Since the days of Lincoln more than ten States have suffered disturbances, amounting in Kentucky and Arkansas to conditions of civil war, in which Federal troops were called upon to maintain order. But that was many years ago, and the present struggle in Georgia is more than a parochial struggle between rival groups for political power. Governor Arnall has proved himself to be a capable, progressive administrator, and men of that calibre are desperately needed if the Old South is to break with the bigotry and ignorance of the past and regain its due share of national prosperity.

THE WORLD OVERSEAS

The Polish Elections

(By a Correspondent)

THE Polish election returns show the expected overwhelming majority of the Government bloc. As in the Rumanian and Bulgarian elections of last autumn, there is ample reason to doubt the genuineness of these results. It is true that foreign journalists have reported that the proceedings were orderly, but this does not mean much. Many candidates of Mr Mikolajczyk's party were "disqualified," and Opposition observers had little or no opportunity of seeing what was done with ballot boxes after the votes were cast. In some places voters have been encouraged to march together to the polls to vote openly for the government. Few believed that secrecy was ensured even when in fact it was, and so feared to incur reprisals by voting against the government. Detailed evidence, for and against, will doubtless accumulate in the next weeks. But the essential fact is that nobody in or outside Poland, friend or foe of the government, believes (whatever he may say in public) that the results reflect opinion. The Polish Government is doubtless genuinely supported by a section of the Polish people, but we are no better able now than before the election to say how big this section is.

The British Government and the British public are sincerely indignant. British recognition of the present Polish Government was given at Yalta on the express condition that "free and unfettered elections" would be held. To secure this pledge was considered by most British people a moral obligation to a brave and loyal ally. The pledge was given, and has now been broken.

And yet the most cursory survey of the political and economic

forces in Poland must cause grave doubts as to whether the pledge could ever have been honoured. There was no "western democracy" in Poland in 1939, and everything that has happened since has made its establishment more difficult. War ravaged Poland. Warsaw was destroyed, and other towns and villages suffered heavily. Robbery by retreating Germans and requisitions by advancing Russians made things worse. Communications were disrupted both in Poland and in neighbouring countries with which the Poles used to trade. Even where industrial plant was not irreparably damaged (for instance Lodz and Silesia), the loss of old markets and raw material supplies created almost insuperable problems. Finally, the huge transfers of population, caused by the loss of western Ukraine and White Russia and the annexation of eastern Germany, imposed an unbearable strain on a weak economy. In these circumstances the country needed above all a thorough reconstruction plan in order to ensure the most rational use of the slender national resources. An impartial observer might reasonably argue that party politics in such a situation were a dangerous luxury and that a coalition of all patriotic forces for an agreed task of economic recovery and social reform was the first necessity.

Unfortunately political passions in Poland are such that this is no more than an armchair-critic's formula. "Moderate patriots" doubtless exist in Poland, but they have no opportunity of affecting policy. The country is torn by the blood feud of the extremists of Left and Right.

The present Government are the heirs of the "Lublin Committee" set up by the Russians in 1944. It is dominated by the Communist Party. The Polish Communists, like their comrades in other East European countries, sincerely believe that social transformation and economic progress can only be achieved if they, the "revolutionary vanguard," capture the State. The Government coalition must be controlled by them, and the other parties must be willing or unwilling prisoners within it. At present the only other important government party are the Socialists. There have been various reports of friction behind the scenes between Socialists and Communists, but co-operation continues and at least outwardly appears cordial. The Socialist Right Wing, led by Zulawski, has broken off, but there is no clear evidence that the majority of the party prefer this Right Wing to the official leaders. The Democratic and the Peasant parties (the latter should not be confused with Mikolajczyk's "Polish Peasant Party") are splinter groups, similar to the "National Popular Party" and the "Ploughmen's Front" in Rumania. They have the same purpose of catching bourgeois and peasant votes, and have been about equally unsuccessful.

The Mechanism of Communist Control

Even more thorough than the Communists' domination of the government is their control of the "commanding heights" of the political and economic administration. The heads of the civil service and directors of key nationalised factories are either Communists or men on whose loyalty the Communists have solid reasons to rely. The State Security Police, directed by Mr Radkiewicz, is for the greater part in Communist hands. The Army's loyalty is assured by the appointment of officers trained in Russia and by the institution of political commissars. All this shows that the Polish Communists, though by no means committed to copy in detail the Russia of the Bolshevik Revolution, intend at all costs to prevent the levers of power from falling into hands which could be turned against them. The Polish State which they intend to build is a revolutionary dictatorship.

The Opposition is as bitter and ruthless as the Communists. One type of opposition is social. The old ruling class of bureaucrats, landowners and business men hope one day to undo the administrative purge, the land reform and the nationalisation laws. Though a small minority, they are intelligent and resourceful. A second type is religious. The Government claims to guarantee religious freedom, and President Bierut recently appealed for the co-operation of the Catholic Church. But though the Church's lands and other property have not been touched, and religious services and education continue as before, most Catholics undoubtedly fear for the future. And on the ideological plane the conflict between Church and Communism is as fierce in Poland as anywhere.

But probably the most general ground for opposition for the average Pole is the national issue. Traditional mistrust of Russia was increased by the loss of the eastern provinces and by the unhappy experiences of contact between the Red Army and the civil population. Nationalist propaganda attributes all present hardships (including those caused by German rule and by military operations) to the Russians, and denounces the Government as a traitor gang employed by Moscow. These three types of opinion cut across the existing opposition organisations, which are of two kinds. These are on the one hand, Mikolajczyk's Polish Peasant Party and, on the other, the underground Right Wing terrorist "Freedom and Independence" and "National Armed Forces."

Mikolajczyk is a democrat, and so no doubt are most members of his party, who accept social reform and friendship with the Soviet Union, but also desire political freedom and greater national independence. But it is also certain that the party is supported by the Extreme Right, who hold very different views. These are the men who always opposed social reform, mistrusted political democracy, and implacably hated Russia. Many of them thought the 1921 frontier inadequate, and hoped that victory in the second World War would extend Poland at least to the Dnieper. The collapse of 1939 might have been expected to discredit this old ruling class of landowners, bureaucrats, and Pilsudskist army officers and business men. This was indeed the first effect, but it was not lasting. Inside Poland the military leaders of the resistance movement came largely from these circles, and in the Emigration men of the same type retained almost complete control. The Ministers in the Governments-in-exile were democratic politicians, but the Ministry officials, diplomats and officers were men of the old regime, if not Pilsudskists then "National Democrats"—personal opponents of Pilsudski but no less devoted to the old social regime and no less chauvinist and dictatorial in outlook. These officials and officers controlled policy in the

Emigration. Above all, they controlled communications with the resistance movement, and used their position to strengthen within it the elements loyal to the old regime. Mikolajczyk as Premier was aware of this situation. He doubtless deplored it, but he did nothing to stop it. Nor, it must be added, did the British Government.

Mikolajczyk's tenderness to the Right won him the mistrust of Moscow and of the Polish Communists long before he returned to Poland. The interest constantly shown in his career by the British Government also did him no good. The Communists, always eager to imagine sinister British machinations against the Soviet Union, regarded Mikolajczyk as the chief instrument of such plans. Ever since his return he has been treated as an enemy by those who should in theory have welcomed him as a cabinet colleague. At the same time he has been courted by the Right Wing underground. There is no solid evidence to connect him with the terrorists, but it would hardly be surprising if, as the violence of government attacks on him increased, his dislike of the Right should have diminished. Inevitably Mikolajczyk's party to-day is less a peasant movement with a positive social programme than a nationalist movement inspired by hatred of Communism and of Russia. And inevitably, as historical experience shows, in such a movement the effective leadership must pass to men of the Extreme Right.

The practical choice in Poland to-day lies between a revolutionary dictatorship of Communists and a counter-revolution by the nationalist and near-Fascist Right. Neither alternative is likely in the foreseeable future to lead to "western democracy."

The choice before the British Government is thus unpalatable, but it cannot be long postponed. If British interests require regular diplomatic and commercial relations with Poland, the British must do business with the present regime. This means that they will abandon their old friends, the former rulers of Poland (and their followers in Poland and outside) just as Britain abandoned its old friends, the former rulers of Russia, when it established relations with the Soviet Union in the twenties. Many brave men will feel betrayed, as in Russia twenty years ago. The alternative is to decide that the moral principle outweighs all else, and to break relations with the present regime. This means the sacrifice of all British interests in Poland, and the further deterioration of Anglo-Soviet relations.

British policy hitherto has made the worst of both worlds. The Polish Communists believe that Britain, through its Embassy in Warsaw, is organising subversive action against them, and intends to use Poland as a base against the Soviet Union. They seem convinced that the "Anders Army" is being busily trained for the next war, and that the "Treasury Committee" is a mere cover for every sort of sinister political activity. On the other hand, the Opposition believe that the Yalta pledge was never meant seriously by any of the Powers, that it was a consciously dishonest alibi of the British Government, intended to trick the British public into surrender to Russia. To-day it is difficult to say which group hates and despises the British Government more—the Polish Right Wing which feels betrayed or the Polish Left Wing which feels menaced.

If the Yalta pledge was sincerely given and was not simply a cover for a diplomatic sell-out of the Poles, then the British Government would be consistent in returning to-day to a policy of non-recognition. But little in the diplomatic history of that time suggests that the Yalta negotiations were perfectly sincere. The agreement, dishonestly made, has now returned to roost in the shape of a difficult and uncomfortable diplomatic dilemma. The British Government have only themselves to blame if, using the ideal of free elections as a "face-saver" in 1945, they need to look for yet another in 1947.

The Republic at Last

[FROM OUR PARIS CORRESPONDENT]

THE Congress of Versailles, nearly nine hundred strong, elected M. Vincent Auriol as first President of the Fourth Republic on January 16th, and achieved, in the midst of massive ceremony and the singing of the *Marseillaise*, a moment of rare emotional unity. He was not everyone's candidate—far from it; but he is a man of long-trying and moderate views. For a people in love with logical forms, too, his election had more than a personal or political significance. It marked the completion of a constitutional system. In the tortuous construction of the Fourth Republic, the keystone at last was safely laid.

No doubt the rapidity of the election—an absolute majority after the first round of voting rather than after the third or fourth—explained some of the general satisfaction. There was the illusion,

ordinary Budget already threatens a deficit of not less than 110 milliard francs.

In the foreign field, M. Ramadier's Cabinet is faced with the Indo-Chinese War, an issue over which deep divisions have already appeared between Right and Left. It now seems clear that the Government is feeling its way towards a more moderate approach than the fighting policy advocated by the High Commissioner, Admiral d'Argenlieu. He has now been recalled, and General Leclerc may take his place with a mandate to end hostilities and to open new negotiations with President Ho Chi-Minh. This step will certainly be unpopular with the Right wing in the Chamber and probably with the more conservative members of the Cabinet.

Yet it seems unlikely that any violent storm will capsize M. Ramadier's ship at least until the Moscow Conference has come to an end. All Frenchmen—from Left to Right—are conscious in every fibre of the German menace, and they wish M. Bidault to plead their case unimpeded by political dissension at home.

Miss Wilkinson's Successor

The death of Miss Wilkinson has led to Mr Tomlinson's appointment to the Ministry of Education. This must come as something of a disappointment for it is doubtful if the new Minister has the qualities now critically needed to drive the central educational machine along its appointed road energetically and fast enough. It is true that Mr Tomlinson has a better background for this post than most of the other front bench ministers, for he has served on the Lancashire County Council Education Committee and knows the teachers' organisations. The language and problems of the educational world will therefore be familiar to him, and it will not be necessary to waste time teaching him a new departmental language. He will also be able to bring to his new ministry a knowledge of the building industry which may serve it in good stead in its battle for new school buildings. But here the advantages are exhausted. It has taken Mr Tomlinson eighteen months to fathom the problems in his old ministry, and it would have been far better to have left him there, where he was doing an extremely important job controlling the building resources of the nation, and to ignore the niceties of political promotion. Such experience is not an asset which the Labour Government has in such an abundance that it can simply be wasted.

The Ministry of Education is not hatching any major bills nor any revolutionary new policies. The Minister has a large administrative job to put the 1944 Education Act into effect, and for this work there is needed the ability to harness the department's diffused energies and to whip them into a canter. Mr Hardman's statement last week about the progress of emergency training schemes demonstrates only too clearly the inadequacy of the advance planning and the weakness of the execution of this operation, and what is true here is true in other parts of the machine. As the result many areas of the country will be in the greatest difficulties when the school leaving age is raised.

The new appointments demonstrate one of the great difficulties of Mr Attlee's administration. There is a plethora of latent talent, the restive back benchers, aching for a chance to prove themselves, but far too little experience of office. On the other hand many have had administrative experience in departments during the war, and this opportunity might well have been used to promote a promising candidate, who would have been prepared to stay at his post for a reasonable period without demanding a new seat in the political musical-chairs. A younger man would surely have filled the bill better.

* * *

Agricultural Policy

The first day's proceedings of the Standing Committee considering the Agriculture Bill saw a more interesting and lively debate than took place on the floor of the House, primarily on the issue of whether the Bill should specify that agriculture will be "fully productive" as well as "stable and efficient." The words themselves are vague; but the argument turned on whether a guarantee in some form should be given that British food production should be expanded to the maximum level or whether the Minister should, as he successfully urged, retain complete discretion to determine what proportion of Britain's food needs should be home produced. Some members fear that British production may in due course be curtailed so as to economise expenditure on food subsidies and take advantage of cheap food imports from overseas.

The answer to this fear is not to lay down more paper guarantees, which may not in fact be honoured, but to make sure that British agriculture reaches a state of efficiency that enables it to produce all it can without undue cost to the Exchequer. There is no reason why British agriculture should not have a considerably higher output, in terms of value, than it has to-day, so long as—and this is the vital condition—it grows the right kind of foods at a rising level of efficiency. This is quite possible. The demand for protective foods—and in particular for milk and dairy products—should rise a great deal further than its present high peak if the nation is to be properly nourished; and these foods are enormously expensive to import, which gives added urgency to the need for the Government to exert more successful efforts to obtain feeding stuffs from overseas. But the Government must guide production into the right lines, which means, for instance, that it cannot allow the uneconomic production of certain wartime crops, such as potatoes, wheat and sugar-beet, to continue indefinitely under normal conditions.

It is certainly necessary to make sure that British agriculture is not tossed to and fro on the tidal waters of commercial policy; but it is for the Minister in the role of pilot to steer a firm course and the rest is up to the agricultural community. It is impossible to tie the Government to a promise to support a large agriculture which may prove to be inefficient. Sooner or later, the taxpayer would insist on a drastic axing of inflated food subsidies and, as a consequence, the demand for the costlier protective foods grown in this country would rapidly shrink. British agriculture warrants Government support in two ways—by a limited assistance to the food producer to protect him from foreign competition and a limited assistance to the food consumer to assist his purchase of nutritious foods. But in both cases there really is a limit to the assistance that can be made available; and the motto for British agriculture is that within this framework of limited aid its size can be as large as its efficiency makes possible.

* * *

Migration Merry-go-Round

The Polish Resettlement Bill debated this week in the Commons is a legislative outcrop of a huge and paradoxical problem. By this Bill, which provides for an estimated expenditure of £4,450,000, the Poles of the various resettlement forces take their place in the scheme of British social security and a step towards absorption in the British national fabric, a proper and necessary step. But for every Pole now in Britain there are hundreds of Displaced Persons, Polish and other, festering in camps in Germany and elsewhere, to whom he is an object of envy; while—and here lies the paradox—hundreds of British workers have their names down on the immigration lists of the Dominions and await only shipping space and the fulfilment of formalities to shake the dust of England permanently from their feet.

They will be welcome in the Dominions, whose attitude to immigrants has greatly changed since the war. Great Britain, on the other hand, is short of some 700,000 workers in coal, textiles, building and agriculture. It is practically impossible to disentangle from the verbiage in which Mr Isaacs wrapped the subject in Parliament on February 4th how far, and in what circumstances, the Government is now prepared to fill this gap by allowing European immigration; their change of heart, if it is a change of heart, certainly deserves a welcome. Yet there seems a serious element of waste in this contemplated merry-go-round. There should be scope, in the needs of Europe, Britain and the Dominions, for some kind of arbitrage operation which would send overseas to a new life the homeless, the stateless, the potentially valuable but actually unvalued, rather than the established, the civically secure and the essentially occupied. But while the International Refugee Organisation itself remains embryonic and inactive it is presumably too much to hope that world migration for the voluntary as well as the involuntary migrant shall—with due regard for individual freedom—be envisaged as a whole.

* * *

Displaced Persons

Bit by bit the problem of over 800,000 displaced persons is being attacked. There is still no general plan, and there cannot be one so long as the new International Refugee Organisation, to which the United Nations have passed their responsibility, has no budget guaranteed by sufficient members. The British Government has wisely signed up and to it goes a great deal of the credit for there being an IRO at all. If the governments of eastern

Europe had had their way the displaced persons of Baltic, Yugoslav and Polish origin would have been left to choose between an uncertain reception by the new regimes and starvation in the camps of Germany and Austria. But now the delegates to IRO are assembled in Geneva taking stock of the functions, assets and machinery which they inherit from Unrwa and other organisations. They will do well if they are at grips with their task by the end of next summer.

Happily, some governments are ready for action, however unconcerted. In Austria the Government is giving to some 120,000 *Volksdeutsche* from German-speaking minorities in Balkan countries the chance to settle in working communities instead of camps. These people, who were forgotten in the Potsdam Agreement, may qualify by work and residence for Austrian citizenship. Even when this bold and sensible plan is under way, there will remain in Austria over a quarter of a million more displaced persons to be dealt with.

Then Belgium is to bring in 20,000 refugees from the Baltic states who are now in displaced camps of the American Zone in Germany. They will take the place of German prisoners now working in the mines. They are to settle in the Limbourg region, where houses will be built for them. There is also an Argentine mission in Rome organising the selection of family groups for immigration, and a Brazilian medical mission studying similar possibilities in Germany. And Mr Isaacs said in the House of Commons last week that inspectors from his Ministry were in the displaced persons' camps studying the capabilities of possible immigrants.

All this leaves nearly three-quarters of a million genuine refugees, political irreconcilables and idle rogues mixed up together in central Europe to be dispersed, settled and rehabilitated. It is high time that some practical American contribution should be made to their future by a relaxation of immigration quotas.

* * *

After the Polish Election

"You have sprung into existence in a fussy, brutal and disgusting manner. But since you seem to be alive and kicking—we are going to recognise the fact of your existence." This seems to be Washington's and London's attitude to the new Polish Government headed by M. Cyrankiewicz. The magic formula about "free and unfettered elections," that had been composed in Yalta and recited ever since in varying tones of blissful promise, uneasy expectation, embarrassed disappointment and ful promise, has proved utterly ineffective; and it has thundering indignation, has proved utterly ineffective; and it has now been tacitly discarded. No honest observer has described the election as even remotely approaching a "free and unfettered" vote. But neither has any sincere observer thought a free election to be even remotely possible in the Poland of today, torn as it is by latent civil war, upset by the migration of millions and morally and politically deranged by the events of the last seven or eight years. The statesmen at Yalta stipulated that the new Polish regime, essentially illegitimate and revolutionary, should produce a certificate of its legitimate birth and respectable parentage—an impossible stipulation.

M. Mikolajczyk's name is not to be found in the list of the new Polish Cabinet. His party has been reduced to a score of seats in the new Sejm. His own following—apart from the insincere and purely tactical support given to him by the terrorist underground—is certainly large; but this is a typically peasant-like

passive following which will not raise a finger in defence of its leader, now that he has manoeuvred himself into a *cul-de-sac*. The individualistic countryside has been nearly reduced to political silence by the socialist towns. The more important will from now on be the economic relationship between town and countryside. This will certainly be the hardest nut for the Socialist-Communist coalition to crack.

The new Polish Premier, M. Cyrankiewicz, is a remarkable personality. A very young Socialist—he is still in his thirties—he led the Leftish youth in the old Socialist Party before the war. During the war he spent four or five years in Auschwitz, the worst of all Nazi death-camps in Europe. From there he managed to keep in touch with Socialist underground organisations in the country and even to take part in directing their activity. Nobody among the political leaders that have emerged from the European anti-Nazi underground has gone through a similar test of character and will power. In the previous Diet he showed himself as a politician of the radical Marxian tradition, with a civilised and independent mind and an indubitable sincerity of purpose.

Following a familiar Polish precedent, the new Diet is to adopt a "small constitution," which means an interim charter that is to remain in force for about three years, pending the adoption of a completely new constitution. The Socialists want the "small constitution" to state explicitly that in the transitional period civic liberties will be restricted only as an emergency measure, and that when the emergency is over, freedom will be established. Meanwhile they want a division of powers between the President, the Government and the Diet modelled more or less on traditional parliamentary lines. The Communists prefer to model the relationship between the legislature and executive on the Soviet pattern and seem to be naively reluctant to admit the present restrictions on civic liberties and to commit themselves to their relaxation in the relatively near future. Meanwhile the Government has appealed to its opponents for reconciliation and promised a new amnesty, the curtailment of expenditure on the security police and so on. It remains to be seen how far the promises will be carried out and, if carried out, what effect they will produce.

Disarmament Deadlock

The Assembly of the United Nations having passed the buck of disarmament to the Security Council, the latter has been trying to do something about it. Conflict has arisen at the outset on the terms of reference for a disarmament commission. The American delegate on the Council has insisted that the scope of the disarmament commission should not include atomic weapons, which are already within the field of the Atomic Energy Commission; he has proposed that the new commission should be called the Conventional Armaments Commission, leaving the atomic bomb in the lonely eminence of being an "unconventional" weapon. The Soviet delegate, declaring his desire to get on with disarmament without delay and protesting that any discussion on terms of reference would be a waste of time, has refused to agree to the American proposal and for the moment there is a deadlock.

The reason for this combat of wills over the terms of reference appears to lie in the fact that the majority report of

that party quarrels had been set aside for long enough to give the new Republic its first protector. More lasting, perhaps, was the relief springing from the knowledge that there now existed a constitutional framework—imperfect perhaps, but sufficiently effective—within which the political battle of the coming years might be fought.

It was appropriate that the new Republic should have been ushered into existence under the auspices of a Government which has tried to steer a middle course between the Communists and the right-wing parties. It cannot be said that the French Socialists have succeeded as a government any better than as a party in steering between capitalism and socialism. True, M. Blum's policy of reducing prices by decree in the hope of bringing hoarded stocks of food and manufactured goods to market is only half applied, and a full judgment should wait upon events. Yet there are reasons for thinking that the next decreed reduction, due for March 1st, will be swallowed up as quickly and entirely by the continued upward adjustment of prices as was that of January 9th.

M. Blum's London Talks

Something of the same air of unreality attaches to M. Blum's discussions in London. A progressive integration of the two economies may be desirable—most Frenchmen think that it is—but only under conditions of "sovereign equality"; and this phrase in France means the immediate and generous delivery of coal and machine tools. Without large supplies of coal and machinery French industry cannot hope to raise present levels of production very much. And they are approximately those of 1938, a bad year. But without greatly increased production, both for home and for export, France cannot meet the obligations imposed by agreements such as those of Bretton Woods on a nation with world-wide trade. France, in other words, would remain commercially a second- or third-rate power. Integration of the two economies would therefore be on British terms; and what went for commerce would soon go for politics and diplomacy as well. Even if the French Socialists would accept this, seeing in it perhaps their last hope of survival, the Communists and the MRP, though for different reasons, would not.

If M. Blum's attempt to patch up the present economic system fails—and it would be rash at least to say that it will not—then his successors must make an economic choice which can scarcely avoid far-reaching political repercussions. In the end only two solutions seem feasible: either to return to the laws of supply and demand by removing all controls on those sectors of the market where no real shortage exists, or to intensify the present controls until they become effective. Such drastic treatment would inevitably mean a few months of unpopularity for any government which undertook it. And this period of unpopularity is precisely what no government of late has felt able to risk.

The political dilemma became acute as soon as M. Blum had handed in his resignation to the new President on the evening after the election. M. Blum might have been willing to remain the leader of an all-Socialist Cabinet, but he was unwilling, in advanced age and enfeebled health, to submit himself to the additional strains of a coalition. An all-Socialist government was favoured by many Socialists and MRP deputies, and it would have pleased the Right, anxious above all to keep the Communists out of office. Precisely for that reason, the Communists would have none of it: and their co-operation in economic revival is essential. The deadlock of December, when M. Blum himself had failed to form a coalition Cabinet, reappeared again; and this time it was a little-known Socialist leader, M. Paul Ramadier, who was asked to try his hand. To expect courageous and unpopular decisions from the coalition formed seems like crying for the moon he has. Yet only such decisions can save the day. President Auriol has difficult times ahead of him.

Union for Trade

[BY A CORRESPONDENT]

THE new combined customs tariff for the Netherlands, Belgium and Luxembourg should come into force on November 1st. The mixed commission responsible for it should have finished its work last year, but to the inevitable technical difficulties was added the absence of economic and administrative experts attending the preliminary committee of the International Trade Conference in London. Their time there was not wasted, and the readiness of the three Governments and their experts to work together was made plain before an international audience. The same cannot so far be said of public opinion in the three countries; private initiative, the business world and the press have done less than was hoped to stimulate public interest. The atmosphere in which people discuss co-operation between the three countries—political

as well as economic—is still too *defrig*, by which the Dutch mean "solemn" and "stiff." Most of the running is made by the experts at the high level.

In their various commissions the experts have made considerable progress and the main problems to be overcome are already clear. The problems fall into three sections, and the Governments propose to deal with them in three successive stages. No official time-table has been fixed for these stages, but it is generally assumed that they will fall in March-April, 1947, November, 1947, and the first weeks of 1948.

The first stage will see the coming into force of the common customs tariff: that will put an end to the collection of duties at the common frontiers. The main lines of this tariff have been drafted in record time and represent a rise in Dutch and a reduction in Belgian duties. It will be on this basis that the Governments will negotiate at the second meeting of the preparatory committee of the International Trade Conference in Geneva, due to open on April 8th. The Benelux Union will there be represented by a joint delegation. This delegation will in fact be negotiating on behalf of a commercial Power third only to the United States and Britain. Although it represents a compromise, this new tariff is homogeneous, drawn up on lines recommended by the League of Nations in 1937 and covering only *ad valorem* duties. It will levy standard duties on the movement of all goods across frontiers not common to Benelux. But there will remain a considerable difference between the charges on production and on the movement of goods due to differences between the excise charges and transit charges in the three countries.

Standardisation and unification of these charges will mark the second stage in the working out of the customs union; the change is necessary in order that these charges should have in each country a similar economic effect.

Standardisation of excise charges will present no major difficulties, either in principle or in practice. The traditional—and for revenue purposes the most important—charges exist in all three countries: on beer, spirits, tobacco and sugar. In Holland there is also an excise charge on salt, which does not exist in Belgium, while in Belgium and Luxembourg excise revenue is raised from vinegar, matches and margarine. The abolition of these is expected.

The problem of equalising transit charges is more complicated, and its solution may raise more than technical difficulties in the quarters directly affected by the proposed changes. In Belgium, for example, the tax is fairly simple; it consists generally of a charge of 4½ per cent on each movement of goods, save for sales to the consumer. In Holland, on the other hand, there is a differential system of rates varying from a ½ to 2 and 4 per cent. Here there will have to be a compromise.

Complete Union

At the present stage of economic development a customs union does not automatically ensure a common economy. In addition to the obstacles presented by customs frontiers, there are quantitative quotas for goods and currencies to be dealt with. It will be the task of the third stage to remove such obstacles and to pave the way towards complete economic union, such as exists already between Belgium and Luxembourg. This final phase—which must include a new agreement, foreseen in the convention signed between the three Governments in London in September, 1944—will bring about the integration of the two economies, thus making necessary the adaptation of internal equilibria and certain structural modifications.

Work to this end has already begun. Five mixed administrative commissions are at work: on industrial development; agriculture and fisheries; distribution and priorities; prices, wages and currency; transport and harbours. A sixth is on the point of beginning work on colonial questions. So far attention has been concentrated on administrative planning, but it is intended to bring in representatives of professional organisations so that no special interest, no aspect of the problems shall be overlooked.

Apart from the future of the ports of Rotterdam and Antwerp, whose prospects depend largely on those of their German hinterland, two problems stand out: the problem of agriculture and the problem of price and wage levels. The agricultural systems of Belgium and Holland are not complementary in the way that many parts of their industrial systems are. They have certain features in common, but there are also contrasts which will cause conflicts of interest unless solutions are found beforehand. On the one hand Belgium and Holland have almost the same area of arable land and both have a net import surplus of primary agricultural products; on the other hand, the area of pasture in Holland is considerably greater than in Belgium. As for farm

products, Belgium is roughly self-sufficient in cheese, whereas Holland is an exporter: in a normal period fifty per cent of the volume of her butter and cheese production is exported, often at prices below those of the home market. The method of quotas by which Belgium defended herself before the war against what was called Dutch dumping, will be, of course, out of question in the customs union, and special agreements will have to be reached. The question is important because it affects almost the whole Flemish area, which is essentially agricultural and has a chronic surplus of man-power, which makes it very liable to unemployment. As for the problems of price and wage levels, these are important to the whole of both economies. It is generally agreed that the greatest possible equality between these levels is indispensable to the proper working of the Union. It is probable that no such equilibrium exists at present. Available figures show that the level of wholesale prices, compared with that of the years before the war, is very much the same in Belgium and Holland; retail prices, on the other hand, are much lower in Holland, notably because the activity of the middleman is better organised.

A preliminary study shows that wages in Belgium have shown a tendency which compares unfavourably with that in Holland. It is generally held that in Belgium the wage index—compared with pre-war—is near the coefficient 300, whereas wages in Holland stand at only 166 for industry and 241 for agriculture, but if such differences persist, equalisation and—in consequence—economic union will be achieved only gradually, and must begin in sectors where equilibrium exists already.

The relative scale and importance of the foreign trade of the members of the Union since the war has to be judged from statistics which can only provide a comparison since last June. Since that date the trade of the Union—excluding trade between the members—is shown in millions of Belgian francs in the next column.

The figures show very clearly the marked progress of the Belgian-Luxembourg Union in its export trade. But both parties have an unfavourable balance of trade.

As for trade between Holland and the Union, the figures show a considerable import surplus for Belgium. In 1945 this amounted to 1,635,000,000 Belgian francs and for the first ten months of 1946 to 1,275,000,000 Belgian francs.

The question is everywhere being asked whether the Union of the three countries will succeed. Numerous requests for information from economists and business men are already reaching the secretariat of the Union. It can be said that the political and psychological conditions have never been more favourable. As for the economic conditions, the international climate is propitious, although allowance must be made for the different effects of war and occupation on the three countries. Those who have pointed

out the political, economic and administrative difficulties inseparable from the organisation of customs unions have emphasised that they are only possible when there is a movement towards freer trade. This tendency towards freer trade can be seen at the moment, though perhaps in unfamiliar and artificial forms, and showed itself in the hopes raised by the partial success of the recent London conference on trade and employment. Success in forming the Union might well stimulate similar attempts by other groups of countries or the extension within Europe of the Benelux Union.

The Gatehouse
SKIPTON CASTLE

CENTURIES OLD ABBEYS, churches, castles, mansions of imposing exteriors... furnishings and decorations, priceless heirlooms of the craftsmen of the past—these are the historic values rich in culture and art which are the background of the Yorkshire of to-day with its thousands of craftsmen skilled in so many trades. This tradition is to be seen throughout Yorkshire, among its people, in its cities and towns, in its industries, and is the solid foundation upon which "The Yorkshire Post" is established. Owned, edited and published in Yorkshire it is indeed part of Yorkshire life, yet with that breadth of outlook which causes its viewpoints to be studied and quoted throughout the world.

the Atomic Energy Commission is unpalatable to the Russians and that they reckon on having a better tactical position if the report is rendered subject to revision by the Disarmament Commission and any action on it thus postponed. The Americans, on the other hand, are anxious to keep the question of the atomic bomb separate from the general issue of disarmament, partly, no doubt, because they have put forward definite proposals on atomic energy and want them to be publicly debated without being mixed up with endlessly complicated schemes for "conventional armaments." There is, indeed, a strong case for the American point of view, for atomic energy is a sharply defined technical field in which there should be a chance of reaching an international agreement, whereas it is difficult to take seriously the prospect of an effective regulation of armaments in general in the immediate future. The experience of disarmament between the wars, when the only real success was in limitation of heavy naval construction—technically more suitable for regulation than military or air arms—indicates that definition of special terms of reference is an important condition of progress in a notoriously baffling enterprise.

* * *

Congress and the Princes

The agreement reached on February 9th between negotiating committees of the Indian Constituent Assembly and the Chamber of Princes has been in striking contrast to the complete breakdown in relations between Congress and the Moslem League. Actually, the ease with which agreement was reached between Congress and the Princes, in spite of the fundamental divergence of their theoretical claims, has been indirectly due to the intransigence of the Moslem League, for the threat of Pakistan and the need for endowing the Constituent Assembly with a character as all-Indian as possible in the absence of the League, has forced the Congress leaders to yield to most of the demands of the Princes. The Princes are now able to enter the Assembly virtually on their own terms and, generally speaking, it is their interest to produce a Constitution by agreement with Congress. They do not want the central Government of India to be too strong; but they can hope for nothing from civil war. They are as monarchs little affected by the communal ranging of India's population; in any case, most of them are Hindu by religion and thus incline towards Congress or the Mahasabha. The most important of the Moslem Princes, who is also the most important of all the Princes, the Nizam of Hyderabad, has not only a majority of Hindu subjects, but is so enveloped territorially by "Hindustan" that it is essential for him to get an understanding with Congress while the going is good.

While the Princes are thus making the most of their opportunity, the Moslem League remains in a position which presents the Viceroy and the British Government with an acutely embarrassing problem. Congress has demanded the resignation of the five Moslem League nominees in the Interim Government on the ground that, if the League declines to participate in the Constituent Assembly, it has no right to be represented in the Government; the League Ministers have refused to resign, claiming that as the League originally accepted the Cabinet Mission's plan without reservations, whereas Congress did not, the League has a better right than Congress to be in the Government. The League seems determined to retain a share of executive power by keeping its Ministers in the Government. But can such a Government continue to function as a Government at all, and if it does not, what is now the constitutional position of the Viceroy? Can he dismiss what is still legally his "Executive Council" and form a new one? It is an irony of the present situation that Congress, which was so impatient for the Viceroy's powers to be terminated even before India had a Constitution, now wants him to use them to get rid of the League Ministers.

Dr Salazar Reshuffles

Something more than a routine rearrangement of Ministers seems to have been going on in Lisbon. Dr Salazar has divested himself of one of his offices—that of Foreign Minister—and handed it over to Caetano da Mata. The former Minister of Labour, Canceled Abreu, has moved into the Ministry of the Interior to take the place of Colonel Bothelo Moniz, who was notorious for his intervention in all the affairs of the country. Most significant of all, the former Minister for the Colonies, Marcello Caetano, has been made president of the National Union,

the one legal party and political movement in Portugal. How do these changes relate to the army officers' revolt of last October and the slight slackening of control which Dr Salazar allowed to the opposition in 1945?

They appear to work at cross-purposes. There is a more liberal Minister of the Interior, but the change at the head of the National Union suggests the intention of tightening up discipline in its ranks, where spirits have been flagging lately. Although only this party is represented in the National Assembly—the opposition, *Movimento de Unidada Democratica*, works underground—its members have been complaining about rising inflation and the inadequate resources allotted to the colonies in the 1947 budget. Foodstuffs generally are short, and prices, according to the cost-of-living index, 100 per cent above 1939 level. Wages have barely risen and black-market prices are on the usual European scale. The situation is one which an active opposition could exploit, and Dr Salazar may have hoped to take all necessary precautions against this by strengthening the National Union on which his regime rests, while making at the Ministry of the Interior what would look outside Portugal like a liberal gesture.

Consumption of Potatoes

One of the main reasons for the relatively high calorific value of the British diet (2,750 calories) is the large quantity of potatoes that the average person consumes. Before the war, apart from the importation of special varieties, the United Kingdom's output was sufficient to meet the demand. Since 1939, however, potato acreage has more than doubled, reaching the record figure of 1,423,000 acres for the United Kingdom in 1946. Production has followed suit, although the annual yield has varied.

Demand for food consumption has increased correspondingly from a weekly average of 58,600 tons before the war to 112,400 tons in 1944. (Fuller figures are given in this week's *Records and Statistics Supplement*.) The following year it declined by 5 per cent and fell again slightly during the first eight months of 1946, the fall being matched to some extent by an increase in the consumption of flour. Since bread rationing, however, there has been a sharp increase in the demand for potatoes, and weekly consumption for the last four months of 1946 averaged 128,400 tons. This was only to be expected, as bread and potatoes are good starch substitutes and increased quantities have also probably been fed to livestock. The present acute supply position has not been brought about by the abnormally bitter weather. Not only has it kept supplies from reaching the consumer, but those potatoes held up in transit as well as those insufficiently protected in store have been affected by the frost to such an extent that a large proportion of them is unusable. This wastage will mean that the demand for potatoes will increase still further. To this increase in home demand must be added the demand from abroad: in 1938 the United Kingdom had a net import balance of about 100,000 tons, whereas in 1946 this had become a net export balance of some 200,000 tons, mainly to Germany.

To ensure that stocks will last till the new crop becomes available, exports this year will be reduced to 28,000 tons—no potatoes being sent to Germany—only 38,000 tons will be fed raw to stock and none will be processed into stock feed. But these savings alone will not be adequate. Either additional supplies must be obtained—the Ministry of Food is at this moment negotiating with the United States for imports and has just concluded a contract with Canada—or the present level of consumption must be reduced by at least 5 per cent. Failing these alternatives the stocks of old potatoes will run out before the new crop comes on to the market.

Progress Towards the Health Service

More steps have been taken towards setting up the machinery of the National Health Service. The Minister of Health responded to the conciliatory resolution passed by the special representative meeting of the British Medical Association on January 28th by inviting the negotiating committee of the medical profession to resume discussions with him. At the end of last week, the representatives of the BMA and the representatives of the other bodies on the negotiating committee decided to accept this invitation.

In the meantime, Mr Bevan is going ahead with the establish-

ment of the Central Health Services Council and the Regional Hospital Boards. The Act lays down that the members both of the Council and the Boards are to be appointed by the Minister, after consultation with the appropriate organisations. He has accordingly requested various bodies to submit to him the names of persons considered suitable for membership. In the case of the Council, the details of whose membership are laid down by the Act, Mr Bevan has addressed himself to the various bodies representing the medical, dental, nursing and pharmaceutical professions, the hospitals and the local authorities. In the case of the Boards, he is requesting names from the university with which the hospital service for the region is associated, organisations representing the medical profession and the voluntary hospitals, and local health authorities. In so doing, he has given some long-winded-for light on the character of the Boards. They are each to consist of 20-30 members, of whom, originally, about one-quarter will have experience in the voluntary hospital service, one-quarter with local government experience, and a smaller proportion, in each case, from the medical profession and the universities. The balance will be made up of two or three people with experience of mental health services and others with a varied background. The members will give part-time unpaid services receiving only their expenses.

It is the Minister's declared policy, in appointing both the Council and the Boards, that their membership should be expert, but at the same time should allow a fair hearing to the views of interested parties. During the Act's passage through Parliament he emphasised the expert rather than the representative nature of the Council and the Boards. It will be the contribution the members can make as individuals that will be valued; they are appointed after consultation with interested parties only in order "to secure a proper balance of the various types of experience and local knowledge." This sort of public body is typical of the times. It is a compromise which tries to secure that an instrument of government is both efficient and democratic. Experience so far leads to the conclusion that bodies thus appointed are liable to be too sectional. It is up to the hospital Boards to prove that their members can act as independently as Mr Bevan has emphasised they should act and as the success of the new hospital service requires.

Control of the Public Purse

Obstinacy was more than usually undisguised in a tussle between the Opposition and Mr Key in a debate on the Ministry of Health's supplementary estimates on February 11th. The argument arose over a report published by the Comptroller and Auditor General a few weeks ago on the comparatively minor matter of an increase in the contract price for 2,400 pre-fabricated houses from £1,242 to £1,515 per house. The Opposition sought, perfectly reasonably, to find out why it had been necessary to increase the contract price by so large an amount.

The details of the argument are unimportant but the principles of the control of public expenditure are not, and there appears to be a serious loophole in that control. Mr Key may well have been correct in the letter of his answer that it is the Ministry of Works' business to supervise contract prices and that it was not for him on the last day of his association with the Ministry of Health to answer for the affairs of his future Ministry. But the implications of this answer cannot be accepted, for the supplementary estimates of the Ministry of Works show no sign of this additional expenditure, and when they come to be debated there appears to be no handle for the Opposition to grasp. Either the Ministry of Health must be prepared to give the full story for increases in their estimates even if they are merely paying local authorities for excess expenditure incurred by the Ministry of Works, or Mr Key from February 12th must be prepared to answer as Minister of Works. He cannot have it both ways, and Mr Hudson was perfectly right to ask that the Committee should sit again and be given the answer. Since this request was outvoted, are both Ministries to escape further examination? This is too easy an escape.

Principles of Dispersal

A few details were given last week of the plan for the permanent dispersal of parts of Government departments to towns outside London. The first list covers 40,000 staff, which is far too small a proportion of the members of the Civil Service in London to ease the problems of over concentration, and the discussions which are now progressing for other departments ought to dispose of another 60,000 if the Government is to make a valuable contribution towards decentralisation.

THE STABILISING INFLUENCE

Between the manufacturer and retailer the wholesaler is a stabilising influence. He cushions the effect of trade fluctuations both on the maker of the goods and on the retail distributor. The wholesaler gives bulk orders to the manufacturer and holds stocks ready for delivery to the retailer in quantities to meet individual requirements. He reduces the number of transactions, lessens the dispatch worries of the manufacturer, and saves time-wasting interviews for the retailer.

The wholesaler is a vital link in the economic chain of industry . . . he is the channel through which goods flow from manufacturer to consumer with the minimum of waste and the maximum of result.

THE BUSINESS WORLD

The Banks in 1947

THE bank chairmen in their annual pronouncements last year, amid the uncertainties of the Government's partially disclosed financial programme, were somewhat tongue-tied. This year they are in full voice. Their statements have regained some of that virility which in former times made them among the most important public judgments upon economic policy. Their dicta upon exports and the balance of payments, upon coal and man-power, upon wages and the need for effort, have indeed been echoed in this week's White Paper.

But, with one exception, the bankers have said little about the important changes which are taking place beneath the surface in their own business. A frank retrospect of 1946 would admit that Mr Dalton has upset many of their earlier calculations about reconversion. Since Government borrowing from the banks had for six years been the whole cause of the big expansion in bank deposits, many bankers found it natural, twelve months ago, to assume that contraction of Government expenditure would check this growth, and perhaps cause an actual shrinkage. Even after due allowance for reconversion finance there seemed no reason to expect any large further increase. In view of transitional frictions, cessation of industrial overtime, and withdrawal of women workers, civil demands for capital could scarcely expand as fast as Government expenditure declined. Moreover, part of the reconversion outlays would at the outset be met, not by borrowing, but simply from industry's large cash balances and from the stream of Government payments for war damage, EPT refunds, and the like.

In fact, bank deposits in 1946 rose faster than ever before. The final figures can now be estimated with a high degree of accuracy. They indicate that clearing bank deposits on December 31 totalled about £5,680 million, compared with £4,850 million at end-1945. This increase of £830 million contrasts with £305 million in 1945 and £529 million in 1941, the year of heaviest wartime credit creation. Yet the fall in Government expenditure, and especially in the Budget deficit, last year reached the best expectations. The "ordinary" deficit for the calendar year totalled £686 million, in contrast with £2,447 million in 1945. On the other side of the account, few people would say that the rate of expansion of civil industry, of housing and re-equipment has bettered expectations.

There is, unfortunately, no means of measuring the extent to which the year's new money was created for reconversion purposes, as distinct from those of the Government. Bank advances, of course, are money creations for these purposes, and they rose by £160 million—more substantially than many bankers were predicting around VE-day, though less so than was expected after the peace-time applications began to stream in. But industry has also been financing itself, to an unknown extent, by selling part of its accumulation of gilt-edged investments. This finance, too, has in effect been provided by the banks, since they have increased their own investment portfolios. But, in view of the extent to which supply shortages have prevented direct borrowers from the banks from taking up more than a moderate part of the credit facilities which have been sanctioned, it seems reasonable to guess that the industrial sales of securities—strictly for the purpose of reconversion finance, as distinct from merely adding to liquid cash—cannot yet have reached very large proportions.

It can certainly be said that the total of industry's new demands on the banks could not have exceeded the decline in the Government's net requirements so greatly that it accounted for the year's huge creation of money. The Government's requirements from the banks, of course, are not measured simply by the Exchequer deficit. The banks are residual lenders and finance the Government only to the extent to which it cannot meet its needs by borrowing from the public. Hence, a considerable part of the increased credit creation reflects the decline in the public's purchases of savings securities. But this decline, like the industrial sales of securities—to the extent to which they have exceeded industry's immediate need for finance—is only part of the dominant factor which has been working upon the banking system. This main factor, as the bankers' speeches plainly recognise, is the Chancellor's cheaper money policy.

It has been demonstrated in *The Economist* repeatedly (and in some detail again last week) how Mr Dalton's efforts to force down gilt-edged yields have necessitated large-scale intervention in the market. The Government can finance these

* Partly estimated.

operations only by turning nominal floating debt (that is, debt held by public departments) into active debt by selling the paper to the banking system for new money. Estimates of such activities for any given period are necessarily subject to considerable error, though the general direction and broad magnitudes can be established. But since some people find these calculations too technical to be, to them, demonstrably sound, it should be emphasised that there is no need to rely upon them to demonstrate the connection between cheaper money and the phenomenal growth of credit. Although, with the appetite for goods at its present level, it is hardly likely that higher interest rates would have added materially to the volume of genuine saving, it is surely axiomatic that they would have made the public much more ready to hold its savings in less liquid form—in other words, to lend more to the Government, to abstain from turning securities into cash, and to buy the securities sold for the finance of reconversion. It is the public's demand for liquidity, rather than its reluctance to save whenever opportunities for spending present themselves, which has produced the rise in deposits. And it is significant that a substantial part of the new money is piling up on "personal" accounts.

It must not be forgotten that the "widow with limited capital resources" and others in that same category do not suffer materially from the taxation of the whole annuity since they are

These tendencies have been accentuated in the past few months. The dominant consideration for the banks in 1947 is whether they will grow stronger still, and that depends upon Mr Dalton. On a short view, the banks have little reason to complain, for the increase in their resources explains why, as *The Economist* pointed out last week, their earnings experience in 1946 was substantially more favourable than had been expected. But almost every one of the chairmen's statements so far published has deplored the plethora of money, in the national interest as well as the banks'.

After meeting demands for advances, the banks have no alternative but to employ their additional resources in Government paper. Of the £830 million of new deposits created in 1946, some £640 million was thus invested, directly or indirectly. The extreme distortion of the normal banking structure by wartime influences, instead of being corrected, is therefore being perpetuated and in some respects accentuated. The proportion of deposits employed in advances, which used to be over 50 per cent and before the war was about 45 per cent, is now no more than 17 per cent—an even lower ratio than at end-1943, when total advances touched their nadir at £250 million below the present level.

The recovery in advances will continue in 1947, and may conceivably exceed the expansion achieved last year. In the past twelve months, industry has been repaying war-time borrowings from the banks, as war contracts have been wound up, and it has also received substantial sums in various compensation payments in addition to the £167 million from net EPT refunds. In the current year this stream of receipts will dwindle, so that industry will have to finance itself by other means. Moreover, new advances will not be significantly offset by repayments of wartime loans. But the volume of new borrowing demands, as one after another of the bank chairmen has emphasised, will depend upon the extent to which reconversion is hampered by shortages of labour and materials, as well as upon the size—which can hardly be estimated—of industry's remaining liquid resources. The potential demand for advances is obviously substantial, and one bank chairman, Sir Noton Barclay, went so far as to say that the long-run prospect was good. But the District's business is probably not typical of the Big Five, and none of the larger banks has ventured upon really optimistic prophecy. Current political trends, notably nationalisation and centralised buying, will eventually make the State the financier in spheres which formerly were financed by the banks. It is true, as Lord Linlithgow of the Midland pointed out, that new ventures may be developed, but such activities as

the Midland's "special advances" scheme—under which £21 million has been lent to about 1,500 small enterprises "primarily on the character and capacity of the borrower"—hardly offer scope for any really large business, unless the banks were to venture much more deeply into the provision of fixed capital.

But a very large expansion indeed would be needed to make much impression upon the advances—deposits ratio. There is no reasonable ground for believing that the function of direct lending to industry can again become the banks' primary function and the principal source of their earnings. It is to services, especially services arising from international trade, that the banks must look for elasticity in their earnings structure. Here the prospect is more heartening than seemed possible a year ago. Several of the banks have drawn attention to the large increase that has occurred in confirmed credits, acceptances and bill collections; the Midland's credits and acceptances are now "several times" what they were in 1938. Especially reassuring is the important and growing part of this business which is financing trade that does not touch British shores—trade in wheat, fish, meat, jute, rubber, phosphates and wool. These tendencies, as Lord Linlithgow points out, are welcome evidence of "an unimpaired degree of confidence, on the part of traders abroad, in sterling and in the technical services available in London as a financial centre." But unless progress towards economic internationalism proceeds much faster and further than at present seems probable, the scope for extension of such banking services must be limited.

Unless and until income from commissions reaches much higher levels, the banks will be impelled by pressure of costs to keep a high proportion of their assets in gilt-edged investments—or, at least, as high a proportion as Treasury financing policy will in effect permit. In the past eighteen months this policy, by switching the banks' liquid assets from Treasury deposit receipt to the much more flexible bills and call money, has allowed the banks a great deal of latitude, and almost one-third of the increase in bank resources in this period has gone into gilt-edged. It cannot be taken for granted, however, that Treasury policy will never be more constricting than this. In any case, the shape of the banking system, the extent of its earnings, and even its security, are in effect more than ever at the mercy of official policy. Lord Linlithgow is convinced that the adaptability of the system and the spirit of enterprise within it will find new ways of flexible service to the business community. It would be faint-hearted to think otherwise. But it would be equally foolish not to face the fact that those who so creditably strive may have to press their way against the main traffic stream. The more nearly British banking approximates to a national service, the more there is the danger that a proportion of its bankers will tend to swim with the tide.

Electronics in Industry

DURING the war years and since, the public imagination has been frequently stirred by scientific discoveries which are thought to promise a new industrial revolution. They have crowded each other out of the headlines at such speed that anything pre-atomic might almost be antediluvian in the popular view. So it is with electronics, which in a brief space has attracted much public attention, and generated a great deal of popular nonsense. The headlines have produced an "electronic brain," which as a name has the single merit of being a shorter way of writing "Electronic Numeral Integrator and Computer." To most people, "electronics" means radar; it has something vaguely to do with back-room "boffins" and "Gee" and "Obce." It is regarded as a new and esoteric study, the latest child of the technicians, which was discovered overnight and is capable of transforming the face of British

industry. It is, unlike the atom bomb, one of the romantic hangovers of the war.

It is not easy to give a five-word definition of electronics. There is a rich confusion in the average layman's mind about where it begins and ends. It was not a product of the war—for radio and television are part of electronics—though it was highly developed during the war. To the technician, the development of electronics is a branch of the study of electrical phenomena which involve the use of the thermionic valve—like the radio valve or the television screen. To the industrialist, electronics is more likely to mean the application in production processes of devices which depend on such valves. It is not exactly a new study, for its foundations can almost be said to be a century old, dating from the study of the electro-chemical reactions of light by Becquerel. But much of it is new discovery with an

old pedigree. Some of the most recent and significant developments in electronics were being studied only a few years ago by Post Office research workers as "interference"—that is, interference with radio signals. The positive nuisance of a decade or so ago has become a new branch of knowledge.

There are certain clearly defined scientific principles and basic techniques which govern all applications of electronics, but in the practical field of industry these uses are distributed in a number of compartments which superficially appear to have little in common. Four such compartments can be identified. First, electronics is closely related to the broadcasting of sound, and to further developments of film recording and television. Secondly, it has particular importance in telecommunications, including cable and high-speed wireless transmission. A third branch covers navigational devices, including radar. And a fourth is concerned with a wide range of industrial applications like control instruments, special heating devices, and X-ray equipment.

All these uses are linked by the common feature of the thermionic valve, which is employed at one stage or another in each of the processes to generate, to rectify, or to amplify a series of radio frequencies, or electro-magnetic impulses. This feature is common to all applications of electronics, whether to communicate a signal, as in radio or television, or to carry out an industrial process, like certain special quick drying processes. Naturally, the devices which are used for the transmission and reception of signals are widely different in function and design. A simple comparison of television, radar and the di-electric process of industrial heating is instructive, for it illustrates the great diversity of the devices which have developed from the common source of electronic knowledge.

When an image is televised, its variations of light and shade are converted into a rapid succession of electro-magnetic impulses by means of an electron camera and a cathode tube. The process is the generation, amplification and transmission of high radio frequencies; at the receiving end, these impulses are broken down into light and shade on the receiving screen—which is in fact the end of a cathode tube. In radar, the accidental discovery that radio signals "bounced back" from passing aircraft—at first regarded as a nuisance to radio transmission—led to the investigation of the "echo" effect which resulted, and to the discovery of a definite relationship between the time of the echo and the distance of the object which caused it. From that point, it became possible to depict the position of objects or their movements on a cathode ray tube, almost as clearly as on a map. Thus a ship or aircraft, by sending continuous pulses at the right frequency can now steer a blind course, following the radar plottings, and relating them to navigational charts to identify wrecks or large buildings. Other navigational aids, such as the Decca Navigator, which has now been officially adopted, also operate by the transmission of radio pulses, but do not work on the "echo" principle.

The third case illustrates the application of electronics to industry. To dry materials which are poor conductors of heat—such as timber, tobacco and grain—is a slow and inefficient process when heat is applied only on the surface. But by using electronic equipment, heat can be applied simultaneously throughout the substance by passing an amplified frequency through it at the required point. Nor is this technique limited to drying. Some materials are more efficiently processed if they can be quickly heated to an exact temperature. In the plastics industry, di-electric pre-heating of moulding powders to a precise temperature, in a fraction of the time used by other heating processes, has been found to increase the speed and efficiency of the moulding process. Again, in induction heating (a sort of twin brother of di-electric heating) tremendous heat can be applied at a specific point, so that localised hardening of steel, for such uses as gears, can be efficiently carried out by electronic means. Brazing, soldering

and annealing processes can be simplified and improved by the same technique. In each case, the process is fundamentally based on one or more of the three functions of the thermionic valve to generate, rectify or amplify radio frequencies.

The field covered by electronics in industry is exceedingly wide. Perhaps the most important application is in electronic measuring devices, such as the control of mechanical processes by the photo-electric cell and the use of electronic pyrometers in furnaces and kilns. In every case the chief advantage of these measuring and controlling devices is their accuracy to within the smallest unit of measurement, their ease of control, and their tremendous speed of operation. The Electronic Computer is an instrument of this sort, which uses thermionic valves as infinitely faster substitutes for a series of cogwheels such as are employed in ordinary calculating machines.

These illustrations suggest the directions in which the application and appreciation of electronics in industry could be widened. Greater accuracy (and increased detail) are required in television and radar; cost of equipment is an impediment; some industrialists have a prejudice against the use of valves which are often—and wrongly—thought to be too flimsy to be used in industrial equipment; and finally there is considerable room for international co-operation.

Achieving greater accuracy is a technical problem on which much work has already been done. For example, two problems in making radar a commercial proposition have been to improve the reproduction of the "map" delineated on the cathode ray tube (that is, to reduce any blurred effect) and to increase the sensitivity of the equipment used so that it responds to small objects within, say, 50 yards from the transmitter, enabling a ship, passing up a channel to identify by radar small objects close at hand, such as buoys, and to distinguish them from other objects shown on the tube. Firms engaged on radar research have now overcome these difficulties sufficiently to conform with the requirements laid down by the Ministry of Transport and are now able to produce commercial radar sets. Decisions to embark upon quantity production of devices based on a new, rapidly developing technique involve, of course, the essence of risk-bearing. And they are not confined to radar, for similar issues faced the Hanks Television Committee in 1943 when it recommended that the 405-line system should be the basis of immediate post-war television development in this country, but argued for the ultimate adoption of the 1,000 line system, which would give sharper detail.

Cost of equipment is an important consideration in installing any type of electronic device. Where large-scale installations are necessary, as with television, a delicate choice is involved to find the right stage of technical development at which funds can reasonably be expended on a large scale; if the new infant is hustled too quickly from the laboratory to the outside world, it may be a prodigy for a time and then die prematurely. It was difficult and expensive to reach uniformity between standard and wide gauge railway tracks in this country. It is much more difficult to reach, at the very outset, the right answers in such a new subject as electronics. The risk of technical obsolescence is high; hence although radar devices for ships are compact and simple to operate, their present cost of about £2,500 must be measured against the risk of their early replacement by something even better.

Even in small units, as in some electronic devices in industry, equipment is still highly priced, for it frequently incorporates items such as large amplifying valves which are, at present, expensive to manufacture. Moreover, most electronic devices are not yet being mass-produced and it follows that assembly costs are high. The most promising industrial field for the application of electronic equipment, therefore, would seem to be in the manufacture of mass-produced articles, where minutely accurate repetitive work is required and where the

able to claim back the whole, or a very substantial part, of the income tax deducted. The person who does suffer is the wealthy annuitant, who—it is conceivable—might have to bear tax at 19s. 6d. in the £ on his annuity.

May I also in this letter comment on the article on page 252, "The Chancellor's Week-end." I hold no brief for Mr Dalton, but surely the position is this, that if the whole of the shares of an entire industry were offered for sale on the same day the result would be a very substantial lowering of the price. I have heard this side of the problem (of share valuations) put up to the Revenue many times when it has been a question of valuing very large holdings. The Chancellor, therefore, in taking quotations for small blocks as governing the value of the whole is not working on the cheapest lines. Looked at purely from the logical standpoint he is doing just the opposite.—Yours faithfully,

W. ROBINSON, Chartered Accountant
97 Burges Road, Thorpe Bay, Essex

[Last week's note had in mind the problem of valuing large holdings for death duties, and claimed only that securities held by the average deceased estate can almost always be realised at the prevailing market prices; special arrangements for valuing in the case of large holdings are, of course, necessary. The compensation for nationalised industries is quite a different case—not of an entire industry being "offered for sale," but rather of being bought on terms chosen by the purchaser without discussion with the sellers.—EDITOR, *The Economist*.]

SIR,—Compensation arising out of the nationalisation of industries and utilities has been based in some cases on Stock Exchange values on the argument that the exchange shows the price between a willing buyer and a willing seller. That assumes that all the stockholders are willing sellers both as a group and individually at that price—an incorrect assumption. Those compulsorily dispossessed of their property being unwilling sellers surely should be entitled to compensation for disturbance over and above the alleged market value, that is for the element of force and compulsion.

Stock Exchange values provide a fair basis as between the several classes of stocks or shares and save much time and litigation in assessing compensation, but to those values should be added a fair percentage for the element of compulsion. The amount of the percentage is arguable but it would probably run to at least 20 per cent in flourishing industries so acquired.

He who is deprived of something forcibly and against his will is surely entitled to more than a willing seller.—Yours faithfully,

R. C. NORTHCOOTE

Denton House, near Harleston, Norfolk.

Tobacco Consumption

SIR,—The greatest surgical lesson of the last war was that even urgent and life-saving operations on an injured man may be fatal if performed before he is properly resuscitated. The same is true of nations, and the Continent is full of examples. The present electricity crisis is an alarming manifestation of the feebling respiration and failing pulse which can be felt throughout the nation. It is the natural result of attempting too many drastic operations, even if well planned and well meant, on the national structure before it had been resuscitated from the wounds of the war.

To enable us to stand these operations the Government sensibly arranged for a blood transfusion in the shape of the American loan to rehabilitate our industries. The figures for the past half year, however, show that only 5 per cent was used for this, its primary purpose, 32 per cent was spent on tobacco and 7 per cent on films. Why is this? I suggest that it is because tobacco raises a relatively enormous amount of indirect taxation and films do the same through entertainment tax. In other words the American Loan, our blood bank, is being used as an easy way to finance extravagant Socialist expenditure, and it is hard to imagine a more indefensible misuse of a loan on the wise use of which our recovery depends.—Yours faithfully,

Dingle House, Winsford, Cheshire

W. N. LEAK

SIR,—The Chancellor of the Exchequer has admitted the desirability of economising in the imports of American tobacco, but did not mention the possibility of switching purchases to Empire sources and the Balkan countries. The public prefer Virginia

tobacco as a matter of taste, but would doubtless smoke any kind of tobacco rather than go without or do with less. A change-over would serve the double purpose of saving dollars and helping to stabilise the economy of countries badly in need of financial support, notably Greece.—Yours faithfully,

Larchfield, Churt, Surrey

GEOFFREY BRACKEN

Agriculture Bill and Farming Efficiency

SIR,—Supervision of farming efficiency within the terms of the Agriculture Bill does seem likely to be on a modest scale. Any expectation, however, that mediocrity and indifferent farming may therefore flourish as never before is one which hardly takes sufficient account of the nature and effects of the Price Review system.

A system of recouping increased expenditures on a "Global Total" basis is one which progressively worsens the relative position of the under-average farm or farmer. On the other hand, price schedules which take note of reducing expenditures in the future, and which therefore it might be supposed would rebound to the relative advantage of such land or farmers, will almost certainly be reflecting reductions of which the better-than-average, and better equipped, farmer can take most advantage.

It seems most likely therefore that "internal" pressure on even the average farmer will be increased rather than reduced. In fact, so pronounced in some directions has the pressure already become that there is danger that the less well equipped farmer will be in difficulties long before opportunities of readjustment to labour and other problems are available to him.—Yours faithfully,

38, Dreghorn Loan, Edinburgh

M. ALLAN KNOX

Road Hauliers' Victory

SIR,—It is difficult to imagine why in your comment on February 1st on the recent road haulage strike you should accuse the employers of "making full use of the opportunities for obstruction which the machinery offered." The position was set out quite clearly in the following extract from a press notice which was issued by this association during the dispute:

"The Wages Board was set up by Parliament after an exhaustive public enquiry and the fullest consultations with both the employers' organisations and the trade unions. The procedure laid down was designed to give every opportunity to take into consideration the views of all interests on both the workers' and the employers' side in this complex industry with its diverse and nationwide activities. It is not reasonable, therefore, to describe the machinery as cumbersome, but in any case, if any change in the procedure is necessary, it is not a matter for unilateral action but for Parliament to decide after taking into account the interests of all concerned."

The last two decisions of the Road Haulage Central Wages Board came into effect on February 11, 1946, and July 1, 1946. When the latest proposals were put forward by the workers, they included among other things a demand for two men to be employed on all vehicles with a carrying capacity of 3 tons and over. Such a demand obviously called for careful consideration in view of the national need for economising in labour, particularly in the distributive industries, apart altogether from the claim for a 44-hour week, which represents a revolution in transport operation.

The official application from the workers' side came before the Board at the end of September, and agreement was reached on November 26th. There seems, therefore, to be no reason for the charge of "obstruction" on the part of the employers, as is shown by the following short statement issued after the acceptance of the award of the Court of Enquiry:

"The Road Haulage Association has accepted the Award of the Court of Enquiry. In doing so it wishes to point out that it has been actuated throughout the negotiations by a desire to do nothing to prejudice the industrial recovery of the country, and it has been impressed by the repeated warnings by members of the Government of the need for increased production. For these reasons, therefore, it has hesitated to accede to a claim which will add many millions to the Nation's Transport Bill. The Court of Enquiry set up by the Haulage Association has now made its recommendations, the Road Joint Industrial Council of its acceptance of them."

It should also be remembered that the employers were supported in their attitude to the 44-hour week by the three independent members of the Central Wages Board.—Yours faithfully,

H. T. DUTFIELD, Chairman

Road Haulage Association, 146, New Bond Street, London, W.1

Books and Publications

Offensive Bomber

"Bomber Offensive." By Marshal of the R.A.F. Sir Arthur Harris. Collins. 288 pages. 21s.

THIS book has many very good qualities. For one thing, it is very readable, written in a direct and lucid style that is in refreshing contrast to most memoirs written by men who have won their eminence with instruments other than the pen. The earlier chapters have some excellent anecdotes, which do not suffer overmuch from having a single hero. For another thing, Air-Marshal Harris has been very frank about the part that he played in the war. Though there is plenty of self-defence, and here and there a hint of retrospective embarrassment, there is no apology in this book. It may therefore serve as opener to an equally frank discussion of one of the most awkward questions for the British people connected with the winning of the war. Was the all-out "strategic" bombing of Germany successful? And was it justified?

Sir Arthur Harris, it is clear, has many of the qualities that are required of the successful militarist engaged in total war. He believes in himself and his own judgment. He is a hard man, determined to go to any lengths to impose his will on those whom he thinks less clear-sighted, less decisive or more subject to their emotions. To use of him the polite phrase that he "is no respecter of persons" is a ludicrous under-statement; only the vernacular gives an accurate description: he evidently doesn't give a damn for anyone. He is a great enthusiast for his own side. And he is also a very good hater. The Navy, the Army, all Civil Servants, especially those in the Air Ministry ("I can recall one civil servant whose whole-hearted devotion to the country and to his work was worth at least a division to the enemy on every day of the war")—these are only the beginning of his hates. (It is of surprising, and not a little flattering, to find *The Economist* on the list. We had always supposed that the destruction of our premises "by enemy action" was Goering's work. After reading Sir Arthur Harris's book we are not so sure.) Nobody would suppose, from reading "Bomber Offensive," that Air-Marshal Harris is an endearing man to know or an easy colleague. But war is a nasty business, and if it is to be won, it can only be won by men who are arrogant, hard and fearless.

Sir Arthur Harris's case is that Bomber Command won the war and could have won it earlier. Moreover, he defends with great skill his own policy of "saturation" bombing of whole industrial areas and derides the American policy of "precision bombing" on "panacea targets."

Even within the narrow framework of the war, can this thesis be maintained? It would be silly to claim that the bombing of Germany did not do very great damage to German war production and transport. Of course it did, and if there had been more of it, more damage would have been done. But the real argument is whether the resources of manpower and of industrial production that were engrossed by the heavy bomber programme for a long period at the crux of the war could have been used elsewhere to better effect. In particular, did the Bomber Offensive delay the invasion of Europe? The probability is that it did.

Moreover, Europe cannot close its book at the end of hostilities and go off to Rhodesia. The really great war-maker is he who wins the war in such a way that his country (let us, for the moment, leave out all others) can enjoy the peace. Manifestly, that was not done in the last war. The gravest threat to the present uneasy peace lies, it need hardly be argued, in the festering chaos that was Germany. Without some economic and political stability there, there can be no real peace in Europe. The Allies have, it is true, done their best, since the last bomb was dropped to prevent any rational policy from emerging. But perhaps Air-Marshal Harris's work did not leave much room for reason. For all the individual heroism that went into it, the final judgment on the contribution that Bomber Command made to the war must remain in doubt; the contribution that it made to the peace is, unfortunately, all too clear.

Exasperating Economics

"Economics for the Exasperated." By Gordon Rattray Taylor. The Bodley Head. 408 pages. 10s. 6d.

THIS is an infuriating book. It misses, by a margin which at first appears narrow but which grows steadily and hopelessly

wider, achieving what every student of economics, and every intelligent citizen conscious of the haziness of his economic ideas wants: the perfectly comprehensible, realistically based, up-to-date and well-written account of the economic system, its workings, its problems and its underlying principles. Mr Rattray has a good expository style, his blending of facts and figures with theory, his use of each to reinforce the other, could hardly be bettered; his setting of British problems against a world background is first rate; he has an uncanny gift for summarising and simplifying the toughest theoretical problems. Only . . .

To begin with, *Economics for the Exasperated* shows every sign of having been drafted, or at least mostly thought out, before the war, and pitchforked prematurely into publication with no more than a few hasty addenda. The reader who has followed the excellent account and criticism of the gold standard, but who finds himself fobbed off with a couple of two-line references to Bretton Woods, has every reason to be exasperated.

Then Mr Rattray's easy writing and swift survey of events mask some curious pitfalls. There is an extraordinary paragraph (pp. 341-2) from which not even the most sympathetic reading can extract any other conclusion than that he believes the Russo-Finnish war to have broken out before World War II. No doubt he does not really; but, assuming that one has not, in other and less violently illuminated fields, followed for oneself the course of the events which he chronicles, how much confidence in his accuracy does such a passage inspire?

But the most serious drawback to this paragon of might-have-beens is its core of theory. Mr Rattray starts off with what looks like a first-rate popular statement of the main Keynesian propositions and an outstandingly good account of the structural changes and rigidities of the economic system. But it gradually appears that to Mr Rattray the Keynesian relatives are absolutes. The industrial countries of the world do not merely have to reckon with a decline in the marginal efficiency of capital; they are "capital-sated." Recipients of large incomes do not merely tend to save a larger proportion of their receipts than recipients of small ones; they are literally incapable of spending what they receive. And so on. The consequences of these divergences, of whose correspondence with the facts Mr Rattray offers no evidence, run and ramify throughout the whole book, as a small error in a compass bearing distorts a chart.

His book is probably the ideal prod in the ribs for the complacent economist—if there are any complacent economists these days—but the reader for whom it is intended, the exasperated ordinary citizen anxious to learn what it is all about, should read it, if at all, with extreme wariness.

Brazilian Civilisation

"The Masters and the Slaves." A Study in the Development of Brazilian Civilisation. Gilberto Freyre. Translated from the Portuguese of the fourth Brazilian edition by Samuel Putnam. New York: Knopf, 1946. Published in Great Britain by Secker and Warburg. xliv + 537. 35s.

THIS remarkable book which has just been published in this country, was first published in Brazil in 1933, under the title of *Casa Grande e Senzala* (the Great House and the Slave Quarters), and has already run into four Portuguese and two Spanish editions. Its author is the most distinguished of the younger Brazilian anthropologists and historians, and this particular book, though greeted with a storm of abuse by reason of its frankness, its iconoclasm, and its indifference to national, racial and religious prejudice, has long been recognised as a major work of sociology and, it may be added, of literature. It is an analysis of the relation between aboriginal Indians, Portuguese coloniser and negro slaves in colonial Brazil, and to it Freyre brings the skill of the trained anthropologist, a wide-ranging erudition and an unfailing capacity for asking questions. The result is a fascinating study of the semi-feudal patriarchal society, based on a system of monoculture and slave labour, which developed in the great plantation houses of the colony. It is, in addition, the most penetrating analysis that has yet appeared of Portuguese colonisation and of the roots of Brazilian nationality, and it is, finally, an important contribution to the wider problem raised by the contact between so-called superior and inferior races.

In Brazil—a society at once the most stable and the most tolerant that Latin America has seen—that relationship was conditioned by the dominance of the sugar-crop on the one hand and by the

overhead cost of electronic equipment can be spread over 2 large output.

Under the third heading, the removal of prejudice, a warning may be needed. In "selling electronics" to industry there is perhaps some danger that the pendulum of prejudice will swing to the opposite extreme. The benefits which this new technology can bring to industry are manifold but they often have to be weighed against alternative mechanical means of performing the required functions. An electronic calculator is not required where a simple machine will do. There are some indications that electronics is regarded as an open sesame to a new post-war "gadgets industry." Such an impression would do no good either to industry or to electronics; the time and money spent on electronic research and development should be properly and not wastefully applied, particularly while British industry is in the throes of capital re-equipment.

Before long, electronic development will have seriously to be tackled internationally. Until agreement is secured on certain key questions, particularly between countries with adjacent land frontiers and between the principal trade-carrying nations, progress will be impeded. Agreements on uniform practices in navigational aids are especially important. This need was recognised at the informal international conference on navigational aids last May and discussions on the standardisation of aircraft equipment have already begun. Co-operation in these matters points in turn to a much wider problem, namely, the need for an ordered allocation of frequencies in the radio spectrum between different countries. All forms of electronic technique use radio frequencies and are therefore concerned with the best and fairest use of the wide range of frequencies which is theoretically available through the bands used before the war for navigational aids, the long, medium and short wave broadcasting bands (including television), the ultra-high frequencies for radar purposes, the infra-red frequencies and up to the ultimate frequencies used in X-rays. Before the war, the broadcasting frequency bands were already becoming overcrowded, and the far greater use of radio communications today makes an international agreement on the allocation of frequencies all the more urgent.

Congestion in the ether has had important technical consequences. Attention has been concentrated more and more on economising frequencies, especially in those sections of the spectrum used for sound broadcasting where the overcrowding

of different stations is most acute—as listeners to the Third Programme will appreciate. Research, both in this country and in America, has been exploring the possibilities of "frequency modulation" for use in particular on the short wave bands to relieve the pressure on the medium and long wave lengths, and it has produced encouraging results. Less emphasis has been placed in this country than in the States on the potentialities of "FM" as a cure for the congestion of the ether, but it has been established that high-quality, noise-free reception can be obtained in this country by employing "FM" transmitters, and making modifications in wireless receivers. Alterations in receiving sets to reproduce short wave "FM" transmissions should not be expensive—indeed, such sets are in the prototype stage—but a complete change of receivers and transmitter to frequency modulation is still a long way off.

Industrially, electronics manufacture is closely connected with the electrical and radio engineering industries. During the war many of the leading firms were diverted from civil research on electronics to special war-time investigations. Ideas and experience were to a large extent pooled. Co-operation among the leading firms on basic technical problems still exists, but some measure of competition is reasserting itself in the supply of equipment. It is too early to say how large a part electronics will eventually play in the business of the leading electrical, telecommunications equipment and radio engineering firms. For some years, at least, electronics can represent only a relatively small contribution to total output, and costs of development will be high. But expansion in production is necessary if export markets are to be won in competition with American firms who can develop their ideas and exploit the economies of large-scale production in a much larger domestic market.

Much progress has been made in this highly diversified field of electronics. In television and navigational aids, research is active and the consumer is beginning to see its results in new services and devices. In industry, electronics has been applied over a wide field, above all in control instruments, welding and electronic heating. Progress in its application is assured. But there is no new industrial revolution in prospect. It is in the particular, not the general, application that electronics can play its part in speedier and more accurate production.

Business Notes

"Extremely Serious"

The psychology of the security markets in these days of economic difficulty is particularly hard to predict. Perhaps the hot-house atmosphere of cheap money dulls the taste for rational analysis of market forces. It has been difficult for several weeks to find any alternative explanation for the market's casual taking in its stride of the coal crisis and, more recently, of the transport strike. But it is hardly less difficult to account for the depressing impact on the City of the White Paper on wages and output. Little, if any, of the factual material provided in that document is new; it omits many points that could have been made, particularly about the country's prospective external position, and it stops well short of positive recommendations of policy.

Yet it has seized the imagination of the market far more dramatically than the details of its component parts, as they have unfolded during the past six months. Doubtless the ordinary share market, after its headlong rise during the previous fortnight, was more than ready for a reaction. The *Financial Times* index of industrial ordinary shares (July 1, 1935=100), which on January 2nd stood at 136.0 had by January 17th bounded up to an all-time "high" of 140.6. On Tuesday, a particularly sharp setback occurred, which took nearly 2½ points off the index, and stability had not been achieved on Wednesday, when it registered 136.2.

It is difficult to rationalise these extremes, either of boom (save on cheaper money arguments) or of correction. Perhaps some speculators, armed with the authority of a White Paper which refers to the "extremely serious" position of Great Britain, are now visualising, in terms of to-day's prices, the potential future consequences for industrial earning power which may result from the cut in coal deliveries and of other shortages. The new "realistic" basis for coal allocations will have extremely unhappy consequences for the steel industry, where it entails a 25 per cent cut in the throughput of coke ovens, with all the consequences of a dislocated balance of production in integrated plants, short time working, inability to blow in new furnaces—and, indeed, the likelihood that some may have to be taken out of production. It is ironical that a plant like that of Colvilles at Clydebridge—on the doorstep of the Lanarkshire coalfield—will be as badly affected as any. Equally, it is inevitable that production of ships' plates, constructional steel, sheets and other products will be seriously reduced. The new system of allocation is intended to bridge the particular difficulties of the next six weeks, but even over that period the output of steel might well be reduced by 400,000 tons, compared with the projected target for this year of 13½ million tons.

The equity share markets seem at last to have sensed the nature of an industrial crisis, in which one shortage generates another, and where the mechanism of production shows an unmistakable

tendency to run down. Perhaps the second White Paper will tackle some of the aspects of economic policy which the first left untouched. But it can hardly produce a recipe which will be capable of restoring the conditions of insouciant boom which so recently prevailed on the Stock Exchange. That requires a different kind of magic, of which Mr Dalton, with his cheap money policy, is the only master. And he himself will hardly fail to take note of the observations of the bank chairmen on the dangerous potentialities of a further drive for even cheaper money.

Australia Cuts the Terms

The new Australian conversion operation came as no surprise to the market in any of its details, save only that the stock, which carries 2½ per cent for a minimum period of 23 and a maximum period of 28 years, is issued at par, and not at a slight discount. Holders of the £17.1 million Australia 4 per cent stock, 1943-48, on whom notice of repayment on April 15th had already been served, and of £1.4 million Western Australia 3½ per cent stock, 1927-47, which matures on June 1st, may convert into the new stock at par until February 5th. Cash applications, however, were received last Wednesday, and will be allotted to the extent that conversion applications are insufficient to cover the required total of £18,516,193.

Undoubtedly Australia is forcing the pace with these terms. They represent a notable advance on the 2½ per cent stock, 1967-71, which was issued last June at par, and now stands at 105. At this price the gross redemption yield is £2 8s. 6d. per cent; consequently the new stock, for all that it represents a further tightening of the screw, cannot be said to be out of relation with the level of Australian credit in the London market. In these cheap money days that level is, in fact, a common datum, which extends over the whole of the trustee market; one of the most spectacular consequences of Mr Dalton's all-pervading policy of cheap money is to compress the yield structure to such limits that municipalities, Dominion and Colonial borrowers can come to the market on terms which are only fractionally different from those which the British Government itself can command.

Nevertheless, the presence of a date—even one which is 28 years remote—is something of an attraction in these days of the 2½ per cent one-way option stock. The fact that Australia will finally repay in 1975, whereas the British Government in that year only may repay the new 2½ per cent Treasury Stocks, is something of an attraction for those investors who must have a dated stock and are prepared to accommodate themselves to 2½ per cent for such an extended period. The results of the issue—for it must be hoped that, on this occasion, the Australian authorities will ensure that the results are published—will be of particular interest, since institutional investors at the moment are, in fact, satisfying their gilt-edged needs very largely by buying railway and electricity Stocks at a discount on their take-over prices, and are thus concerned to a much smaller extent in direct operations in the gilt-edged market.

Argentine Railway Doubts

Conflicting stories have come from Buenos Aires during the past week about difficulties in the talks between representatives of the British-owned railways and the Argentine authorities. Señor Miranda, the president of the Argentine Central Bank, caused some initial dismay—even among those who recalled the chequered course of the negotiations conducted by the Eady mission last summer in Buenos Aires—by his statement last week-end that the negotiations had broken down completely as a result of the British representatives' refusal to accept the Argentine Government's offer for outright purchase of the railways for a maximum sum of 2,000 million pesos—or £125 million. This statement was the more surprising since Sr. Miranda had declared only a day or two earlier that any suggestion that Argentina was contemplating outright purchase was absurd. No official statement has since been made about the course of the talks, but the mere fact that contact between the two sides has been preserved at least converts Sr. Miranda's statement that negotiations had broken down completely. It is, in fact, understood that until his statement was made the course of the discussions had not been unpromising. It is, however, quite understandable that the British side would be extremely reluctant to contemplate an offer of £125 million and that anything below would stand no chance of acceptance.

Evidently the recent negotiations have changed the direction, if not exactly the basic intentions, of that part of the Anglo-Argentine agreement, which was signed in Buenos Aires last September, which provided for the taking over of British-owned railways in Argentina by an indigenous company as from January 1st this year. What now appears to be in issue is not the constitution, capitalisation and the distribution of shares in such a company, but the use of Argentina's sterling balances, which now amount to about £130 million, for outright purchase. But the negotiations have evidently taken a course which calls for considerable watering down of the optimistic guesses in some quarters of the City last September that the Argentine authorities might be prepared to pay as much as £180 million for the railways. The negotiations were always expected to be tough, particularly since with the expiring of the Mitre Laws British Companies have lost a number of financial advantages and are now faced with substantial demands for increased wages. Hence if the negotiations should in fact break down, their position would be extremely difficult. There is, however, no firm indication, as this issue of *The Economist* goes to press, that total breakdown is in question.

The Trade Deficit

The December trade figures, being affected by the incidence of holidays, bring the year's trade totals to a close with something of a question mark, for they fail to show the extent to which the normal rate of export was already being affected by shortages of coal and raw materials towards the close of last year. A prospective fall during the coming months in such items as steel, coal and textiles has already been anticipated by Mr Marquand.

scarcity of white women on the other. The Great House and its slave quarters became an "entire economic, social and political system" and its social history "the intimate history of practically every Brazilian"; and while the latifundary system, of which it is the symbol, made possible the economic development of Brazil, that system was also to result in a perversion of agriculture and in deficiencies in the supply of food which poisoned "the sources of life itself." Malnutrition, slavery, monoculture, help to explain phenomena too easily ascribed to climate and race.

This book may raise more questions than it draws conclusions, but one conclusion is certain. It is essential for any understanding of Brazil and the Brazilians, and the English reader has cause to be grateful for the skill and care with which Mr Samuel Putnam has made it available.

American Economic Life

"The Concentration of Economic Power." By David Lynch. Columbia University Press, 1946. (London: Cumberlege). 423 pages. 31s.

THE mountainous labours of the Temporary National Economic Committee set up by Congress in 1938 ended in the mouse of a fifty-page report; and there has hitherto been no adequate summary of the vast amount of material which it collected on every aspect of American economic life. Nor, in view of the Committee's own incoherence in explaining itself, has there been any clear picture of what the Committee was or what it tried to do. Mr Lynch has now filled the gap with a very competent summary of the evidence and hearings, complete with thumbnail sketches of the Committee's personalities, an introduction on the political manoeuvrings which led up to its establishment, and a brief final analysis of the reasons for its failure to focus the main problems before it more clearly.

It is this latter question which gives the book its greatest interest; for in the nature of things it can be answered only from a general survey such as this. Mr Lynch lays his emphasis chiefly on two points. The first, a matter of committee technique, is the danger of being impartial. A chairman consumed with a holy zeal against the infidel; a hand-picked committee ready to back their chairman to the last ditch and the last *auto-da-fé*; as few departmental ties as possible; narrow and pointed terms of reference—these are some of his formulas for a committee which will genuinely focus the problems (even if on a slant) and force the pace of public discussion. There is a good deal to be said for his view; and it is very noticeable that none of his conditions were actually fulfilled by the Economic Committee.

Secondly, and far more important, the Committee suffered from the prevailing confusion of American economic thought below (and even sometimes at) the highest academic level in the last years before the war. The contributions to the Committee by Alvin Hansen, Mordecai Ezekiel, or Leon Henderson were one thing; the general atmosphere of the hearings was very definitely another. If too much attention was given to trust-busting, and too little to the economies of large-scale production or the more fundamental problems of full employment and industrial relations, the fault lay not so much with the Committee as with the atmosphere in which it worked. It is little use for an official committee to attempt to focus national thinking until public discussion has at least brought a possible focus in sight.

Mr Lynch's analysis leaves the reader regretting, that, after digesting the indigestible, he did not sit down to write the minority report which he might himself have produced had he had the chance. But that will no doubt come later. For the moment, he has provided a very useful introductory survey, with the additional merit (the astonishing merit, to anyone whom duty has compelled to plough through the arid wastes of the Committee's monographs) of being eminently readable. And there is even evidence, in flashes, that he positively enjoyed writing it.

The Future of the Rupee

"The Post-War Rupee." By V.K.R.V. Rao. Oxford University Press. 48 pages. 2s. 6d.

An interesting and momentous dilemma faces the financial authorities in India. The basic factors in the position of the rupee suggest that there should be some depreciation of that currency in terms of sterling and the dollar. Currency has been inflated at a much greater rate in India than in Britain or the United States and prices have risen much faster. On the other hand, never has the technical position of the currency been as strong as it is to-day given the substantial repayment of Indian external debt and the accumulation of sterling credits during the

war. In the light of these contradictory indicators should India raise or lower the exchange value of its currency? Professor Rao addresses himself to this question in a short pamphlet, which surveys the problem with great clarity, insight and objectivity. He reaches the somewhat tame conclusion, "Leave things as they are"—a judgment from which few well-informed observers of the position will differ. The right course is often the unspectacular one, especially in matters of exchange adjustments, where the mere weight of the *status quo*, if it can be justified at all, should be allowed to offset the contrary guidance of more meticulous calculations of disparities in cost and price levels.

Professor Rao, in discussing the future of the rupee, sees no practical alternative to the continuance of the link with sterling for some time to come, though he would like to see some limitation of the power, which, he argues, the rupee-sterling link gives to the United Kingdom, "to get as much of Indian currency as she wants by the mere process of issuing more sterling and selling it to the Reserve Bank."

Let Professor Rao be reassured on this score. The unbridled British expenditure in India during the war was incurred in a cause with which India's interests were unmistakably identified. In the future it will lie wholly within India's control to decide whether or not she exports to the sterling countries more than she imports from them. Looking to the more distant future Professor Rao envisages a position in which the Indian rupee will no longer be linked to sterling or to any other currency but will be a fully autonomous currency to which "it would not be surprising if most other currencies in Asia were to get linked." This is an ambitious vision. To realise it India will have to show proof of economic as well as political stability in the years ahead.

Shorter Notices

"Price-Quantity Interactions in Business Cycles." Frederick C. Mills. National Bureau of Economic Research, Inc., New York. \$1.50

A statistical and mathematical inquiry, covering the period 1904-1938, into the relations of movements in price and output of a number of key commodities.

"Economic Research and the Development of Economic Science and Public Policy." National Bureau of Economic Research, New York. \$1.00

This book consists of twelve papers presented at the 25th anniversary meeting of the National Bureau of Economic Research, covering a wide field which includes methodology, specific national problems, policies relating to international trade and to employment. The contributors are drawn from academic, administrative and financial life.

"Output and Productivity in the Electric and Gas Utilities, 1899-1942." Jacob Martin Gould. National Bureau of Economic Research, New York. \$3.00

This is a careful descriptive and statistical study of American utilities, tracing the growth of the electric and gas industries and placing them in the perspective of American economic development.

From The Economist of 1847

February 13, 1847

It may be a very unwelcome and humiliating doctrine for statesmen and legislatures to recognise, but it is nevertheless one the truth of which experience is forcing upon mankind more and more irresistibly every year, that they are much more powerful for evil than for good; that the greatest and most ingeniously devised schemes to better the condition of the world, which have, when adopted, been applauded as the acme of wisdom and the greatest efforts of human intellect, have proved but miserable failures for the objects in view, while they have had innumerable indirect and mischievous consequences never dreamt of or anticipated. It may be hurtful to the pride of statesmen to discover how little they can really do . . . to eradicate misery, to alleviate suffering, and to improve society. Yet—so it is—the progress of civilisation shows more and more how few and simple are the real duties of a Government, and how impossible it is to add to those duties without inflicting permanent mischief on a community. . . . The chief aim of all the statesmen who have acquired a high reputation has been to remove regulations and restrictions imposed by others—to remedy the errors of former statesmen by removing old regulations, and not by imposing new ones. All that can be said of the greatest statesman is, that he discovered error and removed it; that he found a country harassed by restrictions and regulations, and that he freed it.

AMERICAN SURVEY

The Atom—Top Secret

(From Our U.S. Editorial Staff)

AT the hearing of the Joint Congressional Committee on Atomic Energy on February 4th, Senator McKellar unwittingly committed a major public service. He goaded Mr. David Lilienthal into a statement of democratic beliefs whose succinct clarity silenced the crowded room and then launched reporters around the stenographic transcript clerk. Consideration of Mr. Lilienthal's nomination as Chairman of the new civilian Atomic Energy Commission had been completed except for the attack periodically delivered by the patronage-hungry senior Tennessee Senator whenever the former head of the Tennessee Valley Authority appears for appointment. After about an hour of malicious questions, the Senator said: "The truth is that your sympathies are very leftist, are they not?" Mr. Lilienthal then outlined his faith in democracy as an affirmative, rather than a negative, doctrine, a satisfying and positive alternative to Communism, in such moving and effective terms that one sympathetic member of the inquisition, Senator McMahon, broke the respectful hush with congratulations "to a very real American."

The immediate results of Senator McKellar's persistence are thus so negative as to have been positive, but they have not rooted out the obstinate suspicion, voiced again this week by Senator Bridges, that Mr. Lilienthal is sympathetic to Russia and therefore peculiarly unsuited to be the guardian of the atomic secret. It is even less certain that those military circles who supported the defeated May-Johnson Bill for the control of atomic energy will not reassert their influence—it is possible to infer that many of the questions asked at the hearings had their ultimate origin in this group. The test will come, not over the appointment of the Commission members, but over the appointment of Mr. Carroll Wilson as the Commission's general manager and Mr. Herbert Marks as its general counsel.

Because of these hearings, the Commission has recently had to do two days' work each day, one in the Capitol and one in its uncarpeted offices in the new War Department building, where it is said to start each day by re-reading the declaration of policy in the first section of the Atomic Energy Act of 1945, with special attention to one phrase contained therein: "subject at all times to the paramount objective of assuring the common defence and security." The responsibilities assigned to the Commission in the Act are monumental without the complications that spring from the language of the law just quoted. They seem overwhelming as the implications of this "overriding paramountcy" are understood.

A problem faced by the Commission even before the keys were formally turned over to it at a homely ceremony in President Truman's study on December 30, 1946, illustrates the point. One of the big plants built and operated by the Manhattan District employed processes that had been demonstrated to be obsolete. There was no intelligent alternative to shutting it down and dismantling it. This action appeared simple enough until members of the Commission thought of the information that would be given an interested world by the shut-down. It would be tantamount to announcing, first, that the process being abandoned was inefficient and could be disregarded, and, second, that other processes had been improved to a point where discarding of the inefficient process could not be further postponed. These disclosures, furthermore, would come during the course of delicate international negotiations, and might be expected to raise a question whether the technical bases of the negotiations had become obsolete.

The Commission shut down the plant, and a simple, undetailed announcement was made of that fact. But no member of the Commission believes that any precedent was set or any policy formed by the manner in which this first problem was handled. The incident, to the contrary, convinced members of the Commission that they will have to move very slowly and with great caution on all matters of policy. Mr. Lilienthal, the Chairman, and his colleagues emphasise that, so far, they have been desperately busy studying the law under which the Commission must operate, and the large, scattered and diverse institution they have inherited from the US Army.

If the Commission has as yet no policy other than that prescribed by law, its members do have "thoughts" about the general directions in which they should steer. A first thought is that a great deal more push should be put behind the production and distribution of radioactive materials for use in scientific investigations both in the United States and abroad. An excellent, though modest, start was made in this direction while the Army continued in control. Dr. Eugene Paul Wigner directs the work at Oak Ridge, Tennessee, and shipments are being made daily. By arranging for comparable work from the atomic furnaces at Chicago and Hanford, Oregon, exceedingly valuable research tools can be more plentiful and better distributed.

Mr. Lilienthal (and he is strongly supported in this by all members of the Commission) is deeply convinced that exclusive emphasis on the atomic bomb during the months since Hiroshima has been harmful. He is determined to shift emphasis to the constructive potentialities of self-sustained release of nuclear energies. Though no physicist, Mr. Lilienthal learned a great deal about the engineering and economics of power while head of the Tennessee Valley Authority, and he regards the meagre and hesitant disclosures that have been made about atomic power for industry as naïve. He will push research and development in this field hard. It is reasonable to expect an announcement within five years that nuclear energy can produce electric power at costs figured in fractions of a mill per kwh, and with total regeneration (or even more) of the fuel used.

The Commission has made a start in formulating employment policies for both technical and scientific workers. It is not as well realised as it should be that the centralised, integrated corps of scientists that achieved stunning successes during the war has fallen apart. It will never be put together again at the same level of efficiency. Ways and means must be found to bring it to some approximate of its former greatness. In this direction the Commission is compelled to face some

"AMERICAN SURVEY" is drawn from three sources. Articles described as "From Our U.S. Editorial Staff" are the work of a small group of regular correspondents, resident in the United States. Articles with some such attribution as "From An Industrial Correspondent" or "From A Correspondent in Ohio" are from outside contributors. Everything printed without attribution is prepared in London.

It is disturbing that, at this critical stage, when the export drive calls for renewed impetus, it has received instead a new setback. Even for the last quarter of 1946, the volume of exports is provisionally estimated at no more than 112 per cent of the 1938 level, compared with 104 for the September quarter, 98 for the June quarter and 84 for the March quarter. For the year as a whole it can be said that the 1938 volume of exports was restored, that the volume index continued to rise, though at a declining rate, throughout the year, and that the prospects for the achievement of a volume of exports 75 per cent higher than in 1938 must now unhappily be regarded as obscure.

It has been certain for several months past that the adverse visible balance would be appreciably smaller than the figure which was used in striking the Washington estimate of an overall deficit of £750 million for 1946. The following table sets out the final figures for 1946, compared with 1945 and 1938:—

UNITED KINGDOM OVERSEAS TRADE BY VALUE

	1938	1945	1946
Total imports	919,508,933	1,103,693,217	1,297,682,580
U.K. exports	470,755,320	399,275,982	911,686,238
Re-exports	61,524,646	50,988,697	50,348,445
Total deficit	387,228,967	653,428,538	335,647,897

The adverse balance of £335.6 million is in line with the provisional estimate of £350 million which was suggested in the discussion of the British balance of payments in these columns on December 21st last. Such a relatively favourable result has been produced, in large part, by the painful contraction of imports, which for several months past have been running at a mere 70 per cent of the volume of 1938. In other words, a smaller adverse balance in 1946—so far as it is due to the maintenance of imports below a level sufficient to ensure a satisfactory rate of industrial activity and a more ample standard of living—merely postpones their true cost to later years. There may be some features for satisfaction in the year's figures, but there are even more for concern.

Some interesting portents may be drawn from an analysis, which has been prepared by the Board of Trade, of the 1946 export figures by value compared with those of 1938. "Raw materials and articles mainly unmanufactured" which accounted for 12.1 per cent of the total value in 1938, represented no more than 3.6 per cent of the 1946 exports. Manufactures have increased from 77.6 per cent to 86.3 per cent, but of these textiles have fallen from 21.5 to 20.5 per cent, despite the relatively greater rise in prices of textiles, compared with other manufactured goods. In fact, cotton yarn exports last year represented one-sixth by volume of the 1938 level, and cotton piece goods one-third, and although the total quantity of artificial silk exports was three times the 1938 figure, mixed tissues were halved.

Much of the increase in the manufactures group is attributable to metals (44.1 per cent of total exports by value last year, compared with 37.3 per cent for 1938), and particularly vehicles, locomotives, ships and aircraft (12.5 per cent against 9.5 per cent). But of all the black spots, coal is incomparably the worst. Exports last year represented no more than one per cent of the value of total exports, compared with 7.9 per cent in 1938.

Discount Market Activity

A year which has witnessed capital expansion by nine discount houses did not need the added evidence of the accounts of the "Big Three" companies to prove that it has been a period of activity and prosperity for the market. On the question of expansion, the comparison of principal balance-sheet items given below speaks for itself. The National Discount Company is one of the two members of the market which has not yet increased its capital, but even it shows an increase of 32 per cent in its loans and deposits. The Union's increase is 41 per cent, while that of Alexanders, whose disclosed capital resources have been almost doubled, is 51 per cent.

The manner in which these additional resources have been employed is not, however, so readily apparent from the balance sheets. The Union Discount this year makes a welcome break with tradition by excluding "short-dated securities" from bills discounted, and, by giving comparative figures for 1945, reveals how misleading it is to assume that a balance-sheet "bill" item not thus strictly segregated mainly comprises bills, for the result of this accounting change has been to reduce the Union's 1945

"bill" holding from £116.5 million to £76.8 million. The other two companies—which, it is to be hoped, will next year follow suit—still adhere to the traditional form, so that it would be unwise to attempt to draw definite conclusions from their figures about the relative size of their bill and bond portfolios.

To judge from the Union's experience, however, the year-end investment portfolio has probably declined—doubtless in consequence of Mr Dalton's large repayments of short bonds during the year. It deserves to be noted, too, that at the end of 1945 the market's capacity for absorbing bonds was stretched to the limit, owing to heavy sales by other holders anxious to switch into the 3 per cent Savings Bonds before the tap was turned off. The comparative ratios of capital resources to the total "books" of bonds and bills strongly suggest that, when the National's pending capital rearrangement (including a "bonus" discharge of uncalled

liability) is complete, it will follow the rest of the market in raising additional capital. Its total "book" is nearly 35 times its disclosed resources, compared with ratios of 25½ and 26½ for the Union and Alexanders respectively. These ratios, it should be added, do not afford a level comparison with the end-1945 figures because in December, in consequence of the cessation of clearing bank window-dressing, the market carried over the turn of the year a substantial volume of bills which would normally have had to be sold to the authorities in the closing days in order to finance withdrawals of bank loans.

Building Licences and Wages

With the object of combating the operations of the black market in building, the Minister of Works has announced new measures for tightening up the control over the use of materials and labour. From February 1st, local authorities will be empowered to issue licences for all housing work, irrespective of cost, instead of granting, as at present, a "certificate of essentiality" for work of over £100, and leaving the Ministry itself to issue the licence. This provision applies to private dwellings only and not to work on hotels, hostels, boarding-houses or holiday camps. In future, local authorities will be empowered to prosecute in all cases of infringement of the licensing regulations within their area. Another change in the regulations is the removal of the clause, which lent itself to great abuse, under which no licence was needed for work on private houses, with "unpaid" labour. From February 1st, any private work which is worth more than £10, or uses more than £10 worth of materials, will require a licence, even where labour is unpaid or is provided by the owner himself.

It remains to be seen whether these new regulations will be effective in curbing illegal building operations. No official estimate of the extent of the black market has been given, beyond the statement that the Minister is "seriously disturbed" by it. The difficulty is, of course, to track down offences, and the fact that of 11,155 complaints examined by the Ministry last year, only 133 cases were actually heard, resulting in 22 convictions, suggests that a great many offenders are not brought to book. The devolution of responsibility upon the local authorities, both for issuing licences and for prosecuting those who contravene them, should make for speedier procedure and for greater zeal in dealing with offences, although the degree of efficiency will depend upon the nature of the local authority. The further proposal that authorities should keep a central register of all licences issued is intended to

POULTRY, LONDON, E.C.2

facts of life that both the Army and Congress chose to ignore in their preoccupation with "keeping the secret." A job with the Atomic Energy Commission must be attractive enough to invite a man competent to fill it, despite the stultifications of security regulations and the rather dismal environments of Oak Ridge (Dogpatch), Los Alamos (Happy Valley), and Hanford. The Commission's only important "thought" on this problem, so far, is that work at the sites must be integrated into work in the same field at universities, so that workers can spend some time in the academic atmosphere they prefer. The problem of scientific staff, moreover, is not the only one the Commission must shortly face: collective bargaining as it affects less specialised personnel also has peculiar aspects under these circumstances. At the one site which has been opened for union negotiations, Oak Ridge, one plant has been won by the AFL, by a comfortable majority, one plant by the CIO in an uneasy victory of some two dozen votes in a total of about 4,000, and one plant voted for no union. The contracts are renewable next December.

The Commission has not faced its most dangerous problem, that of disseminating basic scientific information while keeping its secret. Members have nibbled at the problem, and the problem has nibbled at them. For instance, Mr Lilienthal is supplied with reports of spy activity around "the secret." Indeed, such reports are gratuitously pressed upon him. He has no way of assessing the reliability of these reports, except by their character. He has no way of acting on them, even if they impressed him. Actually he is not greatly impressed by what he has seen of the spy problem. But others may be; and it is what impresses others—Congress, the Army, the Departments of Justice and State—that is important to the fate of America's experiment in civilian control of a revolutionary factor in world affairs. In the Senate hearings, the emphasis has been almost entirely on the question of military security. Mr Bernard Baruch reportedly testified that Russian representatives betrayed a suspicious familiarity with secret processes. Mr Lilienthal himself was goaded by his questioners into insisting that the major breach of security was the publication of the Smythe Report in 1945, which was authorised by General Groves, the arch-priest of security. Mr Sumner Pike, another Presidential appointee, in his testimony, made a promising attack upon the sterility of secrecy when he suggested that American national security would benefit more from rapid exploitation of the industrial possibilities of nuclear energy—which would require some freeing and exchange of information—than from a penny-wise, pound-foolish insistence upon paralysing security measures.

In pursuing this double, and almost irreconcilable, task of advancing knowledge of the atom while preserving every security precaution, the Commission must move very slowly.

The Republican Party leadership which now prevails in Congress, and expects to capture the Executive power in 1948, does not like the men President Truman appointed to the Atomic Energy Commission. It regards them as "collectivists." This probably will not block the confirmation of David Lilienthal, Dr Robert F. Bacher, William W. Waymack, Sumner T. Pike and Lewis L. Straus. Republican elders do not feel prepared for a fight about atomic energy control now. The talk is that the Commission will be permitted to work along until 1949, when the law will be amended to increase its membership to eleven, and six "private enterprisers" can be appointed. Perhaps things will develop as the Republicans plan.

But a mis-step by the Commission on the problem of security of information, or some international incident that incites a flare of American fear or belligerence, could upset the Commission overnight. Persons who understand how vital it is that the experiment in civilian control shall succeed should not underestimate the great hazards the Atomic Energy Commission must run these next few years. The Commission has not fallen foul of any of these hazards yet. That is about all that can be said. It will be the most important and hopeful thing that can be said on any future day for a long time to come.

American Notes

Half a Trade Agreement . . .

The fear that the Reciprocal Trade Agreements Act, and through it ITO, were about to be scuttled by the high tariff wing of his party has led Senator Vandenberg, the Republican sponsor of a bi-partisan foreign policy, to attempt to arrange a parallel compromise on foreign economic policy. As extended, the Act permits the President to reduce tariff rates by 50 per cent without recourse to Congress. This is the inducement the State Department hopes to hold out to other nations at Geneva in April. The Republican revolt has taken the shape of demands that further negotiations should be suspended while the administration of the Act by the State Department undergoes a full-dress investigation to determine whether the Act should be revised. It is now clear why Senator Vandenberg declined to go to Moscow. The economic battle will be decided in Washington.

What Senators Vandenberg and Millikin propose are certain concessions in procedure by the State Department to allay the fears of Congress, in return for a pledge that Republican leaders will ensure a "hands off" policy toward the Trade Agreements Act during the coming year. This five-point plan, which has been discussed and accepted by Mr Acheson and Mr Clayton, would empower the Tariff Commission to review all proposed concessions and define to the President the point beyond which they should not go, to avoid injury to the domestic economy; it would put an "escape clause" in every agreement which would be administered by the Commission rather than the State Department; it would make public the hearings and recommendations of the Tariff Commission; and it would deny the benefits of the most-favoured nation clause to countries not extending similar benefits to the United States.

Such an agreement can safeguard the International Trade talks from outright repudiation, if it is accepted by the House of Representatives (which is not only the source of most of the agitation against further tariff cuts, but may be sensitive about its own right to originate tariff policy). But if the price paid is high enough to persuade Messrs. Knutson, Jenkins, and Gearhart to call off their bills, it is likely to limit severely the scope of the negotiations. It introduces a new note of instability into the negotiations; should the United States run into a business recession in the next year, there is likely to be a stampede for the escape clauses. This is rather like the possessor of an umbrella offering it to his less fortunate neighbour on the understanding that it will be returned at the first sign of rain. In economic policy, bi-partisanship comes perilously close to stalemate. And many will doubt whether postponing the final "battle of the tariff" until 1948, when it will be plunged into the politics of a Presidential campaign, is the trumpet blast that will bring down the walls of the protectionist Jericho.

No Golden Gates

The "portal-to-portal" wage claims have been shattered, if not finally destroyed, by a Court decision that the now celebrated union suit against the Mount Clemens Pottery Company of Detroit involved claims altogether too trifling for Court consideration, and that, in any event, any such claims could not be dated back beyond June of last year when the Supreme Court gave the award that seemed, in the eyes of many union lawyers, to justify a completely new interpretation of the Fair Labour Standards Act.

These rulings, which have shattered rosy union dreams of back-payments possibly aggregating \$5 billion, were by no means an unexpected sequel to shock tactics both by the Treasury and the Justice Department. In the first place, the Treasury conceded that payments made by companies to unions would be chargeable against Excess Profits Tax over the appropriate profit-earning period, and with this substantial measure of relief intimated also that the ruling should not be admitted as "a premium for the admission of union claims."

In other words, industry, still rather uncertain of the official reaction to union claims, was told very clearly that such claims should be resisted, despite the fact that several large undertakings had already elected to settle out of court.

The Justice Department followed with the unusual, though by no means unprecedented, decision to intervene directly in a private suit which might well injure the Treasury by as much as 50 per cent or more of any successful claims against industry. From that point, the issue was never in doubt, although Federal Judge Picard, of Detroit, in his re-examination of the test case spent a

great deal of unproductive time in trying to determine the validity of specific claims for time lost. But evidence was so conflicting that the doctrine of *de minimus* provided the only legal answer.

Some of the so-called "portal-to-portal" claims will, no doubt, survive the new rulings. But, as before the 1946 award of the Supreme Court, unions will now have to prove that "unproductive time" is substantial enough to warrant compensation. And they must do so in the full knowledge that the Court has once again demonstrated a masterly ability to abandon an untenable position without any direct reversal of an earlier decision. Had the unions, mainly from the Congress of Industrial Organisations, followed a modest path they might have secured some reasonable concessions. But even for American unions in 1947, industry has no golden gates to open.

The President's Term

Very nearly the first act of the new Republican House of Representatives has been to lock the stable door against another three-term or four-term President. A constitutional amendment to that effect has passed the House by 285 to 121. The habit of fighting Mr Roosevelt, alive or dead, is hard to shake off. The actual wording of the amendment includes persons who have served "all or any portion of two terms," a provision which would bar President Truman from a highly hypothetical spell of office beginning in 1953. At the same time, Mr Truman has again requested Congress to legislate on the Presidential succession. His thought is that in the event of a vacancy at the White House the Presidency should pass to the Speaker of the House, an elected official, rather than to a Presidential appointee like the Secretary of State, as at present. It is not overlooked in the Senate that if he were to die and be succeeded by a Republican Speaker the man thus elevated to the White House would enter the Republican convention in 1948 with manifest advantages, and it is suspected that Mr Truman derives a quiet pleasure from the rôle of a modern Paris.

Democrats who voted against the two-term amendment, resenting the slur on their late leader, were sharply reminded that in 1928 the party condemned in advance the possibility of a third, or rather second and half, term for Mr Coolidge. But the implications of the measure go beyond the question of whose ox is gored. It is characteristically American that the main witnesses in this debate are not the living but the hundred-years dead. Jefferson, whose party was known as the Democratic Republicans, appears for both sides. The Republicans quote his belief in rotation of the Presidency, his hatred of perpetuation of power, while the Democrats recall his statement that in certain situations, such as the threat of the creation of a monarchy, even he, Jefferson, would run for a third term. Ancestor-worship conveniently overlooks the Jeffersonian dictum that the country ought to have a revolution every generation. The Democrats would do well to remember that President Wilson opposed the third term ban because it would "immensely weaken the President's fighting power" on behalf of the people. . . . "We singularly belie our own principles by seeking to determine by fixed constitutional provision what the people shall determine for themselves."

To attempt to tie the future by building bulwarks against the popular will is very reminiscent of the checks and balances which the Constitutional Convention evolved to protect the Government against the masses. For most men, the sheer physical strain of the Presidency precludes a third term. The present amendment would deprive the country of the possibility of continuity of policy in an unforeseeable emergency, and that in a spirit of vindictiveness toward a man now dead. The need for assent by two-thirds of the Senate, and then by three-quarters of the States, gives time for second thought.

State Finances

While war has fastened an unprecedented debt total on the Federal government, State finances have improved beyond all recognition. A recent survey by the Census Bureau of the Department of Commerce revealed that, with few exceptions, cash balances were at record levels. Through 1946, the State authorities were able to rely upon an exceptional level of tax receipts, reflecting new peacetime peaks for national income, while labour, equipment, and material shortages again accounted for an abnormally low rate of capital expenditure. By the close of the year, 28 reporting States disclosed balances aggregating

more than \$2.2 billion in general, highway, and post-war contingency funds.

It is interesting to compare the total of the funds given above with the figure of rather less than \$2.4 billion representing the gross indebtedness of all State governments at the close of the year. A substantial proportion of these funds, of course, represents the deferment of works expenditure that is quite essential so soon as present shortages disappear, but the improvement in local finances is none the less welcome, and will no doubt prove a useful cushion in the event of any general setback in industrial activities.

There is indeed, need for prudent financing since whatever funds are now available, it is apparent that the State governments altogether will be called upon to provide a considerable extension of social services. In a recent analysis of the New York State position, Governor Dewey declared that while its financial position was "the soundest in history" it was confronted with new and increasing demands for social welfare, educational services, pension funds, and heavy constructional expenditures.

One of the items which now seems to be causing concern is the renewed enthusiasm of State electorates for further Veterans' bonuses. Before the November elections, the general trend of opinion seemed to be that Federal payments should provide adequate cover for veterans, and that local schemes should be covered by tax receipts, or be confined to provision from special contingency funds. Since that time, however, as the National City Bank recently reported, "scarcely a week passes without some new bogus bill being thrown into the hopper." In consequence, proposals for new veterans' aid funds from States now total \$3.6 billion—a total which compares with borrowing amounting to about \$450 million after the first World War.

These proposals have yet to run the full legislative course, and many may be abandoned. Even a substantial reduction, however, would leave them at an unduly large level when it is recalled that Federal expenditures in this direction, already generous, are continuing through the 1947-48 Budget year at an annual rate of \$7.3 billion. The National City Bank's conclusion that in view of liberal Federal assistance, such plans are "premature" seems more than justified in the light of the urgent need for development programmes designed to correct some of the prevailing disparity in regional income payments.

Sweet and Low

(From Our US Editorial Staff)—The Committee on Agriculture of the House of Representatives has announced to the world at large, and more particularly to the International Emergency Food Council, a new concept of "America First," applied to the nation's sugar policy. The pre-war concept was one of fostering domestic production, through tariffs, quotas and subsidies, at the expense of the natural "Sugar Bowl" of the Caribbean; the new design is to rig the distribution of world sugar supplies to benefit domestic consumption not only at the expense of more sorely pressed consumers elsewhere but also in violation of explicit US commitments to these other sugar consuming nations and to Cuba in the single purchase agreement for joint account.

Reduced to figures, the situation is that Cuba's estimated production of 5,500,000 (short) tons this year can take care of inventory and national needs, repeat last year's contribution to United States and European consumption quotas, and still leave some 1,416,000 additional tons available for distribution among the nations participating in the single purchase agreement. But the House Agricultural Committee is demanding an increase in the American quotas to individual and industrial consumers sufficient to provide the American housewife with 10 to 15 more pounds of sugar than last year, and to give industrial users a corresponding supplement. If this were done, the additional Cuban production would be absorbed in the United States, with nothing left for the other nations participating in the agreement. In the crop year just ending, estimated production in areas under the US flag was just over its 1935-39 average of 3,954,000 tons.

In "insisting" that the United States retain all of the additional Cuban tonnage, the full committee formally adopts the attitude taken by its Andresen Sub-Committee at a sugar hearing in Washington on January 21st. While this is not necessarily the official position the United States will take in the IEFC meeting, it does reflect a current attitude which must disturb a world concerned not only with an equitable distribution of available sugar supplies but also with an appraisal of America's intentions (or pretensions) about its Trade Agreement programme and its championship of ITO.

MARTINS BANK LIMITED

STATEMENT OF ACCOUNTS, 31st December, 1946.

LIABILITIES	
Capital paid up	£4,160,042
Reserve Fund	4,160,042

THE ZINC CORPORATION, LIMITED.

To the Members,

In my statement to shareholders which accompanied the Report and Accounts for the year ended 31st December, 1945, I made extended reference to the wide expansion in the interests of The Zinc Corporation, Limited, and the direction in which they were likely to develop in the near future.

The interests I referred to may be briefly stated as:—

- (1) The extension of our lead and zinc mining at Broken Hill and the smelting, refining, transport and manufacturing industries associated therewith both in Australia and her Mandated Territories and the United Kingdom.
- (2) The search for and the development and equipment where justified of Mines in the neighbourhood of the existing producers on the Broken Hill field and elsewhere.
- (3) The search in Australia and her Mandated Territories for oil and natural gas and the development and utilisation of coal and other fuels and sources of power.
- (4) The development and extension of manufacturing industries associated with the treatment of sulphur-bearing ores and production of non-ferrous metals.
- (5) The supply and erection of power and other machinery, plant and equipment for use of the Broken Hill field.
- (6) The provision of research, technical, financial, commercial and transport services essential to the mining, smelting and manufacturing industries.

Your Directors are of opinion that the production of the Broken Hill mining field is capable of substantial expansion. In this connection The Zinc Corporation, Limited, and New Broken Hill Consolidated, Limited, have agreed to a joint production programme under which it is hoped that during the next 7 or 10 years output will be raised from its present level of 500,000 tons to about 1,000,000 tons of ore per annum. The expenditure involved in the duplication of these two Companies' present output, with the attendant housing, transport, smelting, refining and other services and on plant and equipment will, it is expected, be in the neighbourhood of £7,000,000 sterling.

The finance necessary for the expansion of production and for reasonably meeting the requirements of the other activities referred to is considerably in excess of the total of the Corporation's current available resources together with such contributions as it is estimated could be made from future earnings without adversely affecting the returns to shareholders. Your Directors have for some time past been giving earnest consideration to the problem of providing this additional finance and have decided that it will be in the best interests of the shareholders to segregate the Corporation's mining and milling operations on its leases at Broken Hill from its other interests and investments. By this method it is believed the finance involving any risk to your firmly established industry, or interruption in the wide employment it provides.

Accordingly, after consultation with the Corporation's lawyers and accountants, it has been decided to form a subsidiary Company with the title of:—

THE BROKEN HILL CORPORATION LIMITED.

This new Company will have an authorised capital of £5,000,000 divided into 44% Cumulative Redeemable Preference Shares of £1 each and Ordinary Shares of £1 each. The issued capital of the Company will be 1,000,000 44% Cumulative Redeemable Preference Shares of £1 each, and 2,000,000 Ordinary Shares of £1 each, leaving 2,000,000 shares unissued.

It is the intention that The Zinc Corporation, Limited, shall subscribe for 750,000 of the above 44% Cumulative Redeemable Preference Shares of £1 each in cash at par and, in addition, will transfer to The Broken Hill Corporation Limited its various holdings in associated and other companies; these holdings will be transferred, in the case of those which are quoted, at or under market prices and in the case of those which have no quotation, at or under cost. In consideration for this transfer, The Zinc Corporation, Limited, will be allotted, credited as fully paid, an additional 250,000 44% Cumulative Redeemable Preference Shares of £1 each (ranking *pari passu* with the 750,000 Preference Shares to be subscribed for in cash) and 2,000,000 Ordinary Shares of £1 each.

The Zinc Corporation, Limited, will at this stage own the whole of the issued Preference and Ordinary Share capital of The Broken Hill Corporation Limited.

In conformity with your Directors' usual policy it is intended in due course to offer 750,000 of the 44% Cumulative Redeemable Preference Shares of £1 each of The Broken Hill Corporation Limited, which are to be subscribed in cash by The Zinc Corporation, Limited, for sale to the shareholders (both Preference and Ordinary) of The Zinc Corporation, Limited. It is also hoped that later it may be possible to arrange for shareholders to have an opportunity of acquiring Ordinary Shares of The Broken Hill Corporation Limited.

Full particulars of The Broken Hill Corporation Limited, together with details of the offer for sale, will be sent to shareholders in due course. The above information is sent to you now as your Board considers that you should be informed as early as possible of the steps which are being taken in planning for the future and for the further development of your interests at Broken Hill and elsewhere.

I trust your Directors may have the same confidence and support in this project as you have been good enough to accord us in the past.

I am, Yours faithfully,

JOHN R. GOVETT, Chairman.

37, Dover Street, London, W.1.

23rd January, 1947.

provide greater publicity and enlist the co-operation of the public in checking evasions.

While the Government is thus preparing to tighten the controls over building operations, it is not yet showing any great concern about the rise in costs. The prospect of an alarming rise in building costs is raised by the building workers' wage claim, which was presented to the employers on Wednesday and was rejected by them on what seem to be very reasonable grounds. The unions asked for an extra 6d. an hour on the present base rate, which would bring the craftsman's rate to 3s. an hour (3s. 1d. in the London area), with a corresponding increase in the labourer's rate, which is 80 per cent of the craftsman's. This claim, it has been estimated, would increase the building industry's costs by the order of £65 million a year and the employers put the increased cost of municipal houses at £90—the union's figure is £60—or 1s. 1½d. per week in rent. Here is surely a clear case of the need for relating wage increases to increased productivity. When building wages were increased a year ago the unions gave a definite pledge that they would work for higher productivity. But although it is difficult to define a satisfactory measurement of productivity in building, there is no obvious sign that this pledge has been made good. One direct way of securing increased output would be to adopt a system of payment by results; this is still under consideration, but there is a great deal of opposition to the idea among the unions and in Government circles and it is unlikely to be adopted without considerable further discussion.

Sterling Negotiations

It was announced this week that preliminary discussions for a settlement of Egyptian sterling balances will take place in Cairo when Sir Wilfrid Eady of the Treasury and Mr Cobbold, Deputy Governor of the Bank of England, are returning from their comparable mission to India. It is also hoped that these gentlemen will have an opportunity to visit Iraq for similar discussions in March. As in the case of the Indian visit, the objectives are cautiously limited to "preliminary discussions," and in view of the disappointing course of the negotiations between the two countries for the revision of the Anglo-Egyptian Treaty of 1936 it may be wise thus to anticipate difficulty in the Cairo discussions. None the less, there is in the announcement made in Cairo and London a strong expectation that the talks will lead to a definitive arrangement without much delay. This emerges from the statement that arrangements are being made for meeting Egypt's essential needs in hard currencies during the period between March 31, 1947, when the existing hard currency agreement terminates, and July 15, 1947, "the date on which more permanent arrangements, to be negotiated between the two Governments, are expected to come into force."

The date has a familiar ring. It is that on which the convertibility of currently earned sterling comes into force, in accordance with the provisions of the Anglo-American agreement of December, 1945. That deadline will provide a useful argument against prevarication in the tough negotiations with sterling area creditors that lie ahead. The sterling balances held by Egypt are between £450 millions and £500 millions, and in size are second only to the balances accumulated by India. The hard currency agreement, which terminates on March 31st next, allowed Egypt a hard currency quota equivalent to £E14,350,000 during the fifteen months from January 1, 1946. If Sir Wilfrid Eady and Mr Cobbold succeed in these delicate and difficult negotiations, they will deserve the fullest praise and thanks.

Statistics of Trade Bill

Sir Stafford Cripps's speech on the second reading of the Statistics of Trade Bill on Tuesday was an effective argument for a measure which ought to fill many wide gaps in our economic knowledge. The Bill (briefly described in *The Economist* of December 14th last) provides for two economic censuses—one for production and the other for distribution. It is intended that the census of production should in future be an annual event, instead of quinquennial as it was before the war. As for the census of distribution it was not a "deep and dark plan, for preparing for the nationalisation of the retail trade"—a headache which Sir Stafford was prepared to leave to some other Government—but a means of ascertaining the structure of the distributive trades, the business which they conduct, the relation of shops to total population in different areas, and the spread of wholesale and retail price margins. Moreover, it would provide an estimate of the expenditure of the public on different types of commodities

which is largely unknown—though not wholly, as Sir Stafford appeared to suggest.

The Opposition fastened upon the fact that 21 separate Government Departments will have power to seek information through the censuses, and that under present conditions the questionnaires would impose a new burden on industry. Even Sir Stafford's assurance that duplication of demands for information would be avoided as far as possible, reiterated at the close of the debate by Mr Belcher, scarcely served as a counterweight to the assertions that the present time, with its shortages of manpower and clerical staffs, and its high volume of form filling, is not ideal for the introduction of the new censuses. But there is no reason why a sensible system of questionnaires, settled in advance by mutual discussion between the Government departments and the industries concerned, should be impossible to devise.

The breeze which has followed the distribution of forms for the 1946 pilot census of production suggests that one of the first lessons to be learned is the art of explanation of the purpose, content and relevance of the questions which are asked. It is surely desirable to set up the limits of detail and of precise accuracy which are required for census purposes, and to explain them fully to industry. Mr Reddaway's recent paper at Manchester showed that, in many particulars, the information required could take the form of intelligent estimates rather than exact measurement. Even so, the extension of the time limit for the return of questionnaires from two to three months is highly desirable—particularly if the publication of final results suffers a delay in any way comparable with that of pre-war censuses of production.

Mr Strauss on Transport

The speeches of the Parliamentary Secretary to the Ministry of Transport, Mr G. R. Strauss, sometimes attract less attention than they deserve. It was left to Mr Strauss before the appearance of the Transport Bill to explain in general terms the Government's intentions about transport and the reasons for their rejection of the road-rail agreement last July. It is he who, in a speech this week, has come nearest to setting out the Government's broad intentions for the development of transport, which were so noticeably lacking in the Second Reading Debate before Christmas. Mr Strauss did not attempt to explain the operational aims of the new Transport Commission in any detail, but he has at least briefly described the principles on which the Commission should work. The Commission should ensure that for each transport purpose that form of service shall be used and developed which is technically and economically the most efficient—an argument for total integration of transport which would not be unfamiliar to readers of *The Economist*. Secondly, he claims that capital for development and modernisation of transport equipment was often not forthcoming in the past unless a quick and satisfactory return could be clearly foreseen. The Transport Commission, therefore, should be able to take longer views and "give all possible scope for technical improvements and those developments which without integration are unlikely to come about." Unfortunately Mr Strauss did not refer even briefly to the associated question of the elimination of redundant capital which under no conditions consistent with the aims of the Commission could be made remunerative.

The functional basis laid down in the Bill, under which the separate Executives will be responsible for operating their own forms of transport, has been widely criticised on the grounds that it will impede the aim of integration. Mr Strauss admitted that a regional rather than a functional basis is at first sight attractive and was, in fact, most carefully considered, but he rejected a regional form of organisation on the ground that it would be "wholly impracticable," at least at the outset, would cause "appalling dislocation" and would "transfer the whole direction of management of transport to the railways as these are predominant in size."

This is hardly the whole answer to the criticism, for both on grounds of size, and also of the time-table which the Transport Commission is apparently to follow in acquiring the various transport interests, it is fairly obvious that the railways will always be predominant in size, and possibly in influence, among the Executives, and conceivably on the Commission. Mr Strauss, however, does contemplate that eventually a full-scale regional organisation may be developed, though that is, of course, a question for the Transport Commission, under the general direction of the Minister. Any benefits of the nationalisation in any event are bound to be slow, and the immediate target, as Mr Strauss sees it, is to avoid inconvenience to traders and the public during the first

Middle East Oil

The Middle East oil agreements (discussed in *The Economist* on January 4th) are now attracting increasing opposition from the independent oil producers, who are seeking anti-trust action by the Justice Department. In Congress, the chief spokesman for the independents is Senator O'Mahoney, Democrat of Wyoming, head of the special committee which declared quite recently that US reserves would be "insufficient for another large-scale war," and urged the rapid development of synthetic production.

The Senator, however, refuses to believe that the solution is recourse to foreign supplies, and more especially of resources beyond the boundaries of the Western Hemisphere. For one thing, the generally accepted European view that Washington is not officially committed by the deal made between Anglo-Iranian and Standard Oil does not carry conviction with the independent interests in America. They emphasise the Standard Oil declaration that the Justice Department and the State Department were both told formally that such a deal was on the way, and that no reaction followed. And they assert, in any case, that official recognition must have been forthcoming both in London and Washington before preliminary moves were made. Though the political aspect of the Middle East agreements is thus brought to the fore, it is obvious that the real concern of the independents follows from the loss of European markets for producers in the Caribbean zone, and the fear that such a development will jeopardise their future either by intensified competition within the domestic market, or by increasing federal regulation, that will be tied to the State Department's conservation policy.

The independents, moreover, declare that since the Standard Oil interests already hold a considerable stake in Latin American output, the terms of the Arabian deals will greatly strengthen the grip of the relatively small number of international concerns upon the world oil market, and will go a long way towards meeting the aims of the Anglo-American Oil Agreement which is still nicely pigeon-holed by the appropriate Senate Committee, and which, quite recently, was thought unlikely to see daylight for some time to come. The independents have fought consistently against the Anglo-American Agreement, but in the light of recent deals some are beginning to wonder whether or not it would be better to have an official declaration of policy. Meanwhile, the American Petroleum Institute, representing the major

producers, has confirmed its acceptance of the agreement, subject to Washington's assurance that the government does not wish to extend its regulatory powers to cover international deals.

The Justice Department seems to have endeavoured to ally some of the more vigorous protests by declaring that it was willing to examine the Standard Oil deals for alleged infringements of the Sherman and Clayton anti-trust acts. Responsible trade quarters, however, assert that the Department is satisfied that these deals do not involve any question of "monopolistic practices" and that they must be judged in the light of State Department policy and of service needs.

Rent Control or Decontrol?

The focus of the housing problem is now rent control, about which a vigorous controversy is raging, with chief attention on residential rents. A sub-committee of the Senate Banking and Currency Committee has just completed some hearings and has before it a bill which would extend rent control without change beyond expiration on June 30th of the present statute, another to extend it with a 15 per cent advance and terminate controls some time in 1948, and yet a third to extend it with allowance for 5 per cent rise each four months with termination of controls some time in 1948. General Fleming, head of the Office of Temporary Controls, was recently ready to permit a 10 per cent advance now, but was overruled by President Truman. Both the President and Governor Dewey in their messages advocated continuation of rent control last month.

From August 15, 1939, to last fall, the rent constituent of the Consumers' Price Index had risen 4.3 per cent while the index in total had mounted 53.9 per cent. Hotel room rents have recently been de-controlled. Provision has been made for upward adjustments in needy cases. Rents on new construction are fixed more in relation to cost than to earlier periods.

The basic argument used by real estate and property groups is that controls aggravate the housing shortage and are inequitable. Control advocates argue by contrast that construction is held up, not by lack of return, but by unduly high costs, and material shortages. In their view, a rise in rents would cause immediate demands for wage adjustments and imperil present negotiations.

THE WORLD OVERSEAS

Coal Problems in Canada

(From Our Ottawa Correspondent)

CANADIAN coal reserves have been estimated as the second largest in the world, yet Canada imports a large (and growing) percentage of its coal. Before the war, it imported about half of its total consumption; but in the later war years, it was importing about 28 million (short) tons a year, almost exclusively from the United States, as against an annual consumption of about 16 million tons of domestic coal. Quite apart from the distortions of the war economy, the relative importance of Canadian coal as a source of energy in Canada has been rapidly declining over the past two or three decades. As recently as 1926, Canadian coal supplied 31 per cent of Canada's energy sources. By 1930, hydro-electric power had outstripped Canadian coal as a source of energy, and by 1945 water power was supplying just over 30 per cent, and Canadian coal only 18 per cent. Petroleum (largely imported), and natural gas together have grown to be almost as important a factor in producing energy as home-produced coal. The above figures do not take into account consumption of wood for fuel, for which statistics are not adequate; but the ratios between the several sources are not affected by the omission.

One of Canada's oldest and most important mining areas, situated on Cape Breton Island in Nova Scotia, has suffered financial stringency and unhappy labour relations for many years, and conditions appear to be approaching a crisis. Certain Pacific coast mines are also languishing. No wonder that Canadians, contrasting on the one hand the almost inexhaustible seams of Canadian coal, and on the other hand the increasing reliance on

imported fuels and the deteriorating state of some of the important coal fields, should demand an explanation of the anomaly. A Royal Commission, appointed in October, 1944, has recently concluded its labours, and the 664-page Blue Book which resulted was tabled in the Canadian House of Commons on January 31st.

Canada's large and increasing reliance on imported fuels ceases to be a mystery when a map of North America is examined. The most valuable coal resources of Canada, measured by quality, thickness of seam, accessibility, and extensiveness of deposits, are to be found in the province of Alberta and portions of the two adjoining provinces of Saskatchewan and British Columbia. The main industrial region and the most thickly populated area, however, lies in southern Ontario and Quebec, two thousand miles away. The gap must be bridged largely by rail. Ontario and Quebec have no coal at all. But the industrial wedge of Canada, located on the St. Lawrence Lowlands, nestles just above the greatest coal area in the world. The Pennsylvania, Ohio, West Virginia, Michigan, Indiana and Illinois mines average, perhaps, a fifth of the distance away from the Windsor-Hamilton-Toronto-Montreal factories and metropolitan areas, as do the mines of the Canadian North-West, and a cheap water haul is available a good part of the way.

The mines of Nova Scotia and of the Pacific Coast are either on tidewater or virtually so, and a cheap water haul is available to them. The coal deposits there, however, are severely handicapped in competition with American mines. Those of the west coast are approaching exhaustion. The Cape Breton mines have

so cope with pitching seams, submarine extraction, weak roof and floor measures, and workings under heavy cover. These conditions, complicated by bad labour-management relations and failure to keep up with technological advances used in the competitive American mines, have brought about a discouraging situation. While man-day production in the Nova Scotia mines has been falling from 2½ (short) tons to 1½ tons, that of U.S. mines has been rising. According to the Royal Commission "more than half of the United States coal which competes in the central Canadian market comes from States averaging 5.08 to 6.77 tons per man-day in 1944." (These are bituminous mines: productivity in the United States anthracite fields was 2.79 tons per man-day in both 1939 and 1944.)

Under these circumstances, any idea of making Canada self-sufficient in coal is flatly rejected by the three commissioners who formed the Royal Commission. Assuming that central Canada will continue to require 25 million tons a year, all of which must be imported from some source or other, the Commission points out that even under the most favourable conditions, the Nova Scotia mines could not provide more than 5 million tons a year, so that at least 20 million tons would have to come from Western Canada. Under conditions of free competition, no Western Canada coal reaches central Canada at all. Even with a tariff of 75 cents a ton against US coal and with a \$2.50 a ton freight-rate subvention, the movement of Alberta coal to central Ontario has never, in normal times, reached more than about 90,000 tons a year—a mere trickle. The Royal Commission estimates that a policy of compelling central Canada to use all Canadian coal would raise the price of equivalent fuel at least five dollars a ton—a burden of over \$100 million a year, which would rest in the first instance upon the people and the industry of central Canada but, by impairing their competitive position, eventually on all Canada.

Accordingly, the Commission does not advise any drastic new measures for encouraging the use of Canadian coal. It would leave the tariff where it is: 75 cents a ton against U.S. bituminous coal, 50 cents a ton against U.S. anthracite, with British imports free of duty. (Before the war Canada imported up to 2 million tons of British anthracite a year, almost all consumed in Ontario and Quebec.) It would discontinue the wartime import subsidies and the production subsidies, but would continue a policy of freight subventions to encourage the use of Canadian coals over a rather wider band of territory than is possible without such help.

Labour unions in the Cape Breton area strongly recommended public ownership of the coal mines, urging that this would bring to an end the long era of animosity between workers and management, and would stimulate production. The Commission did not accept this view. "The evidence submitted to us fell far short of establishing that nationalisation would result in higher productivity." Mr Angus Morrison (one of the commissioners) in a separate report gave warning that the collapse of the Cape Breton industry seemed inevitable, unless adjustments were made in industrial relations and the present antiquated and inefficient methods improved. With a programme of extended mechanisation and a new spirit of industrial relations, the Commission believes that productivity can again be raised to 2½ tons per man-day in Cape Breton and the industry restored to a competitive position.

Poland's New Territories

[FROM A CORRESPONDENT IN WARSAW]

A TRAVELLER to Poland's "Recovered Territories" will almost surely be shown, in the churches and public buildings of Upper and Lower Silesia, innumerable ancient Polish eagles. And now, in the archives of the museum at Jelenia Gora (Hirschberg) an old book has been found, handwritten in Polish, which contains records of all births between February, 1694, and July, 1715, in the village now called Laczinkowa (Lenschik bei Kreis Neustadt). Written in the book "In Year of Grace 1866" is the following plaintive inscription: "It can be seen from this book that our language has not been eradicated from this borderland, where the German territories are next door. It lives—but for how much longer. Only God can know." All of which is interesting from a historical point of view, but as spurious as most such arguments have become when intended to prove a nation's right to territory. More cogent, in fact, than all the eagles—with heads turned rightward—are the strenuous efforts to colonise these territories which the Poles have made.

These lands, largely depopulated, mined and ravaged during

the last furious days of the war, have been restored to an extent which is remarkable, even when it is recalled that much of the land was sown in 1945-6. The Russians are still there, but most observers agree that they are concentrating on guarding communications. The Red Army is mostly in the eastern part of East Prussia—only part of which is Polish—and in two districts in the west, near Szczecin (Stettin) and north and east of Wrocław (Breslau). In these most devastated areas, according to reliable sources, the number of Russians is steadily decreasing and authority as well as installations are gradually being handed over to the Poles. The old German towns retain their physical characteristics and the result is a curious combination of an inanimate German setting with living Polish actors. The street names, even when the streets are nothing more than rows of gaping skeletons, are Polish; the sound of the villages and cities is Polish; the language of the schools, the newspapers, the shops, is Polish. The Polish Catholic Church has replaced the German churches. And the primitive eastern peasant carts now rumble up and down. Most important, there was on November 1st, according to Polish official sources, a Polish population of 4,392,000 settled on these lands, 48 per cent in the towns and 52 per cent on this region. This is more than the population of Ireland or Denmark but still only half the pre-war population. It is also more than the government had dared to hope for when the first loads of people, in every imaginable wheeled contraption, went westward early in 1945.

Since the reconstruction of the territories hinges on population, any examination of what is happening there should perhaps start with an analysis of the present inhabitants. Of the present Polish population 992,000 are considered indigenous by the Polish authorities and 75,000 are still awaiting verification. Of the remaining 3,400,000 Poles, 1,238,774 (about 30 per cent) have come from across the Curzon line; 1,382,688 (30 per cent) from Central Poland; about 150,000 (5 per cent) have been repatriated from Russia and 300,000 (10 per cent) from Germany. Also, 36,000 have come from other European countries, including 3,000 families of Poles returning from Bosnia, where they had been forcibly settled by the Austrians in the 1870's. From France have come 4,795 coalminers with their families, to be followed next year by 50,000, including families. There are also a number of skilled Germans whose knowledge of Polish has led to their return or retention.

German Flight Westward

While the Poles, during the past eight months, have been streaming into the western lands at a rate of 177,000 each month, the Germans have been moving out. Since February, 1946, when the official evacuation plan began to function, 1,483,000 Germans have been deported to Germany, leaving a total of 670,000 out of the 2,900,000 or more who were there when the Poles began to administer these territories. It is not possible to tell precisely how many fled westward with the retreating German armies. It seems reasonably certain, however, that except for the southern district of Lower Silesia, which was either untouched or only mildly damaged and in which most of the German population remained, some 4,000,000 Germans fled westward.

At Potsdam the Poles received to administer all German territories situated to the east of a line drawn from the Baltic Sea through Swinouiscie (Swinemünde) and along the Oder up to its junction with the western Lusatian Neisse and farther along the western Neisse to the Czech frontier. In addition, they received the part of East Prussia not placed under Soviet administration and the area of the former free state of Danzig. These lands, with their great natural and industrial riches, are considered the key to a healthy economic future for the country. With their great industrial potentialities they could at last absorb the surplus rural population. The new coastline, 450 kilometres long instead of 72 kilometres before the war, has already produced an entirely new orientation in Poland's relations with the world outside. It is easy, then, to see how a Pole might be hypnotised by the economic future this new country could offer him. But to an average Pole the mines of Upper Silesia are not the coin of his country in its dealings with other nations. The whole industry of Silesia, mines and outlets to the sea included, is the potential arsenal for a new German aggression. This cannot be disregarded as a mere twist in the popular brain—it is shared by the French, the Czechs, and other peoples who suffered the German occupation.

The patriotic attitude of the Polish population toward the government policy on this question can be taken for granted even though the national tax for the reconstruction of these territories was imposed almost simultaneously with the announcement of the election date. This was the reverse

stage of the transfer and to leave "the full benefits of integration to fructify freely" over a period of some years.

*

Mr Strauss was addressing members of the Permanent Way Institution, and he had some interesting, but far from cheerful, things to say about the condition of the permanent way on the British railways. Before the war they used about four-and-one-third million sleepers a year. During the war years the average was reduced to just under three million, and arrears involving nearly ten million sleepers had thus accumulated by 1946. To wipe off these arrears in five years and to provide for current maintenance, six million sleepers a year would be required, and there is not the slightest chance of carrying out a programme of this magnitude. Pre-war sources of supply like Russia and the Baltic countries are now closed—temporarily at least—and the only supplies at present available are from Canada and the United States. The pre-war stocks of three to four million sleepers have already fallen to the critically low figure of half a million and may fall still further. The only practical alternative to wood sleepers is concrete, and only the pre-stressed concrete can stand the strain of heavy main-line traffic. Even this form, indeed, is unsuitable for electrically track-circuited sections or electrified lines. There is a similar shortage of steel rails, which in the first quarter of the current year is likely to be at least half a million tons. It is quite clear that current maintenance—to say nothing of the overtaking of wartime arrears—will present difficulties in 1947, and there is a distinct possibility that restrictions in railway speeds may be necessary in the interests of safety.

Talks with the Dutch

British officials representing the Treasury, the Board of Trade and the Ministry of Food will be going to the Hague next week to discuss the problems arising out of the decidedly unbalanced state of current trade between the sterling and guilder currency areas. No global figures of such payments are available, but their trend is sufficiently indicated by the following table of direct Anglo-Dutch trade for the first nine months of 1946, with comparable figures for 1938:

(In Thousand £'s)

	First Nine Months 1938	1946
Exports of UK manufacture.....	9,851	21,453
Re-exports	1,247	4,169
Total exports.....	11,098	25,622
Imports from Netherlands	21,978	7,455

This lack of balance in the Dutch trade with Great Britain is only part of the wider picture of disequilibrium presented by Dutch foreign trade. This, in turn, is the inevitable result of the direct devastation of the Dutch economy during the war and of the even more undermining indirect results of the prostration of the German economy which used to provide the main hinterland for Dutch harbours and communications and was both a source of raw materials for Dutch industry and a market for Dutch agriculture and commerce.

The Dutch desire to come to grips with the problem of their balance of payments as rapidly as possible. Since the liberation they have been living largely on foreign credits—mainly of US, Canadian and Belgian origin—and by drawing on foreign reserves including the sterling balances built up during the war partly as compensation for Dutch ships sunk while in the service of the Allies. That process must come to an end and the main objective of the coming talks will be to see how far Dutch trade with Great Britain can be brought nearer equilibrium. There should be ample scope for an increase in agricultural exports from the Netherlands to Britain, though the question of costs and prices may, as in the case of Denmark, cause some difficulty.

The Anglo-Dutch talks cannot be dissociated from the problem of Germany and it is significant that the discussions at the Hague will be joined by representatives of the Anglo-American zone of Germany and will, in part, be concerned with the Dutch share in Germany's economic recovery. What the Netherlands can afford to import must in part depend on what they can export with the help of German raw and semi-manufactured materials and on the extent to which the revived trade of the industrial basin of Western Germany again uses the Dutch ports and is no longer exclusively canalised on foreign exchange grounds to the northern German ports.

Sterling Credit for France

A group of London banks under the leadership of Messrs. Lazard Bros. and Co. have arranged a revolving credit of £12½ million to finance French purchases of wool within the British Empire during the next 12 months. The credit has been granted to the *Groupeement d'Importation et Répartition de la Laine*, a French company, which operates under Government auspices and includes the whole of the woollen textile industry of France. This industry is said to possess 25 per cent of the operating wool working machinery of the world, not counting Germany, Japan and Asiatic Soviet Russia. The French wool industry is working at 110 per cent of pre-war capacity and at least half its output is being exported to hard currency areas. The amount of wool which it will purchase this year is estimated at £35 million and this should be amply covered by the facilities which have been negotiated with the London banks. The repayment of the credit will be linked with exports of French woollen products, but the exchange risk involved in granting the sterling facilities has been further covered by forward exchange contracts with the Bank of France in favour of Lazard Bros., to meet drafts and advances as they mature.

This operation is welcome evidence of the return of foreign acceptance business to the London market. The bills drawn under these credits will presumably be offered for discount in the London market and will provide healthy and stimulating spice to the leaden lump of Government paper which is the market's all-too-monotonous fare.

Boom in Shipbuilding

British Shipbuilders have more export orders on their books than all their foreign competitors together. The returns issued by Lloyd's Register of Shipping for the last quarter of 1946 show that nearly 25 per cent (478,000 tons gross) of the tonnage under construction in British yards is for overseas shipowners. The principal purchasers are Norway (112,800), France (94,215), British Empire (73,654), the Netherlands (41,200) and Denmark (31,860 tons gross). Norway and France are also heavy buyers from other countries. Norway, for example, has another 177,675 tons building abroad, in addition to 77,838 tons in its own yards; while France has 79,924 tons building abroad, apart from U.K., and incomplete returns for French shipyards account for another 196,459 tons gross.

The Continental Allied countries have a long way to go before their merchant fleets are restored to their pre-war strength, and orders are continually being placed for additional tonnage. Despite the shipbuilding delays due to shortage of materials and skilled labour, and to the persistent belief in the ranks that every ship built brings unemployment nearer, work for foreign account is likely to increase still further during 1947—as witness recent orders received from Norway, Sweden, Denmark and the Argentine. Demands for a five-day week in the shipyards are premature, and indeed may have the effect of accelerating the approach of the much-dreaded day when berths will begin to empty, for the prospect of quick delivery weighs heavily with a shipowner in deciding where to place an order.

The total work in British yards amounts to 1,937,062 tons gross, which is 52.7 per cent of the world total of 3,678,481 tons gross. For Britain this represents an increase of 324,252 tons gross and is the highest figure recorded since March, 1922. Launching output declined slightly in the last quarter from 268,715 to 267,760 tons gross, though the annual survey of the *Shipping World* shows a total of 1,225,000 tons launched for the year. Of tonnage under construction, the Clyde, where Saturday morning "token" strikes have become the fashion, has the biggest share of 621,566 tons gross, while the Tyne and Wear yards account for another 574,805 tons. Both these districts have more work than any single shipbuilding country overseas. The highest foreign total comes from the United States, which has 326,753 tons gross under construction, of which 71,842 tons is for export, mostly to Brazil. American builders prophesy a further drop of about 50 per cent during 1947, because of the existing American surplus of tonnage and high labour charges, which prevent the yards from obtaining a satisfactory share of contracts from overseas. Sweden has 248,205 tons in hand, of which some 40 per cent is for export. Swedish acceptance of export orders is limited only by the lack of room for shipyards, for there is no lack of materials and a skilled and willing labour force is available. Canada's new shipbuilding industry is thriving, with 168,000 tons under construction, including some 88,000 tons for France and Brazil.

Silver Collapses in New York

In less than a week the open market price for silver in New York has collapsed from 82 cents to 70½ cents per fine ounce and has now left the official Treasury price of 90½ cents for newly-mined domestic silver in distant and artificial isolation. The weakness of the silver market in New York is a continuation of the movement which began early last December, when the open market price effectively divorced itself from the official price for domestic metal.

The leading US bullion dealers, Messrs Handy and Harman, have in their review for 1946 some interesting things to say about this initial phase of the market's weakness. According to this authority, the decline began as a result of London's efforts to sell silver in New York, thus revolutionising a role which London had maintained throughout the war. London's sudden appearance as a seller is explained in the review as the result of the sharp decline of silver in the Indian market. This decline brought forth some actual offerings of silver from India as well as a flood of enquiries regarding the New York market's ability to absorb sales of silver. Messrs Handy and Harman state, however, that to the best of their knowledge no silver other than current foreign production was bought for New York delivery during the last month of 1946, with the exception of a small amount of Spanish silver which had been refined in the United States. Once the price started its downward move buying dwindled to the vanishing point. Industrial requirements were postponed in the expectation that still lower prices would be forthcoming.

These expectations have indeed been realised, and it is still uncertain whether buyers will be prepared to come in even at the low prices recorded this week. Meanwhile, the relationship between dollar and silver sterling prices is becoming increasingly artificial. At the low open market prices quoted in New York this week, silver had a straight sterling parity of 42d. This compares with an official price maintained at 55½d.—at which it must be said very small business is being transacted—and with a free market price based on the Bombay forward quotation, which has hovered around 61d. There can be very little lasting quality about this highly artificial relationship of international silver prices.

Better Saving Figures?

It is possible to read into the second of the detailed quarterly returns which the National Savings Committee is now publishing

ABBRIDGED PROSPECTUS.

Consent of the Treasury has been obtained to this offer under Regulation 6 of the Defence (Finance) Regulations, 1939.

GOVERNMENT OF THE COMMONWEALTH OF AUSTRALIA CONVERSION LOAN

OFFER OF CONVERSION TO HOLDERS OF £17,098,392 COMMONWEALTH OF AUSTRALIA 4% REGISTERED STOCK, 1943-48

(for which notice of repayment on 15th April, 1947, has been given.)

1,417,801 WESTERN AUSTRALIA 3½% INSCRIBED STOCK, 1927-47

(maturing 1st June, 1947.)

£18,516,193

INTO

Government of the Commonwealth of Australia

2½ per Cent. Registered Stock, 1970-1975,

at the rate of £100 per cent.

Interest payable 15th April and 15th October.

Six months' interest will be paid on 15th October, 1947.

The Government of the Commonwealth of Australia will comply with the requirements of the Colonial Stock Act, 1900, in order that Trustees may invest in the Stock subject to the provisions set forth in the Trustee Act, 1925.

Commonwealth Bank of Australia is authorised by the Government of the Commonwealth of Australia to offer to holders of the above-mentioned Stocks, conversion, in whole or in part, into an equal amount of Government of the Commonwealth of Australia 2½ per cent. Registered Stock, 1970-1975.

Holders of Commonwealth of Australia 4 per cent. Registered Stock, 1943-1948, who convert, will receive on 15th April, 1947, the usual six months' interest then due.

Holders of Western Australia 3½ per cent. Inscribed Stock, 1927-1947, who convert, will receive on 15th April, 1947, interest payments as follows:—

(a) £1 6s. 3d. per cent. (less tax), representing 4½ months' interest at the rate of 3½ per cent. per annum from 1st December, 1946, to 15th April, 1947.

(b) 2s. 6d. per cent. (less tax), representing 1½ months' interest for the period 15th April, 1947, to 1st June, 1947, the difference between the rates of 3½ per cent. on the maturing Stock and 2½ per cent. on the new Stock.

Six months' interest on the new Stock will be paid on 15th October, 1947.

Holders accepting the offer of conversion must lodge their acceptances on the appropriate forms: in the case of the Commonwealth of Australia 4 per cent. Registered Stock, 1943-1948, at COMMONWEALTH BANK OF AUSTRALIA, 8, Old Jewry, London, E.C.2; and in the case of the Western Australia 3½ per cent. Inscribed Stock, 1927-1947, at WESTMINSTER BANK LIMITED, Stock Transfer Office, 9, Old Broad Street, London, E.C.2.

Forms for Conversion have been posted to the Stockholders, or, in respect of joint accounts, to the Stockholder first named in such accounts.

Any Commonwealth of Australia 4 per cent. Registered Stock, 1943-1948, not converted, will be paid off at par on 15th April, 1947, together with the six months' interest then due. The backs of the Stock will be finally closed for transfers on the evening of 14th March, 1947.

The List for Conversion Applications will remain open until 3 p.m. on Wednesday, 5th February, 1947.

on small savings a slight improvement in the trend, but comparable figures are not available over a sufficiently long period to indicate the extent of the improvement. The final quarter of each year is, of course, affected by the Christmas spending, while the third quarter is subject to holiday influences. If these factors can be measured by the size of encashments and withdrawals, the latest figures suggest that the influence of Christmas is of roughly the same order of magnitude as that of the summer holiday. Thus, in the last quarter of 1946 encashments of certificates and

bonds totalled £49.2 million, against £46.9 million in the third quarter, while gross withdrawals from Post Office and Trustee Savings Banks (excluding Service Release Benefit accounts) rose from £153.8 to £160.3 million. On this evidence, holiday influences do not seem wholly to invalidate comparison between the

of conventional political procedure, which always dictates that new taxes must wait until an election has been safely won. The size of the tax is significant—about one-third of the total budget expenditure for 1946—and even the opposition could not object to it, although in the past they have complained that the administration of these territories is too much in the hands of the Polish Workers' Party (Communists).

It is only against the background of the destruction which the Poles inherited; of their lack of technicians, food, and transport and the means of planned colonisation, combined with the profound war-weariness of the population, that what has thus far been accomplished on these territories, can be understood. The destruction of industry in Upper and Lower Silesia, where five-sixths of it was concentrated, was immense. For example, of 1,032 of the largest plants in Lower Silesia, 344 were irreparably destroyed; about 500 have already been partially or wholly put into operation. In Upper Silesia 46 per cent of all plants, including the entire synthetic oil industry, were completely destroyed. In Upper Silesia, all of the coal mines were dead, although the majority were undamaged. In Lower Silesia, only 9 out of a total of 46 mines were irreparable, and 31 of the balance are already working.

The agricultural situation was even more serious. Of 850,000 horses and 3,920,000 cows in these lands before the war only 3 per cent of the horses and 5 per cent of cows remained. Now there are 230,000 horses (22,000 from Unrra; 54,000 from across the River Bug) and 410,000 cows (7,000 from Unrra and 170,000 from across the Bug).

On November 1st under the control of the Ministry of Industry, there were over 230,000 workers in 1,200 large and medium factories, not including workers in banks, ports, communications, forests, transport, shipyards, cooperatives, and industry not under the direct control of the Ministry of Industry.

In the relatively undamaged towns along the Czech border production is about nine-tenths of pre-war, and for the whole area about one-third. The coal output, about 10 million tons in 1946, is 50 per cent of pre-war and is expected to reach a minimum of 19 million tons in 1947. Electrical energy is one of the most crucial problems, with output only 15 per cent of pre-war, largely because the generators are from 25 to 30 years old.

The German Share-Out

[BY A CORRESPONDENT]

IMPATIENCE and exasperation at the tactics and indecision of the Allied authorities in Germany breathe through the report presented at the end of last week by the Secretary-General of the Inter-Allied Reparations Agency sitting in Brussels. Its delegates and their governments see the flow of reparation deliveries drying up and hear war-ravaged countries crying out in vain for industrial equipment they sorely need. Their only hope is that the Council of Foreign Ministers may put matters right in Moscow, and the delegates of the 18 nations represented on IARA have therefore asked that their problem be put on the agenda. After twelve months' work they have no clearer idea of their prospects than they had when they started.

Without a regular supply of resources to distribute the Agency cannot function. It is baffled—as is all economic planning concerned with Germany—by indecision about the German level of industrial production. The original Potsdam plan looked simple enough; by February, 1946, the Control Council was to have agreed on the level of industry, and all plant surplus to its requirements was then to be available to the Agency for distribution. Without an agreed plan for German production there could be no agreed surplus. The Agency has had to beg crumbs from the Control Council's table. In the first months of 1946 the Control Council did release a number of plants on provisional reparations account; but by May it had become evident that Germany was heading for economic ruin and General Clay called a halt. He announced that, pending the economic unification envisaged at Potsdam, there would be no more dismantling of plant in the American Zone. In theory the American moratorium affected only the American Zone: in practice, however, it has proved indirectly binding on the French and British Zones as well. General Clay has since modified his ruling. By declaring "war" plants exempted from the moratorium, he was able to make another release of plants to IARA in the second half of 1946. In addition General Robertson has obtained the approval of the Control Council for an emergency scheme for British deliveries. IARA at his request submitted a list of its members' most urgent requirements, and he is now meeting these by supplying general purpose machine tools from the British Zone to a total value of RM 75 million. The French Zone Commander has obtained

approval for a similar scheme, in this case amounting to RM 15 million.

All this is better than nothing, but not much. The releases are too irregular and uncoordinated to allow IARA to prepare a long-term plan of allocation: it has to live largely from hand-to-mouth. Moreover, only the release of a large number of plants offers any prospect of satisfying everyone. Small releases usually leave dissatisfied customers. But so long as the German economic machine works in fits and starts, reparations are not likely to flow in a very regular fashion.

It is all the more surprising that IARA has so far been a model of cooperation. Among the numerous international bodies in existence, it may claim to be one of the least publicised and most harmonious. Set up by the Paris Conference on reparations of December, 1945, IARA is a fully sovereign body on which are represented the eighteen nations having claims on Germany. In its assembly the delegates take decisions by simple majority vote. In the event of conflicting national claims, there is an elaborate arbitration procedure. But harmony prevails to such an extent that this procedure has only once been invoked, when the French delegate was asked to arbitrate on allocation of a plant demanded by both India and the United Kingdom.

On the executive side, the Agency has an international secretariat. As the Control Council releases plant, inventories are circulated to members. Bids are made and the Secretary-General, having examined the various claims, submits his recommendation to the assembly. Various factors are taken into consideration: the reconstruction programmes of the claimants, their raw material resources, their pre-war commercial relations with Germany, and so on.

The Agency derives its powers from the final Act of the Paris Conference. This specifies two types of reparations: one category includes industrial capital equipment and shipping; the other embraces all the rest. The total of either category each member may receive is fixed in an agreed table of shares. Great Britain, France and the United States jointly are entitled to 72 per cent of the first category and 62.4 per cent of the second. The remaining 15 nations share the rest. What then has the Agency actually handled these last twelve months? First to be shared out was the German merchant fleet; 686,000 gross tons of shipping were divided among members according to a special table based on their overall tonnage losses. Small, ex-occupied, nations feel that this arrangement treated them unjustly: for during the war they had no opportunity to replace the units of their fleet lost flying the Allied flags. For example, the United States, whose merchant fleet multiplied more than sixfold during the war, was yet entitled to a greater share of the German tonnage than France, Belgium, Greece and Yugoslavia together (this in spite of the fact that these lost between them exactly half their merchant fleet).

Capital equipment released so far amounts to about 75,000 machines in 139 plants. These come mainly from the American Zone and are at present being shipped to IARA nations. In addition, there are the general purpose machine-tools from the French and British Zones which are still being allocated. By the terms of the Potsdam Agreement the Soviet Union, in addition to providing for itself and for Poland out of its own zone, was to receive 25 per cent of all capital plant released from the western zones as well. Ten per cent of this was to be delivered unconditionally, but for the other 15 per cent the USSR was to deliver an equivalent value in food or raw materials from its own zone. Though 25 per cent of the western releases have been allocated to Russia, there is no prospect yet of the *quid pro quo*.

One of the Agency's major difficulties is the settlement of German external assets. In respect of those in member countries the Agency performs a threefold task: it attempts to set up a universally acceptable law as to ownership, it tries to find a suitable standard of valuation, and it disseminates to members information derived from outside sources regarding camouflaged enemy assets in their own countries. The first task alone is tremendous, for it raises the whole problem of "test of location" versus "test of issue." The former principle looks like winning, and the ruling of the 18 countries, once given, may well cause this sore topic to be settled in international law generally. Valuation presents equally tricky problems: the inter-custodial conference has tried to harmonise the various national standards so as to make the totals at all comparable. Lastly, the intelligence function is of great service: much useful information came to hand when a census of external assets was recently taken in Germany.

In spite of its successful record so far the smaller nations with claims on Germany are wondering whether the share-out will ever come up to expectation. Unless the Allies agree on an economic plan for Germany and stick to it, they are bound to be disappointed and IARA will cease to be an effective international body.

The Mexican Textile Industry

[BY A CORRESPONDENT]

At a time when the leading textile industries of the world—as represented by Britain and the United States—are grappling with the problem created by a labour shortage, the Mexican textile industry has a problem of an exactly opposite nature to solve. Mexico has too large a labour force—too large, that is, if the mechanisation and re-equipment policy which is generally considered imperative is to be carried out.

Mexican textile firms cannot, even if they wished, simply dismiss their workers to make way for machines. Under the very strict labour laws employers cannot reduce the number of their workers at will, unless the redundant men are compensated; and compensation is fixed at the generous rate of three months' wages, plus 20 days' wages for every year of service. The very powerful Mexican Trade Union movement has established this principle as a legal right.

Manufacturers are, therefore, in two minds. Mechanise they must, in the view of most of them, if they are to hold their own with their older-established competitors, now that these are once more invading the market. The war years have indeed been a golden age for domestic producers, especially the period since 1941, when textile imports from the United States virtually ceased. The predominant cotton textile section increased its output from 335,894,000 metres in 1939 to 519,347,000 metres in 1944. In 1945 exports alone amounted to 138,785,098 metres, mostly to other Latin American Republics.

But, while the end of such a high level of activity is not immediately in sight, it is realised in Mexico that it is only a matter of time before on the home market itself domestic textiles will be challenged by the lower-priced, more finely-produced textiles from Great Britain and the United States. Many operators are under no illusions as to the comparative inefficiency of their plants. Most of these were set up, as small family concerns, during the last century; most of the machinery was made and installed in the period between 1898 and 1910. Little new equipment has been added since 1939, as appears from the following table:—

MEXICAN COTTON EQUIPMENT

Year	No. of Spindles	No. of Looms	No. of Workers
1844	102,000	2,600	..
1862	133,000	6,300	..
1900	500,000	15,000	22,000
1940	850,000	32,000	44,100
1945	950,000	34,000	53,000

Re-equipment is necessary, then, in the interests of more efficient production; renewal of existing machinery alone would represent, it is estimated, investment of some \$20 million. It is also regarded as desirable that the industry should also undertake a considerable expansion of plant.

Up till about two years ago the Mexican textile workers' unions were solidly opposed to mechanisation, through fear that this would lead to many members being laid off. Now they have reversed their attitude, and advocate rehabilitation of the industry with ultra-modern machinery—but with the proviso that laid-off workers be taken care of by the industry in one way or another. In line with this, the re-equipment programme of the large and important *Compania Industrial de Orizaba*, which plans to displace one-third of its labour force of 5,000 by machinery, provides for the establishment by the company in agriculture of those workers who cannot be absorbed in new departments or industries associated with textile production. Other manufacturers, with smaller resources, on the other hand, are not so willing to install labour-saving machinery, if they may not reduce their labour force.

The way has been paved towards a solution of the problem by recent negotiations between the two sides of the industry. Manufacturers and workers have agreed in principle to a plan for reducing the labour force very gradually as reconversion gets under way. It provides for the automatic suppression of all jobs left by workers, and the pensioning off of those over 60 whose efficiency is below par. By this plan it is estimated that in the first year from 4 to 5 per cent of all textile workers will be eliminated. The ultimate goal is a reduction of 25 per cent—a figure regarded as consistent with the modernisation of existing plant. Thus it is hoped to solve a problem peculiarly Mexican at the present time, but which to the student of current trends in labour organisation may well appear to have wider implications.

two quarters. Hence the increase in net cash receipts from all sources, from £39.0 million to £50.5 million, looks tolerably reassuring. But the autumn is undoubtedly a good season from the savings point of view, and an average of no more than £3.9 million per week is extremely small. It contrasts with £12½ million in the corresponding period of 1945, but then subscriptions were inflated by the Thanksgiving Campaign and the first threats of interest reductions. The cash yield for the whole of 1946 was £323 million, an average of £6.2 million per week, but these figures, too, afford no yardstick for measurement of the current trend because of the heavy inflation of sales earlier in the year by the advance notice of the withdrawal of the 3 per cent Defence Bonds. If these special receipts are put at £54 million (as *The Economist* suggested in a detailed analysis on November 2nd), the adjusted average for net receipts in 1946 from small savings as a whole would be about £5.2 million per week. On this basis, the current rate looks rather disquieting. It ought to be noted, too, that during the past quarter £8½ million of the first series of 3 per cent Defence Bonds has been paid off at maturity; reinvestment of this sum would account for the bulk of the increased net savings during the quarter.

Compagnie Française des Pétroles

A clarification of the Business Note headed "Oil Agreements Challenged" which appeared on page 116 of last week's issue of *The Economist* is desirable. This note stated that the *Compagnie Française des Pétroles* was blacklisted during the German occupation of France. Technically, this statement is not accurate, for blacklisting during the war applied only to concerns in neutral countries, whereas companies in enemy-occupied territory came under the Trading With the Enemy Regulations. It is, in fact, understood that the Custodian dealt as favourably as possible with the external activities of concerns which found themselves, by no fault of their own, under enemy occupation and control. That was true of the Iraq interests of the *Compagnie Française des Pétroles*. Last week's statement about the *Compagnie* was based on reports about the American oil companies' attitude towards the 1928 contract. The facts of the *Compagnie's* position during the war, as set out above, should clearly count the more favourably in its relations and negotiations with the American oil groups.

Bills and Revenue

A welcome sign of the approach towards a more normal budgetary situation has been apparent this month in the reappearance of really substantial surpluses in the tax-gathering season. Although revenue in the first fortnight of this month was running a little below last year, mainly in consequence of the reduction in the standard rate of income tax, the surpluses over "ordinary" expenditure have been much larger. The first Exchequer return of the year, covering 11 days, showed a surplus of £51 million, compared with less than £1 million a year before, while in the week to last Saturday the surplus was £39½ million, compared with £18½ million. Unfortunately, the overall position is not so favourable as these figures imply, for "below-line" expenditure has been heavy, requiring some £42 million in the 18 days. Moreover, there have naturally been considerable surrenders of tax reserve certificates, which last week exceeded new issues by £12½ million.

WHY DRY FLY!

This world-famed Sherry (formerly called Findlater's Fino) could not be registered under that name and thereby protected from imitators. For the safeguarding therefore of our world-wide clientele we have re-named it—Findlater's Dry Fly Sherry.

FINDLATER MACKIE TODD & CO. LTD.

Wine Merchants to H.M. The King, Wigmores Street, London, W.1

From the money market point of view, however, the decline in expenditure has proceeded sufficiently for the traditional seasonal pattern of Government week-to-week financing to be discernible, even though the impact of the heavy revenue quarter has been softened, by comparison with pre-war days, by the smoothing effect of PAYE. Seasonal influences, and not any reversal of floating debt policy, explain the under-allotment, by £5½ million, of the £170 million of Treasury Bills offered for tender last week. Two under-allotments occurred in January, 1946, but then the authorities made good the consequential inroad into the available supply of bills by offering and allotting a correspondingly larger amount in each following week. That will not happen this year, for the amount offered at yesterday's tender was £10 million below the recent offering, at £160 million, which is the nominal amount of weekly maturities for the next six weeks. Nominal maturities of Treasury deposit receipts next week are no larger than this week's and they will be only moderately larger in the following week, so that a further under-allotment of the bill issue may be necessary to enable the authorities to return their surplus receipts to the market. In a fortnight's time, however, TDR maturities will rise steeply.

Big Reflux of Currency

The seasonal return of notes from active circulation after the holiday is this year running right up to the best expectations. Early in 1946 the movement of currency for the first time since 1939 resumed its normal pattern: the return of notes from circulation in the seven weeks or so after Christmas exceeded, as is normal, the amount that had gone into circulation in the four or five weeks before Christmas. Last year's reflux, given the high level of the total circulation, was therefore the largest then ever known. But it is being surpassed this year. In each of the past four weeks the total circulation has fallen more rapidly than in the corresponding weeks of earlier years:—

ACTIVE NOTE CIRCULATION (£ Million)			
	1944-45	1945-46	1946-47
Xmas Peak	1242.0	1379.9	1428.2
Subsequent Fall:—			
First week	3.6*	5.1	6.6
Second "	6.8	18.0	19.6
Third "	11.2	14.1	16.4
Fourth "	2.7	10.0	14.1

* Fortnight: comparison distorted because recorded peak was touched on Dec. 20 and this did not reflect the full Xmas demands.

Measured from the low point reached in November, the Christmas demands this year were 17 per cent larger than in the previous year, but the subsequent reflux of notes this year, at £56.7 million, has been 25 per cent larger, so that seven-eighths of the holiday currency has already returned. This welcome experience supports the view that the larger note requirements this Christmas did not reflect any change in the improving trend of the circulation, which in 1946 showed its smallest rise since the early period of the war. It perhaps looks a little less likely than it did a few weeks ago that the authorities will this spring feel disposed to make the first reduction in the fiduciary issue since before the war; but such a move is being brought within the range of possibility, for there is a good prospect that the Bank's reserve of currency, which now stands at £65.7 million, will reach £90 million before the end of next month.

MIDLAND BANK LIMITED

RETURN TO PEACE-TIME SYSTEM
SUBSTANTIAL HEADWAY ACHIEVED
EXPANSION OF OVERSEAS ACTIVITIES

LORD LINLITHGOW'S REVIEW

The annual general meeting of the Midland Bank Limited will be held, on the 29th January, at the Head Office, Poultry, London, E.C.

The following is the statement by the Chairman, the Most Hon. the Marquess of Linlithgow, K.G., K.T., on the report of the directors and balance-sheet for the year to December 31, 1946:—

The continuing stringencies experienced in one way or another by every one of us have given a widespread impression that the transition from war economy has been disappointingly slow. The self-evident effects of war-time disruption of economic activity have obscured the fact that within the business life of the country substantial headway has been made towards the establishment of a smoothly working peace-time system. I propose to illustrate that fact, in my review of the affairs of our Company, by calling attention to the progress of reconversion in banking.

RETURN OF STAFF

At the height of the war effort more than half our permanent male staff, clerical and non-clerical together, were in the Forces, but, apart from the casualties—mercifully much lighter than in the first world war—which we lament, practically all have now returned to their work in the Bank or its affiliated Executor and Trustee Company. Whereas when the fighting ceased there were 8,500 Midland Bank men and women, counting both permanent and temporary employees, in the fighting services, today the number is about 2,700, consisting almost entirely of young men who came into the Bank from school, on a temporary basis, and have since been called up. The staff at work in the Bank, including the Executor and Trustee Company, has risen from the low war-time level of under 12,000 to 15,300, or more than a thousand above the pre-war total. Meanwhile, however, the volume of business to be handled has grown.

Our chief concern in the process of re-absorption from the Forces has been to provide returning men with the concentrated training or re-training necessary to fit them, after an absence in many cases of six years or even more, for their work in the Bank, and further, to give them proper opportunities for the exercise of personal qualities developed during war service. We therefore made plans, in conjunction with the Staff Association, under which every member of the permanent staff resuming Bank work should be welcomed personally, on his return to the Bank, by a reception committee made up of head office officials, branch managers and representatives of the Staff Association, with whom his banking record and war service could be reviewed in relation to his aspirations for the future. Nearly 5,000 men have been individually interviewed in this manner, and, while the procedure has placed

a heavy burden on the panel of members of the committee, I am sure that their efforts have been well spent.

"REFRESHER COURSES"

Many of the returning men have had the benefit also of "refresher courses" in our own training branches. The first of these was established, as an experiment, in London early in the war in order to give an intensive practical training to boys and girls coming straight into the Bank from school with the prospect, for the boys at least, of only a short period of Bank work before being called up. We now have nine training branches, placed at convenient centres throughout the country, and 6,000 juniors, have received tuition there. At present, however, the work of training branches is concerned to only a small extent with the elementary instruction of new juniors, and much more with meeting the needs of returning ex-service men, over 2,000 of whom have had the advantage of these arrangements.

We recognise that nothing can provide a complete substitute for the knowledge and skill that come from practice, but the experiment in preparing members of the staff for the more rapid and intelligent assimilation of the lessons of experience has shown itself to be abundantly justified. Accordingly it is our intention, for the future, that all new entrants into the Bank's service shall pass through the training branches, while we shall continue to develop them for the further training of selected men at more advanced stages in their careers. Ordinarily, moreover, members of the staff are expected to obtain the certificate of the Institute of Bankers, which is regarded as providing the basis of professional qualification.

Reconversion has not made such rapid progress as might have been desired in respect of premises. Much war damage has been made good, in whole or in part, at the 600 and more branches which sustained damage in greater or less degree, but, owing to building controls, we have hardly been able to make a start on the process of overtaking war-time arrears of maintenance and replacement, while none of the thirty-one branches totally destroyed has been rebuilt. Meanwhile, with more staff available, we have been able to reopen many offices, particularly sub-branches, which were closed during the war. Altogether, we have about 1,950 offices open throughout the country, as against more than 2,100 in August 1939 and less than 1,800 towards the end of the war.

RE-EXPANSION OF ACTIVITIES

Another sign of the return to full service of the public is to be seen in the resumption of publication of the "Midland Bank Review". We believe it to be desirable, to

day perhaps more than at any previous time, that everything possible should be done to spread knowledge and understanding of economic conditions and problems. We feel, too, that a bank, by reason of the wide range of information gathered in the course of its business, has a part to play in this healthy process. Partly for this purpose and partly for the assistance of the management in the conduct of the Bank's business, we have strengthened our internal organization for economic information and research.

I turn now to the actual day-to-day business conducted by the Bank, and first I would deal with the two major, traditional services of banking—the operation of a safe, rapid and economical system of transmitting money and the provision of credit for the conduct of business in its endlessly varied phases. There has naturally been a continuous increase, after a short recession at the outbreak of war, in the turnover on current accounts—I say naturally because of the higher level of business activity and the rise in prices. The turnover on current accounts with this Bank has nearly doubled between 1938 and 1946, while the amount of cash passing over our counters is also much larger than before the war. More significant in the present context is the fact that the number of cheques and similar documents dealt with shows an appreciable enlargement, the increase having been most marked in the provinces. Then again, may new accounts have been opened at our branches all over the country, this expansion having been particularly noticeable during the past half-year. It follows that the amount of routine work in the day-to-day conduct of accounts is larger and continues to grow; the same is true also of the volume of work arising from the task which, though new to the banks, is of a somewhat similar character, namely that associated with clothes rationing.

PROVISION OF CREDIT

On a comparison of pre- with post-war, everyone knows that there is a different story to tell of the other main, traditional function of commercial banks, the provision of credit. For some years before the war a tendency towards self-financing had been perceptible in industry and trade; the tendency became more marked during the war, and was strengthened by enforced running-down of stocks in many branches of business, generally restricted private trading opportunities, deferment of expenditure on repairs, replacement and rebuilding, and the provision by Government departments of finance for operations which ordinarily might have been conducted on bank credit. At that stage, moreover, bank lending was concentrated on production essential to the war effort. The specifically war factors have been working themselves off to some extent during the past year or so, resulting in a substantial increase in bank advances, to about the pre-war level: but when allowance is made for higher prices and costs in industry and trade the total is still well below the pre-war volume. So also is the number of advances outstanding, though here too an increase has occurred since the war ended. The fact that to some extent war factors are still in operation, in the form of shortages of supply and restrictions on physical reconstruction, suggests that the re-expansion of advances may be expected to continue. Moreover, while some outlets for lending have been permanently

FOR a year now, BETRO has been reporting to industry on overseas markets. Its wide and flexible machinery is unique in range and in sensitivity to market conditions. In BETRO's first year of activity, research has been carried out on many hundreds of problems raised by firms planning to expand their markets or open up new ones. In the field of Engineering, for example, BETRO has executed research commissions for firms like The General Electric Co. Ltd., Guest, Keen & Nettlefolds Ltd. and Ferranti Ltd. (to name only three); and

reported on subjects as varied as irrigation in South America, trading conditions for containers in the Middle East, and the production of aluminium on the Continent. BETRO's service is available to all manufacturers who are casting inquiring eyes overseas. Applications for membership should be made to the Secretary.

THE GROWTH OF A SERVICE

TWENTY-FIVE years ago, in the streets of Vienna, International Student Service was formed: a medium through which students and professors everywhere were able to help, both physically and morally, their less fortunate colleagues in other lands.

Through the years I.S.S. expanded and, as actual material need became less urgent, turned more to educational and cultural activities. Through conferences and exchange schemes it fostered friendship between academic peoples of all races, nations and creeds. In its Geneva headquarters were prepared such publications as "Education in India and the Netherlands Indies"; "Student Health and Sport in the University"; "Rebuilding Peace in Europe"; and (published, in this country, by the Oxford University Press) Dr. Kotschnig's book "Unemployment in the Learned Professions."

During the war International Student Service found much to do amongst prisoners of war on both sides of the line. Because of its traditional "neutrality," it was able to proceed almost unhindered with this work and, in some places, was able to assist in the formation of camp universities. In the last two years alone of the war, for instance, I.S.S. provided books and study materials to (amongst others) more than 3,500 British, 1,400 American and 4,500 Polish prisoners while, to lessen the distress caused by the acute shortage of text books, 1,500 study courses were multigraphed for Italian prisoners.

At the same time, teachers and students interned in Switzerland were assisted and encouraged. Here, too, camp universities were formed and, in some cases, permission was obtained for certain internees to enter Swiss universities.

An inevitable by-product of war is an increase in tuberculosis. In the spring of 1944 the Geneva I.S.S. office, in collaboration with Don Suisse, took the first steps to open an international university sanatorium at Leysin, Vaud. Here, in the mountains, there are now three clinics filled to capacity with students of all nations, including six Britons. While undergoing medical treatment, they are assisted in continuing their studies.

Faced with urgent and increasing responsibilities, fully conscious of the tragic shortage of books, accommodation, etc., International Student Service is appealing for financial support to all who are interested in the revival of a sorely battered university world. Enjoying the support and co-operation of UNESCO, as it has for so long enjoyed the support of people of all persuasions, I.S.S. looks forward to many years of valuable work in the academic field—with your help.

If you have found this brief outline interesting, you can obtain several publications, dealing more fully with the work of International Student Service, from the London office. Listen, too, to Dr. Malcolm Sargent speaking for I.S.S. in the Week's Good Cause at 8.25 p.m., on Sunday, 16th February.

Whatever you can spare, no matter how small a sum it is, will be gratefully received by the Hon. Treasurer,

INTERNATIONAL STUDENT SERVICE,

59, GLOUCESTER PLACE, PORTMAN SQUARE, LONDON, W.1

THE BUSINESS WORLD

Coal Consequences

WHAT is the economic cost of Britain's defeat in the battle for coal this winter? What is the price, in terms of a more rational fuel strategy, to avert even graver crisis next winter? These two questions are a stark simplification of a whole complex of issues—the immediate effects of power cuts; the painful process of rebuilding minimum working stocks of coal in industrial bunkers; the complete dislocation of industry during the period of crisis, which promises to extend to three weeks instead of as many days; the eventual re-starting of industry "cold" needing weeks to run in; and, for the second time in two years, the building up, with infinite labour, of its stocks of working capital and intermediate products, coupled with an attempt to overtake lost output.

To attempt to measure these problems, however, is not easy. Even in this age of statistics, there is no information about the regional distribution of employment which would enable some estimate to be made of the potential consequences of the cessation of power supplies over the broad belt of England from the South East to the North West. To get even the roughest impression of the numbers affected it is necessary to go through the statistical backdoor and take the figures of insured workers—which is a poor substitute for the real thing. On this basis, the total number of persons affected is of the order of 9 million; but not all of these will have become unemployed as a result of the power cuts. For example, in the North Western region, the number of insured workers is about 2.2 million, of which roughly 450,000 are in metals and engineering and 375,000 in textiles and clothing. These are now largely unemployed, but only part of the 225,000 in the distributive trades will have ceased work; some 160,000 will still be occupied in government services; and the position of well over 900,000 workers in "other industries" defies analysis. Probably the best guess is that more, rather than less, than half of the total of insured workers in the industrial regions at present affected by power cuts may soon be more or less idle. Some, for the time being, remain technically employed, since notices have not been served upon them. But it will be surprising, if the period of the cuts extends beyond a week or two, if the consequent unemployment (open and concealed) does not reach 5½ million, and it might exceed 6 million—say one-third of the total employed in industry, and over three-quarters of those engaged in manufacturing industry.

Obviously, there is no very great certainty about an estimate of this sort. And it is even more problematical to translate it into terms of the inevitable reduction of the national income. But while the immediate crisis lasts, the fall in the net national income (taking it roundly at £8,500 million a year) can hardly be less than £40 million for each week of its duration—say half of one per cent for each week. In these terms, the loss of output may not seem calamitous. But this is not the whole story. Every day's production lost now may mean an equal number of weeks before the tempo of industry can be restored to something like the normal rate. It is not inconceivable that the consequences of the power cuts alone may be a reduction of 3 to 5 per cent in the national income for 1947.

Power cuts, however, are only the immediate manifestation of the crisis. Even without abnormal weather, the seasonal consumption of coal exceeds current production up to the end of March, and April has only provided a very small surplus in the

last two years. This year, the total disappearance of stocks from industrial bunkers and the total interruption of supplies for several weeks owing to hard weather will mean that, even with a realistic scheme of coal rationing for industry based on a strict scheme of essentiality, many industries will not get into a reasonable stride of production until the late spring, and even then their output will be limited by the ability of other industries supplying essential raw materials, intermediate products and components, to keep them adequately supplied. The pipe lines through which the infinitely varied forms of industry's working capital normally flow had been slowly and painfully filling up during the past eighteen months. Many of them—perhaps the bulk of them—have now been exhausted and will have to be replenished yet again. And all will be chaotic and out of balance. The ultimate reaction of this dislocation of industry upon the national income may be at least as serious as the impact effect of the power cuts.

Such is the general economic cost, over the next few months, of the winter's fuel failure. The budgetary and financial repercussions of the crisis are difficult to foresee, and certainly cannot be put in quantitative terms. Both the immediate and the secondary effects will put additional strain upon the Exchequer, but it remains to be seen how far this may involve any increase in inflationary pressure. A significant part of the receipts of direct taxation is now derived from PAYE and therefore the industrial close-down will have prompt repercussions on these receipts, for unemployment immediately involves PAYE repayments because the taxpayer's liability is calculated cumulatively. Other direct tax revenues should not be affected for twelve months or more ahead. There will be no great time-lag in the reduced flow of indirect taxation, and income from excise, especially purchase tax, must tend to decline fairly sharply within a few weeks.

On the other side of the account, the effects on the budget as such should not be large. Emergency measures will no doubt involve additional new Government expenditure, though in the main this will probably be offset by the postponement of some expenditure which would otherwise have occurred. The chief additional outgoings will undoubtedly be those from the Unemployment Fund, the surplus on which by last March had reached the huge total of almost £400 million, and has certainly risen further since then. The cushion here is so very large that there is little danger that the payment of unemployment benefits on the present basis would have any effect on the central budget, unless the consequential dislocation were prolonged. It is worth considering, however, whether the present emergency will not, in equity, call for some extension of the normal principles of relief. The Government has appealed to industrialists to continue wherever possible to pay workers who have been stood off, and a considerable range of industry is obliged to do so—until it gives notice to the contrary—under the guaranteed week. The Government itself has set an example by agreeing to pay its own industrial workers, which means in effect that the industrial tax payer among others is being asked to shoulder an additional burden. If this is fair for the Government, why should it not apply in equity throughout the community? Is the payment of a single guaranteed week without work a reasonable burden on the ordinary shareholders of, say, the Austin Motor Company?

narrowed—I am thinking, for example, of the new central Government arrangements for meeting a large part of the borrowing requirements of local authorities—the openings for enterprise in industry and trade are presenting the banks with opportunities for lending in which they can practise, with due regard for the prudence required by their responsibilities to depositors, their long-established aptitude for informed and far-seeing judgment of business and personal capacity. Thus our own "special advances," by which we lend for small-scale enterprise on the basis primarily of the character and capacity of the borrower, now number about 1,500 and exceed £2½ millions in amount, ex-service men being prominent among those assisted in this particular way. The process of advancing to enterprise still remains that particular part of the business which calls most insistently for the exercise of the special, highly trained qualities of the banker.

INTERNATIONAL BUSINESS

One section of the Bank's activities which has conspicuously reflected the process of reconversion from war to peace is that concerned with overseas trade and international transactions generally. The Midland was the pioneer among joint stock banks in entering the foreign exchange field on its own account, and in the course of a generation built up an unrivalled position in respect of both the volume and quality of its service. It has been my privilege to visit, since I became Chairman, various countries in the Middle East and in the Americas, and everywhere I have been impressed—as have officials of the Bank visiting those and other territories—with the warmth of the welcome received and the high esteem in which the name and service of the Midland Bank are held. I attribute this not only to the direct value of day-to-day association with us, but also to the fact that we have throughout maintained the policy, which we have no intention of reversing, of operating abroad solely through local banks rather than through branches or subsidiary or affiliated undertakings of our own.

With the outbreak and extension of the war, foreign business naturally fell away sharply and heavily; moreover, it underwent a change of character, becoming concerned preponderantly with carrying out the official foreign exchange regulations, the mobilization of overseas assets and similar war tasks. The concentration of import trade in Government departments and the deliberate contraction of exports severely diminished the opportunities for normal business. The staff of the Overseas Branch, along with the special branches in provincial centres closely identified with foreign trade, declined from about 700 in 1939 to well under 300 in 1944. So rapid however, has been the re-expansion since the end of the war that the staff is now appreciably larger than in 1939 and even so is heavily strained to cope with the volume of work to be handled.

HIGHLY GRATIFYING FACTORS

Among the factors contributing to this re-expansion are some which can be read as highly gratifying from the national point of view, in that they indicate not only a rapid growth of the country's export trade, but an unimpaired degree of confidence, on the part of traders abroad, in sterling and in the technical services available in London as a financial centre. Thus the amount of Midland Bank confirmed credits and acceptances outstanding, which declined to very small figures during the war, is several times what it was in 1938. Everyone, I think, has been surprised by the size and rapidity of the expansion in the use of documentary credits, the number of which opened by our Bank during the past half-year is more than twice what it was eight years ago. The strength of the increase is to be traced largely to British export trade, but also to a growing demand abroad for London bankers' credits as a means of financing movements of com-

modities in which this country is not directly concerned. Some of the biggest among recent credits have covered shipments between countries other than Great Britain—many of them outside the sterling area—of such commodities as wheat, fish, meat, jute, rubber and phosphates, and this type of transaction is becoming more and more prominent in our business. There has also been a welcome recovery in the volume of foreign bills collected on behalf of customers.

RESUMPTION OF OVERSEAS TRAVEL

The resumption of overseas travel, while in some degree to be regarded as a restoration of personal freedom and of holiday facilities, is also an indispensable part of the strategy of the export campaign; and here too the growth of our business is illustrated by the fact that for the past half-year the issue of Midland Bank travellers' cheques, which almost vanished as the war went on, was twice as large in number as for the second half of 1938. You will doubtless have read of our branches on the *Queen Elizabeth*, which will shortly be paralleled by similar offices on the *Queen Mary*—the two great Atlantic liners which are in themselves a lasting tribute alike to the vision of the owners and the technical excellence of the builders and all associated with them. Between them the sister ships are to maintain a weekly service capable of transporting no less than 200,000 people to or fro in a year; and we take particular pride in having resumed our pre-war practice of providing a full banking service for business men and others, whether British or foreign, travelling across the Atlantic in the principal Cunarders. As this traffic comprises a continuous demonstration of the unimpaired quality of British shipping, so our branches on board testify to the international worth of British banking service.

BANK'S HELP FOR EXPORT TRADE

As a bank we can, I think, claim some small part of the credit for the rapid re-expansion of the country's export trade and the re-establishment of sterling as a world currency. Before the war ended we made plans to ensure that no opportunities for British export trade should be lost for lack of knowledge which the Bank was in a position to supply; and today we have a considerable department, within our Overseas Branch, providing a specialised advisory service to traders conducting foreign business and dealing with a wide range of inquiries on such matters as export openings, agency and other forms of representation abroad, and trade, customs and exchange regulations in foreign countries. From the other side, we appreciate the compliment paid to us in the large number of bankers and other visitors from overseas who make a point of calling upon us during their visits to London and by the growing practice among the banks abroad of seeking information from us concerning matters of interest to British trade.

All this activity has to be carried on within the framework of war-time Government regulations, now to be made permanent in modified form under the terms of the Exchange Control Bill. The work entailed by these regulations lays upon us a heavy burden, which we recognise as being unavoidable in the changed position of our country. With the post-war re-expansion of trade, the control forms dealt with by our Overseas Branch already run into several hundreds of thousands a year. As the system has become settled, much of the work is standardised; but our position as agents for the authorities, who repose a large measure of responsibility in us for ensuring compliance with the regulations, means that constant scrutiny has to be exercised and skilled knowledge and judgment continuously applied to the details of all transactions. Moreover, many proposals require special consideration, frequently involving intricate discussions by us on behalf of our customers, with the authorities. To summarize, while

over the years our foreign business has undergone many changes, we can derive satisfaction from its continuing growth and from the contribution we are thus able to make to the rehabilitation of the country's economic welfare.

EXPANSION IN OTHER DEPARTMENTS

Another type of business associated with the banks which has shown marked expansion is that of executorship and trusteeship. With us, this is concentrated in a separate company which, however, is wholly owned and controlled by the Bank, thus forming an integral part of our organization and being subject to precisely the same condition of utmost secrecy and confidence concerning customers' affairs as applies to ordinary banking relations. Contrary to experience in the foreign department of the Bank's activities, there was, in the very nature of the service rendered, no war-time contraction in the Company's business; indeed, it emerged from the war with roughly half as much again as at the beginning, and the growth has continued into the peace. Enlargement of personnel to cope with the pressure of increasing work was impracticable during the war, but there are now about 500 men and women on the staff as against 300 in 1939. Thorough internal reorganisation has put the Company in a position to handle additional work as it comes along, and the speed of administration has been materially improved. One branch which was closed during the war has been reopened and a new one established, making a total of twenty-one distinct branches, quite apart from the representation of the Company through all the branches of the Bank itself; and plans are well forward for still further extension. The business handled by the Company is widely varied, but expansion is continuous; lately, for instance, there has been a noticeable increase in the appointments of the Company as custodian trustee of pension and superannuation funds established by employers, usually on a contributory basis, for the benefit of their staffs.

GROWTH OF BALANCE-SHEET FIGURES

In total, therefore, the volume of work undertaken within our organisation is greater than before the war, though the proportion as between different sections of the service have altered. Similarly, the balance sheet shows marked overall expansion—the total at the end of 1946 was two-and-a-half times that at the end of 1938—but important changes have occurred in the composition of both assets and liabilities. Over the past year the continuance of "deficit finance" on the part of the Government, the extent of which is diminishing as war expenditure recedes, has created additional bank deposits, and the process has been accentuated by the evident preference of the public for keeping liquid money available for use as supplies of goods and services are enlarged.

I have mentioned already the upward movement in advances, which even so represent less than one-fifth of deposits as compared with the one-half or thereabouts which was customary before the war. Advances and investments together make up two-fifths of deposits as against the old standard minimum of about two-thirds. For the rest, our assets consist mainly of short-term accommodation to the Government. Altogether, the extent to which deposits are covered directly by Government obligations comes to about thirteen shillings in the pound, quite apart from indirect finance provided through the money market and by our holdings of cash.

FUTURE OF BANKING

Much that has been said in this review of the Bank's post-war activities is directly relevant to the widely discussed question of the future of banking. The question can hardly be answered effectively, that is to say by forecasting the relative weight of the

constituent functions of banking, until experience has been gained of working under the new conditions—conditions in which the financial system is to be regulated and directed with the deliberate and dominant purpose of maintaining a high and steady level of employment. The three new statutes designed to this end consist largely of enabling legislation, under which the authorities have discretion, over a broad area, to act or not to act in a variety of ways and to prevent or permit a wide range of transactions in private industry, trade and finance. All of them touch, to an extent which only practice can precisely determine, the activities of the commercial banks. Moreover, various other measures, such as those for nationalising the coal and other basic industries and for rendering permanent the centralised buying of raw cotton, must have their effects upon the volume and shape of the business the banks conduct; and meanwhile uncertainty as to the future of particular industries tends to obstruct enterprise in various branches of business activity. As regards the effect upon banking, however, the history of its development in this country is marked, from the beginning, by a quality of adaptability which, as I have shown, has been very much in evidence once again in the short period since the war ended. I therefore conclude that, one way or another, banking has an assured place in the country's economic structure. There is no sufficient ground for thinking, as discussion of the question might seem to have implied, that the days of enterprise in banking are numbered; we find that invigorating element at work in the various developments I have mentioned, and I see no reason to suppose that the process of adaptation to the everchanging needs of the public in their financial affairs will provide less opportunity in the future than in the past for the quality of enterprise embodied in the personnel of our well-tried banking system.

NATIONAL DISCOUNT COMPANY, LIMITED

CONTINUED EXPANSION

The annual ordinary general meeting of the National Discount Company, Limited, will be held, at 33, Cornhill, E.C., on the 29th instant.

The following is an extract from the circulated statement by the chairman, Sir Charles D. Seligman:—

The volume of business has been considerable and the total now amounts to over £119 million, being an increase of 30 per cent., or some £28 million, over the previous year's figures. Our deposits, which now stand at over £116 million, are proof that the company has fully shared in the expansion which has taken place in the discount market's activities during the past year. The reserve, which now stands at £1,576,667, has been increased to this figure by the transfer of £100,000 from the profits for the year and of £276,667 from a contingencies account.

The gross profit for the year is £303,868. After deducting expenses and directors' remuneration totalling £64,650, there remains a net profit of £239,218. It is proposed to pay a dividend of 2s. 6d. per share, less tax, on the "A" shares, making 10 per cent. for the year, and 9s. 6d. per share, less tax, on the "B" shares, making 15 per cent. for the year. The dividend on the "B" shares of 15 per cent. for the year is an increase of 2 per cent., and the directors feel justified in proposing this larger distribution in view of the steady growth of the company's profits since the last increase was made in 1935.

In view of the increasing activities and continued expansion of the company's business, the directors in February last appointed Mr W. Shepherd, who was sub-manager and secretary, to join with Mr Bate in the management of the company, Mr J. W. G. Lee, D.S.O., being appointed secretary.

MARTINS BANK LIMITED

SATISFACTORY PROFIT RESULT

INCREASED ADVANCES TO TRADERS

GOVERNMENT BORROWING

MR F. A. BATES' REVIEW

The one hundred and sixteenth annual general meeting of members of Martins Bank Limited, is to be held, on the 28th instant, at the head office, Liverpool.

The following statement by the chairman, Mr F. A. Bates, M.C., A.F.C., D.L., has been issued to members along with the report of the directors and balance-sheet for the year ending December 31st last:—

The net profit for the year is £708,763, which is £62,956 higher than in the previous year. The directors regard this as a very satisfactory result. It will be realised that part of the addition to profit is due to the lower rate of income-tax, and for the same reason the members are receiving a larger net payment.

Interim and final dividends have been announced and the following allocations made:—

To published reserve	£60,042
To reserve for contingencies	£150,000
To reserve for pensions	£50,000
To premises redemption	£100,000

You will observe from the balance-sheet the increase during the year of nearly £40 millions in the current and deposit accounts, bringing the total of this item to £252,555,790. This increment exceeds by some millions that which took place during any of the war years. Our experience of rising deposits, which is common to all the banks, cannot be looked upon as a matter for national congratulation in so far as it has been based upon an unbalanced Budget and further Government borrowing from the banks.

FINANCING TRADE

Advances have expanded by £12,280,254. The ratio of advances to deposits is 17.94 per cent., against 15.53 per cent. a year ago. Analysis of this item shows that advances are well spread and that the return to peace-time production has, as was to be expected, resulted in new and heavier calls upon us by the commercial community. There has in fact been great activity in all the departments of the bank's work and it is very satisfactory to note the gradual return to these normal banking functions. In accordance with the policy of the bank, special attention has been given to applications for accommodation from the small as well as the large trader. Assistance has been provided to many small companies and traders by direct financial help and by introductions to those institutions whose function is the provision of more permanent capital than is usual under banking facilities.

The liquidity of the balance-sheet continues high. Our holdings of cash, balances with other banks, market money, Treasury bills and Treasury deposit receipts amounting to £146,768,088 are 57.98 per cent. of our deposits, against 54.49 per cent. a year ago. Early in December an announcement was made that, having regard to the character of bank assets now ruling, it had been agreed by the banks, in consultation with the Bank of England, that the daily ratio of cash balances to deposit liabilities will be maintained on the basis of 8 per cent. instead of working to a 10 per cent. basis on make-up days. This came into effect on December 31st last.

MORE BRITISH GOODS

The substantial increase of £5,688,634 in contingent liabilities arises mainly from credits established both in this country and abroad in connection with foreign trade. Owing to the demand for British goods from

the liberated territories and other countries which were cut off from supplies during the war, the bank has handled an unusually large volume of foreign business and the number of documentary credits opened by purchasers of British goods has been considerable.

During the year representatives of the bank have visited our banking correspondents in various European countries, the United States and Canada, and the recent visit of our chief general manager, Mr McKendrick, to the leading banks in New York, Boston, Montreal and Toronto will have assisted in maintaining our cordial relationship with them.

I am pleased to report that our trustee department has steadily increased its business. During the last eight years the new appointments of the bank as trustees and executors have more than trebled, which shows how greatly the work of this department is appreciated by our customers.

Mr C. J. Verity and Mr M. Conacher have been appointed joint general managers, a measure necessary to meet the demands of a growing business on the time of the general management. Both officers have long experience of the bank's affairs.

VALUABLE FEATURE

District head offices have always been a special feature of the organisation of this bank and the valuable work of the district boards and officers has been much in evidence. Their accessibility, we find, adds greatly to the convenience of our customers in having their problems considered with speed and local understanding.

I have further to report that the readjustment of the staff following the return of Service men has been nearly completed and with greater ease than was anticipated. I am glad to say that it has been possible to offer permanent appointments to a large section of our temporary staff. In briefly reviewing the year's work, I take the opportunity of thanking all members of the executive and staff for their services, not only at the head office, but also in the district head offices and all branches of the bank, to whose initiative the satisfactory results achieved are largely due. I find the zeal and the quality of the service afforded at every branch most commendable.

THE CHAIRMANSHIP

Changes in the bank's directorate have been referred to in the report, and I now wish to inform the members that, owing to the death of my brother, Sir Percy Bates, last October, I felt it my duty to accept the chairmanship of the Cunard Steamship Company Limited, and Cunard White Star Limited, which prevents me from giving so much time to the affairs of the bank. I have, therefore, with much regret, asked the board to permit me to retire from the chair, a position in which I have had the honour of serving during the last eight years. The directors have agreed to release me immediately after the annual general meeting to be held on January 28th, and they have chosen Mr A. Harold Bibby to succeed me as chairman for election at the first board meeting thereafter. Mr Bibby is well known to the proprietors, having been a member of the board since 1929. His wide experience of commerce and industry both in home and foreign trade is of great value to the bank.

Is it right that private employers, who happen to be within the area of stoppage, should be called upon thus to relieve the tax payer? Many of them, it is true, are still anxious to ensure that their labour force should not be dispersed, but is not the difference between unemployment benefit and guaranteed wages the reasonable limit which they should be expected to pay to avoid this danger, leaving the former to be met by the Unemployment Fund?

If central relief were extended on principles such as these, the budgetary effects of the crisis could become much more substantial. But, in any event, it would be rash to assume that the shape of the immediate budgetary problem will be radically altered. If the Chancellor looked solely to the equation between money and goods, he must have concluded even before this crisis that his proper course for 1947-48 should be to budget for a surplus in order to mop up excessive purchasing power. The present stoppage of work which is coupled with the continuance of full wages, unemployment benefit and PAYE refunds, will tend to make that excess larger than it was before. It has been clear hitherto that the Chancellor's budgetary problem has been to find the best compromise between two extremes of policy—on the one hand to minimise the creation of surplus purchasing power and, on the other, to give the maximum incentive to additional effort. Are financial incentives less important now than they seemed ten days ago? The only safe answer is that if there were any prospect of prolonged unemployment, developing from the coal crisis, the financial incentives would be of a very different sort, and probably more effective than anything the Chancellor could safely offer.

It is far too soon to guess how these conflicting considerations will strike the Chancellor in five or six weeks' time. But it may well be that the budgetary problem has become more difficult, both in its accounting aspects and in its real aspects. On the key part of his policy—cheap money—doubts have perceptibly deepened in this past week. Obviously the deterioration in the position of the central Exchequer (including the Unemployment Fund) increases the Chancellor's need for finance. And industrialists who are relieving the Exchequer of the burden of unemployment benefit will for a time need more finance, too, and some will have to find it by selling gilt-edged securities. Considerations such as these explain and justify the weakness of the gilt-edged market this week.

If the Chancellor is still determined to pursue his cheap

money policy, these new stresses must at least give him pause. Any given rate of interest will require the creation of a larger volume of money than would have been needed in the absence of this series of new pressures. Admittedly the Chancellor has never been frightened by money creation, and he might take the view that though the inflation potential, in the accounting sense of bank deposits, will be increased, the real inflationary danger may actually be reduced. But will this all-pervading crisis give to the British public the psychological shock which was needed? Fuel rationing is obviously not the only austerity measure which will have to be continued after the immediate crisis is over, and for a time the range of formal restraints upon spending may be greater than it was before. But to succeed, these will have to be accompanied by additional voluntary restraint, which may be hard to evoke at this stage. On balance, he may be forced to decide that the cost of consolidating his cheap money policy is enough, quite apart from driving on further.

The coal crisis has anticipated the external economic problem which will face Britain in a year's time. It has removed any chance of reaching the export target in that period—indeed there are chances of a deliberate reduction of exports as a desperate policy to ease the worst burdens on the country's internal economy, with, of course, a correspondingly heavier rate of drawing on the dollar credits. The Canadian credit of \$1,250 million had already been drawn upon to the extent of \$540 million by the end of January, and well over a quarter of the two dollar credits has been exhausted in little more than six months. In this situation, the much-needed expansion of imports, as soon as supplies of essential raw materials become more free, grows more remote.

These are some, but by no means all, of the potential consequences of the failure of coal supplies. The specific consequences for the investment markets are examined in a Business Note on a later page. It may be too early to talk of depression and slump. But it would be equally premature to expect industry to restore overnight its self-regenerating powers as soon as the immediate crisis has passed. The wartime exhaustion of Britain's material and human capital has not been made good during the past eighteen months; indeed, it has deteriorated further. Both are now flowing to waste on a grievous scale which could be made good only by superhuman efforts before the external crisis descends upon the country.

The New Lombard Street

THE London discount market, which rarely attracts much public attention, has lately been enjoying unaccustomed limelight. Against a background of slow evolution, it has suddenly increased its resources by almost 50 per cent, by a series of ten capital operations which within twelve months have added five discount companies to the three whose shares were already known to the Stock Exchange. This particular phase of capital expansion is now nearing its end—and the quite exceptional prosperity of the past few years may be ending, too. But the market now sees plainly the role it has to play. It knows that, for perhaps fifteen or twenty years ahead, it will have important and probably reasonably remunerated functions in the short bond market. And that is a longer period of assurance than it has known for many a year.

In 1939 hardly anyone in the City would have dared to predict such a prospect for Lombard Street at the end of its first post-war year. In seven years, there has been a striking change of function and outlook—how striking can hardly be seen except in historical perspective. For almost a decade before the war, a large question-mark had hung over the future of the market. Its traditional business of discounting commercial bills

of exchange which financed the international movement of goods had been laboriously re-built after the first world war, only to collapse again in 1931; and the thirties brought but a modest recovery. The market remained a discount mechanism because quantities of Government Treasury bills were left as a legacy from war finance, but after 1932 cheap money made bill-dealing an unprofitable, or at least virtually profitless, business. The discount houses perforce sought profits by dealing increasingly in the rising market for short-term Government bonds. But they did so at first almost surreptitiously, and within narrow limits. The highly-g geared business of a discount house is financed by modest capital surmounted by large short-term borrowings, almost wholly from the banks against collateral security. And it was against the tradition of both banks and market that bonds should rank as collateral, though in the twenties they had come to be accepted in small quantities in the customary parcels of bills, and competition among lenders other than the clearing banks often forced them to take larger quantities. The scope for bond-dealing, therefore, was strictly limited, especially among the smaller houses which had not accumulated large capital resources and did not attract un-

secured deposits. Among such houses, two retirements and one merger in 1933, reducing the number of discount houses from twenty-four to twenty-one, seemed to point the way to a secular decline in the bill market.

But, whether it dealt in bills or bonds, the market still performed one of its classical functions. By borrowing at call the short-term funds of the banking system, it provided a central pool through which day-to-day cash shortages of one bank could be speedily supplied from the surpluses of another bank or, if need be, from the ultimate reservoir at the Bank of England—a reservoir to which all discount houses had access but which the banks traditionally preferred not to tap direct. To prevent damage to this short loan mechanism, and to keep the discount mechanism intact against the possibility that the ancient commercial functions might eventually be restored, the clearing banks at last decided to regularise bond-dealing. In 1934 they fixed differential minimum rates for loans against bond and bill collateral, and reduced the minimum rate for loans against bills to $\frac{1}{2}$ per cent; further, they took successive steps to ensure that bank competition for bills would never force the discount rate below the money rate. In effect, therefore, the market had licence to extend its bond dealings within reasonable limits, and was assured that in running its bill portfolios it would at least not make a direct loss and could probably count upon a fractional gross profit.

The risk of drastic contraction of the market was thus averted—but by measures which almost everyone regarded as stopgap expedients. Bond-dealing was regularised not because it was deemed useful for its own sake but because the market performed or might perform other valuable services which could not be ensured unless profits could be won elsewhere. In a rather conventional way, the City hoped for—though hardly expected—an eventual full revival of the commercial bill, and was not prepared to take ultimate decisions about the bill market until it was certain that the hopes were vain. Yet, on the whole, it was equally reluctant to envisage a market permanently supported by bond operations whose principal function was to finance other valuable functions which the market performed gratis—or nearly so. There was, in any case, the ever-present risk that gilt-edged market conditions would cease to give Lombard Street scope for profits, or would drive it imprudently into long-dated stocks, or involve it in undue losses.

The market at the outbreak of war looked back upon some years of excellent earnings, but well knew that its future, so far as any rational analysis could assess it, was poised in uneasy equilibrium. The popular view that the market had been contracting for a decade was never quite accurate. Though mergers and retirements had reduced the number of houses to eighteen, the movement was mainly one of concentration into stronger individual units, as befitted the greater risks of bond-dealing. Aggregate capital resources were prob-

ably rather larger than in 1931. But in 1939 it seemed that a real contraction might be in prospect. The first world war had begun the destruction of one feature of market business but had evolved a new feature—the extensive use of the Treasury bill—to replace the old. A second war would obviously mean more bills, but in a cheap-money war more bills would not bring significantly more profits. Moreover, from the outset there were signs that another of the market's traditional functions was being undermined. A bridge had been thrown across the gap that formerly separated the commercial banks from the central bank: large lines of bills, instead of passing first through the discount market, were sold direct by the authorities to the banks, and in mid-1940 the direct channel was formally opened by the creation of the Treasury deposit receipt. To some, that development looked like the writing on the wall. The mergers and retirements continued, though mainly for personal reasons not directly connected with market conditions.

But in fact, this war, like the last, has produced a new function for Lombard Street. It is one, moreover, which settles—for as long ahead as it is profitable to look—the uncertainties of the pre-war decade. A cheap-money war might keep the profit out of bill dealing, but it also compelled the Chancellor to borrow short—even in his borrowings from the public—and thus to create types of bonds which offered profitable opportunities for the market. From mid-1940, series after series of National War Bonds poured forth through the taps on such a scale that the resources of gilt-edged jobbers on the Stock market were quite inadequate to make a smooth and efficient market in them. The strain at times was very heavy. Before the various Savings drives, the banks and others sold short-dated securities to make way for the new subscriptions which local campaigners expected of them. As each tap neared the end of its flow, the same institutions lightened their portfolios in order to fill them up again with the very last of the tap bonds, thus securing at par a large slice of each issue with the shortest life at which it was offered. Without the aid of the discount market, tapping for the purpose the elastic cash resources of the short loan fund, these sales could not have been absorbed without producing a big jolt in prices. The discount houses saw their chance to do useful and profitable work, and the authorities encouraged them. It was intimated early in the war that a discount house, provided that it conducted itself properly, carrying only short bonds and keeping them in due ratio to its resources, could if necessary look to the Bank of England for loans against bond collateral. Such aid, it is safe to say, has never been needed, for the market has absorbed a greatly increased supply of bills and can always balance a deficient loan position by the simple and costless procedure of selling short bills to the Bank's agent—the "special buyer." But the fact that bonds could thus be pledged if necessary is

NEED FOR HARD WORK AND ENTERPRISE

CAPT E. C. ERIC SMITH'S STATEMENT

The one hundred and fourteenth annual general meeting of the National Provincial Bank Limited will be held, on the 30th instant, at the Head Office, 15, Bishopsgate, London, E.C.

The following is the statement by the Chairman, Captain E. C. Eric Smith, M.C., circulated with the report and accounts:—

BOARD OF DIRECTORS

At the annual meetings of the last thirteen years, it has been our privilege to sit under the chairmanship of Lord Colgrain and to receive from him a review of the situation of the bank and of the conditions of finance and trade. The announcement of Lord Colgrain's wish, by relinquishing the chair, to seek some relief from his heavy responsibilities has already been made public. I would desire to express to him our deep debt of gratitude for the work he has done for the bank since he joined the board in 1903. As you know, for four years he was deputy-chairman and he has occupied the chair since 1933. I am happy to tell you that Lord Colgrain will retain his seat on the board.

It is with regret that we record the retirement from the board in March, 1946, of Mr Francis Alexander Johnston. Mr Johnston joined the board in 1910 and was thus the senior director of the bank after Lord Colgrain. He was deputy-chairman of the bank from November, 1933, to February, 1937, when he retired from that position whilst remaining a member of the board. For these many years the bank has enjoyed Mr Johnston's discernment in business which was always accompanied by great personal charm.

Sir Frederic A. Aykroyd, Bart., has retired from the Bradford and District Local Board of the bank, which has thus lost the benefit of his great knowledge of the business of the West Riding, from which it had profited for so many years. Mr Cecil William Aykroyd and Mr Ronald Arthur Charteris Foster have been appointed local directors of the bank for Bradford and district. Sir Victor G. Carey has been reappointed to the local board in Guernsey, on relinquishing his appointment as bailiff.

MANAGEMENT AND STAFF

The management and staff have continued to render loyal service to the bank throughout a year which has presented many difficulties. The weight of work has substantially increased during the year and, unfortunately, much of it arising from policies outside our control is unremunerative. Nevertheless no effort has been spared by the staff to maintain and, wherever possible, to improve the efficiency of the service which the bank renders to its customers and to the community.

Our staff department has had to deal with the heavy task of placing some 3,000 members of the permanent male staff who have already returned from the Forces. We welcome these men back and are proud of their service to the country. It is not only pleasant but most satisfactory to record that, with few exceptions, they have quickly adapted themselves to the work of the bank and are showing commendable keenness in acquiring a knowledge of the changes which have occurred during the years they have been away. We have also taken back into our service upon demobilisation some 400 men who joined us on a temporary basis during the

war and who have sought reinstatement. In due time we hope to be able to offer permanent employment to those for whom there are vacancies and who have shown themselves adapted for work in the bank.

COUTTS AND COMPANY

The balance sheet of Messrs Coutts and Company, as at December 31st last accompanies our own report and accounts. The business, with its well-known head office at 440 Strand, and its City office in Lombard Street, established in 1772 as Roberts Lubbock and Company, together with branches in the West End of London, has continued to make satisfactory progress.

Recently, Sir Jasper Ridley succeeded Mr Ronald Malcolm as chairman of Messrs Coutts and Company. Shareholders will learn with satisfaction that Mr Malcolm, who has served Messrs Coutts and Company as a director and as chairman for over fifty years, will continue as a director to give to the business the benefit of his long experience.

To Sir Jasper Ridley, who is our own deputy-chairman, we tender our best wishes for a long and successful tenure of office as chairman of Messrs Coutts and Company.

GRINDLAY AND COMPANY, LIMITED

This business, which maintains a particularly close relationship with its European and Indian clientele, also presents a balance sheet which discloses a satisfactory and liquid state of affairs. The political situation in India calls for the exercise of wisdom, patience and goodwill from all parties and communities. The trading potentialities are most promising and it is sincerely to be hoped that a workable settlement of the manner in which India is to be governed will be reached and without undue delay so that India, by increasing the standard of living and the prosperity of her peoples, may play her part in the betterment of the world as a whole. It has, in the past, been the practice of the directors of Messrs Grindlay and Company, Limited, to pay frequent visits to India. The war interfered to some extent with these journeys, but since hostilities ceased they have recommenced. Since last we met, Mr Donald Campbell has returned from India and Mr Grant and Brigadier Low are at present there and have also visited Ceylon, Burma and Singapore.

FOREIGN AUXILIARY

Very satisfactory progress has been made by Lloyds and National Provincial Foreign Bank, Limited, during the year in the re-establishment of its position as an important financial factor in the countries in which it is represented. Commercial business of a very satisfactory nature is being handled by the bank, particularly in the financing of the movement of raw materials and in the manipulation of wool and the process of its manufacture into cloth.

The business is prudently and capably managed and in such circumstances can be regarded as an asset of considerable value to its parent institutions.

STATEMENT OF ACCOUNTS

The most noteworthy change in our balance sheet figures for December 31, 1946, as compared with those at the end of 1945 is an increase in current, deposit and other accounts from £619 million to £726 million.

I have some reference to make a little later to this movement which has been common to the clearing banks as a whole.

The assets by which the item is represented on the other side of our balance sheet show certain changes. Cash, loans to the discount market and bills together total £216 million as against £165 million a year ago. Treasury deposit receipts amount to £206 million compared with £200 million and investments stand at £159 million as against £133 million.

Advances to customers and other accounts amount to £154 million. The figure a year ago was £131 million. The increase in the amount we have lent to our customers as shown by a comparison of the two accounts is therefore £23 million, but in consequence of the increase in the amount of money lodged with us, the ratio of advances to deposits shows little change.

PROFIT AND LOSS ACCOUNT

The figures which are before you fall into line with the conditions governing money values in this country during the year.

The period has been one of declining yields in the gilt-edged market and the effect of this spread throughout banking activities has been felt in a reduction in the margins out of which banks make their profits. The maintenance of the services which the clearing banks render to their customers is reflected in the substantially higher cost of salaries and overheads generally. Increased resources flowing from increased deposits have to some extent enabled us to meet this situation, and our net profit for the year is £1,331,071 4s. 5d. compared with £1,356,025 4s. 4d. for the previous twelve months. We bring in from our 1945 accounts the sum of £814,397 2s. 8d., making a disposable total of £2,145,468 7s. 1d., out of which in August last an interim dividend at the rate of 7½ per cent. per annum was paid, costing £391,025 18s. 2d.

We recommend that the balance be disposed of as follows:—

	£	s.	d.
The payment of a final dividend at the rate of 7½ per cent.	391,025	18	2
and the following transfers:			
To bank premises account ...	100,000	0	0
To pension fund ...	150,000	0	0
To reserve fund ...	250,000	0	0
leaving £863,416 10s. 9d. to be carried forward.			

Your attention is particularly drawn to the transfer to the reserve fund. For some years our published reserve has stood at a figure of £9,479,416, equal to our paid-up capital.

The bank's liabilities have steadily and substantially increased, and in consequence your directors have decided that it is proper that the published shareholders' funds, represented by capital and reserve fund, should now move in the same direction. To increase the reserve fund from £9,479,416 to £10,000,000 requires £520,584.

From our internal free reserves we have transferred £270,584 which, with the recommended appropriation of £250,000 out of our profits for last year, provides the necessary transfer to establish our reserve fund at £10,000,000.

OUTLOOK

I have referred elsewhere to the growth of the bank's deposits. During the eleven months to November last year deposits with London clearing banks as a whole have increased by £652 million to a total of £5,502 million. As regards roughly 80 per cent. of these deposits, the countervailing assets are obligations of the Government. This position merits considerable reflection bearing in mind the fact that in 1938 advances to customers represented 45 per cent. of deposits as compared with to-day's ratio of under 20 per cent. So long as the existing tendency persists, this bank will do its utmost to secure its proper share of such increased deposits. It is, however, more than doubtful

whether such a rapid transfusion into the blood-stream of the country is beneficial. Many people will agree that the time has now come when, if the old-fashioned offices of the barber with his bleeding bowl could be introduced, it would be better for the patient. We are frequently told that the credit of the country has steadily improved since the present Government's advent to office. If by this it is meant that the Government has been able to borrow at progressively cheaper rates, the statement is undoubtedly correct. It should, however, be borne in mind that circumstances have not been conducive to the willing-buyer, willing-seller atmosphere. The restrictions imposed by the Capital Issues and Exchange Controls and the limitations of the Trustee Act have had a material influence on the outcome of conversions.

CONVERSION OPERATIONS AND NATION'S CREDIT

Each operation has been handled with conspicuous ability and the technique employed in each case has followed the same course with much the same results. It has usually taken the investor some time to appreciate the tightness of the corner into which he had been driven, but, once this had sunk in, he has capitulated. Such a market can hardly be described as a free one; in fact, in the case of trustees bound by a trust instrument executed some years ago and incorporating an investment clause devoid of flexibility, these operations come perilously near to forced loans. Conversion operations, such as these, are far from a true yardstick of the country's credit. The result is merely a reflection of the high degree of skill and ingenuity with which they have been effected. The real gauge of credit is the rate at which money can be borrowed in the open market in the face of competition.

CHEAP MONEY NOT UNMIXED BLESSING

Cheap money is not an unmixed blessing, although clearly attractive to a Treasury attempting to cope with approximately £24,000 million of debt. It carries in its train considerable hardship to those who live on the income from savings and the products of commendable thrift. It reacts unfavourably on life insurance and the benefits to be derived from pension funds. It discourages those with an incentive to save and encourages prodigality. It has the effect, in the investor's search for income, of inflating stock prices to figures which are often entirely out of proportion to asset values, and it creates paper profits which are frequently as unjustified as they are unhealthy. It is, in fact, an additional tax levied upon a particular section of the community.

There would appear to be a considerable body of people who hold the unfortunate view that it is immaterial how much is borrowed provided it is borrowed cheaply.

NATIONALISATION

During the year the nationalisation of industry has followed the path already indicated. Politics apart, few would dispute the fact that the only practical justification of the nationalisation of a given industry is the creation of an organisation which will function more efficiently and to the greater public good than its pre-nationalisation constituent parts. Unfortunately, this essential aspect is apt to be lost sight of, although a favourable outcome on these lines is invariably argued in justification of every case, after nationalisation has been decided upon for purely doctrinaire reasons.

A bewildering variety of systems of compensation of the expropriated owners has been made use of and the curious phenomenon has arisen of the purchaser fixing the price and means of payment.

Not unnaturally, doubt and misgiving are engendered in the minds of the owners and management of "suspect" industries. It is not difficult to appreciate that the direction

of a business whose future is obscured by political ideologies should tend to some degree to lose definition and determination. This is not to suggest that indifference is likely to arise, but rather resolves itself into "the little more and how much it is; and the little less and what worlds away."

The possibility of the imminence of nationalisation may quite well, and probably unwittingly, operate to sap the vital stream of energy which must run strongly through any business that is to prosper. There was never a time in our history when the encouragement of enterprise in commerce and industry was more important than it is to-day, and anything which adds uncertainty of tenure to the normal hazards of business can react to the advantage of no one.

EXCHANGE CONTROL

Exchange control is finding its way on to the Statute Book, largely in the form of the Defence (Finance) Regulations of the war period. While no one will deny the necessity of restricting the timorous and craven-hearted in a time of national emergency, such prolongation of restriction as may still be necessary might well have been continued under the old regulations. The exchange position at the present time is obviously one of great intricacy and the handling of it calls for the utmost care and skill and deserves all the support that the commercial and industrial community can give.

Under the terms of the American Loan Agreement, sterling, for current transactions, must, after July of this year, in the absence of exceptional arrangements, be free. This will, possibly, increase existing difficulties. Notwithstanding present problems, it is a pity that Exchange Control should have been accorded a permanent status. It indicates a lack of faith in sterling, particularly from the capital movement aspect. Capital does not seek to escape from sound currency.

WOOL AND RUBBER MARKETS

A material increase in foreign trade bills would be a welcome feature as an indication that international commercial relations were once again moving towards the normal. The reopening of the overseas wool markets has produced a very marked increase in the demand for overseas credits. Prices have been high, and in the case of the finer wools, extremely high, and considerable competition has been met from continental and foreign buyers. From the beginning of the year, the London Rubber Market has reopened and this commodity has begun to shake off some of the shackles of restriction. The operations of the market will be, however, under the paternal eye of the Bank of England. It is to be hoped that these two commodity swallows will be duly followed by a summer, and that other markets will be freed and resume their former functions.

AGRICULTURE

Agriculture, which has enjoyed a number of reasonably good years, although probably few farmers would admit it, suffered a considerable set-back in 1946 through the extremely unfavourable weather conditions. Weather was bad for the hay harvest and quite unspeakable for the straw crops. It is immensely to the credit of the farmers that they achieved the results they did in the face of such disadvantages. What the millable outturn will be remains to be seen, but it will be surprising if it is not seriously affected. This industry is faced in the immediate future by a major problem arising from the repatriation of prisoners-of-war. It is difficult to see where the labour, to replace this wastage, is to come from. Farming land continues to change hands at increasing prices. No particular alarm need attach to this at present, but values are undoubtedly getting near the top of the economic level.

BUSINESS OUTLOOK

Although the business outlook does not call for deep despondency, it would be

to regard it with unmeasured optimism. There is a long way to go before the prosperity we once enjoyed can be restored. The balance of trade, crippled by the loss of a large proportion of our invisible exports is at present barely convalescent. This is an old country and now no longer possesses large, latent and unexploited natural resources potentially capable of reversing an unfavourable trade position. Our chief remaining asset is the skill and capacity for hard work of the population. This is our principal export commodity, but in order to reap any benefits therefrom it must operate. In these circumstances, any interruption of labour is to be deplored, particularly when it arises from trivialities, often originated by irresponsible agents, which are equally abhorrent to employers and organised labour alike.

The tendency is to regard profits as almost immoral and, all too frequently, a desire to work provokes derision and hostility. Greater latitude is needed to encourage initiative. Taxation must inevitably remain at a high level but it should be supported by a proper economy in public spending and reduced Government borrowing.

Above all, it must be made quite clear to the country that, with increased schooling age and decreased pensionable age—both admirable in themselves—the tree is being simultaneously root-pruned and lopped or, if you prefer it, the candle is being burned at both ends. The intervening stratum, which represents what is left of the working population, has to support, not only itself, but both ends. It is surely merely a matter of mathematics that, under these circumstances, more work, not less work, is necessary from every individual. Unfortunately, while hard work and enterprise do not always receive an adequate reward, inertia and idleness too often participate in benefits to which they are not entitled.

MITCHELL COTTS AND COMPANY, LIMITED

DIVIDEND INCREASED

The ordinary general meeting of Mitchell Cotts and Company, Limited, was held on the 16th instant, in London, Mr Alexander Hamilton, the president, was in the chair in the absence of Mr Leonard Aldridge, C.B.E., the chairman.

The following is an extract from the chairman's statement circulated with the report and accounts:—

Post-war problems and the necessary consolidation of the largely expanded activities of our group of companies have called for wide re-arrangements, whereby I have relinquished for the time being the managing directorship and have been appointed chairman in succession to Mr Hamilton who has been appointed president. A large portion of my time will be devoted to the affairs of our group in the Middle East and the African Continent.

In the opinion of the directors the aggregate trading profits for the year to June 30, 1946, can be considered very satisfactory and they feel justified in recommending a final dividend of 17½ per cent., less tax, which makes a total of 22½ per cent., less tax, for the year, an increase of 5 per cent. It was decided to offer to the Ordinary shareholders one new Ordinary share at 25s. 6d. for every five held. The offer was made successfully in September and the final dividend now recommended will be payable upon the increased capital.

Our coal business again shows satisfactory results. Our activities in the Middle East continue to expand. In South and East Africa also our companies have had a busier year than in 1945. Although many problems still exist, results achieved encourage me to believe that the earnings and progress during the current year will be maintained. The report was adopted.

the foundation upon which the market's bond operations now rest.

Lombard Street no longer dabbles in short bonds: it literally makes the market in them. The larger houses, at least, are in contact not only with the banks, insurance companies and other financial institutions, but also with big industrial concerns, and when really large transactions in bonds are involved, take the business direct as well as from the stock market jobbers. This is not a supplanting of the Stock Exchange, but a necessary support for it. The gilt-edged jobbers have not the resources to enable them rapidly either to supply or absorb bonds on the scale of the transactions which constantly occur, and the impact of current taxation upon private fortunes and private firms makes it impossible for them to accumulate such resources. Lombard Street is also the better able to perform another bond function of particular value to the Treasury. Though recent questionings about cheap money are producing a change of habit, normally most institutional and industrial buyers of tap securities of ten years' life or so begin to lose interest in them as they near maturity. The discount market, which does not need to amortise premiums out of taxed income, can bid a better price for short bonds than private investors can afford. Lombard Street buying thus meets the needs of the institutional holders (who, unless the proceeds are at once required, would normally look for a longer-dated stock), and tempts the shorter bonds into a professional market where they remain until, as the redemption date nears, the authorities themselves become extensive buyers to smooth the repayment operation.

These are the bond market functions of Lombard Street which have predominated in the past six years. They explain why the authorities first encouraged the market to consolidate itself into eleven substantial units and, in 1943-44, permitted an influx of additional capital from various financial interests outside the market. Now a further function is becoming increasingly important. Whether or not the Chancellor succeeds in shifting the emphasis of his borrowings to long-dated or irredeemable stocks unsuited to the discount market, it is clear that the short bond market must come under recurrent pressure as industry liquidates its wartime investments to finance recon-

version. The discount market must stand ready to take up these offerings and carry them until redistribution finds for them a permanent home.

The jolt to the market in the autumn of 1945, when short bonds were heavily sold to finance the last-minute rush into Savings Threes, showed what can happen if Lombard Street is unable to take the whole of the strain. Whenever the volume of selling passes beyond the carrying capacity of the professional market, prices must fall to a yield basis appropriate to private investors (unless the authorities buy at high prices themselves). In 1945 a 2½ per cent. yield on short bonds stood squarely in the Chancellor's path to cheaper money. An article in these columns at the time showed that the most reasonable method of avoiding obstructions of this kind in future was to allow the discount market to increase its capital again, and thus to increase its carrying capacity without infringing the normal ratio of about eight to one. That is what has happened. The operations of 1946 have added about £8.7 million to the market's resources, apart from the formation of one new discount house, and when the movement is complete it will probably be found that the normal bond-carrying capacity has been raised from about £170-180 million in the autumn of 1945 to, say, £270 million—with the possibility of rather larger figures in a phase of real stress. The total known resources of the market, including published reserves, carry-forward and share premiums, are now about £26 million—more than double their level of 1925 when there were twice as many individual houses as now. These resources, plus substantial inner reserves, will support a total "book," including both bills and bonds, of perhaps £800 million, more than three times the pre-war level. The market, though almost shorn of its traditional commercial functions, is both qualitatively and quantitatively a more important unit in the financial structure than it has been for many years. It still retains the classic short-loan market functions which Bagehot knew. It still is Lombard Street—despite the growing popularity of a Cornhill address. But, even compared with pre-war days, it is a new Lombard Street, which serves above all the needs of a Treasury wedded to cheap money.

Business Notes

The Market's Reaction

The behaviour of the Stock Exchange this week has borne all the signs that, in the calculations of investors at least, the British economy is facing a prospect which is far more threatening and serious than the immediate consequences of the shortage of fuel and power. The deceleration in the speed of industrial output which could be sensed in recent weeks and which had already taken some of the rosette bloom off equity share prices has become general, and it has brought in its train a shock to confidence in the Chancellor's power to maintain his cheap money policy. Whether these doubts will be justified by future performance remains to be seen, but the weakness of the gilt-edged market, particularly on Wednesday, gives some measure of the increased problem which faces Mr Dalton if he is determined to go forward on this main plank in his financial policy.

The new 2½ per cent Treasury Stock, never very firmly established after the closing of the tap, fell on that day to 98; Old Consols dropped to 96½, compared with 98½ on February 5th, and even the dated stocks showed little or no resistance—indeed, the 1½ per cent Exchequer Bonds, redeemable in 1950, fell by as much as ½. In terms of yields, an undated stock like Old Consols now gives a return of £2 11s. 10d. per cent gross, compared with £2 10s. 11d. per cent a week ago; 2½ per cent National War Bonds 1954-56 £1 17s. 10d. per cent against £1 15s. 3d. per cent; and 1½ per cent Exchequer Bonds £1 4s. 0d. per cent against £1 1s. 7d. per cent.

A considerable revision of equity share values and prospects is also in train, marked by a fall in the *Financial Times* index of

industrial ordinary shares during the past week from 132.5 to 124.4, which compares with the "high" of 140.6 recorded as recently as January 17th. There is good reason for this revision, not merely because the cheap money support for the equity market

may in future be weaker, but also on the calculation of industrial earning power as a result of the fuel cuts and their aftermath. Profits are a residue; the biggest profits—to outward appearance—usually depend upon the spreading of fixed costs

over a large output. For much of industry at present, the fixed costs are continuing, and output is falling to zero. Even a fortnight's cessation of work may have disastrous consequences on the residual earnings of equity shares, and there is now no EPT cushion against which these falls can be offset. It would not be surprising if the equity share market undergoes a period of disturbance lasting well after the immediate crisis. The problems of "essentiality" between industries for coal rations during the summer have yet to be worked out; and their combined impact, with the present stoppages, upon particular companies cannot be judged from their published accounts. But in all cases it is likely to be significant, and in some cases serious.

Argentine Railway Agreement

It was announced in London on Thursday that agreement has been reached after 15 weeks of negotiation between representatives of the Argentine Government and the British-owned railways for the outright purchase of the railways by the Argentine Government for a cash sum payable in sterling of £135½ million. In addition, the Argentine Government have agreed to take over certain of the ancillary undertakings operated by the railway companies for an additional sum of £14½ million, making a total payment of £150 million. It had been fairly evident for a week before the agreement was signed between the two sides that an understanding had been reached in the case of the railways and the fact that Sir Montague Eddy postponed his return to this country last week, provided a hint at any rate that the negotiations about the ancillary assets were proceeding fairly promisingly. The agreement as a whole must be welcomed after the recurrent threats of a breakdown in the talks, but with a real sense of regret. It has yet to be ratified by the Argentine Government, and it will in due course be submitted under schemes of arrangement to class meetings of the stockholders in the various companies. Any attempt to foreshadow the complicated pattern of the schemes which will in due course be put before the four major companies and their satellites is out of the question. There is no uniformity in capital structures or past earnings experience which would enable any general principle to be laid down.

An interesting comparison can nevertheless be made between the market values of the Argentine railway stocks early this week with the terms of the settlement. The market values of the debentures was on Monday last about £86½ million, of which those stocks receiving full service were valued at £61 millions, those on which arrears are being paid at £17½ million and those on which no payments are forthcoming at all at about £7½ million. The total market value of the preference stocks amounted to £13½ million while that of the ordinary stocks approached £11½ million. Thus the total value of all Argentine rail stocks was on Monday last approximately £112 million. The only conclusion that can be drawn from this calculation is that there is an appreciable margin between market values on a day when the sale agreement was virtually secure and the terms of that agreement now it is published. The instinct of the market this week has been to favour the senior preference stocks and but for the profound disturbance which markets have received as a result of the coal crisis there could be little doubt that the Argentine railway market would have provided a burst of speculative activity.

Two points are perhaps worth stressing. First the date of payment has yet to be declared. Secondly £125 million of the total consideration will be contributed by Argentina's present sterling balance, leaving £25 million to be found from currently acquired sterling. The latter will make at least some contribution to the great burden of Britain's external payments—though only at the expense of realising a capital asset, which in happier times provided a regular and valuable contribution each year to the British balance of payments, at a figure well below its original cost and far below its replacement cost.

By Candlelight

The City this week has carried on stoically, if not philosophically, with its principal functions. Cold is hardly conducive to good humoured tolerance of make-shifts, but on the whole there has been surprisingly little friction and a great deal of enterprising improvisation. Perhaps the high light of that was the cast of a stockbroker with a large provincial connection who promptly cabled to Belfast for the dispatch of candles by air. He subsequently had the ironic satisfaction of obliging an importunate friend—the chairman of one of the larger power companies. The supply of candles has, indeed, been a major worry for City firms,

especially the smaller ones. The banks during the restricted hours have worked by candle, hurricane lamp, motor lamps run from batteries or, in a few fortunate offices, by emergency lighting from their own generators. In many mechanised offices, there was a danger of serious delays through the inability to work bookkeeping and tabulating machines; but these troubles seem to have been surmounted by the expedient of doing an hour's machining before nine o'clock, of postponing lunch until after the mid-day switch-on, and by working late into the evening. At the clearing house, conditions have been particularly trying—not so much because of loss of power as for the need for reasonable lighting for the exacting work of sorting cheques. But despite these difficulties, there have been no reports of important delays or of any significant accumulation of arrears of work. The banks, however, have appealed for—and still urgently need—the co-operation of the public by conducting their routine banking business so far as possible before midday.

The Stock Exchange, like other corners of the City, presented a scene without precedent. The floor of the house gets only a modest share of daylight even on bright days, and this week the general gloom competed with the damp chilliness (the Stock Exchange steam heating plant worked with customary efficiency—but there were, alas, no electric fans to push the heat around) to subdue most of the market's human buoyancy. In former times, the sight within the House of any hat but a "topper" was apt to evoke a boisterous response—but this week headgear and overcoats of every description have passed without comment. The authorities themselves have found one source of satisfaction in a reward for foresight. They owned one of the earliest private lighting installations. This equipment, overhauled twenty-four years ago and idle through the general strike and throughout the war, has at last come into its own, to relieve the otherwise intractable problem of continued working in the basement settling room.

British Offer for American Ships

The Minister of Transport outlined on Monday the British proposals for the return or purchase of the American merchant ships at present on bareboat charter to the United Kingdom. Three days earlier Mr William Clayton, US Under-Secretary for Economic Affairs, had disclosed the main details when giving evidence before the Merchant Marine Committee of the House of Representatives when he urged the abandonment of the Republican-inspired resolution to enforce the immediate return of these ships. The background of these negotiations was noted in *The Economist* of February 1st. The vessels on charter are costing the British Government some 2,000,000 dollars a month; they comprise 229 Liberty ships (dry cargo ships of 10,000 tons deadweight), 42 smaller ships of a type invaluable for the Baltic timber trade, and about 35 specialised ships unsuitable for commercial use. This large block of tonnage, totalling some 2,500,000 million tons deadweight represents an annual carrying capacity of some 7,000,000 or 8,000,000 tons of cargo, and its immediate withdrawal would seriously affect Britain's external trade and would disrupt world shipping resources. One of the consequences would be a serious drop in the volume of imports to this country, which in 1946 totalled only 30½ million tons compared with about 55 million tons of dry cargo before the war.

Discussions have been going on for some months to meet this problem, and the British Government has now proposed to the United States that sufficient dollars should be released to enable British shipowners to purchase 100 of the Liberty ships and 15 of the smaller types—this allotment of dollars being in addition to the authorisation given last summer for owners privately to apply for the purchase of some 40 faster ships which are outside the charter agreement. Re-delivery of the remaining Liberty ships to the United States authorities, it is proposed, should begin in June at the rate of ten a month, while the remainder of the specialised vessels are to be returned during this year. It may be noted that the Ministry of Transport recently engaged 20 Scandinavian ships of this latter type on time charter for one to two years. Purchase of 100 Liberty ships, involving the expenditure of, say, £13½ million in dollars, is an unwelcome solution of the problem. The British shipping industry requires a breathing space of 12 months or so to build up its tonnage, and to be forced to expend precious dollars on tonnage which is less than fully satisfactory for its purpose is galling in the extreme. But there is no alternative source of ocean-going dry cargo tonnage apart from the United States surplus. Other maritime nations, in fact, will be similarly embarrassed if the present Republican proposals are to be given effect. British shipyards are employed to capacity in replacing deficiencies of other types, such as tankers and

FOLLAND AIRCRAFT LIMITED

PRODUCTION OF OWN DESIGNS

MR. ALAN P. GOOD'S REVIEW

The eleventh annual general meeting of Folland Aircraft, Limited, was held, on 22nd instant, at Winchester House, Old Broad Street, London, E.C.

Mr. Alan P. Good, the chairman, who presided, said: I think that some explanation is due to you for the deferment of the meeting which we are holding to-day. It has been our practice on previous occasions to hold the Annual General Meeting in the last two or three months of the old year, at which the Accounts were presented to the preceding 30th June. The explanation on this occasion is quite simply that we withheld the presentation of the year's Accounts in the expectation that we would be able to reach finality in the matter of some wartime contracts in respect of which we had outstanding claims on the main contractor and on the Ministry of Supply. In the main we have been able to clear up these outstanding matters and include them in the Accounts which are now before you.

When I last addressed you I said that we did not expect that the next twelve months would be a very happy period and that we did not expect to be able to come back to you with such a good set of figures as on that occasion, and this has proved to be the case. The year has been a transitional one with all the consequent uncertainty concerning the future of the industry which we anticipated. The early part of the year was occupied with working out the wartime contracts which, it was reported to you last year, had been cancelled following the end of the war in the Far East. Much capacity was thereby released and, as your Company was not in a position to go forward immediately with a civil project of its own, your Directors turned their attention to obtaining contracts for work on well-known civil type aircraft. It became very apparent, however, that these contracts were insufficient to absorb the whole of the available capacity and attention was therefore paid to acquiring orders for commercial work to absorb the surplus capacity. Whilst it was anticipated towards the end of 1945, however, that there would be a very considerable contraction in the aircraft manufacturing industry, the characteristic of the first half of 1946 was the resurgence of this class of work. The Company's order book at the end of 1945 showed that only a little over 20 per cent. of the Company's new contracts at that date were on aircraft. By June, 1946, however, the position had altered so materially that nearly 50 per cent. of the new orders were for aircraft components. These were in the main orders for components for civil types, particularly the Vickers "Viking" and De Havilland "Dove" machines. In addition, the Company has been designing and constructing components for the large Bristol "Brabazon" machines. The trend of events in connection with the manufacture of aircraft therefore led your Directors to believe that the contraction expected last year had not materialised to the degree anticipated, and the order book shows that a substantial recovery in aircraft contracts has been made and is continuing.

FUTURE POLICY

After careful deliberation, therefore, the Board of Directors have decided to remind shareholders that the design and manufacture of aircraft and aircraft components was the main object for which the Company was originally formed, and that must be the ultimate aim of the Company. Moreover, it must be made clear that the Company cannot take its rightful place in the aircraft industry by relying on sub-contract work alone, and it must go forward to prove and establish itself by the production of its own designs.

Your Company has an experienced Design Staff approved by the Technical Branch (Air)

of the Ministry of Supply, whose efforts in the main for the year under review have been concentrated on helping the Ministry of Supply (Air) on designs of high priority and, in particular, they have been entrusted, as mentioned above, with the design of various important components for the Bristol "Brabazon" machine. At the same time a number of the senior Design Staff have been investigating various types of aircraft, amongst them a civil type including new features of safety which has been submitted to the Ministry of Supply (Air) for their approval and also a novel design of amphibious aircraft, which has been submitted to the Admiralty. Your Board have adopted the policy of watching the trend of civil requirements during the past year, rather than making a hasty decision to commit the Company to a type which may not be successful and, in the light of the experience thus gained, your Board propose to select the best possible design evolved by the Company's Design Department and go forward with the construction of one or other of these types, if necessary as a private venture. Your Board are now in a position to define the future policy of the Company: that the Company should proceed with the design and manufacture of its own aircraft and that it would engage on whatever aircraft component work is available but that, to ensure a sufficient volume of output which would enable the Company to employ economic numbers and to achieve a reasonable profit each year, the aircraft work should be supplemented by commercial work of a type which will ensure continuity of demand and production.

In the meantime, the production facilities of the Company have been employed on the production of components for several of the well-known civil type aircraft at present before the public and for which large orders are available, in particular the De Havilland "Dove," the Vickers "Viking" and the Bristol "Brabazon" machines. The Company has also received a direct contract from the Ministry of Supply for aircraft equipment. At the same time, the Company is executing contracts for components for the Airco type pre-fabricated house, which is of aluminium construction and suitable to our plant. In addition, the Company is producing a light weight type of electric truck developed by the Brush Electrical Engineering Company, Limited, and a newly developed type of refrigerator. The volume of work on these latter type of commercial contracts is substantial and continuity of production is confidently expected. Since the end of the financial year the work performed by the Company is approximately 67 per cent. on aircraft work, 14 per cent. on pre-fabricated housing work and 19 per cent. on commercial work.

A YEAR OF TRANSITION

The year under review has, as mentioned in the report of the Directors and as I have already informed you, been one of transition and the Board of Directors and Management of the Company generally have required to give almost continuous attention to the results consequent upon the contraction of the Company's activities and the transfer from wartime to peace time. Considerable numbers of productive workers were lost following the closure of the Dispersal factories which the Company operated in wartime and which employed some 30 per cent. of the Company's wartime labour force. Further numbers of productive workers were lost upon removal of the Essential Works Order, and corresponding reductions of staff have had to be made throughout the year to preserve the balance of the labour force. I regret to say that the results of this movement of labour are only too apparent in the

accounts for the year now before you.

Turning to the Balance Sheet, which is already in your possession, you will see that the financial position of the Company remains liquid and strong. To give some of the additional details recommended by the Cohen Report, you will see that we have amplified the printed accounts on this occasion to give you rather more information concerning the finances of the Company. The Fixed Assets are now written down to a figure of £143,101 against £151,447 at June 30, 1945. During the year the Tithe Redemption annuity on the Company's land was compounded for the sum of £803 and this amount has been capitalised, but during the same period the value of Freehold Land and Buildings was written down by £3,542. You will also be able to see the total amounts which have been written off the Land and Buildings since the re-valuation in October, 1937. In similar fashion the cost of Plant, Machinery, Electrical Installation, Tools, etc., is shown and the total amounts written off since they were acquired deducted in the year under review. These assets have been reduced by depreciation and sales by a further £5,607. The net result is that the Total Fixed Assets of the Company are valued at £143,101, which is the equivalent of 2s. 10d. per share of 37 per cent. of the total capital and surpluses of the company. I think that your Company is exceptional inasmuch that the fixed assets constitute such a low proportion of the total capital and surpluses.

LIQUID ASSETS

Turning to the current assets, you will see that these aggregate £411,435, as against £634,369 at June 30, 1945; there have been considerable reductions in stocks and work in progress and trade debtors which, taken in conjunction with the reduction in the bank overdraft, reflect the curtailment of the Company's business and the settlement of outstanding contracts with main contractors and Government departments during the year. At the same time the trade creditors have been very substantially reduced from £210,882 to £68,998.

You will also notice that this year we have shown as a separate item the provisions set aside for deferred repairs and renewals, rehabilitation expenses and contingencies, and that the provisions created by last year have been augmented by a further £4,400, until we now have a total provision of £20,401. Your directors are satisfied that full and adequate provision has now been made for restoration measures and for the cost of carrying out all those repairs necessary to restore your works and buildings to a first-class condition, which they have been unable to put in hand due to conditions prevailing during the war and directly afterwards.

As on previous occasions, we have shown the provision for income-tax for 1946/47 and excess profits tax this year at a figure of £24,100. In addition we have also shown under the deferred liabilities the provision for income-tax for 1947/48 at £16,500. As explained to you last year, it has always been the practice of the Company to include this provision, although you will appreciate that the contingency is over and above the strict legal liability of the Company in respect of the accounting year under review.

It will be seen that the comparison between the total current assets of £411,435 and the current liabilities of £152,477 shows a surplus of liquid assets of £258,959, which is equivalent to 5s. 2d. per share of the Company's permanent capital.

DEVELOPMENT PLANS

We have informed you from time to time that your Company during the war paid sums by way of excess profits tax. Consequently there is due to the Company a refund, after allowing for income-tax, in the region of £60,000, which sum, however, may be expended only on rehabilitation, development and re-equipment. As stated in the

directors' report, it is proposed that out of this sum should be purchased new plant, certain selected Crown plant already being utilised and on hire to the Company and a hangar which was erected on the Company's land in wartime by the Government. Negotiations have been opened for the acquisition of these assets, which are the property of the Crown, and no doubt will be brought to a successful conclusion during the course of the current year. It is proposed also that the general reserve of £65,000, which has been built up during the wartime years, should be held available to meet the cost of development work, both on aircraft and on the commercial work undertaken by the Company.

Dealing with the profit and loss account, it will be seen that, whilst the balance from the trading account shows a surplus of £11,924, yet a small loss of £6,563 was actually made on the year, which position has been recouped by the recovery of the excess profits tax already paid, £38,500. It is proposed, therefore, that, after the loss of £6,563 referred to above has been deducted from the excess profits tax recoverable of £38,500, out of the balance of £31,937 taken together with the carry forward from last year of £7,590, a final dividend for the year ended June 30, 1946, of 4 per cent. less income-tax is recommended, amounting for £6,600, leaving £13,959 to carry forward.

Your managing director, Mr. H. P. Folland, the management and staff of the Company have had an extremely difficult and trying year, and our best thanks are extended to them for their efforts during that year. We can only hope that the results of the current year will show that the period of transition has, in the main, been overcome and we can go forward on a settled policy to a successful future.

The report and accounts were unanimously adopted, the retiring directors were re-elected, and the proceedings terminated with a hearty vote of thanks to the Chairman.

BARCLAYS BANK LIMITED

ANNUAL MEETING OF STOCKHOLDERS

The fifty-second ordinary general meeting of Barclays Bank, Limited, was held, on the 22nd instant, at the Head Office of the Bank, 54, Lombard Street, London, E.C.3.

Mr. Edwin Fisher (the Chairman) presided.

Mr. H. G. Tickle (the Secretary) read the formal notice convening the meeting and the report of the auditors.

With the concurrence of the stockholders present, the report and accounts and also the statement by the Chairman, which had been previously circulated, were taken as read.

The Chairman moved:—

"That the report of the directors produced, together with the annexed statement of the Company's accounts as at December 31, 1946, duly audited, be received, approved and adopted, and that a final dividend of 5 per cent., making 10 per cent. for the year, on the 'A' stock, and a final dividend of 7 per cent., making 14 per cent. for the year, on the 'B' and 'C' stock respectively, less income-tax in each case, be declared, payable on the 8th proximo to the stockholders registered in the books of the Company on the 31st December last."

Sir William M. Goodenough, Bt. (Deputy Chairman) seconded the motion, which was carried.

The retiring directors were re-elected, and the auditors, Messrs. Price, Waterhouse and Company and Messrs. Kemp, Chatteris and Company, were re-appointed for the ensuing year.

A vote of thanks to the staff and a vote of thanks to the Chairman for presiding at the meeting were unanimously accorded and the proceedings terminated.

LLOYDS BANK LIMITED

SATISFACTORY RESULTS

NEED FOR INCREASED PRODUCTION AND EXPORTS

PROBLEM OF "HARD" CURRENCIES

LORD BALFOUR OF BURLEIGH'S REVIEW

PRODUCTION AND EXPORT

During the war there was a good deal of discussion as to what our economic position and standard of living would be when peace came. The answer to that question, never really far to seek, is now painfully evident. We are in the position of a firm or an individual who, through no fault of his own, has had to expend immense resources in a struggle for bare survival, and has emerged from the ordeal so short of capital and so burdened by debt that some even of his best friends may doubt his capacity and strength of purpose to make the necessary effort fully to restore his financial credit and to regain his ancient economic status.

Recovery of our pre-war standard of living, to say nothing of its enhancement, is clearly attainable only through vastly increased production; we can no longer count on a rapid reinforcement of our population by natural increase; on the contrary, our working force is an ageing one. The problem before us is therefore how to organise our available resources for maximum productivity, and the duty of every one of us is to give the greatest output of productive work of which he is individually capable.

Second only to production comes export, and too great stress cannot be laid on the vital character of the struggle for exports in which this country is now engaged. Our very existence is at stake just as it was in the physical battle against Hitlerism. Unfortunately, now that the apparent physical dangers are over it is far less easy to mobilise the great qualities of our people. And in the stress of continued austerity, due partly to the diversion of production for export, there is a danger that "exports" may become, in fact, an object of odium, instead of being welcomed as our only means of economic salvation.

During the last few months fresh light has been thrown on the importance not only of the quantity of our exports but of the direction which those exports most usefully must take. Both aspects of the problem are illustrated by the figures of our overseas trade in the first nine months of 1946, as analysed in the following table:—

U.K. TRADE BY GROUPS OF COUNTRIES (Import surplus: minus) (Export surplus: plus)

	Jan. 1946	Sept. 1946	Three-quarters of 1938
	£m	£m	£m

FRANCE AND FRENCH EMPIRE	+24	-	-3
DENMARK	+20	-	-16
ALL OTHERS	+26	-	-82
ALL COUNTRIES	-246	-	-292

The annual general meeting of Lloyds Bank Limited will be held, on the 31st January, at the Head Office, 71, Lombard Street, London, E.C.

The following is the statement by the Chairman, the Rt. Hon. Lord Balfour of Burleigh, D.L., circulated with the report and accounts:—

My lords, ladies and gentlemen, In accordance with recent precedent, this statement is circulated to members in advance of the general meeting to be held on the 31st instant.

To deal first with personal matters, last July we elected to the board Sir Peter Bennett, O.B.E., M.P., and Sir Harold Bowden, Bt., G.B.E. Both these gentlemen are old friends of Lloyds Bank, and reinforce our counsels with their wide and valuable business experience. We have also had great pleasure in re-electing Lord Brand on his return from the United States of America. He relinquished his seat on the board upon appointment as representative of His Majesty's Treasury at Washington in 1944.

We have suffered the loss by death of Mr. G. F. Abell. Mr. Abell joined the staff of Lloyds Bank in 1893 and rose to be chief general manager, a position which he filled with great ability from 1929 until his appointment as a director in 1939.

I must also refer to the death on Christmas Day, at the age of 85, of our old friend, Mr. W. W. Paine, who retired from the board last year.

I record with pleasure the conferment of a knighthood on Sir Sydney Parkes, C.B.E.

During the year Mr. W. R. Bown, joint general manager, has retired, and Mr. R. T. Fagan has been appointed in his place. We have had pleasure in appointing Mr. Bown a member of the Salisbury Committee of the bank.

BALANCE SHEET

Turning to our profit and loss account and to the important changes in our balance sheet figures, our profit at £1,583,000 is only slightly lower than last year, and may be considered satisfactory, a contributory factor to the result being the large increase in our resources.

Taking first the liabilities side of our balance sheet, our current, deposit and other accounts at £1,012 million are the highest in our history and are £145 million greater than last year. This large increase, which is common to all banks, is far larger than was anticipated at the commencement of the year, and it will be very disquieting if this expansion of bank credit continues.

On the assets side it will be observed that the additional resources are reflected in increases in money at call of £33 million, in our holding of Treasury bills of £45 million and in our investments of £52 million. It is pleasing to record that loans and advances show an expansion of £25 million; it is hoped that this tendency will continue, but much depends in this connection upon an improvement in the position in regard to labour and the supply of coal and raw materials. Our holding of Treasury deposit receipts has been reduced during the year by £16 million.

We still have 58 per cent. of our total deposits held in cash, money at call, Treasury deposit receipts and Treasury bills, the average earning on the aggregate of which is well below 1 to 1 per cent.

passenger and refrigerated cargo liners, as well as dealing with arrears of repairs and maintenance and making good normal obsolescence.

It is difficult, on this side of the Atlantic, to appreciate the motives behind the Washington controversy, particularly in the agreement which led to the present situation. The underlying principle of the original Roosevelt-Churchill plan hardly contemplated that American shipowners should be put in a position to exploit Britain's war-time sacrifice of commercial interests when its shipbuilding resources were concentrated on military requirements. The United States, with 12½ million tons already laid up in reserve, is in no urgent need for the return of ships on charter, and could not find trained crews to man them. American shipping interests are already comfortably protected against competition by operating and building subsidies and by the reservation of coastwise and intercoastal trades to domestic flags. No such difficulties arise over the 750,000 tons of Canadian ships now under charter to Britain, for the Canadian Government has readily agreed to accept gradual redelivery beginning in 1950.

Indian Debt Talks

Although no report has yet come to hand of the progress made in the preliminary talks on India's sterling balances which began in New Delhi last week, considerable publicity has been given to the opening Indian moves in these negotiations. The Indian delegates are reputed to have entered the discussions with a carefully prepared case and a detailed scheme. Under this scheme the debt of £1,200 million would be divided into two parts, the first of £637½ million earmarked for various current needs, and the balance of £562½ million to be funded and released at the rate of about £56 million a year, plus interest at 2 per cent. The annuities on this second part would amount to £65,887,000 a year and the debt would be repaid over a period of ten years—between 1950 and 1960.

As to the first part of £637½ million, the Indian plan proposes that it be dealt with as follows: (a) £187½ million to be set aside for currency reserve of the Reserve Bank of India and to be drawn upon as the need arises; (b) £187½ million for the import of capital and consumer goods to meet the need of Provincial and Central Government plans for economic development; (c) £187½ million for the acquisition of suitable British commercial assets in India; (d) £45 million for purchasing military installations and stores; and (e) the remaining £30 million to provide a margin to be allocated to items (c) or (d) if required. Indian circles have further added that in acquiring British assets in India they should be offered "rates sufficiently below the present inflated levels to give justice to India," and that only high interest yielding assets should be acquired now.

These proposals can be dismissed as an obvious opening move which bears not the slightest relation to practical reality. The British side has been far more discreet and kept silence about the views it may have put forward in the preliminary talks. The subject was, however, raised in the House of Commons last week and in the course of supplementary exchanges to a question about sterling balance negotiations, Mr Churchill suggested that in the time of the late Government the Governor-General of India was notified that Great Britain "reserved her full rights to present a counter claim on account of the effective defence of India by all means, land, sea, air and diplomacy, by which the freedom of India from foreign invasion was secured." Mr Churchill further asked how we could accept the great concessions made on Lend-Lease by the United States and yet divert a large portion of our remaining assets to payment of an exactly similar war debt to the Indian Government. There should be ample room for manoeuvre between the British and Indian points of view.

LMS Dividend

Speculators who were rash enough to suppose that the directors of the London, Midland and Scottish Railway would take a venturesome line of policy in their dividend declaration for 1946 have only themselves to blame. The Board have declared a dividend of 2½ per cent, which they regard in fact as an interim payment for the years 1946-7 taken as one. The Board refer to "various uncertainties in the Transport Bill" to which they have paid regard in this declaration—which is evidently an oblique reference to the restraining effects of Clauses 22 and 23 of the Transport Bill under which the Railway Companies are inhibited from paying dividends except out of the current earnings of the two years. The net revenue of the LMS for 1946, ascertained in

accordance with the terms of the Transport Bill, amounts to £15,923,000, and after payment of the 2½ per cent ordinary dividend the balance carried forward is £392,000.

This contrast with the previous year's declaration of 4 per cent on the ordinary stock seems to have been a blow to shortsighted speculators. For 1945, when 4 per cent was paid, slightly less than 3 per cent was earned on the ordinary stock and the difference was substantially made up from a credit of £519,000 "arising from earlier years' accounts" together with a transfer of £500,000 from the Contingency Fund. The position of the Contingency Funds of the Railway Companies is by no means clear from the Transport Bill. As the law now stands, it would seem that Contingency Funds are at the free disposal of the Boards, but doubtless this loophole in the manifest intention of the Government to keep all railway dividends for 1946-7 within the limits of actual earnings will be stopped up during the committee stages.

Meanwhile, LMS ordinary stock has moved from the pre-declaration level of 30 to a midweek price of 28 xd. As a "short," with a prospective coupon for the current year of £2 15s., the stock yields nearly 10 per cent. It may well be that a wider range of investors than the large institutions will come to appreciate the merits of this and other marginal home rail stocks as a temporary haven for investment funds, on the argument that towards the end of this year the investment outlook will be a good deal clearer than it is to-day, and a guaranteed capital and income even for a year has its attractions.

The Companies themselves will not, of course, derive any benefit from any increase in charges which the Minister of Transport may order this year. The report of the Charges Consultative Committee is now being printed for publication and the Minister of Transport has undertaken to make a statement on charges at an early date.

Double-Shift in Cotton

A week ago delegates from the cotton trade unions met in Manchester to discuss double-shift working. Adoption of double-shift working is one of the conditions attached to the Government's offer of financial assistance to re-equip the industry. The conference adjourned until February 22nd, when Sir Stafford Cripps will be invited to address the meeting. Ostensibly, the reason for the adjournment was the narrow majority obtained on decisions affecting amalgamation.

There is understandable hesitation on both sides of the industry in conceding either re-grouping or double-shift working in principle so long as there is any bargaining value in offering an acceptance subject to reservations. A sweeping acceptance either of amalgamation or of the double-shift might lead, at least in theory, to a widespread imposition of both on smaller firms. The real difficulty is to ensure that, though acceptance in principle is offered speedily, each case for amalgamation and double-shift working is assessed strictly on its technical merits. Although it may be possible to carry out modernisation of factories in the three stages suggested already, there are bound to be important differences of detail in each case. Decisions will have to be taken, for instance, on the counts of yarn to be spun, on the extent to which ring spindles should replace mule spindles and how the male and female labour force can be best deployed. It is doubtful how far these practical issues can be dealt with if uncompromising amalgamation and double-shift working is to be a first condition of assistance for re-equipment.

It is now over two months since the Government made its offer, and no further progress can be expected until the end of February. Meanwhile the industry has been plunged into an almost complete stoppage. Will that be seen as a warning light that cotton, as well as coal, is an urgent industrial problem?

The Transport Bill in Committee

The coal crisis has made no difference to the programme of work for the Standing Committee on the Transport Bill which sat for two days last week and for three days this week—thus affording a perfect illustration of mass-produced legislation in which the important technical detail is discussed upstairs without adequate consideration or publicity. Last week's amendment attempted to increase the size of the Transport Commission from 5 members including the Chairman to not less than 9. This was rejected by Mr Barnes on the ground that the Commission is essentially a body to make policy decisions and should not encumber itself with details of management or operation—an admirable statement of principle which appears completely to ignore the fact that the Commission will be responsible for the

whole of the accounting system for nationalised inland transport and will require a secretariat of considerable size (in some respects duplicating the staff of the Executives) if it is to make satisfactory policy decisions. It will inevitably be immersed in much of the detail as well as the broad policy and to suppose that five members of the Commission will be sufficient for a task of such enormous responsibility is optimistic.

The Parliamentary Secretary was on rather firmer ground when he rejected an amendment to include on the Commission an additional member to be selected by the Minister from persons nominated by the principal transport-using organisations. If the Commission is to work at all it must be as a Commission and not as a representative of particular interests whether transport users, workers or managements. That, of course, is not to say that these interests should not receive the fullest consideration by the Commission. But the principle which Mr Strauss laid down for the avoidance of the explicit representation of any particular interest is surely a sound one. It is surprising that the Minister having insisted on his Commission of five was not prepared to require from each of the members his exclusive services on the Commission. The Government's answer to this proposition was that the Government intended to set up a Commission of full-time members but would not wish to exclude the possibility of part-time members—a compromise which Sir Arthur Salter neatly turned into an argument for a larger Commission of mixed full- and part-time members.

The principal amendment in this week's Committee proceedings attempted to confine the operations of the Commission to long distance road haulage and to rule out the possibility of the Commission competing with private transport operations in the sphere which the Bill leaves open to them. Opposition speakers were unanimous that if the Bill was not amended in this respect grossly unfair competition would occur between the Commission and private road hauliers; and from the Government benches there were counter claims that the Amendment was put forward as a wrecking amendment which would bring the transport of the country to a standstill. Mr Barnes promised to give later consideration to this point, though his words were hardly unequivocal.

Swiss Payments Talks

It was announced this week that Mr Ellis-Rees, of the Treasury, will shortly go to Switzerland to discuss the question of Anglo-Swiss payments and trade. No doubt these talks arise partly from the fact that the Monetary Agreement is nearing the end of its first year, and thus is due for one of those periodical reviews which are a normal feature of Britain's exchange arrangements with Western Europe. But it is a fair presumption, too, that the difficulties which recently gave rise to a new system for regulating Swiss tourist expenditure have not been wholly surmounted. The Swiss agreement prescribed the customary limit of £5 million to Switzerland's accumulation of sterling, but with the important supplementary provision that if the sterling area balance of payments with Switzerland was adverse, the Swiss would finance in sterling the amount of the deficit, up to a maximum of £10 million within the first year and a maximum of £15 million for the first two years taken together. Any deficit beyond these figures had to be settled in gold.

In fact, the first year's limit was closely approached after only eight months, and has recently been exceeded, so that payment has had to be made in gold. In part this was due to heavy (though obviously foreseeable) governmental payments early in the period, particularly for the movement of British troops returning from Italy over the Swiss railways. It arose partly from the summer's tourist outlays, which had also been foreseen but proved heavier than had been expected, necessitating closer control of the winter season's traffic. But more particularly (as *The Economist* pointed out on November 16th) it arose from heavy expenditure in Switzerland by other sterling area countries, and especially by South Africa and India. Britain has felt obliged to deny herself imports of Swiss luxury goods, and high priority goods have been available only in small quantities. British exports, on the other hand, made a strong recovery, and last year were in money values more than twice their pre-war level. From her normal position of trade debtor to Switzerland, Britain became a substantial creditor, only to find that heavy invisible payments and the imports into sterling area countries from Switzerland had swung the overall position back again heavily "into the red."

The second year's account will not be burdened with heavy special payments, which possibly explains why the monetary agreement gave more latitude in the first year than in the second. But the available margin now—an additional £5 million—is un-

likely to suffice for both the budgeted tourist outlays (which are being kept within planned bounds by the new system of Swiss control) and continued Dominion expenditure on the recent scale. If there is an overall deficiency, Britain must pay in gold which she cannot afford and Switzerland must receive gold for which she has no use—for some years now an excess of dollars and gold has been embarrassing the Swiss authorities (who still think in terms of monetary rather than physical controls) because it increases the inflationary potential. Given the autonomy of the Dominion import controls, it is not easy to see a remedy satisfactory to both parties. Britain after this fuel crisis can scarcely hope rapidly to expand her exports, and, in a phase of such pressure, could hardly feel content to use precious productive resources to meet Dominion purchases, except as part of a planned arrangement for release of sterling balances. The only remaining course would seem to be to curtail tourist expenditure. But would that suit the Swiss? Perhaps, after all, they will feel that the better plan for them would be to give a little more elasticity to the limits set in the original agreement.

Cotton Export Pattern

The country's need for increased exports to "hard" currency areas has now been recognised in the new cotton textile export arrangements which were outlined by the Board of Trade last week. Except for certain Empire territories "to which special considerations apply" allocations on a country to country basis are to cease. During the war an intricate export allocation system was built up to direct cotton piece goods to American markets. Later, when lend-lease began, the allocations were revised, so that cotton exports could be directed to those areas where consumers' goods were required to induce the producers of essential foods and materials to increase their output.

Some of the consequences of these wartime changes are indicated in the following table—which shows exports of cotton piece goods and cotton yarn in 1938, 1945 and 1946 to the main geographical areas:—

	Cotton Piece Goods: '000 sq. yds.			Cotton Yarn: '000 lbs.		
	1938	1945	1946	1938	1945	1946
U.S.A.	8,674	2,825	6,521	570	72	214
Canada	64,458	8,072	5,298	3,598	3,954	4,324
S. Africa	109,465	75,510	76,002	2,732	3,929	5,095
Australia	145,894	95,620	87,955	6,540	4,432	4,786
India	273,317	1,223	12,368	5,138	89	144
Remainder of Empire	250,592	182,831	213,732	3,710	2,207	2,855
Argentina	97,584	155	3,601	4,170	2	8
Rest of S. America	67,913	96	1,944	4,060	3	107
Near East	64,233	14,755	23,220	...	...	...
Far East	32,079	60	5,891	...	...	...
Europe	158,282	17,047	30,810	45,952	934	1,261
World TOTAL	1,386,235	441,095	513,287	122,950	16,103	19,383

Total cotton piece goods exports fell from 1,386.2 million square yards in 1938 to 441.1 million square yards in 1945. An even larger proportionate fall was experienced in yarn exports. By 1945, European, Far Eastern and Indian markets had been almost wiped out by war, lack of shipping and other enforced cuts. In piece-goods, the areas least affected by the reduction in exports were the Dominions (excluding Canada) and the Colonial Empire. During 1946, there was a slight readjustment of the balance in favour of Near and Far Eastern markets and of the United States. But progress was sluggish in Canada and South America. The European market recovered slightly, but the Indian market regained only 4 per cent of its 1938 volume. Many of these markets, such as India and South America, may well have disappeared, so far as the cheaper end of the trade is concerned. But the piece-goods figures suggest that in some markets there is still an opportunity to restore, as a first target, the 1938 level of trade, if only the output were available. In others, especially the United States, a further large expansion in sales will require revised and vigorous selling methods to offer serious competition to the protected local industry.

The Board of Trade announcement pointed out that the export allocation is considerably reduced for 1947. This is a masterpiece of brevity, for the new export allocations will have to take account now not only of a limited labour force and the five-day week but also of the fuel crisis. This must react on the size of the export quota. If the public in this country is to be clothed and "hard" currencies are to be earned, there may yet have to be drastic revisions in the special considerations given to Empire customers—or even a return to country by country allocations.

It will be seen that our imports from all countries taken together exceeded our exports by £246 million, or less by about 16 per cent. than in the comparable period of 1938. At first sight this result may not seem unsatisfactory, although it must be remembered that before the war we were able to pay for our import surplus to a large extent out of income on overseas investments which have been sacrificed in paying for the war. But when one examines the composition of this global import surplus, the picture is disturbing; for it will be seen that our deficit in trade with the all important "hard" currency countries, such as the dollar area, the Argentine and Sweden, on which we depend for a large part of our supplies of food and raw materials, amounted to as much as £320 million.

NEED FOR "HARD" CURRENCIES

That trade deficit involves a drain on our exchange reserves which would be serious enough, but unfortunately it is not the only source of strain. Far from receiving reparations from Germany, for example, this country has been compelled to send large quantities of foodstuffs into the British zone simply to avoid economic chaos there, and assistance must also be given to other ex-enemy countries, such as Austria and Italy. So grave would be the consequences of an economic breakdown in Europe that no responsible person can question the wisdom of this policy in our own interest, though perhaps one may be permitted to express regret that Germany could not have been made to be self-supporting from an earlier stage of the occupation. It is patently in our interest that the labour and industrial plant of Germany and of Italy should be brought into production and not be left standing idle at a time when the world is suffering from severe shortages of goods of all kinds. To rehabilitate the economies of these ex-enemy states will, it appears, make heavy drafts on our available dollars for at least a further three years, but fortunately after 1947 at a diminishing rate.

This is one adverse factor which has appeared since the signing of the Washington Loan Agreement to intensify the doubts, expressed at the time by Lord Keynes and others, whether the Loan would prove large enough to tide us over the difficult period before us. Another such factor is the sharp rise in United States prices which has substantially reduced the purchasing power of the Loan—that being only another way of saying that the credit is in danger of running out more rapidly than had been hoped.

In July, 1947, there comes into effect the obligation we have accepted under the Washington Loan Agreement to make sterling earned in current transactions freely convertible into dollars or other currencies, and as things are running at present a critical situation seems likely to arise within two years from now. The severity of the crisis would depend on the extent to which we can succeed in stepping up our production and diminishing our adverse balance with the "hard" currency area.

At present, no other country is under a similar obligation to convert into "hard" currency the proceeds of current trade, owing to the five years' transition period allowed by the Bretton Woods agreement. That would be of little account if such countries were in a position, equally with the "hard" currency group, to supply the essential foodstuffs and raw material that we need; but such is unfortunately not the case. It is because North America and the other "hard" currency areas are alone able to export these vital supplies on a large scale that the problem of securing imports to maintain our standard of living has become almost entirely a problem of securing dollars. And this in turn is why it is so essential, as Government spokesmen have emphasised, that our exports should be directed as far as possible to the "hard" currency countries. This is, however, easier said than done. It takes two to make a bargain.

From what has been said already it will be apparent that this search for so-called "hard" currencies is dictated by the economic realities of our situation. Before the war, doubtless, the dollar became known as a "hard" currency in virtue of its convertibility into gold and therefore into all other currencies; this is still, of course, an important characteristic of a "hard" currency to-day, but what is perhaps even more significant in present circumstances is the capacity of the country in question to supply required goods. In this connotation a "hard" currency country is one which (a) has the goods we need; (b) does not want to the same extent the goods we are able to export; and (c) is not prepared to extend credit beyond a defined limit. It is for these reasons, rather than for convertibility into gold or dollars, that the Swedish krona is "hard" from our point of view, whereas the Danish krone is not. Denmark is a willing buyer of the goods we are able to supply and in return for part of them she sends us dairy produce which is just as important for our economy as Swedish timber; but for her purchases from us in excess of her exports to us she can only pay us in kroner, which are not convertible into dollars. Sweden, on the other hand, is not prepared to increase her shipments of timber to us unless we can offer more of the goods she requires, in particular coal.

These facts illustrate the weight of the burden to be assumed by us on July 15, 1947. The restoration of free convertibility of sterling earned in current transactions was one of the obligations entailed by the acceptance of the American loan of \$3,750 million, and, as I have already mentioned, events subsequent to the signature of the agreement have combined to intensify our doubts as to the sufficiency of the amount of the loan. It must, however, always be remembered that if the risks are great the reward of success would be great indeed also. It would be nothing less than the re-establishment of sterling in its proud position of a universal international currency.

U.S. TARIFF POLICY

Fundamentally, balance in our trade position can be restored only through a vigorous production drive to raise our total output of food as well as of manufactured goods, for the more we can raise our aggregate production the less we shall need to buy abroad and the more we shall have available for export. Yet the utmost effort on our part will not suffice unless at the same time the United States is pursuing policies consistent with expanding world trade. It was foreseen that in the years after the war the outside world would become largely dependent on American supplies to speed up reconstruction. If other countries are to meet their direct obligations to the United States and at the same time to build up the system of multilateral trade which America so much desires, free from discriminatory practices, they must be adequately supplied with dollar reserves; and in the last analysis it depends on the actions of the United States whether the dollars are made available. There is an obvious danger that the unavoidable dependence of war-exhausted countries on American supplies for reconstruction will lead to a world shortage of dollars.

In the first instance, such a dollar shortage can be averted only by large-scale American lending. That lending programme did indeed make some headway during 1946, through the medium of the Export-Import Bank. The time has now come, however, when it was expected that the World Bank for Reconstruction established under Bretton Woods would take over, and it is somewhat disturbing that that institution is apparently not yet in a position to begin effective operations. It is to be hoped that the American financial world will give the new organisation every support, since, as has been said, American lending through that or other agencies is a prerequisite of the kind of trad-

ing world, permitting a broad flow of American exports, which American business men themselves feel to be essential if widespread unemployment in the U.S.A. is to be avoided.

In the longer run, of course, as I emphasised last year, a dollar shortage that would compel other countries willy-nilly to restrict their purchases of American goods can be averted only if the United States is prepared to accept a large increase in imports. We welcome the increasing awareness of that basic fact among business men in the U.S.A., as also the considerable success of the preliminary trade talks held in London last autumn between representatives of eighteen nations. The object of those preliminary discussions was the limited, if important, one of reaching agreement on an international code of general principles to guide commercial policies in a multilateral trading system. The actual work of clearing away trade barriers by mutual tariff reductions and other concessions has still to be accomplished at the full-dress trade conference to be held later this year, and the result of those negotiations will be awaited with keen anxiety. It is not too much to say that that conference will probably decide once for all whether international trade can be rebuilt on a sound footing, or whether the world will relapse into a system of barter and discriminatory practices, with fatal consequences to world prosperity. It will be a tragedy indeed if, after the wonderful Anglo-American comradeship in war, we cannot find means of co-operating in a great drive for expanding trade and raising standards of living throughout the globe, the attainment of which can alone afford any firm basis for hopes of permanent peace in the world. We all welcome what we believe to be the general condemnation of political isolationism in the U.S.A., but failure to co-operate financially in re-establishing trade relations would be equally fatal to prosperity on both sides of the Atlantic.

It should be understood that the interests of this country lie not merely in obtaining direct tariff concessions for ourselves; what matters is that the great American market should become accessible to the goods of the whole world. That is because the settlement of our dollar deficiency must take place to a large extent through triangular and multilateral channels: for example, American purchases of raw materials, such as the rubber and tin of Malaya, are a major source of dollar earnings for the sterling area as a whole. Some people would even question whether scope exists for massive direct exports from Britain to the United States, holding that the direct trade must in the nature of things be confined largely to high-class manufactures and luxury goods enjoying at best a limited market.

PROSPECTS FOR BRITISH EXPORTS

I believe that British exporters in a wide range of industries will find a surprisingly ready outlet for their goods in the United States if they will bend their efforts in that direction. Indeed, the view has been expressed by a competent American observer that, even in lines where British exports are already established in the American market, the surface has been no more than scratched. If this outlet for our goods is to be fully developed, however, it is imperative that our exporters adopt modern methods of sales promotion appropriate to the American market. In the past, failure to employ such methods has been made a reproach to British manufacturers. Instead of relying on resident agents, who do little more than accept orders for the product, some undertakings have recently established their own sales organisations overseas, and it is felt that many other firms might usefully follow this example. In this connection may I stress the importance of visits overseas by firms' principals? Such a visit by a partner or director who is in a position to give orders on the spot and make contact at the highest

level with importing firms has a value which cannot be over-estimated. Our bank and its affiliates stand ready and anxious to assist the export trade in every possible manner.

While a lowering of the American tariff wall is most desirable, it should be realised that, in our case especially, a high level of American national income is no less important; for the amount the USA buys from abroad varies directly with the state of American prosperity, and an increase in the American national income brings a proportionately much greater increase in the demand for the high-class products which in the past have represented the bulk of our United States trade.

EXCHANGE CONTROL BILL

Two Bills now before Parliament are of great interest to us—the Exchange Control Bill and the Companies Bill. The reference already made to our critical position in regard to the dollar exchange is enough to prove the need for the continuance of strict exchange control, and no time limit can at present usefully be set within which control can be terminated. Our whole future standard of living depends upon successful balancing of our "hard" currency accounts. While control must necessarily continue for a long time, it is to be hoped that we shall retain as our object of policy the restoration of free exchanges. Strict control, necessary as it is under present conditions, is in itself a hindrance to legitimate trade. Many types of transaction, e.g., foreign travel, purchase of goods and works of art, which have to be prohibited because they are unilateral, would give rise to corresponding transactions on the other side of the account, and would, in fact, be more than self-balancing and a source of profit, if only an equilibrium could be restored within which greater freedom could be allowed. Further, it is the particular disadvantage of exchange control that it renders illegal many things which the ordinary citizen wants to do and can with difficulty be prevented from doing. A good deal of public education, it seems to me, is needed to teach ordinary people the reasons for exchange control and thereby to discourage evasion which at first sight seems innocent and harmless.

COMPANIES BILL

Shareholders may remember that in my statement last year I welcomed the decision of HM Government to implement by legislation the Report of the Cohen Committee appointed to make recommendations for the revision of the Companies Act, and that I added a plea that the details should be very carefully scrutinised and considered in the light of what is really practicable, particularly the much discussed nominee question. The Companies Bill which has now been introduced is a lengthy and complicated measure, directed largely to furnishing shareholders and persons dealing with companies with more information regarding the affairs of their companies, an objective upon which the Committee laid great emphasis and the desirability of which I endorse.

The Bill indicates that HM Government has attempted to make the proposed changes in the law administratively workable and convenient as far as possible to businesses

honestly and properly conducted, although the Bill is capable of further improvement in this direction. Considerable and important modifications of detail in the Cohen Committee's nominee recommendations have been made. Nevertheless, the nominee proposals, even in this modified form, are so involved that I doubt whether they will be readily intelligible to the ordinary investor, with the consequent risk of failure to comply with the law on his part, through inadvertence or ignorance. It is widely held that it is impracticable to prevent deliberate evasion. If this view is correct, then to enact a law with which only the well-intentioned are likely to comply, and under which the detection of defaulters is so difficult as to be virtually impossible, would surely be contrary to public policy. Such a law would indeed rapidly fall into disrepute through the inertia of even the well-intentioned.

So far as the banks and their nominee companies are concerned, the nominee proposals of the Bill as drafted raise no special point of principle or serious administrative difficulty; but the intricacies and technicalities of the subject are such that personally I believe it would be wise to recognise that the attempt to secure effective universal disclosure, buttressed as it must be by complicated measures to ensure enforcement, would impose upon the companies and the public labour and inconvenience wholly incommensurate with any advantage gained.

One other point: may it not be that the proposals would have far-reaching results abroad, in so far as obligations are to be placed upon foreign owners which may be resented, and which might lead, in some quarters of the globe, to retaliatory legislation of a severe character?

2½% GOVERNMENT BORROWING

Mention has already been made of the unexpectedly large increase in our deposits. I feel bound to make some further reference to this phenomenon because I do not think it can be regarded as being entirely unconnected with the reduction to 2½ per cent. of the rate for long-term Government borrowing.

With a national debt of the present size a reasonably low interest rate is essential if the current burden is to be tolerable, and if the inflationary dangers of large budget deficits are to be avoided. At the same time, particularly when taxation on the modern scale is operating concurrently to reduce still further the return from savings, regard must be had to the effect on national habits of thrift. Individual saving has still a role to play as a source of capital for enterprise, and thrift is valuable for that reason to the whole body politic as well as to the individual saver. But at the present moment it plays an even more vital part in mitigating the pressure on the various physical controls which are still the necessary bulwarks against the perils of a purchasing power greatly in excess of the volume of purchasable goods. Thanks to the good sense and discipline of our people, such controls have been more effective in this country than in any other country in the world. For this very reason it is undesirable to subject them to undue strain or to prolong indefinitely the period of their continuance. It is no doubt within

the power of the Chancellor of the Exchequer to reduce the long-term rate still further, if he is prepared to increase the proportion of floating to total debt. What is to happen in these respects will no doubt be revealed to us during the next twelve months. Meantime, perhaps I may be permitted to express the view that on balance the reduction in rate has gone as far as is consistent with the maintenance of that wholesome relation between spending and saving which, together with increased productivity, is vital to the restoration of our economic health.

STAFF COLLEGE

Turning again to domestic matters, I would like to mention a new departure which we are making this year, and which we believe will be of great benefit to the staff and to the Bank. We are establishing a training college for our staff, and for this purpose we have acquired a freehold mansion, standing in its own grounds of about thirty acres, known as Eyhurst Court, Kingswood, Surrey. We intend in the first instance to concentrate on a course for men of about 40 years of age who through war service, have lost some valuable banking experience and training. Thereafter our basic scheme will include two courses—a junior course and a senior course. Accommodation is available for some forty to fifty students as residents, as well as the residential staff. There are suitable lecture rooms and facilities for recreation. We believe that the courses which we propose to hold will widen the outlook of our future officials and will help to equip them for managerial and other responsible posts.

STAFF

During 1946 the demobilisation of our permanent staff has to all intents and purposes been completed. Less than one hundred of our permanent men and women remain in the Forces. The resettlement has been carried out satisfactorily in spite of the many difficult problems involved, chief among which is the housing shortage. We are by no means satisfied with the distribution of our staff, and both from the Bank's point of view and that of the staff a big adjustment is overdue; but until the housing situation is very considerably easier there are many moves which it is impossible to carry out without the parting of families and consequent discomfort, which neither the staff nor the Bank are anxious to face unless absolutely necessary.

Our returned men and women have settled down well and by their application and determination to resume their interrupted careers have earned excellent reports. We still have a large temporary staff, and active steps are in preparation to give a number of these permanent status. Without their work often carried out in dangerous and trying circumstances, the Bank could not have carried on as it did.

I desire once again to pay a tribute to the work of our whole staff, both permanent and temporary, men and women alike; from the Chief General Managers to the humblest messenger they form a grand team united in their devotion to the service of the Bank and through the Bank to the service of the shareholders and of the public.

NOTICES

WILLIAM R. WARNER & CO., LTD., Power Road, W.4, require an assistant to the Export Manager. Good education and initiative essential. Desiderata: experience import-export procedure, advertising, accounts and statistics, overseas correspondence, knowledge of foreign languages, particularly French; trade marks, contracts; pharmaceuticals and cosmetics. Age about 30. Starting salary £400-£450.

ADMINISTRATIVE or Executive position, or one leading thereto, required by Chartered Accountant, aged 39, Member I.I.A., with extensive experience in management control of production, materials, selling, personnel, etc.; all modern systems, investigations and reorganisations. Over £1,000 p.a. earned since 1942.—Write: Box 398.

SALES MANAGER, experienced Home and Export Markets, General Management, Buying, Licence Negotiations. Proven capability in building and creating business.—Box 404.

URGENTLY WANTED by Market Research Department, "Scientific Investment," by Parkinson.—Write Box 405.

BARRISTER (30), Honours Graduate, formerly Secretary of a National Organisation, now Secretary of a Merchants-Shippers' Company, seeks interesting position. Possessing wide administrative experience, sound knowledge of economics, fluent French/German, widely travelled. Present emoluments £1,600 p.a., but material aspect secondary.—Box 406.

BANK EXECUTIVE, shortly retiring, disliking prospect of inactivity, would welcome opportunity for part-time appointment where wide experience of financial affairs and extensive contacts in Britain and Overseas would prove valuable.—Write Box 407.

UNIVERSITY GRADUATE, qualified Accountant (40), wide experience as Secretary to Industrial Associations, seeks responsible position.—Box 408.

Companies Bill in Committee

On Tuesday the House of Lords began their hearing on the Committee stage of the Companies Bill and succeeded in dealing with the first 13 clauses on which no fewer than 56 amendments were called. An attempt by Lord Maugham to limit the penalties in connection with accounts and auditing to wilful and knowing contravention of the provisions was answered by the Lord Chancellor by the point that a man who was neglectful and failed to carry out the duties imposed upon him by the Act should not be able to get away with his neglect, though he promised to look into the matter further. Lord Maugham also sought to make changes in the rights given to proxies under the Bill to speak at meetings, and the Lord Chancellor was prepared to meet him to the extent that the right should be given in the case of private companies but not in the case of public companies, though he accepted the amendment dealing with part of Clause 5 under which originally provided the proxies could not vote both for and against a resolution. Clearly some proxies would have to attend meetings of public companies prepared to act in opposite directions and, if allowed to speak, to talk with two voices. The present position appears to be that they will retain their right to vote according to instructions of the legal shareholders but may only do so in silence. An amendment was agreed to which provides directors with discretion about the preparation of consolidated accounts which under the Bill have to be prepared as at the same date as those of the parent company. This provision would have involved difficulties for overseas subsidiaries where, unless the presentation of consolidated accounts is to be greatly delayed, it would have been impossible in many cases to make the dates agree. This is a difficulty which is, after all, familiar to accountants and in the past it has not been an impossible matter to make an adjustment in the consolidated accounts to cover the gap in the accounting dates of the subsidiary and parent.

The Lord Chancellor moved an amendment to change the definition of the word "subsidiary." Under the Bill the old doctrine of majority voting power is the crucial test; under the amendment, power to secure appointment of directors is to be the test. This recognition that a Company may, in all practical effect, be a subsidiary even though, from a strictly legal point of view, it is not majority controlled, is welcome. The consequence of such a move as that recently announced by the British American Tobacco Company to "shed" the Tobacco Securities as a subsidiary by reducing its voting power below 50 per cent but retaining its share in the equity had reasoning behind it. On the other hand, it would clearly have rocked the entire foundation of the new Companies Act if there had been any conflict between the legal definition and the practical meaning of a subsidiary.

New Wage Demands

There is a touch of grim irony in a week which has produced nearly 2,000,000 unemployed and queues at the labour exchanges together with further demands for higher wages and shorter hours. The full force of the coal shortage on employment has fortuitously coincided with a court of enquiry recommendation for a shorter working week in shipbuilding, demands for increased wages and shorter hours from railway workers and the submission of the building workers' demands for higher wages to arbitration.

In shipbuilding, a court of enquiry has published its report on the workers' claim for a 44-hour 5-day week. Taking as their starting point the long-established connection between shipbuilding and engineering, where the principle of the 5-day week has already been admitted, the Court have recommended for shipbuilding a 44-hour 5-day week from March to October and a 44-hour 5½-day week from November to February. This 5½-day week during the winter recognises the industry's need for daylight working, especially on the ship-repairing side where harbour dues will have to be paid over idle week-ends. The recommendations apply only to hours, and their effect on wages and production has still to be negotiated and worked out. But one immediate consequence of shortening the working week would certainly be to increase the congestion in the dockyards of shipping tonnage awaiting repair and reconversion.

The possibility of further dislocation and higher costs in transport is raised by the demand this week by the three railway unions—encouraged perhaps by Mr. Dalton's publicity about the £17½ million "profit" on nationalisation—for an all round increase in wages of £1 per week and shorter working hours. Taken by itself, this further increase in wage demands after a consolidation of wartime gains would be serious enough, for it must inevitably raise transport costs and give incentive to other

workers to hold out for increases. It has occurred at the same time as the building industry dispute has gone to arbitration. A double shock to the wages structure would result if both increases were granted and it might well encourage a general demand for wage advances at a time when the industrial system will be struggling to recover from the first effects of the coal crisis. The arbitration findings in the building industry dispute will consequently be awaited with something more than interest, not only for their effect on housing costs but also on the entire wages structure of industry.

These wages and hours demands may well create critical problems at a number of key points once industrial production begins to recover. Their potentialities certainly dwarf the progress in labour relations this week symbolised by the abolition of the Furniture Manufacturing Wages Council and the recommendations of the Café Wages Board for a 47-hour week, holidays with pay and overtime rates for unlicensed premises.

Australian Loan Silence

After the considerable comment which was aroused by the silence of the Australian authorities last year about the results of the Conversion operation in June, it is more than a little surprising that the Commonwealth authorities should be content with the announcement that they regard the result of the conversion offer made last month to holders of £18½ million of Commonwealth 4 per cent and Western Australia 3½ per cent stocks as "satisfactory." Once again, the results of the cash and conversion offers have not been published, though there appears to be at least indirect evidence that the cash applications were allotted in full.

It is difficult to perceive the logic of this reluctance to give information which is clearly required if a fair market is to be made in the new stock on the London Stock Exchange. Silence breeds uncertainty about the hands in which the new stock is held; the opening dealings indicated this uncertainty only too clearly, for the stock rose from a small discount to a quite useful premium. It is surely desirable that all uncertainty should be cleared up by the Australian authorities who, after all, should not be unwilling to follow the established practice in the London market of disclosing the results of the new issues.

Issuing Houses and "Stags"

The first annual report of the Issuing Houses Association suggests that, after a rather halting start, the Association has been able to settle down to some useful work. Its membership has been extended and generalised, so that 52 companies and firms are now members, including practically every issuing house in the country. The Association was born after consultation with the Bank of England; that link has been maintained and strengthened—the Executive Committee have had close touch with the Bank of England and have always found the Governor and Deputy Governor very helpful. The Executive have also established the principle that their contacts with the National Investment Council and the Capital Issues Committee should be covered through their normal contact with the Bank.

As for the work of the past year, the Issuing Houses Association added its voice to those of other investment bodies in representations to the Chancellor of the Exchequer regarding his statement in the House of Commons last March about Japanese bonds. It has also discussed with the Council of the Stock Exchange a variety of questions such as placings versus public issues, and the desirability of bi-weekly meetings of the New Issues Committee. And the new Companies Bill has been under the consideration of a sub-committee. The problem of the "stag" has, of course, a particular relevance for the Association. Clause 48 of the new Bill is framed to deal "with the more objectionable type of stag" and is considered adequate for this purpose. But the Association is also keeping under review "the more complicated issue of dealing with the stag who is prepared to accept allotment with the intention of selling his shares immediately thereafter."

These questions of "staggering" are always difficult in periods of new issue activity. But to seek, as the Association post-allotment speculator will scarcely diminish them. Where is the line to be drawn? Does an allottee who sells after a moment's initial speculation of this type play an important part in establishing a rational market and a firm investment basis for the

The Association acknowledges that this is a complicated problem, and its examination of the problem is likely to be prolonged before a solution—if one exists—is discovered.

Chinese Currency Chaos

The prospect of continuing, and perhaps intensified, political instability and civil war in China has not failed to affect the exchange position of the Chinese dollar. For some weeks past the black-market rates quoted in China for gold, dollars and sterling have been rising steadily, but the movement until this week was at least retarded by the official policy of offering gold in the black market. The amount in question has always been insufficient to satisfy the voracious appetite of the market, which is being fed by the ever-increasing inflation of the domestic currency. This type of intervention in the market is always bound to be extremely expensive in terms of the results which it achieves, especially when applied in China, where it can safely be assumed that a good deal of the gold will find its way into channels for which it was least intended.

The futility of this endeavour to mop up inflation by gold sales has now been realised, and this week the Central Bank of China withdrew from the black market in gold. The result, of course, has been to accelerate the depreciation of the Chinese dollar as measured by prices offered for gold and foreign currencies. Gold bars which were quoted at 676,000 Chinese national dollars per ounce at the beginning of the week, jumped to 920,000 dollars in one day. Similarly, the rate for the US dollar rose from 13,500 to 18,000 Chinese dollars, and that for sterling from 43,000 to 53,000 Chinese dollars. There has since been some recovery from these panic prices—gold fell to 700,000 dollars on Wednesday. But since the fiscal machinery of the Central Government is still largely paralysed while its expenditure, military and civil, is steadily expanding, the sources of the inflationary flood are gushing more strongly than ever.

It is difficult, indeed, to avoid the conclusion that the present Chinese dollar is sliding to complete collapse. The Chinese authorities are still toying with a situation which appears to be sweeping beyond their control. As an example of the type of remedial measure now being suggested in Nanking is the recommendation which comes from the legislative Yuan that in order to meet the present crisis "all gold bars should become Government owned, transactions in gold should be halted, foreign currency transactions should be prohibited, and the black market should be wiped out." This is indeed attempting to cure a raging fever by removing the thermometer.

Exchange Control in India

The Indian Central Legislative Assembly has this week passed a finance bill which in some respects is the counterpart of the Exchange Control Bill introduced in Britain recently. It gives permanent statutory form to the war-time mechanism of exchange control in India which was closely modelled on the British system. Explaining the bill, the Finance Member said that it gave the Government wide and discretionary powers which, however, would be wielded with the general objective of allowing nearly all transactions of a current nature, subject to certain restrictions

designed to ensure that capital was not being transferred in the guise of current payments. In addition, the Government intended to allow moderate transfers of capital where these were required for trade purposes such as the establishment of overseas branches of Indian trading firms and banking and insurance operations. It is the intention of the Indian Government to continue the licensing of imports but to provide exchange freely for duly licensed operations. Foreign exchange will be provided for the transfer of profits, interest and commissions to persons resident outside India. The Finance Member also pointed out that persons leaving India would be allowed to transfer Provident Fund balances and savings up to certain limits.

The main contrast between the Indian and the British exchange control measures is that the former omits any schedule of territories within which exchange control will not apply. This does not imply that India will in future operate exchange control *vis-à-vis* other countries in the sterling area. The decision, according to the Finance Member, was made because in view of India's new status "it was not desirable to include in the new Act a schedule of territories to which exchange control restrictions would not apply, as this might give the impression that India wished to continue permanently the system of pooling her foreign exchange, which is a feature of the present sterling area arrangements." Powers are given to the Reserve Bank under the bill to exclude specified currencies and payments from restrictions, by the issue of notifications, and by virtue of these powers the Reserve Bank will be able to continue arrangements under which transfers to the United Kingdom and other sterling area countries will be allowed without restrictions. The Indian Government's policy, according to the Finance Member, is to achieve multilateral convertibility of all currencies, including the rupee, as soon as possible, and to confine restrictions to those necessary to ensure the control and regulation of capital movements.

In an earlier statement in the Legislative Assembly, the Finance Member gave interesting information about the extent to which India's sterling balances during the war were increased as the result of the pooling of her dollar earnings, and, conversely, of the net expenditure of dollars by India in more recent months. Between 1939 and March, 1946, India's balance of payments with hard currency countries was in the aggregate favourable to the extent of 1,140 million rupees, or £85½ million, and this net amount was contributed to the sterling pool against payment in sterling to India. Between April and September, 1946, however, the position changed, and the balance of payments with hard currency countries had been unfavourable to the extent of 210 million rupees, or £16 million.

Low Cotton Supplies

During the war years, world cotton production ran considerably below the 1935-39 average of 30,875,000 bales. The output of all the main suppliers shared this declining trend, but since world consumption was also reduced stocks began to accumulate. At the beginning of the 1946-47 season, world stocks were estimated at 23.7 million bales compared with 23.5 million bales on August 1, 1939. Production for the current year is calculated to amount to 22,050,000 bales, which would represent an increase of 8 per cent over the very low output of 1945-46. Consumption in Europe is expected to increase by 3½ million bales during the current season while in the United States it will probably be

WELFARE AND PLANNING IN THE WEST INDIES

By T. S. SIMEX

15s. net

Recent developments in many parts of the Colonial Empire, particularly in the Caribbean, in Africa, and in Malaya, have given the subject of colonial administration a new importance. This book is based on the author's personal experience of social problems and administration acquired during three years of work in the West Indies as Social Welfare Adviser on the staff of West Indies Development and Welfare. His conclusions are his own; they are in many respects novel, and he has not been deterred from discussing questions that have embarrassed others. He has compared the development and organization of social institutions there and in the West Indies.

Statistical Summary

GOVERNMENT RETURNS

For the week ended Jan. 18th, 1947, total ordinary revenue was £98,750,000, against ordinary expenditure of £59,210,000, and issues to sinking funds £410,000. Thus, including sinking fund allocations of £11,955,356, the deficit accrued since April 1st is £523,457,356 against £2,098,159,825 for the corresponding period a year ago.

ORDINARY AND SELF-BALANCING REVENUE AND EXPENDITURE

On Jan. 17 applications for bills to be paid on Monday were accepted in full at £99 17s. 7d. and above. Applications at £99 17s. 6d. for bills to be paid on Tuesday, Wednesday, Thursday, Friday and Saturday were accepted as to about 51 per cent. of the amount applied for and applications at higher prices were accepted in full. £160 million (maximum) of Treasury Bills are being offered for Jan. 17. For the week ended Jan. 25 the Banks will not be asked for Treasury deposits.

GOLD AND SILVER

The Bank of England's Official buying price for gold remained at 172s. 3d. per fine ounce throughout the week. In the London silver market price per fine ounce was raised from 44d. to 55½d. on August 6th, 1946. The New York market price of silver changed to 70½ cents on January 20th, 1947. Bombay bullion prices were as follows:—

January 25, 1947

MARKET.—Money conditions at the end of last week of this week suggested that the position might be more comfortable than at any time since the new cash ratio week-end, funds immobilised on official accounts—transfers but also, apparently, in consequence of banks for their foreign exchange working balances—were returning, and on Saturday as well as avoided any recourse to the special buyer. There was a change in the floating debt position. There was money on Treasury deposit receipts, while maturities of (of which £23 million was held by clearing and compared with only £5½ million in the previous week. Treasury bill issue was underallotted by £5 million and thus fell correspondingly short of nominal market applications declined—this is evidenced both by

the Bank return and by the fall in total applications—and the market share therefore rose from 47 per cent. to the high figure of 51 per cent. Partly for this reason, and partly because of tax transfers, the easier condition of the short loan market proved shortlived. On Tuesday, when payments for the new bills began, money was in strong demand, although a release of money later just sufficed to balance the position. By Wednesday, when a hold-up of funds arising from the new issue activity was added to the other sources of pressure, an appreciable sum had to be obtained by sales to the authorities.

The Bank return shows that public balances are still quite high, and that the further large reflux of currency has been much more than offset by a reduction in the Bank's security portfolios. Bankers' balances have therefore dropped by £10 million to £288½ million which by the new cash standards looks a distinctly low figure. If the pressure continues, the banks will certainly lean to work closer to 8 per cent. than they did at the year-end, when the average ratio was nearer 9 per cent.

lightly lower than last year's figure. A prospective demand of 26½ million bales during 1946-47 seems possible, and on this basis the potential end-of-season stock on July 31, 1947, would amount to about 19½ million bales.

Looking ahead beyond this year, there appears, therefore, to be some likelihood of a shortage of raw cotton supplies unless production expands. The International Cotton Advisory Committee which was set up in Washington in September, 1939, was originally intended to regulate world cotton production. In April, 1945, the Committee's functions were expanded. The main cotton importing countries were invited to join and a sufficient number have responded to make the organisation adequately representative of both producers and consumers. The original policy of restriction of production has doubtless been shelved and it is to be hoped that, in its place, an expansionist programme will be substituted. World shortages are more undesirable than world surpluses and the committee will perform a valuable function if it can encourage an expansion in production of cotton to bring it into closer relation with demand.

* * *

Dearth of Timber

The problem of British timber supplies was raised last week in Parliament. It has been said, with scarcely a touch of exaggeration, that the present shortage of supplies is so serious that it may endanger the housing programme and threaten widespread unemployment in the furniture industry. At present there are scarcely any accumulated stocks of softwood in this country, and total supplies in 1946 amounted to only 800,000 standards available for all purposes. Before the war, the trade normally had a million standards in reserve. Since 1929 there has been a serious decline in the world supplies of soft timber. In that year, world exports amounted to nearly 6 million standards; by 1934-38 they had shrunk to 4½ million standards, and in 1946 they amounted to only 2 million standards. Pre-war imports into the United Kingdom amounted to 2½ million standards; last year they totalled less than one million.

The main difficulties in obtaining increased supplies are only too familiar. Exporting countries would be able to send more if Britain were able to supply complementary commodities in exchange. Thus, unless Sweden can get coal, timber has to be used as fuel; Finland requires iron and steel in order to get her communications working before felling can be increased. Further, it has not been possible to purchase any supplies from Roumania, Yugoslavia and the USSR. Small quantities, however, are being bought in the United States, Czechoslovakia and Austria, while the Timber Controller has gone to Canada to buy as much as he can get. Even with the reduction of timber to 1.6 standards per house, the present supply is unlikely to be adequate for this year's programme of 300,000 houses. To cover the gap, forests are being worked in Germany in order to produce timber of housing size. In 1946, 55,000 standards were obtained from this source, and considerably increased quantities are expected in the current year. The dearth of wooden railway sleepers has forced the companies to start using reinforced concrete and steel alternatives on a limited scale.

The position of hardwoods, plywood and veneers is, perhaps, worse. Before the war, there was little home-produced hardwood, whereas in the last two or three years it formed the major proportion of the United Kingdom's supplies, and output is now declining. The level of imports is very low and the situation for the furniture industry has become increasingly difficult. New and unfamiliar timbers are being tried, but the supply situation is unlikely to improve for some time. In the context of a fuel crisis the difficult supply position in timber has been pushed into the background, but nevertheless it will remain to threaten the building and furniture industries for many months ahead.

* * *

—And Supplies from Russia

An announcement of the State Planning Commission in Moscow states that the Soviet timber industry has carried out its plan of output for 1946 to 98 per cent. It is certain that this figure understates the extent to which the timber industry has not fulfilled the plan. Indeed, after the Gopian statement was made, *Pravda* disclosed that timber production in 1946 had fallen short by 9 million cubic metres. Since the total timber output for 1946 could not possibly have been planned at some 450 million cubic metres (the average annual output before the war was about 200 million cubic metres) the percentage of non-fulfilment must have been considerably higher. The deficit of 9 million cubic metres is

significant—the average annual export of timber from Russia in the last pre-war decade was about 10 million cubic metres.

Several reasons account for this unsatisfactory state of affairs in the timber industry. There is the chronic shortage of labour—only half of the plan for the recruitment of labour has been carried out. Output per man has been about 20 per cent below the established norms. If it is assumed that the year's plan aimed at something like the average pre-war output, then the deficit of labour and the lower productivity must have resulted at best in the cutting of only about 100 million cubic metres last year. The progress in the mechanisation of timber cutting is also reported to have been delayed. This reduced output sets the scene for the conflicting claims of the Ministry of Foreign Trade for export timber and of the various housing authorities and industries for domestic use. The Five-Year Plan provides for the building of houses at a rate twice as high as the pre-war rate—which is not too high in view of the destruction of 6 million buildings and of the very high proportion of wooden houses and farm buildings in Russia.

Another formidable stumbling block to expansion of output and export is transport. There is a shortage of rolling stock, of lorries and of all forms of fuel, especially of petrol. The Five-Year Plan provides for further mechanisation of transport as well as of output and for the building of ten thousand miles of rail and motor haulage roads. But it is difficult to say just when the execution of the plan will come into full swing. Until that happens, timber is likely to be allocated for export rather sparingly, unless there are strong inducements to a different policy. Import of machinery from abroad might, for instance, speed up an increase in the output of timber; and it is conceivable that to achieve this, higher allocations for exports might be made at the expense of domestic needs. The Five-Year Plan puts the demand of the timber industry for machines—a demand expected to be met mainly by Soviet industries—at 40,000 electric saws, 12,000 tractors of various types, 470 narrow-gauge locomotives with flat cars, 14,000 trucks with trailers and the requisite number of bulldozers. Importing countries which could meet part at least of the machinery requirements would stand a correspondingly higher chance of getting timber from Russia.

* * *

Victoria Falls Power Expropriation

The South African Government announced on February 5th that the Electricity Supply Commission can acquire other electric power undertakings after a prescribed period and that action would be taken to expropriate the undertaking of Victoria Falls and Transvaal Power Company. The directors anticipate that they will receive two years' notice of expropriation at the end of 1948.

The company, which is incorporated in Southern Rhodesia, supplies electric power and compressed air to the majority of the Rand mines and to other users. It also manages plants for the Electricity Supply Commission. In the event of expropriation, the Commission would presumably acquire the supply service assets of the company on a going concern basis, and the "fair value" could in case of disagreement be determined by arbitration.

The capital structure of the Victoria Falls company is £2,000,000 in 6 per cent £1 preference shares, which participate for a further 4 per cent, and £2,500,000 in £1 ordinary shares, which received 19 per cent for 1945. The preference capital, which until recently benefited substantially from the operation of Dominion income tax relief, is repayable at 20s. In consequence the shares have fallen during the past week from 27s. to 24s. Some estimates have put the break-up value of the ordinary shares at £6—a calculation which has regard to the inner reserve element in the omnibus item of £8.3 million for creditors and taxation reserve. This item is more than counter-balanced by gilt-edged holdings of £8.8 million. The balance sheet itself disclosed a break-up value of no more than 36s. 10d. at the end of 1945, compared with the current price of the ordinary share of 117s. 6d.

Shorter Notes

The joint industrial council for the furniture trade has recommended a plan to help workers in the industry during the present period of reduced earnings. It is suggested that each worker should receive from his employer a loan equal to the amount he would have earned at the minimum time rate for those hours lost during the week. This loan is to be repaid within three months of the end of the present emergency by working extra time. Such a plan has indeed much to commend it and merits consideration by all industries on a national scale. The important point about it is not that it secures the maintenance of incomes during the "shut-down" period, but that it

(Continued on page 303)

*Bombay**

—is today one of the finest cities in the world. Guide books deal faithfully with its architectural features, amenities and historical associations, but largely ignore those "monuments" to engineering enterprise and achievement, the "essential services." Yet the fact is that these services—power, light, water, transport, etc.—are the essential background of this great city: just as BTH is—and for the past fifty years has been—the essential background to many important engineering achievements in scores of big towns the world over.

*BTH supplied the electrical equipment of the entire rolling stock of the Bombay suburban line of the Bombay, Baroda and Central India Railway—including the traction motors and control and auxiliary gear, while Mazda lamps provide much of Bombay's lighting.

BTH RUGBY
THE BRITISH THOMSON-HOUSTON COMPANY LIMITED, RUGBY, ENGLAND

Equipment of an Industry

In the course of its daily work in the service of the community the British chemical industry uses a greater variety of apparatus than any other. This is not surprising since the function of the chemical industry is to help all other industries. Apparatus is needed in the laboratories where research is carried on and the discoveries are made; in the experimental plants where these are tried out; and then in the factories where they are eventually turned over to commercial production. Chemistry is taught in schools and universities, often in well-equipped laboratories, but little is known of the equipment by means of which academic knowledge is harnessed to practical research and production. This series of announcements under the title "Equipment of an Industry" is designed to show some of the instruments and machinery which are used and operated by the men and women of Britain's chemical industry in laboratory and workshop.

The Stalin Gambit

WHEN Mr Bevin told his radio audience on December 22nd that Britain "does not tie herself to anybody" he was doubtless trying to appease the Labour rebels who said, and still say, that Britain has in fact been tied to America. For any other purpose the statement was misleading. Britain is, by treaty, explicitly and closely tied to Turkey, to Iraq, to Egypt, to Portugal; the rope thrown by M. Blum has been caught and the first loop is being made. Not for the first time, the Foreign Secretary has found that sweeping honest-to-goodness statements about British policy may be misunderstood. True, this particular phrase was followed by the qualification "except in regard to her obligations under the Charter"; but that only made matters worse. For the juxtaposition was bound to put ideas into the head of anyone in Moscow who was either looking for trouble, or merely looking up the terms of the Anglo-Soviet Alliance of May, 1942, as part of the briefing for Field-Marshal Montgomery's visit. Article IV of that instrument looks forward to a time when both governments will have adopted "proposals for common action to preserve peace and resist aggression in the post-war period," and will then recognise "by mutual agreement" that special undertakings to help one another against fresh aggression by Germany and its associates have become unnecessary.

The conversations that have already begun through the new Soviet Ambassador in London, Mr Zarubin, should, in fact, be given an objective at once wider and more restricted—wider in space and more restricted in time—than Mr Bevin's proposal of an extension of the present alliance from twenty to fifty years. No British Government can commit the country to any very specific obligations so far ahead, save under the Charter of Uno. In the present state of Anglo-Soviet relations, such a proposal lacks seriousness. What is far more important is that the Soviet Government should be persuaded that these talks should lead up to a patient and wide-ranging survey of relations over areas not covered by existing agreements; for example, the eastern Mediterranean and the Middle East—where there is a gap in the Soviet *cordon sanitaire* and where British military commitments are at least as costly as they are likely to be in Europe. This is not to suggest that it is primarily the British fault that no such general talks have taken place since Potsdam. There has certainly been little sign in the last eighteen months that particular value was attached in Moscow to the British alliance; nor has there been much disposition to observe the spirit of the much neglected Articles V and VI, which pledge the governments to "close and friendly collaboration . . . for the organisation of security and economic prosperity in Europe" and to "all possible" mutual economic assistance. In fact, until Mr Stalin made his gruff gesture of conciliation last week, there was no prospect ahead save running actions of bitterness over Austria, Germany, atomic energy, culminating in a long wrangle over the Far Eastern situation in 1948. Against such a background, European dogged by suspicions: suspicion in Moscow that

THE TIMES

REVIEW OF INDUSTRY

A new and essential Aid to British firms and their agents abroad

A NEW publication—*The Times Review of Industry*—designed to meet the new conditions of home and international trading, will appear in February. Incorporating the long-famous monthly, *The Times Trade and Engineering*, this latest publication of The Times is an essential aid for all leaders and technicians whose everyday activities must take account of the growing union everywhere between industry, science and government.

With an increased number of pages, a smaller and more convenient format, and a cover in full colour, *The Times Review of Industry* is sub-divided into five main sections: editorial notes with special stress on commercial practices and factory problems; technical issues and innovations; review of progress and developments on home industries; commerce and industry abroad, as affecting the British exporter; and last, world industrial finance, with the position and prospects in the principal commodity markets.

Because of the many illustrations, including charts, diagrams and technical drawings, as well as the large number of

advertisements of representative British firms, *The Times Review of Industry* will be particularly valuable to the overseas branches and agents of British firms. Even slight knowledge of English need not debar the foreign reader from keeping in touch, through its pages, with major developments and trends.

For readers in all English-speaking countries—and especially in North America—*The Times Review of Industry* will provide an accurate month-by-month check on economic reconstruction in Britain and expansion of exports. This is of more than academic interest, for the resultant restoration of British purchasing power will offer prospects to overseas producers once again to sell to the world's greatest importing country.

The authoritative and progressive reporting and reviewing that is the hall-mark of every publication bearing the imprint of The Times will, it is hoped, quickly establish *The Times Review of Industry* as the most complete—and most useful—industrial periodical of its kind, not only in Britain, but in the world.

Published February—1/- per copy

or, by annual subscription, 15/- post free in Great Britain and abroad (except Canada, 13/6). Subscriptions in most overseas countries can be arranged in local currencies.

COMPANY MEETINGS

BRITISH-AMERICAN TOBACCO COMPANY, LIMITED

FACTORS AFFECTING FUTURE RESULTS

MR GRAY MILLER'S REVIEW

The forty-fourth annual general meeting of this company was held, on the 7th instant, in London, Mr Gray Miller (the chairman) presiding.

The chairman, in the course of his speech, after dealing with various items in the balance sheet, said:—This brings me to the profit and loss account. "Trading profit, dividends and interest for the year" is arrived at after deduction of all charges and expenses for management, etc., with the exception of depreciation and amortisation, which is shown separately on the other side. You will note that the figure in respect of the year to September 30, 1946, shows a small decrease of £142,507 in comparison with the previous year's figure. United Kingdom taxation—both excess profits tax and income-tax—has also been separately shown. In the case of excess profits tax, there is a decrease of £3,034,382 at £3,887,000, as against the comparable figure of £6,921,382 last year. The principal reason for this decrease lies in the reduced rate of excess profits tax operative during the year under review.

Income tax at £3,557,918 shows an increase over last year's £2,069,654 of £1,488,264. This is the natural result of the position referred to in my remarks regarding excess profits tax; in other words, the reduction in the charge for excess profits tax automatically increases the charge for income tax and you will find that 9s. in the £, calculated on the decrease of £3,034,382 in the excess profits tax charge, accounts for practically the entire increase in the income tax charge. The segregation of these taxation figures explains very clearly why the net profit of £4,975,470 shows an increase of £1,397,109 over last year's figure of £3,578,361.

INCREASED FINAL DIVIDEND

The carry forward last year was £2,571,590, to which must be added the profit for the year as previously mentioned of £4,975,470, less the dividend on the five per cent. preference stock of £225,000; on the six per cent. preference stock of £360,000; and the two interim dividends paid during the year on the ordinary stock amounting to £2,177,795, leaving a disposable balance of £4,784,265.

Out of this amount, the directors recommend the distribution on March 31st next of a final dividend (free of United Kingdom income tax) on the issued ordinary stock of one shilling per £1 of stock, amounting to £1,187,888, the allocation of £400,000 to "general reserve," and of £150,000 to the employees' benevolent fund, leaving £3,046,377 to be carried forward.

You will recall that in announcing the interim dividend paid in September last, we explained that the increase from 10d. to 1s. had been made possible by the reduction in taxation and in my speech last year I stated that we thought it right that the ordinary stockholders, who have suffered in the past from increases in the rate of tax, should benefit at the earliest possible moment from a reduction in the rate. I feel sure you will agree that the accounts now before you justify the increased final dividend which your directors recommend, as being in line with that policy while not conflicting with the equally justifiable policy of conserving your company's resources.

The prospects of the company returning to its offices at Westminster House, which are still occupied by the Ministry of Fuel and Power, unfortunately do not seem any brighter than they were last year.

CONDITIONS ESSENTIAL FOR SUCCESS

Let me say, in conclusion, that I am reasonably optimistic about the future of your company, the success of which, however, becomes more and more dependent on world economic conditions, over which we have no control. In assessing prospects, it may be relevant to state that the accounts now under review do not, to any important extent, reflect a resumption of profitable trading in Far Eastern territories formerly occupied by the enemy. Our companies in those areas are operating, but still only to a limited extent, and it may be some time before conditions are such that business can be resumed on the former scale.

I must apologise for the short notice you have had of the meeting. The reason is that I am sailing next week for the United States, and I wanted to preside at this meeting before I left.

I now beg formally to move the adoption of the report and balance sheet for the year ended September 30, 1946, including the payment on March 31st next of a final dividend (free of United Kingdom income tax) on the issued ordinary stock of 1s. per £1 of stock and the transfer to general reserve of £400,000 and to employees' benevolent fund of £150,000.

I may also mention that the directors have declared for the year 1946-47 an interim dividend of 1s. per £1 of stock (free of United Kingdom income tax) also payable on March 31st next, so that the ordinary stockholders will receive on that date 2s. per £1 of stock. I will now ask Mr Gough to second the resolution and when that has been done, if there are any questions to be put or comments to be made on the accounts, it will be a convenient time to do so.

Mr H. R. Gough (a deputy chairman) seconded the resolution and it was carried unanimously.

F. W. WOOLWORTH AND COMPANY, LIMITED

COMPANY'S BEST SHOWING

The thirty-eighth annual ordinary general meeting of F. W. Woolworth and Company, Limited, will be held in London on the 21st instant.

The following is an extract from the statement by Mr W. L. Stephenson, the chairman, circulated with the report and accounts:—

The directors' report for the year ended December 31, 1946, has, I trust, given satisfaction. It is the best showing the company has produced in its 38 years' existence. A year ago I ventured to predict that for 1946 there could be expected a better supply of improved merchandise and a great increase in the return of Woolworth men engaged in the Services. This is exactly what has happened, although I am not going to suggest that the supply position is approaching normal.

INCREASED TRADING PROFIT

The trading profit is a handsome increase over that of 1945. This can be ascribed to two great factors, substantially larger volume of sales and improved operation.

We are still very far from free supplies of goods to meet consumer requirements. We have as yet made no progress in bringing the physical part of our branch stores to their proper condition, but we have been in the fortunate position of greatly improving the work of operating the company's business.

The accounts disclose a profit for the year 1946 of £9,148,357, an increase of £1,898,909 or 26.19 per cent. over that of the much improved year 1945. The final dividend on the ordinary stock is recommended at 1s. 97d. per unit and a cash bonus of 1s. per unit, making a total distribution for the year of 3s. 6d.

THE GENERAL MORTGAGE BANK OF PALESTINE, LIMITED

DIVIDEND OF 6 PER CENT

The twenty-fifth annual general meeting of this Bank was held, on the 9th instant, at the Bank's offices, at Tel-Aviv.

The chairman, Mr S. Hoofien, explained that, in consultation with the auditors, the directors had reframed the balance sheet so as to make it conform to the requirements of the Cohen Committee. The item "Loans on Mortgage" had increased by £P1,100,000 in spite of repayments to an amount of £P300,000. This latter item included £P180,000, representing repayments in advance of maturity, the lowest for several years. It would appear from this fact that the borrowers' abnormal liquidity was now decreasing. The net increase in the outstanding balance of Loans on Mortgage was the largest on record.

The directors had for several years, at a fairly heavy sacrifice, kept an exceptionally large cash balance; this policy had now justified itself, inasmuch as it had enabled the Bank to commit itself to a much larger amount of loans than otherwise would have been possible with the reduced demand for the Bank's debentures, owing to the flow of available funds towards investment in industry and commerce.

Circulation of debentures had increased by £P400,000. Whilst this amount compared very favourably, not only with recent war years, but even with such prosperous pre-war years as 1937 and 1938, it was still regrettably low in comparison with the needs of the Bank's borrowers.

The report and accounts were unanimously approved.

A dividend of 6 per cent. on both the ordinary and the preference shares was proposed and approved.

ORIENT STEAM NAVIGATION COMPANY, LIMITED

BIGGER AND FASTER SHIPS NECESSARY

The forty-seventh ordinary general meeting of this company was held, on the 7th instant, at No. 7 Bishopsgate, Mr J. C. Geddes (the chairman) presiding.

The chairman, in the course of his speech, said:—The net balance for the year was £148,825, after making provision for depreciation and taxation. A dividend of 5 per cent. free of tax on the ordinary shares, was recommended, leaving a balance of £192,354 to be carried forward to next year's account. £429,575 has been paid towards the cost of "Orcares"; it had been hoped, at the time of ordering, this vessel would have been delivered by now. Construction, however, had been seriously delayed by shortage of material and labour and it was not now expected she would be in service before the middle of 1948.

He referred to the steep rise in building and running costs due to a general advance in wages, then too, more spacious living quarters were being provided for the crew, an increase in area of about 40 per cent. In "Orcares" this is equivalent to a loss of accommodation for about 200 Tourist passengers. In order to offset this loss in earning power this ship alone would have to secure additional net revenue amounting to more than £65,000 per annum. The broad solution lay in carrying more people in each ship and at a higher speed. To achieve both results, bigger and faster ships would have to be built. Into this problem the time taken to overhaul ships and to load and discharge cargo and stores also entered, increased delay in port was a dead loss and could only be paid for in additional freight and passage money.

Xm 56.04260

including the Ruhr—was being organised against the Soviet; suspicion in London that projects of economic co-operation in Europe would be wrecked by Communist criticism and non-co-operation; suspicion in Washington that loans to Europe would be used to establish Socialist dictatorships with their industries keyed to the Five Year Plan.

*

The cure of these suspicions cannot be tried in Europe alone; it has to be tried in the Middle East and the Far East as well. But it is in Europe, in Germany, that the inflammation is worst. It is conceivable that the Russians believe, as it is said the French believe, that Britain intends to rebuild a German state strong enough to restore the Balance of Power on the Continent. The only hard, acceptable assurance that the British have no such cunning and long-sighted intentions would be a long-term undertaking from them to take military action against a German Government which was breaking any of its treaty obligations. That is something Mr Bevin should not hesitate to give, if necessary before going to Moscow. But talks with the Russians should not end there. Having gone this long way to meet them, he should ask for similar assurances in different form that it is not their intention to encourage every left-wing organisation from the Dardanelles to the frontiers of India to act as advance guards of Soviet-Communist expansion. Such assurances cannot and should not come quickly; for they must be firm and far-reaching if they are to mean anything. Once secured, the way might be clear to discuss the form in which Soviet and British interests in that area could be best secured. Each government has clearly recognisable and vital interests along their respective fringes of this land-bridge. For their defence, each is tempted to push beyond the fringes outposts whose activity looks aggressive to the other side. The movement and the suspicion will continue so long as there is no firm mutual recognition of the vital interests and of the distance to be kept between them. Such agreement would be hard to get, but it would be worth trying.

If it is part of Mr Stalin's intention to draw the British aside from the Americans—and *Pravda* has almost boasted that it is—then he should see the advantages of not refusing to discuss the Middle East. There his policy has so far not created an Anglo-American front anything like that which faces him in Germany. There lie most of the military commitments which demand so much British money and man-power; and there, too, lie the most vulnerable approaches to both empires. Should he refuse discussion outright the voices which divide public support of Mr Bevin's policy would have to find a new tune. Should he procrastinate, so can Mr Bevin—over the alliance. Should he show interest, then there would be some hope of breaking the deadlocks which threaten Allied negotiations in Europe by negotiation and agreement elsewhere, with Britain in the Middle East and with America in the Far East. For it is now clear that negotiation of peace treaties settles everything except relations between the great Powers.

In any event, the reaction from Moscow was both prompt and enigmatic. First, there was an article in *Pravda*, in the usual hectoring style, deducing from Mr Bevin's words that Britain no longer had need of the Anglo-Soviet Alliance, and therefore leading in London to the suspicion that Moscow was about to denounce it. Lord Montgomery, returning from his visit to Moscow, is said to have reported that Mr Stalin was seriously concerned at this alleged new development in British policy. A Note is therefore hurriedly dispatched to say that Mr Bevin had not, of course, meant anything of the sort. And, finally, an answer comes from Mr Stalin saying that he will be delighted not only to maintain the Alliance but to extend it provided it is freed of the "reservations" that at present weaken it.

What is to be made of this curious succession of events? It is just possible to take them at their face value. It is just conceivable that the Russians did seriously think that Britain was about to abandon the Alliance. Has there not, after all, been a great deal of talk in Britain of the shortage of man-power and the need to reduce military commitments, coupled with repeated insistence that Uno is the only basis of British foreign policy? Might not this imply a decision to abandon what might eventually be the most onerous of all commitments, the promise to Russia to make war in Europe once again, in certain circumstances? In Moscow, where the unilateral revision of agreements is regarded as part of the technique of realist diplomacy, this may just conceivably have seemed to be the correct interpretation of Mr Bevin's words, *Pravda* may have been rude only to be kind, simulating an unhappy misunderstanding in order to bring about a happy reconciliation, and Mr Stalin's reply of January 22nd may have been a genuine sigh of relief. On this interpretation, the whole incident is proof of a more friendly turn in Soviet policy, to be set alongside such other evidence as the sudden advocacy of disarmament, the strangely compliant acceptance of the anti-Russian turn in Persia and the series of reassuring interviews given by Mr Stalin himself.

But there is another interpretation, which is probably nearer to the truth. This is that the Kremlin saw in Mr Bevin's verbal slip an opportunity to drive a wedge between him and the new American Secretary of State. Mr Bevin, the argument would run, is under heavy fire from the "rebels" in his party (the Kremlin probably exaggerates the heaviness of the fire). He is already under the necessity of proving that he is not anti-Russian in his policy and is doing everything he can to maintain and restore friendship between Britain and Russia. Why not try to get him on the run by making it look as if he is breaking the Alliance? Why not, by this tactic, force him to make some real concessions to the Russian point of view and thus annoy the Americans? Why not, since the Alliance is, after all, an alliance against Germany, claim that it needs to be "extended" and purged of "reservations"—that is, suggest that the price for extension is a move by Britain, in the sphere of policy towards Germany, away from the present agreement with America towards agreement with Russia. And if all this can be done before the Moscow Conference has assembled, it may sow some seeds of suspicion in the Anglo-American camp. At least it was worth trying, and it may be thought in Moscow to have yielded rather more dividends than had been expected. It has, at any rate, brought from London an implied admission that Mr Bevin cannot, for domestic political reasons, do without the Alliance, which puts quite a powerful trump card into the Russian hand.

*

Fortunately, whichever interpretation is the correct one, the next British move ought to be much the same. Now that an extension of the Treaty, and the removal of its present limitations are on the agenda, the obvious British move is to attempt to extend it into other fields of British-Russian contact, in addition to Germany. An agreement made now to resist armed aggression by Germany in an unpredictable future is, after all, of very little relevance to the present day. An alliance, in an unscrupulous and suspicious world, is the nearest thing to a contract of good behaviour that one sovereign state can expect from another and where such alliances against Germany have been concluded by the Soviet as in Eastern Europe they are the outward and visible sign of much wider collaboration. Why not, therefore, try to extend the Anglo-Soviet Alliance, now that extension is in order, into a general understanding on all questions? If the Russians are genuinely anxious for friendship, they would respond. If they are indulging in a tactical bluff this is the way to call it.

Second Thoughts on Planning

IT is a pity that the second reading of the Town and Country Planning Bill should have been pervaded with an avoidable air of grievance. The Bill was published only three weeks ago and, as its Committee stage will presumably not be taken on the floor of the House, it will disappear from the limelight until the occasion of its final fleeting passage through the Commons. Yet exposure to the public gaze is precisely what the Bill most needs, and is capable of benefiting the Bill's friends quite as much as its enemies. One thing about the control of land use that should be clearly realised from the outset by the planners is that an informed and interested public opinion is the indispensable condition of good planning. After all, it is the public that is being planned—that is being sent to Crawley and Stevenage, that is being found work in this town and denied it in that, that is being provided with a national park in one hill area but forced to circumambulate a bombing range in another. Control over development of all sorts is to be exercised in the public interest. The first step should therefore surely be to discover what the ordinary citizen wants—and not merely to listen patiently, if he ventures to speak, but to encourage him to express his views. If this means revising administrative procedure, so much the better. It is time that departmental windows were opened to the fresh air. Happily Mr Silkin's speech gave every sign of recognizing these needs. Can his views now triumph over the bureaucratic mind?

The first of the Opposition's grounds for dividing the House on the second reading was that adequate time had not been given for the local authorities to express their views. The Opposition might have gone further, and pointed out that almost every individual local authority, landowner, builder and industrialist will be affected in some different and often unpredictable way by the Bill's marathon number of clauses. Even a competent and detailed two-hour speech from Mr Silkin is no substitute for reasoned consideration. He said himself that there was enough material for several Bills and several two-hour speeches. Why not then accord the material the respect it deserves? It is far from wise to enact too many measures whose full implications have not been gathered.

The subject-matter of the Bill falls naturally into two stages. The first stage is to unscramble the financial tangle of compensation and betterment. The second and consequential stage is to endow the state with new powers of positive planning. Although the debate centred on the Bill's financial provisions, this second stage is its positive and more satisfactory side. The chief interest in the new planning powers lies in the way in which they will in practice be administered.

The new local planning authorities, the counties and county boroughs, are given complete power to lay out their areas as they choose. They can, in effect, permit or prohibit building and rebuilding without having to worry about the financial consequences. Moreover, they can compulsorily acquire land themselves up to ten years in advance of actual need and erect on it any type of building, including shops and factories. The only check on their activities—and it is a big one—is that exercised by Government departments. Not only does the Minister of Town and Country Planning have the final say on any local scheme, but other Government departments, including the ubiquitous Service departments, cannot be restricted in their activities by the local planning authorities—except by agreement. But however the arms of the octopus disport with each other, the fact remains that every detail of physical development will be controlled, and a greatly increased part will actually be carried out by the public authorities. What vitally interests the citizen is along what lines this control

will be exercised. There need be no doubting that the new powers are adequate. But will they be used well or ill, with wisdom, dispatch and restraint, or with stupidity, tardiness and licence?

The Bill naturally cannot give the answer to these questions, but it should not be wholly silent. It does not contain enough evidence of willingness to invite co-operation and to hearken to objections from interested parties, voluntary societies and the general public. The great increase in planning activity which it promotes cannot operate smoothly for some time to come. The new administrative machinery has to be oiled. Large numbers of new town-planners have to be recruited and trained; indeed, figures given some time ago by Mr Silkin himself suggest that the numbers will have to be doubled or trebled. Moreover, they need to be trained in a new tradition, which will equip them to understand and mould the social and economic fabric of the nation and not just to lay down housing densities and building lines. All this takes time, and the three years which the local authorities are given to prepare development schemes is too short a period, especially since the Minister wisely insists that the local surveys should be careful and detailed and the plans fully aired in public. The planning authorities, central and local, are far from having either the experience or the staff to co-ordinate all types of land use efficiently and promptly. But Mr Silkin can turn this weakness to strength, if he is willing to admit it, to proceed with caution and learn by mistakes and to invite the co-operation of the many who are willing to give it. There is an especial need for fostering independent voluntary surveys, such as those carried out by Nuffield College and by the West Midland group, and as the Minister recognized, for associating the universities (with due respect for the proper boundaries of academic studies) with research into the economic and social needs of their surrounding regions. Planning which goes on behind locked doors will speedily defeat its own end—that of improving the comfort and the convenience of the ordinary citizen. Planning which is willing to encourage and subsidise pioneer investigations of all types, and to seek out and to sound public opinion—to acquaint the public with the plans and the planners with the public—can be both effective and popular.

*

The belief that a public authority, merely because it is in a position to take into account all relevant factors, will automatically act for the public good has by now worn very thin. The fallibility of the planning authorities should be frankly recognised and guarded against. This is best done in two ways. So far as possible, control should be exercised through general edicts, stating what the individual may or may not do with his land and property, and detailed wrangling over individual cases should be kept to a minimum. At the same time, the idea of permitting an appeal to an independent tribunal against planning restrictions, which Mr Silkin toys with vaguely and in a minor way, should be made definite and universal. Strange things can be done under town-planning law in the name of amenity or aesthetics, and in so controversial a field it is wise at least to provide access to a second and unofficial opinion. Even the best-intentioned of public officials are driven by their rules and precedents into a rut, and they should be compelled to emerge at the most frequent intervals and justify their decisions at the bar of common sense.

The Bill's planning provisions are good because of their comprehensiveness. Its financial provisions are bad because of their vagueness, which in places cloaks an undoubted inequity Mr Silkin explained that the £300 million awarded to land

Statistical Summary

GOVERNMENT RETURNS

For the week ended Feb. 8th, 1947, total ordinary revenue was £112,869,000, against ordinary expenditure of £51,537,000, and issues to sinking funds £380,000. Thus, including sinking fund allocations of £12,745,356, the deficit accrued since April 1st is £363,564,009 against £1,970,630,000 for the corresponding period a year ago.

* Government debt is £11,015,100, capital £14,553,000. Fiduciary issue raised from £1,400 million to £1,450 million on December 10, 1946.

GOLD AND SILVER

The Bank of England's Official buying price for gold remained at 172s. 3d. per fine ounce throughout the week. In the London silver market price per fine ounce was lowered from 55s. 4d. to 44s. on February 3rd, 1947. The New York market price of foreign silver remained at 70¢. Bombay bullion prices were as follows:—

THE MONEY MARKET.—Money has remained stringent during the greater part of this week, despite a large repayment of floating debt. There were maturities of Treasury deposit receipts totalling £136 million, so that borrowing was resumed, but the amount called was only £80 million, of which £74.5 million was allocated to the clearing and Scottish banks. On the other hand, the bill issue had been raised to £170 million and thus exceeded nominal maturities by £10 million, while the discount houses secured a substantially increased share—46 per cent. compared with 38 per cent. in the previous week.

Credit conditions at the end of the previous week were complicated by withdrawal of the moneys lodged in connection with the Dobie issue; this disturbance, coupled with tax transfers, compelled the discount market to seek official aid on each of the last three days of the week, with a moderate amount required on the Saturday.

By these standards the market this week has fared better; but although TDR maturities were concentrated late in the week, the banks elected to make large payments for new TDR's in the first few days. On Monday the market escaped recourse to the special buyer, despite payments for new bills, and on Tuesday, when no bill payments fell due, the position was rather more comfortable. By Wednesday, however, sales to the special buyer were again needed, and on Thursday the position was disturbed by heavy tax transfers, offset to some extent by maturities of TDR's.

Wednesday's pressure is reflected in the Bank return by a further contraction of bankers' deposits, to the rather low level of £274 million, but otherwise the only noteworthy movement is an unseasonable expansion of £3½ million in the note circulation, the one obvious manifestation of the dislocation produced by the fuel crisis.

owners as compensation for loss of development value could be satisfactorily deduced from the figure of £9 million quoted by the Uthwatt report as the estimated annual value of development on undeveloped land. The Minister doubles this £9 million to allow for the value of development inside urban areas (excluded from Uthwatt) and he then has to multiply by an appropriate number of years' purchase, which he takes to be 15 or 16. The total then comes out at around £300 million. The calculation is admittedly of the roughest, and Mr Silkin rightly argues that any figure would be more or less arbitrary. But does he seriously maintain that this brand of arithmetic, worked out in secret by the Government and now sprung on Parliament at the second reading without even the accompaniment of an explanatory White Paper, is fairer and more accurate than would be the result arrived at by an independent judicial inquiry? Moreover, taking Mr Silkin's own rough arithmetic, it is inexcusable to take only 15 or 16 years' purchase on the grounds that the asset to be acquired is a speculative one, for the original Uthwatt calculation is already supposed to have removed the speculative element.

Mr Silkin is leaving to Mr Dalton, who is speaking too late for comment in this issue, his usual task of explaining away a confiscatory provision—in this case, the continued retention of the 1939 basis for land acquisition. Some surprise concession is on the cards. Mr Dalton's task is the harder since, having himself made a present of a capital bonus to holders of the National Debt, the Government's treatment of landowners loses even the semblance of logic which it possessed when 1939 prices were first written into the Town and Country Planning Act of 1944. It also does bad service to the cause of planning, as can be seen from the resentment occasioned by proposals to acquire property at Stevenage at 1939 prices.

The Bill's proposals for collecting a development charge from the owner, whenever land is put to a different use, are bad only in respect of their vagueness. It is rather surprising

that the Uthwatt suggestion that the land should be acquired by the State as soon as development takes place has not been adopted. This device would at least prove more expeditious and straightforward than the present arrangements by which the Central Land Board is apparently to be permitted to negotiate the charge individually with each owner. The Minister will give guiding principles to the Board, which he has promised first to explain to Parliament. It would probably be wiser, and it might even be more lucrative, to lay down a few uniform rates of development charge, which should be made subject to Parliamentary approval and varied only in exceptional circumstances, to meet needs such as those of the development areas.

This is far from being a model Bill. It is much to be hoped that during the Committee stage there will be a reduction in the number of its uncertainties, an increase in the public safeguards against inept administration and—if the Labour Party can bring itself to do justice to property owners—an improvement in the terms offered to landowners. But even with these defects, the Bill does offer a remarkable opportunity for replacing the wasteful mismanagement of Britain's scarcest asset, its land, by a scheme of rational and orderly development. The main obstacles in the way—the compensation bogey, the lack of local authority finance, the absence of powers of State planning and development—are all being removed. Such difficulties as remain will be of the Government's own creating, such as the lack of co-ordination among its own departments. No longer can the blame be laid on migrant industrialists or profiteering jerry-builders. It now remains to be seen whether the planning authorities will rise to their opportunity. Their chances will be greatly improved if they remember that physical planning requires a different technique—more delicate and more experimental—than the ordinary routine of administration, and one which can easily be poisoned at birth by bureaucratic niggling and secrecy.

The Housing Programme

At long last the Minister of Health has produced a housing target—or as he prefers to call it a programme—issued in the form of a White Paper on January 28th.* The proposals have been synchronised with the issue of the last monthly report for 1946 so that it is possible to review the possibilities of the next twelve months against the performance of the last twelve, and to indulge in calculations which can be as fascinating as they are uncertain. Nevertheless Mr Bevan's decision to commit himself to a statement of aims is to be heartily welcomed, and the more so since the White Paper is simple, courageous and to the point. Indeed, after the excessive caution the Minister of Health has shown in the past the chief surprise is that he should have been so bold about the future. To aim at quadrupling in 1947 the 1946 rate of completion of permanent houses is ambitious, to say the least.

During 1946 some 60,000 permanent and 90,000 temporary houses were completed with an average labour force of 190,000. During 1947 it is estimated that the number of men available for the erection of permanent houses will be 300,000 and that they will complete 240,000 houses. The 60,000 temporary houses which yet remain over from the temporary programme are mostly aluminium houses, which require very little labour for erection, and their completion should therefore not interfere with the programme for permanent houses, which is the crux of the year's work. Mr Bevan's calculations will, therefore,

* Cmd. 7021.

stand or fall on the number of permanent houses which are completed during the year, and this with no relaxation of the four to one limitation on private enterprise.

How far is the 1947 programme likely to be achieved? This is the vital question, but the answer is extremely difficult to predict, for it depends largely on which set of figures are used to make the estimate. The table below sets out the dilemma, for it shows that the 1947 programme contemplates a trebling of the average monthly rate of completion of permanent houses with only a 50 per cent increase in the labour force. During the last three months of 1946, which is the only fair period to take for purposes of comparison, 7,000 permanent houses were finished each month, with a labour force of 200,000, whereas in 1947 it is contemplated that 20,000 houses will be completed each month with a labour force of 300,000. This looks on the face of it impossibly ambitious.

COMPARISONS OF PERFORMANCE AND PROGRAMME.

	1946	1947
Number of permanent houses completed per month...	7,000*	20,000†
Manpower employed on permanent houses.....	200,000*	300,000†
Permanent houses under construction at end of year...	203,000	200,000

* Average for last 3 months. † Average for year.

On the other hand there were at the end of the year 203,000 houses already in process of erection, so that the 1947 target would only involve finishing these and another 37,000. Looked

at from this point of view the programme appears perfectly feasible not to say modest.

A partial explanation of this conflict in data is the lack of balance in the 1946 programme. With the performance of the whole year set out in the diagram below it is now very obvious that the house building effort of the nation has been too widely spread. In a tremendous effort to get large numbers of houses started, too little labour was concentrated on completing them. The result is that the labour force has been spread thinly over 263,000 permanent houses and has only managed to make 60,000 ready for occupation, whereas if it had been confined to no more than, say, 160,000 or 200,000 houses, at least 100,000 families would now be benefiting. Having seen the results of this policy of dispersion the Ministry of Health have now reversed the emphasis and are going full steam in the opposite direction in an effort to complete those houses which are already half built. The effect of this reversal of policy can be clearly seen from the estimate that no more houses will be under construction at the end of 1947 than at the end of 1946.

In assessing the probability of achieving the 1947 programme two further aspects of the housing situation must be reviewed—those of manpower and of materials. The White Paper contemplates a modest increase in the total manpower employed on building and civil engineering, but a considerable switch-over from work on temporary houses, adaptations and conversions to work on permanent houses:—

	June, 1946	Dec., 1946	June, 1947	Dec., 1947
Number employed in building and civil engineering.....	890,000	943,000	970,000	1,000,000
Number employed on housing work.....	566,200	621,100	582,000	600,000
Number employed on maintenance, repair, conversion & adaptation.....	375,500	366,900	280,000	280,000
Number employed on temporary houses.....	39,200	31,400	2,000	None
Number employed on permanent houses.....	151,500	222,800	300,000	320,000

The total labour force of the building industry, of which some 60 per cent is employed on housing, is intended to rise by only 57,000 over the year, whereas the labour force employed on permanent houses is intended to increase by 100,000 by drawing from the labour used on other housing work. It is impossible to be optimistic about the chances of any total addition to the labour force, but the proposal to concentrate men on finishing permanent houses is thoroughly sound.

But even if the men are successfully diverted, output is still an uncertain element in the equation. The White Paper states that "The building industry have made it clear that they

aim at a rate of output not lower than the pre-war rate." Before the war it was calculated roughly that one man could build one house in one year. With a programme of 240,000 houses and 300,000 men, the ratio is now one and a-quarter men to one house. In view of the increased size and better quality of the Bevan house compared to the average pre-war house such a change in ratio would in any case be inevitable, and does not allow for any deterioration in performance. In fact, with the fall in productivity of the building industry and the difficulties and delays due to failures in deliveries of materials, it is probably an over-optimistic estimate, and the target may not be achieved for this reason. Until productivity can be increased by more efficient methods of construction and better incentives to the men—particularly by some sort of piece-rate or output bonus system—it is likely that the ratio will be nearer to one and a-half rather than one and a quarter men per house.

The White Paper is less decisive in its forecasts on the side of materials and components, and the account of the difficulties in their supply could with great advantage have been expanded. Shortages of materials, particularly timber, have been one of the most serious reasons for the delay in completing houses. Mr Bevan has always been curiously reticent about these difficulties, and the White Paper throws little further light on the position, which naturally leads the onlooker to suspect that bad programming and planning in the Ministries of Works and Supply have added seriously to the inevitable difficulties. At all events the Minister of Health is determined

A "Capital Pension!"

By way of pension . . . Capital Instalments of £100 per annum for fifteen years commencing at age sixty-five . . . followed by an annuity of £150 (subject to tax) for the remainder of life . . . with £1,500 on death before age sixty-five . . . this can all be secured by a male life aged forty next birthday for an annual premium of £55.13.0

BRITISH OVERSEAS AIRWAYS CORPORATION has vacancies in its Economics Branch for Assistants; age range between 25 and 40 years. Essential qualifications are good general education with commercial experience in dealing with analysis of financial results and trends, estimating or the preparation of financial statistics. Applicants should possess initiative, be capable of drafting reports and correspondence, have sound mathematical ability with Economics Degree or recognised accounting qualifications. Experience of methods of financial control in air transport, other transportation, or public utility undertakings desirable. Rates of pay range from £580 to £720 per annum, according to qualifications and experience, plus 21s. per week London allowance. Applications in writing, stating age, qualifications and past experience to Staff Appointments Superintendent, Stratton House, Piccadilly, W.1, marking envelopes "Economics." Enclose stamped addressed envelope for reply.

BRITISH OVERSEAS AIRWAYS CORPORATION has a vacancy for one Statistics Assistant; age range between 25 and 40 years. Applicants should have training and experience in statistics and statistical methods, including use of charts and graphs, with recognised degree or equivalent diploma, also be capable of organising and controlling staff. Rates of pay range from £480 to £630 per annum, according to qualifications and experience, plus 19s. per week London allowance. Applications in writing, stating age, qualifications and past experience, to Staff Appointments Superintendent, Stratton House, Piccadilly, W.1, marking envelopes "Statistics." Enclose stamped addressed envelope for reply.

THE Council of the British Institute of Management invite applications for the post of Chief Executive Officer. The position calls for outstanding qualifications. Commencing salary £3,000 per annum. Practical experience of administration and a knowledge of the theory of Management are desirable. Application with full details of qualifications should reach the Chairman, British Institute of Management, Room 453, I.C.I. House, Millbank, London, S.W.1, not later than 8th March, 1947.

UNIVERSITY OF LONDON.—A course of three lectures entitled "Some reflections on the relation of Government to Industry and Trade in the light of wartime experience," will be given by Sir Oliver Franks (Provost of Queen's College, Oxford) at the London School of Economics and Political Science, Houghton Street, Aldwych, W.C.2, at 5 p.m. on Tuesdays, 25th February, 4th March and 11th March. At the first lecture the Chair will be taken by Professor Arnold Plant (Sir Ernest Cassel, Professor of Commerce in the University of London). Admission free, without ticket.—James Henderson, Academic Registrar.

LADY (29), with industrial and commercial experience, seeks position as Industrial Personnel Officer or in similar capacity. Has Intermediate Exam., B.Sc. (Econ.), London University.—Box 421.

SALES STATISTICAL ASSISTANT (female) required by Market Research Department of well-known Confectionery Manufacturers. Shorthand-Typewriting an advantage. Permanent position for reliable person.—Write, giving fullest details, Box 416.

ASSISTANT COMMERCIAL MANAGER required, possessing degree Lond. Sch. of Econ. or equiv. Alert mind, sound judgment, initiative and tact essential. Quick promotion certain.—Box 420.

NORANDA MINES LIMITED

DIVIDEND NOTICE

Notice is hereby given that an interim dividend of Fifty Cents (\$50) per share, payable in Canadian funds, has been declared by the Directors of Noranda Mines Limited, payable March 15, 1947, to shareholders of record at the close of business, February 14, 1947.

Toronto, By Order of the Board,
January 21, 1947. J. R. BRADFELD, Secretary.

CANADIAN PACIFIC RAILWAY COMPANY.—(Incorporated in Canada with limited liability)—DIVIDEND NOTICE.—ORDINARY CAPITAL STOCK.—At a meeting of the Board of Directors held to-day, a final dividend of Three per cent. (seventy-five cents per share) on the Ordinary Capital Stock in respect of and out of earnings for the year 1946, was declared payable in Canadian funds on March 31, 1947, to shareholders of record at 3 p.m. on February 24, 1947. By order of the Board, FREDERICK BRAMLEY, Secretary. Montreal, February 10, 1947.

ACCOUNTANTS. Chartered or Incorporated, are invited to apply for positions on the consulting staff of Robson, Morrow & Co. Applicants, other than those who have been in the Forces, should have had industrial experience and be interested in developing costing as an instrument of managerial control. Age, not over 37. Training will be given to successful applicants. Four-figure commencing salary, and good prospects.—Send full particulars of education, qualifications, age and experience, marking envelope "Application," to Robson, Morrow & Co., 59, New Cavendish Street, London, W.1.

TRANSLATIONS: Efficient and prompt service undertaken by specialists in technical and literary work. Moderate terms.—Apply to Secretary (E), P.W.E.A. (licensed annually by the L.C.C.), 11, Gillingham Street, London, S.W.1 Tel: Victoria 2705.

MONOMARKS.—Permanent London Address. Letters redirected. 5s. p.a.—Write, Monomark BCM/MONOMARK, W.C.1.

DISTRIBUTION RESEARCH.—International Association of large-scale firms located in different European countries requires an assistant to its Secretary-General for management research and statistics. Salary about £660. Applicants, preferably with economics or commerce degree should have good personality and ability to write. Opportunity to travel and learn modern methods of business organisation.—Box 422.

SOUTH AMERICA.—Experienced Executive (35-45) required by well-known Corporation for development and supervision of sales of pharmaceuticals in Central and South America. Must speak fluent Spanish and be prepared to visit the territory frequently.—Applications, stating age, experience, salary required, and other particulars, in confidence to Box 423.

ADVERTISING EXECUTIVE.—Applications are invited for important appointment with well-known Company (Home Counties). In addition to advertising, candidates must have wide experience of Market Research and Assessment, consumer sampling and forecasting of market potential. University Degree in Economics, Statistics or Social Science desirable; age limits 32-40 years. The appointment will be permanent, progressive, and will carry an initial salary of £2,500 upwards, and pension. Only candidates of highest calibre can be considered.—Apply in confidence, stating age, education, details of career and current salary level, to Box 424.

BIRMINGHAM STOCKBROKERS require statistician to open an investment research department. Applicants must have had experience in the investment sphere but need not necessarily have accountant's qualifications. Preference would be given to a younger man who has had experience in Investment Trust management. Might be chance of partnership later on. State salary. Box 425.

A TECHNICAL EXECUTIVE (Engineering Graduate) desires change of employment. Previous appointments have covered control of all aspects of sub-contracting work, mainly in re-inforced concrete, with particular emphasis on technical supervision from design office through factories to erection. Familiar with modern methods for large-scale production of pre-cast concrete products, pre-fabricated housing and allied building problems, development work, technical and industrial councils and negotiations with Ministries.—Write Box 426.

FOR SALE.—ECONOMISTS from 13/9/1939 to 28/12/1946, excluding 16/7/42 and 26/9/42.—Offers Box 427.

A CHARTERED ACCOUNTANT is required as Assistant Managing Director of a large industrial Company to instal and be responsible for the development of an effective form of Budgetary Control, Standard Costs and all office procedures (Office Staff 250). A high salary will be paid to a first-class man with industrial and administrative experience.—Applicants should send full details of their qualifications, experience, age and salaries to Box 428.

MARKET RESEARCH AND ANALYSIS EXPERT, 36, considerable American experience in both commercial and government work, at present with a temporary international agency, desires to remain in England or Western Europe, if a suitable appointment, preferably commercial, is available.—Please reply to Box 429.

After the Ban

AFTER two weeks of enforced suspension, *The Economist* is now free to appear once again. In each of the two weeks, the Editor of the *Financial Times*, with great generosity, put one of his pages at our disposal, which we were able to fill with a short leading article, a few Notes of the Week and some Business Notes. It is hoped that most of our subscribers were able to see these substitute issues. The type area of one page of the *Financial Times* almost exactly equals that of four pages of *The Economist*, and we therefore propose to reprint these issues in our own format, to treat them as the issues of February 22nd and March 1st, and to regard the continuity of issue as thereby preserved. Copies of these reprints will be sent free of charge, so long as the limited supply lasts, on request (to the Publisher, *The Economist*, 15 Lancaster Place, London, W.C.2—marked "Reprint"), but we particularly ask that only those readers who want them for permanent preservation will make application. It is intended to extend the period of all subscriptions by two weeks.

There is much that might be written in retrospect on the subject of the ban on the periodicals. Two points must suffice. It has emerged that the Government, though they could have taken legal authority to ban the periodicals by issuing an Order in Council, did not do so, and that their "instruction," for all its peremptory language, was without legal force. There has been some criticism of the periodicals for not challenging the position at the outset. Perhaps it would have been a good thing if some organ of the Opposition had done so; but, for ourselves, while protesting against the policies of Ministers, we believe that some latitude of authority should be conceded to His Majesty's Government, if they are acting in good faith in an undoubted national emergency. But the dangers of arbitrary action are obvious, especially towards the Press, and *The Economist* will not in future consider itself necessarily bound either by the agreement of any trade association or by the extra-legal instructions of Ministers.

The second point is to clear up a matter of specific concern to ourselves. Mention was made in the House of Lords on February 27th of an American report to the effect that a project to print an edition of *The Economist* in the United States and to fly copies to this country had been frustrated by the refusal of the Board of Trade to grant an import licence. The facts are that the Whaley-Eaton Service of Washington made a most generous offer to arrange for printing in America and were willing to accept reimbursement in sterling. In declining this offer, with full appreciation of the friendliness that inspired it, we gave as one of the reasons that an import licence would be needed and that, in our judgment, it would be refused. Unfortunately, over the transatlantic telephone, this was accidentally misconstrued as a statement that application had actually been made and rejected. The difference is small, especially since we have confirmed that our judgment was correct. But it is only fair to acquit the Government of an offence with which they have been charged but which they were never, in fact, given the opportunity to commit.

to discount shortages and the programme is, therefore, based on the assumption that materials, labour and transport will be forthcoming. It is specifically stated that every effort will be made to secure supplies, but that if imports of soft-woods fall below the austerity standards required, or the coal situation, reduces the output of bricks, cement, tiles and glass, or other sources of supply fail, then the estimates will not be achieved.

★

When reduced to its essentials the achievement of the 1947 housing programme, therefore, stands or falls on three things: first the success with which local authorities can be induced to concentrate on completing houses rather than on expanding their existing programmes; secondly on how far output per man can be increased; and thirdly on how far the existing shortages of materials can be removed by increased production and imports and by improving the distribution of stocks so as to avoid the constant loss of time on the site. The Ministry of Health's affiliations with local authorities should make the first adjustment reasonably easy. But the White Paper contains no mention of the second objective and only pious hopes about the third. Unless Mr. Bevan can elaborate what he intends in these direc-

tions it is impossible to feel confident that his programme can be achieved.

No mention is made in the statement about the objectives for 1948, but it is clear that if 1947 ends with a labour force of 300,000, and with 200,000 houses in process of erection, only some 300,000 permanent houses can be completed in 1948. The very imperfect estimates which exist allow for a total of 750,000 houses to be provided to meet the post-war emergency. If the 1946 target is achieved, the end of 1948 might see 600,000 permanent houses and 150,000 temporary houses ready for occupation. If these figures can in fact be attained by the end of that year, it will be an achievement which will largely silence the critics who now say, and with much apparent justification, that private enterprise could have speeded up the rate of completions if it had not been held in check by the Minister's doctrinaire prejudices—and this will be the more true if Mr. Bevan is then willing, as he is reported to have recently promised, to give private building its head. The Minister of Health may, in short, be one of the Government's assets at the General Election. But this depends on the time-table being adhered to and any delays would extend the housing emergency well into the politically dangerous period of 1949 and 1950.

Russians, partly to economic difficulties (most caused by the Germans, some by the Russians), partly to political events in the Danubian countries themselves. To-day the social status of the Danubian intelligentsia is unsure, and its political ideas are confused.

In the Danube States, as in Russia a generation ago, there is an urgent need for technicians of all kinds, both to repair the destruction of war and to carry out the wider plans for the future. The new regimes at times seem to wish to attract specialists. They make frequent appeals to the "progressive elements" of the intelligentsia. Conditions of pay and employment, which in present economic circumstances must be regarded as extremely generous, are often offered even to men whose political past might have been expected to count heavily against them. At other times, the same regimes show the greatest distrust towards intellectuals, even towards men who are known for their left wing sympathies. This uncertainty in government policy, and the curious contradictions of many individual cases, create much bewilderment.

The relative freedom which the universities enjoyed under the old regimes has been greatly reduced. There have been considerable purges of professors in Yugoslavia and Bulgaria. Some of those removed were obvious "collaborators," others could hardly be so described. In Belgrade, Sofia and Bucharest, the government now has a big influence in the appointment of professors and in the choice of the qualifications for future appointments of university lecturers and assistants. In Bulgaria those who wish to study at Sofia University must produce certificates from the local Fatherland Front committee of their home district to prove their political reliability. In Rumania a similar political testimonial is required for admission to student hostels, though not for admission to the university. Much is being done to develop the study of Marxist theory in the Danubian universities. This is in principle a good thing, for study of this important subject was almost completely neglected under the old régimes.

But sometimes the new governments seem to go too far. In Sofia University it has been decided to make "scientific philosophy" a compulsory subject in the examinations of all faculties. In Belgrade the text-book for university students of English literature is to be a history of the subject (now being translated into Serbian by a Soviet professor who in his copious footnotes quotes only four authorities on English literature—Marx, Engels, Lenin and Stalin. Unfortunately the number of real Danubian experts on Marxism is small, and many of those who are now teaching it can do little more than repeat slogans learnt by heart like magical formulae. These conditions make life difficult for professors appointed before the war, however conscientiously they try to adapt themselves to the new situation. They also find unfamiliar the institution of a professors' trade union, meetings of which are called from time to time to discuss such matters as British rule in India or the future of Trieste. Circumstances of course vary very much between different universities. In Yugoslavia the changes have been most radical, and Bulgaria is following close behind. In Rumania things are confused, and some people have kept their jobs who three years ago enthusiastically praised the Germans. Budapest has much the freest intellectual atmosphere. Yet this has its dangers, as the freedom is used by men of the past to propagate the old reactionary nationalism.

A large part of the Danubian intelligentsia undoubtedly supports the new regimes. There are first the Communist intellectuals. These include some fine brains—the Hungarian Joseph Revai and the Bulgar Todor Pavlov, to take only two examples. Then there are those who are not Communists and who deplore many of the methods and actions of Communist policy, and dislike the type of men whom the Communists use to carry them out, yet support the governments because they

are convinced that their intentions are sincerely progressive and will one day be realised, and that the alternative is a counter-revolution and return to the rotten past. Thirdly, there are the opportunists, who once declaimed with no great conviction the catchwords of the Fascists, and are perfectly willing, with no more conviction, either to further their personal ambitions or simply to assure themselves a quiet life, to declaim the catchwords of the Communists. These are very numerous. They will serve the present régimes as long as they are strong, but if ever they fail, they will betray them without a moment's hesitation, and will turn and rend their present masters with a coward's savagery.

The intellectual adversaries of the new regimes are also of several kinds. There are first the purged Fascists. Then there are the Conservatives who refused to collaborate with the Germans but cannot reconcile themselves with, or be trusted by, the Communists. Among them are some old and proved friends of Britain. They not only have no political power, but are being gradually excluded from economic life. From

day to day it is harder to earn their living, and their slender means are being whittled away. Thirdly, there are the men of the Left who all their lives hoped, worked and fought for social and political revolution, but cannot recognise in the reality of to-day their old ideals. They approve the government's proclaimed policy, but cannot reconcile themselves to the lies, violence, pompous incompetence and organised lawlessness. They feel unable to join any of the official parties, or put their names to the collective statements, appeals, denunciations or hymns of praise which are constantly issued by the authorities. And so they are treated by the rulers as traitors to the democratic cause, "conscious or unconscious tools of international reaction."

In Soviet Russia between the wars the insecure position of the intelligentsia, alternately courted and persecuted, praised and mistrusted, increased the difficulties of reconstruction. The Danube countries face the same problem. When so much has to be done, it is tragic that thousands of qualified people should be doomed to unemployment and gradual physical and mental decay. Moreover, it is from the discontented intelligentsia that the leaders of any future Fascist, anti-Semitic, extreme Clerical or nationalist movement are most likely to spring. In so far as the Danubian regimes think in terms of maintaining themselves by the sheer physical force of Soviet support, they can, of course, ignore the human waste and the discontent. But if, as is surely the case with most of their leaders, they wish to win the approval of their peoples and to benefit their countries, they must face the task of bringing the intelligentsia into the national life.

Danubia in 1946—iv

Intellectuals and the West

(By Our Special Correspondent)

IN the speeches of the present rulers of the Danube countries it is often emphasised that the new regimes are based on the "workers, peasants and progressive intelligentsia." The last is thus the third class recognised under the new system.

The words "intellectual" and "intelligentsia" have not quite the same meaning in Eastern Europe as in the West. They have a less academic flavour. They correspond in fact approximately to what in Britain is known as "the professional class." In particular they include lawyers, doctors, school teachers and engineers. It is hard to draw a clear line between the intelligentsia and the commercial and bureaucratic classes, though in principle it is distinct from them.

The intelligentsia has played an important part in Danubian history. It has provided many of the leaders of political parties, both right and left. It has provided both the official ideologists, employed to justify past regimes in their days of power, and the revolutionary critics who sapped their foundations. Modern political life began in the Danube countries with the diffusion, by the first intellectuals, of the ideas of 1789, which they picked up either in France or at second hand in Germany. Later, also through the intelligentsia, came the ideas of the Russian Narodniki, the Austrian Marxists, the Soviet Communists and the German Nazis. Apart from these foreign ideas there were the constant influences of the Roman Catholic and the Orthodox churches. Strong traces of all these influences can be found in the Danube countries to-day.

After 1918 the most widespread political tendency among the Danubian intelligentsia was western democracy, of a Wilsonian type. This was reflected in the official politics of Yugoslavia and Rumania, and even the counter-revolutionary régimes of Hungary and Bulgaria paid lip-service. But peasant poverty and illiteracy, the corruption and brutality of the bureaucracy, and the increasing divergence of interests between the bourgeois minority and the peasant majority created contradictions which could not be overcome, and democracy broke down, to be replaced by police dictatorships. The influence of Western ideas was further weakened when the Western Powers showed themselves unable to prevent the revival of an aggressive Germany.

During the 1930's, anti-Western feeling grew among the Danubian intellectuals. To the belief that Western democracy had proved a failure in both internal and international politics was added a resentment of Western economic domination and cultural arrogance. Much Western capital was invested in these countries. That it had brought material advantages was forgotten. There was talk of foreign exploitation, of the desire to keep the Danubian nations in a colonial status. The French and British were accused of wilfully insulting national pride, of supporting reactionary politicians and of using them as colonial governors, representing French and British interests against their own peoples.

Anti-Western feeling led Danubian intellectuals into two mutually hostile camps, which looked respectively to Berlin and to Moscow. Though they hated each other, both used much the same slogans about the Western Powers. The German propagandists identified Western influence with the Jews, and exploited the economic jealousy of the Rumanian and Hungarian commercial and professional classes towards the Jewish bourgeoisie in their midst. They also simultaneously appealed with revolutionary slogans to the oppressed classes and radical intelligentsia, and with counter-revolutionary slogans to men of property. The Communists had a simpler revolutionary propaganda, directed in the 1930's principally against the Fascist Powers, but which also dismissed the Western countries as essentially reactionary. After Munich, the opportunists tended to rally to the German and local Fascist side, but the revolutionaries, hating Germany but disillusioned with the West, looked more than ever to Moscow. They were stronger in Yugoslavia and Bulgaria than in the two northern countries. The achievements of the Soviet land armies, and of the Yugoslav Partisans accentuated this trend.

At the end of 1944 Communism, Russophilism and contempt for the West reached their high-water mark. Even then they did not win a majority of the Danubian intelligentsia, though they won many of its younger and more energetic members. For the last two years they have lost ground. This is due partly to the disappointing experience of personal contact with

Expedients and Policies

THREE Parliamentary days next week are to be devoted to the great debate on the economic state of the nation. To call it, in advance, a great debate is to take a great deal, very probably far too much, for granted. It would be very pleasant to be able to believe that the three days of speech-making will clarify the real causes of the country's plight and set in clear juxtaposition the issues that have to be settled before it can be helped to struggle out of the slough. But the prospects are not promising. The truth is that both political parties are completely bewildered; neither of them knows what can be done, or even what it wants to do. The members of the Labour Party have, to a man, pinned their private faiths and their public careers to one or other of two doctrines—either to the Socialist doctrine that a little State control will solve any problem or to the trade union doctrine that the man who is paid by the week is always right. For men brought up in either of these beliefs to be faced with a situation in which they are either obviously irrelevant or obviously wrong is not merely politically discrediting but personally shattering. There is not a new idea to be expected in the debate from the Labour benches. There may be some new ideas from the Opposition; but there is most unlikely to be an alternative policy, for the Conservatives too have never really evolved any twentieth-century economic policy other than the industrialist's version of trade unionism.

In these circumstances, it is all too likely that the debate—that part of it that is not devoted to recriminations—will concern itself almost entirely with expedients of one sort or another. This is not to say that the expedients are not themselves of importance. Many of them, indeed, if they were not overshadowed by the whole crisis of which they are parts, would rank as major items of public policy on their own account. Nobody at the present moment is likely to underrate the importance of mining 200 million tons of coal in 1947. The question of the school-leaving age is one that rightly excites the liveliest interest. Exports and imports, the possibility of saving dollar exchange, the impending date when sterling must be made convertible—here is another group of topics which make up a crisis on their own account. There is also likely to be some very plain speaking on the subject of conscription and the size of the armed forces.

All of these richly deserve to be fully debated. But it is very difficult to believe that any collection of expedients, any small-scale raising or lowering of the figures in the Economic Survey, will suffice to solve the problem that faces the British people. The question is not whether one or two hundred thousand extra persons can be added to the labour force, but whether the twenty million already in employment are going to be able and willing to work as they should. It is not the marginal expedients of harassed administrators that matter but the whole circumambient atmosphere of economic activity in this country. The economic crisis will be on the way to solution when somebody has discovered, and some economic statesman has applied, some policy that acts not merely on the hundreds of thousands of school leavers, of conscripts or of Displaced Persons but on the tens of millions of ordinary people in ordinary employment. Every intelligent citizen ought to be searching his mind for a policy of universal potency.

The first recourse for such a policy is to the moral sphere. Let the spirit of Dunkirk be re-created—the thought is almost automatic. Moral appeals can sometimes work miracles. But they do not often do so in economic affairs, where the dangers cannot easily be dramatised. The public has, after repeated doses, acquired a high degree of immunity to patriotic exhortation. And the Government have chosen this moment to make what can

only be interpreted as a deliberate decision to prefer the division of the country to its unity. They have taken steps to ram their party programme through Parliament by unprecedented closure powers. So long as they continue to affront half the nation, they undermine their moral authority to make patriotic appeals to the whole people.

It is the search for a policy of universal effect that has attracted so many minds in recent weeks to the financial sphere. It would be very rash to claim too much for a purely financial policy. But its probable results should also not be underrated. More of the country's present ills than would appear at first sight are due to the vast excess of purchasing power, to the seven billions of incomes that press upon the six billions of goods. Why does the public overwhelm the electricity and gas industries with a demand far beyond what was ever imagined before the war? Because they have more money than they know what to do with. Why is the consumption of tobacco one-third greater than before the war, in spite of the swingeing increases in duty? Because almost nobody nowadays has to count his pennies, or his shillings either. Thus the effect of inflation can be traced directly on both the fuel shortage and the dollar shortage. And what more effective stimulus to greater effort could there be than to make it less overwhelmingly easy to earn enough money to buy the goods that are in the shops?

There is, of course, a penumbra of distaste about the word "deflation." To advocate it seems to many people to be asking for mass unemployment and industrial stagnation. When, at the bottom of the Great Slump, the need was to arrest and reverse the excessive deflation, somebody invented the term "reflation" to imply a move in the direction of inflation, but only to the point of equilibrium. Another invented word is needed to-day to imply the exact opposite. "Anti-inflation" is hardly the exact term, since that implies that the chief object should be to prevent any further rise in the price level. But a large part of the present trouble is that we have all the generating causes of inflation, but that it is being bottled up. It would be better to let prices rise than to be driven ever further into the morass of rationing and control by the bottled-up pressure that is generated by a combination of high money incomes and subsidised prices. The touchstone of sound financial policy in the present emergency is comparatively simple: the object should be to bring the seven billions and the six billions together. Anything that cuts down the sources of money incomes or that raises the money value of the goods available—either by an increase in their volume or in their price—helps towards this end.

Any policy of this sort necessarily implies budgetary severity and a postponement of the hopes of large-scale tax remission that had been held out. But there is no reason why a strict financial policy need contradict what has come to be known (rather misleadingly) as the "incentive argument." No tax reduction can ever provide an incentive to effort; it can only reduce the deterrents; and if the total to be collected in revenue is not to be reduced, the need is all the greater for adjusting the incidence of taxation in such a way as to reduce its deterrent effect as much as possible. Methods of doing this have often been suggested here—a revised form of PAYE, the substitution of death duties for surtax, some replacement (if it is possible) of direct by indirect taxes. All these now become urgent necessities. But the paramount necessity is that financial policy as a whole should assist the nation in coming to its economic senses instead of continuing to drug it with the illusion of paper wealth. It may not be able single-handed to solve the economic problem. But it is the only large-scale policy of universal effect that lies to hand.

Moscow—via Dunkirk

WITH the signing of the Dunkirk Treaty, France becomes once again, for diplomatic purposes, a great European power. So far, in the international discussions since the war, its representatives have been working their passage; now they take their place in the first class. M. Bidault need restrict himself no longer to the role of mediator; he goes to Moscow with the confidence that comes of being allied to what the Russians call the Anglo-Saxon interest.

M. Bidault goes also as representative of the nation which has the deepest and most sceptical understanding of the German problem, which can have no *cordon sanitaire* between itself and the secular enemy, and has the clearest permanent interest in preventing the recovery of Germany to first-class military and economic rank. He can criticise freely the Potsdam Agreement, because his government was not a party to it. Above all, he has secured a guarantee that British foreign policy has steadily refused his country in peacetime ever since German ambitions became the main threat to its security. What was refused to the France of Clemenceau and Poincaré has been granted to the France of Blum and Thorez. Britain is pledged for fifty years to discuss common action with France against any threat of German aggression and against any failure of the Germans to carry out their treaty obligations.

There is a sense in which Mr. Bevin may be said to have signed a blank cheque. The treaty may be interpreted as binding Britain to defending features in a future German peace treaty which its Parliament might not indefinitely approve. There might be, for example, misgivings about joining with France in defending the settlement of Germany's eastern frontiers, on which the Russians and their neighbours publicly insist. There might be hesitation to oppose German efforts at breaking down a political structure imposed by treaty without consultation of the German people; just as there might be French hesitation about supporting British policy towards a central German government dominated by Communist influence. Such developments are not inconceivable in fifty years. Mr. Bevin should bear in mind, during the Moscow Conference, that British policy should not enter into commitments for which future generations in Britain may be unwilling to fight, or even to accept compulsory military service. He has only to cast his mind back fifty years—to the views and policies of Lord Salisbury—to realise how fundamentally political views and economic facts may change in two or three generations.

Elsewhere in this issue, our Paris correspondent points out that many Frenchmen will see little more in the treaty than an unusually emphatic expression of British good will, and that

final judgment of its value will wait on the practical execution of the pledges of economic co-operation. It is important to understand what is in French minds. In the course of the London negotiations, it has been said quite frankly that France wishes to occupy in western Europe—with the help of its neighbours—the predominant industrial position once held by Germany. That is why so much importance is attached by the French to giving control of the Ruhr to a non-German body. If the raw material resources and heavy industry of the Ruhr could be integrated with those of France—particularly within the framework of a European scheme in which Britain would join—then the French would feel that Germany had been irretrievably weakened as a military power and France permanently strengthened. They cannot understand why the British, having admitted that the Monnet Plan of industrial development is desirable, and that the French ambition to become a first-class power is legitimate, will not move one step further in logic and support this decisive change in the economic balance of power. The answer is that neither the French political parties nor the French people have yet demonstrated the ability or will to shoulder this responsibility; that the British fear that such ruthless realism would turn western Germany once and for all against the West and towards nationalistic Communism. Whereas the French believe that the Germans are incorrigible and that the best safeguard is to keep them down, the British and Americans, in different degrees, believe that they are educable and that the best way of ensuring their willing membership of the Western world is to help them to their feet. There lies the root of much misunderstanding.

The Dunkirk treaty is welcome to many Frenchmen only *faute de mieux*. They hoped for more, but when it was clear that British economic planning would not look beyond 1947, they decided to accept the offer of the Foreign Office, who were prepared, on a limited horizon, to look ahead as far as 1997. From the British point of view, one of the chief merits of the treaty is that its provisions for action against German aggression will weaken the pull and cogency of the French argument that their security is best assured by leaving Germany poor, divided, weak, and brutalised. Thereby the British argument for a humane and pacifying settlement will gain in force, especially if Russian obstinacy forces the West European powers and the Americans to make their own temporary settlement on the basis of three fused zones. Moreover, the content and form of the treaty are designed not only to allay Russian suspicion of a Western bloc and an abandonment of the United Nations security arrangements; they should also convince

NOTES OF THE WEEK

No New Treaty with Egypt

Nokrashy Pasha's government, swept along by Egyptian public clamour for "permanent unity" with the Sudan, has decided to break off all negotiations for a new treaty with Britain. Thus the fruits of many months' work, including drafts agreed by both parties for an evacuation protocol and a treaty of mutual assistance, are to be thrown overboard, because Egypt will not sign them except as part of an agreement that recognises its "permanent" title to sovereignty over the Sudan, while Britain—very rightly—will not sign away the right of the Sudanese ultimately to decide their own future.

Nokrashy Pasha now intends, he says, to refer Egypt's "whole case to the United Nations." To most Egyptians—indeed to far too many of the peoples of the Middle East—this resort has all the qualities of a rub at Aladdin's lamp. It has but to be tried, and satisfaction will ensue.

But what is Egypt going to say to Uno? However it couches its case, facts unpalatable to itself are bound to emerge from any inquiry into Sudanese opinion. For the Egyptian case, on the Sudan, is that the Egyptians wish for permanent sovereignty over a people whom they believe to desire this. Any suggestion that some Sudanese wish otherwise they pooh-pooh as engineered by British puppets. But is this correct? Conscientious members of Uno will presumably make some enquiries for themselves on the subject, and even the most cursory survey by an unbiased team of Swiss, Brazilians, Danes or others will reveal that the Egyptians are wrong.

It is of course possible that Nokrashy will refer the whole matter to Uno on vaguer and wider grounds of "unfair pressure" due to the presence of foreign troops. But he has weakened this case by his recent agreement to a three-year evacuation protocol. Pending his decision upon what he is going to say, the British government returns *de jure* to the 1936 treaty, but would do well to continue a *de facto* evacuation on the basis of the unsigned protocol. This is the only road to a treaty of mutual assistance when tempers have cooled—and when the Egyptians have been persuaded by the force of the facts to adopt a more moderate policy towards the Sudan.

Sudanese Opinion

Independent examination of Sudanese opinion will show the fact that the Sudanese of the "three towns"—Khartoum, Omdurman and Khartoum North—are divided into two political parties, the Ashigga and the Umma, and that the first wants union with Egypt (though on a much more tenuous basis than Egyptians envisage), while the second does not. But it will also reveal that these townsmen are at most some 400,000 strong in a population of between six and seven million northern Sudanese, and that a third group consisting of sheiks and *nazirs* and merchants from smaller townships is beginning to be articulate. These men do not want to be swept along by urban parties that are apt, while they argue headily about one another's demerits, to forget the importance of a quiet life for the ordinary fellow, and how vital is the link between internal calm and national prosperity.

At a meeting, held this January, of the Sudan's Northern Advisory Council, a group of thirteen sheiks from rural areas submitted a sensible middle-course memorandum. They pointed to the advantages of a return to the all-party attitude towards Egypt that was attained—for a brief moment and on paper—last spring. They said that they did not want Egyptian sovereignty, though they saw the virtues of a link with Egypt. Meanwhile, they sought progress by an extension of local government. It is possible that these views will get a wide hearing because much that they express is common ground with the Umma and Ashigga parties, which do not differ very greatly about their country's future management. The cleavage between them is due not so much to differences about the power that Egypt ought to wield as to Ashigga antipathy to the prospect of rule by the Umma's grand old man, Sir Abdel Rahman el Mahdi Pasha, who is not an orthodox Moslem. If that anxiety could be allayed, the parties would probably both agree with the thirteen sheiks. Can the Egyptians, if and when all these facts are revealed by a Uno enquiry, continue to write off adverse Sudanese comment as the product of British machinations?

The Talks on Burma

The Prime Minister's statement on the results of the conversations with the Burmese delegation recorded a large measure of agreement, but U Saw and Thakin Ba Sein, representing the extreme Burmese nationalists, refused their assent to the joint declaration which resulted. At the other end of the scale Mr Churchill also expressed his disapproval, claiming that it was agreement to "pay and go." Mr Attlee denied that the agreement required the British to "go" from Burma, as it was open to the Constituent Assembly (to be elected in April) either to leave the British Commonwealth or to remain within it, and it was hoped that they would decide on the latter course.

The difference between sovereign independence and real Dominion Status, such as is enjoyed by Canada or Australia, is so slight that it is strange that so much importance is attached to it. The value of Dominion status is that it provides a symbol of the special attachment to the "mother country" of new countries founded by emigrants from the British Isles; it is not really appropriate to an Asiatic country which was brought into the British Empire by an act of conquest. Dominion status in such a case may be a useful device for enabling Conservatives to believe that the Empire still stands where it stood, but for the same reason Asiatic nationalists think it a cover for prolonging British rule. The magic word to-day in all countries such as Burma is "independence"; the Burmese will feel humiliated if they seem to have less sovereignty than India or Siam. But, if

independence is conceded, there is plenty of room for arrangements on economic matters, and if friendly relations can be maintained, there is no reason for severing the special connections established by colonial rule. It is only when the break comes with hatred and bloodshed that a country attaining independence goes out of its way to discriminate against its former rulers, and the hopeful feature of the position in Burma is that there has been so far no armed conflict such as has occurred in Indo-China and Indonesia.

The least satisfactory part of the agreement now made is that relating to the non-Burmese border tribes. The new Constitution is to be made by "Ministerial Burma," that is, the Burmese and Karens only, and this seems to prejudice the future of the hill tribes, who are often very hostile to the Burmese. But even on this difficult problem a statesmanlike compromise has been reached; a joint British-Burmese Commission of Enquiry with a neutral chairman from outside Burma (an American seems to be indicated) is to be set up and should at least ensure that the spokesmen of the tribes get a fair hearing.

Agreement Over Agriculture

Mr Williams, moving the second reading of the Agriculture Bill, displayed a sanguine confidence that here was a measure which no one in their senses would quarrel about. He argued that all sections of the agricultural industry and the Opposition as well were committed to its principles and, as if to point even more strongly the contrast between his fellow Ministers and himself, he addressed his speech to removing any remaining qualms which either the industry or the Tories might have about the Bill's real intentions. He pointed out that not only were farm prices guaranteed, but that Britain's foreign exchange position made it certain that there would be a large assured market for home produce; he stressed that only in exceptional circumstances and after every other method had failed would a farmer be dispossessed for inefficiency; he emphasised that supervision of farming efficiency would be on a modest scale, and carried out by members of the farming community themselves with full right of appeal to independent tribunals against any unwelcome decision; and he indicated that the state would only go in for farming itself, through the medium of the Land Commission, in cases where no one else was in a position to farm efficiently.

The caution and orthodoxy of Mr Williams's polity, which is rather reminiscent of the Conservatives' treatment of industry in pre-war days, offers an ironic contrast with the general tenor of Labour politics. Instead of riding roughshod over the interests affected, as the plans for transport and electricity have done, the Minister of Agriculture goes to the opposite extreme in consulting and conciliating the farmers and, to a lesser degree, the landowners and the workers. Instead of pursuing the normal doctrinaire course of state ownership and control, the Minister has founded his policy on the landlord-tenant relationship and operates his controls through agents inside the industry.

With so much concession to their way of thinking, the Opposition had a hard task to pick a quarrel. But they responded gallantly, and Captain Crookshank and Mr Anthony Hurd made an attempt to cut-bid Mr Williams for the farmer's favour by insisting that definite quantitative targets for different commodities should be established and guaranteed. Routine protests were also entered against Government control and interference. But the Conservatives had no real alternative policy, beyond that of giving agriculture a still higher degree of protection whilst reducing the safeguards for raising its efficiency. Mr Williams has got his wish and the Bill is a more or less agreed measure, although it is perhaps surprising that some of his backbench supporters have tolerated such pussyfoot tactics.

The Need for Incentives

The Agriculture Bill is good enough as a piece of machinery to deserve a general measure of agreement, and some sections, such as the new policy for smallholdings, are excellent. But, so far as the guaranteed prices and markets are concerned, it is no more than an enabling measure, leaving actual policy to be settled by the Minister; while, where efficiency is concerned, all the Bill's eloquent detail and its many minor reforms of value will have in sum a very modest effect. The Minister's own speech indicates as much. The Government's courteous treatment of agriculture has much to commend it when compared with its brusque and boorish manner to other industries. But the Government's policy is in danger of falling between two stools over agriculture in much the same way as did Conservative industrial policy before the war.

The Government promises to shelter agriculture from world competition. It will make entry into the industry rather more difficult, through the greater security afforded to tenants, whilst its fiscal policy is hardly calculated to encourage landlords to invest the new capital which the industry needs. Thus the traditional incentives to greater efficiency provided by private enterprise are all removed or reduced. But what fills their place? Official supervision and official price policy, both of which are drawn up in consultation with the industry, will no doubt drive out a few inefficient or marginal farmers. But the farmer who merely farms indifferently and shows no particular adaptability or foresight may flourish as never before. Not downright inefficiency, but mediocrity and inflexibility are the dangers, and they are serious ones at a time when an adaptable and progressive agriculture is badly wanted.

What British agriculture most needs is the investment of new capital and the adoption of new techniques. It is almost impossible to effect positive improvement of this sort by means of official supervision, and other steps are needed. In general, it is far better to spend public money on raising efficiency than on

subsidising prices. The Government, having decided to keep the landlord in existence, should have the sense to tax agricultural land with moderation and to provide new subsidies for farm improvements; while in the other direction it should surely have enough faith in its own theories to present the Land Commission with enough compact blocks of land to be able to demonstrate good farming. Mr Williams's belittling of the Commission's work was most disappointing.

Mr Williams's real work lies before him. Considerable statesmanship is called for in devising a price structure which will raise efficiency and guide production without depressing it. If he would be a little less anxious for unanimity and rather more willing to employ positive incentives, of both a capitalist and a socialist character, his goal of a prosperous and efficient agriculture would be easier of attainment. It is still a long way off.

A New Food Plan

The commission appointed by the Food and Agriculture Organisation to examine Sir John Orr's draft plan for a world food board has now reported. The ambitious Orr plan has been scrapped, partly on account of the difficulty of obtaining the necessary amount of international capital to finance the board's extensive operations (Britain, for one, would not contribute to a project which must primarily benefit producing nations) and partly, it may be suspected, because of American opposition to a thorough-going system of international regulation. In its place the commission has produced a more modest and workable scheme.

It is suggested that international price agreements for primary products should be reached, but that they should be implemented by interpal policy of the nations concerned. An upper and a lower price limit would be internationally fixed, and exporting nations would set up buffer stocks which they would add to when world prices fell too low and dispose of when they rose too high. Such an arrangement should serve to iron out price fluctuations, but it would not avoid the difficulty that, unless prices were fixed at a lower point than would be politically feasible, buffer stocks would tend steadily to accumulate. To meet the danger of chronic over-production the commission has two valuable suggestions. One is the creation of a famine reserve of basic foods held nationally for use internationally, a precaution whose desirability has been strikingly demonstrated during the last few years. The more far-reaching suggestion is that on the initiative of an exporting nation surplus food should be exported at reduced prices to needy nations. How shortly the world may return to conditions of "over-production" is indicated by the report that the United States already has plans to ship its anticipated future wheat surplus to needy nations. This humanitarian project is welcome, although it needs careful watching to see that it does not inflate the prices paid by the one important "non-needy" food importer, Great Britain.

The commission suggests the creation of a permanent World Food Council but its work seems intended to be mainly advisory. In view of the American attitude, it is only realistic of the commission to envisage that most commodity schemes should be prepared under the auspices of the International Trade Organisation. The commission's scheme is well worth careful study as an essay in the possibilities of stabilising world food prices without imposing restrictions on production.

Back to Palestine

The Conference on Palestine has reassembled. The Palestinian Arabs have said their expected say that at no price can they accept partition. The British Government has now to frame a constructive reply; its intention to do so was intimated by Mr Bevin in his opening speech to the delegates. The reply, once formulated, will presumably be presented to the Arabs round the Conference table and to the Jewish Agency representatives outside the door. Whatever it says, it will not be agreeable to both. But the time-worn procedure whereby their refusal to accept a British solution is followed by stolid British relapse into continuance of the *status quo* will not be repeated. Sir Alan Cunningham's recent visit convinced such members of the Cabinet as still needed convincing that enough has been asked of British servants in Palestine, and that a final settlement must now be formulated and quickly carried out. As if to point to what might happen if matters were allowed to jog on, a British judge has this week been kidnapped from his bench as a hostage for the life of a condemned terrorist. Happily, moderate counsels prevailed all

Moscow that British policy will not connive at German resistance or defiance. If the treaty contributes only towards these things, Mr Bevin's decision to travel to Moscow *via* Dunkirk would be amply justified.

This is likely to be only the first of many journeys in search of a German settlement. The most that should be hoped for from the present conference is that it will take the Foreign Ministers some way towards agreeing on the organisation and control of Germany, pending the conclusion of a treaty. To fix the terms of the treaty is out of the question—not even the deputies have yet considered that. Agreement must first of all be secured on the procedure to be followed in framing them. It will also, probably, be impossible to agree on the future Eastern frontier of Germany; yet this is the question which is likely in the long run to dominate all others. The German people will fasten on it as the point on which no German party leader will ever dare to take anything but the revisionist line; German politicians will press it as the issue most likely to divide the occupying powers. Nor is it likely that the political form of a united Germany will be agreed on.

The question on which some decision must be reached—is only to disagree—is how the Germans are to eat, work and trade. The British and Americans will rightly press this above all other matters on the agenda, because they cannot indefinitely subsidise the provision of food and raw materials to their zones. They will want a definite answer from the Russians whether they intend to observe the Potsdam Agreement, whether the food and industrial resources of Eastern Germany are to be pooled with those of the West. The Russians in turn will certainly demand reparations from the production which is being developed in the West and, unless some satisfaction is offered, they may well refuse the economic unification to which they are pledged. Here is clearly a matter on which no British

delegation can compromise. Mr Bevin, in his review of policy last week, told the House of Commons: "The Cabinet has formally laid down that our objective remains the achievement of economic unity and that, in speaking on this subject in Moscow, I should say nothing to saddle this country with increased liabilities." It would be better to defer for the time being any hope there may be of progressing towards a general agreement with the Russians rather than to purchase a fleeting smile from Mr Stalin by agreeing to an unjust and unworkable policy for Germany. The objective of "German economic unity" itself runs some risk of becoming a misleading slogan. It is, of course, desirable, as is Russian friendship. But a unified Germany with a disastrous policy would be far worse—for Germany and for the Western Powers—than a continuance of the present division with an Anglo-American (and possibly Anglo-American-French) policy in the West that is struggling towards the light. There will be other opportunities of coming to an understanding with Russia, but not of rescuing German policy if it takes another wrong turning now.

If for one or more of the Foreign Ministers the present conference is only a stage in the diplomatic chess game, then the new alliance will do little to make easier the settlement with Germany, for lack of which the recovery of Europe is faltering.

If, as some diplomatic observers insist, it is to be the scene of a full-scale Russian diplomatic offensive to divide Mr Bevin and General Marshall, then Mr Bevin will find the Dunkirk treaty useful. If the Russian demand for a revision of the Anglo-Soviet alliance was just a gambit in this chess game, then Mr Bevin's visit to Dunkirk might be described as casting. But if the Russians really want a closely welded ring of new alliances against German aggression, then the first link has already been forged in the West.

Too Much and Too Soon

"AN unfortunate necessity, and not to be justified except against obstruction or by pressure of business." So Erskine May describes the Parliamentary guillotine, which the House decided on Monday to apply to the remaining stages of the Transport and Town and Country Planning Bills, and the truth of the description is confirmed by history. Of 58 precedents cited from the sixty years since the invention of this procedure for fixing a rigid time-limit to the discussion of a Bill, no fewer than 48 date from two short periods of disturbance and high political feeling, from 1902 to 1914 and in the late twenties and early thirties. Of the ten remaining cases, five arose over Ireland, and three (including two relating to a single Bill) to military conscription.

Government must go on, and a procedure of this kind must clearly be available; but the bare recital of the precedents is enough to show the conditions for which it was designed. It is frankly an emergency measure; for, under normal Parliamentary conditions, the Speaker and Chairmen of Committees (including Standing Committees) have adequate means of speeding the pace of discussion without falling back on a procedure so crude and unselective as the guillotine. Irrelevance and tedious repetition of arguments can be ruled out of order. Adjournment motions, once a favourite weapon of the Irish members, need no longer be allowed to serve anything but their own legitimate purpose; and, most important of all, a Committee chairman can at his discretion pass over amendments on the paper and pick out those which seem most representative. There is no reason why discussion should drift from the point or become in any true sense obstructive unless Chairmen allow it; and on this score neither Mr Greenwood nor any other speaker in Monday's debate had any complaint to raise.

The procedure is designed for an emergency; the question is whether the emergency exists. The Government, of course, claim that it does; and there is certainly an obvious parallel between the present years and the Lloyd George era, or the period from the General Strike to the crisis of the thirties. There would be a pressure of business and the "major division of philosophic outlook" of which Mr Ascheton spoke to Standing Committee B, even if the Government were Conservative. If the Government maintain that there is a choice of evils—between preventing full discussion of complex and controversial issues, abandoning or unduly delaying urgently needed legislation, and driving Parliament beyond the limit of human endurance—they have at least the right to have their case examined. Is there, in fact, the "obstruction or pressure of business" needed to justify this peculiarly restrictive procedure?

There are here two issues—the immediate issue concerning the Transport and Town and Country Planning Bills, and the more general question of the impact of the Government's tactics on the status and efficiency of Parliament. So far as the first is concerned, the Government's case rests on four grounds. The first and weakest is obstruction—the claim that the detailed discussions in Committee have been carried unreasonably far. It is hard for anyone who has actually read the reports of the Standing Committee Debates to take this charge seriously. The Chairmen have done their work well. The debates have been neither irrelevant nor unduly prolonged, and there is no better testimonial to their value than the actions of Ministers themselves. Of twenty-eight amendments of substance moved by private members in the two committees in the week before Mr Greenwood's motion, six were accepted, and fifteen were withdrawn against an assurance

of reconsideration by the Minister—that is, were admitted to have raised legitimate points of information or criticism. Of the seven which were rejected, all but one raised important issues of principle on such matters as the closed shop, Ministerial control of the Transport Commission, or the possibility of sub-dividing some of the larger counties for planning purposes; and the one exception was disposed of in less than five minutes.

But, secondly, the Government argue that time presses, and full discussion will mean delay. So it will; but it is not unfair to ask, delay to what, and with what effects? Does anyone but a politician seriously believe that the national transport system, of which two major components—the railways and the docks—are already under direct public control, will fall into chaos if the vesting date under the Bill is put off six months from January, 1948? It would be more regrettable if the Town and Country Planning Bill were delayed; yet even here a delay of a month or two would scarcely be disastrous, now that the main outlines of the Bill are known and the authorities concerned can begin to prepare for the coming transfer of powers. Actual redevelopment over the next year or two is in any case bound to be only too limited in pace. And has due account been taken of the probable loss to the efficiency of these services, both legislative and, as at any rate one Labour member was ready to admit, administrative, through ill-considered haste? There might have been something to be said for rushing through Parliament a measure such as the Coal Mines Act, whose principles had been thrashed out in years of enquiry and discussion, and whose effect—at least in the short run—was in any case intended to take the form largely of a psychological shock; but the balance of advantage in the present case is very different. The Transport and Planning Bills are among the longest and most complicated with which Parliament has had to deal, and the issues which they raise, especially in the case of transport, are still far from familiar or clear cut. There is far more to be lost than to be gained by skimping discussion of them to the point of sketchiness. And, by a curious irony, it is these measures which are to be pushed through by the guillotine while the Coal Mines Bill was not.

If the Government's reference is to other legislation which might be held up, it may again reasonably be asked—which? Is it perhaps the Electricity Bill, Mr Shinwell's pleasant refuge from the chill realities of the fuel crisis? Is the suggestion that the nation's fate hangs in the balance because iron and steel, under public supervision and with a publicly approved reconstruction programme, may not be transferred to public ownership with the brusque decisiveness characteristic of the Minister of Supply? If arguments of this sort are in the Government's mind, then let them lay their cards on the table for the country to judge. What major legislation—emergencies apart—is proposed for the next year or eighteen months? And will its urgency justify the stifling of discussion precisely where discussion could be most useful?

Until more information is actually forthcoming, it may fairly be claimed that it is not in these directions that the justification for the use of the guillotine can be found. But there remain two other arguments of a more respectable kind. The first relates to the pressure on individual MPs. Extra time could be found this year by arranging for an autumn session; but, in spite of the Opposition's readiness to co-operate, members of all parties must have echoed Mr Greenwood's hope that anything of the kind could be avoided. The second is the possible effect of delays and postponement in legislation on industrial morale, particularly at and about the shop steward level. At a time when the Government ought in any case to be pressing for new industrial policies by no means welcome to their rank and file supporters, they may think it important to avoid any further impression, however unjustified, of a surrender to Tory obstruction. The argument is a dangerous one, since

it could easily be used for blackmailing purposes, and the Government is already only too prone to prefer restrictions and controls to positive leadership which might involve friction with its own followers. But at this particular moment the question of industrial morale is not without weight.

But even if these arguments are admitted, what do they amount to? Not, quite clearly, to a case for driving the Committee stage of the two Bills through by Easter, at a pace which makes a full discussion impossible. Parliament is being asked to do too much and too soon. There must be discussion; and the Government's right course is to begin by cutting the legislative programme down to allow it. Yet it must also be admitted that considerations neither of legislative efficiency nor of industrial morale will justify a snail's pace of progress which, as the Chairman of one Standing Committee observed, would prolong this stage of the proceedings till Easter 1949. Is it really too late to compromise—to try to secure agreement with the Opposition on a programme to be enforced by the normal methods at the disposal of Chairmen, with the possibility, if the worst comes to the worst, of an autumn session as a lesser evil than the guillotine? At the very least, why not accept the Opposition suggestion of extending the Committee stage until Whitsun? Mr Greenwood's concession of an extra day at the Report stage is a step in the right direction; but the really vital matter is to secure concessions for the detailed work of the Committees.

Are these considerations, or rather is their proper balance, not apparent to the Government? Perhaps not; and yet a suspicion remains that the true balance was apparent enough, but was weighed down by the exceedingly dangerous general arguments raised by the Home Secretary and other Labour Members. No Government of modern times, Mr Ede commented, has legislated too rapidly. The danger seemed to him not to be that legislation may be too fast, but that it may prove too slow, and in speeding it on its way a Government would be well advised not to look too closely at Parliamentary tradition and precedent. Here indeed is Mr Ascheton's "major division of philosophic outlook." Parliament has ceased to be an initiating body; but with or without Mr Ede's consent it remains, and must continue to remain, the nation's Court of Enquiry. While the floor of the House provides a platform for the questioning of Ministers and for broad discussions of policy and the principles of measures, the Committees should offer scope for detailed criticism in a less formal atmosphere, and for individual Members to make their personal contribution to legislation. If Parliament is to be anything more than a rubber stamp—a Supreme Soviet or a Fascist Grand Council—it is here that the difference must appear; and if Members of real ability are to be attracted, it is here that they must be offered a chance to give of their best. Pep talks to constituents, posting grumbles to Departments, and endless waiting for the division bell are no diet for a man capable of a real job of work.

Yet, can anyone who considers Mr Ede's principles, as translated into the practice of, for instance, Standing Committee D, seriously believe that back-benchers—particularly Government back-benchers—have at present the chance to use their abilities to the full? Is the ratio of 2½ to 1 between Opposition and Government back-bench speeches on the Town and Country Planning Bill a measure of the relative capacity of Conservative and Labour Members to contribute to the Bill's improvement, or merely of the strength of Labour Party discipline? Mr Ascheton will have the support of many outside his own party in hoping that the Government may yet learn in time to save both the quality of Parliamentary democracy and the competence of their own legislation, that sound Socialist instincts are no substitute for a social process of thought. Democratic discussion is incompatible with the present pace of legislation; and when it comes to a choice, the sense of the country will not necessarily be on the side of Mr Ede.

round and a stay of the condemned man's execution resulted in surrender of the hostage. But the incident leaves the impression that the influence of the Jewish National Council (which is now resolved to commend moderation though not to assist the government in stamping out terrorism) is slender and will collapse at the first puff of a wind adverse to Zionism.

A solution without bloodshed looks to be almost impossible, but partition offers the prospect of less resistance than does any other imaginable plan. Many Jews are ready to accept it. A number of Arabs will, while protesting, acquiesce in it, though none will like it, because all fear the proximity of a thrusting, bustling, wealthy Jewish state, but some—even inside Palestine—will give in because they see in acceptance of the situation the only road to a quiet life. Others—outside Palestine—will do so because they have little time for their Palestinian neighbour owing to preoccupation with their own domestic concerns.

If the British Government is to enforce a partition on two communities, sections of which are unwilling to accept it, must it do so singlehanded? No one will want to help, except with advice. The best method of securing the sanction of world opinion for its decision would be to announce to the United Nations Assembly the project that it intends to execute, unless that body can conceive a better, and also supply the forces necessary to carry it out. But the Assembly does not meet until September. And the British official view is that, unless some third party carries the British plan, as a "situation," to the Security Council, the Assembly is the only body that could suitably receive and handle such a statement. If this is so, the time lag of seven months from now until it meets is, to say the least, highly inconvenient.

Liberating Austria

With Germany prostrate the "independence" of Austria means very little. It is not, therefore, surprising that the Deputies of the four Foreign Ministers have quickly agreed on its acknowledgement in Clause I of the treaty they are drafting at Lancaster House. They have found it less easy to agree on what guarantees of that independence should be secured. The Americans wanted a prohibition of any political or economic "tie-ups," the French a rigid ban on an *Anschluss* with Germany. The British very sensibly argued for a temporary guarantee of Austrian independence until Austrian recovery should be well under way, and for prohibition of the *Anschluss* in the German treaty.

Obviously this country of seven millions with nearly half its population in an oversized capital will never make ends meet unless it is closely tied with some group of states that can take Austrian products and help to feed and fuel Vienna. The neighbours have so far been unhelpful, possibly on hints from Moscow. Nothing has taken the place of *Umtra* save the British loan of £8,500,000 for the purchase of food and raw materials. Two million pounds' worth of coal from the Ruhr has still to be paid for. There are hopes of American aid, and some older hands are recalling that Seipel once proposed a customs and currency union with Italy. Soviet intentions for Austria's economic future will remain uncertain until it is known how many so-called "German assets" in the shape of factories, plants and companies are to stay outside Austrian control. To decide this last point may well take the Deputies many days out of the three weeks left before they report to their Ministers.

It is still anybody's guess whether Yugoslavia's claim to 950 square miles of "Slovene" Carinthia will receive Mr Gusev's support or not. It will certainly receive no one else's—not even that of the Austrian Communists. Dr Vilfan very much underestimated a large part of his audience last week when he argued that Yugoslavia could be better trusted than Austria with this "most suitable territory within the eastern Alps for the concentration of large military formations to move in a southern or south-eastern direction." And if the wishes of the population are to be considered at all it is worth recalling that nine-tenths of the votes in Carinthia during the 1945 election were for parties favouring the integrity of the province.

As for the future, only optimists will assume that the underfed, over-controlled and apathetic Austrian people will quickly put real drive behind their reconstruction. The present Government will gain prestige if it can sign a reasonable treaty, but its need of funds and advice will be a standing invitation to interference from outside. At the moment it faces the virtual certainty of an adverse trade balance this year of over £40,000,000.

Plots and Purges in Hungary

The political consequences of the recently discovered conspiracy against the Hungarian Government are not yet clear. It has been officially announced that its leader, General Veress, has been captured and is being interrogated. About a hundred other arrests have also been made, including the "Committee of Seven" that directed the plot. It seems that the organisers came from the class of senior civil servants, former landowners and army officers which ruled Hungary in Admiral Horthy's day. Such people are still numerous and influential enough to constitute a real danger. Fanatically nationalist and conservative, they can never be reconciled to the present regime.

If the version given by the Communist Vice-Premier Rakosi is correct, the conspirators were certainly very foolish. They are alleged to have intended to restore to their former owners the estates distributed among the peasants by the land reform—an aim in which no dispossessed landed class has yet succeeded. They are also said to have planned their action for the moment when the signature of the peace treaty should cause Soviet troops to evacuate Hungary—apparently regardless of the fact that they are still to remain in Austria and Germany. Though mistakes of this kind seem hardly credible, it must be admitted that in the past the former Hungarian ruling class has often shown its lack of realism and inability to learn from history.

Among those implicated are several members of Parliament from the Small Farmers' Party. This party, which represents the peasantry and urban middle class, and won 60 per cent of the votes in the 1945 election, was forced a year ago, by pressure from the Left, to expel some of its more conservative members. They formed a new "Freedom Party" which is in formal opposition to the Government coalition, to which the Small Farmers still belong. It may now be expected that the Small Farmers' leaders will be asked by the Left to carry out a further purge. At the same time the parties of the Left are drawing closer. The Social Democrats have been conferring with the small National Peasant Party. Elections of workers' delegates to "factory committees" have been postponed, by agreement between Communists and Socialists, in order to avoid friction within the working class.

Ever since its creation the Hungarian government coalition has been weak. The ideological and personal friction has caused many prophecies of its collapse and replacement by a Communist dictatorship—and an abortive Right Wing plot will certainly be a godsend to the Communists. Yet, though the coalition satisfies nobody, it is regarded by all as preferable to any practical alternative. Neither Left nor Centre have felt strong enough to rule alone, and this is probably still the case. The coalition has already survived several crises, and there is no special reason to believe that the present one will destroy it.

Road Hauliers' Victory

The committee of inquiry into the road haulage dispute produced its report with admirable speed, and decided after meeting for three days to reverse a decision which the Road Haulage Central Wages Board had taken several months to reach. The men were jubilant, and with every reason, since the committee gave them nearly everything they wanted. The 44-hour working week is to be operated from March 1st, and the cumulative week is to be adjusted, with provision for overtime payment. The only point on which the committee upheld the original decision of the Wages Board was its refusal to extend the length of the holiday period beyond nine days, excluding public holidays, instead of the twelve days asked for by the union.

The evidence of both sides is set out in the report. For the men, it was claimed that increasing numbers of workers were benefiting by shorter hours and that the reduction in hours and the readjustment of the working week, which would bring road haulage into line with the practice on the railways, could be achieved without any loss of operating efficiency if the employers utilised their fleets and manpower more economically. The employers' case was that they had already made as many concessions in the matter of the cumulative week as they could without interfering with flexibility, and that, whatever might be the experience of manufacturing industry, the road haulage industry could not be operated efficiently on the basis of a 44-hour week. They pointed out that the men's claim was in effect a claim for increased overtime, which would add at least 10 per cent to the wages bill, at a time when the high costs of distribution were already the subject of criticism.

There will be general relief that the strike, which at one stage threatened to paralyse the national transport system, was not carried further, and there is obviously no reason why road haulage

workers should not be given as favourable hours and conditions as workers in other industries and services. At the same time it is impossible not to have misgivings about the method by which the crisis was overcome. The men's victory, for it must be regarded as such, will undoubtedly be considered by other workers as an invitation to resort to strike action. The events of the past fortnight have brought the established wage negotiating machinery into some discredit, and it is hard to say whether more blame attaches to the employers for making full use of the opportunities for obstruction which the machinery offered or to the unions and the Minister of Labour for failing to insist on a re-union and the machinery at an earlier date. It is a matter of urgency, if industrial peace is to be maintained by negotiation and not by threats, that there should be a speedy investigation both by the Government and by the two sides in industry itself into the mechanism for dealing with wage claims and settling grievances.

Safety in the Air

The first public enquiry into an air crash since the R 101 disaster had barely started when there was another at Croydon, and the next day the eldest son of the Swedish Crown Prince was killed in a crash at Copenhagen. Dakotas were involved in all three cases, and some unjustified criticism has resulted. Dakotas crash more often than other types because they are more numerous—they represent over half the world's total of commercial aircraft. Criticism of the fact that British and some other European airlines permit this type to fly with an all-up weight more than a ton above that specified by the makers appears more to the point. Yet the layman would be rash to jump to conclusions on this matter in the face of expert advice—particularly since the same experts did not hesitate to ground the new Vikings when the unsatisfactory performance of their de-icing equipment increased the risk of their operation.

Nevertheless, certain broad matters of organisation call for comment. Briefing on communications procedure appears on the evidence of the inquiry to have been inadequate, and the selection of the pilots, neither of whom had flown on the route before, somewhat irresponsible. A French witness maintained that British aircrews make inadequate use of local radio frequencies, relying instead on long-range control from this country. Be that as it may, there is undoubtedly a case, which was beginning to be appreciated even before the recent crashes produced a spate of anxious criticism, for a thorough overhaul of liaison between airfields and a transfer of the responsibility for critical decisions on landing, changing destination, and so forth from pilots to controllers, whose present function is merely to advise. For it is precisely under conditions when such a decision is critical that the pilot is already working under too much strain to be fairly saddled with the responsibility.

The extended use and standardisation of navigational aids will help to reduce the danger from the human factor. But countries at present without equipment are somewhat reluctant to invest in a particular system when the Provisional International Civil Aviation Organisation may soon recommend the adoption of another. For this reason the recent establishment under the Ministry of Civil Aviation of the non-profit-making International Airadio, Ltd., is a welcome measure, without prejudice to the types of equipment finally installed.

Navigational aids, however, are only one aspect. Engine failure at take-off is another, and de-icing a third. The intricacy and vulnerability of modern aircraft make the closest supervision and most careful organisation essential. In order that British air operations may benefit from the most broadly based collaboration on all matters dealing with civil aviation, a National Civil Aviation Consultative Council was inaugurated last Monday by Lord Nathan. Its members are representative of air operators, clubs, air personnel, aircraft constructors and users of air transport, insurance companies and the general public. Other members may be co-opted. Its work should contribute materially to greater safety in the air—the keynote of the chairman's opening speech.

British and American Car Prices

The Economist of last week (page 147) took notice of a remarkable feat of economic leadership by Mr. Henry Ford. By lowering the prices of all models in the Ford range he made the first practical response to President Truman's appeal for the maintenance of purchasing power, went far to dish the United Automobile

Workers' wage offensive, and administered a salutary shock, worthy of M. Blum, to the passive acceptance of inflation. It would be pleasant to see any corresponding lead given by an important British industrialist, whether inspired by pure public spirit, enlightened self interest, or a desire to steal the Labour movement's clothes while it is bathing. But no such picture presents itself on this side of the Atlantic; on the contrary, the Austin Motor Company, whose chairman only last week announced that "we must break prices," has raised them smartly. The contrast between the value received for a similar expenditure on British and American cars was striking enough even before the war. With the resumption of private car manufacture it has become not merely striking but shocking; even, that is, after allowing for the effects of the purchase tax.

British manufacturers have two time-honoured excuses to offer: the well-known importance of overhead costs in the industry, favouring the American manufacturer with his huge home market; and the cylinder capacity (late horsepower) tax, which, together with the petrol tax, penalises the big car. Both arguments are thin, and the second is the thinner. The way to reduce overheads is to reduce the number of models, which the industry has steadily refused to do; and it was the manufacturers themselves who demanded the retention of the cylinder capacity tax, instead of an *ad valorem* tax which would, with an equal yield, have encouraged the production of the cheap, roomy, willing cars which both the world in general and the long suffering British motorist want. Nor was any reason, apart from the manufacturers' preference, ever given why—even assuming the Chancellor to be indissolubly wedded to the principle of the cubic capacity tax—that tax should not have risen by wide steps so as to force concentration on two or three engine sizes. The conjunction of the Ford and Austin price changes is an unpleasant omen for the British export trade. Perhaps before the next Budget Day Sir Stafford Cripps might have a few words on the subject with Mr Dalton.

Alexandra Palace

The present state of television came in for a great deal of criticism in the adjournment debate in the House of Commons last week. Attention was called to the lamentable lack of accommodation at Alexandra Palace, the relatively low pay of the technicians, cameramen, engineers and script writers, the poor quality of the programmes, the limited range of people who can "look in," and the general lack of interest in the development of television, which, as one Member put it, is regarded as "the poor relation of the Third Programme." Many of these criticisms would appear to be justified, but to none of them did Mr Burke, the Assistant Postmaster-General, give an adequate reply. While admitting that the Alexandra Palace was by no means satisfactory, he denied that either the Government or the BBC had been niggardly in their treatment of television—the sum of £2 million is to be spent on its development—and claimed that the British service was ahead of the American in its quality.

It is no doubt true that technical difficulties have prevented any nation-wide development of television. It has been difficult to procure suitable buildings and sites, and material shortages, such as the shortage of steel and glass, have been operative. But the fact is that at the moment there are not more than 15,000 sets in households, and that reception is normally limited to a radius of 45 miles from the Alexandra Palace. It is hoped to set up a transmission station in Birmingham within two years, which will perhaps provide colour broadcasts, but a site has not yet been found; eventually the aim is to develop a network of stations to serve the main centres of population.

Mr Burke spoke of the Government's desire to "regard television as part of an integrated broadcasting service." The objective is very commendable; but at the moment television is apt to be regarded as a freak offshoot of sound broadcasting, and there is little evidence to support Mr Burke's claim that the British are ahead of the Americans.

Tories Off the Air

The Conservative Central Office has issued a statement claiming that in December, out of 32 political talks by 22 different speakers on the BBC home services (Brains Trusts excluded), no single address was given by a Conservative. Fifteen Socialists, six Liberals, one Independent MP, and ten speakers whose political affiliations are unknown shared the field, though some of the last

Postponement in the Pacific

WITH five peace treaties concluded with European enemies, and with the affairs of Germany and Austria now about to be considered by the Foreign Ministers in Moscow, it is easy in this country to forget that there is another region of the world awaiting a peace settlement for which not even the preliminary discussions and deadlocks have yet taken place. It has so far been taken for granted that Japan is at the end of the world peace queue, and even if it is theoretically admitted that prolonged uncertainty is as bad for international order in the Pacific as it is anywhere else, European affairs hold such an overwhelming priority of attention in this country that there is little sense of urgency about the problems of the Far East. Yet in Australia a very different point of view prevails; as seen from Canberra, the Far East is the "Near North" and the Pacific, not the Atlantic, is the neighbour ocean. If ties of special mutual understanding are still to bind together the self-governing units of the British Commonwealth, it is important that what most interests Australia and New Zealand should not be ignored or overlooked in Great Britain, and the question of expediting a peace treaty with Japan is one to

which the British Government would do well to direct its attention.

Dr Evatt, in a speech to the House of Representatives on February 26th, made a strong case for an early peace settlement in the Pacific. He spoke on the same day that the United States delegation placed before the Security Council of the United Nations a draft agreement for American trusteeship over the Pacific islands formerly held by Japan under League of Nations Mandate. The disposal of these islands—which were overrun by American forces in island-hopping operations during the war—is obviously one of the main questions for a peace settlement with Japan, and for the Security Council to decide it in advance, in isolation from other closely related problems of Pacific defence and insular administration, would be to prejudice the final issue of the peace conference when it is held. The British and Australian Governments have both taken up the position that no formal transfer to American trusteeship can legally take place before the peace conference, but the United States Government has declined to accept this restriction, arguing that it has at present actual authority over the islands and that no other Power is claiming trusteeship

for them. The United States has been strengthened in its demand by the acquiescence of the Soviet Union, which was announced by the State Department only a few days before the proposal was put to the Security Council; it had been generally expected that the Soviet Union would make objections to sole American "strategic area" trusteeship in the islands, and the sudden burst of benevolence towards American oceanic expansion—which has left Britain and Australia out on a limb in the cold wind of American displeasure—appears to be connected with Soviet manoeuvres for improvement of diplomatic position on the eve of the Moscow Conference.

The process of dividing the spoils in advance of a peace conference began, indeed, even before the war with Japan was over. In the notorious Yalta secret treaty on the terms of Russia's entry into the war against Japan, Russia received British and American consent to annexation of southern Sakhalin and the Kuriles, and although, strictly speaking, the Big Three had no authority to commit the future peace conference to these transfers of Japanese territory, nobody is in fact likely to question them, and Russia has formally incorporated the areas under its sovereignty. The United States, however, received no promises from Russia at Yalta with regard to American post-war plans in the Pacific, and this is one of the reasons for Washington's keen desire to get its title to the Mandated Islands recognised as soon as possible; there has been some acid comment on the diplomacy which conceded so much to Russia without getting any *quid pro quo* for American interests, and the Navy Department, which has long been determined to establish permanent bases in the captured Japanese islands, has been alarmed at the prospect of Soviet obstruction over the terms of a trusteeship agreement which might force the United States to choose between intolerable restrictions on strategic use and an indefinite occupation of the islands without recognised title. So the State Department is naturally taking advantage of the present diplomatic opportunity to make sure of the prize.

But such piecemeal settlements cannot be regarded as satisfactory in relation to the general question of assuring future security in the Pacific, in which not only the United States, but also Australia, New Zealand, Britain, France and the Netherlands are deeply concerned. Strategically the former Japanese Mandated Islands—the Mariana, Caroline and Marshall groups—are of great importance by reason of their position between Hawaii and the Philippines and between Japan and New Guinea, but they are only part of the strategic picture, which must also include other Japanese islands—the Ryukyu, or Luchu, and Bonin chains which lie nearer to Japan—and islands further south which are under Australian, British or French sovereignty. The question of the Ryukyus and Bonins will still remain over for the settlement with Japan even if the Security Council disposes finally of the Mandated Islands, and the Ryukyus, at any rate, may be a subject of sharp dispute, for, apart from Japanese claims to retain them on ethnic grounds, their position commanding the approaches to the East China and Yellow Seas makes them far more significant for continental Asia than the more remote islands of the ocean. To leave them to Japan would be a risk, and there has been some talk of reviving under American protection the independent state which existed in the islands before 1879; they are at present, of course, under American occupation, and it is unlikely that the Americans will be willing to let go of them. However, Soviet consent to American possession of Truk and Saipan does not necessarily imply consent to a permanent American base in Okinawa.

To the south of the Mandated Islands, the United States Navy, through the Naval Affairs Committees of Congress, has stated its desire for bases in islands now under non-American sovereignties—notably Manus in the Admiralty Islands (Australian Mandate), Guadalcanal in the Solomons (British) and Espiritu Santo (in the Anglo-French New Hebrides Condominium, commonly known as the Pandemonium). Negotiations over the leasing of these bases would be a matter between Allied nations and would not be formally a part of the peace settlement with Japan. But no sovereign state allows even the friendliest foreign Power to establish military and naval bases on its territory without great reluctance; it is only as part of a jointly planned political and strategic system that such rights can justifiably be claimed and conceded. Unfortunately, the United States, conscious of its supreme power and preponderant role in the victory over Japan, has taken it rather too much for granted that the Navy must have whatever it wants without any corresponding obligations on the American side. Britain and France, with their European preoccupations and relatively small stake in the Pacific, might be inclined to yield easily to

NOTES OF THE WEEK

"Blood for Blood"

The Government's recent declaration on India has passed from the Lords to the Commons for debate. The Opposition has tabled an amendment to the motion of approval and is expected to insist on a division. But there is already a sense of futility about these discussions. On the day of the debate comes the news that large-scale rioting in the Punjab has finally brought down the "Unionist" Coalition Government which has so far kept that province free from the extremes of communal tension. While the British Parliament gives itself up to controversy about the date of British withdrawal from India, Indian politics proceed on the assumption that British authority is already at an end; what interests Indian politicians now is no longer getting rid of the British, but the succession, and in the constitutional vacuum the struggle for the succession is to an increasing degree being decided, not by votes or discussion, but by violence and terror.

London may talk about the pros and cons of "handing over power" in June, 1948, but as far as the vast majority of Indians are concerned, power has already been thrown into the gutter for armed gangs to fight over. Since "law and order" have been transferred to the Provincial Governments, it is they and their police who hold the powers of life and death for the masses of the people, and the Viceroy is only a shadow on the horizon, powerless to save or punish. Impartiality of administration has disappeared in the provinces where tension is highest; the Provincial Government is on one side or the other, and its police act accordingly. Vast massacres take place, while the police look on. It is no or even aid the pogrom-makers of the ruling faction. It is no longer possible for the Viceroy even to find out the total numbers of casualties, for it is useless to request statistics from provincial authorities deeply implicated in the murders of their opponents. "Blood shall be avenged in blood!" the slogan used for the massacres in Bihar, is now ringing through Northern India, and the vicious circle of killing and counter-killing—it no longer matters who began it—is no longer controllable by British power. In these circumstances, the sooner the quitting is completed, the better.

India Among the Nations

An Indian Ambassador to the United States has now presented his credentials to President Truman in Washington. The event raises the question—which may soon become acutely embarrassing to the British Government—of the present international status of India. Legally, until June, 1948, the ultimate sovereignty in India remains British, and it is still an open question whether it is to be transferred to a single central Government or to two or more succession States. Yet India has now been granted independent representation abroad as if it were already an independent sovereign State, and this representation is in the hands of Mr Nehru, who holds the portfolio of External Affairs in the Interim Government and is at the same time the champion of a united India. He is, therefore, in a position to appeal to

any American pressure, but Australia and New Zealand are in a different position; their homelands are in the Pacific, the war has aroused them to a consciousness of their vital interests, and they are unwilling to accept a Pacific settlement by American fiat or by deals between the Great Powers. Hence the vigorous and self-assertive Australian diplomacy, which has become such a factor at international conferences. Australia refuses to be sidetracked or ignored. The first fruits of this new and independent foreign policy may be seen in the recent institution of the South Pacific Commission, which closely corresponds to the Australian scheme put forward two years ago. But the larger issue of a peace settlement with Japan remains, and Australia is determined to take a leading part in it; for this reason the disposal of issues piecemeal without a regular conference causes great annoyance in Canberra and a demand for speeding-up the Japanese peace treaty. General MacArthur is also, for different reasons, in favour of an early conference and treaty, and there is indeed a strong case for completing this business during the present year. Japan, unlike Germany, has a Government and can sign.

the United Nations against British "dismemberment" of India if Britain attempts to transfer what is left of the British Raj to any regional authorities not recognised by Congress. India is already represented abroad and in the United Nations Assembly by the nominees of a party which rejects Britain's right to transfer any powers except in accordance with the decisions of the Constituent Assembly now in being, and Britain, though still nominally holding ultimate authority in India, has no control over this diplomacy. Theoretically the Viceroy can still dismiss Mr Nehru, but practically this would produce such an acute crisis that it is almost out of the question. The situation is indeed a fantastic one, and it is really Britain's own fault for having for over two decades insisted on giving India separate representation in international conferences and the League of Nations before full self-government was attained. Diplomatic relations are a function of sovereignty, and ought never to have been conceded to India during the transition period. As it is, the British Government is probably in for some nasty surprises on the international level in its dealings with the Congress Party.

America and the Eastern Mediterranean

The suggestion to Washington that Britain should shed part of the load of financial assistance to Greece was well timed, and a hopeful reply has already reached London. It is not a purely British interest that a slippery foothold for Western influence should be maintained in and around Greece; and it is better done by firm economic support than by occasional naval cruises which cause unnecessary irritation in Moscow and retard rather than hasten appeasement in Greece and demobilisation in Turkey. Such support can no longer come from British resources alone, and it is only with reluctance that it has been decided in London to fix no date for the final withdrawal of British troops from Greece.

The presence in the country for many weeks to come of the Uno Commission of Enquiry, the work of the American Commission, and the preparation of the Greek Government for a spring drive against armed bands which refuse to take advantage of concessions and amnesties, offer together the prospect of some stability during the summer. The assurances of joint Anglo-American support may ensure that the Greeks will make a strenuous effort to press on with political conciliation and economic reconstruction, without which the future would remain full of danger both internal and external.

The American response to the British appeal has to be considered against the background of consultations with Government colleagues and politicians with which General Marshall has been preparing himself for his journey to Moscow. American interests in the Middle East appear to have been discussed at length. If this should enable General Marshall, as well as Mr Bevin, to use the opportunities of informal discussion which the Moscow meeting will offer to consider relations with the Soviet Union outside Europe, the chances of agreement between the four Foreign

group would probably in fact be Conservative. The BBC's reply is that, whatever may have happened in this particular month, the figures for a series of months show that opportunities for MPs to get on the air are, if anything, overbalanced on the Opposition side; while, where speakers outside Parliament are concerned, the Corporation does not and should not inquire into their political opinions. If the BBC has, in fact, anything of a left-centre bias—and, if so, it is not easy for a casual listener to detect it—the accent is far more heavily on the centre than on the left.

The point, however, is not so much the merits or demerits of the Conservative case on this particular issue as the fact that the issue needs to be raised at all. Under a reasonably competitive system of broadcasting, as *The Economist* has frequently pointed out, a party which failed to secure enough time on the air would have no one to blame but itself. It is perhaps poetic justice that Tories should now be hoist on the petard of a monopoly which one Conservative government established and later Conservative or National administrations maintained; and it may be hoped that this painful experience (or alleged experience) will finally convert Conservatives to a belief in free broadcasting enterprise. With the technical barriers to competition crumbling, and the experience of Holland, the Dominions, or the United States to serve as a guide to administration, the days of the BBC's monopoly should be numbered; and self-interest alone, as the shades of the Socialist prison-house begin to close, should inspire Conservatives to give the lead in this matter which their own professed principles demand.

In this connection a most interesting technical development is now in the offing. The BBC have invited tenders for the erection of two experimental transmitters using the Frequency Modulation (or FM) system. FM, which has been developed quite a long way in America, gives very clear reproduction free of interference. It uses short wave-lengths, and thus dodges the difficulty of scarcity of medium wave-lengths which besets the more orthodox system of broadcasting. It would be possible to have a great number of FM stations in Great Britain, though each of them would cover only a small area. It is an exaggeration, to the point of untruth, to say, as one newspaper has done, that the advent of FM will make it necessary for every listener to scrap his present set. Development will not be as rapid as that. But FM does open up the technical possibility of having a network of broadcasting stations in this country and thus removes the chief technical reason for the present monopoly.

Party Spoils in Japan

It is often embarrassing when people do in excess what they are asked to do. The recent purge decrees of the Japanese Government have shown an excess of virtue in that they have gone far beyond the directives originally issued by Supreme Allied Headquarters for the eviction of militarist and chauvinist elements from Japanese public life. This zeal is somewhat surprising, for it was widely assumed that the parties of the Right, politically preponderant in post-war Japan, would try to protect persons who, even if compromised by their records in relation to Japan's war-making policies, were fundamentally of "their own sort," and Left-wing circles, both in Japan and in the United States, loudly claimed that there could never be any thorough-going purge in Japan unless the Left came to power. But on paper, at least, the scope of the Yoshida Government's new purge orders is so far-reaching that it has caused some bewilderment to foreign observers and *The Times* Tokyo correspondent has reported a belief in "informed quarters" that the development is due to "the pressure of the extreme Left."

But there is a certain relation between cause and effect even in Japanese politics, and there is no reason for a Right Government to yield to the pressure of the extreme Left when it has a safe majority in the Diet and security from the Allied Supreme Commander against violent insurrection. Nor is there any evidence that the Japanese people is so overwhelmed by repentance for past policies that the Government is driven to far-reaching proscription by an insistent public demand. There has been so little compulsion from either Allied or Japanese quarters for the policy which the Government has been pursuing that there can be no doubt but that the latter is grinding an axe of its own in the matter. The reason is not far to seek, if the effects of the change of regime in Japan are taken into account.

Before the war the political parties had very little patronage to bestow; civil servants were selected by examination and had a high degree of security of tenure, while business appointments were at the disposal of private firms; in any case the parties could obtain only a limited share of political power owing to the strength

of extra-parliamentary factors under the old system. Now the parties have full power in proportion to their electoral success; at the same time there is an intense competition for jobs in Japan among the educated classes, for the country is deeply impoverished, the military and naval careers are closed, there are few good openings in trade or industry, and many thousands of Japanese who made a living overseas have been forced back into their homeland. The parties are seeking to build up their strength by rewarding their followers with jobs and attracting supporters by their power to offer jobs. The purge principle has given the Government parties a golden opportunity for expelling thousands of persons from posts not only in the public administration, but also in private business, and replacing them with good party supporters. It is not the Left, but the Right, parties which stand to benefit most from this spoils system, for they are already in power and can make the new appointments; even if the Yoshida Cabinet collapses and the Social Democrats enter a coalition Government, the Right parties can still use their majority in the Diet to get the larger share of the patronage.

Jugoslav Refugees

The murder of a Yugoslav consul by Chetniks in a camp near Naples last week will provide more material for anti-British propagandists in Belgrade. The crime occurred during a visit which the consul made on his own responsibility, against the advice of the British authorities. Perhaps the unfortunate man believed his own government's propaganda, which asserts that the majority of exiles, "the best sons and daughters of the people," long to return home, but are being forcibly prevented by a reactionary clique supported by British imperialists. Whatever the detailed facts, this lamentable incident illustrates a situation which has long been intolerable, and must be remedied.

British policy with regard to Jugoslav (and, indeed, other Eastern European) exiles, has been muddled and weak from the beginning. The Jugoslavs, amounting to hundreds of thousands, now scattered across Germany, Austria and Italy, fall into four distinct categories. First are the ex-prisoners of war, mainly though not exclusively Serbs, who were captured by the Germans in April, 1941. These men are honourable Allied soldiers, and those among them who for political or personal reasons do not wish to return to Jugoslavia under Marshal Tito are morally entitled to expect sympathy and help from the United Nations in general and Britain in particular. The second category are those Chetniks who fought against the Germans and did not willingly collaborate with the enemy against their fellow countrymen. To these men, too, Britain has moral obligations. The third group are those who were conscripted into various quisling formations. The most numerous of these are the "regular" Croatian Army (Domobran), which was not a political force, but was based on compulsory service. Others were mobilised into various "regular" Serbian or Slovene quisling forces or into collaborationist Chetnik units. All these men have fought against their fellow-countrymen in the service of the invader, yet many plead compulsion of one kind or another. Their case is arguable. Finally there are the members of political armies—the Croatian Fascist *Ustashe*, Ljotic's Serbian Fascists, and the leaders of the collaborationist Chetniks. These men are simple traitors and deserve no pity. The Jugoslav Government's claim for their surrender is fully justified.

The fault of British policy has been that for two years it has made no serious attempt to separate these categories from each other. It is difficult for British officers or military government officials to do this without directives; yet though the information required for the directives has been available in London and elsewhere, no orders have been given. The result has been that all Jugoslav exiles have been equally treated, and the genuine refugees have been compromised by association with traitors. Jugoslav Government propaganda has been able to denounce all British welfare work for refugees as "pro-Fascist activity." And indeed, though this accusation is in most cases false, it is not always entirely so. Men like General Damjanovic (a Serb who led troops under Wehrmacht command), the priest Djujic (who fought side by side with Germans, Italians and Croatian Fascists against Tito's men), and Jevdjevic (who kept in contact with German and Italian political and security chiefs), until at least recently, enjoyed freedom of movement, and have had opportunity to spread their Fascist ideas (the word is here used in its exact meaning) among the depressed and bewildered refugees.

The most fantastic case of all is Pavelic, the murderous Croatian Fascist leader, organiser of King Alexander's assassination and of the massacres of Serbs and Jews, who has "disappeared." The

Jugoslav Government believes that the British and Americans are protecting him. This is doubtless untrue, but if formal and urgent orders were given from the highest quarter to all Allied security services, it would surely be possible to find him.

This question is of importance, for it has played a big part in poisoning Anglo-Jugoslav and Anglo-Soviet relations in the last two years. It can be put right without any sacrifice of British interests, and until it is put right it will be impossible to make progress with the great humanitarian task of caring for genuine refugees.

The BMA and Mr Bevan

The British Medical Association has relented—a little. Last December, when the preliminary results of the plebiscite of doctors were made known, the Council announced that it would submit to a special representative meeting a recommendation that there should be no negotiations between the profession and the Minister of Health on the regulations to be made under the National Health Service Act. Since then, two things have happened. The final results of the plebiscite revealed that the majority against negotiations (54 per cent compared with 46 per cent) was not large enough to justify the Council's decision. Secondly, the correspondence between the presidents of the three Royal Colleges and Mr Bevan, commented on in *The Economist* of January 18th (page 98), revealed a conciliatory attitude on the part of the Minister which the Council could hardly ignore.

When the special representative meeting was held this week, therefore, it had before it a resolution of the Council that negotiations should be entered into provided that they were comprehensive in their scope and that the possibility that they might lead to further legislation was not excluded. The resolution was carried by 252 votes to 17. This does not mean, however, that the forthcoming negotiations will be easy going. The BMA leaders apparently still hope for an amending Act which will concede their main demands: the abolition of the clause in the present Act which prohibits the sale and purchase of practices in the public service; the right of any doctor to practise in the public service wherever he wants; the complete disappearance of the salary element in a doctor's remuneration; and the right of a doctor to appeal to an independent body against the recommendation of a tribunal that he should be dismissed from the public service.

On the first demand Mr Bevan cannot give way at all. On the second he cannot give way in principle, though he can go some distance in practice—by, for instance, laying as much emphasis as possible on incentives in unpopular areas and as little as possible on the restriction on practising in popular districts. The public has an interest here as well as the doctors; for free entry and competition, even if modified by a medical wages policy, are as valuable to the consumer of medical services as to the buyer of industrial goods. Local monopolies are a menace to the public, and Mr Bevan has in fact already declared that in the appointment of general practitioners to vacant practices in the public service he intends to allow as much individual choice and local initiative as possible.

In any case, he might reconcile the BMA on these points if he could make concessions somewhere else. Would it not be possible for him to incorporate in the regulations on remuneration the gist of an amendment passed in the House of Lords but turned down by the Commons, and allow a basic salary to be the exception rather than the rule? The Medical Practices Committee might be left to decide whether, when a vacancy was being filled, circumstances demanded that the incoming doctor should be paid partly, or wholly, by salary. Finally, if Mr Bevan could evolve some means by which a doctor's case, in the event of his dismissal, could be given an independent hearing, he would reassure, not only many doctors but a large part of the general public which regards with extreme misgiving this further instance of a Minister being the sole arbiter in his own disputes.

The War Office and the Brewers

The need for national planning—genuinely national planning, with powers to enforce decisions even on recalcitrant Government departments—could scarcely be better illustrated than by the decision of the War Office to retain 238 acres of London's Green Belt near Coudon and Purley for a bombing range. Five minutes in front of the Land Utilisation Survey's map of Great Britain, or the admirable population maps published for the Ministry of Town and Country Planning, should be enough to convince any unpre-

judiced observer that proposals for the further engrossment of open country anywhere in Southern England for purposes of this kind ought to be treated with the utmost suspicion; and when it comes to interference with London's distant and inadequate Green Belt suspicion ought clearly to harden into something a good deal stronger. In view of its manifold needs for urban development, for agriculture, and above all for recreation, the South is far too crowded to accommodate further military activities which can by any manner of means be diverted to the more open country in the North and West. The question, to which attention is drawn in a leading article on p. 179, is whether the existing of prospective machinery of national planning is powerful enough to enforce a view of this kind. Perhaps it is, and perhaps the new Town and Country Planning Bill will add sufficiently to the prestige of the Ministry of Town and Country Planning and its weight in inter-departmental battles to allow it to counter-balance (or at least play off against one another) the narrower views of other Ministries. But for the moment it is an open issue whether the capacity of the War Office for passive resistance, or the relative political importance of London local authorities as compared with demonstrators in the politically marginal areas of Wales, may not be bigger factors in the Government's decisions than unbiased consideration of the best use of the nation's land.

While the War Office has been drawing attention to a field in which planners have intervened too little, the brewers have brought up a case in which past interference has gone much too far. The New Towns Committee not long ago approached the delicate subject of beer with a tact which barely concealed the abandonment of the pussy-foot sentiments of the founders of Letchworth Garden City. The Government, in the person of the Home Secretary, last week expressed its hearty agreement; and the London brewers propose early in March to open an exhibition illustrating the planning of licensed houses in areas of new development. It will, incidentally, illustrate the need, only too often neglected in development schemes in the inter-war years, for planning authorities to consult as a matter of routine with the interests affected by each individual development scheme. The brewers' version of planning for freedom deserves every encouragement—even if, as rumour suggests, their resistance to the insidious assaults of the planners is sometimes carried a little too far.

The Right to Potter

First prize for the silliest piece of interference with people's private affairs, encouragement of snoopers, penalisation of enterprise and misuse of sledge-hammers for cracking nuts, will be duly awarded to Mr Tomlinson, the Minister of Works, for last week's Order on unpaid labour in the building trades. Henceforward any citizen who, having on hand materials—paint legally acquired over the counter, timber from a disused outbuilding or home-made breeze blocks—to the value of £10 must, before he rolls up his sleeves and constructs a new henhouse, apply to his local authority for a permit and wait the necessary weeks until he receives it, under penalty of the law. Worse, he must, if the wording of the new Order means what it says, acquire such a permit before he can even undertake in his own house any job of a total value exceeding £10, including labour as well as materials. One can foresee some pleasant legal proceedings, worthy of Sir Alan Herbert's *Misleading Cases*, with the prosecution arguing that the defendant, having spent a fortnight's holiday and several week-ends on odd jobs and decorations, had at trade union rates exceeded the permissible minimum by 20 per cent; while the defendant will plead that, since he had not attained trade union standards of proficiency, his time should be reckoned at a lower rate, bringing his suspect activities well within the law.

In practice, of course, the Order will be quite unenforceable. How much unsavoury tale-bearing it may elicit can be judged from Mr Tomlinson's own figures of complaints received and convictions made under existing Orders—11,155 complaints, 222 convictions. Snooping, whether private or official, is the last thing likely to encourage a healthy public opinion; and only a healthy public opinion—the notoriously powerful sense that such and such a thing is not done—can effectively prevent the abuse of paid labour masquerading as unpaid which the Order is designed to end. So far as it does succeed in penalising and limiting genuine self-help and neighbourliness it constitutes one more encouragement to the passive and mindless waste of leisure: one more blow to that old educative process of family co-operation which industrialisation has so largely destroyed, and one more narrowing of the small field in which even a mass-production worker can be his own master. There are many rights which could be surrendered with less damage than the right to potter.

Ministers should be improved. There have been signs that the Americans are anxious to begin discussion of the Pacific settlement; and it is legitimate to hope that the British delegation will show an interest in discussing British and Soviet policies in the Middle East. A little give and take on the fringes of the bargaining about Germany should help either to make the Russians more conciliatory or to show conclusively that they have no wish to be so. It is in Greece and the Eastern Mediterranean that the bridge between European and imperial policies lies.

The Services' Manpower

The detailed estimates for the armed forces, of which the totals had already been given in the recent White Paper on Defence, have now appeared and are summarised in the following table:—

	1946-1947		1947-1948	
	Maximum Strength	Net Estimate £'000	Maximum Strength	Net Estimate £'000
Navy	492,800	275,075	192,665	196,700
Army	3,015,000	732,000	1,210,000	388,000
Air Force	760,000	255,500	370,000	214,000
Total	4,267,800	1,262,575	1,772,665	798,700
Add: Labour force required Ministry of Supply's Vote†	1,169,600	416,000	450,000*	95,500
	5,437,400	1,678,575	2,222,665	894,200

* Minimum strength to be reached March 31, 1948.

† Excluding Ministry of Supply's non-defence expenditure.

The individual estimates for the coming year are not strictly comparable with this year's, for the Service Departments themselves will in future bear the cost of various supplies borne during the war on the votes of the Ministry of Supply or the Ministry of Aircraft Production.

But it is not the total cost in money of the defence forces that will be scrutinised so much as their total strengths. The figures given for the forces in the table are maxima. By the end of next March they will be reduced to 1,087,000. But this reduction will not satisfy many critics, not least of whom are within the Labour Party itself. These will represent a more formidable challenge to the Government Front Bench than did the dissidents on foreign policy. Their ranks include the foreign policy "rebels," the anti-conscription elements, members of the party's own Defence Committee, and a considerable section of trade unionists who, otherwise loyal to Mr Bevin, nevertheless criticise the Services' man-power figure as incompatible with the national man-power situation. It is not clear precisely what form the challenge will take, and whether there will be a debate in the near future on the White Paper as such; but a motion for the reduction in the size of the armed forces will almost certainly be considered by the Parliamentary Labour Party at its meeting on Monday and, if it does reach the floor of the House, will command considerable support. In any event, the forthcoming debate on the Economic White Paper will provide back-benchers with an opportunity for urging upon the Government their view that, with the present man-power shortage, the number of troops maintained abroad or kicking their heels in home establishments should be drastically cut down.

The critics are proposing that instead of the reduction of 340,000 from the December, 1946, level of 1,427,000 the Services' share should be scaled down to three-quarters of a million, which would make available a quarter of a million more potentially productive workers, without in any way jeopardising British defence commitments. Although the discussion principally concerns the Army, the demand is being made for an investigation into the position at Admiralty shore establishments, where it is alleged that there is a considerable waste of personnel. The suggestion for pooling resources with the Dominions for Imperial defence purposes is also being advanced. But the main point—on which the Ministers who reply will be most vulnerable—is whether the Service departments have not again succeeded, as they did during the initial stages of demobilisation, in dictating to the civilian Ministers.

To Leave or Not to Leave

As the result of the close-down of industry, the longer-term difficulties revealed by the Economic White Paper and the imminence of April 1st, a good deal of excitement has bubbled up

about the need to postpone the raising of the school-leaving age. The economic arguments for a short-period postponement, which is all the country would consent to, are very weak; for the numbers who stay on each term are small, and it will not be until September, 1948, that the whole extra age-group has accumulated. The immediate effect of postponement would, in the next six months, only add to the total labour force those children whose fourteenth birthday falls within that period. The raising of the leaving age does not result in any sudden and substantial decrease in the supply of labour on April 1st, but only a gradual one. Some 430,000 children leave school at 14 each year, which is equivalent to rather over 2 per cent. of the total labour force. As fourteen-year-olds can rarely do an adult's full day's work, and many of them do not go into employment for many months, the net subtraction from the total labour force is unlikely to be more than one per cent. even as far ahead as twelve months hence.

The educational arguments in favour of postponing the raising of the school-leaving age are very much stronger. The standard of the education which the children will receive is dependent upon three factors, the supply of teachers, the erection of extra classrooms and the provision of equipment. As the full impact of the increased numbers will not be felt until September, 1948, the increases can be met in stages over the whole eighteen months. On this basis it is hoped that sufficient teachers will be forthcoming through the regular and emergency training colleges. The position on buildings and equipment is much more precarious. The situation varies between different authorities; even before the fuel crisis, few local education authorities could feel comfortable about the deliveries of huts and equipment, but many of them had a reasonable hope that they would squeeze through. With the February stoppages the position has worsened greatly, though how much it is too soon to tell. Delays have certainly occurred both in constructing the temporary huts and in fitting them with even the minimum of tables and chairs; paper production for books has also been affected. As a result, the additional numbers staying on will certainly lead to a deterioration of general standards with consequential discrediting of the new reform. The Government might well have taken their courage in their hands and decreed a year's moratorium on raising the school-leaving age—provided always, in view of possible political repercussions, that it was made quite plain that their action was taken for educational and not economic reasons.

LCC School Plan

There is no lack of ambition about the London County Council's £187 million plan for London's schools. It is a grandiose conception, involving an average labour force of 12,000 building operatives over eighteen years, and will at its peak cost the ratepayer an additional 4s. 2d. on the education rate. Coming at the present time, when the difficulties of the nation in producing even the basic essentials of life are so vividly in mind, it strikes an unfortunate note, however excellent the ideals behind it. If comparable plans are produced for houses, roads, civic centres and the like, far more than eighteen years will be required for their completion.

The proposals are closely modelled on the Abercrombie plan, with a primary school with some 700 children for each neighbourhood unit and a secondary school, on the "multilateral" model, with 1,200-2,000 children for each community serving an area of about a square mile. Nursery schools for the 2-5 age group will serve far smaller areas, and will have only 40 places. Playing fields are one of the LCC's worst headaches, since it is quite impossible to provide more than the minimum open space round the schools and in parks for the primary schools alone. Playing fields for secondary school children will be in the Green Belt, where classrooms will be built, so that each class can spend a whole day a week outside London.

Of the 460,000 children in the county area 190,000 will be at secondary, 216,000 at primary and 54,000 in nursery schools. The capital cost of the scheme per child will therefore be about £400 at current prices, of which by far the largest proportion will be on new secondary schools, which are considered to be the central problem, and will demand almost completely new buildings. It is to be hoped that progress on a number of these will be sufficiently slow to benefit from experience of the "multilateral" system in the others. But the bold spirit which conceived the plan and the care and lucidity with which it has been drafted deserve great praise. The children of the future will not suffer from the timidity of their parents, though they may well lose something from their passion for size and equality.

Voluntary Effort

At the request of the National Deposit Friendly Society, Lord Beveridge is undertaking an enquiry into "mutual aid and other forms of voluntary action in social service." Voluntary effort takes two forms: effort on behalf of oneself and effort on behalf of others. Under the first head come all forms of saving, from the nation-wide saving organised by the National Savings Committee to the local slate clubs. In between comes voluntary insurance, and as Lord Beveridge's enquiry is to be sponsored and financed by a friendly society, it will presumably mainly deal with the scope for voluntary insurance once the National Insurance Act of 1946 comes into force and provides by compulsory insurance a minimum income for virtually the whole population.

But Lord Beveridge's enquiry will also be concerned with the other form of voluntary effort, that undertaken on behalf of others. There can hardly be any doubt that there will still be need for this, even when social security for all is nominally established. The gradual assumption by the State of the responsibility for the social services has not so far been accompanied by any falling off in voluntary work in the same field. A treatment centre for mothers convicted of neglecting their children and a council for the care of sufferers from cerebral palsy are but two recent examples of how voluntary effort can find new outlets even in a Socialist state. In the establishment of Homes for the old and the young it was a pioneer. Lord Beveridge's task will be to determine how this form of voluntary effort, at present often misdirected and therefore wasted, can be put to the best effect.

Soviet Reshuffle

The latest session of the Soviet Parliament—the Supreme Soviet—resulted in several reshufflings in the Government of the USSR. The most important of these has been Mr Stalin's resignation from the post of Minister of the Armed Forces and the appointment of General Bulganin as his successor. The Generalissimo's reason for his resignation was "the excessive burden of his main work," presumably diplomatic business connected especially with the forthcoming conference of Foreign Ministers. But it is almost certain that the Soviet public will see in Mr Stalin's resignation an act of deeper political significance.

The gesture would seem to be calculated to underline that the Ministry of Defence is now no longer as important as it was before; that the Soviet Government is bent on maintaining peace almost at any cost; and that the direction of the armed forces can therefore be left in the hands of a second-rate personality such as General Bulganin. Soviet opinion undoubtedly links this with Mr Molotov's plea for disarmament before the United Nations and with further cuts in defence expenditure in the new Soviet budget. In the estimates for 1947, the Ministry of Armed Forces gets 18 per cent of the expenditure compared with 24 per cent in 1946 and 43 per cent in 1945.

Another somewhat sensational reshuffling is reported from the Ukraine. There Mr Khrushchev—"the Stalin of the Ukraine"—has been dismissed from his post as Secretary-General of the Ukrainian Politbureau and replaced by Mr Kaganovich. Only exceptionally grave uneasiness over the economic and political situation in the Ukraine could have impelled Mr Stalin to make this change. Mr Khrushchev has apparently not been able to master the chaos and devastation that war and Nazi occupation left behind. Shortly before his dismissal the Government announced that in 1946 the total industrial output in the former occupied provinces had not yet reached 50 per cent of pre-war production. The Ukraine has also been most severely affected by the drought. In the past, Mr Kaganovich has often been employed in the breaking of bottlenecks by shock methods—his present appointment foreshadows the use of some such methods in a determined effort to speed up the rehabilitation of the Ukraine.

Of the other recent changes, the following are of some importance. Mr Voznesensky, chairman of the Planning Commission, has been appointed a member of the Politbureau in Moscow, which increases his authority. Mr Zhdanov has resigned from his post as Chairman of the Supreme Soviet. The Minister of Health has been dismissed. All these and other changes add up to a considerable shake-up in the Administration. There have also been a number of "reformist" moves in the legislative field, such as the foreshadowed incorporation of Habeas Corpus in the new Criminal Code and Criminal Procedure—all designed to create the impression (or possibly more than the mere impression) of a liberalisation of the regime.

German Drive for Dollars

While the House of Commons was expecting disclosures last week in the debate on a supplementary estimate for Germany and Austria of over £39,000,000, Mr Hynd heard the first doubtful voice—of what may well be a chorus—asking questions about the coming German export drive. They came appropriately from one of the Socialist members for Coventry; they elicited the very un-Socialist reply that "it would probably be a good thing for British industry if there was a bit of sharp competition here and there."

This easy-going aside is, presumably, not typical of the spirit in which Mr Hynd and the President of the Board of Trade will conduct their arguments about German competition with British exports in hard currency countries. The issue has hardly yet arisen in practical form, because no long term export programme for Germany has been submitted to the Cabinet. Its form and content await the result of the Moscow Conference. But the American partners in the Joint Export-Import Agency of the fused zones have already announced a target of £300,000,000, and there is evidence that a tug-of-war between the Board of Trade and the Control Office has already begun.

Three different, but equally important, questions arise. First, will Mr Hynd be able to maintain the claims of dollar-earning German exports against the fears of British industry expressed through Sir Stafford Cripps? The latter has the ear of his colleagues at all Cabinet meetings, particularly at those which discuss trade policy; Mr Hynd can attend only those meetings which discuss Germany. Secondly, what happens if there is deadlock on the Anglo-American body controlling German exports, for example, if the Americans insist on directing them into channels which injure British interests? Thirdly, what is to be British policy regarding German trade with Eastern and Southern Europe (which has no dollars to offer) especially with those ten countries for which Germany in 1936 was both the biggest supplier and the biggest market?

To raise these questions now is not to challenge the policy of subsidising the recovery of Western Germany. Even if it were economically wrong—which it is not—the British taxpayer would demand that the Germans should pay for their own food as soon as possible. But sooner or later the attack from British industry will begin; and woe betide the Chancellor of the Duchy of Lancaster, if it is then revealed that there is no clear Cabinet brief for the British officials running German exports, that these are under-selling (thanks partly to low labour costs) British and French manufacturers, and that the British taxpayer is being saved £100,000,000 a year only at the expense of his own export drive.

Reconditioning Rural Houses

Soon after the Labour Government took office the Minister of Health announced that the new Housing (Rural Workers) Act, proposed by its predecessor, to encourage the reconditioning of rural cottages, would be dropped. This was an interim decision. Mr Bevan declared that as soon as possible he wished reconditioning to be resumed, but that first priority must be given to the building of new houses, to which all the available rural building labour should be attracted.

The Rural Housing Sub-Committee of his Central Advisory Committee has shown in its fourth report (HMSO, 9d.) that even as an interim decision this policy was short-sighted. Proper reconditioning adds to the total housing accommodation available by bringing back into use houses which would otherwise remain unoccupied and by providing extra rooms in existing houses. It also includes a much-needed element of diversity in the housing programme, since the cottages concerned are of varying sizes and can accommodate the larger family, the childless couple or the single person as required. Secondly, full reconditioning will provide a modernised house for about half the expenditure of labour and material required for the same quantity of new houses—by no means an irrelevant point in the light of the Economic Survey's references to the building industry. Thirdly, the balance of evidence received by the committee shows that in the country there is labour suitable for reconditioning which is not suitable for building new houses—this is particularly true of the village craftsmen. Moreover, much of the rural labour is immobile, but could be used for reconditioning property in its immediate neighbourhood.

Having established the case for reconditioning, the committee then discusses how it could best be encouraged. It recommends that the former maximum grant of £100, which, since the owner

Letters to the Editor

The Twilight of Ministers

SIR,—Although I recognise that the admirable article which appeared in your columns last week could only accord a summary treatment to this subject, I feel that there was one serious omission among the precedents mentioned. I refer to the case known as Dalton's Dilemma."

If future Chancellors of the Exchequer had been allowed to arrogate to themselves the same degree of technical information, or to bandy about their department's secret plans with that academic playfulness for which their predecessor in the middle of the twentieth century was so justly notorious, it is legitimate to doubt whether the overweening powers of Cabinet Ministers would ever have been shorn. The chief credit for the vision which immediately perceived the danger—if not for the solution ultimately adopted—must go to the head of my own department. He it was who first realised the prime importance of "The Question of Sources of Personnel Supply." It was useless, as he pointed out in the Purple Paper on this subject, for the State bureaucracy to go to the universities for their supplies of labour, if part of this pool of skilled men leaked away each year into other occupations. How, he asked, could the administrative service of the nation maintain its high quality, if it was not to have the only reservoir of trained human material entirely at its disposal? The question was particularly relevant, for at that time an excessive proportion of our best young men at the universities were being absorbed into the frivolous pursuits of party politics, and meanwhile the State was being forced into the position of an unhappy mendicant begging for the reluctant services of the "marginal intellectual." And the leader in this movement away from public responsibility was the Labour Government's own Chancellor of the Exchequer—the prototype of the arrogant political intelligentsia of the mid-twentieth century.

The manner in which the "Dalton Dilemma" was solved provides yet another example of that happy spirit of compromise, which you rightly acclaim as the desideratum of "less fortunate peoples." The planned allocation of labour was one of the tenets of the government then in power, and it was only a short step from this principle to the law, which has stood the test of time for almost a century, that the State service should receive a first priority allocation and that the surplus should be "seconded" to certain other essential occupations—from which politics was, of course, excluded. That dealt effectively with the future. The problem of the intellectuals who were already in ministerial circulation remained, and there appeared to be no way, short of assassination, round this obstacle to the onward march of British constitutional development. However, the trade unions once again came to our aid, and since the great party purge of "armchair socialists," which preceded the introduction of the two-day week at about this time, the drab don has virtually disappeared from the English political scene.—I am, sir, your obedient servant,

A. SHONFIELD (P.R.O.)

The Ministry of Skilled Labour (Civil Service Commission),
The Athenaeum

Nationalisation and Efficiency

SIR,—Two articles in your issue of January 18th advance the following propositions: (1) The Electricity Bill is good but not urgent and ought to be postponed. (2) The economic fate of the country depends upon the sense of responsibility of the 10 per cent of active trade unionists who provide the effective leaders of working-class agitation.

Can you imagine any quicker way of killing their sense of responsibility than postponing nationalisation measures and so convincing them (however wrongly) that the Labour Government has sold out to capitalism?—Yours faithfully,

Trinity College, Oxford

PHILIP WILLIAMS

SIR,—Mr Tom Sargent's letter in your issue of January 11th is interesting as an example of the methods used by advocates of nationalisation of industry in presenting their case. Industry, privately operated and owned, is wasteful (no evidence being produced); the greatest wastage arises from separate undertakings competing with each other for profits; the aggregation of as many businesses as possible under single ownership would eliminate this wasteful competition for profits; the example of the ICI and other large industrial groups proves this; therefore, nationalisation or

grouping on one balance sheet would eliminate wastage in industry and would also permit production of a "socially useful" character at present not entered upon because it is unprofitable.

One would like to see evidence that public ownership, where it is in practice, is less wasteful and more efficient than private ownership: that if competition were eliminated the community would benefit; that so-called "socially useful" production or services will not become an additional burden on the community, or a matter of subsidy of one section at the expense of another; and, finally, that we have the ability to design and to operate the kind of organisation which will be required to handle these great aggregations of industry under public ownership.

In other words, what we require is a little more evidence and much less *ex parte* statement. To take one point alone: is Mr Sargent quite sure that within the industrial concerns he has in mind there is either greater over-all efficiency or avoidance of competition between individual units?—Yours faithfully,

44 Endcliffe Rise Road,
Sheffield, 11

W. H. HIGGINBOTHAM

Principles of Compensation

SIR,—That Stock Exchange prices reflect political insecurity has long been painfully familiar to British investors in Russia, in South America and in China. But is it not precisely to guard against the changes which result from politicians' being judges in their own cause that we should insist upon our accepted practice in the past that compulsory acquisitions should be at a price determined by an independent valuer, who is bound to assume a willing vendor and have regard only to the intrinsic value of the property? Otherwise, short of complete communism, you favour all other property owners at the expense of those who happen to run the particular type of property which the state covets. Does your correspondent, Mr Watkins, really favour this?—Yours faithfully,

Glebe House, Knebworth, Herts

G. R. Y. RADCLIFFE

The Polish Elections

SIR,—I do not think it is possible to make any analogy between the abandonment by us of our former Russian friends in favour of the new Bolshevik rulers of that country and our relation towards the Poles who fought on our side throughout the recent war. The Russian revolution was an internal affair of the Russian people, the Communist régime was established there without any outside assistance, even to some extent against foreign intervention.

On the other hand what has occurred in Poland was not a change of her political and social system, brought about by a genuine native process, but an enforced imposition on the country of a foreign system, in opposition to the will of the overwhelming majority of the Polish people. The issue is, therefore, not social reforms, as sometimes suggested, but the freedom of a whole nation, menaced from outside.

Neither does it seem fair to describe the Communists and their puppet groups in Poland as the Polish "Left Wing"—while simultaneously calling all the genuine Polish political parties, forming the backbone of the Polish nation, "Right Wing." This alleged Right Wing contains elements sometimes more socially radical and "leftish" than most of the Socialist leaders in the West. That which separates them from the Communists is their will to preserve democratic liberties and to resist all the forms of totalitarianism.

To assert that the only alternative to the Communist rule in Poland is the dictatorship of the extreme Right Wing is to obscure the real issue which is at stake in Poland—the issue whether the Polish nation will be free to shape its own destiny.—Yours faithfully,

J. S. WILLIAMS

Cotton Costs and Prices

SIR,—The letter from Mr R. P. Lynton on "Cotton Costs and Prices," in your issue of January 11th, appears likely to give a wrong impression of the effects of a shorter working week in the cotton industry.

The trade unions did not, during the joint negotiations, base their claim for the shorter week on the belief that production would

not decline; on the contrary, they claimed, and were conceded, a compensatory wage adjustment fully proportionate to the reduction in hours to maintain earnings in view of the anticipated loss in output. It is difficult to compute indirect gains of the shorter week, and the position should be assessed in terms of what deterioration might have ensued in the overall situation by retaining the longer week rather than in positive advantages from introducing a shorter one. In practice, it is the general experience that output has declined since the shorter week was introduced—at many mills, at least—or even more than proportionately to the reduction in weekly hours.

The great bulk of cotton cloths are subject to price-control orders of the Board of Trade, which, even before the change in hours, restricted margins to a level which was anything but generous. The adjustment which the authorities have allowed is materially less than would be necessary to compensate employers fully for the higher wage-rates and higher incidence of overheads per unit consequent upon the reduced hours.

Incidentally, our protest against the experiment at John Bury and Co. was not based upon the merits or otherwise of five-day working; it was made because unilateral action at individual firms on matters of far-reaching consequence strikes at the whole principle of collective bargaining upon which our industrial structure at present fundamentally rests.—Yours faithfully,

GEO. B. FIELDING, Director

The Cotton Spinners and Manufacturers' Association,
Midland Bank House, 26 Cross Street, Manchester 2

Canadian Appeals

SIR,—Your interesting note on "Canadian Appeals" in your last issue has one slip which you may wish to correct. The Dominion did indeed abolish the appeal to the Judicial Committee in criminal cases in 1933, and the validity of that Act was upheld by the Judicial Committee itself in British Coal Corporation versus the King in 1935; but no Act has ever been passed abolishing the appeal in civil cases. The recent proceedings dealt with the validity of a Bill introduced in the House of Commons

in 1939, but never passed. The Dominion Government referred this Bill to the Supreme Court of Canada for an advisory opinion; the Court upheld the validity of the proposed legislation; and certain Provinces then appealed. It is not yet certain whether the Dominion Government will proceed with a similar Bill at the coming session of Parliament.—Yours faithfully,
3 Lakeview Terrace, Ottawa, Ontario

EUGENE FORSEY

Bretton Woods

SIR,—While thanking you for the review of my book *Bretton Woods for Better or Worse* in *The Economist* of January 25th, may I correct a misapprehension? I have nowhere suggested that a high bank rate would be the appropriate treatment of the present monetary situation. As I have said in the preface, my criticism is of the International Monetary Fund as a permanent or long-term plan. I have also, it is true, pointed out the present and immediate need for stabilising the wealth-value of money. But, when "the commercial banks have been stuffed overfull with Government borrowing," something more drastic than dear money may be needed (such as the forced loans which have been resorted to in Belgium and some other countries to extinguish redundant money). And, if inflation takes hold in the United States (where the total of currency, plus demand deposits, has quadrupled since 1929), a rise in the gold value of the pound sterling (probably by several stages) may be necessary to guard against inflation here. Such measures might have to be supported by dear money, but that might not be necessary.

Your reviewer suggests that in advocating freedom to alter parities, I go far towards denying any value to international co-operation in the monetary sphere. But my contention is that, given Anglo-American co-operation in stabilising the wealth-value of the pound and the dollar, rates of exchange would present no difficult problem, and that, without such stabilisation, it would be disastrous to tie the pound to the dollar, and to commit Great Britain to whatever alternations of inflation and deflation the United States might indulge in.—Yours faithfully,

R. G. HAWTREY

Books and Publications

Spengler-Toynbee History

"A Study of History." By Arnold J. Toynbee. Abridgement of Volumes I.—VI. By D. C. Somervell. 617 pages. 25s.

THE Victorians with few exceptions believed in progress. The fact of progress appeared obvious to them, not only on the material, but also on the moral and political plane. Doubts about the inevitability of progress have, however, become more frequent during the last thirty years. Two devastating wars, an unprecedented economic setback and a vicious spiral of ferocious social revolution and counter-revolution have naturally raised the question whether civilisation is really as secure as it looked about 1900, whether indeed it may not be on the way to breaking down altogether, and this has led to a new interest in the fate of systems of human society and culture which came to grief in the past. In the heyday of Victorian optimism historians were of course familiar with ruins, but they were not reckoned really significant; the heir of all the ages did not then think it possible he might be one with Nineveh and Tyre. A corollary of the belief in progress was a concept of the unity of civilisation which fitted in well with the egocentricity of the European outlook; as the way of advance had been through Western civilisation, which was then spreading over the whole world, other forms of civilisation seemed of little importance; they were merely outmoded constructions like the scientific theories of earlier times.

Spengler, the pioneer of the reaction against nineteenth-century optimism, had quite a different idea of civilisation. He held that history revealed not one civilisation, but many, and that each history showed a certain cycle of growth and decay; all civilisations, including the Western, were therefore comparable, and by comparative study of them it was possible to foretell in outline the destiny of the modern world. The work of Professor Toynbee is on the whole in the succession to Spengler, though it has a much more English quality; Toynbee avoids Spengler's absolute determinism and his mind has a brilliant and stimulating vivacity of thought in striking contrast to the pompous and ponderous style of the German scholar. Yet the Toynbee revision of Spenglerism does

not altogether escape from a rigid schematism which is open to the charge of distorting history rather than interpreting it.

The book which has just been published is a one-volume abridgement (made not by Professor Toynbee himself, but by an admirer of his work) of the first six volumes of *A Study of History* which were published before the war with a promise of more to follow. The great length of Toynbee's own composition is not accidental; he is interested in non-European cultures not only for purposes of illustrating his general theory, but for their own sake, and many pages are devoted to particular episodes, so that the book tends to become an encyclopaedia of the lesser known phases of human history. The abridged version concentrates on what is deemed essential to the theory and most interesting to the general public, and it is significant that more than half of the total number of pages is concerned with the "break-downs" and "disintegrations" of civilisations. It is the decline, and not the advance, which gets the greater share of attention.

The value of the Spengler-Toynbee method for historical thinking lies in the release it affords from crude conceptions of single-track automatic progress. Instead of regarding all past civilisations as mere steps upward to our own eminence, we are enabled to view them as "responses" to the "challenges" of specific conditions; history can thus be closely integrated with anthropology and sociology and new insight gained into the processes of cultural and social evolution. But the method needs to be used with great caution and respect for facts; if analogies are pressed too far, it quickly breaks down and becomes a trap for the unwary. Professor Toynbee in his desire to classify civilisations and reduce their history to a common pattern, produces some extraordinary results. On the analogy of the growth of Western civilisation from the dissolution of the Roman empire (the "universal state" of Hellenic civilisation), he dates "Islamic civilisation" (or the two different civilisations into which he divides it) only from about 1275 and calls the Caliphate empire the "universal state" of an earlier "Syriac" civilisation. But the rise of Islam was quite different from that of Christianity; it did not grow within a empire of alien culture, but made its own state from the outset. The distinctive cultural achievement

was expected to contribute one-third of the cost, was based on the assumption that the average cost of reconditioning was £150, should be raised to £300 in view of the rise in building costs. Of this amount, the Exchequer should pay £200, the county council and the rural district council halving the remainder. The committee also recommends, Miss Jennie Lee, significantly, dissenting, that these grants should, as under the old Acts, be paid where necessary to private owners (including owners of "tied" cottages), although it should continue to be a condition of grant that the cottage should be occupied by a person who can pay only a rural worker's rent and that the rent should be controlled within this limit. Mr Bevan may find it difficult to swallow this recommendation. Yet his acceptance or refusal of it will reveal his real desire. Does he really wish to increase the total rural accommodation at the lowest possible cost in materials and mobile labour and in the shortest possible time? Or does he put his political prejudices first?

Town Planning in Committee

The first few days of the standing committee considering the Town and Country Planning Bill were spent on an issue which has become familiar under Labour legislation. How much independence should be given to the Central Land Board, which the Minister is to appoint to administer the £300 million compensation fund and to levy development charges? The Bill, following the familiar pattern, leaves the Board's constitution and powers to be settled in the main by Ministerial edict. Mr Silkin was of course able to claim that this makes for flexibility, while the Opposition argued with a good deal more force that it also makes for a secret and uncertain division of responsibility between Minister and Board which is highly unsatisfactory. Although Mr Silkin has yielded on some points of detail, such as accepting that the Board's permanent secretary—although appointed by the Minister—should be dismissable by the Board, he clearly means to keep a tight rein on the Board's general operations.

The Bill simply states that the Board shall "comply with such directions as may be given to them by the Minister." Mr Silkin stated his willingness to specify that these should be "directions of a general character" and further to provide that an annual report of the Board's activities should be presented to Parliament, stating any directions that had been received from the Minister, except where secrecy was enjoined in the "public interest." These are valuable concessions; but can secrecy ever be really essential in this matter?

Mr Silkin quoted an example. It may well be desirable to levy lower development charges in South Wales and other development areas so as to attract enterprise. This can be done by means of a general instruction to the Board which would be made public. This is sound enough. But Mr Silkin suggested that, in addition, it might be desirable, "on planning grounds," to vary the development charge within the development area itself, and to do so by way of secret direction from the Minister to the Board. This argument envisages that the Board should be used by the Minister as an instrument of detailed town-planning control, auxiliary to his direct powers of forbidding or limiting development.

Any such arrangement is of very doubtful wisdom. It would establish a two-headed control, would require yet more co-ordination among planning bodies, and might undermine such planning freedom as the local authorities are to be given. Surely the purpose of the Bill is that decisions should be taken on planning grounds and that financial adjustments should be consequential? It may be argued that in some cases building will not go where it is wanted, unless special financial inducements are offered. This may hold for a broad area; but within that area it is surely better to offer developers a limited choice of sites (any unsuitable site can, after all, simply be banned) rather than to risk creating the envy and uncertainty which differential charges may create especially when they are operated in secret. It is difficult to believe that the possibility of secrecy, however useful a weapon it may be against obstruction, can do more good than harm.

Ritual Murder

The uproar in the House of Commons on Monday of this week over the delayed executions for ritual murder in the Gold Coast will long stand as a classic case of parliamentary solicitude for the welfare of colonial peoples at its most belated, ill-informed and misdirected. No heed was paid, by those who endeavoured to argue that the principles of British justice had been set aside, to the fact that the Gold Coast Legislative Council whose new

unofficial, elected majority is quite free of any possible dictation by the Governor, is quite capable of acting as a sounding board for local opinion. It would have performed this function by now if there had been a gross miscarriage of justice, without the intervention of the imperial Parliament. The exchanges with the Colonial Secretary in the House showed a complete lack in many cases of any knowledge of conditions in the colonies. Fortunately, members redeemed themselves to some extent on Wednesday after Mr. Creech Jones had made a full statement of the facts and of the Governor's views.

The background to the murder was given on page 641 in *The Economist* of April 20, 1946. Delay in the executions has been due to three factors. First, there have been the carefully timed legal quibbles of the lawyers of the accused whenever execution was imminent. The second cause has been the anxiety of the Gold Coast administration to consider all legal issues raised by the defence, which is understandable, since human lives are at stake. The third has been the intervention by a group of Members of Parliament some time ago to secure further consideration of the case, an intervention which was slow to take any concrete form, but which effectively delayed the executions. Responsibility for delay thus rests on all three to some extent, but primarily upon the family of the late Sir Ofori Atta, with which the convicted men have some blood relationship.

Clearly the Governor, whose full responsibility in the matter has now been upheld, has a difficult decision to make. If the sentence is carried out, Western principles of law and justice (dispensed originally, it should be noted, by an almost entirely African jury) will be vindicated. On the other hand, to execute five men after three years' delay is repugnant to British feelings. Yet if the sentences are commuted, then ignorance, fear and superstition will have gained a resounding victory—and the lesson will not be lost on the inhabitants of the "bush" villages of West Africa. In this country the whole incident is a startling illustration of the degree of ignorance in high quarters of colonial affairs. In matters of justice it is usually the best course to trust the juries, the judges and the executive authorities who are on the spot. If Members of Parliament are not prepared to do that, they should at least inform themselves of the facts.

Crisis of the Hungarian Coalition

The Hungarian political crisis, created by the discovery of the anti-government plot, has deepened in the last weeks. Among the persons allegedly implicated was the General Secretary of the Small Farmers' Party, Bela Kovacs. This man's past record shows that he was no Fascist, and in particular that he was a convinced supporter of the Land Reform. He is of peasant origin. He was, however, generally regarded as belonging to his party's Right Wing, and strongly opposed the infiltration of Communists into the civil administration. As General Secretary, he was responsible for appointments within the party, and is believed to have used his influence in favour of its more conservative elements. He himself admitted mistakes in this connection, but firmly denied that he was engaged in a conspiracy.

The Committee of Privileges of the Hungarian Parliament examined his case, and decided on February 22nd against the annulment of Kovacs' Parliamentary immunity. The decision was denounced by the Communist Vice-Premier, Rakosi, and the Social Democrat Minister of Justice, Riesz. On the 24th it was announced that Kovacs had voluntarily renounced his immunity, and submitted to interrogation by the head of the Political Police. On the 26th it was learned that he had been arrested by the Soviet authorities.

Pressure by the Left Parties on the Small Farmers continued. On March 1st the Small Farmers' leader, Premier F. Nagy, announced that the party would make every effort to "harmonise its political views with those of the Left-block parties." A split has also taken place in the small National Peasant Party, which politically stands between the Small Farmers and the workers' parties. It represents part of the poorer peasantry, and is led by a group of very able radical intellectuals. Its General Secretary, Imre Kovacs (not to be confused with Bela Kovacs), has now resigned and has been replaced by Erdei, who stands for closer co-operation with the Communists.

It remains to be seen whether the coalition will stand this crisis. Hitherto Hungary has differed from her south-eastern neighbours in that a moderate conservative party was represented in the government, and enjoyed very wide freedom of Press and public meeting. This state of affairs was always deplored by the Communists, who argued that it was the cause of the unfavourable attitude of the Soviet Union to Hungary's territorial claims at the

Under One Roof

Here, under one roof, is an organisation covering virtually every requirement in Office Machines, Systems and Equipment.

Most particularly, we are concerned with planned control of raw materials, stock, assembly, man-power, production capacity, progress, selling, and accounting. There are few problems of industrial or commercial control on which we cannot throw the light of specialised experience.

This comprehensive service becomes more apparent during a visit to our systems display rooms.

Accounting Machines; Adding Machines; Calculating Machines; Filing Equipment; Production Control Charts; Kardex Visible Records; Certified Safe Equipment; Remington Typewriters and Supplies.

of Islam was already virtually complete by 1275 and it was particularly brilliant in the period which, to fit the scheme, is compared with the "Dark Age" in Western Europe. Similar distortions are inflicted on Indian and Chinese history for the sake of comparability, and they seem to show that the method used, though it can be a good servant, is a bad master.

Marxian Economics

"Studies in the Development of Capitalism." Maurice Dobb. Routledge. 396 pages. 18s.

MR DOBB's studies, as he himself points out with engaging candour, have grown rather than been designed over a matter of twenty years. Taken together with the need to translate Marxist terminology into the more usual language of political and economic discussion, this process has made them hard reading; and the faint-hearted student may perhaps be excused if he ends by wondering whether his trouble was really worth while.

The most valuable service of Mr Dobb's approach is to drive home once again the lesson that economics must be political economy, concerned with the texture of social life as affected by the market economy as well as with the working of the market itself. History is the best corrective to an unduly technical and market-minded approach to economics; and Mr Dobb avoids, at least in principle, the opposite error of converting economics purely into politics and forgetting that the economist has a special sphere and competence of his own. So far, so good; but, when it comes to current problems, which were after all the author's main target, a book which might have been as illuminating as Schumpeter's *Capitalism, Socialism and Democracy*, peters out through obstinate adherence to the Marxian categories. A framework of thought which makes it impossible to recognise the new feudalism of the USSR for what it is (one remembers the illuminating comparisons drawn by Professor Brogan between pre- and post-Revolutionary Russia), or to proceed beyond the crudities of a Palme Dutt in the classification of Fascism, is not much help in forecasting the problems of the next generation. A little less insistence on using the tools of the Bronze Age of political economy would have paid Mr Dobb a handsome dividend; for, while the study of history may certainly illuminate the future, it is necessary first to analyse the present accurately enough to be able to ask the historian the right questions.

West Indian Analysis

"Welfare and Planning in the West Indies." By T. S. Simey. Oxford University Press. 267 pages. 15s. net.

THIS is a depressing book. Commissions and Royal Commissions are for ever visiting the West Indies, whose inhabitants must have been more reported upon than any other people in the world. Professor Simey, who was social welfare adviser to the first Comptroller for Development and Welfare in the West Indies, does not merely add another fact-finding survey to the numbers that have already been published; he goes back far beyond the existing facts to find their causes. As a psycho-analyst investigates an individual's personality by leading him back to first things and uncovering early environmental stress, so Professor Simey explores the West Indian personality by tracing the origins of the West Indian community. In so doing he explains the main features of West Indian society to-day, not by the people's descent from the African negro, but by the fact that they were slaves. It was the plantation economy that laid the foundations of society. It was Emancipation that destroyed the foundations, and they have never been re-built.

It is not this analysis that makes the book depressing. Indeed, Professor Simey's conclusions about the personality that emerges from it are encouraging. Unlike some other observers of the West Indians, he rejects the proposition that the West Indian is naturally indolent and a permanently inferior specimen of humanity. He finds that the basic personality is sound—or could be if it were not for the two adverse environmental factors that mould it. The first is his poverty. The average West Indian is so poor, so utterly and appallingly poor that he has a craving for food which has become a complex as dominating as sex is, in Freudian analysis, to the average man. The second is his colour. To the influence of colour on social status, and to the attitude of the dominant white caste, Professor Simey, like other sociologists, attributes a great deal of the West Indian's frustration and consequent aggression. The aggression may be overt, or it may be

veiled in the submissiveness and accommodating attitude that are so characteristic of the West Indian.

What is depressing about Professor Simey's study is that although both these environmental stresses are, or should be, removable, he does not seem to see any prospect of this happening. In the case of West Indian poverty, it is not for want of trying. The Development and Welfare organisation was hailed as a great step forward in improving West Indian conditions, but Professor Simey examines it critically and finds it in many respects, particularly in its economic policy, sadly deficient. In his view, nothing less than an entirely new approach is needed, accompanied by new methods of administration and new types of administrators, both in Whitehall and in the islands themselves. And the patient must co-operate with the therapist.

His criticisms will not be popular; and it may be that his conclusions and recommendations, which are not always easy to grasp owing partly to some clumsy writing and partly to his abundance of ideas, are too drastic. But those who would scoff at them as unrealistic and would condemn his analysis as meaningless should first answer these questions. If he is wrong, who is right? And why is it that in spite of all the reports and White Papers, in spite of all the effort and sums of money that have been directed to the islands, conditions should remain so bad and the West Indian personality remain so disintegrated and unstable?

Shorter Notices

"The World of Learning 1947." (Europa Publications Ltd.) 532 pages. 60s.

This is a guide to international academic life which should fill many of the gaps brought about by the war in the world of thought. It contains detailed information concerning universities, colleges, learned societies, scientific institutions and associations, libraries, museums and collections of many countries and the names of the principal staff running them.

"At Home with Income Tax." By R. W. Harris. Stone and Cox. 178 pages. 7s. 6d.

Since a "good tax" should be easily understood, and since the chief beast of burden is the man-in-the-street, a short guide to "How to fill up your returns correctly, understand and check your tax, get the reliefs to which you are entitled and claim repayment," should help to satisfy an obvious and even urgent demand. The explanation of different types of tax and an excellent index should provide the ordinary citizen with a useful help in trouble.

From The Economist of 1847

January 30, 1847

THE wealth of every nation is derived from the labour of its inhabitants, and as it is by physical and mental labour that all is produced, the facilities of obtaining national riches are in greater or less proportion to the intelligence existing in the country. By the spread of knowledge and education, the people are enabled to produce the greatest amount of commodities for exportation, with the least physical toil, whether they be the direct productions of the soil, or are derived from the natural and artificial resources of the country. By the influence of education and intelligence on legislation, wholesome and just laws are enacted; by equal and good laws, the industry of its inhabitants is encouraged; and the people thus finding themselves secure in the peaceful enjoyment of the fruits of their labour, without the imposition of partial and excessive taxation, the general resources of the country are rapidly and extensively developed, and the nation becomes proportionately prosperous and happy.

To use the words of Edmund Burke—"Education is the cheapest defence of nations."

The following extract from the letter of "A Dorsetshire Tenant-farmer" tells its own tale:—

"... I was led to believe when I took the farm that I should not be injured by the ravages of game,* but it has since proved quite differently... Believe me, Mr. Editor, no person could well tell the compensation I ought to have received last year for the destruction the pheasants did to my wheat and barley crops; I consider myself at least 300*l.* out of pocket, owing to the damage the game did me last year; and it is not very pleasant to a farmer to be dogged about in the manner we are, by the rascally gamekeepers, especially on our own lands; I consider they do us as much injury as the game....

* That is the usual tale told to a new tenant on entering a game farm. Victim after victim has been trapped in that way.

Peace Conference. The Small Farmers Party is now to undergo a further purge, and seems likely to lose all independence. There has been talk in the Left-wing Press of new elections, which would probably more closely resemble those of last autumn in Bulgaria and Roumania than the free elections held in October, 1945.

* * *

Government and Opposition in Bulgaria

In Bulgaria, from which (as from Hungary) Soviet occupation forces must shortly be withdrawn, things are not going smoothly. There was a stormy scene in Parliament at the end of January, when the Premier, M. Dimitrov, accused an Opposition member of having obtained by illegal means information discreditable to the Government's conduct of the elections. When Dimitrov demanded the removal of this man's Parliamentary mandate, all Opposition members left the chamber. In a speech on February 11th Dimitrov denied that he intended to expel the Opposition from Parliament. "We could do this, but we shall not." He mingled accusations of sabotage with appeals to "honest and patriotic" members of the Opposition. These two virtues are frequently demanded by Balkan Communist leaders, who often show considerable latitude in their interpretation.

Two trials of alleged military conspirators have been recently held in Sofia. The two groups are the "neutral officers" led by General Popov and the "military league" led by General Stanchev. The first apparently propagated the view that a new war between the Great Powers was impending, and prepared "black lists" of Government supporters for future revenge. The second planned armed action against the Government and "the restoration of the old order." Stanchev was one of the leaders of the military group on which the "Zveno" Party was originally based. He played an important part as a technical organiser of the revolution of September 9, 1944, and distinguished himself in the campaign of the Bulgarian Army against the Germans in 1944-45. He was then given the military command of the Plovdiv district. During 1946 he began to quarrel with the Communists, and in August he was arrested, at the same time that General Velchev, then War Minister, was disgraced.

The background to political troubles in Bulgaria is the economic crisis arising from the 1946 drought, which, though less disastrous than in Roumania, is very serious and is expected to reach its climax in May. Dimitrov, in his Parliament speech, used the words "our people may starve and the livestock die off if the necessary measures are not taken." In these circumstances the Two-Year Economic Plan, submitted to the present session of Parliament, though an admirable document, sounds a little academic. It provides *inter alia* for the doubling of the number of "labour co-operatives" (the Bulgarian version of "kolhozy"), and the creation of 50 "Machine Tractor Stations" by the end of 1948. Electrification plans, to which the Government attaches special importance, include the establishment during 1947 of 12 thermo-electric and 16 hydro-electric centres and 16 transformer sub-centres. Where the agricultural machinery and electrical equipment will come from is not stated.

* * *

Dock Decasualisation

The principle of decasualisation of dock labour, applied for the first time during the war, has been recognised by both sides of the industry as necessary for the permanent organisation of the ports. But efforts to reach agreement on the terms of a scheme have hitherto failed, and the Minister of Labour has had to intervene with his own draft proposals. His scheme would mean the supersession of the wartime arrangements for regulating dock labour and the replacement of the National Dock Labour Corporation and Ministry of Transport schemes for the Clydeside and Merseyside ports by a National Dock Labour Board. Its object is "to ensure greater regularity of employment for dock workers and to secure that an adequate number of dock workers are available for the efficient performance of their work."

The machinery and organisation proposed would follow the broad lines of the recent Forster Committee of Inquiry, and would preserve the main features of the existing arrangements. The Board would be responsible for maintaining a register of dockers and employers and for the allocation of workers to registered employers. It would have powers to ensure that satisfactory schemes for welfare and training were operated. The Board would consist of a chairman, vice-chairman and ten other members appointed by the Minister, together with eight representatives, in equal numbers, of employers and trade unions. It would appoint local Boards, consisting of equal numbers of employers and union representatives, to deal with the day-to-day administra-

tion. Dock workers would be regarded as being in the employment of the Board, and would be expected to accept any work to which they were allocated; disciplinary measures would be taken against any who failed to comply. The scheme would be financed through a levy on employers, fixed by the Board, generally as a certain percentage of gross wages.

The Minister's scheme will be submitted to both sides of the industry for their acceptance; objections can be lodged during the next forty days. There are bound to be some; for the scheme imposes a measure of control which may well be unpopular with both sides in an industry with a strong individualist tradition, while the employers will probably resist the idea of joint control over its administration. The latter objection is certainly wrong; for here, if anywhere, is a case where labour aspirations to joint control can be satisfied, not only with no loss, but at a positive gain to the national welfare. The main legitimate criticism of the scheme is that it evades the controversial question of payment for the guaranteed week. This question has been referred once more to the two sides with instructions to try to effect a settlement by March 31st; if they fail, as they are almost bound to do, the matter will be submitted to arbitration. In general, the new scheme has the advantage over its predecessor of being on a national basis, but will need to be highly flexible in its operation if it is to succeed in so variegated an industry.

In the immediate future, it would affect rather more than 70,000 workers. Whether a labour force of this size will be permanently required depends upon such factors as the level of international trade and the extent to which mechanisation can be introduced into the handling of cargoes. At the moment there is a definite surplus of labour in the docks—which, apart from any other disadvantages, is a thoroughly uneconomic use of manpower urgently needed elsewhere.

* * *

Fire Services Bill

A strange divorce of financial and administrative responsibility makes its appearance in the Fire Services Bill, the text of which was published recently. The dispersion of control in the hands of a multitude of small authorities running the fire services, which existed before the war, is to make way for the concentration of control in the hands of the county and county borough councils, who are to bear seventy-five per cent of the cost. Yet, in spite of the general administrative experience of these larger units of local government and the fact that they will bear the main cost of the fire services, the Home Secretary is to have in his hands almost all the powers over pay, conditions of service, discipline, appeals, and methods of appointment; over the design and supply of equipment, and over the organisation of local schemes. This division between the man who pays the piper and he who calls the tune can hardly be palatable to the more independent authorities.

The need for more efficient and better co-ordinated arrangements than existed before the war is beyond dispute, and it is also desirable that the wartime National Fire Service should be given back into local hands, but it is doubtful whether the Home Secretary need have assumed such all-embracing powers, which give him the right to intervene in the details of local arrangements, or, if he considered this power essential, whether the Exchequer is justified in shouldering only twenty-five per cent of the cost. The powers of the Home Secretary are closely modelled on those he already possesses over the police by the Police Act of 1919, but the Exchequer grant in the case of the police is fifty per cent. No doubt the Treasury has argued that a twenty-five per cent fire services grant is handsome enough when no grant at all was payable before the war, and the Home Secretary has countered that he must have greater powers, and the bargain has been struck accordingly. But both sides of it are at the local authorities' expense.

Shorter Notes

In answer to a Parliamentary question on March 3rd, Mr T. Williams said that he hoped that approximately the same number of German prisoners would be available for the next harvest as for the last one. This surprising expectation was partially explained by a statement that agriculture would be accorded the highest priority, when the remaining prisoners were allocated for work. Even with such a reallocation with all its wastage of acquired skills, the slowness of the rate of repatriation is painfully brought out.

*

The scheme for assisted emigration to Australia, which was announced in March, 1946, will come into force on March 31st of this year. Shortage of shipping will restrict numbers, and

Mr Bottomley assured the House that the proportion of skilled artisans would be limited.

*

The Secretary of State for the Colonies has appointed a committee, to be known as the Colonial University Grants Advisory Committee to advise him on expenditure on higher education in the colonies. The committee will function on lines similar to the University Grants Committee for this country. The chairman is Sir Hector Hetherington. The first task of the committee is to apportion the £4,500,000 earmarked from the Development Fund.

*

The Minister of Health has decided to permit an increase in the maximum selling price of houses built by private builders

Letters to the Editor

The Case for Deflation

SIR,—Your leading article, appearing by courtesy of the Minister of Fuel and Power in the *Financial Times* of February 28th, was so excellent that it seems mere perversity to criticise what was, after all, an unimportant metaphor.

But if a boat "is being borne along by the current of a river," it is more difficult to steer it and not more easy. In fact, if the current is more rapid than the pace of the boat, the only way to continue is to proceed stern foremost with a heavy weight over the bows.

The more I consider this as a simile of the country's present method of progression, the more do I think that your writer has achieved an unconscious brilliance.—Yours faithfully,

A. B. ROBBINS, Capt.

11 St. Mary's Road, Wimbledon

[We wish we could claim it was conscious.—EDITOR.]

SIR,—Your "Case for Deflation" appears to rest on a statement in the earlier Economic White Paper, which you paraphrase as follows: "seven billion pounds of purchasing power are pressing on six billion pounds of goods." Great play has been made with this idea. Is everyone quite clear as to what it means?

The Government seem to suggest that the value of available consumer goods and services should not be noticeably less than the total of all incomes after deduction of income-tax. Admittedly Lord Keynes questioned the social value of private thrift; but we hardly feel that he would have suggested the complete elimination of saving. For surely this is the logical conclusion to be drawn from the Government's argument?

What is this £6,000 million of "goods and services available to be bought by consumers"? We can only assume that it represents an estimate of the total of consumers' expenditure. If this is so, a comparison with the situation in 1945 may be helpful. In that year consumers' expenditure at market value amounted to £5,645 million. The total of incomes, after tax, was £7,103 million. The difference of £1,458 million was, of course, net saving. So far from bewailing this "leeway," the Government in effect exhorted the public to increase it, by spending less and saving more.

The propensity to consume may well be much higher now than in 1945. But surely this does not justify elliptical arguments innocent of any reference to the function of saving. The Government's favoured solution to the present problem appears to be an increase in the output of goods and services to a point at which the entire net income of the community is required to absorb it. Yours, Sir, appears to be to seek, by a different approach, a similar equilibrium—on the one hand to reduce incomes and on the other (a more original approach) to combat inflation by removing controls and allowing prices to rise. Both solutions appear to involve the total elimination of saving, and with it of investment. We realise, however, that appearances (especially wraith-like ones) are apt to be deceptive.—Yours faithfully,

A. C. GILPIN
ANGUS MAUDE

16 Queen Anne's Gate, S.W.1

[Mr Gilpin and Mr Maude, like good economists, are trying to make the matter more complicated than it is. The six billions

under licence owing to the rise in building costs. In future the maxima will be £1,300 (£1,400 in London) compared to £1,200 (£1,300 London) previously. As many local authorities have been receiving permission for some time to accept contracts up to the higher figures, this concession is only fair.

*

In the Ministerial changes announced this week, Mr H. A. Marquand, Professor at the University of Wales, becomes Paymaster-General; Mr J. H. Wilson, Fellow of University College, Oxford, takes his place as Secretary for Overseas Trade, and Mr E. F. M. Durbin, Lecturer at the London School of Economics, becomes Parliamentary Secretary to the Ministry of Works. Forty years ago professional politicians played quite a large part in academic economics, providing several vice-presidents of the Royal Economic Society. The rôles are now being reversed.

of goods surely include the investment goods that are available. It is certainly better that the public should save their excess incomes rather than try to spend them. But it would be better still if they did not have excess incomes on a far greater scale than there is any possibility of matching by a flow of goods—consumption goods and investment goods combined. The only *real* saving that a community can do is the amount of useful physical capital that it creates. Any state of affairs that allows the public to believe that they are saving more than this is unsound. At present the public's huge—and unreal—savings are offset by the Government's continuing dis-saving. Would it not be better to cancel both out?—EDITOR.]

M. Bierut and the British Council

SIR,—Your Former Correspondent would largely contribute to the explanation of doubts raised by M. Bierut's past if, on his part, he would indicate the source of his information. For his facts do not conform either to those published previously by *The Economist* or to the official biography of M. Bierut, as published recently by the *Rzeczpospolita*, the official organ of the Warsaw Government.

"Your Former Correspondent" maintains that Bierut was arrested by the Polish authorities in 1935 "at the height of the Pilsudski terror." But, according to the official biography, the arrest took place in December, 1933—*Rzeczpospolita* No. 312, November 13, 1946. The documents found on Bierut on that occasion made it clear that Bierut had left Poland for the USSR illegally and that he had returned to Poland equally illegally. Therefore it is difficult to attribute the fact of arrest to the "Pilsudski terror." Every Government in the world would have done the same with a man who had transgressed the existing laws.

"Your Former Correspondent" goes on to say that "from 1940 till the second half of 1944 he never left German-occupied Poland for a single day." According to him, it was the "underground activity" in those years as well as his outstanding feats that earned him his highest State dignity in the present regime. This again does not conform to the official biography published in the Warsaw Press, which definitely states that Bierut arrived in the so-called "General Gouvernement" and particularly in Warsaw, only in the middle of 1943, and that it was only then that he embarked on his underground activities—*Rzeczpospolita* No. 325, November 26, 1946. On January 1, 1944, Bierut became chairman of the National Council of the Homeland. As is known, under the Warsaw regime this post was until recently equivalent to that of the Head of the State. Are we to assume that six months' activities would have been enough to elevate Bierut to the dignity of the President of the State, had he not previously played an important part in, and rendered services to, the Communist Party, which accorded him this high honour? Unfortunately, neither the official biography nor "Your Former Correspondent" specify what were really these great merits, since—according to both versions—until the middle of 1943 Bierut was never anything more than "an obscure official" and a philanthropist acting for the benefit of the organisation for the relief of political prisoners.

When, after the formation of the Lublin Committee in July, 1944, Bierut's name was for the first time announced to the world, the broadcasting station of the Union of Polish Patriots in Moscow gave on August 17, 1944, strikingly scarce and very general facts about his career up to date. For two years the Warsaw Govern-

TRANSPORT

BEFORE the war, in conjunction with Messrs. J. S. Fry & Sons, this Firm developed an efficient railhead distribution system. (This is fully described in our book 'Industrial Record'.) Special railway vans carry the products of the two firms to railhead depots. From these depots they are distributed by road to our customers' shops and warehouses. Most of the road distribution is done by road haulage contractors, but some of it by our own vehicles working under 'C' Licences.

The road transport that we operate directly ourselves under 'C' Licences is valuable in many ways. It permits a useful check-up on our contractors' charges. It facilitates experiments in such things as new types of packing or body design. It means that if we are unable to get satisfactory contract services in any locality we can operate without great difficulty ourselves.

Under the Transport Bill now before Parliament, the Government will either take over or control the businesses of our contractors. When it does so it is most important that we should retain our present liberty to run our own vans.

It is true that the Bill will not prohibit our doing this, but we shall only be allowed to do so under certain restrictions. Once the principle of imposing these restrictions is conceded, it would be easy for the Government of the day to make them so onerous that 'C' licensed vehicles would no longer be readily available as a competitive alternative to the nationalised road transport system, a check on its efficiency or a stimulus to its enterprise.

We therefore urge that the Government should amend its Bill and leave unhampered the Trader's right to carry his own goods in his own vehicle to whatever point he desires.

AMERICAN SURVEY

The Chances of Freer Trade

(From Our US Editorial Staff)

"TO be fully effective, general rules for international commercial and trade relations such as those laid down in the Suggested Charter (for the International Trade Organisation) must be supplemented by specific action to reduce, modify or eliminate barriers to trade such as tariffs, quantitative restrictions and discriminations." This sentence is from the Acting Secretary of State's announcement of negotiations for trade agreements with eighteen other countries, made on November 9th last. Evidence is gradually accumulating of the extent to which this thesis has support in a country that has just returned a Republican majority to Congress.

The record of the efforts that the Truman Administration has made in the course of the last two years under multilateral world trade is impressive. The Reciprocal Trade Agreements Act was renewed in July, 1945, for a further three years; under it, the President has power to reduce any American tariff by as much as half of the rate prevailing on January 1st, 1945. The initiatives and invitations of the State Department have been mainly responsible for summoning the Preparatory Conference which met in London last September and the subsequent meeting that is to be held in Geneva in April.

As part of the American preparation for this meeting, the Committee for Reciprocity Information is now holding hearings to get the views of individuals, firms and trade associations interested in items on the published list of commodities whose status may be affected by the forthcoming bargaining on rates. The Committee includes members from the Tariff Commission, and the Departments of State, Treasury, War, Navy, Agriculture and Commerce. Following a general session for members of Congress and general representatives five panels for special classes of commodities are now sitting separately to hear some 850 spokesmen for such varied products as coal, coffee, apples, razor blades, lace, honey, castor oil, spangles and canaries.

What they say follows patterns thoroughly familiar through the twelve years that the Reciprocal Trade Agreements Act has been in operation. In the opening round, the representative of the American Tariff League is heard; so is the representative of the National Foreign Trade Council. This time, the Tariff League's case is a reaffirmation of the belief that tariff rates should be determined domestically (that is, by Congress rather than by negotiations conducted by the President with foreign powers); that chaotic world conditions make this an inappropriate time for reducing US tariffs and a time when foreign nations will give little in return; that recent foreign loans have pyramided abnormal exports on top of normal exports to such an extent that if there were to be an increase in imports sufficient to balance both, it would be so large as certainly to displace goods of American producers. Industries needing tariff protection are not necessarily inefficient; some cannot mechanise entirely and some have a high proportion of labour costs. A diversified economy serves the general welfare and the national security; a flexible, equitable tariff is sound.

In specific support of this line of reasoning, some communities come to the hearings in a body; from Gloucester, Massachusetts, come representatives of the Chamber of Commerce, the Fisheries Association, the Fishing Vessel Owners Association, the Sea Food Workers Union, the Building and Construction Trades Council, the Central Labour Union, the Gordon-Pew Fisheries Co., Ltd., Davis Bros., Fisheries, Inc., and Solomon Sandler, with the Mayor at their head, all demanding to be heard on fish. The representatives of individual industries have a largely unvarying purpose, to meet the general aim of reciprocal reduction of rates with the specific cry; But not ours! There are some understandable exceptions: producers of ethyl gasoline see no harm in facilitating imports of lead; producers of zinc hold that zinc ores should be encouraged, though obviously not the finished product. The Aluminium Association welcomes the arrival of bauxite ores but not of aluminium, while the bauxite producers protest. Makers of chocolate bars are free traders on sugar, cocoa beans, and Near East almonds, but not on their combination of the three.

Because of the large number of parties to the negotiation that is to take place in April, the official list of negotiable articles is a long one; and so, accordingly, is the list of firms filing protests. Even though each firm is interested in only one product—or at most a small group of products—the political effect of their multiple protests is cumulative. Those in charge of the Reciprocal Trade Agreements programme doubtless weighed the loss of time that would have occurred if the series of agreements had been spaced, and concluded that the benefits of a quickly-concluded multiple negotiation were worth the domestic risk of hearing all the opposition at once. But the present demonstration of the political axiom that those in favour of a programme are apt to be silent partners, while those opposed say No at the top of their lungs, may be about to cause the Administration some difficulties.

It is true that there are more than three score organisations interested in the expansion of American foreign trade: important among them are the National Foreign Trade Council, the US Associates, the China-America Council, the Council for Inter-American Co-operation, the World Trade Foundation, the Committee on Foreign Economic Relations. But they have so far failed to make a co-operative approach to their needs for money and personnel, and there is a certain polarity among their more prominent personalities. Their efforts are consequently more overlapping and less cumulative than might otherwise be the case, particularly as respects a campaign across the country.

At the hearings, moreover, the overall interest of the general foreign trade organisations is only sporadically supported by the specific pleas of groups like the National Council of American Importers and individual firms seeking outlets for their goods abroad. The rarity of appearances in the latter category may indicate that many industries are unaware of the possibility of getting the bargaining power of the United States used to obtain reductions of duties, quotas, and preferences that obstruct the entry of their products into other countries. Or it may reflect satisfaction with current private arrangements worked out by firms well related to various cartels.

But the balance of present testimony may be gauged by the introduction into the House of Representatives, within a few days of each other, of four resolutions. These offerings, advanced by Messrs. Jenkins of Ohio, Gearhart of California (both members of the influential Ways and Means Committee), Murray of Wisconsin and Lewis of Ohio, urge delay in trade agreement activity, an investigation of the administration of the programme, the assessment of pertinent information by Congress, etc. The bills in the House (to repeal the Trade Agreements Act) and in the Senate (to require Senate ratification of each agreement), perennially introduced by Congressman Read of New York and Senator McCarran of Nevada, probably stand little likelihood of passage. But on the record of a number of influential members of the House Ways and Means Committee, to which, as concerning a revenue measure, the recent resolutions will go, the chances of a favourable Committee report and hence reference to the Rules Committee—the next stage on the road to the floor of the House itself—appear favourable, although Mr Clayton, the Under-Secretary of State, may request a hearing before the vote is taken in an attempt to kill the resolution at the source. If they get to the Rules Committee, that may be a rather easier nut to crack and another round of personal appearances might suffice.

The action that the House itself would take, if the resolutions got as far as that, is difficult to prophesy. There are many new members whose attitude is unknown. Many Democrats are in favour of protective tariffs.

Moreover, the official Republican attitude on this aspect of foreign policy has been a question mark since Senator Vandenberg's broadcast on January 19th in which, after saying that "there is no longer any partisan politics in the fixed and united American foreign policy" he added that "probably we shall ask more questions" in the realm of economic co-operation.

We are bound to inquire of the world to what extent we are to be required to face State monopolies abroad in trade.

ment avoided the publication of any more detailed biography. It has done so now, but the extensive biography published in the *Rzeczpospolita*, quoted above, unfortunately differs strikingly from another biography published at the same time by the State Publishing Co-operative "Czvtelnik" in the *Polish Diary* for 1947. Would these contradictions arise if it were not for the anxiety to hide certain things in M. Bierur's past—things that could deeply hurt the feelings of the Polish Nation?—Yours faithfully,
8 Motcomb Street, S.W.1

JAN KOWALSKI

Government and Industry

SIR,—In the article on February 1st the writer makes the statement that "design is a matter which largely concerns—though it does not exclusively concern—the consumers' goods industries." And he adds that "it is more efficient capital equipment rather than beautifully designed consumers' goods which the British economy requires."

This point of view presupposes that certain things need to be beautified, whereas others just work. It was as deeply rooted in the Victorian mind as religion for Sundays, or that a large house was a piece of architecture, whereas a factory, a worker's house or a railway station was not.

But one cannot treat design in this watertight-compartment way. Fitness for purpose in its proper sense means that an object is not only mechanically efficient, but gives visual pleasure. And the way that say Swiss machine makers have realised this over a wide range is worth very careful study. The most ad-

vanced factories show a tendency towards order, seemliness, decency, design which will be usual practice in another generation or so. Already it is difficult to attract workers to the jail-like mills.

The writer of the article infers that good design is to some extent a luxury. I maintain that there is no side of British industry which can afford any longer the luxury of doing without so fundamental a part of its sales drive. It would be unfortunate indeed if the Council's first exhibition "Britain can make it," which was necessarily limited to consumer goods should, for this reason, be taken as evidence that the Council is unaware of heavy industry's design problems. I feel sure the Council realises that a society which pays insufficient attention to the design of its capital equipment will never attain a really first-rate standard in its consumer goods. Design, like peace, is indivisible.—Yours faithfully,
GORDON RUSSELL.

Kingcombe, Campden, Gloucestershire

Smuts Puts the Clock Back

SIR,—Criticism of General Smuts's policy towards Indians in South Africa as in your issue of January 25th should surely take notice of the difference in birth rates between the Indian and white races. If we here were faced with the prospect of being swamped by the reproductive rate of a race different from us in tradition and culture, we also would, I imagine, fall to drastic measures. It is always surprising to me how rarely our statesmen mention the danger to world stability from the fecundity of the Asiatic.—Yours faithfully,
HENRY MEULEN

Books and Publications

Where do We Stand?

"Britain and Her Export Trade." Edited by Mark Abrams. Pilot Press. 329 pages. 15s.

THE contributors to *Britain and her Export Trade*, the editor and the publishers, all deserve congratulations on a first rate job, and a vote of thanks because that job was one which badly needed doing. It is all very well to talk in general terms about Britain's load of foreign debts, her need for essential imports, about an export target of 175 per cent of the 1938 values, and about the desirability of expanding the world total of international trade. But the persuasive power of such generalities and apparently arbitrarily selected targets is as nothing to that of a detailed, brass-tacks examination of all the facets of the problem, with their interrelations, past history and future prospects. That is what Mr Abrams and his contributors have provided.

The book is constructed with a sense of logical development and a determination to take first things first—rare in works of collaboration; the contributors have worked as a well-balanced team. The first four chapters deal respectively with the *raison d'être* of international trade, with the balance of payments, with the relations between domestic economic policy and international trade, and with the Bretton Woods organisations. The next considers the matter region by region—the USA, the Empire, Continental Europe, the USSR, Latin America and the Middle East. The next, after summing up the calculations which justify the 175 per cent export target, discusses the specific problems and prospects of shipping, coal, cotton and the tourist trade. This is followed by a chapter of miscellany, dealing with design in export goods, with market research and with advertising; and Mr Abrams sums up, in the final chapter, with a general impression of the outlook.

This general impression can be described neither as optimistic nor as pessimistic. The solution of Britain's export problem depends only partly on Britain's own actions; world prosperity and a high total volume of world trade are essential to her success, and both depend overwhelmingly on the policy of America, first in maintaining her own activity and buying power and secondly in making dollars available to the rest of the world. Britain's own task, of modernising backward industry, attaining higher managerial standards and a new attitude of mind among wage earners, emerges as formidable but not impossible. America's success is also problematic; Mr Abrams shows in a telling series of quotations how well the administrators understand the situation and how far-sighted are the measures which they have planned, but he is under no illusions as to the backing which they may expect to get from public opinion.

Not all the contributors, as one might expect, are of equal excellence. Mr Oleg Hoeffding stands out among the regional

analysts, Miss Jean Bird, for different reasons, among those treating specific industries. Both Mr F. Clark, dealing with market research, and Dr Friedlander, discussing advertising, make one wish that they could have brought a touch of imagination as well as competence and clarity to the job; the subject of which they each study one aspect is, after all, that of public relations in economic matters, and neither in quantity nor in quality does it get the treatment that it deserves. There are gaps elsewhere, too. The Far East is left entirely untouched; the section on the Empire is overwhelmingly devoted to the Dominions, paying no attention to the prospects, which bulk large and hopefully in many people's minds, of the large-scale development of backward areas. There is, perhaps in a spirit of resignation, no discussion, by any of the contributors, of any alternative or complementary structure to the open multilateral system, whether consisting of a network of bulk-purchase agreements or of the deliberate harmonising and compensating, during reconstruction, of the capital equipment of various countries. Indeed, the reconstruction needs of Britain herself are rather taken for granted than evaluated and analysed.

Possibly some of these shortcomings may be remedied in a later edition. For this is a book which, topical as it may be, should see many editions. No other gives, or is likely to give, a view at once so full, so precise, so clear and so stimulating, of Britain's No. 1 problem. No journalist, Member of Parliament, industrialist or business man in any way concerned with foreign trade should miss it; while the ordinary intelligent citizen may be grateful to Mr Abrams and his team for giving him the essential facts in so attractive and easily assimilable a form.

Americans in Persia

"Americans in Persia." By Arthur C. Millspaugh. Faber and Faber. 293 pages. 18s.

DR MILLSPAUGH's position as Administrator-General of the Finances of Persia in 1922-27 and 1943-45 makes him eminently well qualified to discuss the Persian problem. The main interest of this book lies in Dr Millspaugh's account of the policies of the three Great Powers in Persia during the war years and the methods by which they pursued their policies. He was an eye-witness of the events he describes, and gives a clear account of the various trends of policy. He shows how Soviet policy throughout the war years was designed to obtain "a preferred and privileged position, political and economic," for the USSR. "Until that end is attained," he writes, "the Soviet Government will not be interested in stability or good government in Persia. Chaos serves their purpose better than order. They want the kind of government that can be purchased, hoodwinked or intimi-

dated" (p. 193). He attributes Soviet opposition to the Financial Mission to the fact that the Mission gave strength to the Persian Government and won friends for it among the people, and aimed at treating foreign traders impartially. In so far as American policy in Persia is concerned, Dr Millspaugh accuses the State Department of failure to co-ordinate American policy in Persia and of refusing to accept the implications of the international responsibilities accepted by the USA.

The earlier part of the book is devoted to a short description of the internal Persian background, the Shuster Mission of 1911 and the first Millspaugh Mission. Then follows a relatively detailed account of the activities of the Second Mission, the difficulties which it met in its relations with the Persians and with the representatives of the three Great Powers and the various factors which contributed to its failure. In dealing with the internal, i.e., Persian, aspect of the problem, Dr Millspaugh tends to over-emphasise the defects of Persian administration and society in general, and perhaps fails to give due weight to Persian criticisms of the Mission and its methods. The final chapter discusses possible future developments and Russian co-operation, which the writer considers a pre-requisite to the solution of the Persian problem. Internally, he sees representative government and financial reform as the keynote to reconstruction. He doubts the ability of Persia to save herself, and proposes therefore that the task of internal guidance be entrusted to the three Great Powers. Unless these Powers can find a way to co-operate effectively in such an enterprise, he considers it unlikely that anything constructive can be achieved.

Russian Population

"The Population of the Soviet Union: History and Prospects." By Frank Lorimer. League of Nations, Geneva. 289 pages. 15s.

DR FRANK LORIMER, of Princeton University, has made a very thorough and extensive study of Soviet population. As his publishers rightly say: "He is concerned at once with the dynamics of population growth and with the ethnic and economic background and economic evolution of the vast area with which he deals." Partly, perhaps, because of its scope, Dr Lorimer's work sometimes makes the impression of a vast and elaborate structure built on statistical sand. For Russian population statistics are incomplete, vague and unreliable; it is sufficient to recall that the Government's displeasure with the results of the population census of 1937 was enough for that census to be entirely suppressed and for the very able and conscientious statisticians who were in charge of it to be engulfed by the great purge that was then in progress. The census of 1937 revealed an alarming deficit in population. It showed the total Soviet population at 165 million or so compared with an expected total of roughly 180 million—the total shown in the officially approved census of 1939 was 170 million. The informed reader takes, therefore, somewhat sceptically Dr Lorimer's view that "the 1939 data are presumably more accurate as regards all purely objective inquiries."

However, "the broad outlines of the account—says the author—have greater validity than many of its constituent parts." And some of the author's broad guesses and estimates have the quality of revealing approximations to admittedly inaccessible truth. The projections of Soviet population trends into the future are of special interest. Projections previously made have now been reviewed by the author in the new light of Russia's estimated war losses, actual and potential. Thus the population of the Soviet Union is expected to amount to 222 million in 1970, whereas a projection not adjusted to losses caused by the war showed a population of 251 million in that same year. Twenty-five years after the war Russia's losses through increased mortality and reduced fertility will amount to nearly 30 million souls! This may still be a rather conservative estimate, since the official Russian figures may well have understated the actual losses of the war and since the author makes no allowance for such post-war disturbances as famines. Even so, the growth of Soviet population will still be rapid, and the Soviet Union will still be much "younger" than the rest of Europe. By 1970, 35 per cent of its people will be under 20 years of age—only 21 per cent of the Western European population will belong to that age group. Fifteen per cent of Western European society will then consist of men and women older than 65 years—in Russia the same age group will form only 8 per cent of the population. But Soviet Russia, too, will be approaching "maturity." Its people will be much "older" in 1970 than they were in 1940, when 45 per cent of the whole Soviet population were reported as younger than 20 years.

Shorter Notices

Select Reading Lists for Colonial Studies. Nuffield College. II: Colonial Economics. Institute of Colonial Studies. Oxford Press. 1s.

The bibliography on colonial affairs, which is being compiled under the auspices of Nuffield College, is designed primarily for the benefit of members of the Colonial Service. Judged by this number, on colonial economics, the bibliography should be of great value to all who are interested in the colonies. Its great length shows that there is no justification for pleading ignorance as an excuse for indifference on the part of the British people towards their colonial empire.

"The Colonial Office from Within." By Sir Cosmo Parkinson. Faber and Faber. 157 pages. 8s. 6d.

Sir Cosmo Parkinson was permanent head of the Colonial Office from 1937 to 1942. His book is a short, engaging review of the changes in that department over the years from 1909, when Sir Cosmo was first connected with it. This is no critical survey of Colonial Office organisation. The author, who gives one-and-a-half out of about 150 by no means closely printed pages, to the idiosyncrasies of the Colonial Office Lift, does not intend that it should be. The book's chief appeal will be to those who already have connections with the Colonial Office and Colonial Service. But for others who wish to know how this rather complicated department works, the book also has virtues; it is short, readable, and informative.

"Industrial Peace and the Wagner Act." By Theodore R. Tserman. McCraw-Hill. 91 pages. 7s. 6d.

This booklet, written by an expert, will be of value to anybody interested in the history and future of American labour relations.

"Labour Party Year Book, 1946-47." Edited by the Research Department of the Labour Party. 567 pages. Paper 6s. 8d. Cloth 8s. 2d.

This is the first issue of the Year Book since 1932. It contains, among other facts, information about the development of the Labour Movement since the General Election, about the work of the Government Departments, and a number of statistical tables and directories. This comprehensive survey should be of value to the general public.

"The City's Finances." Manchester City Treasurer's Department. 48 pages.

Manchester Corporation have produced an excellent and attractive booklet showing, in coloured pictorial statistics, the main features of the City's finances. The excellent diagrams cover not only strictly financial matters, but also details about infant mortality, school population, and housing and other social problems.

"A Guide to Official Publications on Building." By Colin Penn. Published for the Royal Institute of British Architects by the Architectural Press. 6s.

A useful guide to the voluminous literature on building and building materials, with some valuable background information, by the author, under the subject headings.

From The Economist of 1847

March 6, 1847

[From an article on the Ten Hours' Factory Bill]

No persons are more acutely convinced than we are that more leisure and less toil are desirable for the working classes, no persons more ardently wish than we do that our females and our children were spared, by the amply-remunerated toils of their fathers and brothers, the necessity for undergoing irksome labour; but we are thoroughly convinced that this can only be brought about, or approximated to, by perfect freedom, giving the utmost possible abundance. There must be an abstinence from that interference, on the part of the Government, which is always costly and never productive, and only imposes an extra degree of toil to pay its cost, after the wants of the labourer are supplied. The enormous expenses of the Government, increased unhappily year after year, and more this year than any one, with one exception, since the peace, is amongst the causes of the severe toil and little leisure of the productive classes, and not the least advantage of perfect freedom will be to diminish its expense and lessen its demands on the sinews of labour. While the Government is making almost unheard of demands on the capital and labour of Great Britain, while their produce is exposed in the foreign markets to keen competition, it seems to us one of the least wise things that ever was sanctioned, for the Prime Minister and some of the Cabinet to give their countenance to a measure for imposing restrictions on the hours of toil and the running of machinery, by which alone that vast expense can be supplied.

We are bound to inquire to what extent other countries are going to continue to make bilateral trade agreements for political purposes instead of multilateral agreements such as we are committed to.

A Resolution of the House, of course, does not bind the Executive in the same way that a Bill passed by both Houses does unless it is successfully vetoed. But suppose a resolution demanding delay of the reciprocal negotiations scheduled for April 8th were passed. And suppose, at the cross-country public hearings on the ITO charter which are to be held across the country starting on February 25th, testimony should come predominantly from opponents of the plan. The bargaining position of the American representatives at Geneva could then hardly be more than negligible

California is not Depressed

(From a Correspondent in San Francisco)

DURING the war, while California's industry poured out unprecedented quantities of ships and aircraft and weapons, it was freely predicted that the State would face a severe industrial adjustment when the shooting stopped. Now, more than a year after the Japanese capitulation, it is apparent that the prophets were wrong. Far from collapse, the flamboyant State seems headed for greater-than-ever prosperity. The doleful prophets based their predictions of disaster on their belief that, at the end of the war, California's expanded industries, the "war babies," would be abandoned, and widespread unemployment would result. The good workers, skilled and dependable, would return to their peace-time homes, while the bad, the casual and unskilled, would stay behind to bask in the widely-advertised sunshine and be supported by unemployment relief and pensions.

But California did not collapse, even though the Army and Navy cancelled many contracts within hours of the Japanese surrender. Many adjustments were necessary, but they have been made without a major dislocation. Shipbuilding has disappeared as an industry in the State. But aircraft manufacturers are doing better than anyone had hoped. The aviation industry is still the biggest employer in Southern California—employment has stabilised at about 75,000 workers. And the aircraft plants are turning out airplanes. They did not turn to fabrication of refrigerators and stoves and novelty items made of light metals to survive, as it was forecast that they would have to.

Despite the readjustment in aircraft and shipbuilding, among the hundreds of sub-contractors, employment has held to high levels. Employment in September, 1946, according to the State Reconstruction and Re-employment Commission, was approximately 3,550,000—below but close to the wartime peak of September, 1943. Many workers drawn to California by wartime jobs have been absorbed in industries and trades which lacked workers during the war—the construction industry, the laundries, hotels, restaurants, retail stores, and many other service trades. No skilled man is without a job if he wants to work. Unskilled labour is having a harder time. Even California's highly-mechanised agriculture has little use for an unskilled hand. Actual figures on California's employment and unemployment are impossible to find. The Reconstruction and Re-employment Commission estimated September unemployment at 260,000. The job situation is extremely fluid, however. One official said that "workers are playing musical chairs, going from job to job. Between times, they are listed as unemployed." Reports from State employment offices show little demand for unskilled labourers while listing demands for skilled workers. In one office, the report showed 4,000 labourers out of work and a demand for 1,300 skilled construction workers. Negroes, largely untrained, are finding jobs harder and harder to get. Some employment experts believe that unemployment cannot be reduced below 2 per cent of the population. On this basis, minimum unemployment would be a constant 185,000.*

The big fact about California after a year of peace is that its wartime population has not left the State. Figures compiled by the Department of Motor Vehicles, which checks arriving motorists at state border stations, indicate that California gained 2,320,000 residents during the war years. The same agency, which makes some effort to check arrivals by train and plane, has

*Applied to the United Kingdom this proportion would give a figure of 960,000 for minimum unemployment. The circumstances may not, of course, be exactly similar; but the comparison suggests that the proportion is high.—EDITOR.

—the other delegations might relevantly inquire just what they could accurately claim to represent. The effect of such a situation, nullifying two years of American initiative, would be felt not only by the ITO, which has not yet come into being, but by the International Bank and the Monetary Fund.

Mr. Clayton and the staff at work on the RTA programme, whose concern at the present trend of events is clear, may remember the Presidential torpedoing of an International Economic Conference once before, just after the political balance of the country had changed. But the memory can hardly make them more eager to go to Geneva, nine weeks from now, subject to a Congressional April fool.

found that people are still coming into California; instead of losing residents California is gaining permanent settlers. It is estimated that California now has a population of 9,225,000, second only to New York. (On this computation, it is contended that Pennsylvania, formerly second, has lost population directly to California.)

This increased population means a wider market for the nation's products. Eastern manufacturers with 15 per cent of their domestic market now in the eleven western states, of which California is by far the largest, are finding it economical to establish branch plant operations in the west, particularly in California. New western industries are being established to meet the market's demand. In common with other states, California, before the war, had a great backlog of unfilled needs, the result of lowered production during the depression. The shortage was intensified by the war period, when civilian goods were produced sparingly. With the tremendous increase in population—which is up by one-third since 1940—these demands are greater than anticipated and cannot be satisfied for many years. The great influx of new residents has aggravated the needs—for more homes, churches, schools, roads, transportation facilities, sewers, more school teachers, policemen, firemen, more workers of almost every type.

Actually, the war years merely accelerated an already rapid growth. In 1900 California was twenty-first in the population ranks of the States. With a population of 9,225,000 in 1946, the population had increased almost 500 per cent in 46 years. Before the war California was well on its way toward industrialisation. Between 1904 and 1939 industrial production increased eight times. In 1939 California produced 4.9 per cent of the manufactured goods produced in the United States. During the war the State produced 9.2 per cent of all war supplies. The pre-war trend and the post-war outlook are for development of an integrated agricultural-industrial economy. Thus Los Angeles county, the country's leading agricultural county, also leads the country in production of aircraft, motion pictures, sports wear apparel and oil well equipment. It is near the national top in production of furniture, rubber tyres, automobile assembly and refined petroleum products. The State's steel-fabricating capacity is being enlarged—Columbia Steel alone has a \$25 million expansion programme under way. Mr Henry Kaiser's Fontana steel operation promises California an integrated steel capacity and the United States Steel plant at Provo, Utah, will soon be producing sheet for western needs.

It is difficult to find a pessimistic man in California. Chambers of Commerce, deluged by inquiries for plant space from industrialists, see nothing but prosperity ahead. Los Angeles leaders predict that their community will be the world's largest city within 15 or 20 years. The San Francisco Bay Area envisages a population of 2,500,000 by 1965 on a "conservative" basis.

There are, however, some limiting factors. One is the lack of water. Already a few thoughtful people are concerning themselves with the coming struggle between urban-industrial users of water and the agriculturists who depend on the available water for irrigation. Los Angeles will not become the world's largest city unless it gets more water. Already it brings water for urban use 300 miles in a great aqueduct and its engineers are ranging ever farther. It is altogether probable that water from the Columbia River in the States of Oregon and Washington will be carried south to serve San Francisco and Los Angeles within the not too distant future.

The State recently lost 15,500,000 acre-feet of water from the

Colorado River, which normally helps meet the needs of Southern California. This water was allocated to Mexico in perpetuity. The water lost by California will be returned to Texas by the agreement, Texas receiving the water from Mexico out of the flow of the Rio Grande. The average run-off of the Colorado is 15,000,000 acre-feet. Half of this is allocated to the "Upper Basin" states along the river; the remaining 7,500,000 acre-feet was allocated to Southern California, but the water granted to Mexico comes first. Thus, in dry years, when the flow of the stream is diminished, Mexico is guaranteed its 1,500,000 acre-feet; Southern California takes what is left of its allocation. The water treaty was a Texas idea. It was engineered, with overtones of the Good Neighbour policy, by the State Department, and a great deal of help from Senator Tom Connally, of Texas, Chairman of the Senate Foreign Relations Committee.

But California is still a part of the United States and the world. It is not isolated and it cannot control its destiny. National labour policies, national policies affecting production and employment will all have a direct bearing on California. So will world economic conditions affect the State. California cannot remain prosperous without "good growing weather" throughout the world.

American Notes

Killing the Goose?

THE US Treasury has now made a decisive bid to relieve industry from the burden of "portal-to-portal" wage claims, extending back to passage of the Wage-Hours Act in 1938, and embracing, with claims for damages, an estimated total of at least \$5 billion. The claims of the unions are based on a recent Supreme Court decision that wages that are based upon "time spent in productive labour," should be read as covering all the time spent on company premises, from entering the "portal" to leaving it. In the flood of suits which followed from this ruling, overtime payments have been sought not only for unproductive time spent within factory premises, but also for time spent in parking automobiles on company grounds, time "lost" in using company canteens, and in making use of all amenities provided by the more considerate type of employer.

The Treasury ruling does not challenge the legal basis of these union claims. But it provides that employers may re-assess the basis of tax returns for the fiscal years against which such claims would be chargeable, and thus become eligible for EPT refunds. There will be endless complications in this method of procedure, including war contract re-negotiations. But in six of the nine years covered by portal-to-portal claims, EPT was chargeable at varying rates, and over three years a very large number of undertakings were paying taxes at the top rate of 85 per cent. The effect of the decision will thus be to transfer a very large share of any future burden from industry to the Treasury which, if the unions succeed in their suits, may easily provide 50 per cent of the total now involved.

It does not, of course, follow, that the unions' claims will be readily allowed. For bargaining purposes, they have clearly been assessed at the highest possible levels, and some of them are little short of fantastic. In making its decision, the Treasury has intimated to industry that the concession has not been made "as a premium for admitting union claims," and in another direction, the Department of Justice is seeking reconsideration of the case against the Mount Clemens Pottery Company of Michigan and thus of the Supreme Court award which first began the snow-ball process of portal-to-portal suits. Without seeking a direct rejection of the Supreme Court decision, the Justice Department has asked the Michigan Court to re-examine the claims, and to decide whether they may stand "against the realities of industrial life," or may be waived as altogether too trifling for Court concern.

The knowledge that the government has made such a forcible intervention has given a great deal of encouragement to industry, which is altogether aware of the manoeuvring space permissible for court interpretations, and is also aware that where courts may hesitate, Congress is now only too willing to take up the challenge and has, indeed, prepared several measures—some of doubtful constitutionality—ranging from direct outlawry of portal-to-portal claims, to a "windfall tax" which would eliminate any benefits attaching to future awards. The portal-to-portal claims have been described with some justice as the "greatest legal-economic controversy of American history" and it is certain that any full impact upon industry would be extremely damaging. It does not seem at all likely, however, that final awards will be more than relatively modest, though retrospective payments may well bring some addi-

tional worries to Republican Party Budget-shapers. Throughout the weeks in which accumulating claims have reached such vast totals, it is significant that Wall Street has obviously refused to share alarmist suggestions that the unions now hold the power to kill the goose with the golden eggs.

Peace in Industry

There have been welcome signs this week of a more conciliatory approach to the collective bargaining negotiations now proceeding in the steel, rubber, and automobile industries. In Detroit the Automobile Workers' Union has agreed to an extension of its contract with the Chrysler Corporation from January 26th to February 26th, thus ruling out the possibility of an immediate strike in the automobile industry. The United Rubber Workers, who also belong to the Congress of Industrial Organisations, have signed their first company-wide agreement with the US Rubber Company, covering improvements to working conditions such as paid holidays and "severance pay." Discussions of the union's claim for an increase of 20 cents an hour in wages paid by US Rubber and three other large companies will follow.

A similar atmosphere of accommodation pervades the early stages of negotiation between the Steelworkers' Union and the US Steel Corporation. The present contract, which was due to expire on February 15th, has been extended to April 30th, to allow more time for the wage negotiations which will have an important bearing on the national wage-price structure and may, if the past is any guide, once more set the wage pattern for the mass-production industries. Last Saturday a long-standing grievance was disposed of when the union and the company signed an agreement on job reclassifications. Nearly 50,000 different job titles now give way to a standard hourly wage scale. Wage increases totalling \$17 million a year will end wage inequalities inside and between plants of the company, and workers will receive \$32 million of back-pay.

It may be a trifle early to rejoice. As yet there is no sign of any agreement on the basic question of wages. And though falling prices, mainly of food, may lessen the pressure for significant wage increases, industry may well be prepared to demand a substantial *quid pro quo* for any rises it grants. US Steel has undertaken a counter-offensive by insisting that the new contracts provided for an open shop, that productivity be raised, and that the union bind itself to a no-strike, no-lock-out pledge, with agreed penalties for breaking the pledge on either side. There has been a perceptible shift in the relative strength of the two parties at the conference table.

Congress Settles In

Despite a general lack of surface excitement the Republican majority in the new Congress has achieved its first victory on the floor of the Senate, with a 47-to-45 vote for continuing the work of the special War Investigating Committee that was for long headed by President Truman (as a Senator) and is now under the chairmanship of Senator Owen Brewster of Maine.

Nominally, of course, the current Republican voting margin of 51 to 45 should be more than sufficient to ensure supremacy in major contests. The vote on the Investigating Committee, however, raised some particularly controversial issues. In the first place, many Republicans who greeted with jubilation the theory of "one more probe" were none the less unwilling to press investigations to a point which might embarrass the service chiefs and the State Department through an investigation of German occupation policies. Secondly, the Congressional Reorganisation Act was expressly designed to curb the growth of special committees, and that policy is not opposed to general Republican theories on the need for economy. Thirdly, the Democrats, by pressing for an investigation through the relatively friendly hands of Senator Aiken (as chairman of the regular Committee on Executive Expenditures) could then allege that Republican leadership was unwilling to entrust the work to its own established body. So far from expressing concern at their narrow victory, Republican leaders forecast that on very few future occasions would there be so close a division, and that the majority party had safely overcome a situation which might have provided a revival of the two-party "coalition" that so often plagued the Administration in the days of Democratic majorities.

From this early test, the Democrats can draw modest consolation. They have won a declaration from Senator Taft that the establishment of special committees will be frowned upon in

AMERICAN SURVEY

The Third Arm

(From Our U.S. Editorial Staff)

ACCORDING to the little descriptive booklet that awaits visitors to the huge white marble building where, since 1935, the justices of the Supreme Court of the United States have had their official being, "Our government is divided into three separate and equal branches, so constituted that each functions freely within the limits of its constitutional authority, though open to check by one or both of the others if attempt be made to exercise powers not granted by the Constitution."

For almost a decade, the third arm of government has rarely been in the news. The restlessness of men like Mr. Byrnes, in the judicial interval between his legislative and his executive phase, has been matched by more than one of his former colleagues. With the exception of Mr. Rutledge, who came to the Supreme Court from the post of Dean of a Law School, followed by that of Judge of the Court of Appeals, and the questionable exception of Mr. Frankfurter, whose law courses were, after all, a recognised nursery for New Deal administrators, the entire Court is now composed of men with recent service in major executive or legislative posts. Perhaps that is why the Court is not too composed—the echo of each other's footsteps in the unaccustomed quiet might easily get on the nerves of men, not past their prime, suddenly removed from the bustle and strain and spotlight of the—till now—more vivid arms of government.

But an inverted parallel with the years 1933-37 is now bringing the Court into the centre of attention. The decision in the case of *Anderson versus Mount Clemens Pottery Co.*, which touched off the "portal-to-portal pay" suits, now amounting to several billions*, and the pending decision on Mr. John L. Lewis, are matters which concern far wider groups of people than the immediate litigants. And beyond these specific cases, is the Court's position as a political institution.

In 1933 and 1934, despairing Republicans could offer each other the partial comfort of saying, "Anyhow, we still have the Court." And the decisions of 1934 and 1935 indicated that they did. Today, Democrats are trying to look from the White House over the dome of the Capitol to the peaked roof beyond. In their eyes, now is the time for the good men of the Court—seven Roosevelt and two Truman appointees, all except Mr. Burton of indubitably Democratic origin—to come to the aid of the Party.

But in today's American context the matter is not so simple. When the New Deal's record legislative output reached a Supreme Court composed of Chief Justice Hughes and Justices Van Devanter, McReynolds, Brandeis, Sutherland, Butler, Stone, Roberts and Cardozo, a group whose advancing years raised the Court's average age to 70 in 1935 for the first time in American history, the question repeatedly presented was whether Acts of Congress were constitutional. One by one, the Court knocked out the major New Deal measures. The negative unanimity it achieved over Mr. Schechter's sick chicken—whose death was generalised into the death of the National Recovery Act—was not always maintained, but in less than two years it effectively upset eight major pieces of legislation. The Roosevelt counter-attack followed.

But the last Federal law upset by the Court was in May,

* The Supreme Court first ruled that wages based on hours of work should cover all time spent by workers on company premises, from entering the "portal" to leaving it. This decision brought a wave of union claims (recently totalling \$5.8 billion) and the Court ordered a review of the case by a Federal District Court which dismissed the claims. Congress is now seeking a ban on all "portal" wage claims.

1936; in a manner reminiscent of the House of Lords at the time of Britain's liberal revolution, the Court defeated a proposed change in structure by itself behaving in the manner which the structural change would have induced. With the substitution of only one Justice—Black for Van Devanter—in 1937 it upheld the National Labour Relations Act, the Social Security Act, the Regulation of Public Utility Holding Companies, the Home Owners Loan Corporation Act, and slightly changed versions of some of the Acts—farm mortgage moratorium, railway labour—that it had thrown out before. Perhaps the most telling evidence of the majority's altered view is the fact that in the 1937-38 term of Court, Justice Brandeis dissented only twice. So even before Mr. Roosevelt got the Court, through continued tenure on his part and death and retirement on the part of the Justices, the Republicans had lost it. In reversed circumstances, what are the Democrats' prospects?

Now, most of the questions likely to come before the Court are not likely to be questions of constitutionality. The Republicans are not coming in with a sheaf of innovations ready to offer as law. Their major legislative proposals, to the state legislatures as well as to Congress, largely concern the single subject of labour. Fewer Court rulings on the constitutionality of statutes can therefore be expected, and the great majority of cases reaching the Courts will be brought under statutes that are themselves not in doubt or under the familiar guarantees of the Constitution itself.

*

In these circumstances, the major issue before the Supreme Court may be that of its own function. The Court of 1933 appeared to have a large measure of unanimity with regard to the subject matter of New Deal legislation, and to act on that basis. Today's Court may have a comparable predilection for a roughly definable political position, but it appears to be divided on the appropriateness of acting on that basis.

The issue goes deep into political theory. During the New Deal years, a philosophy of law developed which might claim ancestry by the Yale Law School out of the Department of Justice. Its main thesis was that the law is what the judges say it is; their reference to precedent and the like is sanctimonious hokum which puts a dignified cover over what the judges think is appropriate substance. If this is true, then any judge consciously or subconsciously starts with what he regards as a good decision, and works up reasons to back that decision. By adherents of this philosophy, the majority judges of the Supreme Court in the early New Deal years are taken as examples of subconscious judges, and the stigma of reactionary is likely also to be applied to contemporaries who do not believe that a justice's own opinion on the rights of a given case ought to enter into the opinion that is handed down in some Monday morning's batch of decisions. Ironically, the logic of this philosophy leads the New Dealers to approve of judicial decisions which represent the minority position in the country—which is exactly what the New Dealers accused the "Nine Old Men" of doing a decade ago.

The alternative view is less an argument regarding the likelihood of judges' views on the substance of statutes playing a part in their decisions as an argument in favour of courts recognising the maximum breadth of legislative initiative. According to this view, whether or not a law is a good law is not the Court's function to say; rather, it is whether or not the legislature making the law stayed within reasonable constitutional limits when passing it. Much of the personal feeling on the Court, as evidenced in the Jackson-Black outburst of

last year, in the Frankfurter-Douglas difficulties, and in the appointment of Mr. Vinson, veteran composer of many executive agency feuds, as Chief Justice, stems from this divergence of philosophy.

The Democrats may therefore find that some appointees who were staunch supporters of New Deal substance before they became justices, now regard the subject matter of statutes as no longer their speciality. And some of those whose decisions have followed New Deal tendencies most regularly may

be susceptible to the effects of the new climate in the country. This is a Court of relatively young men, most of whom have had legislative and executive experience. Even more than the Courts in the days when Mr. Dooley wrote about them, they may have a predilection for the election returns.

But with labour now turning to its old enemy, the Courts, in an effort to redress a legislative balance shifting against it, the third arm of government will over the next months be exercising its full share of power.

America's External Budget

(By an Economic Correspondent)

THAT the evolution of America's future commercial and financial transactions with the rest of the world will be of hardly less importance than that of Britain in the nineteenth century is a commonplace. The unknown factor is what form this evolution will take or, more precisely, what will be the size, ingredients, and degree of stability of the American balance of payments.

One of the most interesting features in America's current transactions with other countries is the change between their pre-war and post-war size and composition. This change is shown in the following table, which shows the figures for the average of the three years, 1937-39, and for 1946, the first post-war year.

BALANCE OF PAYMENTS OF THE UNITED STATES
(Millions of Dollars)

	Receipts		Expenditure	
	1937-39	1946*	1937-39	1946*
Goods.....	3,200	12,000	2,454	5,000
Other receipts (or expenditure)...	1,138	3,100	1,336	1,950
Including:—				
Shipping and freight	269	..	345	..
Tourists	133	..	314	..
Interest and dividends	587	600	243	160
Miscellaneous	109	..	435	..
Total	4,338	15,100	3,790	6,950
Difference financed by:—				
Unilateral transfers (net)			548	3,400
Capital and gold (net)				4,750
Total	4,338	15,100	4,338	15,100

* Estimates.

The size of America's external budget has risen greatly, especially on the export side. Total receipts in 1946 were three and a half times as high as during 1937-39, while expenditure and less than doubled. The gap between current receipts and expenditure rose from an average of \$548 million in 1937-39 to no less than \$8,150 million in 1946. More than half the exports of goods and services had to be financed by unilateral transfers (that is, grants and relief payments), by lending and, to a small extent, by drafts of importing countries upon their dollar and gold resources.

The ingredients of the balance have changed significantly. Imports of merchandise barely doubled and other income rose by less than fifty per cent. On the other hand, exports of merchandise in 1946 were nearly four times as high as in the pre-war years; other receipts more than doubled, partly as a result of the growth in income from shipping services.

The first question, obviously, is whether the balance of payments will continue on its present scale. Although it has grown enormously during the war, the gross total is still appreciably smaller, relatively to the population, than that of Great Britain. But this is no criterion, for America's economic make-up differs from Britain's; for example, America needs nothing like Britain's food imports. Nevertheless, if America is to play a role in international trade in the twentieth century comparable to that of Britain in the nineteenth, the size of its current exports of goods and services would not seem to be unusually high.

The major problem (which is strikingly brought home by the figures of the first full peace-time year) is how the present

rate of exports of goods and services is to be financed in the future. The authors of an article in the December issue of the *Federal Reserve Bulletin* took an optimistic view of 1947. They assumed a reduction in the exports of merchandise to \$11 billion. If "Other Receipts" amounted to some \$3 billion, the dollar bill for the rest of the world would be about \$14 billion. They assumed, further, that imports would rise to \$6 billion, or \$6½ billion if newly-mined gold were included. If "Other Expenditure" was the same as in 1946, that is some \$2 billion, total current expenditure would be \$8½ billion, leaving a gap of \$5½ billion to be financed from other sources. They recognised that unilateral transfers (exclusive of supplies sent to occupied areas) would drop to about \$1 billion and, on a number of assumptions, reached the conclusion that only \$3½ billion remained to be financed, a task that could be accomplished without undue strain by drafts upon the British line of credit, by the Export-Import Bank, and by the two Bretton Woods institutions, the International Bank and the Monetary Fund. They also drew attention to another source of finance, that is the dollar and gold resources of foreign countries; towards the end of 1946, the gold and dollar resources in the hands of foreign monetary authorities alone amounted to more than \$19 billion, against \$11½ billion at the end of 1945.

*

The estimates for 1947 (even these are based on some optimistic assumptions) do not answer the question about the future size of America's transactions with the rest of the world. If these are to be maintained at anything approaching present levels (\$14-15 billions a year), a gap of \$7-8 billion remains to be filled in the future when no more unilateral transfers can be expected, and when foreign countries will have reduced their gold and dollar holdings to the size of working balances. The question therefore resolves itself into whether or no the United States will provide dollars, by purchasing foreign goods and services and by lending to the tune of \$7-8 billion a year. Stated in this form, there is a strong presumption that the answer will be no, that the size of America's transactions with the rest of the world will not be maintained indefinitely at the present level, even if allowance is made for any possible fall in prices. Nevertheless, there is equally no justification for the belief that the scale of transactions will decline to the pre-war level, or that ultimately it will not reach and even exceed present levels. The prospect is for a marked dip in the curve, beginning this year, followed by a long-term rise. But the dip may be quite substantial.

At first sight the prospect for higher imports of goods and services does not seem bright. The temper of the present Congress suggests that too much should not be expected from the forthcoming Conference of the International Trade Organisation in April. Yet, the underlying trends are not gloomy. America can reasonably be expected to have a growing bill for raw materials, both through an expansion in imports and a reduction in exports. Tourist expenditure abroad may be expected to increase substantially. But it will take years before these trends will add many billions to present imports. Again, America can reasonably be expected to continue foreign lending, in the near future mainly through Government agencies and later also by a resumption of private lending. But the

general by majority leaders, and they have secured a guarantee that future work of the War Committee will not cover the conduct of US forces and of military governments overseas. But clearly, there will be no ban on special committees, and Democrats, surveying past "probes," and not forgetting Mr Pecora's denunciations of Wall Street, realise that war expenditures on so vast a scale as those incurred between 1941 and 1945 can probably provide a great deal of campaign material for 1948.

In other directions, the organisation of committees both in House and Senate is now complete, with the Taft-Vandenberg leadership supreme in the Senate, and with the House forces in the safely conservative hands of Mr Joseph Martin, the Speaker, and Mr Charles Halleck, the majority leader. For floor work, the necessity of presenting a complete legislative Budget by mid-February means that fiscal policies must command priority over labour legislation.

Presidential Timber

In the absence of a Vice-President, as now, the Secretary of State stands next in succession to the Presidency, and so speculation about General Marshall's political future was inevitable. The columnists could hardly be expected to overlook the possibility that General Marshall was being groomed for the Democratic nomination in 1948. These speculations have now been dispelled by the new Secretary of State with a thoroughness unusual in American politics and reminiscent of General Sherman's famous, "If nominated, I will not run. If elected, I will not serve." A convincing disclaimer was essential if the new Secretary of State is to succeed in the difficult months ahead. A man suspected of political aspirations would risk forfeiting from the start the co-operation from a Republican Congress which is central to the peace-making. General Marshall has made his own contribution to a bi-partisan, or rather non-partisan, foreign policy.

There is, in fact, a surprising degree of unanimity that Mr Truman will take the field again in 1948—perhaps because the President's prestige has rallied somewhat from its pre-Christmas low, partly because there is little enthusiasm elsewhere to undertake so long a shot. The case is very different with the Republicans. The prize is so glittering that they suffer from an embarrassment of riches.

From Ohio comes the news that Senator Bricker has decided to relinquish any Presidential aspirations he may have in favour of the state's favourite son, Senator Taft, now at the very peak of Congressional authority and power. The major challenge to Senator Taft resides in Governor Dewey of New York. Indeed, it is not impossible that in 1948 a Republican convention might find it impossible to decide between these two powerful contenders. In that event the nomination might go to a dark horse, someone like Governor Warren of California (though he is somewhat out of favour because of his refusal to accept the Vice-Presidential nomination in 1944) or to Senator Vandenberg, who despite his protestations that he has no Presidential aspirations, might well allow himself to be drafted.

Another Mission for Mr Hoover

Mr Herbert Hoover has been asked by President Truman to undertake a fact-finding survey of food needs and related economic problems in the British and American zones of Germany and Austria. The facts can hardly be unknown to the Administration, and in Washington it is deduced that what is hoped from this mission is a report which will convince Congress that the \$300 million deficiency appropriation (the English translation would be Supplementary Estimate) for the occupied countries is justified.

From this it has not been difficult for some commentators to read into the appointment the first move toward a bi-partisanship in foreign economic affairs paralleling the existing co-operation in the political aspects of foreign policy. The need for such an extension of the bi-partisan technique is painfully evident. Early reactions toward the expansion of the reciprocal trade agreements programme are not promising. Foreign lending is attacked by even so internationally-minded a Republican as Mr Harold Stassen. In economic affairs there is a widening gulf between the Administration and the triumphant Republicans.

If it is indeed the hope of the Administration that Mr Hoover's mission may help to bridge this gulf, the risk that Mr Hoover's report may not be to its liking may be worth taking, though there are already some misgivings at the "free hand" which Mr Hoover has demanded to explore the general economic dislocations. But even if Mr Hoover returns convinced, can he exert an influence on

his party remotely comparable to that of Senator Vandenberg in political affairs? Mr Hoover has never recovered either with his own party or with the country the position which he lost in 1932.

Credits for Industry

Unless Congress is willing to give a broad renewal of powers by June 30th next, the Reconstruction Finance Corporation, which began its career under President Hoover in 1932, will then finish its corporate life. The part played by the Corporation through the depression years, and again during the war, when Federal finance of new plant and equipment gave it a new lease of activity, may be judged by the fact that, at the close of the war, loans and other authorisations totalled more than \$39 billion, while the outstanding balance at that time was still in excess of \$10 billion.

Under President Hoover, the RFC was first called upon to buttress the banking structure, and advances to banks and trust companies, including those for reorganisation and liquidation of closed banks, amounted to more than \$2 billion, with another \$1.5 billion granted for purchases of preferred stock where capital had been impaired. The original restrictions on the class of borrowers eligible for loans (banks, insurance companies and railroads) were later relaxed, and the RFC was given the power to extend credits over general manufacturing, trade and service industries, so long as the credits would relieve unemployment, and so long as private finance was not in sight. Credit standards were also liberalised, until the business improvement of 1937 brought Mr Roosevelt's direction that further loans should not be made. Later, under the National Defence Act of 1940, disbursements totalled no less than \$21.3 billion.

The RFC has now petitioned a suspicious Congress for renewal. As an agency which played a major part in the New Deal era, it was marked down for expiry by all Congressmen pledged "to get the Government out of business," and it is more than possible that the Republicans will decide to liquidate the only existing Federal agency with powers to finance private industry. There is, however, as in so many other cases, a disposition to retreat on earlier pledges and to examine the position anew in the light of the depression which may develop some years ahead.

No one believes that the RFC should retain its multi-unit war powers, and Mr. George Allen, who became the virtual administrator, following his appointment as director last year, completed his short term of office with a recommendation for eventual liquidation. But there can be little doubt that, at some time in the future, the loan powers, administrative capacity, and experience of the RFC will again prove to be useful assets. It would certainly be going a long way for even the Republican Party to say that never again will Federal funds be needed for the stimulation of private industry.

Shorter Notes

Business circles have welcomed, as an offset to President Truman's warning of the increasing concentration of economic power, a Federal Reserve report indicating that small businesses which survived fared better than big companies during the war. The key phrase unquestionably is "who survived." The report shows that small and middle-sized firms showed a "relatively larger increase in sales, profits, and assets" than the larger firms, but it does not attempt to calculate the number of small businesses which succumbed to industrial Darwinism.

The Edison Electric Institute, representing about three-quarters of the electric power industry, has revived charges that TVA rates are heavily subsidised and that real power costs are hidden, by expenses charged to reforestation, soil and mineral development, etc. The Institute estimates a loss on power charges of "almost \$100 million since 1934" whereas the TVA Controller, Mr Arnold Sunstrom, declares that the Authority is now earning more than 4 per cent on the "net average investment in power facilities." The Institute's move is no doubt directed particularly against the TVA statement that charges to consumers are being made at the rate of 1.80 cents per kilowatt hour, against a national average above 3 cents. The industry believes that power rates generally, which have fallen for many years in contrast to other living costs, are now due for an upward revision.

THE WORLD OVERSEAS

Problems of Italian Reconstruction

Italian Economy in the Balance

(By Our Special Correspondent recently in Italy)

The first two articles in this series appeared in the issues of THE ECONOMIST dated November 30th and December 21st. The series was then interrupted to enable the two concluding articles on the Italian economy to take account of (i) the results of the Reconstruction Loan, (ii) the Italian Government's latest estimate of its foreign trade balance in 1947, and (iii) the outcome of Signor de Gasperi's visit to Washington.

THE root of Italy's economic difficulties lies in the problem of scarcity. After seven years of war expenditure, of fighting and destruction and of prolonged and costly liberation, the Italian economy has not recovered its pre-war productive level, quite apart from the extra output necessary to make good the waste and damage of war. By the end of 1946 agricultural productivity was improving, but remained at a level well below the pre-war average. Industrial activity climbed steadily during 1946 and reached an average of about 65 per cent of 1938 by October. But in general terms it is estimated that Italy's national income has diminished by 40 per cent and this missing 40 per cent, coupled with war devastation, has for the time being placed the Italian economy under considerable strain.

The scarcity of goods would in any case have had an inflationary effect. But between 1943 and 1945 Italy's two governments—Badoglio's in Rome and Mussolini's in the north—had recourse to the printing press and between 1942 and March, 1945, a very great expansion of the currency took place. In 1942 the total circulation stood at 79,165 million lire. Then came the period when the two régimes maintained themselves by issuing fresh money and, in addition, Allied amlire were brought into use. By 1944 the total circulation had jumped to 319,397 million lire (plus 63,841 million amlire). But since March, 1945, the printing of extra money has been checked and since 1945 the circulation has only risen from 389,809 million lire to 417,711 million (the August, 1945, figure, excluding 92,885 million amlire). Nevertheless, inflationary pressure is constant and has tended to increase this winter.

This disproportion between an inflated circulation and a general scarcity of goods has reduced the pre-war value of the lira about 30 times. This fall is reflected in the price level. The cost of living in October, 1946, was about 29 times higher than in 1938. It is difficult to speak of a general level of prices, for one of the marked features of Italy's economic disorganisation is the existence of a great variety of price levels reflecting all manner of special conditions and varying very much from region to region. But it is probably true to say that wholesale prices have increased by over 30 times. And since in the last six weeks the government has taken measures to suppress the "black market" in Rome and other cities and many goods have become even more unobtainable, there is reason to suppose that the present level of prices may now be higher still.

It is misleading to speak of a black market. Only in rationed goods—flour, pasta, oil, fat—is the market black. For the rest it is simply a "free" and exceedingly expensive market. The ration is small—the basis is 250 grammes of bread a day and (since December) only one kilogramme of macaroni a month with a tiny addition of oil and fat. There are frequent local famines and when recently in Naples the macaroni deliveries broke down the result was unrest and a hurriedly called general strike. The unrest is, however, understandable, for if the customer cannot buy his daily bread ration (just under half a pound) at the controlled price of 6.50 lire he may have to buy flour in the black market at about 130 lire the kilo (the price in Rome in early December). Olive oil at 650 lire a litre and sugar at 700 a kilo would probably be beyond his means.

It has proved impossible to keep much proportion between rates of pay and the vastly increased cost of living. On an average wages have risen about 18 times, salaries only seven. The

"salarial"—the clerks, the government officials, university lecturers, small professional people—are the most hardly hit, for they cannot easily supplement totally inadequate earnings. Some workmen can hire out their skills, especially when they are working only part-time in the factories. The landowners and the peasants, on the whole, live well. The industrialists can maintain their position. The new "commercial" classes (in other words, the free marketeers) live as they have never lived before. At the other end of the scale, over two million unemployed, unabsorbed returned prisoners of war, disabled men, widows with young children, live in great misery. Unrra, for instance, puts the figure of those below subsistence level at above six million.

The implications of such a situation are obvious. The lira is under constant inflationary pressure. The disproportion between earnings and prices has an unstabilising effect economically and politically, and the need to raise earnings only threatens to increase costs and establish the familiar vicious spiral. The degree of devastation in the country and the substratum of profound misery compel the Government to spend large sums on reconstruction and relief. But this governmental expenditure only increases the risk of inflation. The Government is, moreover, divided within itself on the question of doing less or doing more to remedy a grave economic situation. The left-wing parties urge more control and more government direction in order to remedy the glaring injustices of the present position. The men of the Right argue that more control will simply put a further brake on the initiative needed to get industry to work. Between the two the Government's approach has tended to be hesitant. It has taken a variety of measures and discussed as many more, but the fact of coalition at the political level is reflected in compromise in economic affairs.

One urgent aspect of the inflationary problem is presented by the coming budget. When the figures were first forecast in the summer of 1946 it was thought that Government expenditure would amount to 341 milliard lire, revenue to 148 milliard, and the gap to be closed to 193 milliard. During the autumn, however, it became clear that the Government's expenditure, particularly in the sphere of relief work, would have to be much heavier. Early in the autumn the then Minister of the Treasury, Signor Bertone, estimated that expenditure was more likely to be in the neighbourhood of 700 milliard. Revenue, especially from taxation, was, however, showing some improvement and might bring in about 280 milliard. The gap would thus rise to about 400 milliard. It is probable that when the final estimates are made the gap may be even larger. The Government's immediate problem is to find some way of bridging it. Not much can be hoped for from extra taxation. It is true that taxation has increased much less in proportion to other factors (it is only about five times as heavy as in 1938), but the complication of the Italian tax system, in which there are at least 14 direct and 30 indirect types of tax, the difficulty of tracking and assessing the new wealth and, above all, the traditional Italian habit of avoiding taxation, make it unlikely that taxes will make the contribution they should to bridging the inflationary gap. The last Government did, therefore, discuss and agree in general terms to a programme whose four parts were held to be interdependent. It was decided to introduce a capital levy, to convert the lira possibly into a new depreciated currency, to peg wages and salaries for six months and to issue a reconstruction loan. The success or failure of the loan would be the key to the scale of the levy and the value of the new currency.

Of this programme, two parts have been carried through. Since October last, wages have been officially stable. The loan issued in November remained open to the public until January 4th, and a week later it was announced that 231 milliard lire had been invested. One hundred milliard of this was promised before the loan

prospective increase in overseas expenditure and lending cannot be expected to reach anything like \$7-8 billion a year in the near future—and lending leads to a contra entry for interest. Any detailed assessment of prospects reinforces the conclusion that the size of America's external budget will fall—probably markedly—before it will rise again.

The second question, whether the country's external budget is likely to remain reasonably stable from year to year has already been partly answered by the conclusion drawn from the present gap between imports and exports of goods and services. It will also depend, in no small measure, on the prospects of the American economy as a whole. Obviously, the size of imports and exports of goods and services is closely related to the level of internal economic activity. And there are few in this country optimistic enough to say that the trade cycle has been eliminated. There is still much talk of a backlog of unsatisfied demand; but no one knows how much of it will become effective; there is an enormous unsatisfied demand in China. The disturbing element is (apart from the running down of accumulated savings) the unfavourable income-price ratio that has developed, especially in the lower income categories.

In a booklet issued by the Department of Commerce in 1943 (entitled "The United States in the World Economy") Mr. Hal B. Lary wrote:

It would be tragic indeed if the United States, after a period of renewed full participation in the world economy, were to permit another abrupt fall in the supply of dollars to disturb the recreated international trading and financial mechanism, whether wilfully through increased trade restrictions, carelessly through the misbehaviour of foreign investment, or involuntarily through the improper functioning of the domestic economy. Commercial and investment policies, however, are susceptible of intelligent determination and should no longer constitute such disturbing elements as in the past. The functioning of the American economy as a whole beyond question presents the most baffling problems. On the solution of these problems through the maintenance of a high and reasonably stable level of economic activity in the United States the interests of this country and other countries are most clearly and indisputably united.

Mr. Lary's warning has become urgent, for present indications point unmistakably to a fall in the supply of dollars.

American Notes

The Price of Greatness

A Republican Congress which found economy in government to be one of its most effective campaign slogans is rapidly being presented with a bill of international costs with which it had not reckoned. It is discovering, almost overnight, that it is not cheap to be a Great Power. The British fuel crisis aroused the Cassandras to cries that Britain would be forced to abdicate and that the United States must be prepared to step into her part at short notice. Mr. Walter Lippmann wrote, more moderately, of the forced and disorderly liquidation of so many British external commitments that the whole situation in Europe, Africa, and Asia will become inordinately more difficult to manage peaceably.

In the most exaggerated comment there was a trace of a desire to wear the lion's skin before the lion is really dead. But even the friends of Britain were beginning to admit publicly that the loan granted in 1945 was likely to prove insufficient. In Greece and Palestine Britain prepared to shed some of the load.

The Administration is preparing to request Congress for a loan of \$400 million for relief and military assistance to Greece, basing its plea on a frank recognition of the dangers of Soviet expansion in the Eastern Mediterranean. Mr. Hoover has returned from his mission to Germany and Austria with some suggestions for making relief more efficient, more economical and more likely to be repaid, but the immediate burden of his report is the urgent need for more food for the children, the aged and the "normal consumer." Mr. Truman has transmitted to Congress his request for funds for the International Refugee Organisation. The Secretary of State has protested against the cuts in Army expenditure as they affect relief for the occupied countries; the fate of Mr. Truman's estimate of \$350 million for relief for the liberated countries still hangs in the balance. General MacArthur has made it clear that he must have either more food or more soldiers in Japan. And there were many doubts whether the threatened cuts in the appropriations for the Armed Forces did not deprive General Marshall of his trump card at Moscow.

It is at last becoming crystal clear that there can be no bi-partisan foreign policy conveniently insulated from domestic affairs; that to play the part of the greatest Power takes thought, and money, and men. There has not been much time to study the rôle, and it is thrust upon the United States at a moment when the party in power is pledged to cut down the functions and the cost of government both at home and abroad. Mr. Truman's speech in Texas this week will almost certainly put the alternatives of this historic choice before the country. But an even heavier responsibility lies upon the internationalists of the Republican Party, who will have to persuade their economy bent colleagues that peace is a good investment.

"Republican" Trade Agreements

The Executive Order covering the future pattern of trade agreements was published last week by President Truman. Government officials in Washington maintain that this Bipartisan Agreement secures the Cordell Hull tariff policy from any major reversal, and Republican Party spokesmen are eloquent on the concessions made to the Minority Party in Congress.

Overseas observers, however, will be rather more suspicious. The United States now reserves to itself the right to withdraw all concessions wherever imports "threaten" domestic producers, and the Tariff Commission is empowered to exercise a constant patrol against imports, and to recommend modification, or withdrawal, of tariff concessions whenever such "injuries" are in sight. The Commission will operate to some degree in public, and it must publish the results of individual analyses. The Commerce Department will exercise a similar control over export prospects, and all trade pacts must contain most-favoured-nation provisions securing the United States fully against any possible discrimination.

This "compromise" may be better for Mr. Truman than a trial of strength in the 1947 Congress. But while it does not restore the tariff autonomy of Congress—powers which wrecked every major move for tariff reductions before 1934—it is a very sad relapse from recent practice. The Tariff Commission is certainly more than a partisan body, and has produced some excellent and detached surveys of tariff possibilities. But it must now operate against a background of continual clamour from every type of industrial interest, and that clamour will become almost irresistible as business activity falls away. If all nations take this pattern at the Geneva Conference next month (and the United States has less justification than any other nation) the world trade climate is likely to continue bleak and unpromising.

"Magnificent Prosperity"

Life is flowing strongly along the Pacific coast, where Californians wait no longer for Townsend pensioners from the Middle West, but watch the surge of industrial activity released by war contracts, and speculate on the possibility of vast new markets in the Far East for US manufactures. Hot-Gospellers and ecclasiasts still flourish, but for 1947 a more suitable example of Californian vigour would be Mr. Amadeo Giannini, head of the Bank of America with its 500 branches and its record of expansion which is still regarded with something like suspicion by the more conservative financiers of the eastern States.

Moved by this mellow climate, the Secretary of the Treasury, Mr. John W. Snyder, quite recently delivered a speech in San Francisco on the "magnificently prosperous condition" of the nation. Certainly Mr. Snyder was not talking against the book, as can be seen from the preliminary figures for 1946 now issued by the Commerce Department:—

	1939	1945 (billion dollars)	1946
Govt. expenditures	16.0	83.6	35.0
Private capital formation	10.9	9.1	32.0
Consumer expenditures :—			
durable goods	6.4	7.7	14.0
non-durable	32.6	65.6	77.0
services	22.7	33.2	36.0
Gross national product	88.6	199.2	194.0

A substantial part of this expansion in dollar incomes follows, of course, from rising price-levels. In 1946, farm prices soared above all former peaks, and while wholesale commodity prices altogether remain below 1920 tops, the uptrend following the

opened to the public by the banks and credit houses, and their contribution appears in the event to have been in the neighbourhood of 119 milliard lire. Thus 112 milliard represents genuine cash saving. This figure, which is equivalent to just over 10 per cent of the present bank notes in circulation (450 milliard lire) and bank deposits (650 milliard lire), is probably as high as could be expected. The loan remained open only six weeks. It paid only 3.5 per cent interest. Prices have increased in the last year more than the amount of money available, and people have not the reserves of spare cash they disposed of during the first inflationary period. Previous loans (including the Nitti loan after the last war) gave much the same result. Nevertheless, the sum achieved is not sufficient to bridge the gap in state expenditure, and the Government must now decide whether to continue with the capital levy and the conversion of the currency.

On these two points, both the last Cabinet and its advisers were divided. The Left, led by the Communist Finance Minister, Signor Scoccinarro, were in favour of a very stiff levy on a sliding scale amounting to confiscation of the higher incomes. The Right wing of the Christian Democrats and the very Conservative Signor Corbino, who preceded Signor Bertone at the Treasury, opposed it. The result was that the country got the worst of both worlds. The levy and the conversion were discussed sufficiently to frighten people and undermine their confidence in the lire. But no steps were taken to mop up the excessive purchasing power pressing on the price level.

The fate of the levy and the conversion scheme in 1947 will depend upon the political complexion of the new Italian Government, but it is at least possible that neither scheme will be carried through. The Government will, however, be left with the problem of providing work and relief at great cost to the poorest classes in such a way that the inflationary situation is not aggravated. But without any effective measures for drawing away the new milliards pumped into public works, some further rise in prices seems inevitable, and with it an even greater pressure on the most poorly paid members of the community.

It is a truism to say that the only way out of the Government's dilemma is a great increase in production. It is the missing 40 per cent of the national income that has created the present largely uncontrollable situation. A strong politically united Government with an effective civil service, or alternatively a revolutionary dictatorship, could no doubt so divide Italy's straitened resources that they were more evenly distributed. But the Italian Government is neither. Moreover, one vital factor in the economic picture is to some extent outside its control. The condition of Italian economic recovery is the import of raw materials. The reason why Italian industry is running at about 65 per cent of its pre-war average is simply because it is receiving rather under 60 per cent of its pre-war imports of coal. Thus the position of Italy's foreign trade is a vital factor in determining the degree of economic stability that can be achieved, and to a large extent the Government's efforts to avoid inflation and prevent destitution turn on its ability to balance not so much its internal accounts as its external trade.

Finland's Ordeal

[BY A CORRESPONDENT]

THE long-awaited peace treaty is not likely to make life any easier for the Finns. It will bring no alleviation of the armistice terms under which they have been existing with such difficulty for the last twenty-eight months. The territorial clauses are unchanged: Russia retains Petsamo, the Porkkala area and the province of Karelia, which includes Viipuri, Finland's second city, part of the Saima Canal, her main industrial artery, and land which produced 12 per cent of her cereals and meat and 10 per cent of her industrial output. The military clauses are made more severe: Finland must surrender all armaments in excess of those needed by a standing army of 34,000 men. The reparations bill is not reduced: it remains at 300 million dollars' worth of goods to be delivered by September, 1952.

This reparations burden, which Finland has been shouldering since the armistice of September, 1944, is a great deal heavier than may appear at first glance. The Russians insist that reparations-goods be valued at the price level of 1938 (with additions of 10 per cent or 15 per cent in some cases), which means that the cost to Finland is greatly in excess of \$300,000,000. The nature of the goods required and the dates for their delivery are specified in the closest detail. Only one third of them are

forestry products, although these formed 80 per cent of Finland's pre-war exports. The rest is to be paid in ships, cables and machinery, which before the war made up only four per cent of Finland's exports. Nearly one third of the bill is to be paid in machinery, which Finland has never manufactured before and for which she must import the raw material. To pay for these imports Finland has little surplus available for export: she must have credits from the West. Meanwhile, if the Western Powers fall behind schedule in their deliveries to Finland, the Finns must be late in their deliveries to Russia. Finland is not allowed to make up for a deficit in deliveries of machinery by sending a surplus of wood-products; each category of reparations-goods must be sent in full, and delay involves a fine of 60 per cent per annum. Apparently Finland is now late in deliveries of machinery and ships to the value of \$4,000,000; for this she incurs a fine of \$200,000 a month.

Thus saddled with reparations, the Finns have been able to do little for their own economic rehabilitation during these last years. They have been shockingly short of food, especially of meat, sugar and fats, and the position is getting no better; indeed, this month when the bread ration is to be reduced, it will get worse. Transport, deprived of coal, coke and petrol, and with no renewal and little repair of rolling stock, is in a critical position. The housing shortage is appalling: the Finns are now short of 140,000 dwellings. Finland exported nearly 60,000 tons of prefabricated houses in the last quarter of 1946, but so little can be spared for domestic building at home that a maximum allowance of one room per person is imposed in the Finnish towns.

The Finns are united in the effort to pay reparations, and all are agreed that good relations must be maintained with Russia. Except for the Communists, they are as suspicious and distrustful of Moscow as ever they were; all they have learned is that they cannot afford to pursue a policy of isolation from Russia. The Finnish Communists are not in a strong position: they know that they cannot do without Russia, and that Russia has so far been able to do without them. They have made themselves useful to Moscow in small ways—a demonstration here, a procession there, a press agitation on this point, a trade union concession on that—but Russia has had her way with Finland without their help.

Russian Adroitness

In her policy towards Finland, the only really democratic country which she has ever defeated, Russia has behaved with remarkable subtlety. There has been no military occupation, no NKVD penetration, no planting of ex-Comintern agents in key positions, no deluge of propaganda. The Finnish press has been left free, provided that it does not criticise the Soviets. The Finnish general election of March, 1945, was the freest as well as the first to be held in any defeated country. The Finnish Government, though prodded behind the scenes by the Control Commission and by the Soviet Foreign Ministry, has ostensibly been left alone to carry out the armistice terms.

The result is a strange mixture of freedom and fear in the country. It is still democratic, Scandinavian in character and outlook, and western in all its aspirations. Culturally and politically the Finns speak the same language as the Swedes and the English. All their reforms of the post-war years—in education, in land settlement, in labour conditions—have been on western rather than on eastern lines. They know that they are at the mercy of Russia, and that the quality of Russian mercy is strained; but while there is life there is hope. The Finns' hope is based on the fact that their peace treaty must be signed and guaranteed by Great Britain as well as by Russia.

Just recently there have been signs that the Russians may use a lighter hand in Finland. They have released the Malm airfield for Finnish use, on condition that the Finns do not arrange any air service to foreign countries. They have agreed "in principle" to Finnish requests to use the Saima Canal for timber transport and to reopen the direct Helsinki-Abo railway, which runs through the Russian area of Porkkala. But at any moment these concessions may be withdrawn and new conditions imposed. The Control Commission is to remain in Finland for eighteen months, after the ratification of the treaty.

Whether Finland can survive as a free democracy in the post-war world seems to depend on Russo-British relations, on the readiness of western Governments and banking houses to grant credits and loans, and on the continued steadiness of the Finns themselves. On this last point there need be least doubt; the privations the Finns have endured and the efforts they have made during these last few years have proved their capacity.

collapse of the Price Control Act last summer was certainly the sharpest movement on record. The Labour Bureau index of living costs (1935-39=100) was 99.4 in 1939, 128.4 in 1945, and above 153 in December last.

The dollar figures thus require a substantial deflation before the physical volume of activity can be measured. But a more faithful indicator of progress is the Federal Reserve Board's index of industrial production (1935-39=100) which held steadily on a new plateau above 180 through the autumn months, after dipping below 150 in the reconversion period. The 1939 average for this index was 109 and the present level far surpasses any previous peace-time peak.

The employment record moreover, is one of equal encouragement. Apart from the boom in farm employment, the Reserve Board records the following changes since 1939:—

	1939	1943	1945	1946
	(non-farm employment in millions)			
Manufacturing	10.1	17.4	15.0	15.0
Transport	2.9	3.6	3.8	4.0
Trade	6.6	7.0	7.2	8.2
Finance, etc.	4.1	4.1	4.6	5.3
Total	30.3	40.2	38.1	40.6

The surge of productive power from V-J Day onwards is certainly worth stressing when it is recalled that the problem of adapting resources brought fears of serious unemployment and deflation late in 1945, and that industry through that winter and spring was at times nearly paralysed by strikes in key industries.

For How Long?

For Mr Snyder, apparently, the path is clear. In San Francisco, at least, he declared himself to be free from fears of depression, and maintained that inflationary price movements and possible labour disturbances were the only "national liabilities" in sight. Industry, however, still bemused by the depression years, is more than a little suspicious of present good fortune, and almost every forecast indicates that most executives are looking for some recession in the not far distant future.

There is now a solid basis for estimating the gross level of national expenditures that will be necessary to sustain full employment, assuming a fair stability of price levels from this point onwards, and assuming the present labour force of about 60 millions. Over the latter half of 1946, the unemployment figures were fairly constant at an average monthly level of 2 millions. And industry was by itself sustaining that level of employment, for, although government expenditures on goods and services were excessive by any pre-war standard, the net cash outlay of State and Federal governments over 1946 altogether can have made no more than a relatively modest contribution to the national product. The slack, of course, was taken up by the formidable expansion in gross private capital formation from a 1939 figure of \$10.9 billion to \$32 billion.

In this total, constructional work of all types showed an appreciable advance, the dollar total advancing from \$3.6 to \$8 billion, while industrial expenditures for durable equipment were up from the \$5.5 billion of 1939 to \$13 billion. Net exports of goods and services at \$5 billion, and inventory accumulation to the tune of \$6 billion also accounted for a substantial part of 1946 activity.

Residential construction could expand very considerably from its 1946 level of \$3 billion—given the necessary stimulus from State and Federal agencies—but the gross figure of \$13 billion for equipment is almost double that of the 1930-39 yearly average, and clearly reflects a great deal of rehabilitation work. Similarly, the stimulus from inventory accumulation in 1946—even when allowance is made for the fact that much of it merely reflects rising prices—may not be easily repeated, while the export volume clearly hinges on the ability of the World Bank to develop channels for international lending on a scale never before attained.

These activities, with consumption, will determine the future national product. In such a year as 1946, with a distorted flow of consumer products as between durable and non-durable goods, and with a very considerable backlog to overcome, it is clearly of little use to make elaborate calculations on the long-term propensity to consume. For what it is worth, however, it may be noted that personal savings accounted for about 12 per cent of income payments after taxes, against 9 per cent in 1939 and 24 per cent in 1945, when the dearth of outlets for personal income was still exercising its effect on consumption levels. Durable goods expenditures in 1946 were double those of 1945 at \$14 billion, despite the continuing and acute scarcity in many lines.

So much capital equipment is still needed that the United States—relatively modest recessions apart—may be able to go on for quite a long time before any deflationary abyss yawns ahead. But population is still expanding, and the latest Labour Bureau survey predicts a total civilian work-force of 62.5 millions in 1950. To sustain full employment then will demand an even higher level of physical output than in 1946. In such a volatile economy as that of the United States even modest changes in capital expenditures act as a powerful lever in either direction. If pressed for a fuller definition, Mr Snyder would, no doubt, bring in some reservations on the longer view.

Budget Revision

Congress seems to have fallen badly into arrears with its fiscal procedure, for the Legislative Reorganisation Act last year provided that a Joint Committee should by mid-February in each year submit a full legislative Budget for the ensuing fiscal year, complete with overall estimates of receipts and expenditures, and coupled with a concurrent Congressional resolution fixing a definite ceiling on actual appropriations.

The Committee has not yet finished its full task. In mid-February, however, without any particularly detailed analysis of White House estimates, it did decide upon heroic action and voted for a full \$6 billion reduction in the Presidential expenditure estimate of \$37.5 billion. Approval was general in the House, where the Republican leadership took stern action against their more faint-hearted party members. In the Senate, however, more cautious views prevailed. Senator Taft declared that \$6 billion was a great deal of money to dispense with at one sweep and Senator Vandenberg, with an eye on foreign commitments, found himself unable to support the figures approved by the Joint Committee and sternly denounced by the heads of the Service departments as crippling, both in terms of occupation forces, and of development and training.

The revised figures must now be accepted by both Houses. At least \$4.5 billion will be taken from the Presidential figures, however, for that figure has been agreed by the Senate, subject to the proviso that no major reduction will be made in the service estimates; detailed figures have not been given, but the Committee's earlier figures were believed to include a reduction of about \$2 billion in the service vote of \$11.5 billion.

There is, no doubt, a great deal to be said for drastic action, and the Republican Party has been bemused by its election pledges offering a simultaneous cut of 20 per cent in personal tax rates and a substantial reduction in public debt. But it seems altogether unlikely that the majority party has gone the best way about the task. Provision of a ceiling, without very careful analysis, can only mean that all sorts of useful expenditures will be abandoned in order to make way for other appropriations, having a more direct connection with electoral prospects in 1948. And there is force in the President's contention that just at this time Congress should be prepared to walk slowly where international issues are involved.

There is, too, an element of unreality about present predictions concerning the possible surplus and the probable amount of debt reduction in 1947-48. The Budget Committee boosted the estimates of the yield of present taxes by \$1.4 billion from the Presidential figure of \$37.7 billion, and calculated that on reduced expenditure levels a tax cut of \$3.5 billion would leave room for \$3.5 billion of debt redemption. The Committee may be right, but the President's figures were based on the assumption that 1946 activity and incomes would continue without major interruption. On present tax schedules, Treasury experts hold that receipts may decline by as much as one-third of any fall in the national income level. Meanwhile, so long as current activity lasts, and so long as present Budgetary plans are in force, the national income for the first time in nearly a decade will be receiving no material support from Federal deficits.

Shorter Notes

The latest *Fortune* survey finds that any one of five possible Republican contenders for the Presidency could, if the election were held now, defeat Mr Truman as the Democratic candidate. According to the poll, Governor Dewey would receive 50 per cent of the vote, to Mr Truman's 28 per cent, Senator Vandenberg 42 per cent to Mr Truman's 27 per cent, Mr Stassen 40 per cent to Mr Truman's 25 per cent, Senator Taft 35 per cent to Mr Truman's 31 per cent, and Senator Bricker 39 per cent to Mr Truman's 28 per cent. What is surprising is to find Senator Taft, who wields so much power on Capitol Hill, lagging so signally.

THE WORLD OVERSEAS

France and the Alliance

(From Our Paris Correspondent)

It goes without saying that a military pact with Britain should be popular in France. To most Frenchmen the alliance seems so obviously necessary and desirable for both countries that failure to conclude it would have been thought a singular lapse of statesmanship. The unanimity of 608 votes marked the Assembly's approval of the treaty.

Yet it would not do to ignore the sense of disappointment with which opinion on the French side of the Channel has greeted what seems to it to be a document of very limited significance. After the unexampled upheaval of the last ten years, an alliance, many had thought, should be more than a bare promise of mutual military aid. There has been an element of wishful thinking on both sides at the root of this disappointment. If the British negotiators had hoped to include provisions for the progressive harmonisation of the two economies—in fact, a widening of the productive resources of the sterling area—the French had hoped to see British policy towards Germany emerge from its present obscurity into the light—sharp enough, if not always entirely clear—of French thought on the subject. Both have been disappointed.

It would be none the less wrong to see in this disappointment any French reluctance to enter the alliance. Everything which may commit Britain to what the French are accustomed to regard as a realistic policy towards European problems will be welcomed by them. The French Communists, for example, have gone out of their way to emphasise that no permanent alliance can be satisfactory to the French unless it rests upon an effective settlement of the German problem; but, having made this reservation and given themselves the ground for later protest, the Communists have supported the alliance even in its present form.

Most Frenchmen see the real danger for Europe not in actual German aggression, against which British aid can be expected to be automatic, however inconveniently late, but in the threat of aggression. This, indeed, was one of the knotiest problems of the negotiations; the point to which the French held on through thick and thin was inclusion of "the threat of aggression." But the threat of aggression—occupation of the Rhineland, tearing up of disarmament clauses, a growth of militant nationalism—can be met only by a satisfactory Allied settlement with Germany. Therefore the German treaty is to be regarded as the logical forerunner of a real Franco-British alliance—not as its successor.

In emphasising this, the Communists have doubtless had in mind the possibility that the British Government would not support the French position at Moscow, and would oppose that outright and international control of the Ruhr industrial area in which the French see their best hope of future security. All parties here, indeed, understand by "security" a good deal more than merely military desiderata: it implies a settlement in which France can acquire something like economic equality with Germany. To the

French, this westward shift of the industrial centre of gravity in Europe would seem obviously to be also in the British interest. Hence the confusion of mind which arises from what seems often a British intention "to rebuild Germany even at the cost of France."

There is a feeling in France that the signature of a Franco-British alliance as the mere completion of the existing system of Franco-British-Soviet defence against Germany is only a phase, and a rather brief one, in the development of post-war power relationships. Unless the Big Four are substantially agreed on the broad lines of their German policies, this triangular system can have little real content. As they stand to-day, the treaties are provisional acts of goodwill which must be revised after the German settlement, or else written off as decisive international engagements.

Nationalism in South America

[FROM A CORRESPONDENT]

In a century and a-half Latin American nationalism has passed through three phases. The first was the movement for independence from Spain and Portugal. It was not supposed at that time that regional and particular interests would be so powerful as to lead to the creation of a number of independent states. Cultural background and political ideals showed no very great variations. It was geography that prevented the emergence of a Latin American federation comparable to the United States; and Nature was assisted by the self-interest of the small ruling cliques, as well as by the absence of any serious menace from outside, for which the protection offered by Great Britain and the United States was largely responsible.

The second phase was much less recognised abroad as it was mainly one of literary expression. Once political independence had been secured and consolidated, even if political life was tumultuous and disturbed, thinking men in the later nineteenth and early twentieth centuries began to ask "independent for what?" This was the burden of the great patriotic writers, particularly in Argentina; Manuel Galvez and Ricardo Rojas are good examples. They were concerned with a critique of the cosmopolitan culture of cities, and sought to uncover and give form to the genuine historical and cultural tradition.

The third phase is economic nationalism of the type which has become familiar. Most of the Latin American Republics have shown the symptoms in varying degrees. It is not exclusively economic in character. Development of national resources by national brains and brawn is usually only one aspect of a programme which may include almost anything, from the revision of school text-books to the selective control of immigration.

Most developments of Latin American nationalism since the phase of independence have stumbled over certain obstacles. Chief among them is the diversity of peoples. In English and French America the indigenous tribes were largely exterminated, or at least did not survive in numbers sufficient to affect the growth of those regions as areas of a European type. But in many parts of Latin America, particularly those where developed civilisations flourished before the conquest, the Indians have survived in millions. The racial problem is traditionally regarded with tolerance, if that is the right way to describe a wide process of actual miscegenation; but the necessity of some degree of cultural assimilation, if a worthy and reasonable nationalism is really going to benefit the masses, has only recently been faced, and that mainly in Mexico.

In certain Republics it is difficult to see how the pressure for national growth and enrichment can benefit the people at large unless the cultural problem is solved by a social transformation. Whatever one may think of the present mood of Argentina, at least most of the people have been ready to believe that they will reap the benefits of a nationalistic policy. But in such countries as Peru or Bolivia increased national strength and prestige or

Commercial History and Review of 1946

The Economist's Annual Commercial History & Review of 1946 will be published with the Records and Statistics Supplement of March 15, 1947.

A limited number of copies of the Commercial History, price 6d., will be available for readers who are not subscribers to Records & Statistics. Orders should be sent to—

French Manpower Problems

[BY A CORRESPONDENT]

THE British Government's White Paper on manpower and production should be of considerable interest to the French, who are faced at present with the parallel problem of an "almost universal shortage of manpower." Indeed manpower shortage, which seems to be the price of an economy of full employment, is even more critical in France than in Britain.

It is therefore a matter of life or death for France both to tap new sources of labour and to raise the output of the individual worker to offset the shortage of workers. This was recognised in the Monnet Plan. It aims at raising 1,200,000 workers by 1950. Of this total 480,000 must be found by the end of 1947, 220,000 between 1948 and 1950 and a further 500,000 workers, mainly unskilled, will be needed to replace the prisoners of war, when they have been withdrawn. The problem is most acute in the mining industry, which now employs 55,000 Germans.

The chief source from which this additional labour is to be drawn consists of organised immigration of Algerian and foreign workers, but the extended employment of women, the reduction in the strength of the Army, and a switch from non-productive to directly productive work are also planned. There is obviously scope for a considerable reduction in the large army of *fonctionnaires*, and those engaged in distribution and non-essential services.

Of the sources of immigration, the main reliance is placed upon Italians, and it is eventually hoped to place about 200,000 in industry and agriculture. The unions' chief concern has been lest unskilled Italian labour should undercut French labour at a time when they are desperately trying to maintain and raise their own standards. Therefore the acceptance of immigrants will be conditional upon their health, political views and degree of skill.

The difficulties that have arisen in Britain in connection with the employment of foreign labour are not likely to be repeated in France, where there is a long tradition of industrial immigration. The Ministry of Labour's *Revue du Travail* recently showed that about 1½ million foreigners worked in France in 1945, the great majority being Italians, Poles, Belgians and Spaniards.

Unlike Britain, the French labour force was not augmented to any extent by female labour during the war. The numbers of women employed increased from 1,875,000 in 1936 to 1,886,000 in 1946, and during the same period the proportion of women to the total labour force increased by only 2 per cent, from 30 per cent to 32 per cent. The Government's intention is to encourage women to enter industry and to transfer them from the less essential occupations to manufacturing industry. Improved family allowances, the extension of welfare facilities and the provision of crèches and nurseries aim at achieving this. A decree in July, 1946, established the principle of equal pay for equal work; before that date a difference in remuneration of 10 per cent was allowed, though in April, 1946, the average female wage was lower by about 15 per cent than that of men.

Even if the French Government is successful in its attempts to bring in foreign labour and to recruit more women to productive industry, the problem still remains of raising the level of skill, for at present only about one-quarter of the labour force consists of skilled workers. Training schemes, on the lines of the British Government Training Centres, are being extended. They apply not only to women, but also to young and unskilled workers, and to men who have been physically or mentally disabled by the war or by industrial accidents. In November, 1945, there were 43 such centres; by October, 1946, the number had been trebled; the target for the end of the year was 250 and the ultimate target 750, with the object of obtaining 300,000 skilled workers.

The Role of the Unions

The French trade unions, like the British, are co-operating fully in all the schemes for increasing production. Much emphasis is placed on the *Comités d'entreprise*, of which there are now about 5,000 and which have very much stronger legal backing and wider powers than the British Joint Production Committees. They have, for example, powers to inspect the books of their firm. Their effectiveness varies considerably. In the nationalised firms and industries the *Comité d'entreprise* is a very live force. In some firms, it is still largely window-dressing.

Like the British TUC, the French *Confédération Générale du Travail* officially condemns strike action. In fact, there has been remarkably little labour trouble in France since the liberation, and most of the strikes that have taken place have been short-lived and more in the nature of political than industrial demonstrations. In the first half of 1946 the average number of working days lost was only 50,000 a month. The freedom from serious strikes is

mainly attributable to the influence in the CGT of the Communists, who are all out for production. A Communist speaker, urging the postal workers to return to work in the recent dispute, told his audience, "The strike is the weapon of the trusts." The trusts have succeeded the "two hundred families" as the chief bogey of the French workers.

Unlike the TUC, the French trade unions are accepting the necessity for increasing working hours over and above the legally-established 40-hour week. The principle of the 48-hour week laid down in the Monnet plan has been accepted, although the unions hold that the excess should be regarded as overtime. Working hours have been increasing, and last year the length of the working week averaged 43 hours.

Collective bargaining was suspended in 1939 and replaced by the State fixing of wages and salaries. Now the wheel has come full circle, and collective bargaining was restored on January 1st. Under the wartime system, the state fixed minimum and maximum time rates for each industry, graded according to the skill or qualifications of the worker and also the region he lived in.

The return to free wage negotiation, strongly advocated by the trade unions, was opposed by the employers, who argued that so long as prices continued to be rigorously controlled, wage control should remain. The position is now somewhat uneven, as about 40 per cent of the working population will continue to have their wages fixed directly by the State because their industries have been nationalised.

It is too early yet to judge the effects of the change in wage-fixing methods on the French economy, or whether the fears that it will lead to inflation will prove justified. Hitherto, the wage increases that have been secured have been more than absorbed by prices, and it is likely that the trade unions, freed from the checks of state wage fixing, may seek to remedy this state of affairs. The CGT's main emphasis at the moment, however, is on a minimum subsistence level and on measures to secure stabilised prices at a lower level. It is also too early to see whether the projected modernisation of French industry will have favourable effects on productivity, so that higher wages can be related to higher output. But it certainly seems that in the present crisis stage of French production there is some illogicality in the unions' demand for a planned economy in which wages alone are unplanned.

Records and Statistics

In addition to the short "Statistical Summary" which appears weekly in *The Economist*, a full service of statistical and factual information appears weekly in

Records and Statistics

Supplement to *The Economist*

Records and Statistics is a separate, self-contained weekly publication of from 16 to 24 pages. It includes not only many statistical tables but also factual records of public affairs, including Parliamentary activities and digests of state papers, and industrial and commercial reports from home and overseas. It is believed to be the most comprehensive statistical and factual report appearing weekly anywhere in the world.

The *Records and Statistics* Supplement to *The Economist* is available by postal subscription only. The subscription, which may be sent direct to this office or through a newsagent is 30s. per annum. For those who are already direct postal subscribers to *The Economist*, the economy of posting both publications together makes it possible to quote a combined subscription of £4. Subscribers to *The Economist* who wish to receive *Records and Statistics* should notify this office as soon as possible, but are asked not to send any money until an account is rendered. It is regretted that it is no longer possible to supply back numbers of *Records and Statistics* or to date subscriptions back.

Paper shortage also makes it impossible to supply sample copies. For a limited time, however, subscribers to *Records and Statistics* will be allowed, if they wish, to cancel any unexpired portion of a subscription.

THE ECONOMIST, BRETTENHAM HOUSE, LANCASTER PLACE, LONDON, W.C.2

Passenger confidence...

As with all other forms of passenger transport, passenger confidence in air travel increases proportionately with experience and development. With the accent on safety, aircraft design today is governed by a desirability to create and hold passenger confidence. The "Bristol" Wayfarer is remarkable in this respect; the fixed undercarriage is a symbol of the many inherent safety features of its design... it is a dependable rugged aircraft for mass passenger travel, capable of operating with bus-service regularity at economical fare rates.

THE BRISTOL AEROPLANE COMPANY LTD.

Rare Good Whisky

Every drop of Johnnie Walker sold to-day has to come out of precious reserve stocks. Not until distilling is 'going strong' again, and then not until a period of maturing has passed, can supplies of good whisky be increased. Johnnie Walker will always be rare good whisky; here's to the day when this good whisky will no longer be rare.

an augmented national income, mean nothing to three-quarters of the population. What is needed in the Andes is an intensified struggle against poverty, ignorance and disease. Otherwise, the creation of a strong national economy and freedom from the influence of foreign capital become little more than the slogans of a sensitive political dignity. Latin American governments have been too ready to assume that social progress must be promoted through a national consciousness artificially stimulated by heady draughts of anti-foreign propaganda.

It is in Mexico that a strongly nationalistic policy has been pursued longest. That country began the belligerent phase of its great social and political evolution in 1910, and in 1917 a constitution was promulgated which proclaimed in principle the "nationalisation of the sub-soil." For some years the government was pre-occupied with more urgent functions, but an attempt was made to enforce the new laws in 1927. It led to much controversy with the United States. The six-year plan adopted by Cardenas in 1933 contained a new set of provisions, and expropriation of the oil companies was announced in 1938. This provoked emphatic protests, and diplomatic relations between Great Britain

and Mexico were interrupted in the same year, not to be resumed until 1941. To-day the wells and properties are entirely worked and managed by Mexican direction and labour. It is difficult to know what the true financial position is, and whether the deal has been as profitable to the Mexican Government as it expected. Most of the production is consumed locally. Meanwhile negotiations for final settlement of compensation due to British and Dutch interests have proceeded slowly and with many interruptions, being at present temporarily suspended. The points at issue concern firstly the outstanding claims of either side against the other, and, secondly, the different and more important question of valuation of the expropriated assets.

In certain other respects the Mexican revolution has positive achievements to its credit. In its early years it was very strongly nationalistic, and relations with the United States were considerably embittered. All this has now changed to an attitude of cordial friendship. Similarly the exclusion of foreigners and the ministers of religion from the teaching profession led to violent conflicts with the Church which have given way to counsels of moderation. Much of the enthusiasm for popular education and certain aspects of the land reforms and of labour and social legislation have brought positive gains.

More recently it has been the nationalistic developments at the other end of the continent that have attracted attention. In the last two decades Argentina has passed through a period of national change and development; partly as a result of preserving her neutrality in two wars she has become conspicuously rich. Fortunes can be made in Argentina with very little effort. She has made an active start with her own industrialisation, and in the Italian community of immigrants and immigrant-origin some six million strong she possesses a labour force which makes a lot of noise but also works hard. She suffers from certain handicaps and from a shortage of technical leadership, but these very limitations arouse the spirit of emulation. The discovery that her position in the world is generally a strong one creates a tendency to attribute any temporary difficulties to "foreign economic bondage."

It is unnecessary here to recapitulate the steps which led to the recent agreement for the disposal of the Argentine sterling balances and for the purchase of the British-owned railways. It seems probable that every effort will be made by President Perón and his government to maintain the nationalist spirit close to boiling point. A recent distinguished visitor to Buenos Aires relates how on all sorts of occasions, when international affairs were being discussed, he heard the phrase "We and the United States." Perhaps in Buenos Aires this was a passing phase, but it is a dangerous path and is apt to terminate suddenly in the dark. It does not mean that there is going to be no opportunity for British exports, British enterprise, or British technicians; it does mean that Britain will have to study Argentine susceptibilities much more closely than in the past. British traders will, at some points, have to identify themselves much more intimately with the country.

Economic Aspects

The campaign is already in full swing. All the protective devices of full economic nationalism are in force. The differential exchange rates favour the import of capital goods at the expense of foreign competition with locally produced consumer goods. The new insurance tax imposed in 1946 is twice as high for foreign firms as for Argentine ones. Under the new five-year plan (that blessed solace for national ills) state activity has been vastly extended, and almost every aspect of the national life, from education to commerce, comes under direct control exercised under the immense powers possessed by the President.

In Brazil the nationalist programme has been developed in more reasonable measure and temper, and has found expression in three main directions. The development of national resources has been actively pursued, particularly since the five-year plan of January, 1938, and under the stimulus of war. The great steel plant of Volta Redonda was erected with United States credit and technical assistance. The extraction of new and rare minerals essential to industry and the manufacture of finished products have been accelerated enormously. At the same time the progress of cultural and racial assimilation has received attention. As elsewhere in Latin America, the activities of certain sections of the German communities supplied an undeniable justification for special measures. All schools must be directed by Brazilians; conscripts must speak Portuguese only; no foreigners may be employed by public authorities; special conditions govern the publication of reading matter in any language other than Portuguese. Finally, special regulations have been directed at foreign corporations. They can no longer acquire large tracts of land. The progressive nationalisation of insurance companies was begun in 1940, and in 1940 and 1941 conditions were laid down to limit the acceptance of deposits of foreign banks. In all Latin American countries particular provisions govern the extent of foreign participation in national air-lines, but in Brazil and Mexico 100 per cent of all employees in all categories must be nationals.

It is difficult to generalise about the ultimate direction of such tendencies, as conditions vary so very greatly from one Republic to another. The character of British participation in the life of Latin America will undoubtedly change in the future. It is no longer a region, if it ever was, where a young man with no resources can back his luck and stumble on wealth. Immigration and occupations will be closely controlled. For a long time to come, however, there will be an opportunity for Britain to sell heavy plant and machinery and certain, but not all, lines of "consumer goods." A vast country like Brazil, on the eve of a great national development, is sensible enough to see that the exploitation of its own soil requires resources it cannot itself provide. Even Argentina, which tends to regard itself as in a somewhat isolated position in the American continent, will stretch many points in order to retain the friendship of Britain and the goodwill of almost a century of active connection.

Industrialisation in Turkey

[FROM A CORRESPONDENT IN ISTANBUL]

A BEGINNING is now being made with the new Turkish five-year plan of industrialisation, roughly formulated last summer. To see it in perspective, it is necessary to retrace the outlines of the Republic's past efforts at industrial planning.

When the Government's preoccupation with political security, educational and religious reform, and reduction of foreign economic influence lessened in the early nineteen-thirties, the need for a thorough reorganisation of the economic structure moved into the foreground. Characteristically, both of the time and the scene, the brief discussion of the alternatives, private initiative versus state planning, ended in a complete victory of the latter. Industrialisation through a five-year state investment plan was made the official goal in 1933, though it was planned ultimately to hand the new industries over to private enterprise.

Such Government action actually was the only way then, and still remains so now. While the Government at first was by no means averse to co-operation between private and public investment under state guidance, private capital and initiative were practically non-existent except in the purely commercial field, where, furthermore, Greeks and Jews held a monopoly position. In 1934 altogether 550 joint stock companies existed in Turkey, of which the largest had a capital of £13,000,000. At the same time, there existed in the United States about 27 corporations per 16 million inhabitants—the Turkish population figure of 1934—having more than \$10 million share capital. In 1934 only 15 big companies were privately owned in Turkey. In 1936 the 60,000-odd industrial establishments employed on the average four persons per enterprise. The idea of joint stock investment had not taken root in Turkey at that time, and little progress has been made since. Existing stock is mostly held by a relatively few bankers and businessmen, and companies having several hundred thousand stockholders, common in advanced capitalist countries, are completely absent.

Industrialisation was advocated with three main ideas in mind. Firstly, that Turkey should be independent of foreign supplies of the most important industrial staple products, such as cement, iron, glass, steel, paper, textiles, etc., at least to such an extent as to tide her over periods of interrupted trade, such as that of 1940-5. The first World War showed clearly, and the second reinforced the conclusion, that even allied to a major belligerent Turkey would not be immune against catastrophic shortages until her industries were built up sufficiently to manufacture the indispensable minimum of both capital replacements and consumption goods. Secondly, that the export value of domestic raw materials and crops would be raised, and imports be reduced, by the creation of food industries and home manufacture of finished and half-finished goods from Turkish raw materials. Thirdly, that political independence must be safeguarded, even in peacetime, by economic independence or, in the words of a slogan popular at the time: "Political revolution must be implemented by industrial revolution." This motive, of course, is to some extent ideological rather than economic.

The first five-year plan, inaugurated in 1934, aimed at establishing the following groups of industries:

- Textiles—chiefly cotton, hemp, wool; silk excluded.
- Metals and minerals—iron, copper, coal and coal derivatives, sulphur.
- Cellulose—paper, cardboard, rayon.
- Glass and ceramics; cement.
- Chemicals—sulphuric acid, superphosphate; sugar.

The investment envisaged in this plan was realised, by and large, though somewhat belatedly. A separate plan, relating chiefly to mines, mining industries, electrification, domestic fuels, shipyards and machine industries, was outlined in February, 1936, for completion by 1941; but progress on this was slow, and the war arrested it entirely. Just before the outbreak of war, the first blast furnace was lit at the iron and steel plant of Karabük, near the Black Sea coast, and in the course of the war the number of blast furnaces was increased to three and the capacity of the steel furnaces stepped up accordingly.

The latest five-year plan, announced last summer, is apparently designed partly to implement and partly to supersede the uncompleted programme of 1936. Information is still fragmentary on the plan as a whole, and somewhat vague regarding specific purpose and technical detail of each proposed project. The general framework will emerge, however, from the following tabulation of available information:

Product	Location	Projected Capacity (metric tons p.a. unless otherwise stated) incl. pres. capacity	Expansion or New Construction
Chemical Industry:			
Nitric acid	Kütahya	6,000	New
Nitrates	Istanbul or near Izmit	30,000	New
Caustic Soda	Istanbul or near Izmit	6,000	New
Sodium Carbonate	Izmit	20,000	New
Copper sulphate	Izmit		New
Carbon Sulphide	Gemlik		New
Textile Industry:			
Linen	Bakirköy	25 million m ²	Expansion
Cotton fabrics	Halkınar	25 million m ²	New
Printed cotton goods	"	6,000	Expansion
Pack thread	"	2,000	New
Hemp thread	"	600,000 m ²	New
Wool cloth	Hereke		Expansion
Wool cloth	Defterdar		Retooling
Mohair yarns and fabrics	Bursa		New
Cellulose Industry:			
Packing paper	Izmit	3,000	New
Paper and cardboard	"	16,500	New
Electric power for Cellulose Industry	"		Expansion
Bonding material for paper manufacture	Borçka, vil. of Artvin	13,000	New
Synthetic fibre wool	Gemlik	600	New
Cellophane	Gemlik	600	New
Cement Industry:			
Cement	Sivas	90,000	Expansion
Black cement slabs	"	6 million m ²	New
Cement slag	Karabük	200 tons/day	New
Karabük Iron and Steel Works:			
Roller steel	Karabük	200,000	Expansion
Finest gauge wire	"		New
Steel plates and sheets	"	30,000-45,000	Expansion
Steel pipes	"	30,000	New
Steel	"	30,000	New

In June, 1946, the National Assembly decided to raise £150 million by a "National Construction Loan" to carry the new plan into effect.

Though no details are available on the financial and administrative mechanism to be employed in the execution of the plan, it is safe to assume that the present system of investment through the privileged State banks under the control of the Ministry of Economics will be maintained. Under this system the Ministry of Economics is the central planning authority responsible for the execution of the plan to the Cabinet and the Assembly, while the Sümer Bank, which owns or controls a large section of Turkish industry, including the Karabük Works, will be charged with finance and organisation. In varying degrees, other State banks and agencies like Eti Bank (mines and minerals) and MTA (prospecting and development of minerals) may be employed.

Critical comment on the plan evidently may refer either to its substance or to the proposed executive mechanism. On the latter information is scanty. On the substance of the plan, criticism in Turkey is levelled chiefly at the plans for a chemical industry, which apparently call for new construction considerably in excess of what has hitherto been published. If, it is argued, Turkey was to develop industries producing mass consumption goods for the domestic market from domestic raw materials, the Turkish chemical industry should be of the modest size imposed by the strictly limited domestic market, as the high cost of production would preclude successful competition on export markets.

A weightier objection is that Turkey is a typical agricultural country, with 65 per cent of its population working on the land, yet neither agricultural implements and machinery nor food-processing industries figure among the productive capacity to be installed. It is known that the Zirai Donatım Kurumu (Office of Agricultural Produce) has been authorised to make large and costly purchases of such equipment as tractors and ploughs abroad. Should not the modernisation of agriculture have first priority in Turkish economic reorganisation? Ship-building, machine tools and road-building machinery are further conspicuous omissions. The failure to co-ordinate the construction and import planning now left in the charge of the Ministry of Communications with the five-year plan is justly criticised.

Generally speaking, it is evident that insufficient attention and publicity is being given to the paramount question of cost of production. Owing to inefficient management, unskilled labour and the monopolised "etatistic" structure of Turkish industry, the prices of consumption goods of domestic manufacture are mostly disproportionately high, even in comparison with the abnormal present levels abroad. As long as there is no certainty, proved by meticulous expert calculation, that the new plant will produce at economic prices, the high cost of living and all hardship and injustice that necessarily attends it in a country with only rudimentary social legislation may only be perpetuated and the main purpose of the costly national investment contemplated will be defeated.

Boom in Switzerland

[FROM OUR SPECIAL CORRESPONDENT]

SWITZERLAND is in the throes of a boom which fills its people with anxiety rather than satisfaction. The foreign trade figures for 1946 have just been published. They show that although the 1938 figures of quantity have not yet been reached, those of value have been left far behind. And whereas in 1945 the unique situation arose, thanks to the destruction of productive capacity elsewhere, that Swiss exports exceeded imports by over 248 million francs, in 1946 imports exceeded exports by 747 million francs, a higher figure than any reached since 1933 by the country's habitual excess of imports over exports.

	Imports		Exports		Balance in Millions of Francs	Export to Percentage of Imports
	in Units of 10 Tons	in Millions of Francs	in Units of 10 Tons	in Millions of Francs		
1938 ..	737,920	1606.9	61,105	1316.6	-290.3	81.9
1945 ..	146,052	1225.4	17,612	1473.7	+248.3	120.5
1946 ..	544,040	3422.5	49,648	2675.5	-747.0	78.2

Swiss imports in 1946 naturally consisted almost entirely of foodstuffs and of raw materials, especially for the metal and mechanical industries. Watches headed the exports (in terms of value), with machines, silk goods and chemical products following not far behind. Whereas in 1938 Germany came an easy first on the list of Switzerland's customers and of its suppliers, in 1946 the United States had taken Germany's place both for Swiss exports and imports, while France has remained second-best supplier, and is now second-best buyer.

All this looks splendidly satisfactory on paper: profits are tremendous, labour extremely scarce and skilled workers' wages almost proportionately high. And yet a boom in a vacuum is an uncomfortable thing; a boom, that is to say, in a small country surrounded by a devastated continent, which cannot really afford to buy highly finished Swiss products, still less to provide Switzerland with the material resources which—apart from inadequate water-power and attraction for tourists—it entirely lacks. And to be as much involved economically with the United States as it was formerly with Germany is a change of dubious advantage for Switzerland.

Already there are signs that the zenith has been passed, particularly for the watchmakers. At all events, anxiety lest the bubble should suddenly burst is sufficiently great for the Swiss authorities to be at one and the same time exerting themselves to organise an influx of foreign labour (nearly 50,000 workers were brought in from neighbouring Italy during 1946) and preparing to be able to withdraw foreign workers' permits at the moment when the demand for labour may cease and Swiss workers themselves again be faced with unemployment.

It is not only a matter of anxiety for the future; the boom has already created a number of immediate problems. There is an inflationary tendency, not in the sense that the Swiss franc is weak, for there is twice as much gold in the National Bank as in 1938, and, whereas at the end of January, 1946, the note circulation (*Notenumlauf*) had gone up by 56 million francs, at the end of January, 1947, it was up by 81.6 million, thus reaching the figure of 3,883 million.

Prices are high. But life is easy enough for industrialists and skilled workers, though both complain that they are forced to spend all they gain. But it is really difficult for officials and clerks and all those whose incomes are more or less fixed; while there is an additional payment to officials and many other white-collared workers in proportion to the cost of living, it varies from canton to canton and from town to town, and is mostly inadequate. It should be noted that, outside the traditionally privileged hotels and restaurants, ordinary life is in many ways not very much easier than in England; household rations are not quantitatively much more generous, and they are relatively far more expensive. Clothes are unrationed but dear, and coal is fantastically expensive. The housing shortage in this neutral country seems to be as great as in a country like our own, which endured air-raids and flying bombs. There are various explanations of this housing difficulty, such as an increase of population of over 7 per cent during the war and the influx into the towns caused by the present industrial boom. But considering the activity of the building industry now that cement is unrationed, the shortage remains astonishing. The building boom, when it has at last borne fruit, is, of course, particularly likely to be transformed very suddenly into a slump, since it can but depend upon internal demand.

The situation creates discontent as well as anxiety. The industrialists and many other Swiss citizens, who have now experienced two world wars as spectators and easily think in terms of 1913, are eager to return to the full freedom of *laissez-faire*. It is not quite clear how this could be done in the Europe of 1947, but Switzerland is loud with demands for the abolition of rationing and other controls, and with protests against the bureaucracy of the Federation, i.e., of the central authority. The technical developments of the century have inevitably increased Federal authority at the expense of the cantons, causing what may be regarded as a very gradual evolution of the constitution. The necessities of the last war greatly stimulated this tendency, to the chagrin of conservative, that is to say cantonal and anti-centralist, opinion, which expresses itself in violent abuse of the now greatly extended Federal apparatus of officials. More moderate opinion joins in in favour of a rapid return to constitutionalism in place of war-time decrees and the alleged extravagance of the Federal credits granted at home and abroad during and after the war.

There are, however, anti-traditional voices, backed by the large but very cautious Social-Democrat Party, which deplore that Switzerland has not advanced beyond nineteenth century standards in social legislation, and who claim that the prosperity of the moment should make it possible for the profits of industry to flow into a system of what are elsewhere regarded as normal social insurances. Further, progressive opinion believes that the Federal authorities, far from abdicating at this moment in favour of the once sovereign cantons, should insist upon the powers with which economic history has inevitably invested them in order to plan insurance against the dangers of a slump. The issue of the moment is that of National Old-Age Insurance, which has not hitherto existed in Switzerland—there has only been cantonal and municipal organisation of relief for the needy. During the war a temporary system was inaugurated by which employers, employed and Federal authorities contributed to a fund to ensure payment to men who were forced to leave their work for military service at the frontiers. A considerable amount of the sum collected in this way remains over, and in December, 1946, Parliament voted that this should be converted into the basis of an old-age insurance fund.

But in Switzerland when a law has gone through Parliament that is not the end of the matter; its citizens still have the right to demand that a referendum be held in order to make sure that the electors, and not only the elected, still favour the measure. Accordingly the opponents of socialising and centralising tendencies have begun to collect the signatures necessary for a referendum to be held on this issue, and it is thought that in the three months which the constitution allows them they will certainly succeed in gaining the number of supporters they require. There is, of course, a strong case for leaving as much social organisation as possible to small local authorities who can familiarise themselves with particular circumstances, and there is no doubt that the conservative peasants of the Catholic cantons of the interior take this view. On the other hand, the big Liberal Party (*Freisinnig-demokratische Partei*), with which big industry is associated, has officially declared in favour of a national centrally organised old-age insurance system. The issue is further complicated by the fact that a referendum upon certain economic decrees, which ensures Federal credits to the peasants, has in any case to be held, and is likely to split from conservative but interested peasant opinion those conservatives who wish for a contraction of the Federal finances.

A great deal of opposition to the old-age insurance law is expected from Geneva and the west of Switzerland, partly for anti-Socialist reasons, but mainly because the French-Swiss, and especially the Genevese, are feeling aggrieved. The war has certainly reinforced the self-confidence of the German-Swiss, who feel themselves almost surprisingly well able to get on in the world without the background of Germany; while the French-Swiss are uneasy about their background of a strongly Leftist France. Since the war, in spite of the boom in watches, which are a mainly French-Swiss product, prosperity has seemed to work out to the advantage of the German-Swiss, who can afford to do things on a larger scale. Meanwhile the watch industry now expects to decline. Geneva is particularly jealous of Zürich, believing among other things that Zürich has been unduly favoured in the matter of air traffic. The French-Swiss are a minority, and the birthrate does not operate in their favour; it is inevitable that they should resist centralising tendencies with something like fanaticism.

While Switzerland is thus faced with difficult political and economic problems, it would be foolish to exaggerate their gravity. No outsider who has observed the country during the last ten years could doubt that its national unity has been strengthened.

Wellington*

— the capital of New Zealand, with its magnificent deep water harbour, is situated in the south western corner of the North Island. Not only politically, but also geographically and commercially, it is the hub of New Zealand. Electric trains and trams ply between the city and its extending suburbs. Electric supply comes from the Government system of interconnected hydro-electric stations, while the city's own quick steaming plant acts as a standby.

*The famous BTH name is much in evidence in Industrial and Municipal undertakings in Wellington. Equipment for the entire electric tramway system is, for example, predominantly BTH. Mazda Lamps, too, make a great contribution to the city's lighting. (The main electricity supply to the city passes through two 30,000 kVA transformer banks and 11 kV switchgear — all BTH.)

Weighing Words

How much weight does your signature carry? The chemist can weigh it accurately, however lightly you pencil it. With like precision he can weigh a single pollen grain, or a particle no heavier than a twenty-eight millionth part of an ounce! He must determine such minute weights in the course of his daily work, and does so easily and swiftly by means of this micro-balance. The modern micro-balance is a jewel among laboratory instruments, so sensitive that it must be treated with the utmost care. Draughts, moisture, slight changes in temperature, or even the distant rumble of heavy traffic can upset it. A rise of two degrees in temperature within its glass cabinet affects its accuracy. So fine a degree of adjustment is often needed to obtain information of the greatest practical importance. For example, an infinitesimal speck of vitamin D is the whole daily dose for a human being. It is a far cry from the test-tube to the micro-balance, but they form the alpha and omega of an armoury of instruments which enables the British chemical industry to give the nation unfailing and expert service.

The British delegation's task in India has been described as "mainly exploratory." It is perhaps too early to undertake a definitive settlement of the debt. A short-term, interim agreement, comparable with that recently negotiated in Argentina and based on the same principle of the maintenance of minimum balances is probably the best that can be expected of the present discussions. It should be added that if these discussions are wholly abortive the sole alternative for Britain would probably have to be some form of blocking. Such a decision, though

fraught with serious consequences for all concerned, would in the circumstances be an unavoidable measure of self-defence and of protection for Britain's other creditors. The debts to India, Egypt, Palestine and Iraq (as the table and chart show) are the crux of the sterling balances problem. Two, at least, of the other capitals concerned, Cairo and Bagdad, will be visited by the British delegates on their return from India. Reasonable success in New Delhi would give negotiations with the other creditors an excellent send off.

Government and Industry

THE Industrial Organisation Bill, which has been presented to Parliament this week, turns out on examination to be a milder measure than had been freely forecast. It is, first and foremost, an enabling Bill, and not an executive Bill. Secondly, it is inspired primarily by the need to increase the efficiency and productivity of industry and to enable it to render more economical service to the community. Its critics will, no doubt, insist that each of its seventeen clauses resounds with the overtones of Socialist economic policy. But they will not be able to assert—as they feared—that it is an instrument for super-streamlined nationalisation of industry by Ministerial Order.

The Bill's main purpose is to enable any one of eight Departments (the Board of Trade, Agriculture and Fisheries, Supply, Food, Works, the Admiralty, Fuel and Power, and the Scottish Office) to establish bodies known as Development Councils, after consulting with "any organisation appearing . . . to be representative of substantial numbers of persons carrying on business in the industry and such organisations representative of workers in the industry as appear to the Board or Minister concerned to be appropriate." "Any industry" may be endowed with such a Development Council after consultation, provided that the necessary Order is approved by an affirmative resolution of each House of Parliament. Each Development Council will include members representing the industry, others representing "the interests of workers" and thirdly, independent members—one of the latter being chairman. Their numbers will be specified in the Order; in other words the Bill itself does not stipulate that they must reproduce the exact counter-balance of employer and union members which has been a feature of the Working Parties.

Although the new Development Councils are in line of descent from the Working Parties, they are not necessarily to be confined to those industries which have already had the benefit of working party investigation. They perpetuate, in a sense, the working party principle of tripartite investigation, but at the same time they are limited in two ways—first, as to time, and secondly, as to scope. On the first point the Bill provides that within three years of the appointment of a Development Council, and thereafter at five-yearly intervals, its work and functions are to be reviewed by the Minister concerned in consultation with the Council, and arrangements for the termination of a Development Council may be made with the affirmative consent of each House of Parliament. The second limitation upon the Development Councils is that their functions are much less universal than those of the Working Parties. The first Schedule to the Bill, setting out the functions which may be assigned to Development Councils, includes a large number of what might almost be called the automatic recommendations of almost every working party. They include such entirely praiseworthy objectives as collective scientific research; enquiries about materials and capacity; methods of production and new technical equipment—even including the equipment and operation of model factories. Improvement in design and training appear high in the list, but there is a somewhat more equivocal function of promoting "production and marketing of standard products." Labour questions include

the improvement of working conditions and prevention of industrial diseases, and on the selling side the Councils may concern themselves with the development of exports and with publicity in the home market. All these recommendations have appeared in one Working Party Report or another, and some of them appear in all the Reports. The improvement of accounting and costing information, including the development of standard costings and the calculation of statistics are equally useful functions which Development Councils may be assigned. Development Councils will not automatically pursue all of these functions, but only those placed upon them by the Minister in the Development Council Order, and any extension of them will require an Amendment Order.

Thus, the first task of a Minister is to decide that a given industry would benefit from the introduction of a Development Council. He must then allot precise functions to the Council. Most of these functions are in the direction of promoting action which is clearly advantageous in principle, though some, like standardising of products and arrangements for co-ordinating production and marketing may not fall quite so clearly within that category. But the general tenor of the first Schedule of the Bill is at any rate not restrictionist; it does not pursue some of the narrow aspects of cartelism and economic nationalism which have occasionally appeared in certain Working Party Reports. The Development Councils will have no power to promote the division of markets or to develop schemes for fixing of prices. They may undertake enquiries about methods of production and new equipment, but they have no functions in the field of industrial finance. Their enquiries are to be made only with the consent of the Minister, and the information which they obtain will be published in the form of a summary and disclosed in detail only to the independent members of the Council or to Government servants.

There is, of course, a real danger that much of the work of the Development Councils in obtaining information about their industries may duplicate the statistical enquiries of the Board of Trade in connection with the censuses of production and distribution. A Development Council may call for such information as it thinks it requires for the exercise of its functions, including particulars of productive capacity, capital assets, staff, output, orders, sales, deliveries, stocks and costs. These are, of course, the ingredients of the future annual census of production, and the most specific assurance will be required in the Second Reading Debate that the fact-gathering apparatus of the Development Councils will not seriously overlap with that of the Board of Trade in its census of production questionnaires.

Development Councils will be financed by means of levies (limited either in total amount or by specified maximum rates out of which they will be able to meet their costs and administrative expenses. A Development Council which undertook all the nineteen functions laid down in the First Schedule—and these may be increased if necessary—could become a research organisation of a very formidable character, with an annual budget of many hundreds of thousands of pounds. It must also be recognised that some Development Councils will either

have to accommodate their work to that of research organisations already established in particular industries, or will duplicate some work which is now being done. Admirable though the aims of the Development Councils may be, it must be admitted that they will make further inroads on scarce administrative and technical manpower and will involve a further increase in the overhead costs of British industry. It may be that, in certain cases, the Development Council will be the best employer of technical research staff, if only because the products of their research can be disseminated among all members of an industry instead of being confined to the larger and more prosperous concerns which are in a position to undertake independent research. But equal emphasis ought at least to be laid on the comparatively simple things which are already known and could, with energy and the necessary capital, be introduced here and now in British industry. Fundamental research is admirable as a long-term commitment and British industry has suffered from its lack in the past. But many British industries, particularly those which have had the advantage of investigation by Working Parties, have been shown to suffer, not so much from lack of technical knowledge, but from lack of well-designed factory layouts, modern buildings, and such equipment as simple conveyors—in other words from lack of the elementary framework for increasing efficiency, and for improving the morale of workers and their output.

Clause 11 of the Bill enables the Board of Trade, with the approval of the Treasury, to make grants from public funds to the Council of Industrial Design, or to any other non-profit-making body whose objects include the improvement of design in industry. It is estimated that some £234,000 will be required by the Council in 1947-8 and that grants to other bodies during that period may amount to £50,000. No estimate for expenditure for the encouragement of improved design in subsequent years is offered in the Bill, though it is expected that expenditure in this comparatively new field may well increase. Here again, the intention of the Bill is exemplary and the recent "Britain Can Make It" exhibition showed,

within limits, what could be done by the successful combination of industrial design with good industrial technique. But design is a question which largely concerns—though it does not exclusively concern—the consumers' goods industries. There is every reason why, say, a machine tool should be well designed in the sense that it observes the principle of fitness for purpose. But the design of the great bulk of capital goods output is limited by technical characteristics; it is pressure per square inch or revolutions per minute which govern the design of much capital equipment and in the larger order of things it is more efficient capital equipment rather than beautifully designed consumers' goods which the British economy requires.

This distinction introduces the larger questions of industrial policy which the Industrial Organisation Bill, despite its title, leaves rather on one side. The Bill takes up the lowest common denominators of the Working Party Reports which have so far appeared. It enables eight Ministers to introduce a comparatively simple collective organisation for the performance of necessary and desirable collective functions. But it leaves aside the major questions of industrial policy. It is concerned with things which wideawake industries and firms have already been doing and which the more backward industries should undoubtedly be encouraged to do. Yet, just as the Bill could not possibly be represented as "nationalisation on the side" nor can it be claimed as a new blue-print for British industrial development in the round. The fundamental problems of the best use of limited available resources of capital and manpower, the timing of re-equipment, the extent to which re-grouping should be pursued—all these questions have still to be faced. Development Councils may be able to throw some useful additional light on their particular industries, which in due time may enable the Government or industry to dispose more effectively of the nation's available resources. But it would be optimistic to suppose that the effectiveness of the Development Councils will be equal in every industry to which they are appointed or that their annual reports will provide a collective plan for the entire range of British industry.

Business Notes

Stability and Cheap Money

Some measure of stability has been restored in the security markets this week despite the further accentuation of the coal crisis by extreme weather, which curtailed even the hand-to-mouth supplies of fuel to industry and has caused further short time working. Nevertheless, on Monday and Tuesday this week the *Financial Times* industrial ordinary share index grounded at 133.8 and on Wednesday there was a minor recovery to 134.2. Some limited upturn in prices was perhaps to be expected, if only because last week's tendency for turnover to increase as prices declined had already shown signs of abating. Certain groups in the equity share market have still pursued a somewhat erratic course, and the best that can be said for the market as a whole is that it has managed to become mainly firmer though it still remains quiet.

An improved tendency is also evident in the gilt edged market, though here the volume of professional dealings is responsible rather than public support. The common factor which, more than any other, is likely to determine the course of prices in gilt-edged and ordinary stocks is still the cheap money programme, though it is now engaged in a tug of war with falling output and employment. This week the Chancellor of the Exchequer has staged another of his departmental seshows, presumably with the intention of providing at least inferential evidence about his cheap money intentions. On this occasion it is the issue of £10 million of 2½ per cent Airways stock by the British Overseas Airways Corporation to the National Debt Commissioners. The stock is optionally redeemable in 1977 and finally in 1982, and it has been issued at 101½. This piece of internal financing follows within a month of the replacement of the £69½ million 3 per cent Coal Commission stock 1980-2016, by a new 2½ per cent stock

at 100½ redeemable 1986-2016. From these manoeuvres, it may be permissible to draw up a scale of long-term interest rates, as Mr Dalton sees them. A rate of 2½ per cent, it would appear, is appropriate to a direct Government obligation optionally redeemable after 30 years. But for a fixed date even beyond the century a half point premium is exacted, and for a fixed date 35 years ahead as much as 1½ points premium. On this basis, the redemption yield on a 35-year dated stock must now be accepted at £2 8s. 9d. per cent.

These considerations have clear relevance for the terms of the transport and other compensation stocks. Mr. Glenvil Hall, the Financial Secretary to the Treasury, took matters very little further in last week's debate on this question. The Chancellor had promised during the Second Reading of the Transport Bill, that transport compensation stock will be redeemable "within this century." Mr. Glenvil Hall repeated the assurances that the stock would be redeemable; it will not, he said, be an irredeemable stock. But he was not prepared to give any commitment about the date on which the stock will be redeemed. In fact, it is by no means clear whether, in the minds of the Chancellor and the Financial Secretary, a "redeemable stock" means a stock with a definite and final date of redemption within this century, or whether they interpret it to mean a stock redeemable at the option of the borrower of the same one-way type as 2½ per cent Treasury stock. This important point should obviously be cleared up quite unequivocally in the Committee proceedings on the Transport Bill, for the general impression is that the Chancellor is committed to a stock with a fixed date, and he should obviously correct this idea if it is wrong. In any event, it is already clear that, if Mr. Dalton has his way, a dated stock redeemable within the century would carry appreciably less than 2½ per cent.

THE BUSINESS WORLD

Coal—The Target Examined

THE 1947 industrial problem is fundamentally a problem of coal. . . . We cannot afford to set a lower production target for 1947 than 200 million tons of coal, deep-mined and open-cast. . . . It will be a hard target for the miners to reach, but it will meet only our minimum requirements." It is on these texts that the "Economic Survey for 1947" is based. Two hundred million tons (incidentally, of undefined quality, which nowadays makes all tonnage statistics of dubious value) is integral in the plan, but to write a figure is not to achieve it, as the White Paper plainly recognises. More men are needed, first to make good inevitable wastage in 1947—last year over 76,000 left the industry—and secondly, to produce the required increase in the mining labour force from 695,000 to 730,000 by the end of this year. "Increased output per man-year," says the "Economic Survey," "is as important as the recruitment of more miners"—in fact, in the next crucial nine months, it is the only means of getting the increased production, since the new recruits will not be fully effective in production."

In short, the 1947 coal plan counts very largely on a further improvement in production, in line with the trend of recent months. It talks, in fashionable jargon, of the "re-deployment of labour in the mines" to assist increased output, without explaining whether this means moving labour from less to more efficient pits. It promises full assistance for the manufacture and import of coal-mining equipment; consumption will be reduced by conversion of coal-burning plant to oil-firing and by drastic reduction of non-industrial consumption of coal, gas and electricity. Coal is the basis of the whole programme; "there is bound to be continuous anxiety about supplies until the National Coal Board's long-term reorganisation plans begin to produce results"; in 1948 and 1949, more coal will be needed than in 1947; exports must be resumed as soon as possible; and stocks must be rebuilt meanwhile to the safety mark.

It is a formidable programme, and for this year at least it depends almost entirely on greater effort by the existing labour force. Is this remotely possible? The first major doubt arises from the introduction of the 5-day week in May, for the miners have made it quite clear that they do not intend to abandon this claim on account of the crisis. The five-day week may not mean much further reduction of output, but equally it does not promise any expansion. In 1946, the average number of shifts possible per wage-earner was 5.76 per week, but only 4.84 were actually worked; and the number of shifts worked at the face is a good deal lower—in January it was 4.51, against the overall average of 4.87. Since voluntary absenteeism among workers at the coal face has been obstinately running at 10 per cent or more for many months, the five-day week has for the most part been a matter of practical observance already. But if the 4½ shifts worked at the face each week could be consistently raised to 5, the difference would be represented by 20 million tons of coal—twice the increase for which the "Economic Survey" budgets.

That is a dramatic increase which the White Paper does not dare to suggest. The encouraging trend of production in recent months is still modest, relative to the national need. In 1939, output per man-shift was 1.14 tons overall; in 1944 and 1945, the figure was one ton, and last year's improvement, welcome though it was, only raised it to 1.03 tons. But since the summer

holidays, better outputs per man-shift have been regularly scored—1.05 tons in October, 1.06 in November, 1.04 in December, and 1.06 in January. If the "Economic Survey" is taken at its word; if no additional output this year is counted on from new recruits; and if it is assumed further, that an unchanged mining labour force of 695,000 will work the same number of shifts, then to get another 10 million tons of deep-mined coal would involve an increase in output per man-shift from 1.03 to 1.09 tons, or in annual output per wage earner from 259 tons to 273 tons. Such an achievement is not impossible, but it is far from probable.

On the assumption of a static production force—which the White Paper appears to contemplate for this year, since it discounts the contribution to output from new entrants—there seems little hope of reaching the target of approximately 190 million tons of deep-mined coal, unless there is a radical change in the working practices of miners. The assumption that the labour force can even be maintained without impairing output is, in itself, rather dubious. Last year, although men between 18 and 50 were not allowed to leave the industry without permission, the wastage from retirement, sickness and other causes amounted to 76,434. The intake of 73,337 included nearly 28,000 of ex-miners from the Forces, a mere 5,000 from Government training centres, over 12,500 juveniles and nearly 28,000 from other sources. All the signs suggest that the rate of re-employment of former miners demobilised from the Forces is well past its peak, and for skilled recruits, the industry will have to look for ex-miners from other industries—in January the number of these men re-attracted to the industry was as many as 2,590, compared with 1,140 for January, 1946, and out of the total recruitment of 7,500 in that month, just over half were drawn, either as ex-miners or new recruits, from other industries. January yielded a net intake of 2,900 for the mining labour force, a rate which would produce the "planned" increase of 35,000 recruits by the end of the year. But of the new recruits, 3,450 had received no training before entry. In other words, even to maintain the existing labour force will involve some dilution of its skill, for its ageing and skilled workers cannot be wholly replaced by fully experienced younger men. It is difficult to estimate the consequent effects on output; they should not produce any marked decline, but they cannot encourage a marked increase. Similarly, if the expected increase of 35,000 is achieved, the maximum contribution to output which it could make in this year would be of the order of 4½ million tons—in fact it will be less, even on these assumptions, because its productivity will be lower until it is fully trained.

This analysis of what can be got, on the best assumptions, from the present labour force shows that 200 million tons of coal will indeed be a hard target for the miners to reach by increased physical effort. Even if the campaign for incentives succeeds—it must be remembered, of course, that these can only be provided at the expense of the rest of the community—doubt must remain whether a few thousand aluminium houses and revised allocations of rationed foods for mining districts will evoke the required increase in output. The miners have also made much in their recent discussions with the Cabinet Coal Committee (taken, incidentally, over the heads of the National Coal Board on which the Unions are well represented) about delays in the installation of mining machinery and

mechanical equipment. Many of the critical shortages are of electrical equipment—which is common to industry generally—and of other general engineering supplies. But it is questionable, even when exports are so urgently needed, whether the nation can afford to export 13,354 tons of coal cutting, winding and other machinery valued at £2,332,567, as it did last year.

Mechanisation, however, means several different things. It may mean cutting coal by machinery; no less than 72 per cent of the total output in 1945 was so cut. It may mean tonnage of coal conveyed by machinery—71 per cent in 1945. But it is between the cutting and the conveying that mechanisation needs to be greatly developed; in 1945 the tonnage of coal power-loaded was a mere 1.3 per cent of the total, and 98.7 per cent of all coal cut by machine, pneumatic picks or by hand was loaded by hand into tubs or conveyors. There is no quick way of remedying this state of affairs, and the National Coal Board must be left to work out this technical revolution with the utmost speed and determination. But the Board has so far been very discreet about its shorter-term policy. Is the policy to wait until the mines are modernised and re-equipped? Is there nothing which can be done, as an interim measure, to increase the supply of coal? Perhaps the reference to "re-deployment of labour" in the White Paper suggests an answer. If so, it must be found in terms of the following table:—

COAL: EMPLOYMENT AND OUTPUT BY REGIONS, 1946

Regions	Average No. Wage Earners on Books	Per Cent.	Total Output ('000 tons)	Per Cent.	Output per Man-Year (tons)
Northern	150,300	22	34,022	19	226
N. Eastern	129,200	19	37,113	21	286
N. Midland	91,800	13	32,611	18	355
N. Western	58,100	8	12,655	7	218
Midland	58,900	8	16,310	9	277
Wales	114,900	17	21,887	12	191
Scotland	79,200	12	22,265	13	281
Kent	6,000	1	1,277	1	213
Totals	688,400	100	178,140	100	259

NOTE.—These figures are estimates derived from the monthly returns; annual returns of employment and outputs by regions are not available from the Ministry of Fuel and Power or the National Coal Board.

If there is any principle of re-deployment, it should surely be to transfer labour, as far as possible, from those pits and regions where it is less effective in terms of output to those where it would be more productive. That, however, is largely a paper solution; it could not be done without intolerable upheaval and dislocation, so long as the total labour force is static. But now that a 5 per cent increase in the labour force is "planned," should not the new entrants be guided, as

far as possible, into the more productive districts? Unfortunately, this principle has not been particularly evident in the recent trend of coal-mining employment. It could, however, be more deliberately adopted in the employment of foreign workers. Their numbers in the immediate future will, admittedly, be all too small, and the White Paper preserves a conspicuous reticence about their use in coal-mining this year. The projected intake of 300 Poles a week into the pits has yet to be matched by anything like that number receiving training, and the proposals to use Displaced Persons are at present in a very tentative stage. When foreign workers are available, however, they must be used in those areas where they will make the greatest contribution to output.

There can be little doubt that the Government have pitched this year's coal target uncomfortably high. Yet, even if it is achieved, it will meet only the bare minimum of requirements. The first task is to rebuild stocks before next winter to a reasonably "safe" level—sufficient to provide against repeated disaster, if not for comfort. Distributed stocks in October, 1944, were 18½ million tons; a year later they had fallen to 13½ million tons, and by last October to 10.9 million tons. The nation has lived on its working capital of coal until it is exhausted. Stocks on February 15th amounted to only 5½ million tons, compared with 8.6 million tons a year earlier. The first task in the summer months must be to build up stocks, not by a mere 4 million tons or so as in the two previous years, but by at least 12 million tons. Allowing for the bare minimum for exports and bunkers of 9 million tons, this means that inland consumption of coal between now and the beginning of October has to be kept to 100 million tons; approximately the same level of inland consumption for the same seven months last year. Since the target is only a target, some form of restriction of domestic gas and electricity and of industrial coal allocations is inescapable. There will be limited assistance from conversion to oil-firing, though on this, as in other matters, Mr Shinwell was altogether too optimistic about the consequent saving of coal; he had to admit a reduction in the original target of 3 million tons to be saved in the current coal year to one million tons, owing to lack of equipment for which priority was promised. The present shortages of coal for industry have been masked by the power cuts, and only now is the exhaustion of supplies, particularly in the North-West, becoming clear. The next hard fact which has to be swallowed is the severity of the necessary cuts in industrial coal supplies during the summer which will be needed if safe stocks are to be secured by next autumn, even on the best assumptions that the 200 million ton target will be reached.

Bretton Woods in Practice

THIS has been a momentous week for the two Bretton Woods institutions. The Bank has found a new president. The Fund has begun exchange operations. Though the news from the Bank is still far less definite than that from the Fund, it deserves precedence. For without a considerable loan programme by the Bank there can be little hope of the Fund fulfilling many of the hopes placed in it. The Fund is a stabilising mechanism which cannot be expected to function effectively if the prevailing conditions of many of its members are chaotic. Its intervention is intended to equalise balances of payments which are already within reasonable distance of equilibrium. In the world of to-day, with so many countries crying out for foreign capital, and especially for dollars, to help their struggle for economic survival, the Fund must find the scope for its activities seriously curtailed. The Bank must blaze the trail

of reconstruction and, by scattering dollars, recreate conditions in which the Bretton Woods philosophy of convertible currencies, non-discriminatory currency practices and reasonable stability of foreign exchange rates can become a reality.

The appointment of Mr. John McCloy as successor to Mr Eugene Meyer in the presidency of the Bank is, therefore, a very welcome development. Now that the Bank has an executive head again it is to be hoped that little more time will be wasted before beginning loan operations. There are plenty of claimants. The main obstacle to early action is the neglect to date of any real preparation of the American market for the bonds to be issued through the Bank. It should always have been evident that the main problem of the Bank would be to find, not borrowers, but lenders prepared to accept reasonable terms. One of the main strictures that can be made of Mr Meyer's

Spending the Dollars

The details given by Mr. Dalton in Parliament this week of Britain's payments for imports from the United States have been much publicised, but few people realise that they throw very little light upon the problem which really was in the minds of the Chancellor's questioners. Behind the questions which in fact were asked was the bigger question of what is the true state of Britain's dollar account and what are the reasons for the very rapid rate of drawings upon the American credits. The distribution of Britain's payments for visible purchases from the United States was already approximately known, and Mr Dalton's tabulation, reproduced below, does not differ very much from earlier estimates.

But there are important portions of the overall dollar account which have never been disclosed and defy estimate. Britain has to pay dollars not only for imports from the United States but also for a significant volume of purchases from other countries—notably sugar from San Domingo and oil from Venezuela. In addition to these payments for visible trade, there are onerous "invisible" payments, chiefly for Governmental expenditure arising from the war, such as the dollar portion of Britain's expenditure for the maintenance of the British zone in Germany.

Nor is this all. Britain's resources are still the central reserve for the whole sterling area, and it is virtually certain that some of its members are now taking more dollars out of the pool to pay for current imports than they are putting into it by current exports. Finally, Britain has already begun the process of making sterling convertible for new current transactions. Argentina now

EXPENDITURE IN USA ON UK CIVILIAN IMPORTS AND FILMS

TOTAL ‡	124.0	100

* Cereals products £7.7 million; eggs £12 million; milk products £3.5 million; oils and fats £1.5 million; other, £5 million. All the cereals for human consumption.

† Highly seasonal payments, corresponding with crop.

‡ There were no imports of coal. Expenditure on coal bunkers, estimated at £400,000, excluded from table.

§ The table covers only supplies from U.S.A. There are substantial imports from other sources which are paid for in U.S. dollars.

has the right to turn the net sterling proceeds from her trade with the sterling area into any currency she pleases, and there is little doubt that already this right is adding its quota to the strain on Britain's reserves. On the other hand, as the Chancellor pointed out, Britain's reserve of dollars is not limited by the amount of the dollar credits, but is constantly fed from the dollar receipts from current business. There is no doubt that this current flow has been disappointingly meagre, but in the absence of detailed figures it is impossible to guess how far it has gone to meet the payments indicated above.

Mr Dalton's figures, however limited their application, are none the less disquieting. Too much attention ought not to be paid to the preponderance of tobacco, for the six months in question covered the main importing season, and tobacco's share for a full year would certainly be much less than the 32 per cent of the past six months. But it is very plain that a high proportion of British dollar purchases are required for current consumption. Imports of machinery and other manufactured goods absorbed only 11 per cent of the total, with a further 3 per cent for ships. Quite obviously, the dollar credit has so far made but a small direct contribution to the re-equipment of British industry.

Wanted—A Bank President

The task of finding a successor to Mr Eugene Meyer as president of the International Bank for Reconstruction and Development has so long defeated the efforts of the American Government (the post is understood to be an American preserve) that a temporary solution has had to be found by allowing the US executive director, Mr Emilio Collado, to act as temporary chairman of the board of directors. Mr Collado, as representative of the country which not only provides the largest quota to the Bank's capital but which will take up the bulk of any issues made under

the Bank's auspices, is the obvious person to fill the vacuum left by the departure of Mr Meyer. His assumption of those responsibilities in the circumstances that have arisen was, in fact, provided for by the articles of agreement. The wonder is that where nature's abhorrence has been reinforced by the offer of a remuneration of \$40,000 a year tax free, the vacuum should remain unfilled so long. Mr Collado's relations with the British and Canadian executive directors are said to be satisfactory, and on the basis of the collaboration between these three men the task of pushing on with the work of the Bank and, in particular, of preparing the all-important initial bond issue, should make some belated progress. Rumours that Mr McCloy has accepted the presidency should be treated with reserve.

Meanwhile, the *Washington Post*, Mr Eugene Meyer's own paper, has had the following interesting and presumably well-informed things to say about the position of the Bank's president:

Evidently the negativeness of the men who have been approached to take the presidency is due to their chariness over the lack of authority in the office commensurate with the responsibility put upon the president in the public mind. The lack can be filled not only by a decision on the part of the Administration to relieve the incumbent of fear of the veto power which is held over the president by the executive directors representing member nations, but also by the Administration of the predominant lending nation. Somehow the World Bank president's position must be buttressed, for the institution is an indispensable agent in the economic resurrection of a war-ravaged world, and its services are urgently in demand.

This cry from the heart, with its scarcely veiled reference to the intervention of the US administration (presumably through the National Advisory Council) in the affairs of the Bank, confirms most of the informed news which has been reaching London from Washington on this subject. The US executive director, with the Secretary of the Treasury and the other members of the National Advisory Council constantly at his elbow, is in effect the real power on the board. Provided he works in collaboration with two or three of his co-executive directors, his voice must prevail and the position and power of the president must be reduced to virtual nullity. Yet it is on the president that the main task of "selling" the Bank's bonds to the financial community falls. This form of government has been and will be found impracticable. The first few months of the Bank's existence have revealed not merely the weaknesses of the form of government given to the Bank by the Savannah interpretation of the Bretton Woods agreements; it has also revealed the seriousness of the second Savannah blunder, that of choosing Washington, the political capital *par excellence*, as the site for this institution. There will have to be a considerable retreat from Savannah if a worthy holder of the office is ever to be induced to accept the presidency.

Industry and Coal

The recent adjustment of coal allocations to tally with deliveries has brought realism with it. But it has also brought short-time working and positive unemployment in several of the important consuming industries. The rough and ready orders of priority which have been laid down have produced difficulties of their own, for it is frequently the small and apparently less important firm which produces the essential component or material on which a regular flow of industrial production depends. The process of industrial deceleration due to coal is thus almost co-extensive with the whole range of industry.

The latest coal figures for January show the persistence of the gap between coal production and consumption. Provisional average weekly consumption for January was 3,927,000 tons, against 3,843,000 tons a year ago, while production amounted to 3,711,000 tons, compared with 3,409,000 tons in January, 1946. The steady rise in production is welcome, but it is still quite insufficient to overtake the rise in consumption; thus coal stocks last month totalled only 8,418,000 tons, against 11,512,000 tons a year ago. There are encouraging signs that rising output per manshift has gone far to counteract the fall in manpower, but the need for a larger labour force is clearly reflected in the latest figures. Overall output per manshift was 1.07 tons in mid-January, compared with 0.95 tons at the end of December and 1.01 tons in January, 1945.

In Lancashire, industry is now operating on 50 per cent of the basic coal allocations, though the cotton industry receives a measure of priority with a further 15 per cent (making 65 per cent in all) which is to be drawn from the regional reserve pool. This rate of supplies should suffice for about a three-and-a-half-day week for cotton firms and the additional 15 per cent for cotton should give the industry a much-needed advantage in retaining its labour

force. Some interruption of clothing supplies to the consumer must be expected, particularly since there is no similar preferential treatment for the woollen and worsted industries across the Pennines. No news is yet available from Yorkshire of any supplementary allocations and wool textile employers, who are faced with the same acute labour shortage as the cotton firms, are apprehensive lest the inevitable short-time working should attract labour away to other industries which are less affected by the coal shortage. Yorkshire woolcombers, who occupy a key position in the worsted trade and suffer a 50 per cent cut in their coal allocation, may only be able to run three days a week for the next six weeks. The maintenance of the worsted manufacturers' output depends now on adequate stocks of tops, which are likely to vary considerably between firms. All sections of the industry are likely to have to adopt a shorter working week until increased supplies of coal are forthcoming. From Sheffield it is reported that a four-day week may have to be adopted in the steel industry. The same general picture could be painted for the Midlands, Tyneside and Scotland.

The revised allocations scheme, to bridge the estimated weekly gap of 300,000 tons of coal for the six critical weeks, makes no changes for domestic users, the electricity and gas utilities and the railways. Cuts for iron, steel and coke-oven firms were limited to 25 per cent. The 50 per cent cuts are therefore widely distributed over industry; the hesitancy in some regions to allocate supplies from the supplementary pools suggests that, in certain districts, even the new level of allocations may not be satisfied by actual deliveries.

Progress of French Deflation

The monetary experiment launched by M. Blum during his short period of office has been taken over with great assiduity by the government of M. Ramadier. The technique of the operation continues to show considerable skill. In particular, the French authorities have understood that in an experiment of this kind it is never sufficient to stand still. Each blow has to be succeeded by another. The hoarders have to be kept on the run. Confidence has to be maintained and strengthened by constantly dangling before the public the possibility of still more surprises. The Government must always appear to have several more tricks up its sleeve.

The main difficulty experienced so far in implementing the plan has been the resistance shown by French peasants to disgorging their grain. The French Government is meeting that problem by threatening the French farming industry with the prospects of substantial imports of wheat from the United States and Canada. For any French Government, to whom protection of domestic agriculture has always been an axiomatic basis of policy and not a question of opinion, this is very strong language. The Blum experiment has had perhaps its most spectacular success in the illicit gold market, where the price for French gold louis has dropped over 30 per cent since the Blum experiment was launched. A year ago the gold louis was quoted at about 7,000 francs. Three weeks ago the price stood at about 5,000 francs; this week it has fallen to 3,500 francs. There is some suggestion that the collapse in the price of gold coins has been helped by devious official selling of gold in the black market.

If this has, in fact, occurred, it is another indication that the technique of the French authorities has improved considerably in recent months. The illicit market in gold is one of the keys to the French economic position. The collapse in the price of gold and the uncertainty regarding the future of that price, which the experience of the last few weeks must have engendered, should induce hoarders to disgorge and holders of commodities, and especially of foodstuffs, to resume their sales against bank notes and through normal trade channels.

Deposit Accounts Rising

The habits of the public in the conduct of its banking accounts, and especially its choice between deposit and current accounts, normally show very little variation from year to year, but in recent months some interesting movements have been discernible. It is now more than twelve months since the reduction of the maximum interest allowance on deposit balances and the abolition of interest on current accounts became effective. At the time of the original announcement, in mid-October, 1945, it was a moot point whether the effect would be to enhance or reduce the importance of the deposit account. Some bankers held that, with the maximum interest allowance reduced to only ½ per cent,

many customers would either put their money into securities or would prefer to forgo interest and keep their liquid funds on the more flexible current accounts—for the minimum notice period for a deposit account had been extended from seven to fourteen days. Others thought that the abolition of current account interest, the payment of which was very widespread, would drive funds on to deposit accounts. Both influences have certainly been present, but, except at the outset, the second has predominated. It was not until last June that current balances surpassed the peak level touched in the previous September, but deposit balances had been virtually restored by last April.

CLEARING BANKS: DEPOSIT AND CURRENT ACCOUNTS
(Annual Averages)

	Total Deposits	Deposit Accounts	Current Accounts	% of New Deposits in C/As
	£ mn.	£ mn.	£ mn.	% of Total
1938.....	2,277	1,033	1,244	54.7
1939.....	2,248	996	1,252	55.7
1940.....	2,506	1,018	1,487	59.3
1941.....	2,970	1,085	1,885	63.5
1942.....	3,275	1,128	2,148	65.6
1943.....	3,677	1,222	2,455	66.7
1944.....	4,153	1,388	2,765	66.4
1945.....	4,692	1,566	3,127	66.2
1946*.....	5,044	1,706	3,338	66.2

* Eleven months.

The experience of the past year has, indeed, abruptly slowed down the tendency in 1945 for new money to concentrate upon current accounts. During the early years of the war, as the accompanying table shows, the ratio of current accounts to total deposits rose steeply from its pre-war norm of about 55 per cent to 67 per cent, and during this period a high though falling proportion of new money accumulated on these accounts. In 1945, however, the ratio of new money thus employed started to rise again. Of the average addition to total deposits during the year 67.2 per cent, against 65.2 per cent in 1945, was on the average held on current account. In 1946 the proportion dropped to 60 per cent. Evidently, even a rate so low as ½ per cent still has attractions, though it is perhaps questionable whether the increase in deposit accounts—now some £170 million higher than in September, 1945, when the rate was 1 per cent—comes mainly from former holders of such accounts. To a large extent it presumably reflects transfers by customers whose current accounts formerly carried interest.

"Outside" Competition

In this connection it is worth noting that the maximum rate paid by the clearing banks, and adopted by them in response to an official request, does not apply to non-clearing banks and merchant banks, some of which are believed to be offering appreciably higher rates in some instances, particularly for foreign balances. In view of the need both to minimise the direct strain upon sterling and to avoid creating awkward precedents for the official negotiations on the overseas sterling balances, this is particularly undesirable. Ought not the authorities, both in the national interest and in fairness to the clearing banks, to cast their net rather wider in this matter?

Of less consequence from the wider point of view, but even more glaring in its injustice to the clearing banks, is the anomalous position of the Co-operative Wholesale Society's Bank, to which attention was drawn in Parliament this week. In the past year this institution has secured the accounts of a number of local authorities which formerly banked with clearing banks, and one reason for its effectiveness in competition must be its continued payment of 1 per cent interest on current accounts and 2 per cent on seven-day deposits. The problem of unfair competition which thus arises merits investigation from more aspects than that put to Mr Dalton on Tuesday. Especially relevant is the consideration that the CWS Bank could scarcely function as such—and certainly could not continue thus blatantly to overbid the main deposit banks—if it did not rely upon them for essential central services, notably the service of the clearing house and the provision of cash.

Railway Earnings Deficit

No information is likely to be available for some time about the extent of the deficiency in the Government account of the controlled railways and London Transport for 1946 compared with the fixed annual sums payable by the Government to the

short tenure of office as president is that it saw no attempt made to co-operate with the New York bankers and issuing houses in preparing the market for the Bank's bond issues. That was a strange mistake to come from such an old Wall Street hand as Mr Meyer. Mr McCloy who also has considerable Wall Street experience will not repeat this error. It is fair to assume that before he took office he made preliminary soundings in the capital market which reassured him that the institution over which he was being asked to preside was not likely to prove stillborn.

Mr. McCloy's appointment coincides with the resignation of Mr. E. G. Collado as US executive director and his replacement by Mr Eugene Black, formerly of the Chase National Bank. It had long been known that Mr. McCloy's diffidence in accepting the presidency that had been offered to him many weeks ago was due to his distrust of the machinery of Government designed for the Bank (and this applies to the Fund, too) at the Savannah inaugural meeting of governors. It was decided at this meeting, against the vain protests of the British delegation, to vest the real power of determining policy and also of day to day administration, in the twelve executive directors working "in continuous session" at the offices of the Bank. This created almost insuperable administrative problems and made it difficult to find a president of the calibre required for this responsible post. The departure of Mr Collado probably represents a victory for a new and more sensible conception of the powers and duties of the executive directors, and the day may not be far distant when these directors will no longer be required to sit in continuous session or to devote their full time to the services of the Bank. It is perhaps unfair to associate Mr Collado's name with the dispute that has centred around this issue or with the resignation of Mr Eugene Meyer. Mr Collado merely obeyed the dictates of Savannah. He followed the by-laws and regulations as they had been drawn up and interpreted at that meeting, and those who know him will vouch that no one could have played his part with greater tact and discretion. But if the whole conception of the role of the executive directors had to be changed it was, perhaps, inevitable that the US director should go and be replaced by someone untainted by the previous unworkable arrangements and, at the same time, more acceptable to Wall Street, which holds the purse strings as far as the operations of the Bank are concerned.

The same problem of executive machinery faces the Fund, but in less urgent manner. In the first place, the Fund has found in M. Camille Gutt a managing director who by his combination of tact and character has hitherto succeeded in overcoming most of the problems inherent in the difficulties and weaknesses of his position in relation to the executive directors. The Fund, moreover, is a far more self-contained institution than the Bank. It works with its own resources and need not woo any external interests. Whereas the Bank presi-

dent's main task in the immediate future will be forging the relations between his institution and the American capital market, a task that could not be satisfactorily performed by him as long as everything had to be referred to the executive directors, no comparable complication arises in the work of his *vis-à-vis* on the Fund.

The Fund opened for exchange business on March 1st, and during the previous few days most member countries paid in the balance of their subscriptions—small payments having been made earlier to provide the Fund with resources to meet current expenses before it began to earn any income. The payments of the US and British quotas illustrate the two alternatives which were offered to members for calculating their gold subscriptions. The United States, with a quota of \$2,750 million paid \$687½ million, or one-quarter of its quota, in gold and the balance of \$2,062½ million in dollars. The United Kingdom quota is \$1,300 million, or £322,580,000. Of this, £1,032,000 had already been paid in sterling earlier, leaving £321,548,000, which was paid on February 27, 1947. Of this, £51,203,000 was paid in gold, which represented one-tenth of the net gold and dollar holdings of the UK on September 12, 1946, the day on which the Fund announced that it would shortly be in a position to begin exchange transactions. The balance of £270,345,000 was paid in sterling and of this, £238,075,000 was immediately reborrowed from the Fund against non-interest-bearing notes issued to the Fund and cashable on demand. The balance of £32,270,000 is being left as a balance in the Fund's account with the Bank of England. The only surprising feature of this payment is the magnitude of the amount of sterling which the Fund wishes to keep in cash. It is as much as 10 per cent of the British quota and represents a quite unnecessary immobilisation of sterling and a further burden on the British Exchequer which has to borrow the money. A much smaller working balance could have been maintained, given the fact that the rest of the sterling part of the subscription is available to the Fund in notes cashable on demand.

Now that the Fund has begun exchange operations a test will be provided of the principles under which access to the Fund's resources is permissible. The articles of agreement of the Fund are in this, as in other respects, liable to varying interpretations. In the normal course, a member will have the right to buy the currencies of other members in exchange for its own currency up to 25 per cent of the buyer's quota in any year and provided the Fund does not hold more than twice the buying member's quota in its own currency. Does this mean that all members will from now on have the automatic right to withdraw from the Fund in US dollars (for that will obviously be the most desired currency) one quarter of their quota in each of the next five years (five years, because the Fund will already hold at least 75 per cent of each member's quota in its own currency at the start of business)? Many countries

in urgent need of dollars will plead strongly for this "automaticity" of access to the Fund's resources. But there is certain to be some opposition to this attitude and the articles of agreement will give this opposition some grounds on which to base their resistance. In particular, the articles state that the Fund in order to safeguard its interests may waive any of the conditions defining access to its resources and may limit any member's use of the Fund's resources if it is of opinion that the member in question is using those resources "in a manner contrary to the purposes of the Fund." In prevailing conditions, with the world running short of dollars at a frightening rate, and with many countries in desperate need of US and Canadian currency for their reconstruction needs as well as to bridge the gap of their current international accounts, it would be easy to plead that any large or continuous use of the Fund's resources (and particularly of its limited resources of dollars) would be "contrary to the purposes of the Fund" and should,

Business Notes

Industry in First Gear

Last Monday the switch-on was extended to the North-West and, after a week-end decision, to London and the South-Eastern areas. But industrial electricity has been restored with a narrow margin of safety—as Monday morning quickly showed. At an early hour there were widespread cuts even in the Midlands, where the switch-on took place nominally a week earlier. Clearly, a few days of bad weather and interrupted transport is capable of reviving the emergency situation of the last three weeks, and domestic consumption—now largely a matter of “honour”—is a critical factor.

honour"—is a critical factor.

These renewed cuts in power supplies in the main industrial areas are particularly serious, since many factories have not yet been able to start up, much less to achieve pre-crisis levels of output, owing to lack of coal and essential components. They have further concentrated attention on the need to spread the load over a longer working day. If meeting the preferences of labour and avoiding increased wage costs were the only considerations, there would be much to be said for staggering the working week over seven days and thus spreading part of the industrial load over the week-end. It has been estimated, however, that on Sunday about 7 million kilowatts of capacity is at present used by domestic and other consumers. Since there is now only about 9 million kilowatts of effective capacity available, there is no margin left for increasing the week-end load if at the same time urgent maintenance work is to be carried out as well. Nor is double shift working, even if it can be arranged between employers and workers, any solution of the power shortage unless it is arranged so that peak loads are smoothed out. It is the periods of maximum demand which lead to load shedding and involve waste of solid fuel at the generators. The pattern of industrial consumption must be accommodated, if it is possible with the minimum domestic load. That means either night shift working, or a very substantial transfer of power load to an afternoon shift. Such a transfer, together with a detailed scheme of industrial coal rations—not merely for industries but broken down for individual firms—promises the only basis for the resumption of balanced industrial production in the next few months. These are simple formulas on paper; but they involve immense social, administrative and economic difficulties.

Night Work

It was hardly to be expected that the proposal that firms should arrange to work night shifts, in order to relieve the electricity load, would be accepted with any alacrity. Nevertheless, the rejection of the night work scheme as impracticable by the TUC's special fuel committee, and its alternative suggestion that firms should work double day shifts instead, raises an awkward dilemma. But the TUC's attitude is understandable, in view of the many practical difficulties of organising night work. Without the trade unions' co-operation, it would obviously be impossible for the Government to carry through its proposals, and in mixed industry the night shift must now be regarded as a dead letter. But it ought to be applied, as far as possible, to those industries or processes which use more power and less labour than the average.

therefore, be disallowed. This brings one back to the importance and urgency of getting the Bank on its feet. The loans of the Bank are the only means of getting American capital flowing out again in substantial amounts into other countries and helping to create the general environment of stability in which alone the Fund itself can find the most congenial atmosphere for its own operations. But meanwhile the Fund should realise that it is dealing with some very sick members and that if it waits until each patient shows signs of reasonable health before offering its aid, it may soon find itself with several corpses on its hands. A little help now, when dollars are so desperately needed, would be worth a lot of help later. The executive directors should occasionally remind themselves of the excellent advice they gave to their Governors in their first annual report, namely that "in the early period of its operations the Fund may take risks that would not be justified under normal circumstances."

The TUC's recommendation for double day shift working does not in any way imply that this will be accepted by the unions as part of industrial policy, to enable the fullest utilisation of machinery and equipment. The TUC evidence before the Ministry of Labour's double shift committee did give a conditional acceptance of the principle as applied to manufacturing industry, but it is doubtful whether the rank and file trade unionists, on whose decision the working of double day shifts in any individual factory would depend, will be willing to accept it. If, however, the TUC's proposals, arising out of the present fuel emergency, should result in an extension of double day shifts, their rejection of night work may prove in the long run to be a blessing in disguise.

The difficulties over night work referred to by the TUC committee are concerned partly with pay and partly with factory organisation.

The engineering industry's talks on Monday failed because of differences about the question of payment. Normally, night work is paid at the rate of time and a fifth, but the employers, uncertain about the duration of the period for which they would be expected to operate night work, were unwilling to add so much to their costs. The Factory Acts preclude the employment of women and young persons on night work, but under wartime emergency powers the Ministry of Labour could grant dispensation to firms which showed that this was necessary in the interests of maximum production. The emergency powers still exist, and could—at least in law—be re-applied in the present circumstances. But the practical objections to employing women on night work are considerable. During the war factories were suitably organised, and generally provided canteens, transport facilities and arrangements for the care of children. But in peacetime it means, for the worker, an inevitable dislocation of domestic routine, and for the firm it means reorganisation and improvisation, with more absenteeism and a lower level of efficiency.

Equities versus Gilt-Edged

The industrial "switch-on" has brought the anticipated response in the industrial share markets. Indeed, it would be more accurate to say that, so far as ordinary shares are concerned, they accepted the resumption of power in the Midlands last week as a portent for the rest of the country. The result was that, after a further improvement on Monday, prices tended to react, apart from such features as store shares, which responded handsomely to recent dividends. By comparison with pre-crisis levels, the ordinary share markets now present an interesting picture. In the middle of January, the *Financial Times* industrial ordinary share index stood as high as 140.6; when the market closed on the Friday afternoon four weeks ago, when Mr Shinwell made his fateful announcement, it stood at 131.9—already difficulties over coal were making their influence felt. The crisis took the index down to 124.4 on February 12th, and last Wednesday it stood at 132.0.

In short, equity share investors refuse to recognise that the fuel crisis marks the end of a period of rising share values. Clearly,

undertakings, which amount to £43,469,000. All that is known is the total traffic receipts for the 52 weeks of the year, which amounted to £355,497,000, and showed a decrease of £22,913,000 compared with the corresponding 52 weeks of 1945. The net revenue of the railways' pool for 1945 was £62,547,000, from which the Exchequer derived the surplus of £19,078,000. But it was realised last May that, owing to falling traffics, there was no hope of a surplus for 1946; on the contrary, the Minister of Transport first estimated, on the basis of calculations supplied to him by the railways in March, that the pool would show a deficit of £40 million last year. This was later modified by closer estimates (which increased the main line receipts by £13 million) and the adjustment of charges from July 1st (from which a yield of £15 million was anticipated in the second half of the year). The deficiency for the year compared with the annual charge of £43,469,000 was thus put at £12 million.

This figure can be roughly reconciled with the estimated net revenue account for 1946 of the main line railways, excluding London Transport, given at the charges inquiry last September, which were based on the July 1st level of charges for the second half-year:

	£ million
Receipts—Passenger.....	151
Freight.....	155
Miscellaneous.....	3
Expenditure.....	309
Net receipts.....	273
Other receipts and expenditure (net).....	36
Net revenue.....	Dr. 8
Fixed annual sums.....	28
Deficiency.....	38
	—10

It is known that the net revenue of the pool for 1945 (of £62,547,000) was contributed by the main line railways to the extent of £59,985,000, while London Transport provided only £2,562,000. London traffic has been rising, though probably not to a sufficient extent to meet the £4,835,705 payable by the Government to the Board. Hence it is not unreasonable to estimate the total pool deficiency for 1946, based on the September figures, at £12 million, which will fall to be met by the Exchequer.

The final question remains about the behaviour of traffic receipts in comparison with the earlier estimates—it may be assumed that expenditure is likely to stand at the estimated level. The 52 weeks' receipts for the railways and London Transport totalled £355,497,000. If it is assumed that £45 million of this total represents London Transport takings, the main line receipts would be £310,497,000, which compared with the September estimate of £306 million (after deducting the miscellaneous item to make the two figures comparable) would give an increase in receipts of £44 million.

This is probably as far as it is safe to go. It leads to the conclusion that the net pool for 1946 will show a possible deficiency of somewhere in the region of £7½ million to be met by the Exchequer, which is less than was originally anticipated. But no provision has been made for contingent liabilities, which absorbed £30 million from the pool revenues in the years 1941 to 1945. If the Minister decides to make a reserve for 1946, the deficiency will be increased, but in view of the Transport Bill he may decide not to do so. He has also to reach his decision about the level of charges in 1947 on which the Charges Consultative Committee spent many days in the autumn.

Wool Prices and Subsidies

A fortnight ago, the Wool Control allocated between 11 and 12 million lbs. of wool matchings to the worsted topmakers. This exhausted the Wool Control's stocks of matchings which were left over after the free wool market began to function again last autumn. The matchings were originally allocated on condition that the topmakers accepted the obligation to turn out for the home market at least twice the approximate weight of tops produced from the matchings which they had been allocated. The prices for matchings were fixed by the Wool Control at a figure which was intended to enable the firms concerned to make them up within the fixed price officially allowed for tops in the home market.

This obligation was not acceptable to the topmakers, for they argued that many firms in the industry had refrained from building up their stocks by purchasing dear wool after the free market opened, and that it would be unreasonable to expect them to draw on their limited stocks to an amount equal to the matchings allocated to them, or to buy wool at current high prices to make tops for the home market at the controlled price. In the face of this criticism, the Wool Control has agreed to waive the conditions which were originally sought from individual topmakers, provided that the industry as a whole undertakes to produce for the home market a quantity of tops at least equal to that which would have been forthcoming under the first scheme. In other words, topmakers with low stocks of wool under the revised scheme will be able to pass their quota to other firms in the trade which are more fortunately placed.

The entire scheme can only be regarded as a short-term palliative to remedy the shortage of tops. It follows the now familiar pattern, by which a chain of subsidies links the final price of clothing to the raw material from which it is produced. But the quantities involved in this scheme illustrate the increasing difficulty of attempting to keep prices down by any system of variable subsidies. Matchings weighing 12 million lbs. would make about 6 million lbs. of tops and, including an equal amount made from firms' stocks, would provide about one month's production if topmakers were fortunate enough to get the necessary coal. The more significant factor is that rising wool prices are now exerting almost intolerable pressure on the fixed topmakers' margins for home production; the worsted utility scheme to provide clothing of reasonable quality at fixed prices for the domestic consumer is thus becoming increasingly dependent upon subsidies at each stage of production.

Relief for Trustees

The Chancellor of the Exchequer has on at least two occasions refused to contemplate any change in the Trustee Acts. The consequences of cheap money for trustees and beneficiaries have now become almost commonplace. The range of permitted investments under the Trustee Acts in these days is confined almost entirely to the "Dalton 2½ per cents" and the incomes of all forms of trusts, charities and settlements have been cut to the point at which serious hardship is resulting.

Mr Dalton was, however, persuaded in the House of Commons last week to expand his blank refusal to appoint a Committee to consider the amendment of the Trustee Acts. Yet his further explanation in support of his refusal contains one or two curious features. He stressed the "additional risks" that would be involved in any extension of the Trustee lists—presumably meaning by this phrase the industrial risks involved in an extension of the list to equity shares. These risks are, of course, real in normal times, but it would be difficult to measure them against the risk which at present pervades the whole process of Trustee investment—that one day money may be dearer than it is now, and that trustees who are at present forced into the 2½ per cent gilt-edged market may suffer capital losses. It is, nevertheless, welcome news that Mr Dalton, so far from excluding rational reconsideration of the matter, has it under consideration now. He is, of course, entitled to point out that there are "very great difficulties" in the way of any extension of the Trustee list—though to this safeguarding phrase he added another which suggested that there were also "very serious objections" to any extension. The difficulties can, of course, only be solved by expert examination of the problem, and this—as has been repeatedly suggested in these columns—might be a fitting duty for the National Investment Council. But it is more difficult to see where the "very serious objections" lie. Is the Chancellor here speaking *qua* Chancellor and expressing concern about the possible diversion of Trustee funds from the gilt-edged market? Or is he suggesting there is some fundamental weakness in any investment policy which is not confined to the narrow limits laid down by the Trustee Acts? The answer to this latter point of view—if indeed the Chancellor holds it—is that trustees, where they can and where they are well advised, are already operating under far wider powers than the Trustee Acts permit.

The 8 per cent Target

The mechanism of the short loan market has been creaking and groaning rather noticeably in this running-in phase of the banks' new cash ratio—and not all the groaning has come from the mechanism. The discount houses have been complaining

that the banks are following a too rigid policy in their lendings to the market which, in consequence, has been obliged since the turn of the year to seek accommodation through the "special buyer" more frequently than in the past. There is no doubt about this increased frequency: such assistance was needed on 11 out of the first 24 working days under the new system. But it cannot yet be regarded as proved that this derives from faulty technique on the part of the banks. On the contrary, some members of the market would also argue that repeated recourse to the special buyer—especially when it occurs on successive days—is evidence that the authorities must be holding the credit reins too tightly. Alternatively, the authorities in this period of heavy transfers of tax money to the Exchequer may have been repeatedly over-estimating their cash requirements.

The truth seems to be that all three factors have been present. Over-estimation of official needs is indicated both in the under-allotment of the Treasury bill issue a fortnight ago and in the considerable sums which have been temporarily immobilised in public accounts. As for the technique of the clearing banks, there is no doubt that most banks have been pursuing an extremely cautious policy and are particularly concerned to avoid showing in their monthly statement a cash ratio of less than 8 per cent. They are therefore apt to postpone part of their lendings until late in the day, and also to call in loans suddenly from the market. Such a technique may possibly compel the discount houses to seek official aid more frequently than they might otherwise need to do.

Given these conditions, if the authorities held the credit reins more loosely, there would be less recourse to the special buyer. But if they were to expand the credit base spontaneously, instead of leaving the market to seek whatever official aid is needed, they would simply be encouraging the banks to work persistently above the 8 per cent cash ratio. If, therefore, there has been any deliberate tightening of the rein, it is a fair presumption that its object is to force the cash ratio down.

January Ratios Lower

Already, the banks' technique is adapting itself to the needs of the situation. The ratio on December 31st, the first day of the new regime, was 8.78 per cent for the clearing banks as a whole,

... but a cheque is better!

No great harm is done if a properly drawn cheque goes astray, but when cash is lost, the results may be serious. In these days, an account at the Westminster Bank is not simply a pleasant conceit—it is a very real necessity. To the man of moderate means it makes a special appeal, for not the least of its advantages is the peace of mind which comes from the certain knowledge that one's money is completely safe. The Manager of any local branch will gladly explain the many ways in which the Westminster Bank can be of service.

WESTMINSTER BANK LIMITED

while two banks showed well over 9 per cent. The first monthly "make-up"—that for January 15th—makes a much better showing. None of the nine banks whose statements have so far appeared showed a ratio as high as 9 per cent, though Martins (with 8.94 per cent) comes close to it. Three other banks show 8.5 per cent or more. Of the bigger banks, the Westminster has been most successful with a ratio of 8.1 per cent, while Lloyds, which in December showed 9.2 per cent, now shows 8.2 per cent. The best budgeting of all, however, has again been achieved by Coutts, which in December showed 7.85 and now shows 8.03 per cent.

It is perhaps questionable whether this general improvement would have occurred if the authorities had left much slack in the market. Indeed, it may yet be necessary temporarily to tighten credit to the point at which a number of banks are forced to show less than 8 per cent, in order to drive home the lesson that the target figure will never be satisfactorily established so long as there is more reluctance to work under it than over it. A better technique will reduce the jerkiness in the short loan market, but under the new regime the discount houses cannot expect that recourse to the special buyer will ever be as infrequent as it was before. The very essence of the change which is taking place is to ensure that day-to-day gaps in the credit supply are filled by official credit instead of by fluctuations in clearing bank cash ratios.

Associated British Picture and Warner Brothers

Warner Brothers, the American film-producing company, have held a 37½ per cent interest in Associated British Picture Corporation, Ltd. since 1940, and the association of the two undertakings has been taken a stage further by an agreement announced this week. The Associated British company's studios at Elstree, Herts, are being reconditioned and modernised at a cost of £1 million. When the operation is completed the company will produce there during the following two years six feature films, which are intended to be "similar in quality to those now produced by Warner Brothers at their California studios." Warner Brothers will supply stars, directors and equipment (will they also supply stories?) for these productions, and when the films are completed they will include them in their American and Canadian circuits on the same terms

Recent trade figures for Kenya show considerable changes in the relative importance of the Colony's exports.

In pre-war days Kenya coffee, together with gold and tea, headed the exports table. During the last few years, however, and as a result of war-time demands, exports of pyrethrum—the basis of many insecticides—and sisal greatly expanded. In 1944 the combined export of these two commodities exceeded in value the combined totals of coffee, tea and gold.

The gradual change-over to a peace-time economy with its varied demands may well bring about further changes in the commercial activities of Kenya. Modern commercial development calls for careful and continuous study of local market conditions. Full and up-to-date information, backed by an intimate knowledge of the Colony, is available to merchants and manufacturers interested in trade with Kenya.

BARCLAYS BANK
(DOMINION, COLONIAL AND OVERSEAS)

HEADOFFICE: 54 LOMBARD STREET, LONDON, E.C.3

a net fall of 6 per cent from the peak levels of January which leaves share prices as a whole exactly where they were before three weeks of industrial closure does not represent any serious attempt to discount the consequences of the fuel crisis in terms of falling productivity and profits. It is, indeed, impossible to rationalise the behaviour of the equity markets, except on the assumption that the British economy is now faced with a more active phase of inflation than it has experienced hitherto. That there is some escapist element in the faithful support of industrial shares could hardly be denied, but it is doubtful if there is any widespread feeling, as yet, that a hedge against inflation is necessary at all costs—the "costs" in this case being the reduction in profits which many industrial concerns will face as a consequence of severe industrial disruption.

Of the behaviour of the gilt-edged market, there is rather less room for doubt. The market wears the signs of vulnerability, and prices have fallen significantly this week. On Wednesday the new 2½ per cent Treasury Stock was no better than 96½. The proximate cause of this week's falls can hardly have been the response to the Hull conversion, which leaves the faithful National Debt Commissioners to take up 46 per cent of the issue. For an offer which was open throughout the crisis period, no favourable result to match the 100 per cent public subscription of the Ayr conversion could have been anticipated. But the Hull result underlines the growing doubts about the feasibility of a renewed drive for cheaper money, and the inclination of the larger investors to hold back until the Chancellor has given some sign of his intentions.

"Expendability" of Sterling

By July 15, 1947, when under the Anglo-American financial agreement Britain is called upon to make all currently earned sterling in the hands of non-residents available for expenditure in any country in the world, little will have to be done to implement this commitment. The increasingly free use of current sterling was taken a long step further at the end of last week by the creation of "transferable accounts." These accounts represent current sterling held by residents in Argentina, Canada, Newfoundland and the Belgian, Dutch and Portuguese monetary areas. From now on transfer of sterling from one transferable account to another, irrespective of the country of residence of the account holder, may be made freely, subject only to subsequent reporting to the Bank of England. These facilities will be extended to residents of other currency areas in which the monetary authorities or the Exchange Control are prepared to supervise exchange transactions and apply a form of control broadly similar to that operating in this country. This reservation is obviously essential for the protection of the British control. By making current sterling freely expendable within the countries operating these transferable accounts the danger of leakage through capital export is increased, and it can only be kept within reasonable bounds if these facilities are restricted to countries which themselves control the export of capital, and do so in a manner which commands the confidence of the British authorities. Taking into account the arrangements already made with Belgium, Holland and Portugal, the use of sterling by Canada to finance trade with a large number of hard currency areas and the fact that current sterling held by US citizens has all along been convertible, it will be seen that the step to be taken next July will be little more than a formality.

The Transport Commission's Functions

At least four Bills of vital interest to the business community are now in the Committee Stage, and it is obviously impossible for *The Economist*, particularly after it has suffered from guillotine for a fortnight, to attempt to do justice by way of comment on the proceedings. This is particularly regrettable in the case of the Transport Bill, where the discussions on the early clauses have raised fundamental issues about the work of the Transport Commission, and its relations with the separate Executives and the Minister. Clause 2, which defines the powers of the Commission, was approved after a cautionary protest by Sir Arthur Salter about its monopoly position, and the admission by Mr Barnes that he did not in any way underestimate the far-reaching powers conferred on the five Commissioners. Prolonged debate took place on whether the Commission should have the duty of providing "safe" transport and upon the potential consequences of the absence of any form of internal competition between the different elements of the Commission's undertaking and its ap-

parent ability, since it controls the finances of the whole in a single fund, to subsidise one form of transport at the expense of another. On this Mr Barnes gave the general assurance that the accounts of the separate forms of transport would be presented in such a way as to enable the public to judge each section separately.

On Clause 4, which defines the powers of the Minister towards the Commission, Mr Barnes obtained his wishes, after a ranging debate, without serious opposition, and he was disposed to accept a few opposition amendments, including the not unimportant one that any direction from the Minister which is omitted from the Commission's annual report must be backed by his notification that it is against the interests of "national security" (instead of the vaguer phrase against the national interest). Perhaps the crux of the problem of organisation of the Commission and the Executives, and their joint relations with the Minister is the latter's power of appointment to both bodies. Mr Barnes denied any intention of desiring to keep any decision on these matters as a piece of departmental machinery within the Ministry. But he insisted that only the Minister could appoint—partly because only the Minister could answer Parliamentary questions about their salaries, and partly because the Commission could not be allowed to make the appointments themselves, for fear that their choice might be unacceptable to the Minister. But Mr Barnes did not answer the fundamental point that the Executives, being agents of the Commission, ought to be in direct line of descent and appointment from them, and should be subject to the clear authority of the Commission without any form of external pressure. The Opposition amendment to place the power of appointment with the Commission, subject naturally to the Minister's consent, is clearly preferable.

On the question of regional organisation Mr Barnes stated that "this was not the purpose of the Bill." But he did not explain by what means, other than eventual regional schemes, the integration of transport which he seeks can be secured. On Clause 6, which provides for the Consultative Committees, Mr Barnes was on more effective ground in rebutting Sir Arthur Salter's fears that they would be "hand-picked, rarely meeting, and remote." The Minister's hope is that they will work continuously, effectively and adequately. But they might equally degenerate into mere procedural machinery.

Disclosure of Nominee Holdings

The Committee proceedings on the Companies Bill in the House of Lords have a disarming air of suavity and calm. In fact, the proceedings in five Committee days have been expert and businesslike, with none of the political flourishes which have distinguished the Committee proceedings elsewhere. Close attention to detail has resulted in amendments to require 21 days' notice of any motion to remove directors—with the intention of avoiding a "snap vote" in general meeting, though not of abating the force of the Cohen Committee's recommendation that shareholders should have greater powers to remove unsatisfactory directors than at present. An interesting discussion on the proposed age-limit for directors (variable with the consent of the shareholders) produced the suggestion that ages should be stated in the annual report and a question whether the same limit should apply to members of national boards. Amendments to the provisions governing disclosure of directors' transactions in the securities of the company will exempt from disclosure transactions by directors made in a fiduciary capacity and will stiffen the penalties for non-disclosure in other cases.

On the disclosure of tax-free and other emoluments to directors the Lord Chancellor admitted that he would prefer to use the word "chargeable" rather than "charged" to British income-tax, except that the former would be quite impracticable. But the most important development in all the proceedings has been the Government's decision to drop the clauses requiring the disclosure of nominee holdings where these amounted to one per cent or more of issued capital. The Lord Chancellor made it quite clear on the Second Reading that he was not convinced of their practical effectiveness. At a later stage he admitted that his mind had fluctuated, and finally he disclosed that after half an hour's thought he had developed no fewer than five different ways of avoiding the clauses. This is a regrettable, if inevitable, decision. The Cohen Committee were insistent that disclosure should be required, but the necessary machinery has defeated the ingenuity of the legal draftsmen. Perhaps this is partly due to the consequence of insisting on disclosure of one per cent or more when the public interest in the majority of cases would have been satisfied by the disclosure of a much higher percentage—say, 5 per

Prudent and active men, who know their strength, and use it with limitation and circumspection, alone go far in the affairs of the world.

GOETHE

TO recognise and seize favourable opportunities, while taking at the same time reasonable precautions, is to exercise that combination of enterprise and prudence which is essential to progressive business organisation.

Energy and confidence are personal gifts but in the observance of the wise injunction of "circumspection" conference with your bank manager can be helpful.

DISTRICT BANK
LIMITED

March

March is a month for quarterly payments.

Many payments occur regularly and are usually

fixed in amount—rent, insurance premiums, sub-

scriptions, transfers from your own account to

those of your family or dependants. The Bank

can save you the trouble of dealing with such

payments and the inconvenience which follows if

they are overlooked. It will do your 'remembering'

for you. Every month the Midland Bank makes

thousands of such payments, ranging in amount

from a few shillings to hundreds of pounds,

the customers' instructions being known as

"standing orders".

MIDLAND BANK LIMITED

ment a relatively smaller share in lease profits (though this might be partially made good by taxation) if the mines are rich than is the case for No. 1 area. The Welkom Gold Mining Company is first to develop the No. 1 area with a working capital of £2,750,000. The other two areas will be developed by subsidiaries of Welkom with working capitals of £2,250,000; these will be formed one year and two years after Welkom and will each have £1,000,000 of share and £1,250,000 of loan capital.

The finance of the new Welkom company, with its £6,000,000 capital and the "rights" attributable to shareholders of interested companies, is necessarily complicated. The African and European Group, as owners of Block 7, have an 85 per cent participation in the purchase consideration (£750,000) and in the working capital of the Welkom company, Western Holdings 12½ per cent and Blinkpoort—whose shares are dealt in under rule 34E in London—2½ per cent. These participants will provide £1,000,000 for 4,000,000 ss. Welkom shares and will loan £4,000,000 of unsecured debentures initially interest-free but carrying interest at 5 per cent after the development period, and redeemable out of not less than half the profits available for dividends. A further 1,000,000 ss. shares at par will be subscribed by the debenture subscribers and by the Anglo American Corporation, who jointly with African and European are acting as guarantors of the debentures. The merit of the large loan capital is that this can be repaid during the early lives of the mines, when capital expenditure can be set off against profits according to the "new mine" tax regulations. Shareholders should thus be protected against mistaking initial high dividends for indications of the amounts likely to be distributable when the Government comes to take its full share of profits.

Existing shareholders in African and European Investment will be offered, in due course, Welkom shares at par on a share for share basis. The residual holding will amount to about 1,700,000 Welkom shares and £1,232,500 debentures. Shareholders in Lydenburg Estates will be offered 5 Welkom shares for each three Lydenburg held; the residual holding will be 100,000 shares and the Anglo American Corporation has offered to provide up to £500,000 at 5 per cent to enable Lydenburg to take up its proportion of guaranteed debentures. Western Holdings shareholders will be offered 3 Welkom for each 10 shares held. OFSITS and Middle Wits will receive participations. The Welkom share offers will be subject to permission by the Union and British Treasuries. The latter refused permission to WRITS to make an issue to shareholders and the Capital Issues Committee has turned down the South Witbank Coal Mines' application. It is to be hoped that there will be no unnecessary delays in opening up the area, for on the Orange Free State as well as the Far West Rand will rest the burden of replacing the declining production of the old Rand in the next decade. Already a market capitalisation of £25 million for the Welkom properties is being canvassed, or over 50s. per ss. share.

More Commercial Bills

In more ways than one, the London money market is recovering traditional functions which have long been in a state of atrophy. Even before the war the volume of commercial bills handled in the discount market was but a fraction of what the market had reckoned upon a decade earlier, and the further steep decline during the war led many people to assume that this variety of business would sooner or later virtually disappear. In the past year, however, as the bankers' speeches have pointed out, London's acceptance business has been rising fast. Some discount houses report that their turnover of commercial paper is now running at almost two and a half times the level of a year ago. That is perhaps a larger growth than is general in the market, but the year-end balance-sheets of the three largest companies made it clear that the expansion has been very marked. At December 31st these companies showed "re-discounts"—that is, commercial bills sold to the banks which had not then reached maturity—totalling over £18½ million, which is 120 per cent more than the end-1945 figure and 150 per cent more than that for 1944.

The clearing banks' total of acceptances, endorsements, etc., at the year-end was about £193 million, compared with £116 million in 1945, but most of this growth and most of these totals certainly reflect business other than acceptances. To judge from the figures of those banks which show acceptances separately, clearing bank acceptances, though rising, are still quite small. Acceptances by the London merchant banks, however, are now estimated at around £50 million, which is far above the wartime level and begins to compare with the figures customary before the war. This business finances a considerable range of trade, but without doubt the most important commodity at present is

wool—and that will increase further when drafts are made upon the French wool credit discussed in these columns last week. At the moment, tobacco financing is also important. Acceptances by the Indian and Eastern banks, which before the war formed a large part of the supply of commercial paper, are also rising, but the amount is still relatively small. Despite this growth in acceptances generally, commercial paper of course plays a very minor part in the business of the market, and in view of the large resources available, competition both for bills and for acceptance business is very keen—the latter, in particular, is being transacted at fine rates.

Malayan Tin Problems

The Malayan Government has now transferred to the tin mining companies some 70 per cent. of the loan funds which were set aside to compensate the mining concerns for war damage and to help them in their rehabilitation, particularly in the overhaul and repair of dredges. The total amounts which are to be made available are between £2½ and £2½ millions and the remaining 30 per cent. will be paid when legal formalities have been completed. Some 60 loans were applied for and all these have been granted except six, of which two are subject to reconsideration. When the companies' claims for war damage are finally settled, they will be offset against the loans, which are interest free until 1950 and bear 3 per cent. thereafter. Up to the present, tin mining companies have been financing the rehabilitation of their properties out of their own resources and in some cases these have run low.

A solution of the tin mining industry's post-war financial problems, however, does not mean that their physical difficulties will be quickly overcome. The shortage of mining machinery and component parts is world wide; production is not increasing as rapidly as was hoped; and delivery dates are remote. Near-starvation in Malaya during and after the war has debilitated the labour force, and there is widespread disorganisation in transport and coal mining, which is reacting on the recovery of the tin mining industry. Earlier forecasts about the time needed to restore dredges to normal production were based on preliminary surveys of damage. In some instances the damage was over-estimated; in others it could not be properly assessed until a good deal of work had been carried out at the mines. It would, therefore, be unfair to suggest that the programme of restoring Malayan tin dredges is months in arrears, without due acknowledgment of the local difficulties and shortages of new equipment and parts.

	Average 1935-38	1939	1940	1941	1947	1948
Malaya	58,388	56,001	86,384	78,000†	46,150†	72,800†
Netherlands E. Indies	29,313	31,410	44,563	51,090†	32,100†	47,500†

† Estimates.

It is, however, disappointing that more rapid progress has not been made, particularly since in the Netherlands East Indies—which have been affected by serious political trouble since their liberation—tin production is recovering more rapidly than in Malaya, and may indeed regain the pre-war annual rate of production of about 40,000 tons during the second half of this year. This recovery has been achieved despite the fact that newly-built dredges are not yet in operation in the Netherlands East Indies. Evidently the two large producers that are primarily responsible for the Netherlands East Indies output of tin have been able to restore a relatively efficient scale of operations quite quickly. They will soon have the benefit of new dredging capacity supplied by the United States. Indeed the Dutch appear to have taken a far-sighted view of their tin-mining policy by acquiring new equipment from America at the expense of dollars, in order to earn a satisfactory dollar income in future from tin production.

Shorter Notes

The report of the Burnley Building Society for 1946 is the first among the larger societies, and it reveals some highly significant movements. Mortgage business reached a record figure of £5,306,782 representing a rise of £2,606,864 over the previous year. The Society was accordingly able to absorb just over £1,000,000 of new share subscriptions—nearly twice the volume of the preceding year—and over £2,000,000 of deposits and loans,

TRADE WITH THE EAST

THE CHARTERED BANK OF INDIA, AUSTRALIA AND CHINA provides a complete banking service, backed by practically a century's first-hand experience of Asiatic economic conditions, for every financial operation connected with TRADE, INVESTMENT AND TRAVEL IN THE EAST. The Bank's branch system, under British management directed from London, extends throughout

INDIA • BURMA • CEYLON
MALAYAN UNION • STRAITS SETTLEMENTS
BRITISH NORTH BORNEO AND SARAWAK
FRENCH INDO-CHINA • SIAM • INDONESIA
CHINA • THE PHILIPPINE COMMONWEALTH

Merchants and Manufacturers planning to establish, renew or extend business relations with the East would be well advised to consult the Managers in London or Manchester.

Associated Bank in India — The Allahabad Bank Limited

The franc has been the monetary unit of France since 1795. The word derives from the inscription "Johannes Dei gratia Francorum rex" on the gold coins first struck in 1360 by King John II of France.

franc

For many years Barclays Bank have fostered the growth of Anglo-French trade by providing a comprehensive foreign banking service, reinforced by the establishment of their own French associate, Barclays Bank (France) Limited. Today, when the expansion of our export trade is vitally important, Barclays Bank offer a complete foreign service, together with such other banking facilities as customers may require.

The Three Banks

The Royal Bank of Scotland, Glyn, Mills & Co., and Williams Deacon's Bank Limited, constitute a banking group whose resources rank them sixth among the banks of Great Britain. Their resources are large enough to meet the requirements of any customer. These three banks, each with a famous banking tradition, each still retaining its individuality, can give to every customer the advantages of their pooled facilities and diverse financial experience.

with consequent saving of administrative detail and manpower.

In part compensation for the sacrificed clauses, however, the Government have strengthened the Board of Trade's power of inspection so that they will be able to act "when there is good reason so to do." In the light of the admission by Lord Swinton that in his former office of President of the Board of Trade he had instituted enquiries into two companies which were subsequently discovered to lack authority, an extension of powers is plainly necessary. But if the Government cannot control the nominee problem, it would be optimistic to expect the City of London to be able to do so. The Lord Chancellor invited the City to "set its face" against abuse of nominee holdings. The truth is that it recognises the evils of abuse, but lacks the sanctions to stop them.

Stability in Exports

The January Trade Returns (summarised in the *Records and Statistics* supplement) present a rather flattering picture of the United Kingdom export position. Total exports valued at £91.2 million were 60 per cent above those of January, 1946, and 133 per cent more than the monthly average for 1938. The volume of exports has been provisionally estimated at 112 per cent of 1938; which compares at least respectably with that for the last quarter of 1946, which was calculated to be 111 per cent. The volume of exports in November last, however, was itself 12 per cent greater than in 1938, and in July 20 per cent greater. Exports do not necessarily correspond with production during that month, but rather with output of preceding periods. The stability of January exports at least shows no response to the increasing numbers engaged on export business in earlier months.

Compared with a year ago there have been some notable increases, particularly in what might be termed the difficult industries. Exports of iron and steel manufactures totalled £7.3 million, as against £5.2 million in January, 1946; cotton yarns and manufactures and woollen and worsted yarns and manufactures both showed fairly substantial gains. Exports of apparel were also surprisingly high, reaching £3.2 million, compared with £0.7 million a year ago. But the main expansion was due to machinery, vehicles, electrical goods and chemicals. Shipments of machinery to overseas countries amounted to £13.4 million (an increase of £7.2 million), while exports of vehicles reached £12.7 million (an increase of £7.7 million). Some of the expansion is undoubtedly due to inflated values, but the increase in volume, nevertheless, is creditable.

There is, however, one disquieting factor. Exports have been unable to maintain the peaks they reached during the second half of 1946. This is all the more alarming because the totals for February and March are certain to reflect the direct effects of the fuel crisis. When account is taken of the number of working days in each month, exports over the last seven months show a disturbing stability.

EXPORTS RE-CALCULATED ON BASIS OF 26 WORKING DAYS

1946		1946	
July	£89 million	October	£87.5 million
August	£78 "	November	£92 "
September	£74 "	December	£90 "
		January, 1947	£88 million

This suggests that productive efficiency is not increasing. If so, it will be the more difficult to reach the export target of 140 per cent of the 1938 volume by the end of this year.

Trade Against Dollars

The direction of British trade is conditioned partially by the dollar position and partially by its fundamental need of certain localised commodities. The ideal situation would be to purchase all food and raw material requirements from sterling countries and to sell exports in the hard currency areas. Unfortunately, an analysis of the 1946 balance of trade shows that the trend has been in the opposite direction. Compared with 1938, imports from the main "soft currency" countries increased by 30 per cent, whereas exports to them increased by nearly 120 per cent. Imports from hard currency areas last year were double those of 1938, whereas exports increased by just over 50 per cent. The

United Kingdom is dependent on supplies from the Western Hemisphere and alternative sources of supply cannot be found within the sterling area. Hence if the dollar trade account is to balance at all, increased exports to those countries are essential.

Trade within the Empire has increased proportionately compared with 1938. Nearly half of the United Kingdom's imports came from imperial sources as against 40 per cent before the war, and they took almost 50 per cent of Britain's exports. Empire trade, however, has greatly changed its economic significance, as Canada, which is now an increasingly important supplier, is one of the hardest currency countries.

The balance of payments with the hard currency countries can be seen from the following table:—

(£ '000)

	Imports	Exports	Re-Export	Balance
Canada:				
1938	78,708	22,530	1,038	— 55,140
1946	195,150	32,603	798	— 161,749
U.S.A.:				
1938	117,980	20,484	8,274	— 89,222
1946	226,876	35,448	4,380	— 187,048
Argentina:				
1938	38,471	19,338	377	— 18,756
1946	66,961	20,521	411	— 46,029
Sweden:				
1938	24,542	11,720	1,108	— 11,714
1946	32,013	21,414	1,089	— 9,510
Switzerland:				
1938	7,376	3,475	787	— 3,114
1946	3,163	9,451	1,212	+ 7,500

Switzerland is the only one of the countries above with which Britain has a surplus balance, whereas with Sweden the deficit has been reduced compared with pre-war. In the case of both the United States and Canada the deficiencies in the balance of payments have grown much larger compared with 1938. The deficit with Argentina has also increased considerably owing to the greater value of imports obtained from this source. It is difficult to estimate how far exports to Argentina can be expanded. Most of the commodities it requires, such as textiles, Britain is unable to supply in adequate quantity. But the deficit would be less severe if the Argentine Government's unique selling position was in any way weakened.

Argentine Railway Problems

After a day's suspension of dealings on Thursday of last week, the Jobbers were back at their stands on Friday, coping as well as they could with acute buying pressure. Prices, particularly of certain junior stocks, continued on their booming course until Tuesday, when the market experienced its first bout of profit-taking for many days. The suspension of dealings has aroused a good deal of controversy, based on the doctrine that the duty of a market is to continue to function if it is humanly possible. Unfortunately, the dealers have been close to breakdown for several weeks past. There were only three dealing firms left, after an exodus which dates back at least 25 years, and new blood was not attracted to deal in a dying market. Nor can the existing firms afford to take any large jobbing risks under present conditions; their profits go very largely to the Chancellor of the Exchequer, while they have to meet their own losses.

Given the recent strain of dealing—increased by the gloom in the corner of the "House" which the Argentine rail market occupies—the day-long queues, and prolonged office dealings after hours, the need for respite was not unreasonable. But evidently, the publication by the British Argentine Railways Council of a statement showing the basis on which the total purchase price would be split up between the various companies came as an unexpected blow to the market, which had been jobbing for a fortnight after the signing of the agreement in ignorance of the fact that, by agreement dating from the departure of the British mission last Autumn, the sales proceeds would be divided among the companies on the basis of "recognised capital" as defined in the Mitre Law. The railways rejected any alternative method involving past or prospective earning power as "affording no generally acceptable basis."

The division of the sale price, excluding the value of London

as their own films produced in California are distributed; in fact, they have stated that the productions from Britain will replace a similar number of productions from California.

It is estimated that each film will produce, apart from any exceptional profit, some million and a half dollars for the British company, which will be a welcome contribution toward the dollar account for films. The arrangement has the blessing of Sir Stafford Cripps, evidenced by his presence and words at a celebratory lunch given in London last Wednesday. But the details so far announced leave a number of questions unanswered. If the Board of Trade regard the agreement solely in the light of the number of additional dollars it will produce, then their benevolence can be understood. But there are other considerations, not all of them divorced from the dollar aspect. Good British films, showing life as it is here, not as it exists in Hollywood's imagination, are an artistic challenge to American films in North America and should therefore, if given a fair chance, also be dollar-producing instruments. But if this new agreement amounted to no more than a device for making American films in Britain, the resulting dollars might then be purchased at too high a price. The test, of course, will come when production starts. Warner Brothers have no financial control over the British company and Sir Stafford was at pains to declare that he intended that they should not acquire it. From that it must be assumed that the cost of modernising Elstree will either be found from British sources or, if financed from America, will be without limiting conditions. But if Warner Brothers by this agreement gain control of the production policy of the British company, then the actual ownership of the company's shares ceases to be a matter of the same importance. Mr Jack Warner promised that what he sought was co-operation, not domination. It is for the directors of Associated Pictures to ensure that, granted the assistance of American stars and American directors, the resulting product is British and of the high standard that British films have shown they can attain.

Ceylon's Export Levies

For some months past India and Ceylon have been considering the resumption of the pre-war auction system for selling their tea and ceasing to supply it in bulk on annual contracts to the Ministry of Food, which have given the growers their pre-war profit plus an increase sufficient to cover their higher costs. This impatience on the part of the growers—natural enough in the circumstances—has led the International Emergency Food Council to drop the allocation of tea after the present allocations expire at the end of March.

On the other hand the Ministry of Food, being anxious to secure the benefit of any long-term decline in commodity prices, has shown itself quite unwilling to renew the bulk purchase contract for Ceylon tea on the terms which were demanded by the growers, and auctions for export teas have accordingly restarted. Both India and Ceylon are imposing levies on exported tea so that the public revenues of the two countries can obtain a direct share of the benefit of high world prices. India has imposed an export levy of 2½d. per lb. on export teas, but Ceylon, which began modestly with a levy of less than 1d. per lb., has now decided to increase it to nearly 7d. on all teas sold after the two opening sales. At these two sales, extremely high prices were paid for the small quantities of 1947 crop teas which were on offer.

Great loyalty and self-sacrifice are required for the successful operation of all international allocation schemes, and it is not surprising that with the passing of war-time conditions these qualities are more difficult to evoke. Ceylon's action appears to be opportunist to a degree, for in addition to the increased tea levy, it has also imposed this week a levy of 10 rupees per cwt. on copra. Half of this levy will be paid over to the local producers, but the whole of the financial burden falls on the Ministry of Food, which is taking the copra on a bulk contract. Ceylon's action, however, is not quite as cynical as it may sound, for the present tea and copra levies are estimated to yield about 126 million rupees a year and will enable the Government to reduce the export tax on rubber from 2.50 rupees to 0.75 rupees per 100 lbs. The Government's intention is to avoid the painful deflation of the rubber industry's costs—indeed, the elimination of much of the industry—by enabling it to share in the benefits of high prices for other natural products, and to give it some degree of protection, now that world rubber prices are well below Ceylon's production costs. Even the concession to the rubber producers, however, will not bring the cost of export rubber from Ceylon into line with Malayan prices. Ceylon's latest moves seem more designed to take advantage of fleeting opportunities caused by world

shortage than to lay the foundations for a planned policy of orderly commodity marketing.

American Tonnage on Charter

The US Maritime Commission and the State Department placed different interpretations on the effect of President Truman's "end of hostilities" proclamation on the present charters of American merchant ships to the Allied nations. The immediate reaction to the proclamation was noted in *The Economist* of January 11th. According to a statement by the Lend-Lease administrator, Mr Chester T. Lane, from the State Department at Washington, a misunderstanding arose because the "termination of hostilities" is not the same thing as the "termination of the state of war." It may be recalled that President Roosevelt, in a letter to Mr Winston Churchill of May 23, 1943, transferred for temporary wartime duty under the Red Ensign between 15 and 20 American ships a month for ten months. The President pointed out that as a result of an earlier agreement American shipyards had concentrated on merchant ships and British yards on naval construction, and that the British merchant marine, though short of ships, had at that time a surplus of trained seamen.

An agreement signed on November 24, 1944, by Lord Leathers, Minister of War Transport, and Admiral Land, then chairman of the US Maritime Commission, specifically provided that ships transferred were to remain under the British flag "until six months after the termination of the war as proclaimed by the President, or such earlier termination as Congress by concurrent resolution, or the President by proclamation, may designate." The State Department points out that none of these events has occurred and the position of such ships is not affected by the "end of hostilities." Republican elements in Congress, however, are apparently not satisfied with the position. Mr Fred Bradley, chairman-designate of the Merchant Marine Committee in the House of Representatives, has countered by tabling a resolution demanding the return of all chartered vessels on the completion of voyages in progress on the date of its adoption. The State Department had previously indicated that it might, if necessary, initiate legislation to extend the charters on the existing terms, but the Republicans are seeking to enforce an earlier termination "by concurrent legislation." They claim that the charter terms for the British are more favourable than those available to American nationals; but the more likely explanation is the desire to embarrass or remove the growing competition of British shipping in world sea transport.

The ships were used free of charge up to the month of December, 1945. From that date, by a modification of the Land-Leathers agreement on February 15th last year, Britain has been paying a yearly charter rate based on 15 per cent. of the statutory sales price of the vessel concerned as laid down in the Ship Sales Act of 1946. The majority of the vessels concerned are Liberty ships, whose statutory price is \$639,000. The annual charter rate for each ship is therefore about £24,000, which represents an annual expenditure of well over £5 million in American dollars as long as the use of American ships continues. This sum, at present building prices, would probably cover the cost of building 20 similar vessels per annum in British yards. The basic annual charter rate asked by the Ministry of Transport for three-year charters of Government surplus ships of comparable type is about half the American rate, and represents only 10 per cent of the basic price for outright purchase, although successful tenderers have generally offered an excess of about 10 per cent over the basic charter rate.

Welkom and Block 7

Far too little is known about reef grades and widths and probable costs even in the area of most forward development in the Orange Free State for any categorical statement to be made about the Welkom Mining lease terms agreed between the Anglo American Corporation Group and the Union Government. These provide, without minimum payments, for the working of three leases; the No. 1 (northern) area of 4,710 claims borders the east of Western Holdings—Blinkpoort "second lease" area, on which the phenomenal Geduld No. 2 strike took place, and on this the Government percentage of profits is zero when the ratio of working profit to recovery is 6 per cent. The No. 2 and No. 3 areas, of 4,839 and 4,263 claims respectively, lie to the south; No. 3 borders on the east of St. Helena. The lease terms in these areas also provide that the Government does not share in profit until the profit-recovery ratio is 6 per cent, but they give the Govern-

TRADE WITH THE EAST

assets, but including ancillary assets in the Argentine is set out in the following table:—

Group	Amount
Buenos Ayres Great Southern Railway, including Bahia Blanca & North Western Railway, Buenos Ayres Ensenada & South Coast Railway, (50%) Buenos Ayres Midland Railway	50,557,222
Buenos Ayres Western Railway, including (50%) Buenos Ayres Midland Railway	17,510,044
Buenos Ayres & Pacific Railway, including Argentine Great Western Railway and Villa Maria & Rufino Railway	32,959,748
Central Argentine Railway	40,819,498
Entre Rios Railways	4,208,757
Argentine North Eastern Railway	3,944,731
	£150,000,000

The complication of inter-company holdings makes any guess-work about the pattern of the future schemes of liquidation quite impossible. Even in the apparently simple case of BAGS, the residual value of the ordinary stock—as distinct from its nuisance value—cannot be specified. In Central Argentine and even more in BA and Pacific, the complications are even more acute. But two points of principle can at least be made. First, the delay in disclosure of the basis of apportionment has resulted in higher prices for the junior stocks and enhanced their nuisance value, making it conceivably more difficult for the prior charges to obtain their full legal deserts. Secondly, the joint wisdom of Daniel and Solomon will hardly produce schemes which, after recent events, can satisfy the expectations of every class of holder. There is, therefore, a strong case, for independent confirmation of the schemes by an authoritative *ad hoc* tribunal or, if necessary, by the Court itself.

Gold and Dollar Holdings

Amid the gloom with which the dollar position is being viewed and anticipated, the Chancellor has let in a ray of sunshine: the revelation that the national gold and dollar holdings on September 30, 1946, amounted to £629 millions gross as compared with £545 million three months previously and £595 millions on June 30, 1945. This is a substantial improvement which is unlikely to have been counterbalanced by the change in gold and dollar liabilities that must be deducted from these figures to obtain the net totals. Some indication of the size of these liabilities is provided by the fact that the British gold subscription to the International Monetary Fund calculated at one-tenth of the net holding of gold and dollars on September 12th (that being the date on which the Fund announced that it would "shortly be in a position to begin exchange transactions") was £51,203,000, giving net reserve on that day of £512,030,000. It is evident from the trade returns that a substantial amount of gold must have been imported from South Africa last year. The surplus of British exports to South Africa over imports from that country was about £60 millions, and in addition a further repatriation of South African securities had to be financed. The sales of South African gold which in the main financed these transactions are probably the principal source from which the increase in the gold reserve was derived. In addition it is possible that the working balance kept in New York was somewhat above the normal level on September 30, 1946, as a result of unutilised drawings on the American loan. Whatever the explanations of the improvement, the very substantial increase in the gold holding suggests that the rate of drawing on the dollar credits this year may not prove as heavy as had generally been anticipated, since it must surely be axiomatic that the credits will not be drawn upon merely to make possible an increase in the gold reserve.

Sterling Debt Talks

The Anglo-Egyptian talks on sterling balances ended in Cairo last Monday with the issue of a *communiqué* which suggests that, as in the New Delhi discussions, the two sides could do no more than exchange views which were clearly beyond the range of reconciliation at the present exploratory stage of the discussions. It was announced in Cairo that the whole field of the Anglo-Egyptian debt had been surveyed in a spirit of candour and friendliness, that each side now had a much fuller understanding of the standpoint of the other, and that the official delegation would report to their respective governments. The unofficial reports on the course of the negotiations have thrown some light on the views put forward by each side. The Egyptians explained that the sterling balances, amounting to about £440 million, were widely distributed,

namely £144 million as cover for the note circulation, £250 million held by the Egyptian banks and £46 million by the general public.

This wide distribution, it was argued, made any writing down technically and equitably impossible. The reasoning is not particularly convincing, since it should not be beyond the bounds of reason for the Egyptian Government to vest privately-held sterling, compensating the owner in Egyptian pounds. The British negotiators appear to have suggested some such solution, which would have involved a partial writing down of the sterling debt and the conversion of sterling Treasury Bills backing the note issue for Egyptian Treasury bills. It is presumably at that point that the discussions were broken off, to be resumed in the near future. Sir Wilfrid Eady and Mr Cobbold have now proceeded to Baghdad where they will engage in similar discussions with the Government of Iraq. Meanwhile Australia and New Zealand have shown the way demanded by equity and generosity by announcing gifts of £A25 million and £NZ12½ million respectively as contributions to British expenditure on the war fought in the Pacific. These gifts will have the effect of reducing Australian sterling balances, which are now about £180 million, by £20 million, and New Zealand balances of about £90 million, by £10 million. There should, of course, be no need for a special agreement to govern the manner in which these accumulated balances can or will be spent. The matter can be left to the realism and good sense of the Australian and New Zealand authorities.

Copper Price Again Increased

The Ministry of Supply announced last week an increase of £10 a ton in the price of copper, raising the official rate for high-conductivity electrolytic type to £127 a ton. Prices of other forms have been adjusted correspondingly. This is the second increase this year, for on January 1st the price was raised from £98 to £117 a ton. The United Kingdom's main sources of supply during 1946 for electrolytic types were Canada and Chile, which together accounted for nearly 70 per cent of the total imports. Smaller quantities were also received from the Belgian Congo and Rhokana in Northern Rhodesia. Blister types of copper were supplied almost entirely by Northern Rhodesia. United Kingdom stocks at the end of November amounted to 94,000 tons, of which 8,300 tons were held abroad. At the end of the year they were probably equivalent to about three months' supply. Domestic consumption of virgin copper for 1946 averaged 27,100 tons a month, compared with 24,100 tons in 1945 and 21,500 tons in 1938. In January, however, there was a very sharp increase to 33,500 tons, although the consumption for the current year may scarcely total 275,000 tons owing to the recent fuel crisis. The greater demand is mainly accounted for by the electrical industry, although there is an increasing substitution of copper for scarcer metals, such, for example, as lead and this may have permanent effects upon the future use of lead in building.

In the United States the demand for copper has far outstripped domestic supply; it has been estimated that the latter can only cover about 60 per cent of consumption. Prices in New York have also moved sharply upwards, being quoted last Monday at 21½ cents a lb., or equivalent to £130 a ton. The Office of Metals Reserve is expected to have disposed of its stock of imported metal by the end of March, and thereafter home consumers will be partially dependent on the world market. To what extent the import duty of 4 cents a lb., effective from January 1st, will act as a deterrent to the purchase of imported supplies remains to be seen. But the level of demand for copper in the United States will no doubt break down this resistance; if so, a further rise in the world price will be inevitable.

The crucial problem from the British standpoint is the source or sources of new supplies to meet the American demand. As the United States possesses fairly ample smelting and refining capacity, it would be more likely to import copper ore, if possible, than semi-finished metal. This would presumably prevent the United States from participating to any markedly increased extent in the Canadian market. In all probability the additional supplies will come from Chile, Mexico and Peru, and possibly also from the Belgian Congo. Prospects of an expansion in production are not very bright. There have already been reports of a curtailment in Northern Rhodesian copper output owing to coal shortage. At the moment the effect is not very serious, but if it spreads, shipments may be reduced. Again, there are the perennial labour difficulties in Chile which must be taken into consideration. But as the increased demand for copper seems to have come to stay,

at least while the general shortage of non-ferrous metals persists, the high price should induce some expansion in output.

The position of other non-ferrous metals is scarcely any easier, except perhaps for tin. Lead recently rose in New York to 15 cents a lb., equivalent to about £83 a ton, compared with the official British quotation of £70 a ton—a margin well in excess of the US import duty of about £6 a ton. As lead, like copper, is almost wholly imported into the United Kingdom in a refined state, the fuel crisis is unlikely to react upon supplies, but they will continue to be scarce for other reasons. With zinc, however, a fair proportion of British supplies is refined here, and the fuel shortage will reduce them. For tin, reserve smelting capacity exists which, given an adequate supply of fuel, could be brought into operation if necessary.

Brazil and Sterling

Some surprise has been caused by the announcement that the Bank of Brazil, acting on instructions from the Ministry of Finance, has suspended purchases of sterling and a certain number of other non-convertible currencies. This decision must probably be viewed in the light of tentative negotiations which have taken place between representatives of the British and Brazilian Governments for disposal of accumulated sterling balances which Brazil holds to an estimated amount of over £50 million. The preliminary talks on this subject have revealed the now familiar clash of views. The Brazilians would like to spend the whole of their sterling in the near future on a programme which would involve heavy imports of machinery and capital goods from Britain. The British attitude has been that Brazil cannot in this respect be treated more favourably than other holders of sterling balances, and the lines of an agreement have been suggested which would involve modest releases of these balances over the next few years. More formal negotiations are due to begin in the near future, and the Brazilian move must probably be regarded as the opening gambit in those talks. The suspension of sterling purchases merely means that Brazil is not prepared to accumulate further sterling area currencies until such time as an agreement has been reached making any current accumulation of sterling available for expenditure in any currency area in the world.

War has brought great changes to the industries of Jamaica. Even today the impression probably persists that bananas form the major part of the Colony's exports. Recent trade figures, however, show that sugar, rum, pimento—known alternatively as Jamaica pepper—and citrus fruit pulp have ousted the banana, at least temporarily, from its former pre-eminence.

The gradual change-over to a peace-time economy, coupled with improved transport facilities, may well bring about another swing of the pendulum. Modern commercial development calls for careful and continuous study of local market conditions. Full and up-to-date information, backed by an intimate knowledge of the Island, is available to merchants and manufacturers interested in trade with Jamaica.

World Shipping Co-operation

February has been an eventful month for shipping in the international sphere. The proposals for the formation of a permanent Inter-Governmental Maritime Consultative Organisation as a specialised agency of Uno have been taken a stage further and the next meetings are expected to take place in London later in the year. Such a body must be universal to be of any practical advantage, and even if all nations, including Russia, are willing to co-operate there is bound to be great difficulty in defining its functions. In this respect the Atlantic is likely to be the barrier between parties of different persuasion. The International Shipping Conference, reflecting the views of "private" shipowners, has welcomed and emphasised the proposed exclusion from IMCO's terms of reference of all matters suitable for settlement through the normal processes of international shipping business, and has itself resolved to apply for consultative status with the Economic and Social Council.

Two further factors emerged from the London meeting of the International Shipping Conference. Scandinavian shipowners, in particular, did not appear to share the fears of British tramp owners that steps should be taken now to prepare a freight co-operation scheme to cope with any prolonged decline in rates in the future; while France was not represented at all in view of the threat of nationalisation. This has since developed into a three-part scheme whereby the two largest concerns (already for the most part state-owned) will be entirely state-operated, intermediate fleets will be state-controlled, and the rest "free." Meanwhile, the *Comité Maritime International* is resuming its work in the field of maritime law, and the Imperial Shipping Committee is taking up again its inquiry, interrupted by the war, into the shipping needs of the British West Indies and Bermuda, a subject in which Canada has a direct interest and in which the State-owned air corporations may be expected to have their say.

British Shipping Prospects

Reviewing the state of the industry in his presidential address to the Chamber of Shipping, Sir Ernest Murrant ended on a note of sober optimism, which he admitted was based more on

SAFE AS HOUSES

But are they? Is *your* house safe, in the sense that it is the best place to keep your cash? How much wiser it is to open an account at the Westminster Bank, where your money

will have complete protection, yet always be readily accessible. The process is simple and the account can be opened with a modest sum. The Manager of your local branch will be glad to tell you of the many ways in which the Westminster Bank can be of service to you.

WESTMINSTER BANK LIMITED

ment a relatively smaller share in lease profits (though this might be partially made good by taxation) if the mines are rich than is the case for No. 1 area. The Welkom Gold Mining Company is first to develop the No. 1 area with a working capital of £2,750,000. The other two areas will be developed by subsidiaries of Welkom with working capitals of £2,250,000; these will be formed one year and two years after Welkom and will each have £1,000,000 of share and £1,250,000 of loan capital.

The finance of the new Welkom company, with its £6,000,000 capital and the "rights" attributable to shareholders of interested companies, is necessarily complicated. The African and European Group, as owners of Block 7, have an 85 per cent participation in the purchase consideration (£750,000) and in the working capital of the Welkom company, Western Holdings 12½ per cent and Blinkfontein—whose shares are dealt in under rule 34E in London—2½ per cent. These participants will provide £1,000,000 for 4,000,000 ss. Welkom shares and will loan £4,000,000 of unsecured debentures initially interest-free but carrying interest at 5 per cent after the development period, and redeemable out of not less than half the profits available for dividends. A further 1,000,000 ss. shares at par will be subscribed by the debenture subscribers and by the Anglo American Corporation, who jointly with African and European are acting as guarantors of the debentures. The merit of the large loan capital is that this can be repaid during the early lives of the mines, when capital expenditure can be set off against profits according to the "new mine" tax regulations. Shareholders should thus be protected against mistaking initial high dividends for indications of the amounts likely to be distributable when the Government comes to take its full share of profits.

Existing shareholders in African and European Investment will be offered, in due course, Welkom shares at par on a share for share basis. The residual holding will amount to about 1,700,000 Welkom shares and £1,232,500 debentures. Shareholders in Lydenburg Estates will be offered 5 Welkom shares for each three Lydenburg held; the residual holding will be 100,000 shares and the Anglo American Corporation has offered to provide up to £500,000 at 5 per cent to enable Lydenburg to take up its proportion of guaranteed debentures. Western Holdings shareholders will be offered 3 Welkom for each 10 shares held. OFSITS and Middle Wits will receive participations. The Welkom share offers will be subject to permission by the Union and British Treasuries. The latter refused permission to WRITS to make an issue to shareholders and the Capital Issues Committee has turned down the South Witbank Coal Mines' application. It is to be hoped that there will be no unnecessary delays in opening up the area, for on the Orange Free State as well as the Far West Rand will rest the burden of replacing the declining production of the old Rand in the next decade. Already a market capitalisation of £25 million for the Welkom properties is being canvassed, or over 50s. per ss. share.

More Commercial Bills

In more ways than one, the London money market is recovering traditional functions which have long been in a state of atrophy. Even before the war the volume of commercial bills handled in the discount market was but a fraction of what the market had reckoned upon a decade earlier, and the further steep decline during the war led many people to assume that this variety of business would sooner or later virtually disappear. In the past year, however, as the bankers' speeches have pointed out, London's acceptance business has been rising fast. Some discount houses report that their turnover of commercial paper is now running at almost two and a half times the level of a year ago. That is perhaps a larger growth than is general in the market, but the year-end balance sheets of the three largest companies made it clear that the expansion has been very marked. At December 31st these companies showed "re-discounts"—that is, commercial bills sold to the banks which had not then reached maturity—totalling over £18½ million, which is 120 per cent more than the end-1945 figure and 150 per cent more than that for 1944.

The clearing banks' total of acceptances, endorsements, etc., at the year-end was about £193 million, compared with £116 million in 1945, but most of this growth and most of these totals certainly reflect business other than acceptances. To judge from the figures of those banks which show acceptances separately, clearing bank acceptances, though rising, are still quite small. Acceptances by the London merchant banks, however, are now estimated at around £50 million, which is far above the wartime level and begins to compare with the figures customary before the war. This business finances a considerable range of trade, but without doubt the most important commodity at present is

wool—and that will increase further when drafts are made upon the French wool credit discussed in these columns last week. At the moment, tobacco financing is also important. Acceptances by the Indian and Eastern banks, which before the war formed a large part of the supply of commercial paper, are also rising, but the amount is still relatively small. Despite this growth in acceptances generally, commercial paper of course plays a very minor part in the business of the market, and in view of the large resources available, competition both for bills and for acceptance business is very keen—the latter, in particular, is being transacted at fine rates.

Malayan Tin Problems

The Malayan Government has now transferred to the tin mining companies some 70 per cent of the loan funds which were set aside to compensate the mining concerns for war damage and to help them in their rehabilitation, particularly in the overhaul and repair of dredges. The total amounts which are to be made available are between £2½ and £2½ millions and the remaining 30 per cent will be paid when legal formalities have been completed. Some 60 loans were applied for and all these have been granted except six, of which two are subject to reconsideration. When the companies' claims for war damage are finally settled, they will be offset against the loans, which are interest free until 1950 and bear 3 per cent thereafter. Up to the present, tin mining companies have been financing the rehabilitation of their properties out of their own resources and in some cases these have run low.

A solution of the tin mining industry's post-war financial problems, however, does not mean that their physical difficulties will be quickly overcome. The shortage of mining machinery and component parts is world wide; production is not increasing as rapidly as was hoped; and delivery dates are remote. Near-starvation in Malaya during and after the war has debilitated the labour force, and there is widespread disorganisation in transport and coal mining, which is reacting on the recovery of the tin mining industry. Earlier forecasts about the time needed to restore dredges to normal production were based on preliminary surveys of damage. In some instances the damage was over-estimated; in others it could not be properly assessed until a good deal of work had been carried out at the mines. It would, therefore, be unfair to suggest that the programme of restoring Malayan tin dredges is months in arrears, without due acknowledgment of the local difficulties and shortages of new equipment and parts.

TIN PRODUCTION IN FAR EAST (long tons)						
	Average 1935-38	1939	1940	1941	1947	1948
Malaya	58,388	56,001	66,384	78,900†	66,150†	72,800†
Netherlands E. Indies	29,315	31,410	44,563	51,000†	32,100†	47,500†

† Estimates.

It is, however, disappointing that more rapid progress has not been made, particularly since in the Netherlands East Indies—which have been affected by serious political trouble since their liberation—tin production is recovering more rapidly than in Malaya, and may indeed regain the pre-war annual rate of production of about 40,000 tons during the second half of this year. This recovery has been achieved despite the fact that newly-built dredges are not yet in operation in the Netherlands East Indies. Evidently the two large producers that are primarily responsible for the Netherlands East Indies output of tin have been able to restore a relatively efficient scale of operations quite quickly. They will soon have the benefit of new dredging capacity supplied by the United States. Indeed the Dutch appear to have taken a far-sighted view of their tin-mining policy by acquiring new equipment from America at the expense of dollars, in order to earn a satisfactory dollar income in future from tin production.

Shorter Notes

The report of the Burnley Building Society for 1946 is the first among the larger societies, and it reveals some highly significant movements. Mortgage business reached a record figure of £5,306,782 representing a rise of £2,606,864 over the previous year. The Society was accordingly able to absorb just over £1,000,000 of new share subscriptions—nearly twice the volume of the preceding year—and over £2,000,000 of deposits and loans.

faith than on reason. That British shipowners generally share Sir Ernest's broad confidence is shown by the fact that the industry has committed itself to an estimated expenditure of some £230 million to make good the tonnage losses suffered during the war. The bulk of this sum, estimated at about £150 million, is represented by ships built, building or on order, totalling about 2½ million tons gross. More than £60 million has been expended in the purchase or hire of Government surplus ships, and shipowners are ready to support the Minister of Transport in his offer to purchase 115 of the American ships at present on bareboat charter, for whose return there is pressure in Washington. The industry intends eventually to restore the Merchant Navy to its pre-war strength in ships, though obsolescence and normal replacement programmes will demand further expenditure if its efficiency is to be maintained.

In view of the high costs of building and operating ships today, the shortages of materials and delays in production and the inefficiency of ports overseas, Sir Ernest Murrant's confidence shows a strong contrast to the cautious mood which seems to prevail in shipping circles in the United States, and may result in a further stiffening of restrictive policies to the detriment of British shipping and economic recovery. It would be dangerous to answer flag discrimination or state subsidies like with like. Given a sufficient volume of international trade, British owners can carry their proper share without fear of being ousted by new competitors. With this in mind, no doubt, the Chamber of Shipping adopted a resolution affirming the determination of the industry to do all in its power to expand and maintain the Mercantile Marine, and calling upon the Government "to do all possible to encourage international commerce and to remove trade barriers." World trade is a key to the prosperity of the shipping industry, and shipowners are watching with keen interest the approaching International Trade Organisation negotiations.

South African Budget and Rand Mining

British taxpayers may be forgiven for glancing enviously at the Union of South Africa, where last week Mr Hofmeyr introduced his Budget for 1947-8 and offered tax reductions amounting in all to £15,835,000. Although the Finance Minister had to provide for higher social services, his Budget was greatly assisted by the reduction in Defence expenditure and he was able to give moderate concessions in many directions—including postage and sugar as well as corporate taxation. Mr Hofmeyr recognised the importance of the gold mining industry in contributing to South Africa's external payments—last year's gold sales totalled £103 million and paid for 54 per cent of imports—and he did not fail those who had expected concessions in gold mining taxation. There is to be a revision of the basic tax formula to provide that when the ratio of working profit to gold recovery exceeds 6 per cent (up to which no tax is payable) the percentage to tax payable will be reduced. For a mine with a ratio of 10 per cent of profit to recovery the rate of tax will be 25.2 per cent (instead of 28 per cent under the old formula). The new formula defines the tax percentage as 63 minus 378 divided by the ratio of profit to recovery. The second concession is that the "new mine taxation" principle will be applied to all mines which have any unredeemed capital expenditure, and the rate of amortization of such expenditure may in future be increased from 20 per cent to 22½ per cent. Under the new taxation formula, Mr Hofmeyr is budgeting for a reduction in the yield from £9.3 million to about £8½ million while the new concessions for capital expenditure will involve a loss of revenue of something over £1½ million in the current year. Both may be expected to provide considerable direct benefits for the gold mining industry, though British investors will regret that the Finance Minister did not see his way to abolishing the non-resident levy.

The new concessions should encourage the mining industry to make a careful study of the economic possibilities of ultra-deep mining of rich deposits which are costly to work. These possibilities exist on the Central Rand but they occur with even greater significance for the future of the Rand mining industry in the area south of the West Wit's line and in the Orange Free State. Reduced taxation on working profits will, of course, assist the higher grade mines which are not required to make correspondingly increased lease payments and in some cases there may be significant increases in the share of working profits available for shareholders. The special levy on the diamond industry of four shillings in the £ has been reduced to one-third at a cost of £410,000 a year, and the profits tax on fixed property is to be abolished at a cost of about £700,000, which should assist township development. For industry the excess profits duty and

trade profits special levy are being abolished forthwith at a cost of over £8½ million and the standard tax level will remain at 20 per cent.

Danish Food Agreement

The Treasury announced last week the terms of the new Danish Food Agreement. It has been agreed that Denmark will balance its payments with the sterling area for the year 1947. As far as possible Denmark will make additional food exports available, but nevertheless it has still been compelled to adopt an import programme based on essential requirements. The United Kingdom has agreed to assist Denmark in the purchase from non-sterling sources of certain essential commodities, such as feeding stuffs, which are not otherwise obtainable.

The contract provides for an increase in the price of butter from 220s. per cwt. to 242s., to meet the increased cost of oilcake. The Danish Government will take steps to restrict the domestic consumption of butter-fat—a very important provision. Before the war Denmark exported over 80 per cent of total butter production, the annual average quantity supplied to the home market being about 25-30,000 tons. In 1946, although production was only 77 per cent of the pre-war level, domestic consumption totalled 62,000 tons, so that if the Danes are able to reduce supplies to their home market to 1938 figures, at least an additional 30,000 tons could be purchased by the United Kingdom under the clause of the long-term contract, which provides that 90 per cent of the residual exportable surplus, after meeting the supplies under fixed contract, is to be sold to this country. Increased quantities of margarine or oils and fats, however, will have to be made available in return to Denmark.

The price of bacon has also been raised, from 150s. per cwt. to 161s., and the export target figure for 1947-48 has been fixed at 75,000 tons. If this target is achieved, it would be possible to increase the bacon ration, though not to the pre-war level of consumption. In 1938 imports of bacon and ham into the United Kingdom from Denmark totalled about 170,000 tons. The Danish Government, however, has given an undertaking that the increase in price will be used for the benefit of bacon production. In addition, Denmark has agreed to sell 30,000 tons of meat during 1947, either in the form of cattle or frozen meat, of which between 5,000 and 6,000 tons represents a carry-over from the 1946 contract. Moreover, Britain will purchase approximately 30,000 tons of potatoes during the next three months. In the case of both these latter commodities the timing of the additional imports is important. Meat stocks in this country are not sufficient to withstand any strain resulting from the holding up of shipments from Australia arising from labour troubles. With potatoes there is an apparent gap of one month's needs between the exhaustion of present stocks and supplies from the new crop. The Danish purchase, together with extra supplies from Canada which have been arranged, will insure against any shortage during the remainder of the season.

Clearly, the agreement as a whole is advantageous to both sides. Britain has had to pay higher prices, but the Danish case for such increases could not be described as unreasonable. Beyond this Denmark has undertaken to take steps to improve the long-term export position, which should be most valuable to the United Kingdom. To pay higher prices now to encourage an expansion in production is more sensible than paying extortionate prices merely for short-term supplies—as in recent transactions with Argentina.

Discount Market Capital

The capital expansion of the discount market, discussed in a leading article in *The Economist* of February 15th, is now virtually complete. The tenth capital issue in just over twelve months was announced last week. The National Discount Co., Ltd., traditionally the second largest of the discount houses—and now confirmed in that position by this new financing—is offering to shareholders the whole of its unissued "B" capital, into which the unissued "A" shares were converted last January, when, in addition, the last £2 10s. of the £7 10s. "B" shares was paid up by capitalisation of reserves. Offered at £20 per share (compared with a market price of just under £26 before the announcement), the issue will bring in nearly £1,458,000, and will raise the total paid-up capital of the company by £547,000 to almost £2,700,000. The total known resources, including the premium on the issue and the carry-forward, will then be £5,138,000. The National Discount Co., it is interesting to recall, was not only the

first discount company but also one of the first companies to be formed with limited liability—it dates from 1856.

This issue brings the total influx of resources into Lombard Street up to roughly £10,150,000, excluding the £500,000 capital of the new discount house formed at the end of last year. The aggregate known resources of the twelve houses which now constitute the discount market are thus raised to about £27½ million, but total resources, including inner reserves and the capital of the one remaining partnership, are probably about £6 million more than this. Meanwhile, another of the medium-sized houses—Gillett Bros. Discount Co., Ltd.—is this week introducing its shares to the Stock Exchange. Dealings in the £1 ordinary stock units were expected to open towards the end of the week at about 70s.-71s., at which they would yield 3.4 per cent on the well-covered 12 per cent dividend paid in 1946-47. The recent balance sheet showed that last year's capital increase had led to a big expansion in operations; indeed, the proportions of published resources to total commitments and to the bond portfolio were a good deal smaller than is customary—though it is known that the company has a considerable inner reserve. After this introduction, only three of the discount houses will not have shares on the stock market—Ryders Discount Co., in which the United Dominions Trust has a large interest; Seccombe, Marshall and Campion, the private firm which acts for the authorities; and the newly-formed company, Clive Discount.

An Anglo-French Bank

The joint enterprise of the Banque Nationale pour le Commerce et l'Industrie and of two London financial houses, Messrs S. G. Warburg and Co. and Messrs Robert Benson and Co., is creating a new bank, the British and French Bank (for Commerce and Industry), Ltd., which will operate in London. It will take over the business of the London branch of the BNCI. The capital of the new bank has been fixed at £1,000,000, of which £750,000 will be issued. The issued ordinary capital consisting of 450,000 shares of £1 each is being subscribed by the BNCI. The British interests are taking up and will place privately 300,000 4½ per cent cumulative participating preference shares of £1 each. The venture is of special interest as it represents an alliance between private British capital and a nationalised French bank.

The BNCI has a well-developed network of branches and subsidiaries in French colonial territories and the London bank should play an important and useful part in financing the trade between these areas and the rest of the world.

Silver Arbitrage

The silver market is undergoing a most interesting phase of adjustment to post-war conditions and to the gradual breakdown of the insulation of various national markets previously separated by war-time exchange and import controls. The recent break in New York prices from 90½ cents which obtained until towards the close of 1946 to 70½ cents, recorded last month, attracted considerable demand for silver in the American market for shipment to India, where the rupee price remained relatively stable and at one time showed a premium of over 40 per cent on the New York parity. Such arbitrage was not possible to London firms which would not have been granted the dollars to finance their New York purchases, since the resale of silver would be made against rupees, and would merely have reduced Indian sterling balances.

But Continental interests which hold some dollars and desire sterling have come into the market by buying in New York, shipping silver to India and converting rupees into sterling. By such operations the arbitrageurs in question have made substantial profits. Another way of expressing these deals is that the operators have been able to convert their dollars into sterling at a rate of about \$3 to the pound. The result of these operations has been to narrow the gap between the New York and Bombay prices, but it is interesting to note that the narrowing has been effected through a rise in the New York price, which this week has touched 83 cents per fine ounce. The London price quoted for authorised users has risen with the New York quotation, and from its recent "low" of 44d. has recovered to 50d.

Shorter Notes

Two new directors have been appointed to the Court of the Bank of England. They are Mr. Charles Dukes, who has been a member of the general council of the TUC since 1934, and

GEORGE COHEN SONS AND COMPANY LIMITED

SHARE CAPITAL

Authorised.		Issued and to be issued.
£1,500,000	In 1,500,000 4½% Cumulative Preference Shares of £1 each	£1,000,000
£600,000	In 2,400,000 Ordinary Shares of 5s. each	£600,000
£2,100,000		£1,600,000

The Subscription Lists will open at 10 a.m. on Friday, March 14th, 1947, and close on the same day, for an

ISSUE OF

700,000 4½ per cent. Cumulative Preference Shares of £1 each at 22/6 per share, and
800,000 Ordinary Shares of 5/- each at 15/6 per share.

The remaining 300,000 4½% Cumulative Preference Shares and 1,600,000 Ordinary Shares are owned by the Directors and members of their families.

The Prospectus will show (*inter alia*) that:—

1. The Company is believed to constitute one of the two largest organisations in the United Kingdom concerned with the recovery and merchandising of all classes of scrap metals, and to be the largest organisation in the United Kingdom for the reconditioning, conversion and redistribution of all classes of machinery. It also operates a large hire fleet of builders' and contractors' plant.
2. The present £1,000,000 Preference Share Capital is covered nearly 2½ times as to capital, and over 4 times as to dividend.
3. The Ordinary Shares at the price of issue show dividend- and earnings-yields of 5.1.0% and 7.82% respectively (the former based on the level of distributions in each of the last three financial years), without taking into account any profits which may be earned by the balance of the new capital after repayment of loans and bank overdrafts.
4. The above yields are based on the profits of the last financial year, which were below the average of the profits of the last 11 years. Change over from war to peace activities has now been completed.

Prospectuses (upon the terms of which alone applications will be considered), and Forms of Application, can be obtained from:—

BAY HALL TRUST LIMITED.

Summary of Directors' Report for the year ended 31st December, 1946, and of the accompanying Statement by the Chairman, Sir Charles Hambro, K.B.E., M.C.

DIRECTORS' REPORT.

The gross revenue amounted to £155,670 compared with £129,936 in 1945. After charging Debenture Interest, Income Tax, Directors' Fees, Management and General Expenses amounting to £84,234, the net profit is £71,436. Adding £148,467 brought forward, the total available for appropriation is £219,903 and a dividend of 6 per cent., free of tax, is recommended, which will absorb £60,828, and leave £159,075 to be carried forward.

At market prices on December 31st, 1946 (or where no market price existed at valuations by the Directors at that date amounting to £306,690), the Share and Debenture Holdings and British Government Securities had an aggregate value of £3,387,903, as compared with their book value of £2,089,195.

CHAIRMAN'S STATEMENT.

The net profit of £71,436 compares with £65,153 for 1945, an increase of £6,283. Double taxation relief allowable to the Company, amounting to 3s. 4d. in the £, has been taken into account in arriving at the provision for taxation shown in the Profit and Loss Account. At the end of 1946, the value of our investments showed an indicated appreciation of £1,298,708 over book cost. Over 96 per cent. of the investments, including British Government Securities, taken at the valuations at December 31st last, are situated in the United Kingdom, South Africa, and other parts of the British Commonwealth. Similarly measured, but excluding British Government Securities, about 93 per cent. of the investments are in Ordinary stocks and shares and the balance in fixed-interest-bearing securities.

COMPANY MEETINGS

WESTMINSTER BANK LIMITED

LARGE INCREASE IN DEPOSIT AND CURRENT
ACCOUNT BALANCES

REPRESSIVE EFFECT OF GOVERNMENT CONTROLS

THE HON. RUPERT E. BECKETT'S REVIEW

The annual ordinary general meeting of Westminster Bank Limited will be held, on the 5th instant, at the Head Office, 41 Lothbury, London, E.C. 2.

The following are extracts from the statement by the chairman, the Hon. Rupert E. Beckett, which has been circulated with the report and accounts:—

For the past year deposit and current account balances show an increase of more than £130 million. It is certainly a problem how best to deal with these increases, as the rates prevailing for Treasury deposit receipts, Treasury bills, and market money, reduced to their present level in October, 1945, have now been in operation for a full year, and have had some adverse influence on our gross interest earnings, though these have been partially recouped by the elimination of interest allowances on current accounts and the fixing of ½ per cent maximum rate for deposits at 14 days' notice. Favourable earning factors have been increases in the totals of advances and investments, but there have been very material increases in costs, particularly in staff costs, embracing salaries, wages, and pension liabilities.

We have earned a profit available for distribution of £1,366,622, which is less than 1945 by £38,970. It has been decided to deal with this sum as follows:—To place £300,000 to officers' pension fund, £200,000 to bank premises reinstatement and rebuilding account, and to pay, less tax, the same dividends as last year. This year there appears for the first time in our statement of accounts the audited accounts of our foreign auxiliary, Westminster Foreign Bank; the year's working has resulted in a modest profit. The Ulster Bank figures are satisfactory, though the profit is some £5,000 less than that for 1945.

EFFECTS OF CHEAP MONEY POLICY

I pass on to the subject that engrosses the attention of us all—our country's economic well-being. Our Budgets are coming down to more tractable levels. We have succeeded in limiting the annual interest and management charges on our National Debt to about double the pre-war sum. But this moderation of the tax burden has been made possible by the unrelenting pursuit of cheap money, which is arbitrary and often inequitable in its effects. For a great many humble folk it whittles down their small incomes derived from Government investments, whilst, in another important direction, it creates serious and increasing difficulties for trustees and all concerned with pension and provident funds. A significant feature is that the continuous down-drive of Government interest rates forces investors to seek better yields elsewhere, inflating the prices of equities and of new share issues to levels which may not prove justified by actual trading results in the testing years ahead.

SHORTAGE OF LABOUR

In the field of labour, over 4,000,000 men and women have been demobilised from the Armed Forces and Auxiliary Services within the brief space of eighteen months, but our present labour force is only approximately at the same strength now as in June, 1939, and, moreover, is still maladjusted to to-day's needs. Shortages of labour in particular trades are common, and there are also signifi-

cant shortages of several important raw materials. All this means irksome delays and hindrances to continuous running and smooth production.

COAL INDUSTRY

Our coal industry is in a most unsatisfactory state. The total production of coal since June, 1945, has been at the annual rate of 185 million tons, against 226 million tons in 1938. The present production is not sufficient to meet even our domestic and industrial needs; consequently, our exports of coal are almost negligible. We must get more men, and especially young men, into the mines, inspired to work with a will and produce to full capacity. If we cannot solve the coal problem our future as a leader in the industrial world is indeed bleak, and our standard of living must remain low.

EXPORTS

The development of our export trade affords us some encouragement. We are now running at a level about 20 per cent above that of 1938. Even in a seller's market, this may be accounted a creditable performance. It has been assisted by the drafting of considerable numbers of workers into the export industries, but it is of little use drafting more men into the export industries while shortages of important raw materials, shortages of power, and difficulties of transport block the way to progress. Too much of our export trade is being done with "soft currency" countries. Half our imports are coming from America and Canada and only 14 per cent of our exports are going there. The American and Canadian loans are helping us out for the time being, but Sir Stafford Cripps has reminded us that the dollars are being rapidly spent, and once these are exhausted we shall have at our disposal only those which we can earn.

HOUSING, FOOD AND DOMESTIC GOODS

The rehousing of our people continues to be slow and wholly inadequate to the great need; the total of nearly 43,000 new permanent houses completed at the end of November last is, in view of our need, trifling. Our food situation remains frugal and austere, and it is disappointing that we are still in the precarious position of facing possible cuts in our meagre rations, rather than passing on to a fuller and more varied diet. Domestic goods remain in short supply. Hardware goods are easier to obtain, but these goods, though useful, are secondary. The most urgent requirement of the people, apart from food, is clothing and footwear, and new stocks of household linens and furnishings, and for none of these is there early promise of supplies commensurate with the huge pent-up demand.

We have not yet moved very far along the road to recovery. There are many factors impeding progress; two comparatively new ones have to be taken into account.

GROWTH OF GOVERNMENT INTERVENTION

The first of these is the modern growth of Government intervention. The war forced us to turn the whole of our energy and resources into the single task of its prosecution, and this entailed Government direction through-

out our economy. Controls are mainly repressive in their effects, but the demands of peace are all for freedom and enlargement.

NEED FOR INCREASED PRODUCTION

The withdrawal of the principal controls is not yet practicable, but trade development is undoubtedly hampered by them, and their mitigation, and eventual removal, must be kept ever in view. The merits and demerits of nationalisation I shall not here discuss. But I do question the timeliness of so radical and far-reaching a change at this present juncture. Benefits cannot be expected to accrue except over the course of years. Our present-day problems are essentially short-term; we want tangible results in the shortest possible time.

The withdrawal of the principal controls is not the prevailing psychological attitude of our people. A spirit of apathy, of disinclination to exert oneself, pervades the whole community, and there is little sign anywhere of willing and cheerful service. This is no doubt in part simply the ordinary reaction after so great and prolonged a war effort. It is partly attributable also to the very natural feeling of disappointment engendered by the continued shortages from which we suffer. While such an attitude persists we are not likely to put forth our best efforts, particularly when the general shortage of labour offers greater opportunities for sloth to those inclined to take advantage, and when taxation falls so heavily on marginal earnings. With nationalisation spreading its tentacles, and the future of industry generally uncertain, many people—and, regrettably, young people, in whose hands lies the destiny of our country—are feeling the urge to play for safety and security. The spirit of adventure is being curbed and there is an unwelcome readiness to go under the umbrella of a Government Department or a Government-owned industry. There are far too many acting in this way, and "non-productive" labour is growing out of all proportion to "productive" labour. Incidentally, one cannot help noticing the mental confusion of the individual who demonstrates his conception of freedom and independence by consistently flouting his trade union leaders and at the same time votes himself into the constriction and possible tyranny of the "closed shop." While the popular slogans persist of shorter hours and more money, less adventure and initiative and more security, we shall not travel far on the road of recovery.

With all these considerations in mind it is obvious that our progress must inevitably be gradual, but that for the reasons I have outlined it is being impeded unnecessarily by some obstructions capable of removal, or at least of moderation, to our national advantage. We must work, and speedily. Competitors, some suffering few of the disabilities under which we labour, are getting off the mark quicker than we are, and unless we hasten we shall be left well behind in the competitive years that lie ahead.

The heart of all our problems is production. With shortages of modern machinery and equipment, we must rely ultimately on manpower. Production means taking off our coats, disregarding the clock, forgetting the immediate rewards, and slogging at our jobs. It is the hard way to our salvation, but there is no other. And a bit of conscientious work will help us to regain that morale and self-respect we stand in danger of losing.

If, starting with the coal industry, all workers in all walks of life—directors, managements and rank-and-file will rededicate themselves to their daily tasks, working not in self-interest alone, but in the true team spirit, the sooner will a greater and brighter day dawn for Britain and once more prove that her long and distinguished industrial record is justified by the sterling qualities still inherent in her sons to-day. "In due season we shall reap if we faint not."

COMPANY MEETINGS

LOTUS, LIMITED

SATISFACTORY RESULTS—INCREASED PROFITS

Mr. H. J. BOSTOCK'S REVIEW

The forty-fourth annual general meeting of Lotus, Limited, was held on February 26th at Stafford, Mr. H. J. Bostock chairman of the company presiding.

The following is the Chairman's statement:—

The year's trading has resulted in the satisfactory Net Profit, after providing for Excess Profits Tax, of £139,317, which is £60,880 more than last year.

In drawing the accounts various changes have been made to bring them into closer accord with current practice.

Taking first the Balance Sheet. Fixed Assets are shown at cost less depreciation. As compared with 1945 there is an increase of £44,348, due to purchase of certain properties, outlay on new buildings and expenditure on re-equipment and modernisation.

Under Investments and Advances, Subsidiary Companies account for £586,309, against £537,025.

Under Other Investments there is a reduction of £9,168 in respect of certain miscellaneous investments that were sold during the year.

The liquid position is satisfactory. Current Assets totalling £734,347, as against Current Liabilities and Provisions £473,420, the surplus being £260,927, as against £257,360 a year ago.

Reserve for Development, £71,410, is due to the repayment of E.P.T., which must be expended on development work.

PROFIT AND LOSS ACCOUNT

In the Profit and Loss Account it will be seen that Net Profit on Trading stands at £287,141, as against £202,963, an increase of £84,178. The value of sales was the highest in the Company's history.

To this must be added Profits (less Losses) of Subsidiary Companies. They, too, have done well, the total being £54,543, as against £23,786, an increase of £30,757.

Excess Profits Tax, which includes £12,059 in respect of the 1945 liability, requires £185,069, being £173,000 for the year.

Directors' and Managing Directors' Remuneration shows the aggregate amount of the Directors' emoluments, both as Directors of the Company and in respect of their services in connection with its management. Payment is partly by salary and partly by commission based on profits. The amount is considerable, but the work done both by Managing Directors and Directors holding office under the Company is exacting in its demands upon their time and ability. The results are shown in the balance carried to the Report on the front page, which is £139,317, as against £78,437 for 1945.

The Report is set out in a form which shows first the deduction of Income Tax, £39,000. After that the transfer to Pension Fund, £7,007, which will bring the Fund to £20,000, and an allocation to Reserve of £5,725, making the total Reserve £75,000.

DIVIDENDS

The payment of Interim Dividends required £19,835. Adding the balance brought forward from last year £28,646 gives a disposable surplus of £96,396.

The dividends recommended are:—

7 per cent. on the Preference Shares for the half-year.

21 per cent. on the Ordinary Shares, making the rate for the year 14 per cent. twice the rate of dividend on the Preference Shares, requiring £46,028.

There follows a recommendation to give to the Lotus Employees' Benevolent Fund £20,000. The Fund, formed by setting

aside from the profits of the years 1922 and 1923 £30,000, has been of the greatest help in providing assistance to employees when ill or recovering from illness, and also in supplementing pensions to older workers. The trustees can be relied upon to turn to good advantage the additional income that will come by raising the Fund from £30,000 to £50,000.

After these appropriations there is left a Carry Forward of £30,368, being an increase of £1,722.

In the Consolidated Balance Sheet Investments and Advances to Subsidiary Companies are replaced by Statements of Assets and Liabilities.

Fixed Assets are £483,055 in excess of the corresponding total in the Lotus Balance Sheet.

Similarly Current Assets are larger by £188,198.

On the other side Reserve for Development stands at £111,910, the increase coming from E.P.T. refunded to Lotus & Delta Ltd.

With the return from active service of men and women called up during the war there has been a steady improvement in the labour position, but there is still a marked shortage of Closing Room operatives. The Closing Room more than ever is the bottleneck of the industry. Many manufacturers, being unable to obtain operatives in their home towns, have established branch factories in other towns and villages for closing uppers. We acquired very suitable premises at Westbury which have materially helped the Northampton factory. At Stafford the position, though serious, is less acute, and has been mitigated by the recruitment of women from Cannock, Rugeley and other nearby towns.

LEATHER POSITION AND PRICES

Leather is one of the commodities that are in short supply. The scarcity has been most marked in the better selections, and in order to maintain production manufacturers have had to take selections that ordinarily they would have regarded as unsuitable.

Designers are to be congratulated on their success in producing patterns requiring a minimum of leather and making the best of inferior materials. One of the most satisfactory substitutes for upper leather has been found in gabardine, from which very attractive and serviceable shoes for women are made.

The price position is obscure. Tanners are called upon to sell leather at prices below the real cost of production when hides have to be bought in the world market. They have been given by the Board of Trade a subsidy to offset the increased cost of hides and so enable them to supply shoe manufacturers at prices which permit the continued production of Utility Footwear at the prices fixed by the Board of Trade.

Sole leather has been in short supply, particularly in the better qualities, and there has been an increasing use of plastics for soling light shoes of the wedge heel and platform type. The material wears well, but is inclined to slip on wet pavements. One of the most satisfactory alternatives to leather is crepe rubber, which should be in larger supply this year.

Throughout the year shoe production has lagged behind demand. The ever-present problem before manufacturers and retailers has been how to make the best of the available supplies of materials for footwear.

The Board of Trade has controlled the output of individual manufacturers by a system of licences designed to secure a fair

division of the available leather between different users. Wisely the restrictions on design have been withdrawn, and manufacturers have produced remarkable range of styles, turning to good advantage very unpromising leather. Viewing the current range of models the comment "Britain Can Make It" comes to mind again and again. When fine leathers are again available still more alluring shoes will certainly follow.

The war has witnessed style developments, notably peep toes, sling backs, wedge heels and platform wedges that the 1939 buyer would unhesitatingly have turned down. The lesson alike for retailers and manufacturers is "Never stand still," and that success comes to the trader who can correctly interpret the signs of the times and is not afraid to back his judgment.

APPRECIATION OF LOTUS AND DELTA SHOES

It is gratifying to be able to report that customers have never been better satisfied with the design, quality and value of Lotus and Delta shoes than today. In achieving this result we have been greatly helped by putting into practice information gained in visits to America of directors and executives. The friendly relations established with manufacturers and distributors in America have proved of the utmost value. Through them we have been put in touch with some of the most active minds in the industry.

The American shoe manufacturer owes much of his success to having at his disposal a wide range of components which, when assembled, enable him to offer to his customers shoes that are elegant in design, uniform in quality and very reasonable in price. We have derived much advantage from the production in our own engineering department of knives and dies and also of certain components.

At Stafford the Board of Trade granted a licence for the extension of the East Block and providing modern cloak rooms and lavatories and some extension of manufacturing space. The building should be ready for occupation in the spring.

At Stone we are planning the erection of a new factory to replace the present buildings, some of which go back to the middle of the last century. The reputation gained by Stone for the manufacture of the highest quality of fashion footwear fully justifies the provision of a factory with working conditions that comply with modern standards of amenity, cleanliness and comfort. The days have long gone by when the skilled craftsman producing articles of high quality worked in cramped and often squalid conditions.

At Northampton we have acquired an option on the land zoned for industrial development under the Town Planning Scheme.

As a nation the maintenance of our standard of living unquestionably depends upon a great increase in our export trade. Shoes present a difficult problem in that, being made from imported materials, the added labour value does not offset the cost of the imported materials, with the result that an export trade in shoes may mean an increase in the adverse balance of trade.

It is therefore desirable to give preference to exports for "hard currency" countries, particularly the U.S.A. There Lotus Veldtschoen enjoy a very enviable reputation. We have formed a company, Lotus Shoes, Inc., with an office in New York for handling the sale of men's shoes.

FRIENDLY RELATIONS WITH SUPPLIERS AND CUSTOMERS

Our relations with suppliers and customers have never been closer or more friendly. Adversity may make strange bed-fellows, but it promotes good understandings also. We have all learned more about each other's difficulties, and have realised that in a common danger we can co-operate to the

mutual advantage of all concerned. It is earnestly to be hoped that the closer contact between principals brought about by the war will be maintained and developed as the years pass.

While there is a scarcity of necessary or desirable materials, some form of control to ensure a fair allocation between different producers or distributors should be maintained, much as we dislike any check on private enterprise. When supply and demand are more or less in balance, variations in price bring about the needed corrections, but when balance is disturbed, whether by war, crop failures or surpluses, failure of an industry to attract sufficient recruits to maintain the labour force, rationing can do much to check violent fluctuations in price and generally to steady the swing of the economic pendulum. The aim should be to restore as soon as possible the conditions that are favourable to private enterprise.

PRODUCTION AND DISTRIBUTION PROBLEMS

The tendency for production and distribution to be concentrated in larger units sets different problems for owners and executives. If control is to be centred in one man there must be a corresponding decentralisation of administrative detail, otherwise large questions of policy are neglected and efficiency is jeopardised.

Good staff work is as essential for a well run business as it is for the Army or Navy or Air Force. Well thought out and clearly defined plans executed with promptness, accuracy and vigour are the best preparation for overcoming the difficulties that lie ahead.

The more widely executive responsibility can be shared, the more smoothly any business should run. With sharing of responsibility should go a similar sharing of information. Works councils are still in their infancy, and their limitations as well as their usefulness have to be ascertained.

The prevalence of piecework in the shoe industry and the insistence in successive National Conference Agreements on the right and duty of operatives to exercise to the full their trade skill and knowledge have secured to workers that they will benefit by their industry and application. The Go Slow habits that in other industries have sapped efficiency and raised the cost of their products are not found in a modern shoe factory.

TRIBUTE TO WORKERS AND MANAGEMENT

Here I gladly recognise the good will that has for so long existed between workers and management at Stafford, Stone and Northampton. It has helped us to carry through with a minimum of friction and disturbance changes in organisation and methods necessitated by alterations in fashion and public demand.

The Five-Day Week, adopted first at Stafford in May, 1944, and later at Stone, now applies to Northampton also.

Interesting questions as to the future of the shoe manufacturing industry are suggested by the recommendation of the Working Party to establish a Shoe Manufacturing Services Board.

We live in an age when the bars on co-operation between men imposed by physical distances have been broken down by the discoveries of science. Communication between one part of the world and another is now virtually instantaneous. Journeys that formerly occupied weeks and months by sea and land are now reduced to hours by air transport.

On all sides we see the formation of associations or unions designed to promote the economic wellbeing of the members. Decisions on policy and developments are made by men meeting as representatives of a whole industry with a wider view of economic forces and tendencies than is open to individuals who, in seeking their own advantage, may often act to the detriment of other sections of the community.

Much as we dislike interference with what we regard as our own affairs, we recognise that in other activities of commerce or business a measure of control or direction is essential for safeguarding the public interest. Perhaps as good an illustration as any is the need for regulation of advertisements in town as well as country districts. Left to themselves unscrupulous advertisers have disfigured natural beauty and vexed the many people who hold that in the beauty of the English country-side we have a heritage of unspeakable value.

THE FUTURE

As to the future. With larger supplies of material and a growing labour force production of Lotus and Delta shoes should continue to rise. Whether it will be sufficient to meet the demand is doubtful. One important reservation has to be made. Great as the importance of production is, the financial problems must not be lost sight of. The present condition is unquestionably critical. In the event of the American recession proving the forerunner of a serious trade depression, the man who could forecast the effects on British economy would indeed be bold.

The report and accounts were unanimously adopted.

THE SCOTTISH PROVIDENT INSTITUTION

MUTUAL LIFE ASSURANCE

The 109th Annual General Meeting of the Scottish Provident Institution was held in Edinburgh on the 4th instant.

The Chairman, Sir Ernest M. Wedderburn, LL.D., D.K.S., said that the net new sums assured, £3,341,302, were the highest recorded in the Institution's long history. There was also a substantial increase in the number of new annuities the purchase prices amounting to nearly £500,000. The aggregate claims at £1,449,057 were lower than those of the previous year and the claims by death again reflected a favourable mortality experience.

Interest revenue exceeded that for 1945 and at £1,077,180 gross or £800,824 less income tax, showed a yield of 4 7s. 9d. per cent. gross or 3 5s. 6d. per cent. net on the Total Funds. Those had increased during the year by nearly half a million pounds and now amounted to £25,188,006. The appreciation of the market value over ledger value of the Stock Exchange Investments had increased substantially and the Directors felt that the financial position of the Institution was very strong and that the distribution of the assets was particularly suitable to the times.

GROUP LIFE AND PENSION BUSINESS

Last year the Institution had resumed Group Life and Pension business. These schemes met a need long felt by employers and employees. To the employees they gave a feeling of security in that their future was satisfactorily provided for. They secured freedom from want and, in so far as they were contributory, did so by the employee's own efforts. Further, as benefits usually depended on salary, an additional incentive to work is afforded. The employer, on the other hand, was enabled to organise his business so that an employee could be retired in due course without hardship to himself and without unduly burdening the employer with the cost of a pension.

The new National Insurance Act provided pension and death benefits similar in form to those under a group life and pension scheme but of an amount sufficient only for the lowest paid employees. Firms employing skilled operatives and clerical and administrative staffs would therefore still find it necessary, in the case of their more able and enterprising employees, to supplement the Government scheme with one providing additional pensions.

The report and accounts were adopted.

THE BRITISH LINEN BANK

LORD AIRLIE ELECTED GOVERNOR

The annual court of proprietors of The British Linen Bank was held, on the 4th inst., at the head office in Edinburgh.

The Earl of Home, governor, who presided, said, in the course of his speech: Since our last meeting we have celebrated the bi-centenary of the incorporation of the bank, and it is appropriate that to mark the year which witnessed so interesting an event we are in a position to present a statement of accounts which constitutes a record. The balance sheet total at £82,778,954 shows an increase of over £10,000,000 on the previous year's figures. Deposits and drafts amount to £69,000,000—an increase of more than £9,000,000.

Turning to the assets, the items cash, cheques, short loans, bills and Treasury deposit receipts at £32,000,000 are up by more than £5,000,000, and show a ratio of 42 per cent. to liabilities to the public. Investments in Government stocks show an increase of over £4,000,000. Advances at the date of the balance were below the average for the year, and at £8,800,000 show only a small increase.

PROFIT AND DIVIDEND

The past year has seen important changes affecting revenue and expenses. Interest rates were reduced at the instance of the authorities, and the yield on investments continued to fall. The staff in large numbers returned from the Forces, charges for salaries and pensions increased, and all other expenses rose, while on the other hand the rate of income tax was reduced. The full effect of these factors has yet to be felt, but our increased resources this year have enabled us to show a profit of £246,125, compared with £232,141 a year ago. Allocations are recommended of £25,000 to property reserve, £35,000 to pension fund, and £50,000 to contingency account, and it is proposed that a dividend be paid at the usual rate of 16 per cent. per annum, leaving £150,715 to be carried forward.

THE OUTLOOK

The difficulties now facing our country arise largely from failure to heed the implications of the fact that we are much poorer as a consequence of the war. Our situation is that of a debtor who has incurred heavy losses, but has been allowed a limited time to retrieve his position. The recent official economic survey fully justifies the warnings of the business community, who would be glad to see policy even more closely examined. It is difficult, for example, to escape the conclusion that centralisation of control of all activity is more effective in respective directions than in promoting prosperity. The situation calls for wise and broadminded statesmanship as well as for a united and wholehearted effort on the part of the community.

You were good enough to elect me as deputy-governor 25 years ago, and you appointed me to succeed the late Lord Rosebery as governor in 1930. I feel that the time has come when the reins should be handed over to a younger man, and you will be invited to elect as governor the Earl of Airlie, who has acted so acceptably as deputy-governor since 1930.

The report was adopted and a half-year's dividend at the rate of 16 per cent. was approved.

The Right Honourable the Earl of Airlie, K.T., G.C.V.O., M.C., was elected governor in succession to Lord Home.

In recognition of his services to the bank, the Earl of Home was presented with a replica of his portrait, painted by Mr James Gunn, the original of which had been gifted by the stockholders to the bank on the occasion of its bi-centenary.

TECALEMIT, LIMITED

INCREASED PROFIT AND DIVIDEND

MR. S. G. GATES' REVIEW

The twelfth ordinary general meeting of Tecalemit, Limited, was held, on the 31st ultimo, at Winchester House, Old Broad Street, London, E.C., Mr S. G. Gates, the chairman, presiding.

The chairman, in moving the adoption of the report and accounts, said: Ladies and gentlemen,—Demand for the company's products has steadily expanded throughout the year. Production, however, has not been able to expand in proportion, owing, in the earlier months of the year, to a shortage of labour following on the removal of the Essential Work Order and, more recently, to an equally severe shortage of raw material, particularly steel sheet and steel bar. Moreover, our troubles have throughout been accentuated by lack of factory space. In fact, from the point of view of production, the past year has been one of the most difficult in the company's history. During recent months there has been an improvement in output, and, given normal conditions, this improvement should be progressive. But until supplies of coal and steel become more plentiful our situation, like that of most engineering firms, must remain precarious.

During the year our Coventry subsidiary has, with the consent of the Board of Trade, changed its name to Coventry Precision Engineering and Repetition Company, Limited. This change was made in order to bring the company's title more into line with the class of product which it has now been making for a number of years. At present, only a portion of Coventry's capacity is being used for aero work, the remainder being devoted to the manufacture of those Tecalemit products which require the highest degree of precision.

Our Australian company is in process of transferring its headquarters from Melbourne to Adelaide, where a larger factory has been acquired in order to provide for the increasing demand for Tecalemit products in the Dominion.

LARGE INCREASE IN EXPORTS

Direct exports to which, in accordance with Government policy, we are giving high priority, are now running at about five times the value of our exports in pre-war years. But our main participation in exports is indirect, through the incorporation of our products as standard equipment on motor-cars and machinery of all kinds. We are making every endeavour to expand our business abroad, and Mr Taylor is at present in South Africa on a visit which has this object in view. On that account he is unable to be present at to-day's meeting.

PROFIT AND DIVIDEND

The profit for the year, after providing for income-tax (less net E.P.T. repayable £10,700) is £120,081, as compared with £111,249 last year. This figure includes a dividend from our French associate company, but in view of the difficulties under which French industry is labouring at the moment I am afraid that we must not look for any return from that source this year.

Our dividend rate has remained unchanged since 1940, despite the enormous rise in wages and prices which has taken place in

the meantime. The view of your directors is that a modest increase in the rate of dividend is now justified, and their recommendation is that a final dividend of 14 per cent. be paid, making a total of 20 per cent. for the year. If adopted, this recommendation will leave the carry-forward at £69,324, as against £50,188 brought in.

BALANCE SHEET ITEMS

I will now turn to the balance-sheet before you. You will observe that a further £15,000 has been placed to obsolescence reserve, making a total of £40,000 under this head. As I explained last year, this reserve is a provision created to cover the possibility of a loss, or, alternatively, an increased liability to taxation which may arise on the realisation of certain plant required for wartime purposes. The reserve has now reached the full amount which can possibly be required for this contingency.

A provisional payment of £138,034 has been received by way of refund of Excess Profits Tax. It is thought that the final figure, which cannot yet be exactly determined, will not differ greatly from the amount already received.

The bank overdraft on July 31, 1946, stood at £35,756, as compared with £209,028 a year before, this decrease being due to the refund of E.P.T. already referred to and the reduction of stock and work in progress from £692,094 to £530,173.

INCREASE OF CAPITAL

It has, nevertheless, been obvious, as I indicated last year, that fresh capital was required. The permission of the Capital Issues Committee having been received, a further issue of 514,124 shares of the company's authorised, but unissued capital has been made to existing shareholders in the proportion of three shares to every ten held. These shares have been issued at 22s. and will produce approximately £550,000 after expenses, which sum the board considers necessary to finance the further expansion of the company's business and to build new factory premises now urgently required. To this latter end negotiations have been undertaken with the Plymouth City Council for the leasing of a factory site in Plymouth, where the necessary labour is available for our purposes. As part of the site needs to be acquired by compulsory powers, the matter is still *sub judice*; but we hope for a favourable decision shortly. The new factory will relieve the strain on our existing production resources and permit us to introduce new products for which no space is at present available. Considerable thought has already been given to its design, and it is hoped that improved lay-out and the most modern equipment will in time enable us to produce in larger quantities and at lower cost.

You will, I am sure, learn with regret that Mr W. J. Parslow, who had been in poor health for some time, was compelled on medical advice to tender his resignation from the office of managing director on November 1st last. Mr Parslow had been with the company for twenty-two years and had played a considerable part both in building up its business and in steering it through the difficulties of wartime. He carries with him in his retirement the best wishes of his colleagues.

The report and accounts were adopted.

MUFULIRA COPPER MINES, LIMITED

MR. CHESTER BEATTY'S STATEMENT

The adjourned seventeenth ordinary general meeting of Mufulira Copper Mines, Limited, was held on the 28th ultimo.

The following is an extract from the statement of the chairman, Mr A. Chester Beatty, which was circulated with the report and accounts:—

The production of blister copper for the year ended June 30, 1946, amounted to 50,040 long tons. This represents a decrease of 8,235 long tons compared with the output for the preceding year, and corresponds fairly closely to the production rate forecast in my last statement.

The cost of production for the year on an f.o.b. Beira basis before provision for replacements, was £42 17s. 4d. per long ton of blister, compared with £38 9s. 7d. for the preceding year. The average price realised on sales for the year was £57 17s. 11d. per long ton of blister, compared with £53 0s. 11d. for the preceding year.

THE YEAR'S PROFIT

The balance carried from the operating account to the profit and loss account is £785,601. After deducting London expenses and loan stock interest and transferring £200,000 to replacements reserve the profit carried to the appropriation account is £585,601, representing a decrease of about £88,000 compared with the corresponding figure for the preceding year.

As was the case last year, owing to reduced output and higher costs the profit resulting from mining operations was less than the standard profit for excess profits tax purposes and in consequence we drew still further on the excess profits tax "cushion"; this is reflected in the credit of £511,000 appearing in the appropriation account in respect of estimated excess profits tax recoverable for the year.

After debiting the appropriation account with £404,000 representing income-tax payable on the profit for the year and the liability for income-tax which results from our drawing on the E.P.T. "cushion," there was a net profit after taxation, of £644,549, out of which £35,700 was transferred to loan stock redemption reserve, leaving a net profit for the year of £608,849, which compares with a figure of £339,416 for the previous year.

The directors declared a dividend of 3s. 6d. per share less tax at 9s. in the £ costing a net amount of £470,554, and leaving a balance of £138,295 which added to the amount of £192,161 brought forward from last year, gives a balance of £330,456 to be carried forward.

TAX POSITION

I am pleased to say that H.M. Inspector of Taxes has admitted a claim for a revision in the method of computing the profits of the standard period for the purposes of excess profits tax with the result that there is a substantial reduction in the company's liability for tax. The revised basis has been adopted in computing the profits for the year ended June 30, 1946, and the result has been to effect a saving in taxation for the year of about £125,000 as compared with the computation on the original basis. In regard to the years up to June 30, 1945, we estimate that the revision will result in a reduction of over £450,000 in the liability for taxation, and it follows that there is a corresponding over-provision for taxation in those past years.

The company's appeal in connection with other taxation matters has been set down for hearing by the City Commissioners in the near future and we expect that when this appeal has been settled it will be possible to dispose of the other questions namely

valuation of copper stocks for purposes of excess profits tax and "surplus cash." In view of the complications and inter-relationship of the various taxes it is difficult to state the exact amount involved in the stock valuation and "surplus cash" questions, but the amount is estimated to be in the neighbourhood of £500,000, all of which has, of course, been included in the provision for taxation set aside out of profits.

COAL SITUATION

The coal situation has caused and continues to cause us much concern. There is no shortage of coal production at the colliery and the problem is entirely one of transport, due to the failure of the Rhodesia Railways to meet all the traffic requirements of the territories served by this railway system. The prospects for the current year are not promising and inevitably production will suffer on this account.

The report and accounts were adopted.

OROVILLE DREDGING COMPANY, LIMITED

INCREASED COSTS

The thirty-fifth ordinary general meeting of Oroville Dredging Company, Limited, was held, on the 30th ultimo, at 49, Moorgate. Mr W. H. Geikie presided in the absence through indisposition of the chairman, Mr Frederick W. Baker.

The following is extracted from the chairman's address circulated with the report and accounts:—This year we have published consolidated accounts of Oroville and its subsidiary, Pato Mines (Colombia), Limited. The consolidated profits statement shows that the combined profit for the two companies was £39,330. Of this £34,375 is to be distributed to Oroville shareholders and £50 to the outside shareholders of Pato Mines.

The recovery of gold by Pato Consolidated for the year ended April 30, 1946, was considered satisfactory by the management of that company. The production for the first six months of the current year—that is, to the end of October, 1946—amounted to a total of 13,385,825 with gold at \$35 per ounce from 7,326,000 cubic yards. A further dividend of 15 cents, plus a bonus of 5 cents, has been received in December, 1946, on account of the year to April 30, 1947.

Living costs in Colombia have increased, and as a result higher wage scales are now prevailing. Freight rates to and within Colombia have nearly doubled, and in addition to this the cost of equipment and supplies has increased by about 30 per cent. at source has increased by about 30 per cent. Future operating costs, including Colombian taxation and the price of gold, will decide as to what extent the marginal reserves can be handed at a profit. The management are endeavouring to step-up the drilling of some of the large untested areas, though this is being held back somewhat by the difficulty of obtaining drilling equipment. Everything possible is being done to further the installation of the small new river-type dredge, and also the large dredge which is to handle about 6,000,000 yards a year, but in view of the supply position in the United States it will be fortunate if the former is in operation by the end of 1947, and the latter by the end of 1948. On the whole, the year to April 30, 1946, was a difficult operating year in many ways, and particularly in regard to lack of supplies and shortage of suitable trained personnel.

The factors affecting operations and costs at Pato Consolidated apply in full measure to those of Asnazu Gold Dredging, Limited. No dividend was received from Asnazu during the year, but in February, 1946, the entire Asnazu project was thoroughly reviewed by the management of that company and a revised operating programme was outlined. It is a reasonable expectation that this revision will permit the resumption of dividends within the next year or so.

The report was adopted.

JOSEPH NATHAN AND COMPANY, LIMITED

GLAXO EXCHANGE APPROVED

RECOVERY OF OVERSEAS TRADING

The forty-seventh ordinary general meeting of Joseph Nathan and Company, Limited, was held, on the 30th ultimo, at the Abercorn Rooms, Great Eastern Hotel, Bishopsgate, London, E.C., Sir Harry Jephcott, M.Sc., F.R.I.C., Ph.C. (chairman of the company), presiding.

The secretary (Mr J. A. Nathan, A.C.I.S.) read the notice convening the meeting and the report of the auditors.

The following is the statement by the chairman which had been circulated with the report and accounts for the year ended September 30, 1946, and was taken as read:—During the year Mr Alec Nathan retired from the board after forty years' service with the company as a director, and as chairman of the board for the past nineteen years. By his foresight and untiring energy, he greatly contributed to the growth of the company.

CONSOLIDATION OF RESOURCES

Of recent years the chairman has repeatedly declared the policy of the board to be the direction of the company's resources into those channels which were judged to offer the greatest scope for development.

The policy has now been brought to its full consummation by the disposal of the company's principal freehold property in New Zealand and an agreement for the sale of Joseph Nathan and Co. (N.Z.), Limited.

The effect of all these operations is that, except for an investment in a subsidiary company and some small properties, your company has only one asset—its investment in Glaxo Laboratories, Limited. Under these circumstances, there no longer remains any useful or rational purpose in the continuance of Joseph Nathan and Company, Limited. Indeed, to continue it would have the effect of making it cumbersome and difficult, if not impossible, for the directors to keep you as fully informed of the company's activities as they desire, or as is their duty.

All stockholders' rights will be precisely the same as at present and all will benefit from the enhanced security which the directors are confident will accrue from focussing the company's resources within the Glaxo Laboratories, Ltd.

THE GLAXO LABORATORIES, LIMITED

In the statement to stockholders very full information is given with respect to the past record of the Glaxo Laboratories together with accounts for the financial year ended September 30, 1946. There is no occasion to refer to these figures; they speak for themselves. The progress which has been characteristic of Glaxo since its formation as a company and, for that matter, many years previously, has been well maintained.

Export trading is no new venture for the Glaxo organisation; it is almost as old as Glaxo itself. It is perhaps significant that the company had its origin overseas, and the pioneering spirit which characterised the earliest history of Joseph Nathan and Company, Limited, found new expression in the world-wide development of the Glaxo laboratories. For more than 25 years export has constituted a very large proportion of the Glaxo Company's business. By 1939 Glaxo Laboratories, Limited, was firmly established in many overseas markets in India, Australia, New Zealand, Italy and South America through its subsidiary companies, and in very many other countries with its own resident staff and experienced agents of proved ability.

The war imposed a severe check upon this export development. A large number

of the overseas staff were on active service and the markets were, in many cases, only kept alive with such token quantities of goods as the circumstances permitted. The very rapid redevelopment of this export business has demonstrated in most satisfactory manner the prestige which attaches to the Glaxo products and the goodwill which has been built up.

It is a matter of particular satisfaction that, during the year, sales in overseas markets have been more than three times the sales in 1939.

PENICILLIN PRODUCTION

The company's deep fermentation Penicillin plant at Barnard Castle came into operation during the year and we have had the distinction of producing a large quantity of penicillin of such high quality as has greatly added to the company's reputation with the medical profession. This is a new process which is passing through a phase of very rapid evolution: within the short time during which we have been operating, improvements have been developed which we must adopt in production practice if we are to maintain our position, especially in overseas markets in the face of American competition. This will call for the courage to "scrap and replace," employing plant of improved design as rapidly as improved technique dictates. This is an expensive procedure, but vitally necessary to establishing a firm foothold in so new a technical field. For these reasons it is not to be anticipated that penicillin will contribute in a substantial degree to increased profitability during the development phase which will characterise the immediate future.

Further extensions of our activities in the field of antibiotics and the pressing need for increased manufacturing facilities to meet the expansion of our pharmaceutical trade have called for the provision of additional accommodation. With these ends in view, an appropriate site has been secured at Ulverston in Lancashire. Plans for development along these lines are being actively pressed forward.

The new conditions of pay, together with the five-day week, wherever the nature of the operations permit, have been greatly appreciated by the staff. This scheme, at its inception, was in some degree experimental and it is highly satisfactory to record that, thanks to the excellent co-operation of staff and management, output has not suffered.

STOCKHOLDERS APPROVE PROPOSALS

As will be readily appreciated from this brief review, from the accounts and from the information in the accompanying circular to stockholders, your company—Joseph Nathan and Company, Limited—is now, in all but a formal sense, Glaxo Laboratories, Limited. If the proposals which are now being placed before you are accepted, the effective position will be brought to practical reality.

The report and accounts were unanimously adopted and the dividends as recommended were approved.

At separate general meetings of the 7 per cent. cumulative "A" preference stockholders, the 8 per cent. cumulative preferred ordinary stockholders and the ordinary stockholders, and at an extraordinary general meeting of the company subsequently held, resolutions were passed approving the voluntary liquidation of the company and the exchange of stock in the company for equivalent stock, class for class, in Glaxo Laboratories, Limited.

LONDON MIDLAND AND SCOTTISH RAILWAY COMPANY

NATIONALISATION A THREAT TO INDUSTRY

INADEQUATE COMPENSATION TERMS

SIR ROBERT BURROWS'S VIEWS

The twenty-fourth annual general meeting of the London Midland and Scottish Railway Company was held, on the 28th ultimo, at Euston Station, London, N.W.

Sir Robert Burrows, the chairman, in the course of his statement, said: A year ago we described very fully the steps we had taken to place our track and equipment in an extraordinary degree of efficiency at the outbreak of the war. The nation, not the stockholders, gained by this. Your reward is mere abuse from the Chancellor, who should know that the worn condition of much of your property is due to its intensive use by the Government for direct or indirect war purposes since September, 1939. Even a public inquiry where the statements of the Chancellor and other Government spokesmen could be examined and cross-examined in a judicial manner has been denied us.

NET REVENUE

The net revenue for the year 1946 in comparison with that for 1945 was:—

	1946	1945	Inc.	Dec.
	Thousand £	Thousand £		
Under control agreement...	14,750	14,750		
Outside control agreement...				
From year's working	1,173	950	223	
From earlier year's working	...	519		519
Transfer from contingency fund	15,923	16,219		296
	...	500		500
	15,923	16,719		796

The increase in the net revenue from sources outside the Control Agreement includes £196,000 from a special dividend distribution in 1946 by the Birmingham and Midland Omnibus Company on the winding up of two of their subsidiary companies.

DIVIDEND DECISION

The Transport Bill now before Parliament has the effect of "freezing" for the time being for the purpose of dividends for the year 1946 any net revenue other than the above £15,923,000, thus excluding the net revenues of the company held in reserves or carried forward from 1945 or even adjustments in respect of previous years.

In these circumstances your board have declared a dividend of 2½ per cent. for the year 1946 on the ordinary stock, which with interest on debenture stocks and the dividends on the guaranteed and preference stocks will absorb £15,531,000, the balance of £392,000 being carried forward to 1947. In recommending this course your board have in mind various uncertainties of the Bill affecting the distribution for the years 1946 and 1947, and the dividend proposed is in effect an interim payment for the two years 1946 and 1947, regarded as one.

REPLACEMENT OF WASTING ASSETS

As you are aware, in good and bad years, we have consistently made annual charges to revenue for the replacement of our wasting assets, such as the track, rolling stock and steamboats, the amount for 1946 being £10½ millions. These amounts have been calculated each year on the current cost of replacing the assets and were naturally appreciably greater than if calculated on the original cost. Each year these charges were submitted in great detail to the Minister of Transport, who forwarded them with his comments for consideration in open Court by the Railway Rates Tribunal.

Our prudence in this respect has not only reduced your dividends, but has had its reaction on the Stock Exchange quotation for your stocks, which the Government have

chosen to take as a true valuation of your property and as the price at which you would be prepared to sell.

NATIONALISATION

When we met last year the Government had announced its intention of nationalising the railways, but had not indicated in any way the details of their plan in regard to the compensation they proposed to offer to the stockholders. I cannot do better than quote what Lord Royden said at our last annual general meeting:—

"The decision to nationalise the railways as in the case of the Air Services is political and not based on any suggested lack of efficiency or economy in the conduct of the undertaking... and that while we are in the hands of Parliament on such matters your board would vigorously resist any proposal which in its opinion is detrimental to your interests."

This we have done and will continue to do.

"FITIABLY INADEQUATE"

It is difficult to speak temperately about the financial proposals for compensation contained in the Transport Bill. It is almost universally recognised, except in Government circles, that the compensation is pitifully inadequate. It is not unreasonable to ask that the price to be paid for railway stocks should be determined not arbitrarily by the buyer, but by an independent tribunal. Compared with the standard revenue, or even with the revenue enjoyed under control, the compensation proposed by the Bill stands condemned.

The price the Stock Exchange placed upon the railway stocks for purposes of comparatively few sales was governed by many factors, the chief probably being the uncertainty of the Government intentions and the aftermath of the war. Furthermore, the price of the railway stock only applies to a very small proportion in the hands of the public. Had any person desired to acquire the railway companies by buying the stock in the market, the price would have risen rapidly.

STOCK EXCHANGE OPINION

The council of the Stock Exchange found it necessary to take the unprecedented step of making representations to H.M. Government on this matter and they have set out in a reasoned statement why the proposed basis of compensation was not equitable.

I should like to quote two extracts from these representations:—

"... They desire to state authoritatively that Stock Exchange quotations are not related directly to the value of a company's assets, or to the amount of its profits, and consequently these quotations, no matter what dates may be chosen for reference, cannot form a fair and equitable, or a rational basis for compensation."

"... It is the considered opinion of the Council that the only fair and equitable method of arriving at a proper basis for compensation is, failing agreement between the parties, by arbitration..."

I am afraid that the policy pursued in the past by the railway boards which I have mentioned of devoting a large part of the revenues of the respective companies to the maintenance and improvement of the track and rolling stock, prudent and proper as it was at the time, has contributed something to the low quotations of the preference and ordinary stock on the Stock Exchange. Had the railway companies, as they are now alleged to have done, put dividends first and allowed the track and equipment to remain

merely in safe condition, larger dividends would have been paid, but the railways could not have handled the war-time traffic. The Stock Exchange quotation, further, takes no account of the very many valuable non-revenue-producing assets of the companies.

It is a curious thing that one of the first actions of this Parliament was to increase considerably the remuneration of the Members of the House of Commons. The Government has now, however, turned on the stockholder who has made provision for himself, and proposes to halve his income.

Railway and canal companies from their inception have been statutory companies and subject to one form and another of rigid public control. The State's right to nationalise the railways was embodied in the Railway Regulation Act of 1844, which is still the law.

This Act provides for the purchase of any railway authorised after 1844 at 25 years' purchase of the profits of the three preceding years, and if the average of those profits is less than 10 per cent. of the capital, the railway company has the right to require an arbitration on the additional amount, if any, to be paid for the value of its prospects.

CREATION OF A MONOPOLY

I should like to turn for a few moments to an examination of the other provisions of the Bill. Although the words "co-ordination" and "integration" are freely used in the debates on the Bill, the Bill itself gives no indication how such integration is to be achieved. In fact, its main purpose seems to be to create a vast monopoly without any promise of efficiency and without any check by Parliament, or by any independent tribunal, leaving the Minister to impose any restrictions he may choose upon the unfortunate user of transport.

The Government has introduced a Bill to amend the Companies' Act and seeks to protect the public and the shareholders by imposing further restrictions on those who direct public companies. Yet at the same time it introduces the Transport Bill under which every safeguard hitherto imposed upon the railways in the interests of the users of transport is swept aside.

VAST SYSTEM OF PATRONAGE

A vast system of patronage is placed in the hands of the Ministry of Transport. The Minister alone appoints the five Commissioners and the forty odd members of the subsidiary boards. He alone can fix their remuneration, their periods of office and the terms of their pensions.

There have been sixteen Ministers of Transport in the twenty-eight years since the Ministry was established, an average of 1½ years for each Minister. This means, of course, that apart from patronage, the average Minister will have little time to acquaint himself with the very complicated problems of transport and inevitably the Commissioners will be controlled by those in the Ministry.

Furthermore, there is no provision for the form in which the accounts should be presented. I need hardly remind you that the railway companies have yearly to justify their efficiency before the Railway Rates Tribunal. No such provision is inserted in the Bill. Efficiency and economy are to be left to chance, and, if the Minister so chooses, his report to Parliament may be in a very abbreviated form.

All checks and controls are swept away. Severe restrictions on the right of the trader to carry his own goods in his own vehicle are imposed. A rigid Government monopoly is established which provides no benefit to the nation or the users of transport.

Your board, with your support, will continue to fight the Bill, its financial provisions and its general purpose, which I feel carries with it a grave threat to the industrial future of the country, leaving the stockholder despoiled, the public unprotected and bureaucracy triumphant.

The report was adopted.

GREAT WESTERN RAILWAY COMPANY

UNFAIR TREATMENT OF STOCKHOLDERS

LORD PORTAL'S SPEECH

The annual general meeting of The Great Western Railway Company was held on the 5th instant, at Paddington Station, London.

The Rt. Hon. Viscount Portal, P.C., D.S.O., M.V.O., the chairman, in the course of his speech, said: Including the balance of £269,305 brought forward from last year and the profit of £245,074 secured during the year on realisation of investments, the amount available for appropriation amounts to £7,981,769 against £7,405,560 last year (when £150,000 was transferred from the Contingency Fund), an increase of £576,209. Taking all the circumstances into consideration, however, we feel we can safely recommend a dividend of 3 per cent. for the half-year ended 31st December last, making 5 per cent. for the whole year.

HARSH TERMS OF TRANSPORT BILL

When I addressed you last year at our Annual Meeting, I told you that it was the Government's intention during the life of the present Parliament to introduce measures designed to bring transport services essential to the economic well-being of the Nation under public ownership and control. The Transport Bill which was introduced in October of last year has had its second reading in the House of Commons and is now in the Committee stage.

The adoption of that course necessarily limited discussion on the Bill and opportunities for criticism have been restricted still further as the result of the Resolution passed by the House of Commons on Monday last imposing a guillotine procedure. The Stockholders have doubtless taken due note of this. The Railway Companies and other inland transport undertakings have opposed the Bill and will continue to do so, not only to protect the interest of Stockholders and the Staff, but because there is nothing in the Bill to indicate the means by which a more efficient and economical transport service is to be provided, and the benefits which users are likely to obtain.

MAIN PROBLEM UNTOUCHED

Although it has long been recognised that the main transport problem to be solved is that of securing a greater measure of co-ordination between the various forms of transport so that those responsible for the provision of transport services may be able to meet the needs of the public to the best advantage, the Bill contains no constructive plan for dealing with the problem. It merely lays down that it will be one of the duties of the British Transport Commission to work out a scheme of co-ordination, without giving any indication as to the lines on which co-ordination is to be effected and the interests of users safeguarded.

The total market valuation of our undertaking based on the compensation terms set out in the Bill only amounts to about £163 millions. While it is not possible to give any actual figures of the value of the physical assets which the Government will acquire, it is safe to say they are worth more than the proposed total compensation. Our Rolling Stock, which stands in our capital account at £22 millions, is estimated to be worth nearly double that amount, after making full allowance for the expired life of the stock and accumulated arrears of repairs.

The strength of our financial position is demonstrated by the Balance Sheet. In addition to our physical assets our liquid resources amount to some £49 millions including the investments held by the Trust Fund. Moreover, a conservative estimate of the market value of our investments in associated road undertakings would be £7 mil-

lions compared with the £3 millions shewn in the capital account.

UNFAIR BASIS OF EXCHANGE

The basis on which the exchange values of the railway stocks have been fixed is set out in the Fourth Schedule to the Bill, and as you, ladies and gentlemen, will have appreciated, it entails a substantial diminution of income to the Stockholders. It is computed by reference to the average of the quotations for the securities appearing in the Stock Exchange Official Daily List on 6 days in November 1946, with certain minor exceptions, where the quotations on alternative days in 1945 are adopted. Apart from the inherent unfairness of this basis, one would have thought that the Government Stock to be given in exchange would also have been computed by reference to its market value on the dates chosen for the quotations of the Railway Stocks which are to be extinguished.

Although the Council of the London Stock Exchange itself has pointed out the fallacy of using the basis in the Bill, the Government insists on treating Stock Exchange prices as reflecting the operation of the law of supply and demand, but it must be borne in mind that Stock Exchange bargains are between a willing seller, or one whose circumstances may compel him to sell, and a willing buyer, and it certainly cannot be said that the railway stockholders as a whole are willing sellers.

STOCK EXCHANGE QUOTATIONS INAPPROPRIATE

The doubts and uncertainties of recent years render Stock Exchange quotations particularly inappropriate as a basis for the valuation of British Railway securities, and if further evidence of the fallacy of adopting the Government basis were needed, it is apparent in the case of our Debenture stocks. The five classes of this stock all rank *pari passu* but the reduction in income will vary from 4½ per cent. in the case of the 2½ per cent. Debenture Stock to nearly 29 per cent. in the case of the 5 per cent. Debenture Stock.

The rate charge, guaranteed and consolidated preference stocks, which have always received the due rate of 5 per cent., are dealt with even more severely, their respective annual losses amounting to £1 10s. 2d., £1 11s. 6d., and £1 17s. 5d. on every nominal hundred pounds of stock, whilst the Ordinary Stock—which for 77 years has received an average dividend of nearly 5½ per cent.—gets this reduced to £1 9s. 6d. per cent.

The net result of the proposals in the Bill is that the Stockholders will be deprived of £18 millions per annum—which incidentally will mean a loss to the Exchequer of about £8 millions—and whether the saving effected at their expense will benefit the users of transport to any material extent or be absorbed mainly in additional costs is certainly problematical.

Whatever the future may hold in store we shall continue, as long as we are permitted, to run this great undertaking with its traditions of over 100 years, in the best interests of the public whom we are privileged to serve and with every regard for the well-being of the staff and the duty which we owe to the Stockholders. We can look back with justifiable pride on the history and achievements of the Company throughout the long period of its existence and can only hope that its past record may continue to inspire whoever succeeds us in the control of its destinies.

The resolution for the adoption of the report and accounts was carried unanimously.

MANCHESTER SHIP CANAL COMPANY

SIR FREDERICK J. WEST'S REVIEW

The eighty-ninth ordinary general meeting was held, on the 28th ultimo.

The chairman, Sir Frederick J. West, G.B.E., in the course of his speech, said: It is a disappointment to me that the trade of our port over the last year, in common with other British ports, does not present a better picture.

The net revenue for 1946, compared with that of the previous year, showed a decrease of £385,213. The net revenue for the year was £391,037. It was unnecessary to make any provision for income-tax, and thus, after adding £25,985 balance brought forward from the previous year's account and deducting £345,802 loan and debenture interest, there remained £71,220 balance available for dividends and reserve, compared with £274,401 in 1945. To this amount has been added £180,000 transferred back to revenue from income-tax account, as explained in the directors' report, giving a total balance available of £251,220.

DIVIDENDS

It is proposed that there should be appropriated £35,000 to the reserve for contingencies and repairs, and that out of the balance of £216,220 the following dividends, amounting to £213,417, should be paid:—
3½ per cent. on the Manchester Ship Canal Corporation 3½ per centum preference stock.
3 per cent. on preference shares.

1½ per cent. on ordinary shares, carrying forward £2,803 to next year's account.

Your board is pleased that, notwithstanding the substantial decline in net revenue, they can recommend the payment of the same dividends as these of the previous year—especially as this can be done without reducing the provisions which are being built up to cover the renewal of plant, machinery and equipment.

Receipts from tolls, ship dues and traffic rentals, etc., showed a decrease of £148,087.

The expenditure in the working of the Ship Canal showed an increase over 1945 of £98,499, of which dredging was responsible for over £65,000. The cost for dredging in 1946 was £280,000, being the highest ever incurred, and compares with £214,000 in 1945 and with the average cost of £141,000 for the preceding ten years.

All amounts set aside for taxation have been credited to one account and have been, or will be, needed to cover the company's liability for income-tax on all profits earned to December 31, 1946, with the exception of £180,000 which has been brought back to revenue. I give this information as it has been suggested by some shareholders that we have over-provided for taxation.

THE TRANSPORT BILL

It is necessary to refer to important measures which are now before Parliament. The Transport Bill is of vital significance, and I think we were all surprised by the drastic nature of this nationalisation measure, which embraces all inland transport while giving little or no indication of how it is going to be organised and operated. Its most surprising feature is the inclusion of harbours and port facilities in a Bill for the nationalisation of inland transport, because it is well known that harbours and port facilities exist solely to serve shipping: a highly competitive industry which is still to remain in the hands of private enterprise.

The Bill itself does not provide for the immediate transfer of the harbours to the Transport Commission, with the exception of those owned by the railway and canal companies, but it gives the Commission power to make schemes which may have that effect, and which (in the event of opposition) can be confirmed by the new special Parliamentary procedure.

WILLIAMS DEACON'S BANK LIMITED

"EMINENTLY SATISFACTORY RESULTS"

MR G. P. DEWHURST'S ADDRESS

The annual general meeting of Williams Deacon's Bank Limited was held, on the 30th ultimo, at Manchester.

The following are extracts from the statement which has been circulated by Mr G. P. Dewhurst, the chairman, in advance of the meeting.

BALANCE SHEET ITEMS

Our deposits at £104,643,000 show us an increase of 23 per cent. over last year's totals and for the first time in the history of the bank have passed the £100 million mark.

A similar proportionate expansion of deposits differing only in relatively small degree has been the experience of the other clearing bankers during the year. This general increase—hitherto unequalled in so short a time in English banking—is not a phenomenon to be viewed with complacency. I will refer to it again in a moment or two.

Acceptances and credits opened have increased by £475,000, a reflection of the finance of imports handled during the war years by the various Ministries, and also a welcome reflection of the greater use of the documentary credit, often to facilitate the movement of goods which do not touch the shores of this country.

Endorsements and other obligations show an increase of £519,000.

On the other side of the sheet our cash, balances with other banks, money at call, bills, and Treasury deposit receipts show an increase of £13,843,000 and at over £60 million are equal to 57 per cent. of our deposits, and I may perhaps remind you that the average earnings on that group of assets have, during the year, been at the rate of less than half of 1 per cent. per annum.

There has been an increase in investments of £2,628,000, taking the total to £31,864,000. It will be seen, therefore, that the liquid position of the bank needs no emphasis.

Advances at £14,925,000 give us a welcome increase of £3,338,000. This addition is well spread and there are indications that once the difficulties of supply are surmounted customers' demands will broaden.

Turning now to the figures of profit and loss, our net profit, after making the usual provisions appears at £238,547 10s. 2d., or an increase of over £22,000 on the year.

This profit, with a balance of £115,489 brought forward from last year, gives us a total of £354,036 10s. 6d. now to be dealt with.

After transferring £100,000 to pension fund we are in a position to pay dividends at the rate of 12½ per cent. on both our "A" and "B" shares and carry forward to next year's account £125,130 5s. 6d., as against £115,489 brought in.

SATISFACTORY RESULT

This, I submit, is an eminently satisfactory result if we take into account the inevitably increased overhead expenses, including larger salaries through the higher scale of staff remuneration, even though these have been offset to some extent by the employment of increased deposits and the reduction in taxation.

There has been a noticeable and gratifying increase in the volume of new business that has come to the bank during the past year. In addition, our customers are availing themselves more and more of the services of our trustee departments, while the increase in the volume of foreign business has imposed a heavy strain upon the staffs of our foreign departments both in Manchester and in London.

Turning for a moment to wider questions, I think the past year can be described as a

period during which the bulk of the switch-over from war production to the needs of peace was smoothly effected and when the difficulties inherent in the immense movements of labour not only from the Services back into industry, but from the war industries into other lines of activity, were successfully surmounted. Both these constitute, of course, very considerable achievements.

PROMISING START OF EXPORT DRIVE

In addition, the past year has seen the opening of what will be a grim struggle to achieve an export trade sufficient, after allowing for the diminution of our invisible exports, to maintain the standard of life to which we have been used. The official target for exports of 75 per cent. in volume above the 1938 figure has, of course, not been reached or even approached during the year. That is not surprising. In fact, I think it may be said that a promising start has been made inasmuch as the actual visible adverse balance is less than for 1938, but it must be remembered in this connection, firstly, that half of our pre-war overseas investments have been sold; secondly, that there is a heavy deficit of over £300 million in the balance of trade with those hard currency countries which provide so many of our indispensable imports; thirdly, that in a matter of months we are under obligation to restore free convertibility of sterling for current transactions; and, lastly, we should remember, as I said last year, that the condition of a seller's market will only obtain for a limited period, perhaps more limited than we think.

When, in addition, one notices that the export curve tended to flatten towards the end of the year, it will be seen that a testing time lies in front of us when the resources of the Canadian and American loons have been reduced or used up, when the free convertibility of sterling for current transactions obtains and when full competitive conditions return.

Nevertheless, the dislocation brought about by the war was bound to be profound, and we have at any rate the satisfaction of noting that the trade deficit for 1946 is very considerably less than was forecast by the British experts at Washington.

NEED FOR INCREASED PRODUCTION

As to the future, the crying need is for production, which involves hard work from all classes and I am glad to see that in the recent White Paper the facts are clearly stated so that no section of the community should be in any doubt as to its duty but there is, I am bound to say, a considerable difference between posing the problem and achieving the solution, and I wonder whether in spite of the vital importance of exports at this stage some psychological impetus to the working man by means of an increase in the number of consumer goods available in the home market might not be good business.

As regards fuel; the shortage of coal has become a standing menace to the whole industrial structure of the country. Under these circumstances the Government's scheme of fuel rationing is to be welcomed in so far as each industry now has some measure of certainty about its reduced supplies. The coal question is the kernel of our problem, although one of its troubles—shortage of labour power—is common and likely to be common throughout industry. In connection with this shortage I support the voices that have been raised suggesting the employment of foreign labour.

CHEAPER MONEY POLICY

Internally the drive for cheaper money has continued throughout the year, culminating in a "long" 2½ per cent. Tap issue. The Chancellor has thus achieved a technical success of the first order and it may well be that his plans dovetailed into the nationalisation programme.

No responsible person would, I think, care to dispute the necessity for low money rates in view of the size of the National Debt and the pressing needs of reconstruction, but cheaper money tends to bring certain disadvantages; indeed when coupled to heavy taxation the result is inevitably to weaken incentive, to discourage thrift and to encourage extravagance, while the effect on that deserving section of the community which is living, or trying to live, on the income of its past savings is notably hard.

I referred a moment ago to the increase in bank deposits which the past year has witnessed, remarking that it was not a phenomenon to be viewed with complacency. This concomitant of the cheap money policy arises from the support which the Government during its operations has given to the gilt-edged market, and also from the desire of the public to maintain a liquid position. The latter motive is not far removed from a reluctance to invest—an ominous portent. During the first eleven months of the year the deposits of the Clearing Banks went up by £650 million, over £400 million of which has been lent back to the Government, while the movement has been accompanied by a continuation of the long rise in Stock Exchange prices.

I should imagine that the long-term implications of an extremely cheap money policy must now be receiving the careful consideration of the authorities. In fact, however much one endorses a cheap money policy a point is bound to come where the advantages of any further progress along that road must be considered in the light of the disadvantages. It may be that that point has been reached and the Chancellor will be content with his victories and rest on his laurels.

COTTON TRADE

While nationalisation of the principal industries of the country has been the main feature of the Government's policy during the year, the cotton trade of Lancashire has been exempt from any such project, but at the instance of the President of the Board of Trade a Working Party, with the widest terms of reference, under the chairmanship of Sir George Schuster, has been formed to examine the industry with all its ramifications and report.

This Report has been on the whole well received by the trade, and has now been followed up by a declaration of the Government's attitude in the matter conditional on certain undertakings by employers and operatives, the main features of which are the re-equipment and modernisation of the mills, the grouping of mills into larger units, the introduction of double shift working, and the acceptance by both parties in the industry of labour deployment and utilisation.

Given the observance of these conditions, the Government are prepared to make a grant of 25 per cent. towards the cost of the mechanical re-equipment of the spinning mills, which will carry a priority of delivery from the textile machinists.

In striking contrast to the above appears the decision of the Government against, in my view, the best opinions of the industry to close the Liverpool Cotton Market. The prestige of that market was immense. Even at this late hour, I trust the Government's decision is not irrevocable.

As was to have been expected, the year has been one of great activity in the engineering trade, and it is, however, encouraging to note that the steel output of the whole country was almost 1,000,000 tons higher than in 1945.

The report and accounts were adopted.

MIDLAND BANK LIMITED

ANNUAL MEETING OF SHAREHOLDERS

The ordinary general meeting of shareholders of the Midland Bank Limited was held, on the 29th ultimo, at the Head Office, Poultry, London, E.C.2. The Most Hon. The Marquess of Linlithgow (the chairman) presided.

The chairman proposed the motion for the adoption of the report of the directors and the audited statement of accounts for the year ended December 31, 1946, which was seconded by Lord Royden (director) and passed unanimously.

Resolutions were carried authorising the payment on February 1st of a dividend at the rate of 8 per cent. actual, less income tax, for the half-year ended December 31st last; re-electing Colonel The Hon. G. K. M. Mason, D.S.O., J.P., and Sir Francis L'Estrange Joseph, Bt., K.B.E., J.P., D.L., as directors; fixing the sum payable to directors; and reappointing Messrs Whinney, Smith and Whinney as auditors for the ensuing year.

The meeting closed with a vote of thanks to the chairman, proposed by Sir Frank Newson-Smith and seconded by Mr Edward Simmons.

BIGNELLS, LIMITED

PROFITS MAINTAINED

The tenth annual general meeting of Bignells, Limited, will be held, on the 7th instant, at Rushden, Northants.

The following is an extract from the statement of the chairman (Mr Arthur J. Bignell) circulated with the report and accounts:—

The accounts for the year under review show the results of the company's first complete post-war year's trading, and it is very satisfactory to know that, in spite of the difficult trading conditions which we have experienced, our profits have been more than maintained. Our gross trading profit at £66,597 was slightly in excess of that for the previous year, but owing largely to the reduction in the rate of excess profits tax as from January 1, 1946, our net profit for the year amounted to £28,459, which is approximately £11,000 higher than that for the previous year.

NOTICES

DOMINION OF CANADA

TWO-AND-A-HALF PER CENT INSCRIBED STOCK, 1947.

For the purpose of preparing the Interest Warrants due April 1, 1947, on the above-mentioned Loan, the BALANCES will be STRUCK on the evening of March 1, 1947, after which date the Stock will be transferred ex-dividend.

For the Bank of Montreal, Financial Agents of the Government of the Dominion of Canada in London.

A. D. HARPER, Manager.

47, Threadneedle Street, E.C.2. February 1, 1947.

THE UNIVERSITY OF MANCHESTER

CHAIR IN ECONOMICS

Applications are invited for appointment to a second Chair in Economics. It is hoped that the person appointed will be able to enter upon his duties on September 29th, 1947. Salary according to qualifications and experience.

Applications, which must be received on or before February 28th, 1947, should be sent to the Registrar, the University, Manchester, 13, from whom further information may be obtained.

CAMBRIDGE GRADUATE (Economics), 27, good business and administrative experience, seeks suitable London post; economic journalism, trade research or business executive. Highest references.—Box 411.

In drawing your attention to the E.P.T. post-war refund of £19,608, I would mention that during the year additions to property and alterations and improvements to our Kettering factory have been completed at the cost of £10,596, which expenditure is on account of our post-war development programme.

Owing to unforeseen building difficulties and delay in the installation of new plant my expectations regarding production at our Kettering factory have not been fulfilled. However, in a short time we shall be producing Goodyear welted shoes at this factory. Our Station Road factory, Rushden, has been derequisitioned and completely refitted and reorganised, and is now in satisfactory production.

During the year under review, there has been a considerable expansion in our export trade, and, when licences are more freely granted, our goods will be circulating in most of the world's markets.

MARTINS BANK LIMITED

ANNUAL GENERAL MEETING

The one hundred and sixteenth annual general meeting of Martins Bank Limited was held, on the 28th ultimo, at the Head Office, Liverpool, Mr F. A. Bates, M.C., A.F.C., D.L., chairman, presiding.

The chairman said that his statement had already been circulated to members, who he hoped would appreciate the soundness of the balance-sheet and the excellence of the results of the past year, coupled with the evident growth and progression of the bank's service to its customers.

The chairman moved the adoption of the report and accounts and approval of the recommended final dividend, making 15 per cent. for the year. Mr R. V. Buxton, D.S.O., a deputy-chairman, seconded, and the resolution was carried.

On the motion of Sir Harold Parkinson, O.B.E., seconded by Mr A. M. Buxton, Mr F. A. Bates, Mr J. H. B. Forster, D.L., Mr H. Mancknols Walton and Mr Myles L. Kenyon were re-elected directors.

Mr Lewis Rhodes proposed, and Mr Alan J. Stott seconded, the reappointment of Messrs Harmood, Banner, Lewis and Mounsey, Liverpool, Messrs Peat Marwick Mitchell and Company, London, and Messrs Thomas Bowden Sons and Nephew of Newcastle-upon-Tyne, as auditors. The motion was carried.

Alderman Edwin Thompson submitted a vote of thanks to the chairman for his past services, particularly throughout the war period, and this was cordially approved.

The chairman, in reply, spoke of the admirable spirit which animated the conduct of the affairs of Martins Bank, and the valuable support which this engendered from the commercial community which it served. He also expressed his gratitude to the general manager and to the management and staff for their zealous service in the bank's interest.

Mr J. McKendrick, chief general manager, speaking for management and staff, said Mr Bates, who had occupied the chair for a longer period than any previous chairman in the history of the bank, had always encouraged a broad and progressive outlook, and this had been reflected in every department of the bank's work.

S. HUBBARD, LIMITED

DEVELOPMENT PROGRAMME

The 23rd annual general meeting of S. Hubbard, Limited, was held on 29th ultimo, in London.

Mr G. O. Hubbard (Managing Director) said that during 1946 the company had made various changes in its organisation to meet current conditions. As a result the values of the company's sales during 1946 were increased by 35 per cent. The net profit for 1946 was £132,000 compared with £79,000 in 1945. The Directors recommended that the same dividend should be paid as in earlier years, namely 10 per cent., less income tax.

The company's programme of development would involve further capital expenditure amounting to £140,000. The company proposed to raise approximately £300,000 by the issue of 200,000 four-and-a-quarter per cent. cumulative preference shares of £1 each at 21s. per share, and 160,000 ordinary shares of 5s. each at 13s. 6d. per share. The preference shares would be offered for public subscription but applications from the shareholders would receive preferential consideration on allotment. The ordinary shares would be offered to the existing shareholders.

As regards the future prospects of the company, the directors were confident that their proposals would place the company's finances on a sound footing. As the proposed programme progressed, the company would be able to provide hat manufacturers with increasing quantities of wool and fur felt hoods and capelins at economic prices and continue to play its part in supporting the hat trade in the production of hats at reasonable price values. In their opinion the future success of the whole trade lay in the possibility of the public buying quality hats in increasing volume at the lowest prices. The prospects for 1947 appeared good.

The report was adopted.

VICTORIA UNIVERSITY COLLEGE

WELLINGTON, NEW ZEALAND

Applications are invited for the Chair of Political Science. Salary £1,200 per annum (New Zealand currency). Allowance for travelling expenses. Further particulars may be obtained from the Secretary, Universities Bureau of the British Empire, 24, Gordon Square, London, W.C.1. Closing date for the receipt of applications 7th April, 1947.

UNIVERSITY OF LONDON.—The Senate invite applications for the Readership in Public Finance tenable at London School of Economics and Political Science (salary £800). Applications must be received not later than 27th March, 1947, by the Academic Registrar, University of London, Senate House, W.C.1, from whom further particulars should be obtained.

UNIVERSITY OF LONDON.—The Senate invite applications for the Readership in Commerce tenable at London School of Economics and Political Science (salary £800). Applications must be received not later than 27th March, 1947, by the Academic Registrar, University of London, Senate House, W.C.1, from whom further particulars should be obtained.

UNIVERSITY COLLEGE OF WALES, ABERYSTWYTH

An appointment will shortly be made to a teaching post in the Department of Economics and Political Science on the scale of salary £600 to £750 per annum. Applications are invited, and should be sent to the Registrar, University College of Wales, Aberystwyth, by March 15, 1947.

R. A. LISTER AND COMPANY, LIMITED

SATISFACTORY RESULTS

MR PERCY LISTER'S REVIEW

The ordinary general meeting of R. A. Lister and Company, Limited, was held at Dursley on the 21st ultimo. Sir Percy Lister (the chairman) said:—

Your directors' report and audited accounts are submitted herewith. In accordance with our previous practice we have included a consolidated balance sheet together with a consolidated profit statement, both of which once more reflect the strong financial position of your undertakings.

From the consolidated accounts you will observe that the new capital accruing from the issue of a further 300,000 ordinary shares during the year, largely accounts for the increase in the balance at bank and cash in hand from £398,000 to £1,424,000.

It will be observed that the sundry debtors have increased by approximately half a million pounds. This has been brought about by the changeover from war to peacetime trading conditions, and it is anticipated that this tendency will increase, particularly having regard to the very high percentage of the company's products which are distributed in the export markets in the face of world competition.

HARRISONS LISTER ENGINEERING LIMITED

With our old and esteemed friends, Messrs Harrisons and Crosfield, Limited, who, for over a quarter of a century, have represented us in some of the principal markets of the Far East, we have jointly formed Harrisons Lister Engineering Limited, thereby tangibly combining the mutual knowledge and interests of old-established merchant and manufacturing companies to meet the new post-war conditions. Already the results accruing from this valuable combination are most encouraging.

The manufacturing resources of your group of companies have been substantially enhanced during the period under review by the acquisition of a modern factory in Sydney, Australia; the leasing of a wartime-built factory near Swindon from the Admiralty; and the establishment of a factory in a development area at Cinderford which, whilst still under construction, has already commenced productive work.

In this connection the capital in the wholly-owned subsidiary companies, Messrs Blackstone and Company, Limited, of Stamford, and Messrs Lister Blackstone, Pty., Limited, in Sydney, Australia, has been considerably increased.

SUBSTANTIAL CAPITAL EXPENDITURE FOR INCREASING PRODUCTION

Very substantial capital expenditure for increasing the production in the five main factories of the group is now in hand. This expenditure has only been incurred after the most careful study by our engineers and executives on the Continent and in the United States of America, as well as in this country and will, we are confident, so soon as the delivery of the requisite capital equipment and building materials permit, result in a considerably increased production, better working conditions and the more economical utilisation of labour.

Since the date of the balance sheet a sum of £70,879 has been received in respect of the E.P.T. post-war refund for your group of companies, covering the period up to September 30, 1944. This amount is not brought into the statement of accounts submitted. This refund will be spent during the current financial year on the re-equipment of our factories. The company may be entitled to a further refund in respect of the period from October 1, 1944, to December 31, 1945.

R. A. LISTER (MARINE SALES) LIMITED

Our wholly-owned subsidiary, R. A. Lister (Marine Sales) Limited, are responsible for the distribution of the Marine propulsion engines and auxiliary equipment manufactured by the parent company and Messrs Blackstone and Company, Limited, and have developed an extremely interesting and ever-growing volume of business in this highly specialised field, and from the orders on hand from all parts of the world it is expected that the activities of your Marine company will continue to be satisfactorily reflected in your accounts.

Our associated company in the United States of America, whose production during the war was almost exclusively for war requirements, has now become a wholly-owned subsidiary company, and its products have been converted to meet current demands.

The old-established French and Belgian subsidiary companies, despite long years of enemy occupation, are finding an increasing demand for our products. Adequate provisions have been made for possible exchange fluctuations.

PROFIT AND DIVIDEND

Turning to the profit and loss account it will be observed that the consolidated trading profit was £408,636, which, after making provision for taxation for the year amounting to £209,357, resulted in a net profit of £199,279, to which must be added a credit arising out of the settlement of Government contracts completed in previous years of £5,075, leaving available £204,354. Of this figure £28,465 is retained in the accounts of the subsidiary companies, leaving the sum of £175,889, which, with the balance brought forward from the previous year of £73,836, makes a total available for distribution of £249,725.

You will observe from the directors' report that your directors recommend that the bonus for the year should be increased from the 6 per cent., which has been paid for the past ten years, to 8 per cent., making, with the interim and final dividends, a total distribution on the nominal value of the ordinary shares of 18 per cent.

If the directors' recommendations are approved there will be available to carry forward on the profit and loss account to next year, £150,254.

In my statement to you last year I intimated that my tour round the world on behalf of the company's interests would necessitate my being absent from the last annual meeting. This tour involved contacts on five continents, including visits to the subsidiary and associated companies in Asia, Australia, Canada, United States and the Argentine, as well as to the company's distributors in other countries, and my colleagues share with me the belief that the results accruing from this trip will prove extremely beneficial to the interests of your group of companies.

Our research and development division has been continuously active since the cessation of hostilities and your directors hope to introduce new products of considerable interest to the home and export markets during 1947.

CONFIDENCE IN THE FUTURE

We feel confident that, given an adequate solution to the shortages of housing, labour, and materials which, under current conditions, are so largely beyond our control, the results for the year under review and the steady progress of the past 20 years can be maintained.

In conclusion I am sure it will be obvious to you that the excellent results submitted to you have only been achieved through the loyal support and co-operation of the executive officers, staff and employees in your employ in all parts of the world, and on your behalf I have the greatest pleasure in expressing to them all your sincere thanks.

BIRMINGHAM AND DISTRICT INVESTMENT TRUST, LIMITED

STRONG LIQUID POSITION

The sixty-third ordinary general meeting of the Birmingham and District Investment Trust Limited was held on the 28th ultimo in London.

Mr H. C. Drayton (chairman and managing director) said that the profit and loss account showed that their total revenue for the year had increased by £97,623. The directors recommended that a dividend of 8½ per cent., less income tax—the same as for last year—be paid on the Ordinary shares, leaving a balance of £146,045 to be added to Undivided Profits Account. The liquid resources of the company were now very great, and the directors were in a position to take advantage of opportunities which might come along to invest under conditions more satisfactory than those at present offering.

A valuation had been made of their general investments, which stood in the balance sheet at £2,532,435. The estimate, which was made at 31 December, 1946, showed an appreciation of 52.7 per cent. This compared with an appreciation of 36 per cent at the end of 1945. This estimated increase in the value of their general investments was due, he would suggest, to the abnormal conditions of the times and should be regarded with some reserve.

The directors had decided not to recommend any alteration in the rate of dividend on the Ordinary shares. The investment market was now very difficult, and changes in values of industrial equities were in his view more likely to be downward than upward in the future. The financial outlook was disturbing and there was a lack of confidence in the country's capacity to weather the financial difficulties of the immediate future, to pay our debts, and at the same time to provide for the improved standard of living which the people in this country had come to expect.

Everyone who had the good of the country at heart wished to see an improvement in the standard of living of our people, but that should not be unduly hastened. It needed careful planning. If more leisure was to be enjoyed, output per man-hour must be increased. If we were to continue to enjoy the fruits of the world, we must have foreign exchange and production costs would have to be adjusted as world markets came back to normal.

The result of increasing wages and lengthening holidays before the necessary preparations had been made was giving rise to a national feeling of frustration, resulting in a loss of incentive to work. Improved standards of living could only be won by harder work, increased output, the development of technical efficiency, economy in public expenditure, and a growth of discipline among the workers. Wages rates must ultimately be related to the market demand and therefore could not be regarded as unalterable.

Extended Nationalisation of industry would, in his opinion, fail to provide the specialised conditions under which British trade had to be carried on. Individual initiative, he was glad to say, was not yet dead in the British working-man. He would never be a machine. Individual effort must be encouraged and rewarded, and flat uniformity of effort discouraged, if a maximum output was to be obtained.

The report and accounts were adopted.

HENRY MEADOWS LIMITED

PEACETIME PROGRESS

ACHIEVEMENTS TO DATE

What has our development programme to show? We were the first to meet the change in requirements of the new taxation basis so as to achieve the fullest benefit from cubic capacity rating, and this feature is already embodied in some of the post-war engine units supplied for luxury automobiles. Again, in our range of petrol engines, most of which are developed as multi-purpose designs, our standard 6-cylinder 100 h.p., 130 h.p. and 200 h.p. models represent the largest size engines on sale in their respective class in this country.

Further, our policy of standardisation has been extended to include a common basic design where the mere change of the head, with its ancillary components, will provide a ready conversion of the engine from petrol to diesel, or vice versa. This dual fuel technique extends to natural gas and kerosene, thus covering the whole fuel range determined by its local fuel availability.

NEW DIESEL MODELS

Our new range of diesel models now includes the 6-cylinder, 103 litre unit, introducing a novel standard to the transport field of usage, thus to provide a compact, square engine, having equal bore and stroke, looking-glass reversibility, and every combination of rotation, handling, and control. The 4-cylinder model in the same range possesses similar characteristics.

Additional to our well-established industrial products, a demand for semi-portable and mobile power units has been met by a range of "Power Packs" and so satisfy many emergency and stand-by requirements. In the marine field our range has been supplemented by a number of new models, including the "Kingfisher," which, by reason of its popular appeal to small boat owners opens an excellent additional market.

Transmission gear is an important section of our business. In this field there has been considerable advance in technique, but, while great strides have been made towards complete automaticity, the trend is still governed by the degree of mechanical refinement relative to cost. We will, therefore, retain a comprehensive range of gear boxes, reverse gear and transmission models to meet most applications.

Having regard to our immediate programme we feel we have the solution of the manufacturing cost problem, and also provision sufficient to meet the requirements of successful long-term trading. Action is necessary to recover productivity and prosperity in a war-impooverished economy, calling for supreme effort. Unfortunately, the spirit of initiative and enterprise is difficult to retain because of the current atmosphere of frustration which is still felt in almost every aspect of industrial and trade activity. Cost of production has again risen during the year under review consequent on delays and shortages of supplies, as also scarcity of experienced labour, and hence the price level is being raised thereby tending to strain the relationship between supply and demand, and with it nullifying most of the beneficial effects of a seller's market.

Our own pre-war overseas contacts were overhauled, others established and expanded, with the result that we carry forward into the next operating period a well-filled order book containing a high proportion of export business.

In conclusion, therefore, although, in general, depressing conditions are still prevailing, your direction goes forward with courage and justifiable confidence to a task made lighter by the unique organisation which we have established for ourselves within our industry.

The report and accounts were unanimously adopted.

GAS LIGHT AND COKE COMPANY

INCREASED GAS SALES

The annual general meeting of this company was held on 20th ultimo, in London.

Mr Michael Milne-Watson (the Governor) said that he would like to refer to the great loss they had suffered in the retirement of Mr A. E. Sylvester from the Governorship. He also wanted to pay a tribute to Mr Henry Woodall who had resigned his directorship and with it his office of Deputy Governor at the end of the year. In June the directors had elected Major The Hon. Gwilym Lloyd George, P.C., M.P. to fill a vacancy at the Court. To fill another vacancy the directors had recently elected Mr W. K. Hutchison as a director and had appointed him a managing director.

DEMAND FOR GAS

Turning to the working of the company during the past year, he was pleased to have to report a continued increase in the sales of gas which were over 5 per cent. above the pre-war output of 1938. Throughout 1946 the demand had been expanding and at the present time they were running at an increase of 7 per cent. over the corresponding pre-war period. That, from a business point of view, was satisfactory, but the actual demand in severe weather was higher and was, in fact, more than they were able to meet. The main reason for that was that their plant had not yet recovered from the war years, when it had suffered not only extensive war damage but the inevitable postponement of normal maintenance.

Shortage of gas-making plant had throughout the winter kept them on the verge of curtailment of supplies, and it had become necessary to reduce pressure during exceptionally cold spells. The position would, however, have been much more serious had they not in November increased their calorific value from 500 to 520 B.T.U.'s by stopping the extraction of benzole and by the further enrichment of gas with oil. Briefly, the result of that change was to sell a gas which gave more heat for an equivalent volume. No one paid more, of course, since gas was charged for on the basis of heat content.

Such a measure could only be a short-term palliative. If they were to meet the vast and ever increasing demand for gas, they must have more plant. Had it not been for the war they would have been expanding evenly throughout the last seven years, but as it was they were now faced with a huge rebuilding programme at a time when steel and other essential materials were in universally short supply. The programme, which entailed the expenditure of some £10,000,000 was progressing all too slowly.

DEVELOPMENT AND RESEARCH

They had continued their policy of research work in both gas manufacture and the development and design of appliances, and, although that had cost them some £75,000, there was no question that it was money well spent, for it was only by looking ahead that they could be assured of continued successful competition with other fuels.

Turning to the company's employees, of the 8,000 who had left the company to serve in H.M. Forces and Industry, only about 1,000 had still to return and he thought it spoke well for the company's labour relations that the number who had decided not to resume work with the company was very small. To assist ex-Servicemen to find their feet once more in their civilian employment, they had where necessary instituted refresher courses which he believed had done much to help them over the difficult transitional period.

The report was adopted.

Statistical Summary

GOVERNMENT RETURNS

For the week ended Jan. 25th, 1947, total ordinary revenue was £125,551,000, against ordinary expenditure of £58,341,000, and issues to sinking funds £300,000. Thus, including sinking fund allocations of £12,255,356, the deficit accrued since April 1st is £456,547,893 against £2,058,706,619 for the corresponding period a year ago.

GOLD AND SILVER

The Bank of England's Official buying price for gold remained at 172s. 3d. per fine ounce throughout the week. In the London silver market, the price per fine ounce was raised from 44d. to 55d. on August 1st. The New York market price of silver changed to 60¢ on January 20th, 1947. Bombay bullion prices were follows:—

1947		Gold	Silver
Jan. 23		Rs. a.	Rs. a.
" 24		104 12	154 8
" 25		106 0	157 2
" 27		107 0	156 14
" 28		106 12	154 10
" 29		106 12	157 0

THE MONEY MARKET—The short loan position in the early part of this week was easier than for some time, mainly, it appears, because the market and several banks had considerable holdings of end-month Treasury bills acquired and retained last year for the purpose of the monthly make-up as it was before the cessation of window-dressing. These maturities thus helped to swell the supply of available funds, instead of being used simply to inflate bank cash on the one hand or for re-sale to the Bank of England on the other. Whereas, at the end of last week, there had been further dealings with the special buyer (though none on the Saturday), on Monday and Tuesday this week credit supplies were plentiful, with the banks taking considerable lines of March and April maturities.

The floating debt position differed little from the previous week. There was again no call for funds on TDR's, while maturities held by the clearing and Scottish banks totalled £23 million. Bill maturities

and payments were again nominally balanced at £160 million, and the market secured roughly the same proportion as in the previous week—about 50 per cent—although applications were divided between 89-day bills (Monday, Friday and Saturday) and 90-day bills (Tuesday, Wednesday and Thursday). As applications for both were submitted at the same price, the market secured a full allotment of the longer bills but only 24 per cent of the shorter.

The £7 million reflux of currency was again larger than in the corresponding week of 1946, but virtually the whole of this movement was neutralised by a decline in the Bank's total security portfolio. Hence, by Wednesday, market payments for bills and tax transfers had dried up the credit surplus and forced the discount houses to seek official aid on an appreciable scale. The note circulation is now almost back to its November '46 low, and the Bank's reserve stands at the unusually high figure of £86.8 million.

LIEBIG'S EXTRACT OF MEAT COMPANY, LIMITED

LARGER PROFITS AND DIVIDEND

The eighty-second ordinary general meeting of this company was held, on the 20th ultimo, in London, Mr Kenneth M. Carlisle, chairman and managing director, presiding.

The chairman said that the profit and loss account revealed a balance, before taxation and excluding exceptional items, of £696,000 against the comparable figure of £497,000 for the previous year, or an improvement of £199,000. To that balance was added £147,000 in respect of trading and other credits not attributable to the current year, in comparison with only a small counter-part last year. Against the resulting total of £843,000 there had to be provided the very large sum of £644,000 in respect of British and Dominion taxation.

The rise in profits on trading came chiefly from their overseas establishments. It was due in large measure to the higher prices realised for factory products and by-products following the removal of certain controls and ceilings as well as to the improved return from the estancias directly operated by the parent company. Although there was a considerable increase in manufacturing costs, the former factors more than offset the latter. The total ordinary dividend for the year would amount to 9s. free of income tax, against 8s. for the previous year.

In regard to the current activities of the Continental companies, each had had its own particular problems to face, but all had continued to manufacture and trade under varying degrees of inhibitions and difficulties. On the whole the volume of output, having regard to the shortage of supplies and materials, had been encouraging, and, although larger quantities of products than were produced could have found a ready market, trade during the first year after liberation could be considered to have been re-established on a satisfactory basis. Profit margins, however, had been difficult to maintain owing to the ever-rising costs of production and the delays in obtaining from the various control offices the requisite authorisation to adjust selling prices to meet changed conditions. All difficulties would no doubt be overcome, and they would then look forward to reaping the reward of patience and perseverance in some adequate return from their considerable investments.

POSITION IN SOUTH AMERICA

The year had not brought any relief from anxiety to the industrialist in South America. He had referred last year to the manner in which he was gradually being subjected to controls from the purchase of his raw materials to the disposal of his products. That tendency had become accentuated and it was difficult to foresee, as it was impossible to predict, what would be the ultimate effects of the latest measures, but they were bound to be far-reaching, and he feared that they could probably only react to the disadvantage of the company through the curtailment of liberty and initiative.

All their estancia companies had come through with balances on the right side, but their profits were now subject to income tax at 15 per cent. against the rate of 5 per cent. ruling three years ago, and furthermore dividends remitted abroad were penalised to the extent of an additional deduction of 5 per cent. There was also in the case of farming companies which remitted abroad more than 50 per cent. of their profits a 30 per cent. absentee sur-charge payable on income tax corresponding to their profits. It was a matter for regret that discrimination was now being exercised against foreign capital.

The report was adopted.

UNIVERSAL PICTURES COMPANY

U.S. MARKET FOR BRITISH FILMS

The annual stockholders' meeting of Universal Pictures Company, Inc., is scheduled to be held on the 12th instant.

The following are extracts from the annual report presented by Mr J. Cheever Cowdin, the chairman of the board, and Mr N. J. Blumberg, the president.

Universal Pictures Company is now devoting its creative and technical resources to the production of pictures of outstanding distinction. Production of so-called "B" pictures, Westerns and serials has been eliminated.

Implementing its new production policy, Universal Pictures has acquired the assets of International Pictures Corporation, and the production organisations of these two companies have been merged. This combination of creative and technical talent, story properties and star contracts gives Universal one of the strongest production organisations in the motion picture industry.

William Goetz and Leo Spitz, outstanding producers, who headed International Pictures, have been placed in full charge of Universal's production activities at the studio. The company's productions now carry the trade mark of Universal-International Pictures.

In addition to 25 pictures of distinction being produced at its California studio, Universal has arranged for the exclusive distribution in the United States and in Central and South America of British pictures produced by the J. Arthur Rank organisation, with the exception of two to be handled by another company and five to be distributed annually by Eagle-Lion.

POPULARITY OF BRITISH FILMS

These arrangements to distribute British pictures in the United States mark the beginning of an earnest effort to provide the British film industry with an opportunity to add materially to the world-wide earnings of their pictures. It is our opinion that British pictures should have the same opportunity to earn revenues in the United States as Hollywood pictures have in Great Britain.

The J. Arthur Rank pictures shown in the United States have been very favourably received. Critics and the public have been quick to recognise the outstanding quality of "A Matter of Life and Death," "Henry V.," "Caesar and Cleopatra," "Seventh Veil" and "Brief Encounter," to mention only a few. Box-office results indicate these pictures offer a type of entertainment the American public wants to see.

Another outstanding group of British pictures is to be distributed by Universal in the United States and Latin America this season. They include among others "The Upturned Glass," starring James Mason; "Black Narcissus," a Technicolor production, directed and produced by Michael Powell and Emeric Pressburger; "Great Expectations," Charles Dickens's classic, with John Mills and Valerie Hobson; "Odd Man Out," starring James Mason and Robert Newton; and "The Magic Bow," with Phyllis Calvert and Stewart Granger.

British stars are gaining a growing recognition among American film-goers. Phyllis Calvert, Stewart Granger, Rex Harrison, Deborah Kerr, Margaret Lockwood, James Mason, Lilli Palmer, Michael Redgrave, Patricia Roc and Ann Todd are among those whose artistry and personalities are winning for them a substantial following. As these British stars become more widely known throughout the United States there will be even greater interest in their forthcoming pictures.

U.S.-BRITISH ALLIANCE

The agreement between Universal and the Rank organisation for the distribution of the British product in the United States and

Latin America presages a new era of co-operation in the motion picture industry. It not only provides the opportunity for the American and South American public to see the best British pictures, but paves the way for the exchange of acting, writing and directorial talent between the United States and Great Britain.

Universal's line-up of current and coming productions will be the strongest in its history. Under the new Universal-International banner, top ranking stars are appearing in productions with outstanding story values, including best-selling novels and Broadway stage successes.

STERLING TRUST, LIMITED

DIVIDEND 6 PER CENT.

The thirtieth ordinary general meeting of the Sterling Trust, Limited, was held, on the 25th ultimo, in London, Mr Maurice Hely-Hutchinson, M.C., the chairman, presiding.

The following is an extract from his statement circulated with the report and accounts: Gross revenue from all sources at £228,613 shows an increase over last year of £22,634. The net revenue is £69,864, an improvement of £8,974. Your directors recommend the payment of a final dividend of 4 per cent. on the ordinary stock, making 6 per cent. against 5½ per cent. for 1945.

We continue to lose remunerative investments by redemption or conversion to lower rates, and this movement is likely to be intensified by nationalisation of certain undertakings. Fortunately, its effect on our revenue has, so far, been more than offset by increased dividends on ordinary shares, but it should be noted that these distributions have, in several instances, included special or Victory bonuses. We cannot rely on a repetition of these payments. Nevertheless, an estimate of income for the current year shows no very material change from the normal revenue of 1946.

The valuation of our investments at December 31, 1946, shows a surplus of £1,100,891, or 24.4 per cent., on the balance-sheet figure, a rise of 15.7 per cent. over the year. Based on this valuation, the geographical distribution is as follows: Great Britain and Empire, 84½ per cent.; South America, 9½ per cent.; Europe, 3½ per cent.; Asia, 1½ per cent.; other countries, 1 per cent.; and the proportion invested in British Government securities is 5 per cent., in other bonds 18 per cent., in preference shares 32½ per cent., and in ordinary shares 44½ per cent. The report was adopted.

BRITISH TYRE AND RUBBER COMPANY, LIMITED

INCREASED PROFIT AND DIVIDEND

The twenty-third annual general meeting of this company was held, on the 14th ultimo, in London.

Sir Walrod Sinclair, K.B.E. (the chairman), said that the profit and loss account of the British Tyre and Rubber Company showed manufacturing and trading profits, after providing profits tax and excess profits tax and including the net dividends from subsidiary companies, at the substantial figure of £384,088, an increase of £98,388 over the previous year. That was a very satisfactory result in a year that had been far from normal.

While the subsidiary companies had contributed their share towards the total, the substantial increase arose as a result of the company's own operations and corresponded with a greatly increased turnover. The board felt that it was equitable that the shareholders should participate in the increased profits, more particularly having regard to

the financial strength of the company and of the group. They accordingly recommended a final dividend of 10 per cent., making a total of 15 per cent. for the year, an increase of 3 per cent. over the previous year, the highest distribution ever paid by the company.

While the board was gratified to be able to place before shareholders such satisfactory results from the year's operations, he would be failing in his duty if he minimised the difficulties that appeared to lie ahead.

Whilst he could not predict the future, he could say quite definitely that with such an efficient and loyal staff and workpeople, coupled with a substantial volume of orders on hand and ample liquid resources, the board had confidence in the company's ability to maintain satisfactory results.

The report was adopted.

HENLYS LIMITED

DIVIDEND OF 100 PER CENT.

The adjourned 18th ordinary general meeting of Henlys, Limited, was held, on the 27th ultimo, in London, Mr H. G. Henly, chairman and managing director, presiding.

The following is an extract from his circulated statement:—

The net profit is £176,325 after bringing in dividends from the subsidiary companies in the sum of £57,120. These are fully covered by the profits earned by the subsidiary companies during the period. Your directors recommend a final dividend of 80 per cent. on the ordinary shares, less income tax. They consider that the highly successful

results amply justify a total dividend of 100 per cent. on the ordinary shares.

For many years past your company, as England's leading motor agents, has specialised in the buying, reconditioning and selling of used cars, and I feel that during the past year the Henly organisation has fulfilled a very urgent need in these days of limited new car production in being able to assist in satisfying the public's demand for transport, essential to the full recovery of the nation's economic position.

All necessary steps had been taken during the war years to be prepared to change over from war-time conditions to our peace-time activities, and this fact has enabled the Henly organisation to render invaluable service to its many customers in dealing with overhauls, repairs and the provision of spare parts and accessories.

It can be anticipated that despite the difficulties of the motor car manufacturers we will be able to distribute a greater number of motor cars during the current financial year than during the past year, in addition to which the prudent use of our specialised knowledge in the used car market should ensure even greater profits during this year. The report was adopted.

GENERAL CONSOLIDATED INVESTMENT TRUST, LIMITED

INCREASED REVENUE

The 51st ordinary general meeting of this Company was held, on the 28th ultimo, in London.

Mr Bruce Outley (the chairman), in the course of his statement, said: The total number of individual investments at the time of the balance sheet was 665, an increase of 43 over the number held at the same date last year, thus indicating an even wider distribution of your funds. On book value 84½ per cent. and on market value almost 92 per cent. of your company's funds are now invested in Great Britain, the Dominions and the Colonies.

The total book cost of all investments has risen by £85,422 during the year. With regard to the unquoted investments, the value placed on them represents 2.84 per cent. of the total valuation of all the investments and their book costs 6.65 per cent. of the aggregate figure shown in the balance sheet. A valuation of all the investments shows an appreciation of 30.51 per cent. over book cost.

The gross income of £112,526 shows an increase over the previous year of £5,905. Arrears of income at about £2,800 are less by £6,600 than were received last year. This means that our gross revenue from normal sources has risen by about £12,500 during the year under review. The profit for the year at £71,723, before charging income tax but after allowing for other charges, is higher by £4,573. Income tax requires £1,171 more, so that the net profit after allowing for income tax has increased by £3,402. Your board recommends the payment of a final dividend of 6½ per cent., on the ordinary stock, making 9 per cent. for the year, an increase of 1 per cent. over the previous year's regular dividend.

The report was adopted.

THE UNIVERSITY OF MANCHESTER

Applications are invited for the appointment of THREE RESEARCH ASSISTANTS IN ECONOMICS. Salary according to qualifications and experience. Duties to commence as soon as possible. All applications should be sent not later than March 31, 1947, to the Registrar, The University, Manchester, 13, from whom further particulars may be obtained.

A Profits Policy?

THAT a comprehensive wages policy is overdue is obvious. It is less certain that such a policy will be effectively hammered out and imposed by a slightly schizophrenic Cabinet who can never, in this connection, be quite sure whether they are His Majesty's Government or the Political Action Committee of the Trades Union Congress. If it is so drafted and imposed, a *quid pro quo* is likely to be required. The Trade Unions are already pressing for a profits policy to match the wages policy and, with Budget Day looming ahead, there appears the possibility of a nicely symmetrical policy of profits restriction.

Unfortunately, the necessities of party diplomacy and the facts of economics are not here in perfect harmony. The symmetry does not exist; between wages and profits there is no exact parallel. Wages are contractual payments, profits are a residue. Trade Union agreements, or the law of the land may say: You shall pay no less, or no more, than the following. No law or agreement can say: You shall make such and such an annual surplus over expenses, no more and no less. With considerable difficulty, with a touching reliance on the conscientious scruples of the business man, and with a deplorable indifference to justice as between the plodder and the venturer and between lightly and heavily capitalised industries, the law might indeed put a ceiling on rates of profit per unit of capital; but it could not, as it does with wages, put a floor under them, and in any case it is not profit rates but profit totals which interest public opinion, and particularly the sensitive opinion of those likely to be affected by a wage policy.

This confusion between the rate of profit and the total of profits is only one of the many misunderstandings that surround the whole subject. For example, some of the language that is held in Labour circles suggests a belief that there has been a large increase in the profits of industry during the war years. But there is really very little warrant for any such belief. It is true that, in the official estimates of the National Income, the item labelled "Interest and Profits" shows an increase of 85 per cent from 1938 to 1945, while those labelled "Salaries" and "Wages" show increases of only 44 per cent and 64 per cent. But this crude comparison is most misleading. For one thing, "interest and profits" includes farming profits and professional earnings, neither of which are usually intended when accusations are levelled at "the profits of industry." Secondly, the totals of salaries and wages must be adjusted for the great transfer of men and women into the armed forces. The total of "earned incomes" shows an increase of 94 per cent.

A much closer approximation to what has been happening to industrial profits can be obtained from the figures compiled by *The Economist* from the published accounts of joint-stock companies. The results can best be exhibited in the form of a chain index-number, as follows:—

1939	100	1942	99.8	1945	110.7
1940	102.3	1943	102.0	1946 (9 mos.)	120.8
1941	99.6	1944	106.2		

It is true that the figures on which this index is based, though they are struck before the payment of income tax, are calculated after Excess

Profits Tax. But the sum collected in EPT and NDC together never reached £500 millions in any one year. If it were possible to calculate an index of profits before EPT it would be most unlikely to show an increase of more than 50 per cent over the eight years, which would barely be enough to keep pace with the falling value of money. Moreover, companies have followed a very conservative policy in the distribution of their earnings. In 1939, of the total of profits coming under review for *The Economist's* figures, 15.1 per cent was placed to reserve; for the first nine months of 1946 the figure is 22.2 per cent. With such a moderate increase in total profits, and with a reduced proportion of them being distributed, it is probable that the real purchasing power of personal incomes derived from profits, even before the payment of income tax, is now lower than before the war.

The second great misconception about profits is that they are identical with rich men's incomes. There is, it is true, a connection, but it is not very close, and if there were, as there should be, a great increase in profit-sharing schemes, the connection might become quite remote. Even if all profits went into rich men's pockets, any sort of tax on, or restriction of, profits as such would still suffer from the overwhelming disadvantage that it would fall exclusively on one form of rich man's income. There are relatively just as many large incomes derived from rent or interest or preference share dividends as there are from profits—but a tax on profits falls exclusively on the ordinary shareholder. Where is either the equity or the common sense in taxing the rentier only once and the enterpriser twice? If distinctions have to be drawn between different kinds of property incomes, those that are the fruit of risk-taking should be taxed more lightly, not more heavily, than the rest. If "soaking the rich" is the order of the day, then the best way to do it is by means of death duties. The second best is by a wider margin in the income tax between earned and unearned incomes. The worst of all—worst in equity and worst in its effect on enterprise—is a tax on profits as such.

The third misunderstanding is that a Labour Government ought to want lower profits. It is true that the "profit motive" is in bad odour. The words conjure up a picture of esurient plutocrats pursuing a selfish interest diametrically opposed to that of the general public, inordinately greedy, totally irresponsible, and entirely dirty-hearted. To try to replace this picture by one of a gallant, public-spirited, far-seeing and devoted band of crusaders against national penury would of course be purely silly. But why it should be more greedy to try to improve one's profits than to try to improve one's wage or salary, and more irresponsible to put capital into greyhound tracks than to prefer the life and pay of a pools tout to those of an agricultural labourer, or more hardhearted to close down a redundant works than to limit the right of entry into a union, or more unpublic-spirited to restrict production than to "work to rule," it is really very hard to see. The sins of business men are on a larger scale, and therefore more striking, than those of their employees; but their unethical practices are no more and no less an argument against high profits than the unethical practices of other people are an argument against high wages and salaries. Any Labour Government that knew which side its bread was buttered would want a rise in the total of profits—just as any Conservative Government ought to take heart from a rise in the total of wages. High profits and high wages are (inflation apart) both of them signs of high activity. They are at once the means to and the product of a high standard of living.

But because a special tax on profits or an attempt to limit the total volume of profits would be both unjust and unwise, it does not in the least follow that any sort of policy towards profits and the processes by which they arise is either impos-

sible or undesirable. What is important and necessary is that profits, like wages, should be a return for services genuinely rendered. Profits from serving the public by enterprise and judgment, by indefatigable probing after better techniques, by economy and boldness, by the divining of new needs and the harnessing of new resources, by all those qualities which lie outside the scope of plodding routine administration, are one thing; profits from squeezing the public, by rings and the ubiquitous price-maintenance agreement, by feather-bedding and the suppression of new processes, by the inert weight of monopolistic inefficiency, by sheer stertorous inactivity behind a safe barricade of licensing regulations, are altogether another. The trade unions are constantly urged to forget their depression-mindedness, to abolish restrictive regulations, to rid themselves of 'cannery', to encourage mobility, and so forth. It is time that the captains of industry heard some similar advice, equally well-sustained and forcible. There is no defence for the "private unenterprise" which Mr Herbert Morrison castigated some years ago, and whose props and buttresses—whether the outcome of "self-government in industry" or of Government action—were, no less than the silliest trade union restrictionism, the fruit of depression-mindedness.

Here is the field for a real profits policy, a policy designed to emancipate the old slogan of "small profits and quick returns," a policy which in reducing the rate of profit would greatly increase the total volume of profits—and of wages too. From left to right across the whole spectrum of economic opinion there is not one dissident today from the proposition that what British trade and industry need is more mobility, more fluidity, speedier adaptation. The right profits policy is one which would remove from profits the stigma of monopolistic extortion by breaking down the adhesions and limbering up the ankylosed joints of the "private sector" of the British economy. To clamp special taxes and restrictions on profits will not help towards that end; indeed, it will drive the private sector further into timidity. But if a real profits policy on these lines were pursued—it would be pleasant to be able to point out any signs that the Government intend to do it—a high profits index would mean what it always should mean: a forward-moving, dynamic system moving under good economic leadership towards prosperity.

The Stalin Gambit

We regret that, owing to a misunderstanding about a last-minute correction in proof, the paragraphs of our First Leader of last week, as happened to the stanzas of Goldsmith's "The Prospect," were printed out of their intended order. We apologise to those of our readers who thought our views even less coherent than usual; those who noticed nothing wrong possibly owe us an apology. A limited number of prints of the article in its correct sequence is available.

This is an appropriate opportunity to express, on behalf of our printers and ourselves, regret at the misprints that occur in *The Economist*. The printing trade in London, and most particularly the printers of periodicals, are still suffering from the most grievous shortages of labour and plant, which have been intensified by the agreements recently reached with the Unions. A higher proportion of the contents of *The Economist* is written and set up in type within the 48 hours prior to publication than is the case, we believe, with any other comparable periodical. It is something of an achievement in present circumstances that the paper gets printed at all, and it is inevitable that mistakes should occur from time to time. We attempt to correct those that are misleading, and not merely annoying, and we ask for the indulgence of our readers until normal conditions return.

Defence in Two Worlds

HAD Lord Montgomery been asked, during his recent visit to Moscow, in what sense exactly he was Chief of an Imperial General Staff, he would have found it hard to answer. The present CIGS is not the man to denigrate his own title by explaining that it is archaic; nor would he insist that it means all it says to Soviet statesmen, who must by now have decided that no useful calculation can result from the formula: Australia is to the United Kingdom as Byelorussia is to the Soviet Union. He would have had to explain that in peacetime the Imperial General Staff exists only as an idea in the minds of students of the Defence College; that the brains of "imperial" strategy come almost exclusively from the forces and universities of Great Britain, and the plans from its Navy, Army and Air Force staffs; that whenever the Dominion Prime Ministers meet in London to discuss the Empire, they think of 10, Downing Street as a club where much is said off the record, and nothing ever finally decided, about their greatest common interest—security. So the fighting men are left to do a great deal more planning and preparing than the politicians dare or care to take credit for. In the circumstances of last month, the CIGS might have added a caution to the effect that a Dominion—in Mr Bevin's phrase—"ties itself to no one"; it is automatically brought into war by no alliance or undertaking of the Government in London.

This sketch would have been received in Moscow with polite incredulity, as it once was in Germany, and still is in America. At first sight it looks like a caricature. Only when the lines are thickened, and the shadows rubbed in, and the detail drawn, is a formidable power revealed. The incredulous foreigner might well ask whether nothing has been learnt from the war, how such loose arrangements as those of 1939 can be tolerated, why a Socialist Government is not planning with the Dominions the most efficient organisation of their productive resources for security. He might even ask whether imperial defence was to be one of the last refuges of private enterprise. He would not be far wrong. For the essential idea of the latest thinking on imperial defence is that essential war industries, skilled white manpower, research organisations, and raw material stocks, should be dispersed throughout the Commonwealth.

The very suggestion at the moment sounds fantastic: emigration of skilled workers, when increased production is the target for years ahead; creation of heavy and light Dominion industries to compete with British; emigration of scientists when there are not sufficient scientific students to meet the current needs. Yet the suggestion was quite seriously made, less than nine months ago, by the British Chiefs of Staff. It was presented, as part of an outline plan of imperial defence,

for study by the Dominion Prime Ministers, with the approval of a Labour Cabinet well aware of the man-power problem looming ahead. It was cordially received—particularly by the representatives of Australia and New Zealand—because it offered a sharing of British skill, brains, and man-power for industry, and of authority, responsibility, and planning for defence. Little has been heard of that plan since. The detailed comments of the Dominion Governments have not yet reached London. It is never referred to in current home controversies about defence and man-power, about foreign policy and Britain's declining strength. The usual cosy haze is gathering around yet another vision of imperial co-operation, obscuring indiscriminately what is practicable in it and what is impracticable.

Yet if any question is vital it is this: whether it is safe to continue indefinitely the concentration of skill, productive power and military resources in an island so vulnerable to long-range weapons and new methods of warfare. The first result of dispersal would obviously be to weaken one of the three integrated economies which have proved their power in modern war; but the long-term result might be to establish in Africa and the Pacific new concentrations of power more effective because less vulnerable to an unexpected attack. What choice is to be made and how will it affect policies for emigration of British workers, immigration of foreigners, planning of potential war industries, distribution of fuel and raw material stocks, and the allocation of financial burdens? The question is neither premature nor pessimistic. Whatever security plans are evolved by the United Nations, they will involve risks for the Powers who will have to enforce them. Whatever defence plans are approved by a British Cabinet will affect in a variety of ways its financial and industrial policy, and that of each Dominion.

It would not perhaps matter that Dominion—and Colonial—resources should be temporarily out of mind were the man-power situation in this country not so desperate. A considerable cut in the strength of the regular services, a reduction in the numbers employed in such masked war industries as civil aviation, the importation of foreign labour, all these would be more confidently accepted if the planning of which they are part covered also greater Dominion contributions of men and economic potential to imperial defence, and a great increase in the total number of skilled workers in the Dominions, to be secured by training and alien immigration. Financial as well as man-power difficulties arise from imperial commitments, from the need to keep forces in the eastern Mediterranean, the Middle East, and the Indian Ocean; therefore, the attempt to solve them should take account of imperial resources. tunity to do so offered itself in the House of Lords last week when the first debate of this Parliament on imperial defence took place. But when Lord Strabolgi rose "to draw attention to the contribution to be made by the United Kingdom and the Colonies to the solution of the problems of imperial defence" he referred to the "contributions of the Dominions" as a separate subject and seemed to suggest that there was no desire on either side of the House to discuss it. Lord Addison was thereby enabled to avoid all reference to broad principles and to confine himself to general assurances that the Army's regular strength would be "substantially lower" than a million men, that the possibility of raising large bodies of troops in the African Colonies was appreciated, that the Royal Naval Reserve would not be abolished and that the salvation of the country if again involved in war would lie in the work of the new Ministry of Defence. It would have been more satisfactory to learn that the Ministry of Defence, even in the throes of reorganisation, was following up the general plan presented to the Commonwealth Prime Ministers and the Colonial Secretary last summer.

It is a striking feature of this plan that it reflects the influence on Service minds of day-to-day contact during war with scientific, industrial, commercial and financial experts. It rises above the narrow conception of strategy as the disposition of armed forces to the broader view of it as the disposition of total national and imperial resources. Interruption of that contact and a waning of that influence may partly account for the

obscurity into which the Chiefs of Staff's ideas seem to have fallen. If so, then the Ministry of Defence should provide for its revival. Lord Montgomery and his two Service colleagues now have a scientific colleague in Sir Henry Tizard. They need yet another—maybe two more—to advise on the industrial and economic aspects of defence and on the problems of civilian and labour organisation in war. How else can the Minister of Defence form an independent judgment of the resources on which he can call or balance the claims of British social policy against the requirements of imperial defence policy?

In the present session of Parliament there will be questions and debates in the Commons on foreign policy, on conscription, on man-power needs, on colonial policy, on defence organisation. Both sides of the House should use these opportunities to ensure that imperial needs and resources are never lost sight of, that no readiness of the Dominions to share the burden of world power is overlooked, that British foreign policy in Europe has the general support of these "middle Powers," which intend anyhow to play the dominating British part in the affairs of the Pacific. Nor should it be forgotten that Britain's chief friends in Europe—the French, the Belgians, the Dutch—have vast imperial territories. Their interests were shown during the war to be bound up with those of the Colonial Empire and their resources must be counted as part of the wealth and strength of western Europe. When these things are forgotten and imperial governments lose their sense of purpose, planning becomes parochial and foreign policy defeatist.

The Smaller Powers and Germany

WHEN the peace treaties with Germany's satellites were discussed in Paris last summer, it soon became evident that the smaller Powers fell into two groupings—the Poles, the Yugoslavs and the Czechs voting on most occasions with the Soviet delegates, the other nations—in particular the Western Europeans and the British Dominions—generally siding with the Anglo-American view. This division was kept within some bounds by the fact that on a number of major issues, the Big Four were already agreed, but the clash came clearly into the open whenever a problem had been left unsettled. And it tended to crop up even in discussions where agreement had been reached by the Great Powers, for some of the "Western" countries, Australia at their head, challenged the right of the Big Four to make decisions binding on the whole Conference and urged that greater consideration should be given to the views of the middle and smaller Powers. The "Eastern" Powers, on the contrary, on most occasions reaffirmed their faith in Great Power unity and their support for the agreements previously reached.

Both the clash over procedure and the division on substance are already reappearing at Lancaster House, where the four Deputies of the Foreign Ministers have almost concluded their hearing of the smaller Powers' views on the German treaty. Once again, the British Dominions are expressing their vigorous disapproval of methods of peace making which leave to the smaller Powers little more than permission to put a rubber stamp on the conclusions of the Big Four. Neither the Canadians, the South Africans nor the Australians have submitted detailed statements of their views on the German treaty and are not prepared to do so until they see some hope of having them seriously discussed. Meanwhile, the Australians and South Africans have proposed that the Moscow Conference should lay down only general directives for the German settlement and that their detailed application should be worked out by special committees on which all the "active belligerents" serve and which would prepare the treaty for the final Peace Conference.

Both the Australians and the Canadians suggest that this treaty need not necessarily be a treaty with Germany in the formal sense of a contract signed by two sides. No German Government exists and it would be unwise to bring one into being prematurely, simply in order to sign a peace. They suggest, instead, that the treaty should take the form of an International Statute imposed on Germany until such time as a central government exists capable of signing a formal peace treaty. In this proposal, Australia and Canada have Belgium's support.

The Czechs, the Poles and the Yugoslavs, on the other hand, have merely expressed their gratitude for being allowed to state their views at this early stage and each Government underlines the need for agreement between the Great Powers as an essential condition of the peace.

The differences on the substance of the treaty are more difficult to define at Lancaster House than they were at Paris. Then, the matters on which the Great Powers differed were lifted into prominence by the fact that they were the exceptions to complete agreement on the rest of the drafts. But in the case of Germany, all is confusion. Nominally, the Great Powers have agreed on a number of policies. They began the process in 1945 at Yalta, carried it on at Potsdam and at the reparations conference in Paris, and added another chapter with the Level of Industry Plan in March, 1946. But it is an open secret that all the Great Powers are ready, and some anxious, to revise all these agreed policies and that, in fact, many of them are already a dead letter. In short, the chief difference between peace making in Paris and the present phase at Lancaster House is that at Paris the Big Four had reached preliminary agreement. So far, on Germany, they are deeply divided.

The attitude of the smaller Powers throws some light on these divisions. With certain exceptions, they have again split into an Eastern and a Western grouping with sharply divergent views. In the political sphere, South Africa, Canada, Brazil, Greece, Norway, Belgium and Holland favour a federal Germany. The Poles, the Czechs and the Yugoslavs favour a centralised unitary state and for the same reasons—that to split

up Germany's historic unity will increase pan-Germanism and revisionism, that the separate federal states will be a cover for aggressive nationalist elements and that a centralised government is more accessible to Allied control.

In the social field, there is more apparent agreement. Most Powers speak of de-Nazification, and Canada, Poland, Yugoslavia, Norway, Czechoslovakia and Holland all refer specifically to the breaking up of the trusts and monopolies which have dominated the German economy. But it is not at all certain that the different Governments have the same process in mind when they speak of "breaking up the trusts." The Poles, the Czechs and the Yugoslavs couple their attack on trusts and monopolies with demands for land reform to destroy the power of the Junkers and ask that all trusts in the hands of "collaborators" (which virtually means the whole of heavy industry and mining) shall be nationalised, whereas the Westerners, such as the Canadians and even the Dutch, see in cartels not so much a malevolent social and political force as a dangerous economic obstacle to private competitive enterprise. Under a common form of words lurks considerable divergence of interpretation, and the Yugoslav delegation made no secret of its belief that Britain and America are supporting the industrialists and the Junkers against "the true interests of the German people."

The division between East and West is repeated over the territorial question. South Africa specifically condemns the Polish annexation of Germany east of the Oder, Australia refers to the Atlantic Charter with its pledge that frontier changes shall be made only with the consent of the people concerned and Canada asks that frontiers should in general follow the ethnic line. The Belgians and the Dutch both seek very small frontier rectifications to their own advantage; they, therefore, do not specifically condemn the enormous transfers of territory which have taken place in the East. But they underline the modesty of their own claims. Poland, on the other hand, demands that the Oder frontier shall be recognised in the treaty, the Yugoslavs specifically support the Polish claim and the Czechs demand a series of frontier changes in their own favour, although on a much smaller scale. The Czechs have an obvious and overwhelming common interest with the Poles, since both have been responsible for a mass evacuation of Germans from their territory. The Czechs' uneasiness can be measured by their demand that the peace settlement shall forbid the expelled Sudeten Germans to form any separate group or organisation which might develop revisionist aims.

The most controversial issue turns on the problem of Germany's economic future and, in particular, on reparations. On this point, the distinction between East and West is somewhat blurred, for most of the smaller nations are determined to receive reparations, and the Greeks and the Norwegians, for instance, are almost as insistent as the Yugoslavs or the Poles. Only South Africa has reached the decision to renounce all industrial reparations. Nevertheless, underlying the general desire for reparations, there are two sharply divergent lines of approach and they, as might be expected, represent a Western and an Eastern point of view.

The "Western" nations—the British Dominions, Belgium, Holland and Norway—are more or less prepared to face the fact that if reparations are to be paid, the German industrial machine must be restored sufficiently to give a measure of prosperity to the Germans and to supply a balance from which reparations can be paid. But they recognise that this strengthening of the German economy might recreate a war potential in Germany. The South Africans, the Canadians, the Dutch and, more guardedly, the Belgians, therefore suggest that this danger can be met in general by integrating German industry in a larger European economy and in particular by setting up a permanent international control in the Ruhr. The Canadians suggest that the larger task of integration could be entrusted to the newly-

formed European Commission. The Belgians specify that control in the Ruhr should be vested in the first place in Britain, France, Belgium, Holland and Luxemburg, but they do not regard this list as exclusive. The other Powers are content to say that it should be "international."

The approach of the Poles, the Czechs, the Yugoslavs and the Greeks simply ignores the problem of restoring the German economy to some degree of prosperity. On the contrary, the Poles and the Yugoslavs denounce the recent Anglo-American decision to make credits available to Western Germany as a first sinister step in the direction of the Allies' loan policy between the wars, when, between 1925 and 1930, according to the Poles, foreign loans to the extent of \$9 per head of the population were invested in Germany, the ex-enemy, against \$1.85 in Poland, the risen friend. The Easterners all insist that the reconstruction of Germany's victims must come first and, even if German recovery is delayed, German wealth must be sent as reparations to rebuild the war-devastated lands before it is used to restore Germany. The Yugoslavs and the Czechs, in particular, wish the reparations agreements reached in Paris to be honoured. There, it will be recalled, all the Powers, with the exception of Russia and Poland whose quotas were fixed at Potsdam, agreed on the percentage of German reparations each should receive, although no global figure was fixed. The Yugoslavs now suggest that at Yalta not only was the sum of \$10 billion allocated to Russia, but a further \$10 billion was agreed for the other Powers; accordingly they demand their promised percentage. They also remind the Powers that agreement was reached at Paris to take reparations from current production, especially coal, to allot German assets held in the Western Zones of Austria and to take over German property invested in neutral countries.

The Yugoslav proposal may receive some support in the West, for the Dutch and the Belgians were signatories of the Paris agreement and however much more alive they may be than are the Eastern governments to the necessity of restoring the German economy, as an essential preliminary either to reparations or to European prosperity, they, together with all Germany's neighbours, to the East or to the West, have a natural tendency to seek to insert in the treaty a number of their own special economic interests. The Greeks ask that Germany should be compelled to buy Greek tobacco for the next twenty years. The Yugoslavs want part of the German Danube fleet in reparations. The Belgians want 6 million tons of coal, 750 million kwh. of electricity, and deliveries of phosphate and salt in annual reparations for the next forty years. The Dutch and the Belgians wish to control Germany's river transport, to prevent any diversion of traffic from the Rhine to the North German ports and to veto German canal building. The Dutch want to prevent German self-sufficiency in food and to forbid high agricultural tariffs. The Norwegians demand control of German trawling, a limitation on the size of German fishing and merchant ships, and a complete ban on German whaling expeditions.

It is difficult to believe that the statements and suggestions of the smaller Powers will do much to clarify the German issues. Their bewildering variety of particular demands will need to be co-ordinated, while the general cleavage in their approach will only reinforce, since it almost precisely mirrors, the divisions between the Great Powers. This is not to say that divergencies are essentially insuperable. Given patience and the desire for understanding, a compromise could be found between extreme federalism and extreme centralisation, between the various versions of "de-Nazification" and even between the question of restoring or not restoring German economy as a preliminary to reparations. But the smaller Powers can make little contribution to that compromise. Either it will be worked out in Moscow or the divisions on Germany will remain.

that would mean abandoning the nationalisation programme. And they cannot embark upon a great campaign of moral leadership because Mr Attlee is Mr Attlee. So all they can do is to stand pat upon the collection of administrative expedients they inherited from the Coalition, as modified by the pressure of events in the last eighteen months, and excuse themselves by the newly-discovered limitations of democratic planning.

They are, in fact—to explore another historical parallel—taking up exactly the same position towards the economic problem that Chamberlain took up towards the war in the winter of 1939-40. It will be remembered that he then boasted that his war policy differed from that pursued in the first war in that it was planned, and his plan was to do everything possible, and to make every effort, short of seriously inconveniencing anybody. Now, as then, the sticking point has evidently not yet been reached, and until it has there is little hope of a change in policy. In April, 1940, *The Economist* wrote of the economic policy that then mirrored the Government's general attitude:

We must pin what hopes we can to the possibility that, by the autumn, the need for a revised policy will be too pressing to be denied, and that by that time, through a change of personnel or some other minor miracle, a breath of realism and courage will have blown through the windows of the Treasury. Then, the prayer was granted in the most literal fashion and, by the autumn of 1940, the Treasury was fully open to the air. Now also, there will be no prospect of a radical escape from things as they are, of any change in the policy of "Crisis as Usual," until politicians are similarly willing to forget their party programmes and their personal ambitions. The sticking point may come this autumn, or it may wait until 1948. But it is surely coming.

★

The debate was properly focused on the immediate problems of the next few months. But there were some longer-term implications of which it would be as well to take note. Both sides showed some concern with the concept of democratic planning, and there was obvious heart-searching on both sides of the House. Democratic planning as interpreted by the White Paper is obviously not a very effective or satisfactory system of managing the nation's economic affairs. The Government are almost openly faced with the dilemma of either going forward until their planning is no longer democratic or of going back until some of their followers will say it is no longer planning. It is getting clearer with every week that the present variety of controlled economy, with all its deliberate distortions, can be made to work, only if it is possible to direct labour by compulsion to where it is required. There was a phrase in Sir Stafford Cripps's speech in which he appeared to contemplate

compulsion of manpower not only in wartime but also "as may be necessitated by some urgent economic crisis." But on the whole, the Labour Party may be relied upon to resist conscription of labour as least as strongly as anyone else. But if they do, they will sooner or later, and in greater or less degree, be forced back into the un-socialist arms of uncontrolled markets and the free price mechanism.

In this situation it might have been thought that the tactics of the Opposition would have been to make the dilemma appear even sharper than it is, to launch a counter-offensive against all forms of planning and generally to emulate the "free enterprise" campaign of the American business man. The debate would then have seen a lining-up of opposing forces, some determined to plan at any cost, others determined to scrap all the planning machinery. Instead, there was a most significant attempt, on both sides of the House, to find some common ground and to insist that, if the present attempt at democratic planning were no great success, another attempt must be made. Mr Eccles made this point most clearly.

I am surprised continually at the poor show the Labour Party has made of planning. . . . There must be behind that incompetence some underlying weakness. . . . I am sure that an immense amount of harm has been done by the confusion between planning and controls. Planning and controls in this country are irreconcilable enemies. The better the plan the fewer the controls; the more the controls the less flexibility we have in our economy, and without that flexibility it is not possible for a British Government to plan for abundance. . . . The purpose of planning is to take something off the ration and the purpose of a control is to put something on the ration. The Labour Party have been too afraid of their vested interests to draw up an overall plan. The tragedy is that, under the lead of the Chancellor of the Exchequer, they have been able to console themselves for the shortcomings of their plan by their faith in their controls.

Some encouragement, in a long-run context, can be derived from language of this sort when it is held by rising members of the Conservative Party. It is already beginning to merge from a possibility to a probability that the Labour Government's economic policy will be an open failure, for which they will pay at the polls at the next General Election. If this were to mean a blind reaction to Brummagem Conservatism of the Chamberlain brand, then the long-term outlook for the country would be as dark as the short-term prospect undeniably is. But if a false start in democratic planning were to be followed by a second and sounder attempt to master the economic environment by methods of freedom, then it would still be possible to believe that the British people will yet, through the interaction of their parties, show the world how to solve the major problem of twentieth-century democracy.

Mr Bevin's Brief

PUBLIC diplomacy as practised by Mr Molotov sometimes recalls the Mad Hatter's Tea Party. In Moscow on Monday he welcomed his fellow Foreign Ministers with a speech in which he said they were gathered together to "consider" a number of questions about the settlement of Germany and for "discussion" on the Austrian treaty. Shortly afterwards he proposed that they should begin discussing the situation in China. General Marshall, who has said he will not stay in Moscow more than a month, asked for a day to digest this *hors d'œuvre*; and the afternoon's work ended with unanimous agreement on Mr Bevin's proposal that Prussia should disappear from the map, split up for ever into the present separate provinces.

The procedure is not as crazy as it sounds. The four Foreign Ministers represent empires; their interests rub together over vast areas outside Germany. Misunderstanding

between them flares up more hotly and more often in Germany than elsewhere, but it is always smouldering in the Balkans, in the Middle East, and in China and Japan. Mr Molotov was giving a startling, eccentric but useful reminder that bargaining may be done on the fringes of the negotiations about Germany and Austria; bargaining which began a fortnight ago when he made no objection to the Americans' proposal that they should make themselves trustees over the Pacific islands formerly under the Japanese mandate and so anticipate the Pacific peace settlement. It may be that Mr Molotov, with Mr Stalin close at hand, sees a chance to get away from the piecemeal approach to a post-war settlement, to raise hopes of a wider understanding between the new American Secretary of State and himself, leaving Mr Bevin isolated in his determination to settle German business first.

The British need to get decisions about Germany and

Austria during the coming weeks is more urgent than that of any other Government. Over a third of this country's expenditure on German food and administration has to be paid for in dollars. Failure to carry out the economic unification of Germany, to pool the food and industrial resources of the four zones and the occupying Powers, has created a liability which seriously strains British economic strength. Even the industrial recovery programme planned with the American zone cannot begin to make good the losses suffered until four or five years have passed. Even if the British Cabinet were not vitally interested in the economic recovery of western Europe as a whole, self-interest of the crudest kind would force them to advocate and assist German industrial recovery. It is a tragedy—for which the Russians have themselves largely to blame—that every British and American measure taken to that end has encouraged the suspicion in Moscow that "certain circles" intend to build up the strength of western Germany to the point where it will restore the balance of power on the Continent. Whereas the French have merely doubted the will and ability of the British and Americans to control a revived Germany, the Russians have chosen to believe in a plot to use Germany against themselves. The belief needs no elaborate explanation; it springs from the Soviet conception of politics as naturally as cynicism about Germany springs from French memories of three wars. So long as it persists, the Russian tactic will be to delay a German settlement, to insist on detailed and long-term undertakings to nip German aggression in the bud, and to seek outside Germany opportunities to divide Britain from the United States.

It will therefore need all Mr Bevin's patience and determination to keep the conference moving towards the chief British objective: an agreed provisional economic and political regime for the whole of Germany, which will enable it to pay its way. The French and the Americans have no such vital interest in preventing delay. American policy on Germany reflects an odd mixture of motives. Predominant is the fear of a central German government in Berlin, controlled sooner or later by Communists. Next to it comes a not wholly disinterested anxiety to see Germany contributing to prosperity in western Europe; next to that a genuine belief in the possibility of re-educating the Germans and converting them to the peaceful and democratic way of life. The Americans have plenty of dollars—if only Congress will provide them—and they are under great pressure to speed up the political rather than the economic restoration of Germany, in order to reduce their occupation forces. They push ahead more rapidly with new governments and constitutions in their own zone than with economic policies for Germany as a whole.

The French, too, are in no hurry for a German settlement, unless it produces a regime for the Ruhr which gives them economic supremacy in western Europe, and so lasting security

against German resurgence. Their aim is to keep Germany weak, by one means or another. Communist strength in their own country prevents them taking an active part in the Soviet-American duel and their interests outside Europe do not clash with Russian interests.

Here are reasons enough for expecting no German peace treaty for a very long time to come. What, then, if anything, can emerge to Britain's benefit? First, perhaps, a four-power pact of mutual assistance to prevent German rearmament, on the lines suggested by Mr Byrnes. There could be no more binding guarantee of a permanent American interest in European peace than this; no more concrete evidence for the Russian public—whatever their rulers may choose to think—that there is no Anglo-Saxon plot to throw the weight of western Germany into the scales against the Soviet Union. If anything can create confidence between the Foreign Ministers, this should. Secondly, progress may be made in strengthening the existing Anglo-Soviet alliance, which provides not only for joint action against German aggression, but for co-operation in European reconstruction. This would constitute further evidence of British determination to keep Germany harmless and a possible basis for broaching Mediterranean and Middle Eastern questions later on. Thirdly, a peace treaty may be made with Austria, making possible the withdrawal of troops from the four zones, a truce to the daily frictions of Allied control in Vienna, and in due course an approach to the problem of the Danube. Fourthly, there may be agreement to revise the plan produced at Potsdam for the level of German industry, within the limits of which Germany cannot pay its way. Lastly, detailed instructions may be given to the deputies to continue to work on a draft treaty.

In other words, it is unwise to hope that Mr Bevin will be able to do more than assist in creating an atmosphere of confidence in which the programme of German recovery worked out for the British and American zones can be developed without destroying all hopes of Soviet agreement to later political and economic unification of Germany. Even from this work there will be exasperating, perhaps fatal distractions; disagreement about Germany's eastern frontier, about the Control Council's report on the working of the Potsdam agreement, about reparations from current production, about the elimination of Nazis, the employment of German technicians and the destruction of German armament plants. These will occupy the ministers in the conference room. Outside it there will certainly be distractions. Mr Stalin is unlikely to miss this chance of trying the mettle of General Marshall.

What should be Mr Bevin's attitude to these distractions from the agreed agenda? The Soviet *New Times* said on the eve of the conference that "real progress in international affairs—including a solution of the German problem—is only

27th March, 1947

The results of the Society's first post-war triennial valuation will be fully reviewed at the Annual General Meeting to be held on the above date and reported subsequently in this paper

Whose Victory in Asia?

IF a Nazi and a Japanese militarist were to-day to survey the countries recently overrun or threatened by the aggressions of the Axis Powers, it is probable that the latter would find more satisfaction than the former in the enduring traces of his defeated policies. In Europe, indeed, there are turmoils and tensions in plenty, but they arise from conflicts among the victors rather than from any post-war activities of former friends or protégés of Germany. The race of quislings and collaborators in what was German-occupied Europe has been virtually wiped out; Franco survives, but he is at least subjected to verbal penalties by the United Nations. In several Asiatic countries, on the other hand, ex-collaborators flourish, or their memory is honoured, in spite of the Allied victory over Japan. The reason for this is the support which the Japanese in their own interest gave to forces of insurgent nationalism in Asia, other than Chinese, and although these forces were of little use to Japan when the tide of war turned and have indeed broken away from association with Japan in defeat, they have given a queer twist to Allied victory from India to the Philippines.

In 1941 there were in Asia east of the Indus and south of Siberia only three independent states—Japan, China and Siam. In India, Burma, Malaya, Indonesia, Indo-China and the Philippines some degree of rule by Western nations was established. It was this world of dependent territories which Japan, an Asiatic Power, invaded, and it was obviously to Japan's advantage to promise independence to the subject peoples and proclaim a war of liberation from colonial rule. Moreover, the fact that the Japanese had already been making war on China meant that they could exploit antipathies against China which existed where Chinese immigration had created minority problems in relation to the native population.

The countries under Western sovereignty were in various stages of constitutional development. The Philippines were the most advanced in progress towards self-government; there was already internal autonomy under a "Commonwealth" government, and full independence (with reservations about American naval bases) had been promised for the year 1946. Burma came next; there was already an elected legislature and a responsible Burmese Cabinet, but wide powers remained to the British Governor and no dated pledge of independence had been given. In India there was provincial self-government, but progress towards responsible government at the centre had been held up. In Malaya, Indo-China and Indonesia the structure of colonial rule had been little affected by the movement towards transfer of authority into the hands of elected native representatives. Moreover, in parts of all these countries, except the Philippines, there was a system of indirect rule through native princes and chiefs; these, long accustomed to external control and mainly concerned about retaining their position and revenues, were obedient enough to the existing regime, but for the same reasons were for the most part ready to transfer their obedience without great reluctance to a power which proved itself stronger.

In no one of these countries, not even in the Philippines, was there any national control over foreign policy. The foreign policies which determined their relations with Japan were decided in London, Washington, Paris and The Hague. It was not the Burmese, but the British, who decided whether the Burma Road was to be kept open or closed; the Japanese had no more say in the Dutch decision to join in applying economic sanctions to Japan after the entry of Japanese troops into southern Indo-China than the Annamese had in the French decision to permit that entry. In the Philippines the economic measures

taken against Japan by decree of the President of the United States were very unpopular with Filipino business interests, for there was a lively Japanese demand for Philippines minerals—iron, copper, manganese and chrome—which were not marketable in America.

There is, indeed, no reason to believe that any of the dependent countries of south-east Asia would have taken economic action against Japan if their native national leaders had had the choice. But the measures taken on their behalf by Western Governments were passively accepted on the assumption that the Western Governments were at least able to protect from invasion and devastation the countries which they ordered to cut off supplies from a great naval and military power. But when the time came, it turned out that neither the Americans nor the British nor the Dutch were able to defend the countries which they had committed to operation of their policies. Their unsuccessful efforts at resistance only brought the horrors of war on to the heads of the population. The one country which remained unscathed in the great forward sweep of Japanese power was Siam, whose Government at once capitulated and joined the aggressor.

That the Japanese were never able to achieve popularity in any of these countries was due primarily to the attitude and behaviour of their troops. Whatever measures might be devised by Japanese politicians and propagandists for winning over Asiatic peoples in the struggle against the West, they were unable to alter the character of an army trained to regard itself as the instrument of a divine authority, to wage war with the utmost ruthlessness and to treat all non-Japanese as inferior beings. Everywhere the man in the street—or in the jungle—became disgusted at the arrogance, cruelty and rapacity of the Japanese soldiers. Moreover, the Japanese were unable, even to the limited extent to which they might have wished it, to bring to the occupied territories anything like the "co-prosperity" of which their propaganda talked.

Nevertheless, the Japanese did attract support by a policy of rewards to anti-Western nationalists. They set up and gave

diplomatic recognition to three formally sovereign independent States—the Philippines and Burma within the sphere of their occupation and "India" represented by the "Government" under Subhas Bose, first in Singapore and later in Rangoon. A fourth State, that of Indonesia, was prepared in the last months of the war, though it was only formally proclaimed after Japan's surrender. In Indo-China the Japanese were content to maintain French authority nominally intact until the spring of 1945, when it became clear that the French administration and troops would turn against Japan at the first opportunity and the Japanese were forced to suppress them; by this time the Annamese revolutionary nationalist movement had become so closely associated with Chinese support that the Japanese could make no use of it, and all they could do was to proclaim the independence of the French-protected kings of Annam, Cambodia and Luang Prabang and take over direct control themselves in Saigon and Hanoi.

The Japanese had not under-estimated the immense importance for Asiatic nationalists of the outward semblance of independence. The Japanese certainly intended to keep in reality the tightest control in future over all the countries of Greater East Asia, and the creation of the new sovereignties did not interfere with the almost unlimited powers of the Japanese army commanders in their respective zones. But the Japanese understood well, what the Anglo-Saxon so often does not, the humiliation of lacking recognised national independence, the injury to pride which is suffered, particularly by the educated section of a subject people, and which tends to rankle to the exclusion of rational calculations of gain and loss. For this reason the Japanese let their puppets have all the outward trappings of sovereign power.

The results of Japanese political warfare can be seen to-day in the political standing of leaders, who either actively co-operated with the Japanese or adopted a neutral attitude. In India, the dead Subhas Bose is regarded in Congress circles as a national hero, while public honour is given to the Indian soldiers who joined his army to fight under Japanese command.

NOTES OF THE WEEK

No Respite for MPs

It does not appear that the present sittings of Parliament will differ in character from those before the Christmas recess. In the two weeks since the House of Commons reassembled, the second readings of the Agriculture Bill, the Town and Country Planning Bill and the Electricity Bill have been held, and the standing committee on the Transport Bill, increased in size to 50 members, has begun its sittings. The Government, it is quite clear, is determined that its legislative programme shall be completed at all costs.

What is the cost? On two occasions this week, the Opposition protested against the way the House is being driven. Mr Eden called attention to the fact that although a debate on the world food situation—at the Government's instance, it is worth pointing out, not the Opposition's—had been fixed for Thursday, the full report of the preparatory commission of the Food and Agriculture Organisation, which should clearly be one of the chief raw materials for the debate, was only available on Tuesday. He therefore asked that the debate should be postponed for a week to allow members time to study the report. This very reasonable request, which was supported by Mr Wilson Harris, an Independent, was turned down flat by Mr Greenwood, whose attitude appeared to be that members should find time, and that the pre-arranged Business of the House cannot, under any circumstances, be disturbed. The second protest was made in Standing Committee on the Transport Bill, which after this week is to sit three mornings a week. As there are some 800 amendments down to the Bill, which is not only highly controversial but also the most important measure of the session, a three-day week is almost inevitable if its committee stage is to be completed, as the Government wishes, by the end of March. But MPs, as Sir David Maxwell Fyfe reminded the Minister of Transport, are not expected to be concerned merely with the Bills they are specially charged with in Standing Committee. They also have to consider the other Bills

The Congress Party itself, which refused all co-operation in the war against Japan and attempted an insurrection when the Japanese were approaching the borders of India, retains undisputed leadership of Indian nationalism, except in so far as it is challenged on communal grounds. In Burma, no politician who remained unequivocally loyal to Britain throughout the war seems now to have wide political influence; the two strongest candidates for power are Aung San, who organised the Burma National Army to fight on the side of the Japanese, but subsequently made secret contacts with the British and turned against Japan in the last phase of the war in Burma, and U Saw, who was interned by the British at the beginning of the war for secret correspondence with Japan. In Siam, the anti-Japanese faction came to power when Japan weakened, but no harm has befallen Pibul Songgram, who declared war on Britain and the United States; he is remembered as the statesman who enlarged Siam's territory and saved the Siamese from the scourge of war which swept Burma. In Indonesia the Japanese protégé, Soekarno, continues to be President of the Republic and men trained by the Japanese formed the nucleus of its army. In the Philippines, those who openly sided with the Japanese have been swept away, but the recent Presidential Election was won, not by Osmeña, who (after the death of Quezon) headed the resistant Philippine Government in Washington, but by Roxas, whose attitude during the war was ambiguous and whose following included many politicians seriously compromised with the invaders. Only in Indo-China is nationalism fairly free from a pro-Japanese past, and that is because there it was the French rulers who co-operated with Japan, while the Annamese sought the protection of China.

It is, indeed, a striking picture that the Asiatic scene presents; from a Western point of view it is hardly a pleasant one, but it is better that we should recognise, without deceiving ourselves, that in each of the countries surveyed above, the late war appeared primarily as a struggle between outside Powers, which it was right for a patriot to utilise according to opportunity for the attainment of national independence.

before the House—not to mention their other parliamentary functions or their own private pursuits in earning a living.

It is not, it should be emphasised, merely the Opposition which suffers from this furious driving on the part of the Government, although it is clearly a more obvious loss to the country if the Opposition is not to be allowed to perform with due care its constitutional function of opposing. Individual members as well, and Labour back-benchers in particular, inevitably feel sore and frustrated when they are pushed along the legislative course, which they neither help to chart nor are allowed to modify, with such speed that they cannot attend properly to their non-legislative functions. It is high time that the Government realised that a member has a wider duty than simply to give silent support to whatever legislation it introduces.

Administrative Break-down?

This over-concentration on new legislation is having its effect on members of the Government as well. In addition to giving legislative form to Labour's policy, they are responsible for the day-to-day work of their departments. But how can Mr Barnes and Mr Strauss give proper attention to their departmental duties when one or both of them has to be in Standing Committee on the Transport Bill three mornings of the week and, after the committee adjourns, be briefed on the amendments to be discussed on the following day? How, in particular, can Mr Shinwell give his full attention to the Electricity Bill and to the serious fuel shortage at the same time? It is hardly surprising that, in the circumstances, Ministers tend to be overbearing in debate, refuse to listen to telling points made by the Opposition, and refuse to make concessions even when the facts of the case and informed opinion are clearly against them. One has the feeling that their

possible by strengthening and developing co-operation between the great Allies." If this means that a four-power pact and a new Anglo-Soviet alliance would make agreement about Germany easier, the sentiment is irreproachable. But if it means that decisions on how Germans are to live in the immediate future must wait on a global agreement of the Yalta kind—in fact a fresh definition of spheres of interest between the Russians and the Americans—it is unacceptable to any British Foreign Secretary in the present situation. His country, too, faces a struggle to live and pay its way; it cannot put off any longer measures to help 20 million famished and resentful Germans to do the same. If the conclusion—or the offer—of solemn engagements to keep Germany harmless, detailed and prolonged to an extent unprecedented in our peacetime history, is not enough to allay Soviet suspicion of British intentions, then Mr Bevin should be ready to pursue a zonal policy with the

Americans, and darn the consequences of Russian displeasure. Mr Bevin may well have to take this line. He can expect little understanding and sympathy for his case from Mr Molotov. The economic crisis facing Britain is different in kind from that which now occupies the Soviet Government. They have no inescapable dollar problem, no need to sell goods to buy food. They can isolate themselves from the effects on Europe of continued stagnation in the German economy. Mr Bevin has to convince them that he will not postpone further the economic recovery of Europe and the saving of £120,000,000 on the British Budget while they insist on guarantees and evidence of British good faith beyond those already offered. He has already given the warning in the House of Commons before leaving: "I should say nothing to saddle this country with increased liabilities." The brief is clear and Mr Bevin should stick to it.

Development or Welfare?

IT is just over seven years since the development and welfare policy for the colonies was inaugurated. On February 20, 1940, a White Paper was published which declared that the sum of £5,000,000 a year for five years would be made available by the British taxpayer to enable the colonies to undertake projects that they could not finance from their own resources. In the succeeding years, this White Paper was followed by two Acts, more White Papers and despatches, as a result of all which the term "development and welfare" has become as familiar to those working in and for the colonies as are the older concepts of trusteeship and the dual mandate.

In the course of the last seven years, too, the scope of development and welfare has been greatly increased. Finance from the United Kingdom can be counted upon at least until the year 1955 and to a total of £120 million during this period. More important, Colonial governments no longer regard the Development and Welfare Fund merely as a means of financing isolated projects such as a new bridge here and a library there. They have been instructed to draw up ten-year plans to promote the advance of their territories all along the line; and for the execution of these plans finance from the Fund is supplementary to what can be raised from their own resources and from loans.

These ten-year plans are gradually being completed, and the table at the foot of page 365 shows the expenditure contemplated in several colonies, distributed under different heads. It will be seen that big expenditure is planned for the social services, in particular the health services and education. This is not surprising in view of the neglect of the social services in the past. The medical and health services of Nigeria, say the compilers of the Nigerian plan "are far below the average in the Colonial Empire and, in some respects, as bad as anywhere in the world." Again, the Jamaican Agricultural Policy Committee, reporting in 1945, stated that "there can be few countries where the over-all state of rural housing is worse than it is in Jamaica." The reason for this neglect is very simple. The colonies could not afford social services because their resources were too small. The purpose of linking development with welfare, therefore, was to encourage the colonies to increase their wealth so that they could eventually support the social services out of their own resources. If assistance had been given by the British taxpayer for welfare projects alone, there would have been no prospect of colonial peoples ever being able to do without that assistance, and "he who would be master in his own house," as the Comptroller-General for Development and Welfare in the West Indies has pointed out, "must be able to meet his bills."

What, therefore, one looks for anxiously in the development and welfare plans that are now appearing is some sign that development will proceed fast enough for the colonies to be able to carry their own burden of social services in the foreseeable future. Unfortunately, this sign is nowhere in evidence. It is not that the problem is not recognised. The residual recurrent expenditure on the various projects at the end of the ten-year period is estimated, and the question of whether the colony's finances will be able to support it is then discussed. But it tends to be regarded as a financial problem only. For instance, the Secretary of State, commenting on the plan for Zanzibar, which allocates more than one-third of the total expenditure to education, pointed out that too little attention had been paid to the development side of the programme, but agreed to the heavy commitments to education provided that the people of Zanzibar are "prepared to bear the additional taxation which will be necessary to provide the finance required." Nowhere does the plan produce estimates to show that the people will be, not only prepared to shoulder this commitment, but able to. At the present time, the people of Great Britain are being told that they are heading for bankruptcy if they continue to demand the same or a higher standard of living without contributing an increased output of goods and services in return. Yet the colonies are being encouraged to plan for a higher standard of living long before it is clear whether they will be able to maintain it or not.

This does not mean that development and welfare should be regarded as mutually exclusive. In the colonies, where the present standard of living is so low that for the average man life is a prolonged struggle for subsistence, it may well be that health and educational services will have a direct effect on productivity. It is certainly premature to assume, as is so often done at present, that the African and West Indian are permanently incapable of doing an honest day's work, until their attitude has been tested in a better environment than is their lot to-day. But against this must be set the fact that every extension in the health services, every success in reducing mortality, will increase the number of people whose needs will have to be met. Unless development proceeds fast enough to enlarge the absorptive capacity of the colonies, it will soon be a question not of raising their standard of living but of preventing it from falling below its present low level.

This danger is at present most clearly apparent in the West Indies, and it has been stressed in every report and survey, official and unofficial, that has been published. In Jamaica, it is estimated that 20,000 adolescents come on to the labour market every year. Even if the object of an intensive system

of agriculture—at present, only one person is engaged in agriculture for every five acres of agricultural land—were achieved, it would be impossible, so the Agricultural Policy Committee declared, for the land to absorb all the available and expected manpower. If an attempt were made to solve the unemployment problem by land settlement, it would only be at the expense of agricultural efficiency, which requires increased mechanisation in order that the output from the land can be raised from its present low figure.

The picture is one of decreasing productivity of land, with ever-increasing expenditure necessary to remedy that condition, and of a rapidly increasing population with increasing demands for the products of the soil.

Jamaica cannot hope, so the committee argued, to pay for all the imports required to maintain a reasonable standard of living for the islanders. The balance must be supplied locally, even though the local costs of production are high.

It is impossible, therefore, to suppose that there can be much hope for increasing the standard of living in the island, unless a determined and constructive effort is made to use the resources of the country for every industrial purpose for which they are suited.

Yet, on examining Jamaica's ten-year plan, what does one see? The sum of £250,000 is allotted to industrial development, and it is declared that "any programme of industrialisation which will be feasible in the immediate future cannot but detract from the essentially agricultural background of the country. . . ." But the plan fails to answer these questions. Can agriculture, which only receives a slightly larger allocation than is given to the health services, support an increasing population at the higher standard of living aimed at and illustrated in the allocations to the welfare programme? If not, at what standard of living can the population be supported? Or, if the higher standard of living is to be pursued, how many people can be maintained at that level, and what is to happen to the surplus?

It is not only in the West Indies that these questions need answering, although they are there most urgent. In the Fiji plan, too, the rapid increase in the population, together with the shortage of land, is admitted to raise a serious problem, but it is dismissed with the statement that the aim of raising the standard of living would consequently be frustrated if there were a substantial and uncontrolled influx of immigrants into the colony. It is true that the economic budgeting required to answer these questions would be virtually impossible in many colonies, where the essential statistics are lacking. The Kenya plan does at least raise them, and it is significant that it is the only one to attempt to scale down the welfare side of the programme to a more practicable size. But until they are answered, how can any one say whether the purpose of the plans will be fulfilled?

The truth is that, as successive Secretaries of State have fully realised, the purpose—raising colonial standards of living—

cannot be fulfilled without a far greater investment of capital than is contemplated in the ten-year plans. It is thus presumably more than a coincidence that the last few months have seen a start in the formation of public corporations, first foreshadowed by Mr Stanley in 1945, to carry out development projects in the colonies. The first is the Cameroons Development Corporation, which will run the former German estates in the Cameroons on behalf of the native peoples and provide welfare services—for health and education—out of its own revenue.

★

But this pioneer scheme has been completely overshadowed by the recently published "Plan for the Mechanised Production of Groundnuts in East and Central Africa" (Cmd. 7030). Here at last is the sort of economic planning that is needed to change the face of the colonial empire. Welfare services will accompany the production scheme, for each unit will be a model centre of "improved standards of housing, health, nutrition and welfare." But from the African viewpoint the importance of the scheme lies in the economic development that is envisaged—in the revolution in agricultural technique primarily, but also in the indirect development that will follow from the improved communications and water supplies in the project's areas and from the eradication of the tsetse fly. Stock-farming and local processing industries are among the secondary developments contemplated. It is difficult to decide which is the more encouraging part of the investigating mission's report (it is interesting and significant that of its three members one was chairman of the Jamaican Agricultural Policy Committee)—the vision with which they look to the future and describe the immense potentialities of the scheme, or the hard-headed practical thinking and costing which have gone into the immediate plan for producing groundnuts.

But two things should be emphasised. First, the amount of capital that will be invested in the scheme is £25½ million; the total area involved is 3,210,000 acres; and the farming operations will employ 32,000 Africans. The combined development and welfare plans for the whole of the three colonies concerned—Tanganyika, Kenya and Northern Rhodesia—contemplate a total expenditure of only £47 million. This comparison shows how totally inadequate are the colonies' resources, even when supplemented by the Development and Welfare Fund, to carry out the big development schemes that are needed. Secondly, the £25½ million that will be granted by the British Treasury for the production of groundnuts will be forthcoming because of the world's, including Britain's, shortage of fats. In other words, the needs of the world come first; the needs of the colonies—the urgent crying need to raise their standard of living—are only a secondary consideration. What has now to be decided is whether capital, on the scale of the groundnut plan, can ever be got into the colonies primarily for their own sake.

	DEVELOPMENT £000						WELFARE £000					MISCELLANEOUS £000

FOOTNOTE: The statistical summaries of the plans have not all been drawn up on the same lines, and it has not been easy to allocate each of the different items to its appropriate heading. In particular, some plans distinguish between irrigation and water supplies to towns and villages, and others do not. When it appears that the expenditure on "water development" is primarily for the purpose of supplying piped water to the inhabitants, it has been allocated to "town and village development."
 * Includes items classified as "miscellaneous" in the plans and other items, such as tourism and fisheries, which are either peculiar to one colony or not large enough to specify separately.
 † Included in agriculture. ‡ Includes £1,500,000 for "rural development," that is, centres for training Africans for both development and welfare projects.

Reconciliation and Divorce

POLITICIANS are apt to fight shy of divorce. It is a subject on which opinions are deeply felt and tenaciously held; from the politician's point of view it suffers from the disadvantage that these opinions run across the normal lines of party cleavage. Strong opinions which the Whips can manipulate are the motive force behind Parliamentary life. When they break loose from party channels they may provoke an outstanding debate in the Commons, but Heaven knows what damage they may do in constituency organisations. This may be one explanation of why Parliamentary action on divorce usually lags some twenty years behind public opinion.

Wars breed matrimonial troubles. The causes are easy to see and the remedies hard to find. In the majority of cases from the last war the damage is already done and divorce is the only remedy—no remedy to the broken marriage, but at least providing the circumstances in which the partners to that marriage may make an attempt to build up again something from their maimed personal lives. The divorce courts, too, constitute an authority, independent of the passions and prides of the parents, which can safeguard the interests of the children of the former marriage. So far as the courts are concerned, what is needed from them is a clean and aseptic surgical operation. Delay and clumsiness are as dangerous there as they are on the operating table. Most fortunately for Britain, that need has been realised in the quarters from which action can be initiated. The Lord Chancellor has used his responsibilities as head of the judicial system with intelligence and courage, and the Committee he appointed in June last has carried his intentions into full effect. The final report of this Committee, commonly known as the Denning Committee, was published recently and no words could be too high to commend its activities. In seven months the Committee has produced two interim reports (on which action has been taken), and has now presented a final report of a quality demanding the closest attention from any thinking adult.

The wreckage of the war can be tidied up. A task of a different order is the problem of the future. Is the family an important social unit? If so, what can society do to preserve it from shipwreck? The answer in the Report is clear. For those who are unmarried, social education in the wider sense. For those who are married, the provision of an instrument, and a technique, that will undertake the task of reconciling differences between the spouses at the point when the prospects for permanent reconciliation are at the brightest. That raises the immediate question: is the State to undertake either task, directly or indirectly, and if so to what extent?

The conclusions of the Denning Committee are that the State is directly concerned. It considers that it is "a function of the State to give every encouragement and, where appropriate, financial assistance to marriage guidance as a form of Social Service." It rejects Lord Merriman's plan, outlined in his recent speech in the Lords, to make an attempt at reconciliation a part of the normal procedure of a divorce application. It considers that such a step would leave the attempt too late in the day for substantial success, and in any case introduce too formal an organisation for such a personal task. It advocates, instead, the extension, and support by grants-in-aid, of the activities of marriage guidance organisations and court probation officers, who are already experienced in this work. In addition, it suggests the appointment of court welfare officers, and details what it considers should be their duties and qualifications. All these reforms can be introduced without the need for legislation.

Thinking on divorce is handicapped by a divided allegiance between the claims of religion and the claims of the social

structure of the State. Roman Catholics and the majority of the Anglican and Nonconformist churches hold the view that a Christian marriage is indissoluble by human agency. Even where they admit of special cases, that fundamental attitude colours their thinking on the whole subject. And, if marriage is indissoluble, reconciliation is not important—in fact, it is irrelevant. It makes no difference to a sacramental marriage if the partners are unhappy or happy, faithful or inconstant. They will answer for these actions, as individuals, in another world to another judge. Here they must work out their individual salvations within the fixed status that their marriage has given them. A friend or a priest may intervene to help. The State has no duty, and no right, to attempt to do so.

Those who do not possess the faith of which a sacramental marriage is part see a marriage that is in difficulties from another aspect. As the Welfare State develops, it is increasing its concern to see every obstacle in the way of the happiness and development of each individual removed. The State is concerned to provide every kind of treatment and support in respect of physical illness. It attempts to abstract insecurity from employment, and so free every individual, and family, from its basic fear. It endeavours to set up a general goal of community effort and community consciousness. It cannot—nor, in fact, does it—leave out of its activities the welfare of such a socially important thing as marriage. But it could go very much further and do so very much faster. If free education, hospital services, compensation for industrial injuries, pre-natal care and supervision are important, surely an organisation to care for a marriage in danger is even more so?

The final report of the Denning Committee deals with every aspect of matrimonial difficulty, including the technique of reconciliation. It is to be hoped that the Government will have enough foresight and moral courage to take action at once on those of its recommendations which can be carried into effect without legislation. Some require legislation. At the end of the present Session the greater section of the Government's electoral plans for socialisation will have been completed. To achieve that rapid conversion of so much of the economic life of the country, the Government have already sacrificed an urgent measure of criminal justice reform. They cannot defer that Bill again. Nor should they defer the question of divorce law reform. A Government does not live, nor do a people, by the bread of economics alone.

In essence, the solution is simple. Freedom to hold a faith or belief implies freedom to allow others to differ—there are limits to that, where the political security of the State is concerned, but this is not jeopardised by the difference between the sacramental and the social view of marriage. Whatever action the State takes, the result must be to leave any acceptance of its aid a voluntary decision of the person seeking it. Compulsion would not only make it ineffective; it would be wrong in itself. On the other hand, those who hold that each marriage must be left to work itself out should recognise that they have no right to force that view on others, or, more important, to use their influence to deny others the access to information and guidance from a public organisation. That influence is used in many ways, direct and indirect; it still remains intolerant, an unwillingness to admit that another opinion might be right.

In the end, this issue will be settled by the man in the street, not by the politician. If the politician dare not lead, he must be driven, and only an informed public opinion can drive. This is the final reason for expressing thanks to Mr Justice Denning and his Committee. They have prepared the brief.

NOTES OF THE WEEK

Washington and Moscow

For the time being the Foreign Ministers have resisted the temptation to turn attention from Germany and Austria to such matters as China and Japan—that is, they have, at any rate, kept them off the formal agenda. Mr Molotov will doubtless let off a firework from time to time, to light up promising by-ways of negotiation outside the conference room, but he is unlikely to find anything to make so much noise and attract so much attention as President Truman's speech to Congress on Wednesday. It combined ideology and realism in a manner which challenges the Communist monopoly of this kind of diplomacy. It is the argument used, rather than the aid for Greece and Turkey proposed, that will have to be answered: "I believe," said President Truman, "it must be the policy of the United States to support free peoples who are resisting attempted subjugation by armed minorities or by outside pressure." Even more challenging is the demand that Congress should recognise that "totalitarian regimes imposed on free peoples, by direct or indirect aggression, undermine the foundations of international peace and hence the security of the United States."

The assumption by the Americans of responsibility for the *pax Britannica* at the point where the Russians look out on the Mediterranean and where Europe and the Middle East meet must make Mr Molotov more eager than he was already to find out the full contents of General Marshall's brief.

From the British point of view it is good that Mr Bevin's thesis and that of the Russians on the economic future of Germany already confront one another. Mr Molotov has objected to British delays in destroying potential war plants in their zone, revealing that 676 plants in the eastern zone have already been "removed"—which is not the same thing as destruction. Mr Bevin, who might have retorted with questions about synthetic oil plants in full production under Russian direction, insisted that fulfilment of the Potsdam Agreement and revision of its level-of-industry plan should come first. Both parties could, if they wished, meet allegations of breaches of Potsdam by counter-allegations, each showing what a keen eye its intelligence service keeps on the other's zone. Such skirminshing is inevitable and so far it has sounded less bitter and determined than might have been expected. It is a hopeful sign that the Foreign Ministers will themselves discuss the Control Council's report on conditions in the zones and not shelve the issues by reference to the deputies.

The Conscription Bill

The Government has introduced what may well turn out to be its most difficult Bill of the session, difficult not because it will cause popular resentment on the ground that it is unnecessary, but because the principle of peacetime conscription is opposed by a large section of the Parliamentary Labour Party. The new National Service Bill is likely to be attacked, not only by Labour pacifists but by the back-benchers who hold that, in the present shortage of manpower, it is wrong to have considerable numbers of men in the armed forces.

Yet the Bill goes some way towards meeting all the objections. The provisions for deferment are as generous as had been forecast and make full allowance for the needs of higher education. More important, the Bill is limited in time until 1954, unless extended by Order in Council which will provide an opportunity for reviewing its necessity. Thirdly, it limits the period of service which conscripts will serve to eighteen months as a maximum—it may be reduced—plus five-and-a-half years in the Reserve. Thus, in effect, from the beginning of 1949, when the Bill will come into force, the total size of the armed forces will be considerably reduced, for eighteen months' conscription will yield about 300,000 men and the number of volunteers cannot be expected to exceed 450,000. Thus, at long last the Government has accepted 750,000 as the outside figure at which the armed forces can be maintained. If, as is very possible in these days of over-employment, the number of volunteers falls below 450,000, the size of the forces will be correspondingly less. What the Government's critics should now attempt to drive home is that, since the armed forces will have to cut their establishments, and the country its commitments, in accordance with this outside figure of 750,000 in two years' time, why should they not do so now? And they should ask the Government to show quite clearly what advantage is to be gained by eighteen months' conscription

instead of twelve. Will the benefit to the armed forces of an additional six months' training offset the extra social dislocation that it will cause?

Joint Planning Staff

Sir Stafford Cripps's statement in the debate on Monday that a new joint planning organisation is to be set up and that a man "of very special attainments and experience" is to be made the executive head of it, has been greeted with a hubbub of excitement and applause which events may not justify. The decision itself is necessary and overdue, as the absence of adequate planning revealed in the Economic White Paper has shown, but the appointment of the new man with a joint planning staff under him is probably much more a piece of essential administrative machinery than an altogether new driving force within the political ranks of the Government. Surmise has revolved around a number of figures who achieved fame during the war, but very few of these men have political views which are compatible with the central planning of a Socialist Government—or which would make their decisions acceptable to the present Cabinet. Nor is it probable that Mr Morrison would brook a rival on territory he has made so much his own. A Socialist Beaverbrook to provide the drive, working with a first-class economic administrator to provide the ideas, might well have been an ideal combination for the necessary jet-propulsion; but neither the candidate nor the political atmosphere is available, and it is far more likely that the appointment will be of an ex-temporary civil servant who has had experience of the organisation of production in wartime.

The failure to produce a *deus ex machina* should not, however, be allowed to obscure the rightness of the new decision on a more modest plane. The Government's planning, as revealed hitherto, has been far too limited both in time and space—limited to a few months ahead and split up between a number of departments which seem to have little concern for each other's activities. If the new planning staff produces a policy which looks far enough ahead, which concentrates on the real obstructions to economic activity and which mobilises all the departments in a single strategy, it will have done very good work. But the ultimate difficulty will still remain. To draw up an effective plan may be difficult, but it is child's play compared with the difficulty of getting a Cabinet of politicians to implement it. No amount of new planning machinery will be of much avail until Ministers are prepared to do things that their followers, their constituents and the keepers of their party consciences will equally dislike.

The Great Thaw

Life is once more limping back to normal. Commercial consumers, such as offices and shops, may turn on lights and electric fires with caution during the restricted hours; cinemas are showing full programmes and theatre matinées restarting; hairdressers can give permanent waves. Shorter newspapers, telescoped BBC services, burst pipes, leaking roofs and the menace of floods remain as the aftermath of the great freeze up.

The long-term effects of the crisis cannot be gauged so easily, but they will certainly be serious. The extent of industrial resumption is shown in the unemployment figures. Whereas, on February 26th, 1½ million were recorded as unemployed by the Ministry of Labour (of whom just over one million were "temporarily stopped" as a result of the switch-off), the total had dropped to half that figure by March 5th, and only 323,000 of the total of 780,000 were "temporarily stopped." Nevertheless, the period of uncertainty is by no means over. Discussions about staggering hours, to relieve the electricity load, are still going on, and no definite decision has yet been announced by the Government. Mr Isaacs, however, indicated in the economic debate on Tuesday that the TUC's suggestion for double day shift working would be adopted and that the original proposal for night work would be dropped. In fact, many individual firms have gone ahead with their own schemes for re-arranging working hours on this assumption.

When the respective merits of double day shifts and night work are debated, it is as well to distinguish between present and future advantages and needs. To relieve the electricity load, night

back to Germany since September. But the rate of the British scheme—15,000 a month from Britain and 2,500 a month from the Middle East—is still regrettably slow, although lack of transport is still the principal difficulty. Germany needs these younger men badly for social stability as well as economic reconstruction; the war has left two German women for every man in the middle-age groups. Productive workers are short and dependants overplentiful.

In this situation Germans will regard with suspicion the French Government's suggestion—accepted in outline by the Americans—that their prisoners of war should be given the option to remain in France as free workers. Admittedly, the Monnet plan demands an additional labour force of 1,200,000 in the next four years, and the French were counting on keeping as long as possible the Germans employed in mining, agriculture and reconstruction. But the type of immigration which the French propose is that which is most injurious to Germany, excluding as it seems to do any family units, women or children. Moreover, there has to be added to the number of those "lent" by the Americans who may choose to remain in France another 450,000 prisoners, captured by the French themselves, for whom there appears to be no scheme of repatriation at all. In spite of the fact that there is no sovereign German Government, there are no good legal grounds for the retention of these men, even though the Potsdam Agreement allows their employment on reparations account.

* * *

De Gasperi's Third Cabinet

One cannot but admire the patience and self-abnegation with which Signor de Gasperi keeps a frail barque of government afloat on the yeasty waters of Italian politics. After a twelve days' crisis, he has succeeded in forming his third Coalition, and certainly before him lies a remarkably thankless task. In the immediate future, the Italian Government must sign its peace treaty—a treaty which all parties agree in condemning and which has already caused a marked nationalist revulsion in Italy. And behind the treaty lie all the urgent unsolved problems of Italy's economic life—the ending of Unrra with its relief work for millions, the unbridged gap in the Italian balance of payments, the slow but unchecked rise in prices, the precarious outlook for the import of wheat and coal.

Signor de Gasperi's own party will bear the onus of these difficulties. That a distinguished Independent, Count Sforza, should be at the Foreign Office when the treaty is signed is less important than the fact that the Government which appends its signature to the document will be predominantly Christian Democrat. The Christian Democrats not only have the Premiership. They also control the key Ministries of the Treasury (now fused again with Finance), Foreign Trade and Agriculture, together with the Interior, Education, and Merchant Marine. If disasters befall Italy in the next months, the Christian Democrats are likely to bear the blame.

How will this affect their electoral chances next summer? The Republicans, the *Uomo Qualunquista*, and Signor Saragat's dissident Socialists are directly in opposition, and of these the *Uomo Qualunquista* are almost certain to profit by Italy's frustration over the terms of the peace. The fortunes of the Left wing parties are more difficult to gauge. The division of the Socialists between the followers of Nenni, who support co-operation with the Communists, and of Saragat who oppose it, is certain to lose both wings of the party a measure of working-class support. Signor Nenni's decision to leave only two supporters in the Cabinet and like Signor Togliatti, the Communist leader, to devote himself, outside, to electoral preparations, will hardly offset the confusion and disillusion introduced by the Socialist split. It is therefore likely that the Communists, who have also kept only two minor figures in the Cabinet, will profit most from the fact that, at a time of crisis and discontent, the Christian Democrats are carrying the main burden of office.

American Withdrawal from China

The decision to abandon the American effort to mediate a settlement between the Chinese Government and the Communists, and to withdraw from China the American military units still stationed there, was one of the first results of the replacement of Mr Byrnes by General Marshall at the State Department. It was a decision due neither to the ordinary process of policy-making in the Department nor yet to any general political views of the new

Secretary of State, but to General Marshall's recent direct personal experience of mediation in China. His experience clearly convinced him that mediation was useless and was only making the Americans unpopular in China. Although the withdrawal of the Marines is an act of policy which has long been demanded by Leftist circles in the United States, and can usefully be quoted in Democratic Party propaganda to "Fellow Travellers" as evidence of the progressive sentiments of the new Secretary of State, General Marshall should not be assumed to have taken his decision out of any sympathy for the Chinese Communists. At first sight Chiang Kai-shek's Government may appear to have been weakened by a withdrawal of American armed support, but it is by no means certain that he does not in reality gain politically from the move. The real intervention of the Americans in China, when they enabled Chiang Kai-shek to take the surrender of the Japanese in Tientsin, Peking and other cities which would otherwise probably have passed into the hands of the Communists, was finished many months ago, and since then the presence of the Marines has hardly affected the military situation; it was never intended to use them for military operations against the Communists, and American public opinion would not tolerate their being so used. On the other hand, their presence in Chinese cities, and their manifest opulence in a poverty-stricken country, have given the Communists a wonderful propaganda opportunity, of which they have taken full advantage. They have denounced Chiang Kai-shek as a puppet of American imperialism, imposing his rule on China with foreign military aid, and have accused the Americans of trying to turn China into a colony, even going so far as to compare them with the recent Japanese invaders. Now that the American forces are being withdrawn and Chinese soil is left once more to Chinese armies to fight over—for the Russian troops have long since departed except from Port Arthur and Dairen—both the Kuomintang and the United States gain in reputation with the Chinese public from their formal divorce.

The Japanese General Strike

On February 1st Japan was to have been in the grip of a general strike organised partly for enforcement of economic demands, but also partly, as was openly admitted by some of the leaders, for the overthrow of the Japanese Government headed by Mr Yoshida. At the last moment, however, after all attempts at a settlement had broken down, General MacArthur intervened and prohibited the strike, threatening punitive action by the occupation authorities against anyone leading or taking part in a general strike. General MacArthur justified his prohibition on the ground that the general strike was too deadly a weapon to be used in the present "emaciated" condition of Japan, and also with the contention that it would interfere with the Allied occupation. No attempt was made to start the strike in defiance of General MacArthur's order, but the Federation of State Railway Workers' Unions on February 3rd made an appeal against the order to the Far Eastern Commission, requesting an Allied international investigation of the case.

Although there may have been a strong case for American prohibition of a strike designed to paralyse Japanese economic life at a time when Japan is largely dependent on American bounty for its day-to-day existence, larger political issues were certainly involved. The general strike was promoted particularly, though not exclusively, by the Japanese Communists, who only obtained a very small representation in the Diet at the General Election last April, but have captured commanding positions in many of the trade unions which have sprung up in all branches of industry since the lid was taken off labour organisation by Allied directives after Japan's surrender. The Communists have given the trade union movement a strongly political character and have made no secret of their intention of using it to bring about an overthrow of the Government by extra-Parliamentary means; further, their propaganda has taken on an increasingly anti-American tone which the gadfly tactics of General Derevyenko, the Soviet representative on the Allied Council in Tokyo. The collapse of a Japanese Cabinet as a result of a Communist-promoted general strike would indeed have greatly strengthened the Communists and gained credit for their direct-action methods at the expense of constitutional political processes; it is understandable that the American authorities should fear the development of a revolutionary situation which might have a sharp anti-American tendency. On the other hand, the grievances of Japanese labour are many and real, and the Americans, having boasted of the freedom they have con-

ferred on the labour movement, ought not to be too surprised at the turbulence which they have done so much to encourage.

Renewed Crisis in India

After a period of slightly relaxed tension the situation in India has again become critical with the arrests of Moslem League leaders in the Punjab and the Moslem League Working Committee's fresh decision not to take part in the Constituent Assembly. The acts of the Punjab Government have been marked not only by an extraordinary vacillation—certainly a symptom of the uncertainty and confusion of authority which is now widespread in India—but also by a news black-out so drastic that even *The Times* correspondent in Delhi had to report that the situation in the Punjab was "obscure." The Punjab Government, politically undermined by the recent successes of the Moslem League, appears to be wavering to and fro between conciliation and forcible suppression of the Leaguers. It is unlikely that its action has been sufficient even to clip the claws of the League's political strength, but it was certainly enough to eliminate whatever flavour of moderation might have been found in the resolutions passed by the League's supreme leadership in session at Karachi. The most important of these resolutions, as adopted, condemned the acts of the Constituent Assembly as "ultra vires, invalid and illegal," and gave notice that the League would not recognise any Constitution which it might frame.

The situation has been complicated by the attitude of the Princes, who have empowered a committee to represent them in negotiation with the British India section of the Constituent Assembly already elected, but have laid down basic principles for their participation widely at variance with the Congress doctrine about Indian national unity. The conflict between Congress and the Moslem League naturally strengthens the bargaining position of the Princes, who can use the rivalry of the two parties in order to extract better terms for themselves. On the other hand, the renewed refusal of the League to enter the Assembly, and the doubt about the competence of the Assembly to make an Indian constitution without the Moslems, are causing the Princes now to hold back from any commitments. Both they and Congress are now pressing for an unequivocal British statement on the rights of the Assembly. The British Government is being put in an increasingly difficult position. So far it has apparently recognised the Constituent Assembly, but has issued a warning that it will not impose on the Moslem areas a constitution not endorsed by the Moslem League. This is not ultimately a logical attitude. If the Government holds that the Assembly can only make a constitution for a certain part of India, it must clearly say so; if it holds that the Assembly has all-Indian authority, then it must face the problem of enforcement.

Spanish Reshuffle

Members of Uno having withdrawn their heads of diplomatic missions from Madrid, Spaniards naturally ask—what next? So does the outside world. Some more effective policy and organisation among the exiles and some less doctrinaire attitude to Franco's opponents of the Right Centre is expected of them. Dr Giral, head of the Spanish Republican Government exiled in Paris, resigned his office at the end of last month, several days after five of the fourteen members of his Cabinet had withdrawn. Politics in exile, with their inevitable non-reality and pre-occupation with party intrigue, make the present crisis rather paradoxical, and the formation of a new Government will probably take a long time. The president, Martinez Barrio, is known to be engaged in negotiations to widen the basis of the Government so as to organise the active collaboration of all Republican parties in exile with the resistance forces inside Spain.

The five Ministers who withdrew from Dr Giral's Cabinet belong to the Socialist party, the trade unions and the anarcho-syndicalist movement. They are Santalo, the Catalan Republican leader, Enrique de Francisco (Socialist Minister of Economic Affairs), Trifon Gomez (Minister for Emigration, representative of the trade unions), Moracio Prieto and Leiva from the anarcho-syndicalist movement. They declared that Dr Giral's policy, although it achieved a considerable success at Uno, had failed to secure the recognition of his Government by other countries.

At their recent party conference in Toulouse the Socialists learned that the various resistance groups active inside Spain had no confidence in Dr Giral. They demanded therefore the widest

possible broadening of the Paris Government. Prieto is known to have recommended less talk about the problem of republic or monarchy and more active steps for the extension of the resistance movement inside Spain, even to the point of enlisting some of the military and monarchists who seem to be dissatisfied with Franco. The Socialists—more so than the Republicans—seem to think that the situation in Franco's Spain is favourable for a broad national resistance movement.

The Communists, who were in a minority in the former Cabinet, naturally found no fault with its head, because Dr Giral inclined frequently to their point of view. Their wish is that the broadening of the Government should be entrusted to the same Dr Giral, who has clearly failed to weld the various parties, trade unions and other representatives of Republican Spain in exile with the resistance movement inside Spain into an effective instrument for the overthrow of the present regime. General Franco himself, knowing that the resistance movement inside Spain is in no state to wage open civil war, is playing a subtle game to keep himself in power, in spite of the fact that the Falange is no longer a reliable political force. If he could assume the presidency of the republic, the way would be open to enlist, either in fact or in name, some of the Catholic political forces, which could then take the place of the Falange.

Franco's regime has probably come to a stage where it could not survive the political drive of an effective national resistance movement. But the Spanish Republicans in exile realise that foreign intervention alone can ensure their success. If President Martinez succeeds in forming a new Government it will soon face the same difficulty which brought about Dr Giral's downfall—its complete ineffectiveness without foreign aid.

The Snyder-Dalton Letters

Four letters exchanged between the US Secretary of the Treasury and the Chancellor of the Exchequer on the recent Anglo-Argentine financial agreement were published this week. They concern the clause in the agreement with Argentina which provides that if in any year the balance of payments with the

Records and Statistics

In addition to the short "Statistical Summary" which appears weekly in *The Economist*, a full service of statistical and factual information appears weekly in

Records and Statistics

Supplement to *The Economist*

Records and Statistics is a separate, self-contained weekly publication of from 16 to 24 pages. It includes not only many statistical tables but also factual records of public affairs, including Parliamentary activities and digests of state papers, and industrial and commercial reports from home and overseas. It is believed to be the most comprehensive statistical and factual report appearing weekly anywhere in the world.

The *Records and Statistics* Supplement to *The Economist* is available by postal subscription only. The subscription, which may be sent direct to this office or through a newsagent, is 30s. per annum. For those who are already direct postal subscribers to *The Economist*, the economy of posting both publications together makes it possible to quote a combined subscription of £4. Subscribers to *The Economist* who wish to receive *Records and Statistics* should notify this office as soon as possible, but are asked not to send any money until an account is rendered. It is regretted that it is no longer possible to supply back numbers of *Records and Statistics* or to date subscriptions back.

Paper shortage also makes it impossible to supply sample copies. For a limited time, however, subscribers to *Records and Statistics* will be allowed, if they wish, to cancel any unexpired portion of a subscription.

THE ECONOMIST, BRETTENHAM HOUSE, LANCASTER PLACE, LONDON, W.C.2

work is obviously more effective. In fact, it has been claimed that a double day shift will save very little power at the cost of a reduction in the total number of hours worked in a week. On the other hand, the long-term objective of making a more efficient use of machinery can be achieved as easily by a double day shift as by night work and with far fewer social disadvantages. It is true that the unions have not agreed to the double day shift as a permanent arrangement. But, once tried, it may turn out to be less objectionable to them than it appears in prospect.

* * *

Domestic Consumption

How does the switch-on leave the ordinary person in his own home? The economic debate has not made his position much clearer. Sir Stafford Cripps announced that the coal budget was based on the assumption that there would be "continued substantial restrictions on domestic and non-industrial users." These would be achieved by the prohibition of "certain wasteful, unnecessary usages during the summer, such as domestic space heating," and "it may be we shall be driven to the necessity of a domestic fuel rationing scheme."

If there was one lesson which the war brought home, it was that when a commodity was in really short supply, the public as a whole preferred a clear-cut rationing scheme to queues or to distribution on the most-favoured-customer principle. Yet the merits and drawbacks of fuel rationing were thoroughly debated in 1942 after Lord Beveridge had produced his scheme, and it was rejected as being impracticable. If today the Government feels that it cannot add the burden of fuel rationing to an already heavily overlaid administration—not to mention the alleged meter-illiteracy of the masses—the decision will be accepted.

But in that case the alternative should be a big campaign for voluntary saving such as was conducted during 1942-43 and, it is generally conceded, resulted in considerable saving. What is quite wrong is the present method of imposing a blanket prohibition on the use of electricity in certain hours, with severe penalties if the prohibition is ignored. Such a prohibition makes no allowance for variations in individual circumstances; it makes any appeals for voluntary economy virtually worthless; and, now that the supply is no longer cut off, it tends to be more and more ignored the longer it is in force. If Sir Stafford's statement means that the present system is to be retained indefinitely, and its scope widened, the Government should think again. The British public will tolerate rationing and will respond, at least in some measure, to appeals for voluntary saving. But it will not respect an unfair law which cannot be enforced.

* * *

Empire Prepares for Geneva

Delegates of the United Kingdom and Empire countries began discussions in London this week in preparation for the tariff and preference negotiations which will open in Geneva next month. As in the case of the first meeting of the Preparatory Committee of the Conference on Trade and Employment, in London last October, it has been thought desirable to arrange preliminary talks between representatives of the Commonwealth so as to ensure the greatest possible intra-family agreement before beginning discussions with strangers. This is all the more important on the eve of the second meeting of the Preparatory Committee, which will get down to actual tariff and preference bargaining.

The Empire talks are being held in a privacy illumined only by the most innocuous and uninformative of press notices. But it may be assumed that the discussions have left the sphere of commercial ideology, which was largely the concern of the meeting last October, and are now centred on the more practical, mundane affairs of actual tariffs and preferences. The main issue that will have to be decided by the British and Commonwealth delegations at Geneva next month will be the extent to which they are prepared to sacrifice imperial preference in return for tariff concessions from the United States. The British attitude seems to envisage a very considerable whittling down of preferences on the reasoning that anything like the required expansion in British export trade can only be obtained if the United States and other hard-currency markets open their doors much wider to the import of sterling area goods. This is a point of view which is not wholly shared by certain of the Dominions, notably Australia and New Zealand. The object of the Empire talks will be to see how far these differences can be reconciled before the horse trading begins in Geneva.

Sir Stafford Cripps, who opened the Empire talks last Tues-

day, hoped that in meeting the difficulties that faced the United Nations "the climate of agreement" might be more readily reached in the economic than in the political field, and he saw in this "climate of friendly agreement" something which might be more important than the detailed agreements themselves. One can but hope that the woolliness of this observation is not characteristic of the attitude with which the British delegation will be travelling to Geneva; for there they will meet other representatives who will be much more interested in the details of what they will be trading than in any nebulous "climate of agreement."

* * *

European Commission

Whether or not the Big Four representatives at Lake Success all mean the same thing when they talk about an Economic Commission for Europe, they look like setting, on paper, a good example of agreement to their Foreign Ministers in Moscow. They are now drafting the terms of reference for the new body, and Mr McNeil has returned to London from the Economic and Social Council hopeful about the prospects of a working agreement on this far-reaching American proposal. A Soviet representative, Mr Chernyshev, is taking a cautious but not unhelpful part, thanks largely to Polish and Czech insistence on the advantages which this form of co-operation with the Americans may offer.

Three tasks are proposed for the commission: measures to get governments working together on reconstruction in devastated areas; joint study of economic problems and developments; collection and evaluation of information. Such proven bodies as the European Coal Organisation and the Emergency Economic Committee for Europe would be absorbed into the new organisation and their methods of work extended into spheres where national plans clash or overlap and where materials and equipment are scarce. Obviously an expert body of this kind is not always going to agree either with the statistics offered by governments or with the general character of their economic planning. Sooner or later it will run into the same objections in the name of national sovereignty as the Security Council has encountered in its discussion of atomic energy controls. But if powerful and regular American assistance can be secured on no other terms the "planning" governments may find it worth their while to make, in the limited European sphere, concessions which they would anyhow be asked to make within the broader framework of an international trade organisation.

The Americans see in the commission a means of getting European trade arrangements on to multilateral lines and of curbing the restrictive policies of governments to which Congress is unwilling that direct loans should be made. The British see the possibility of getting American support behind a European revival, of involving eastern Europe in closer relations with the West, and of preventing an economic split running down through the centre of Germany. The Russians see a means of coaxing American capital and goods into devastated neighbouring territories—in other words, a temporary substitute for Unrra rather than a permanent international organisation. The French see the chance of getting a European framework within which German raw materials and productive power could be brought under joint control.

There is a good chance of the European Commission coming into existence. Whether it survives or not will depend on its ability to make itself so indispensable that no government, even for the most pressing political reasons, will be able to afford to leave it or remain aloof.

* * *

Nehru-Jinnah Approach

While the night skies of the Punjab are reddened with the arson of communal riots in a score of different places, new attempts are being made to end the deadlock between Congress and the Moslem League over the future of India. The provision in the most recent British declaration for transfer of power to regional authorities, if no central government can be established by agreement in the near future, has put a strong pressure on the Congress Party to come to terms with the Moslem League in order to obtain its participation in the Constituent Assembly. The prospects of unity have thus been improved to the extent that breakdown of the inter-party agreement on the basis of the Cabinet Mission plan has been due to subsequent Congress reservations from the original acceptance. On the other hand, the same provision has also encouraged Pakistan extremists to think that they have only to dig in their toes to get full independence and the reference to "existing provincial governments" has made

it urgent for the Moslem League to capture the provincial governments of the Punjab and the Frontier Province, which, for reasons of local politics and electoral "weightage," they have not so far controlled in spite of their majority in the Constituent Assembly elections for the three "Group B" provinces—Frontier, Punjab and Sind. The recent Punjab disturbances have not been merely manifestations of communal hatred, but have had on the Moslem side the political purpose of breaking the "Unionist" coalition Government hitherto in office; in this they have been successful, but it has not been possible to form a purely Moslem League Government with a working majority in the Provincial Assembly, and the British Governor has been compelled to take charge of the administration—a dangerous situation for the British sixteen months before their final exit.

The most interesting feature of the Congress Working Committee's directives for fresh negotiations with the Moslem League is the proposal for division of the Punjab into two parts, separating the mainly Moslem and mainly Hindu-Sikh areas. This would be a sensible idea provided agreement could be reached on the boundary between the two zones. Unfortunately Congress simultaneously demands that the Interim Government be recognised as a "Dominion Government" immediately, so that a Cabinet in which the Moslem League is in a minority would be recognised as the irremovable, legal Government of all India. This move, which is obviously designed to put the League in the position of rebels, cannot fail, if it is seriously pressed, to exacerbate the conflict.

China's New Crisis

The fears recently expressed in Nanking that the Foreign Ministers' Conference in Moscow would go outside the European questions on its agenda and discuss Chinese affairs in China's absence have quickly been realised. At the first meeting of the Conference Mr Molotov proposed that the situation in China should be discussed, though no advance notice of such an intention had been given to the other three Powers. The Chinese Government have lost no time in declaring that they cannot agree to the inclusion of China's internal affairs on the agenda of the Foreign Ministers' Council, whether China is represented or not. Mr Molotov's argument is that his request is merely for a review of the decisions taken about China by Britain, the United States and the Soviet Union in December, 1945, at a conference not attended by China. The three Powers then agreed on the need for a unified and democratic China and the ending of civil strife, a formula similar to that previously adopted for Poland, Yugoslavia and other Allied countries torn by political dissensions. Attempts to dictate a settlement to the warring Chinese parties are more likely to involve foreign Powers in mutual conflicts than to gain support or goodwill among the Chinese. Nevertheless, the Chinese civil war is a fact which other nations cannot altogether ignore or isolate, and consultation among them may be of value if it serves to limit the international repercussions of the trouble.

In China itself the fiction of continued negotiation is now finally at an end. The Communist delegation has been ordered to leave Nanking and the lid has been taken off the war since General Marshall abandoned his efforts at mediation. At the moment the Communists are on the offensive both in Manchuria and Shantung, while the Government is confronted with non-Communist revolts and intrigues in other parts of China, including an upheaval in Formosa (which foreign observers expected as an inevitable consequence of the manner in which "liberators" from Fukien took over the island from the Japanese) and a bid for power by the ever-turbulent Southern soldier-politician, Li Chi-sen. In the midst of this confusion, Dr T. V. Soong (who has never been popular in China, but owed his authority to his supposed standing with the Americans) has been forced out of office and General Chiang Kai-shek is for the time being his own Prime Minister. He has weathered many storms but this one is, perhaps, the worst he has yet had to face.

* * *

Mr Dalton and the Universities

Mr Dalton revealed this week two important milestones in the journey towards university expansion—a journey in which he claims, and has so far shown, a great interest. There are advantages in having a don as a Chancellor of the Exchequer, for no previous Chancellor has ever opened the Treasury's purse strings so wide. Before the war the total Treasury grant to the universities was £2,250,000 a year, including both recurrent grants and grants for capital expenditure. Even allowing for the post-war

increases in costs for maintenance and salaries and the rise in the number of students, the size of the new recurrent grants which Mr Dalton announced in the House of Commons on Monday is satisfactory. Next year the universities are to receive all but £10 million and by 1951-52 £12 million on revenue account, which should provide them with a welcome freedom from immediate financial anxieties. There is indeed a possibility that the limitations on capital expenditure which the Chancellor also announced will make it difficult to deploy the full amount of revenue expenditure. The schemes for physical expansion submitted by the universities for the next five years would necessitate capital grants of £40 million for new buildings and £10 million for acquiring sites, existing buildings and new equipment. Although he accepted the need for these developments, he did not think the limitation of resources would permit an expenditure of more than £20 million on new building. Bricks, not money, is therefore going to be the limiting factor over the next five years.

*

The second milestone has been a letter from Mr Dalton to the Parliamentary and Scientific Committee on the subject of their report on the universities and scientific manpower, which was discussed in these pages on December 14th. The committee claimed that an expansion from 50,000 students in 1939 to 108,000 by 1951 was essential to give an adequate supply of scientists. Mr Dalton countered that the committee were taking an unduly gloomy view of the output of scientists and that the University Grants Committee considered that a total expansion to 88,000 was all that was practicable over the next ten years. Unfortunately, nothing but a full-dress inquiry can settle the argument about how many graduates of different types the country needs, and such an inquiry is certainly urgent, but Mr Dalton's conservative figures are based on the revised estimates which the universities themselves have submitted, and further pressure may have to be put on them. Why should there be no new women's colleges at Oxford and Cambridge and no new universities? He made the surprising statement that he shared the committee's views on the inadvisability of any new universities at this stage. But why should the vigorous movements in towns like Stoke or York not be encouraged, even if modestly at the start?

He was also unnecessarily vague about the upgrading of technical colleges to university status. It well may be that the one-sided nature of these colleges makes them unsuitable for university status, but something must be done to improve the quality of applied scientific research. It can only be neglected at the country's peril, and it would have been more satisfactory if Mr Dalton could have said something more about its development at existing universities.

* * *

New Farm Prices

There is something rather frightening about Mr Tom Williams's deep satisfaction that the new schedule of farm prices has received the full approval of the National Farmers' Union. In the annual review, which preceded the fixing of the new schedule, it is clear that the farmers' representatives got the better of the bargaining with the Ministry of Agriculture. The main aim of the new schedule is to stimulate the revival of livestock production as fast as feedstuffs become available. Higher prices have therefore been fixed for most livestock products for the year

Commercial History and Review of 1946

The Economist's Annual Commercial History & Review of 1946 is published with the Records and Statistics Supplement this week.

A limited number of copies of the Commercial History, price 6d., will be available for readers who are not subscribers to Records & Statistics. Orders should be sent to—

The Publisher,
THE ECONOMIST, Brettenham House, Lancaster Place,
London, W.C.2.

sterling area be unfavourable to Argentina, the deficit may be met out of Argentina's accumulated sterling balances. It did not take long for the doctrinal experts in the US Treasury and State Departments to detect the conflict between this clause and the provision of the Anglo-American agreement of December, 1945, which lays it down that all releases from accumulated sterling balances must, within one year of the effective date of that agreement, "be freely available for current transactions in any currency area without discrimination." Mr Snyder pointed this out to Mr Dalton in a letter dated October 31, 1946. Mr Dalton, replying on December 17th, tried to avoid an acknowledgement of guilt. He wrote that "it is not possible to separate the terms of any agreement . . . from the circumstances of the negotiations, or the facts of the trade with the country with whom the agreement is concluded," and added that since the probability of a deficit between Argentina and the sterling area during the next four years was so hypothetical "further consideration of this question might be deferred until events indicate that there is some reasonable probability of its becoming actual."

These evasive tactics proved ineffective. Mr Snyder came back to the charge and with a touch of acerbity confessed himself "unable to reconcile with the spirit of the US-UK agreement any commitment which under certain contingencies, even though remote, might require action at variance with the agreement." Mr Snyder then asked for "some statement from you indicating that your Government has no intention of including such a clause in future agreements." There could be no wriggling out of this, and Mr Dalton in his reply wrote that he was "happy to give you this assurance," and promised that if the unlikely contingency of an Argentine deficit *vis-à-vis* the sterling area were to arise in the next four years "it would always be our desire to avoid discrimination (at variance with the Anglo-American agreement)."

The correspondence makes it clear that the letter of the Anglo-American Agreement was certainly, and its spirit probably, violated. Unfortunately it also makes it clear how very hard the conditions of that Agreement were and how difficult it will be for Britain to make much progress in compounding with its creditors if it is allowed to pay them off only in dollars or the equivalent.

* * *

Straw for Bricks

Mr Bevan has begun to fill in some of the gaps in the overall framework of his plan for the completion of 240,000 permanent houses this year. The letter he addressed last week to local authorities is illuminating for two reasons; first, because it is frankly stated that the capacity of the building industry to finish houses has been overtaxed by spreading its resources too widely; and secondly, because of its emphasis on the necessity for Government departments and local authorities to act in concert in order to establish a better balance between building proposals and building resources and between the different demands for building work.

Both these statements are open admissions of failures in planning which had long been suspected. In such a huge enterprise there were bound to be mistakes, and it is reassuring that the Minister has been honest about them and set himself to remedy them. But the failure to secure proper co-ordination on a regional level is disturbing for more reasons than the low output of houses. The delegation of authority away from Whitehall and the efficient distribution of resources locally are crucial matters if the present huge bureaucratic machine is not to grind to a standstill. The Regional Housing Officers of the Ministry of Health were appointed expressly to accelerate decisions on the spot and secure proper local co-ordination. But in spite of this there have been bitter complaints of workers being taken without warning from housing work to build government offices, and of the local authorities having incomplete information about the total demand for local building labour. The new procedure for zonal conferences for which the local authorities will be given the whole of the available information about building commitments and building resources for the zone should do much to remedy this, but the failure shows how far the machinery of delegated control has yet to develop to achieve efficiency. Until these conferences are held the further issue of licences to private builders and acceptance of tenders is to be deferred, except in the few areas where labour is under-employed.

Last week's White Paper on the housing programme glossed over the difficulties of planning and co-ordination. The revised procedure should improve local planning, and it now remains for Mr Bevan and Mr Tomlinson to be equally forthcoming about the deficiencies on the side of materials and to propose methods for increasing their output and distribution.

Concerning Honesty

No one will dispute Lord Templewood's fresh plea, made last week-end to the Department of Criminal Science of Cambridge University, for a new penal system on the lines of the Bill he had so nearly piloted through Parliament when war broke out. Nor will anyone dispute the need for the reform of the magistracy, on which a Royal Commission is at present collecting facts, or that something should be done to lessen the inappropriateness of sentences imposed in particular cases. But, although Lord Templewood referred to the root cause of delinquency as moral and the decline of moral restraints, neither he nor others who ascribe the rise in juvenile delinquency to the breakdown of family life during and since the war are quite specific enough in their diagnosis. The plain truth is that from being the honestest people in the world, the British people are becoming completely dishonest.

This does not merely mean that ordinary crime, from big burglaries to petty pilfering, has become much more prevalent. What is disquieting is that whereas, during the war, on the whole the rationing and similar regulations were respected and those who infringed them were regarded as anti-social, today there can be only few who have not offended in one way or another. Those who have not obtained "extras" in this way are popularly considered to be as unfortunate as those who have and have been found out. It must indeed be difficult for magistrates to pass a judicial sentence in such cases—it may not be generally realised that the sentences which can be imposed for such offences are very heavy—when they themselves have guilty consciences. But since this general disrespect of the law springs from the universal shortages and austerity imposed by circumstances, they, and the public as a whole, might spare some pity for those "who steal with nothing left to pawn."

But the Government too has its part to play. Law falls into disrespect when it is bad law, and, as Mr Churchill pointed out last week, measures and methods that were justifiable as wartime emergencies are not justifiable for peace. Clearly, rationing and other controls must continue. But reliance on the *agent-provocateur* to catch out and punish a few individual offenders against regulations which are respected by none will alienate public opinion more than ever. Law, in a democracy, can only prevail when it has popular support, and the sooner the Government gives proof that it intends to reduce the maze of ill-understood regulations the better.

Shorter Notes

The chairman of the European Coal Organisation recently pointed out that Poland, with the new coalfields taken over from Germany, was supplying only seven per cent of the pre-war imports of Europe, compared with the ten per cent it contributed before the war. The figure of seven per cent excludes agreed deliveries to the Soviet Union. These facts have to be borne in mind in considering the latest production and export figures from Warsaw for 1946. Exports reached the figure of 13,548,000 tons which is compared with 11,669,000 tons in 1938; but they include deliveries to the Soviet Union. The total amount of coal sold last year was 47,782,000 tons and production in 1947 is estimated at over 57 million tons. Of this increase, 5 million tons will be exported. The effect on Europe's annual deficit of 52 million tons will, therefore, be small. But the later possibilities of expansion should be considerable as present Polish production is unofficially estimated at little over half pre-war figures.

Reference was made in both the last two weeks to the action of the Ford Motor Company in America in reducing the price of its cars as a gesture against inflation, and a depressing contrast was made with the steadily and steeply rising costs of British cars. This week the British Ford Motor Company announces, not indeed a reduction, but a pledge to keep its present prices steady for as long as possible. The contrast between American and British policy is still visible. But even passive existence to the upward trend of costs and price is praiseworthy.

Another attempt to reform motor taxation is to be made. The Joint Committee of the Automobile Clubs are putting forward a proposal for a flat-rate licence fee of £5 per annum plus an extra 3d. a gallon on petrol. They claim that this would not lead to any reduction in revenue and that there is now substantial unanimity in the trade in support of the proposal. The suggested reform would certainly be a great improvement. But whether Mr Dalton will be willing to abandon the new cubic capacity tax so soon after its start can only be doubtful. It is a pity the motor trade did not see sense at the first opportunity.

Letters to the Editor

Second Thoughts on Planning

SIR,—May I ask the hospitality of your space just once more for a brief comment on the further criticism of the £300 million fund in your article on "Second Thoughts on Planning"?

You argue that it was "inexcusable" on the part of Mr Silkin to take only 15 or 16 years' purchase on the grounds of the speculative nature of the asset to be acquired. Your reason is that the original Uthwatt calculation is already supposed to have removed the speculative element.

Are you not forgetting there the distinction between the riskiness of income from development rights to *landowners as a class* and the *individual owner*? Even if the total income may be fairly safe to owners as a class, the individual's *share* in it may still be extremely uncertain—and the compensation is paid to individual owners, not a fictitious class.—Yours faithfully,

H. W. SINGER

The University, Glasgow, W 2

[Surely the process of sharing out a global sum, which discounts speculation, ensures that the individual owner's share is also purged of its speculative element.—EDITOR.]

M. Bierut and the British Council

SIR,—May I raise some points on the Note published in last week's issue of *The Economist* entitled "M. Bierut and the British Council"? You give a biography of the Polish President which bears all the marks of having emanated from the Polish emigrés in London and which, as a result, is distorted by the political outlook of these groups. It is true that M. Bierut was relatively unknown before he took office, and it was inevitable that a number of biographies should have been written about him. But *The Economist* must surely be concerned with the accuracy of its facts.

You write that M. Bierut's "past career has not been free from a certain ambiguity of allegiance which causes some Poles to raise their eyebrows. Bierut, like Dzierzhinsky and Menzhinsky, was one of the Poles who took part in the Russian revolution." This statement must cause anybody with some inkling of Russian and Polish affairs to raise his eyebrows. At the time of the Russian Revolution, Bierut was an obscure official of a Polish Co-operative in his native town of Lublin, which was then under Austrian occupation. He remained in Poland, holding modest positions in the Co-operative movement, first in Lublin and then in Warsaw, all the time up to 1927. The placing of his name in a besides that of Dzierzhinsky or Menzhinsky, though it may in a sense be flattering to President Bierut, will startle any student of the Russian Revolution. Incidentally, many Poles did really take part in the Russian Revolution, and their careers have, nevertheless, been quite free from "ambiguity of allegiance." Before 1918, and even some time after, Poles took part in Russian political life in the same natural way in which Irishmen used to participate in English politics. I know at least one Minister of the former Polish Government in London (and now still a leader of the "irreconcilables" here) who was the chairman of the Soviet of Orel, already after the Bolshevik Revolution.

You further write of M. Bierut that "in 1923 he came from Russia to Poland as an organiser of the Polish Communist underground movement, but soon had to flee the country and spent several years in Austria and Czechoslovakia. Returning to Poland in 1932 with a Soviet passport he was arrested and sentenced to a long term of imprisonment, but, claiming Soviet citizenship, he was exchanged for a Polish political prisoner held in the Soviet Union." The truth is that before 1927 M. Bierut lived in Poland, as I have pointed out, and was active in the near-Communist MOPR (which was an organisation for the relief and assistance of political prisoners); and because of this he was several times imprisoned. Finally, he went into exile in 1927. He lived abroad for three years; and spent some time also in Russia. He returned to Poland in 1930 (and not in 1932) and was imprisoned again five years later (in 1935) at the height of the Pilsudskist terror. Far from claiming Soviet citizenship and being released on this ground he spent the years from 1935 to 1939 in Polish prisons in Warsaw and Rawicz.

You stated that "subsequently he held an important post in the

NKVD and . . . took an active part in the killings and deportations" of Poles. But at the outbreak of the war M. Bierut was employed by a Workers' Housing Co-operative in Warsaw. During the tragic exodus of Poles from the capital, which was ordered by the Government during the siege of Warsaw, M. Bierut left Warsaw to find himself in the Soviet-occupied Eastern Poland. Subsequently "the important NKVD agent" can be traced in a group of Poles who themselves were recruited for labour to the Ukraine. He was lucky to get the job of a book-keeper in a Polish working community near Kiev. A year later he was back in German-occupied Poland. In his native Lublin, and later in Warsaw, he took part in Communist and near-Communist underground organisations. From 1940 till the second half of 1944 he never left German-occupied Poland for a single day. It was his underground activities in those years, as well as his genuine devotion to his party, that earned him his prominence in the present Polish regime, rather than an imaginary career in the NKVD.—Yours faithfully,

YOUR FORMER POLISH CORRESPONDENT

The Twilight of Ministers

SIR,—May I add a footnote to your correspondent's interesting extract from the erudite work of the Silkin Memorial Professor of Political Mechanics? On looking through an old file of the *Manchester Guardian*, found among my grandfather's papers, I came across an account of the second reading of the first Town and Country Planning Bill, a measure to which I suppose the Professor owes his Chair. The Parliamentary correspondent, in reporting the Debate, reproached Mr. Silkin for reading his speech "every word of it," and he went on to prophesy that "the next stage on this road will be the circulation of Ministers' speeches beforehand." That was exactly a century ago (January 30, 1947), or eleven years before the date (1958) by which, according to the Professor's account, the time-saving expedient of printing Ministers' speeches in Hansard before they were delivered had become firmly established.—Yours faithfully, GILBERT WALKER

Selly Park, Birmingham. January 30, 2047.

Crisis in French Empire

SIR,—With reference to the article of your Paris correspondent, entitled "Crisis in the French Empire" and published in your issue of January 11th, I should like to make a few comments.

1. He says that "the French conquered the Annamese Empire, which stretched in lush and antique opulence . . ."; he could perhaps remember that in spite of that "opulence," the Annamese peasants were at that time constantly being attacked by looters, especially in the North, and happened to be protected against them by the soldiers of Gallieni and Lyautey.

2. He seems to describe the Viet-Minh as a purely nationalist movement, having the support of the whole population of Indo-China; this is misleading. The Viet-Minh cannot claim to speak for all the peoples concerned, and this is not surprising for anyone possessing an even superficial knowledge of the history of the country and of the racial and social differences which exist there.

3. Your correspondent states that "the activities of the Viet-Minh against the Japanese were widespread." It would be very interesting to have more detail as to these activities, as your correspondent, in holding this point of view, contradicts what has already been said on the subject by many other reliable British reporters.

And since your correspondent speaks about the relations between the Viet-Minh and the Japanese, why does he ignore the fact (which on the contrary is only too well-known) that the Viet-Minh was put into power by the Japanese during the spring and the summer of 1945, and helped by them in many ways, not only between March and August 1945, but even after the Japanese capitulation? This has been pointed out by many British observers.

4. As to the violation of the agreement of March 6, 1946, your correspondent puts all the blame on the French; however,

beginning April 1st. By this means it is hoped that a substantial increase in pig and poultry output will be achieved starting in 1948-49; beef and mutton production will take longer to restore.

The prices for cereal crops harvested next autumn have been raised above their original level, partly with the idea of encouraging much-needed spring sowing. The weather has been so bad, however, that it is most unlikely that the Government target of two and a-half million acres of wheat will be reached this year. Next autumn the Government intends to attempt, for the second time since war ended, the discontinuation of compulsory cropping orders, which are distasteful to farmers. It points out, however, that owing to uncertainties about overseas supplies of feedstuffs, it is necessary to plan for a higher degree of self-sufficiency than before the war, though below the wartime peak. To assist the reaching of these targets, the Government has fixed 1948 prices for the principal crops at levels which are no less remunerative than this year's prices, but the acreage payments for wheat, rye and potatoes are to be abolished and to be replaced by an equivalent increase in guaranteed prices. The incitement to grow these crops on unsuitable land is thus reduced, but their profitability on suitable land is correspondingly increased.

The Government's purpose is to give generous enough inducements to raise livestock production and to maintain, without the spur of compulsory controls, a fairly high tillage acreage. The long-term dangers of measuring the satisfactoriness of a price schedule by the degree of approbation it receives from producers are too obvious—to anyone except, perhaps, Mr Williams—to need repetition; but the need for expanding livestock production in this country is so urgent that the Government may be able to justify its policy by results. That remains to be seen. The danger is that higher prices will not be an effective encouragement to the producer to overcome the physical difficulties which stand in the way of higher livestock production; instead they may serve to compensate him for a low turnover.

* * *

Less Food at Higher Cost

The higher prices awarded to British farmers will mean another increase in the high cost of food subsidies. The supplementary estimate of the Ministry of Food, which was debated in Parliament last Friday, shows an increase in the Ministry's trading deficit of nearly £50 million for the financial year ending on March 31st. The original estimate gave a deficit of £232½ million, the revised estimate is £281 million, or over 20 per cent higher. The melancholy fact is that less food has been received for a considerably higher cost. It is not the Ministry's fault that the original estimates for individual items were badly out, although Dr Summerskill was irresponsibly light-hearted about the discrepancy. Expenditure on cereals, for instance, shows an actual saving of £25 million, owing to the sad fact that the anticipated supply has not been available. Most other items show unexpected additional losses. There have been higher Dominion prices for butter, higher Cuban prices for sugar, and much higher Argentine prices for meat; indeed it appears that to get an existing meat contract carried out an extra sum of £7 million had to be paid to the Argentine Government, a payment about which Parliament is demanding further information. The increase in bacon prices must have been fabulous to convert an anticipated credit into a £5 million loss, since the ration has been kept on a much lower scale than was budgeted for.

Part of the Ministry's additional expenditure is due to changes in stocks, and the remainder is shared in equal proportions between home and imported supplies. If overseas food prices continue to accompany domestic farm prices in their upward spiral, the financial outlook for the coming year is exceedingly grim. Unless something is done, food subsidies will cost a great deal more during the coming year, since last year's increases in domestic farm prices, let alone the further increases authorised for this year, have not yet made their full impact on the Ministry's trading account, while higher prices have recently been negotiated with Denmark, Canada and other overseas suppliers. If, as is devoutly to be hoped, the supply of livestock products steadily increases, the cost will be still greater.

If Mr Dalton is in earnest about checking inflation, he has no course but to compel a modest rise in food prices and prune the subsidies. The Government cannot forever delay this action out of fear of causing a cycle of wage claims. The cost of food, in relation to earnings, is a good deal lower than before the war, yet the normal alternative outlets for expenditure are very scanty. It is agreed that the pruning of subsidies must proceed gradually, and instead of an all-round cut, suitable individual items—of which eggs might be an example—should be decontrolled. For

one thing, this would facilitate staff reductions at the Ministry. It is bad enough having less food at greater cost, without also having more controllers doling it out.

* * *

Right and Left in Hungary

The American Note, delivered to the Soviet chairman of the Allied Control Commission in Hungary on March 5th, denounces "foreign interference in the domestic affairs of Hungary, in support of repeated aggressive attempts by Hungarian minority elements to coerce a popularly elected majority." It states that in the opinion of the United States Government, the charges against Bela Kovacs, former secretary of the Small Farmers' Party, of taking part in "subversive anti-Soviet terrorist groups," and of organising "espionage directed against the USSR," are unwarranted. Finally, it protests against the unilateral Soviet action, taken without consulting the American and British representatives. The British Government has delivered a Note expressed in similar terms.

The Americans' attitude is justified in so far as no evidence of Kovacs's guilt has been supplied to them, and there do not therefore seem adequate grounds for such drastic action as his arrest by the Soviet authorities. It is true that the Minister of Justice, the Socialist Riesz, a lawyer of some standing, has declared himself satisfied, but he has not stated his reasons. The Americans are also fully justified in objecting to the failure of the Soviet authorities to consult them. This is just one more example of the intolerable situation in which the Western Powers, though formally associated with the Soviet Union as victors, are in practice ignored and insulted.

The wide political implications of the American protest are, however, less certain. American and British observers who treat the whole conspiracy as a "frame-up" are making assumptions that are not proved. The evidence already revealed at the trial now taking place in Budapest shows that there was a real conspiracy. It is also fairly certain that elements of the Extreme Right in Hungary were in contact with Hungarian exiles in the western zones of Austria, remnants of the Hungarian Nazi army of Szalasi who fled there in 1945 and who have enjoyed a surprising degree of liberty since that time. It is only too probable that these exiles were themselves in contact with "Anders' Poles," who have for long indulged in many parts of Europe the Polish national talent for subversive plots and the Polish national hatred of Russia. Charges of this kind must, of course, be substantiated, but they should certainly not be lightly dismissed.

Whether, in fact, the Hungarian Communists are at present aiming at creating a dictatorship is by no means clear. Neither the economic nor the political situation in Central Europe is particularly favourable to them. Anti-Communist and anti-Soviet feeling is undoubtedly widespread in Hungary, and the action of the Western Powers will encourage both the Extreme and the moderate Right to resist demands from the Left, in the belief that they will receive effective backing. Whether it is wise to encourage this belief at present, and whether it will benefit the "non-Marxist" democrats in the end is an open question. Hitherto, in spite of enormous economic and political difficulties, Hungary has been able to preserve a remarkable measure of political freedom. It is surely desirable that every effort be made to save this freedom, to prevent a "show-down" in favour of either the Communists or the Extreme Right, even if there is provocation from either or both of them.

* * *

The Corfu Strait Appeal

The British appeal to the Security Council about the mining of two British destroyers in the Corfu Strait last October, has run, as was to be expected, into heavy political weather. If this were a case before a court of law, the issue would be simple enough. The mines raised in the minesweeping operation were examined by British naval experts, together with a French observer, and found to have been laid not more than six months previously; they could not, therefore, have been mines laid by the Germans during the war. The minefield stretched for three miles close to the Albanian shore of the strait, on which the Albanian Government, in the words of the British accusation, maintains "elaborate and vigilant defences"; it is held, therefore, that it must have been laid either by the Albanian authorities or with their connivance. Even in time of war the laying of a minefield without warning is an offence in international law; much more so in time of peace. The question whether British warships had the right to pass

through Albanian territorial waters in the Corfu Strait is quite distinct from that of responsibility for the minelaying; the passage was certainly justified by normal international usage, but even if the British case were unsound on this point, it would have been illegal for Albania to bar passage with an unnotified minefield.

In the theory of appeal to the Security Council, it was the task of the Albanian representative to refute the charge brought and the duty of the members of the Council to consider the case in a judicial spirit. But the speeches of the Albanian representative and of Mr Gromyko, who supported him, were marked by the most fantastic irrelevancy; hardly any attention was given to the evidence and every aspect of British policy towards Albania over the last three years was brought under review. The familiar line-up in the Council was at once manifest. It was clear that the Soviet Union regarded the case simply as a move in Balkan power politics, and was determined that Soviet prestige and influence in the Balkans should not suffer from failure to protect a Communist-controlled Government in trouble with a Western Power.

There was a peculiar irony in Mr Gromyko's argument that the case should never have been brought before the Security Council because the incident did not threaten peace. The incident has not threatened peace and security precisely because Britain has used the procedure of appeal to an international authority instead of that of ultimatum and naval bombardment which in other days would have been the natural consequence of such an incident. But it is possible on very different grounds to question the wisdom of Britain's appeal to the Security Council. Could not this case have been brought before the Court of International Justice? If this is not a strictly "justiciable" issue, it is hard to see what is. By bringing it before the Security Council, which is a political body, the advantage of a purely legal procedure has been lost.

Argentina Blows Cold

The Soviet-Argentine economic flirtation seems to have ended. The Soviet trade mission to Buenos Aires, after a year's work, has had little success and its leader left for Moscow last week. The chances of success were never great; the motives for its arrival were primarily political, and its commercial activities smacked strongly of sharp practice.

At first General Perón's attitude, on the morrow of his election, seemed to favour both the mission's political and its commercial aspirations. The Soviet delegates responded with the rosiest visions of great trade between the two countries. Thousands of lorries and tractors (apparently Lend-Lease equipment), farm machinery and aero-engines would be sent to this new "champion of the workers." A factory would be built in Argentina to produce the "Molotov" car more cheaply than any other could be sold there. Bids made by other countries were overbid, and their bargaining points out-bargained. The Combined Food Board was embarrassed in its relief programme. Argentine exporters were encouraged to disregard their contracts with other countries. All this was gratifying to Argentina, which wished to exploit its position as a supplier of essential and scarce raw materials. But there was still no sign of the "unlimited possibilities" of Russo-Argentine trade being realised. A shipload of newsprint came from Finland, some coal from Poland and from Russia some caviare for the General.

Meanwhile relations between Argentina, the United States and Britain improved. The real goods and regular markets they could offer became increasingly attractive. The Soviet mission, having served its purpose of strengthening Perón's hand, was ignored. The political mission, however, remains. Perón's materialistic demagoguery provides little margin for its activity inside the country, and the present good neighbourly relations between Argentina and the United States limit its influence on foreign policy. But its mere presence remains important.

Regionalism in Africa

Within the last ten days amended proposals for the closer organisation of the East African dependent territories of Kenya, Tanganyika and Uganda have been published and the second meeting of the West African Council has taken place. Both represent, in different degrees, an effort for closer collaboration among the African colonies.

The first flush of enthusiasm for regional organisations in the colonies has now passed. The advantages of close collaboration between colonies which are territorial neighbours (as in East Africa) or have common strategic or supply problems (as in West

Africa) were much more apparent during the war. Old rivalries and suspicions are re-asserting themselves, and many people in the colonies see less reason to-day for co-operation in running common services and for consultation on matters of common interest now that their security is no longer threatened.

Since the visit of the Secretary of State to East Africa amendments to the East African scheme have been made as the result of strong local criticism. The idea of a High Commission and a central assembly with control over certain inter-territorial services has been preserved, but alterations in the method of representation on the central assembly have been made, and it is suggested that the whole scheme should have a trial run for four years. The ball has now been passed to the local Legislative Councils. Local opinion is being fully consulted before any constitutional changes are made.

The two-days' meeting of the West African Council, which consists of the Governors of Nigeria, the Gold Coast, Sierra Leone and Gambia, has been presided over by the Parliamentary Under-Secretary of State. Civil aviation, meteorological services, higher education and common legislation covering such subjects as customs duties and income tax have been discussed. But there seems little indication of the West African Council fulfilling a forceful rôle in its present form, since it can be driven but little faster and further than its individual members wish to go.

Vigorous regional organisations can be built up only gradually as legislative councils grow in experience and develop a sense of responsibility. Administrative efficiency may call for a more rapid rate of progress towards inter-colonial federation, but it would be wrong to push it along faster than local opinion is prepared to make it work.

Houses in January

As might have been expected, there was a sharp fall in the number of houses finished during the month of January. As the weather during the whole of February was worse still, a very serious hold-up in the building programme will certainly emerge when the February figures are published next month. Building work is always very susceptible to weather changes, and the direct results of the freeze-up will be generally expected. What is not yet known is the effect of the coal crisis on the output of building components, and delays in building may continue for months owing to shortage of bricks, tiles and all the other necessary materials and equipment which should have been produced during the past weeks. The margin was already so slender that delays in deliveries will be very serious.

Detailed figures are given in the *Records and Statistics Supplement*. The completion of permanent houses built by local authorities fell from 5,464 in December to 4,517 in January; houses completed by private enterprise fell from 3,536 to 3,434 between these two months. The fall in the number of temporary houses completed during the month was much more striking; only 4,764 temporary houses were completed in January compared with 12,771 in December. Some fall was expected owing to the ending of the temporary house programme, but not as sharp a one as this.

The effects of the weather were also felt on other housing work, particularly conversions and war-damage repairs. During the

he states himself, in a previous paragraph, that apart from the very definite attack of December 19th (which he does not deny) the guerillas did not cease their activities after March 6th. Does he realise that, in failing to stop the irregular activities of the guerillas, the Viet-Minh has committed a violation of the afore-said agreement?

5. Speaking about the position of the French Socialist Party on the Indo-Chinese problem, your correspondent ignores the fact that the Socialist minister concerned, M Moutet, when leaving Paris, was ready to negotiate with the Viet-Minh, but, after having visited Indo-China, declared that it was in the existing circumstances impossible to do so. This omission in his article is all the more surprising as M Moutet's declaration made a very strong impression in France.

6. In his last paragraph your correspondent says that "It is a measure of their [the French authorities] embarrassment that they have suspected foreign intervention wherever French authority is threatened," and he gives as an example the supposed "intervention" of the British in Syria and Lebanon. There also he should make a more precise statement as it would be interesting to hear that the fate of Lebanon and Syria has never been of any concern to any British citizen in any way.

Yours faithfully,

JEAN LEQUILLER

26, Montpellier Place, London, S.W.7

The Industrial Organisation Bill

SIR.—In its article on the Industrial Organisation Bill, *The Economist* of February 1st makes two statements which I should like to be allowed to qualify a little. One is that "it is more efficient capital equipment rather than beautifully designed consumer goods which the British economy requires." The second

is that design in capital goods like machine tools means only functional design and fitness for technical purpose.

The first statement suggests an unnecessary antithesis. If the better design of consumer goods were no more than an added amenity for the citizen at home, it might fairly be placed second to the needs of capital re-equipment. But improved design is a big factor in reaching our export target. It plays its greatest part in those markets where the standard of living is highest, among them the dollar countries. Mr Dalton, when President of the Board of Trade, estimated that design played some part in rather more than half the ranges of commodities exported before the war. It would be a pity if, even inadvertently, *The Economist* implied that good design was something of a luxury. Dollars are just as useful if earned by well-designed textiles or domestic metal goods as by switchgear or lorries; the improvement of design makes no claim on the import programme and very little on manpower.

As to your second point, it is true that, in the saleability of producer goods, appearance plays a smaller part than in consumer goods. But its part is not negligible. Other things being equal, good form and finish appeal to the technical buyer; even when other things are not equal, there is evidence that British machines have suffered in the past by not looking as shapely and attractive as competitors of inferior performance. Apart from saleability, the effect of the form and colour of machine tools, looms, and other plant on the worker's attitude of mind is a factor not to be overlooked. Output rates are affected by more things than "pressure per square inch or revolutions per minute." The Council of Industrial Design has found many of the leaders in the engineering industry well aware of the importance of design, in the wider sense, and ready to take systematic steps to improve it.—Yours faithfully,

S. C. LESLIE,

Director, The Council of Industrial Design

Tilbury House, Petty France, S.W.1.

Books and Publications

Soviet Impact

"The Soviet Impact on the Western World." By Professor E. H. Carr. Macmillan and Co. 116 pages. 5s.

The title of Professor Carr's new book perhaps over-emphasises one aspect of the problem he is really concerned with. His actual subject is as wide as the crisis of "Western democracy," and the chief elements and symptoms of that crisis had developed even before the Soviet experiment began, or independently of it. But it is enough to list the points of the analysis to realise how complex are the causes and effects.

Professor Carr's argument runs approximately as follows. On the political plane, Soviet influence has led to a sharp realisation of the "imperfections of bourgeois democracy." The Soviet experiment has made the Western world aware of the possibilities and the techniques of planning and has induced it to retreat from *laissez faire*. In international affairs, the Russians have taught the West to attach new importance to the economic background of diplomacy, to mass propaganda and to the half-forgotten truisms of "power politics." The fading of individualistic traditions and a semi-conscious acceptance by the West of the totalitarian standards of mass civilisation reflect the "ideological impact" of the Soviets. Now and then Professor Carr gives more than a hint of his awareness that in all these matters the Soviet impact has been a secondary factor. But sometimes he is apt to forget his own reservations and to treat it almost as the primary factor. This over-emphasis may serve a useful purpose, because the deeper, enduring Soviet influence on the West, apart from current diplomatic controversy, is only too often ignored.

Professor Carr is certainly right in giving a warning against some of the current errors in the treatment of Bolshevism. One is to regard Bolshevism as "a specifically Russian phenomenon, without significance for Western civilisation." Another is to treat its impact as that of "an alien and unfamiliar Eastern ideology." "Bolshevism," says the author, "has Western origins and a framework of reference in Western thought and life. It lies . . . in the main stream of European history." Professor Carr has documented this assertion of his thoroughly. Generally speaking, most of his statements about Russia are very well documented—his knowledge of the inner history of post revolutionary Russia

is almost unique in the academic world, where most of the experts on Russia tend to stop mentally at 1917.

For all its stimulating provocativeness and brilliance, Professor Carr's reasoning has quite a few striking flaws. He seems to attach equal importance and positive value to the chaff as well as the grain of the Soviet experiment. Understandably impatient with the failures of *laissez faire*, the shibboleths of "bourgeois democracy" and prejudiced ignorance of the Soviet experiment, he readily accepts the remedies of planning, as they have been developed in Russia. He also implies that a planned economy must necessarily go together with the totalitarian outlook. Does not Professor Carr draw overhasty generalisations from Russian experience? Even his theoretical definition of planning seems to be exclusively too tied down to the Russian background. Thus, he states that "the essence of planning is the assignment of priorities in the allocation of scarce resources." Planning is thus seen only in the content of an economy of scarcity. A theoretical definition ought not to overlook the possibilities and implications of planning in an economy of abundance. Indeed, the Socialist will argue that the real advantage of planning, such as prevention of slumps and overproduction, would become fully apparent only if the method were to be applied to an economy of abundance. He may further argue that successful planning of and for plenty is unavoidable in an economy of scarcity. To see in the single party state one of the lasting or epoch-making elements of the Russian revolution is therefore perhaps as wrong as it would have been, say, a hundred and forty years ago to see in Fouché's police state one of the lasting achievements of the French Revolution. The real legacy of the French Revolution has been epitomised in *Egalité, Liberté, Fraternité*, and not in the police state to which it immediately gave birth. History may still make a similarly discriminating assessment of the legacy of the Russian revolution.

In his all too brief conclusions Professor Carr is concerned with the response of the Western world to the Soviet challenge. Here he is less provocative—and more vague—than in the analytical chapters. "The prospect," he says, "is probably not an out-and-out victory either for the Western or for the Soviet ideology, but rather an attempt to find a compromise, a half-way house." But he does not attempt to give a concrete outline to its structure and lay-out.

Rambles Among the Social Sciences

"Political Economy in the Modern State." By Harold A. Innes. Ryerson Press. 270 pages. 21s. (Obtainable from Hatchards Ltd.)

PROFESSOR INNES' title suggests many possibilities. The modification of economic theory by its political setting; the contribution of that theory, modified or not, to the art of government; the decline of the competitive economy; such are a few of the themes which might be treated under that head. In fact, he would have done better to call his book *An Economist at Large* and leave it at that. For this is no consecutive treatise but a collection of essays and addresses, published and unpublished, written over the last dozen years for a variety of purposes and occasions and covering subjects as various as the role of the University, transport and tariffs, the Canadian fur trade, the economic importance of gold rushes, and relations between Russia and the West. Professor Innes is a connoisseur in borderlands, intellectual as well as geographical, and the points where ideas and techniques meet and interact are the landmarks of his exploration. But he brings no cosmography back with him. The title essay, for instance, is less a study of political economy, in the modern state or elsewhere, than a stimulating but quite inconclusive study of the mental climates prevailing in Western Europe and America since the seventeenth century, in which no coherent thesis is discernible—at least after the second careful reading.

Incoherence, indeed, is Professor Innes' besetting sin. With notable liveliness of mind, with impressive erudition, with an ant-like industry in the assemblage of facts, he suffers from an extraordinary lack of organisation. Facts and quotations are less marshalled than hurled pell-mell at the reader, who is never certain whether the juxtaposition of two statements is meant to imply a casual connection, an illustrative parallel, a whimsical contrast or the chance neighbourhood of two items in Professor Innes' card index. Coupled with a style even more atrocious than is normally to be expected of North American academics, this characteristic goes far to make his essays totally unreadable.

This would hardly matter if their content were negligible. But they are, in fact, highly stimulating and packed with significant and out-of-the-way information; several of them deal with subjects regrettably unfamiliar to the English reader, and they abound in original and fertile cross-references, linking ideas hitherto unconnected. The papers on Unused Capacity provide a striking case in point, connecting as they do the movement of immigration with the nature of Canada's outward trade. So do the two essays on the newspaper, which treat of the interconnections of papermaking technique, advertising, the ethics of reviewers, publishing finance, mail orders, the lumber trade, the length of novels, and the climate of public opinion. The wealth of knowledge, the boldness of interpretation, and the far-ranging alertness and curiosity which these papers display make one feel that to be one of Professor Innes' students must be an exhilarating, even if exhausting, experience.

Manchester Guardian

"C. P. Scott, 1846-1932: The Making of the 'Manchester Guardian'." Frederick Muller, Ltd. 252 pages. 12s. 6d. net

THIS volume commemorates the centenary of the birth of C. P. Scott, editor of the *Manchester Guardian* for over fifty years. It is rather a history of the *Guardian* itself (including the periods before and after Scott) than a biography of its famous editor. This is entirely fitting, for no editor ever lived more completely for, and in, his newspaper than did C. P. Scott.

Among the illustrations to the book is a reproduction of the "prospectus" of 1821, announcing the forthcoming issue of "No. 1 of a New Weekly Paper to be entitled *The Manchester Guardian*." It opens with these sentences:

It may be safely asserted that no former period in the history of our country has been marked by the questions of a more important character than those which are now claiming the attention of the public. To anyone who regards for a moment the conflicting views and wishes of the commercial and agricultural interests—the considerations which may arise out of the existing laws for the regulation of our currency—the present and anticipated pressure of the National Debt and Taxation—this statement will be sufficiently apparent.

These words are an example of the repetitiveness of history. Despite their slightly archaic ring, they are as apposite today as they were a century and a quarter ago, and they would equally well have served to introduce the infant *Economist* one hundred and three years ago.

The life of Scott is told with admirable skill in a long chapter by J. L. Hammond, the author of the official biography. The rest of the book consists of chapters by members of the staff

of the *Guardian* describing the growth of various of its "features"—literary and dramatic criticism, the Sports Page, commerce and finance, and so on, and partly of a selection of Scott's own writings. These extracts are of particular interest in that he wrote very little under his own name, and few readers of his paper had, therefore, any means of judging the quality of the editor's own contributions. They include the signed article on journalism, which appeared in the centenary number of the *Guardian* in May, 1921—the article containing the famous passage defining the purpose and duties of a daily newspaper:

A newspaper is, of necessity, something of a monopoly, and its first duty is to shun the temptations of monopoly. Its primary office is the gathering of news. At the peril of its soul it must see that the supply is not tainted. Neither in what it gives nor in what it does not give, nor in the mode of presentation must the unclouded face of truth suffer wrong. Comment is free, but facts are sacred.

In his leader writing Scott is revealed as a first rate craftsman developing his case skilfully and persuasively in short, telling sentences, yet with few of those arresting phrases which ornamented the work of the chief leader writer of the latter part of Scott's reign over the *Guardian*, his own son-in-law, C. E. Montague.

Shorter Notices

"The Times' Review of Industry." 1s. monthly.

The first number of "The Times' Review of Industry" is of a more convenient and attractive format than its parent, "The Times' Trade and Engineering Supplement." The contents of the February issue cover the same wide range of industrial topics, and include articles on noise in industry, the position of British coal exporting concerns, and a contribution on the re-equipment of the Lancashire cotton spinning industry. The *Review of Industry* also includes the industrial and trade reports which were a feature of the *Trade and Engineering Supplement*.

"The Building Societies Act, 1939." By C. G. Garratt-Holden. (The Building Societies Institute—Franeay and Co., Ltd.) 48 pages. 2s.

This booklet is a reprint of a memorandum issued in 1939 by the Building Societies Association, to which has been added the Building Society Rules. It is a valuable and authoritative source of reference for Building Society managers and could be studied with advantage by Building Society investors and borrowers.

From The Economist of 1847

February 6, 1847

Lord Palmerston is in some respects the most unfortunate of men. We sincerely believe no statesman ever more ardently desired to maintain the peace of the world, or used more unremitting exertions to do so; and not without great success. But the noble lord's mode of securing peace has often looked so much like "threatening war," that it is not difficult to understand how his lordship has got the false character which he has. If the country has, for several years together, under his management of the foreign office, "smiled in peace and plenty;" . . . yet, even then, people have generally imagined there was something in the shape of a drawn sabre, and an empty scabbard, suspended over the country. Notwithstanding which, his lordship . . . has often succeeded in maintaining peace at critical moments.

Again, Lord Palmerston, we believe, is, personally, one of the most indefatigable ministers who ever held the foreign seals. The extent of the work which his lordship does personally is almost incredible. Yet he has the unhappy knack, while working hardest, of obtaining the character of neglect, and, what we are sure his lordship least means, of a want of respectful attention to his duties to foreign ministers.

★

DEALINGS WITH THE FIRM OF DOMBEY AND SON. NO. V.

We think Mr. Dickens ought to be indicted for cruelty, not to animals, but to his readers. He has for the last four months inspired them with interest and love for a charming creation of his fancy, and in the present number he introduces death ruthlessly, to destroy the object of so many pleasing sensations. We know not how he will answer for the many thousand tears which he has caused to be shed during the last three or four days, nor how he will supply the vacant place made in the list of his *dramatis personæ* by the death of poor Paul Dombey. Our only hope is, that Miss Tox is not the person by a union with whom the great Dombey is to obtain the object of his ambition—the son-partner of his house.

month only 19,000 families were rehoused compared with 29,000 in December. So far 344,487 families have been rehoused since March 31, 1945—a total which looks considerably better than the total of 164,032 entirely new houses which have been built in the same period.

Seamen's New Deal

One of the most far-reaching and comprehensive industrial agreements ever made has been settled by the representatives of seafarers and shipowners on the National Maritime Board. After nearly 18 months' hard work, protracted by the incidence of the ILO Maritime Conference, agreement has been reached, without resource to any arbitration or Governmental assistance, with effect from April 1st, the date on which the wartime Merchant Navy Reserve Pool ceases to operate.

The agreement constitutes a genuine new deal for a body of men whose conditions of work and pay, compared with the importance of their services, used to present nearly as lamentable a picture as those of the miners. Increases in monthly rates, new provisions for holidays and for leave in lieu of Sundays spent at sea, merely consolidate wartime gains. The real novelty lies in the security of tenure given by the two-years contract which puts any seaman covered by the Board's authority "on the strength" either of an individual line or of the shipping industry itself, together with the provision of "efficient service pay" which, with its annual increments, gives an incentive to steady service. The gap in the National Health Insurance provisions which, up to the introduction of special wartime legislation, penalised any sailor unlucky enough to suffer sickness or injury abroad, has now been permanently closed. The establishment of the new grade of "engineer assistant"—ranking higher than a petty officer—circumvents the bulkhead blocking the engine room staff's promotion, while the setting up of wages scales for cadets and apprentices should encourage newcomers. All these improvements are expensive, but the expenditure is likely to prove a good investment for British shipping.

The improvement of "conditions" in the physical sense must wait on the building of new ships; on sea as on land, war has put the slum-clearance programme heavily in arrears. But union circles are confident that the heavy drain of men from the service which followed the ending of wartime compulsion will be satisfactorily halted by the new seamen's charter.

Letters to the Editor

The Case for Deflation

SIR,—While there appears to be a growing body of opinion that an indefinite continuation of the present excess of purchasing power over the supply of goods is undesirable, there is some confusion over the means by which purchasing power can be deflated.

The inadequacy of present supplies of consumer goods is largely due to the necessary diversion of a large part of our limited resources to the construction and reconstruction of capital assets. The amount of annual net investment required for this is certainly over £1,000 million, and probably over £1,500 million. This means that the country is committed to saving at least twice as large a proportion of the national income as in 1938, whereas the proportion that individuals would save voluntarily is probably smaller than before the war.

The equating of the supply of savings with the demand for investment goods could be carried out in several ways:

- (1) By open inflation, with prices rising faster than money incomes.
- (2) By a quite improbable increase in the rate of voluntary savings.
- (3) By an indefinite continuation of the present system of controlled inflation, under which people are prevented, by a system of price controls and rationing, from spending as much of their incomes as they would like. One great disadvantage of this system is that, with the government's present limited powers, it is difficult to direct resources into the uses where they are most needed, and to prevent their diversion into uses outside the scope of the present system of controls. If this system is continued, therefore, some extension of the field over which government power is exercised will probably become essential.

Shorter Notes

Contrary to some reports which had forecast the retention of summer time throughout next winter, the new Summer Time Bill was not amended in the House of Lords. Summer time will consequently come into force on Sunday, and end on November 2nd, with a period of double summer time from April 13th to August 10th. In subsequent years, the period and the amount of summer time will be decreed by Order-in-Council. In moving the second reading of the Bill, the Home Secretary said that the amount of fuel saved would be negligible—about 150,000 tons—but that the measure would enable a more effective use to be made of the fuel available through the staggering of working hours.

For the first time it has been found possible to plan coal exports from the Ruhr three months ahead. Exports will be increased by 50,000 tons in April and by 200,000 tons in May. This will be particularly welcome to the French, who will appreciate quick fulfilment of Mr Attlee's promise to M. Blum that the cuts in their allocation of German coal made four months ago should be restored as soon as possible. For the first quarter of this year they are to receive 362,000 tons, for the second quarter 500,000 tons. This means further progress towards reducing the present French deficit of 300,000 tons a month.

So far, of the 20,000 men recorded as deserters from the armed forces, only 842 have responded to the Minister of Defence's announcement towards the end of January that voluntary surrender would be taken into account when sentence was passed and that family allowances would be payable from the time of surrender. Possibly many deserters have been hanging back in the hope that more favourable inducements would be offered. This hope has now been dispelled by the Ministry, which also confirms March 31st as the date after which those surrendering cannot expect to receive the present inducements. But the fact that so many deserters are still at large shows more than anything else how little they fear being caught and how inefficient the system of tracing them must be. If anything more were needed to emphasise the ineffectiveness of the identity card, this surely is it.

(4) By a restoration of the price system by means of a monetary deflation and rise in interest rates. This, if carried far enough, would bring demand into equilibrium with supply by enforcing a reduction in the rate of investment, especially in durable assets, and thereby slowing down the rate of replacement of assets lost in the war. It would also probably cause a financial crisis and severe, if temporary, unemployment.

(5) A preferable form of deflation would be the deflation of money incomes by high direct taxes coupled with a reduction in government expenditure. The resulting budget surplus would bring the national rate of saving into accordance both with investment plans and with the present artificially low rate of interest.

(6) High direct taxation, at least on its present basis, has an adverse effect on the incentive to produce. It would be better to achieve the necessary budget surplus by means of a rise in prices paid by consumers without a corresponding rise in prices paid to producers. This would bring the money value of the available flow of goods and services into balance with money incomes. It could be achieved:

- (a) By a decrease in subsidies.
- (b) By an increase in purchase tax on those non-essentials of which the supply is insufficient to meet the demand at existing prices. When supplies of such goods begin to be freely available for immediate delivery, it will be a sign that taxation is high enough; when unsold stocks begin to accumulate, it will be time to consider tax reduction.
- (c) If the proportion of resources now employed on the production of some non-essential is regarded as excessive, the industries concerned could be compelled to release resources by penal rates of purchase tax.
- (d) Where it is technically difficult to levy purchase tax on the products of over-expanded industries, it might be possible to obtain the same results by taxing the resources

employed—e.g., by taxing them a given proportion of their wage bills.

If by a combination of the foregoing expedients it were possible to achieve a substantial budget surplus, it would become practicable to carry out a considerable relaxation of the controls without either a rise in interest rates or a risk of inflation.—Yours faithfully, F. W. PAISH

London School of Economics, London, W.C.2

SIR,—You have described the inflationary menace of the present time as "seven billions of incomes that press upon six billions of goods." May I suggest that the source of the trouble is not an excess of incomes over production, but the reinforcement of incomes by a disproportionately large stock of money and bank credit ready for spending at a time when long arrears of spending have become a matter of urgency.

Incomes are generated by production, and the total of incomes is equal to the total of output of goods, services and capital outlay. So long as consumers do not spend more than their incomes, demand just disposes of output, and there is no inflationary effect. It is when they draw on reserves of money, and spend more, that stocks of goods are depleted; orders given to producers who are working to capacity cannot be met without delay, and prices threaten to rise. When prices rise, incomes and output reckoned in money units rise with them.

Controls are being relied on to prevent prices from being raised—prices charged by retailers to consumers, prices charged by producers to wholesalers and retailers. In your article printed in the *Financial Times* of February 28th you pointed out that the elimination of the threat of inflation might get rid of a great part of the controls, and you now suggest in your article on "Expedients and Policies" (March 8th, p. 314) that what is needed is heavier taxation.

The extinction of spending power from the proceeds of taxation is indeed an important anti-inflationary instrument. But how long is it going to take to extinguish the excess of spending power? The excess is a matter of thousands of millions. Taxation at the present time is of almost unendurable severity. Could a surplus of £500,000,000 possibly be squeezed out? Even if it can, are we to rely on the precarious defence of controls for, say, five years against a danger which is now immediate and imminent?

It was with such considerations in mind that I have felt moved in recent years to urge resort to a forced loan assessed on holdings of currency and bank credit, such as has been applied in Belgium and some other countries since the end of the war.—Yours faithfully, R. G. HAWTREY

29 Abchurch Lane, London, W. 8

[The danger, which Mr Hawtreay sees, of an attempt by the public to spend the hoards of currency and credit they have accumulated from their past savings is a real one, though at present still contingent. What is very actual is that the total of personal money incomes greatly exceeds the supply of goods, because the State is running a vast deficit. This discrepancy is not too large to be removed by policy. Incidentally, we did not advocate heavier taxation on balance, but a deferment of any cuts.—EDITOR.]

Books and Publications

The Middle West Comes of Age

"Mid-West at Noon." Graham Hutton. Harrap, London, 1946. 18s.

THE best thing about Mr Hutton's book is that it has at last been written. It was long overdue. It is a singular fact that the Middle West is in many ways a darker and more unexplored continent than Africa. The states which make up the Middle West contain more than 40 million Americans; yet because they are lost in the anonymity of a great union, they are known most vividly through the distinguished American novelists who are attracted from the vogue for literary expatriation. These are the writers who have created the general ideas which the term Middle West summons up to the mind; but between that extreme and the other, represented by the famous survey "Middletown," there is very little outside the history text-books.

To his task Mr Hutton brings immense reserves of enthusiasm, sympathy, insight and knowledge. He is as knowledgeable and as interested in the diverse streams of immigrants which settled the Middle West as he is in current relations between the sexes; in the cult of the average and standardisation of life as he is in the industrialisation of the region; in the impact of international forces on the inherent "insulation" of the Mid-West as he is in

Expedients and Policies

SIR,—In the article "Expedients and Policies" dated March 8th you speak of the need for "adjusting the incidence of taxation in such a way as to reduce its deterrent effect" on production as far as possible. Might I suggest that a method of carrying out such a policy would be for each unit of production to fix a weekly target and to pay a bonus for all output over and above the target figure. The following conditions would have to be observed:—

(1) The target must be fixed after joint consultation between management and workers, and would have to bear some relationship to output over previous weeks. In fact, the average of the past few weeks might well be accepted as a suitable target.

(2) The bonuses must be graduated so that the larger the increase of production the higher the rate of bonus.

(3) The bonus should be exempt from PAYE so that the worker in making an increased effort should not feel that he is being "penalised" in any way. The Revenue would not be the loser by this proposal, as in order to qualify for the bonus the worker would earn more wages and thus pay more income tax. He would, however, feel that he was being offered a special incentive for his increased production which would have, I believe, a profound psychological effect.

This suggestion would have the result of gearing increased production to increased wage earnings in a rough-and-ready sort of way, and I know of no reason why it should not be made generally applicable to industry. The Treasury would surely not oppose it if it could be proved that as a result of its introduction we should get the increased production on which our economic survival now depends.—Yours faithfully, C. A. LIDBURY

Design in Industry

SIR,—Mr Gordon Russell's interesting point that "design, like peace, is indivisible," was strikingly illustrated during the war when all the American technical military equipment with which I came into contact was invariably of much neater appearance and layout than the corresponding British product—though both were designed, often experimentally, under conditions of extreme urgency. The American designer evidently regards neatness of appearance as an integral part of his product's utility.

The opposite outlook, which is currently doing us so much damage, is nowhere more apparent than in the British motor industry. Egged on by the unctuous trade journals and by mechanically-minded diehards, the motor industry, with only two exceptions I can think of, is busily exporting cars hardly distinguishable in style from 1938 American models. Inevitably our manufacturers will eventually follow the American trend; because it happens to be also supported by practical considerations, but meanwhile all the out-moded protuberances that disfigure our car bodies are passionately defended on grounds quite different from those which historically occasioned them.—Yours faithfully, H. A. FRIEDHOUSE

33 Whitehall Lodge, Pages Lane, Muswell Hill, N.10

the physical surroundings which helped to create it. To almost every subject he brings illumination and information—as when he compares the Middle Western lag in amenities with the conscious sacrifice of consumption goods in Russia under the five-year plan. In the Middle West it was unconscious—but the effect of sacrificing the improvement of social conditions to capital formation has been the same. Mr Hutton has also a remarkable gift for making the reader see the prairies and feel the violence of the alternations between the hard, bitter winters and the baking, relentless summer heat; he has a very acute eye for what it is in landscape and architecture that is peculiarly Mid-Western. Most of all, he is fascinated by the fact that the Middle West is still in a process of becoming. Nothing has jelled; the greatest questions are still there to be answered.

The spreading industrialism of the Mid-West is gradually amalgamating with the industrial West. Inevitably, as sectional barriers break down, a greater uniformity of life among these nineteen states will result. Will they abandon or retain the faith in the individual which is the most characteristically Middle Western approach to life? What will happen to the party lines now that big business no longer holds the reins and labour unions are an accepted part of the civilisation? It is Mr Hutton's contention that the Middle West, despite all the very natural tempta-

AMERICAN SURVEY.

Coming Labour Laws

(From Our U.S. Editorial Staff)

THE new Republican Senate is now beginning to give some indication of what it proposes to do about labour legislation. Just before the election, a Gallup poll was based on the question: Should the Congress elected in November pass new laws to control labour unions? Twelve per cent of those polled were undecided; there were 66 per cent who said yes, against 22 per cent who said no. That was before the coal strike in December further hardened public opinion in the conviction that something ought to be done. It is therefore hardly surprising that of the first 200 Bills on all subjects introduced into the Senate as soon as the new Congress was organised, 30 should have been on labour (there was also a number of resolutions and joint resolutions). Hearings on those Bills are already well under way.

The Bill (S. 55) introduced by Senator Ball, for himself, Mr Taft and Mr Smith (all members of the Senate Labour Committee) and tentatively called the Federal Labour Relations Act of 1947, and those of Senator Morse (S. 73) and Senator Ellender (S. 404) (likewise Labour Committee members) all have as their first purpose the establishment of a Federal Mediation Board. The Board could proffer its services, either on its own motion or at the request of one or more parties to a dispute, whenever a dispute threatened to cause a substantial interruption of commerce. If mediation failed the Board should try to induce the parties to accept arbitration. The Bureau of Labour Statistics is instructed to keep a file of all agreements and arbitration awards, open to inspection as data aiding in the settlement of disputes. Further clauses of the Ball-Taft-Smith Bill make the "checkoff" (deduction of union subscriptions from wages by the employer) illegal, require joint control of trust funds, forbid the unions to organise foremen and other supervisory employees, make the unions liable to suit for violation of contracts, declare boycotts illegal as combinations in restraint of commerce, and require the registration of labour organisations as a basis for certification under the existing National Labour Relations Act.

Other Bills that have been introduced would outlaw the closed shop, forbid industry-wide collective bargaining, prevent the collection of funds under the recent portal-to-portal pay suits, amend the National Labour Relations Act (the Wagner Act) to permit employers to give employees their views on labour matters, to redefine bargaining units so as to discourage large union aggregations, to transfer parts of the National Labour Relations Board to the Department of Justice, to redefine "employee" with a view to preventing strikers from voting in subsequent plant elections.

These are the asking bids in the Senate. In the House, some 50 measures have been introduced largely parallel in content. On the other hand, Senate Joint Resolution 22, introduced by Senator Murray, would implement President Truman's suggestion in his message on the State of the Union, that a Com-

mission should be set up to study the whole matter, and that action should be deferred until a report is available.

So far practically all the private witnesses, employers and corporation counsel, before the Senate Committee on Labour and Education have testified to industrial support for the general tenor of the major bills. Mr Schwellenbach, the Secretary of Labour, as anticipated, supported the Murray resolution and opposed the chief provisions of the other Bills. He pointed out that the period just ended was a time of exceptional stress and reorganisation; that legislation passed now will be permanent legislation, and that a thorough Commission approach is therefore doubly desirable.

Meanwhile the U.S. Chamber of Commerce announced that it favoured the application of the anti-trust laws equally to labour and business organisations; the elimination of jurisdictional disputes; the outlawing of secondary boycotts; and voluntary arbitration rather than arbitration by a government tribunal. The Chamber opposed the appointment of a Commission of inquiry as suggested by President Truman, industry-wide bargaining, the closed shop and the establishment of a Federal Mediation Board. Similarly the National Association of Manufacturers has produced a ten-point programme, in which opposition to the closed shop is prominent. And the chairman of the NAM Board, at a New York forum on the economic outlook, recently charged the new Republican Congress with selling out to organised labour with the election of 1948 in view.

*

From now until a passable Bill is achieved by both Houses, the process of bringing down the asking bids will be at work. The men's clothing industry has already appeared to support industry-wide bargaining and the closed shop; the desire for industry-wide bargaining by this collection of small firms which feel themselves individually weak may be paralleled by some large firms which normally deal centrally with a considerable number of branch plants.

Labour will appear on its own behalf, but the various unions will also leave no stone unturned in convincing the employers with whom they have contracts that one aspect or another of the Bills would be impractical, and letting the political pressure be applied from the management side.

This is definitely the strategy of the Congress of Industrial Organisations; how far the major units of the labour movement will act in concert is yet to be seen. Mr Murray's invitation to the AFL, issued in December, for unified action against "a deliberate and monstrous movement underway to cripple if not destroy the labour movement of this country" was countered on January 31st by the AFL's executive council with the proposal of organic unification of the labour movement and the appointment of Mr John L. Lewis as one of the five-man committee to negotiate if the CIO cares to.

There seems to be a change over the last weeks in the national atmosphere, and the wind is not blowing so strongly against labour as it was. Some people attribute this cynically to an incapacity of the public to keep interested in an issue in the absence of a crisis, and these prophesy public regret at any relaxation when the next crisis comes. Another view is that more and more people, including many who in November and December said "there ought to be a law," are remembering that law can be effective only where there is underlying consent, and are further remembering that the phrase, "the public

"AMERICAN SURVEY" is drawn from three sources. Articles described as "From Our U.S. Editorial Staff" are the work of a small group of regular correspondents, resident in the United States. Articles with some such attribution as "From An Industrial Correspondent" or "From A Correspondent in Ohio" are from outside contributors. Everything printed without attribution is prepared in London.

must step in," really means a Government agency.

Once before, the Government, after a wave of strong popular feeling, undertook to cope with a prominent pressure group on the same issue that is the basic issue to-day. The monopoly exercised by the railroads produced the Interstate Commerce

Commission; the monopoly of other corporations, the Anti-Trust Acts. Big labour is now behaving very much as big business did then. In the end, though the railroads failed, they succeeded in operating reasonably well under the ensuing not-too-drastic legislation.

Learned Society

(From Our U.S. Editorial Staff)

AMERICA'S economists and statisticians have just put themselves on display at the concurrent annual meetings of the American Economic Association, the American Statistical Association, the Econometric Society, the Institute of Mathematical Statistics and the American Finance Association. The display was more than a little revealing. The quantity of the profession is large indeed, its prosperity is evidently at historically high levels, its stamina is quite remarkable, and its orientation, at least to observers with a world viewpoint, is curious.

The meetings are of course intended to some degree to be all things to all people, and this must be realised in interpreting them. For the young college instructor, the stepping stone to a better salary increment and a promotion in grade may be an invitation to read a paper before this gathering of his peers. For the intellectual whose pursuit of his daily bread keeps him in some remote place off the beaten track, exposure once a year to the varied old and new interests of his fellows forestalls the freezing of his own intellectual processes. Then, too, there is the urge to meet people for direct exchange of views outside the formal sessions. On the bread-and-butter level are the operations of the "slave market" where many seeking jobs complete dossiers, listing their progress toward the Ph.D. union card, their honours, prizes and awards, and other qualifications which might endear them to the heart of a college dean desiring to add to the lustre of his teaching staff, or to a possible government or business employer—though the emphasis is academic. Finally, a very few business men stray into the rarer atmosphere, hoping the oracles may give them some perspective on their own operations.

Great physical stamina was demonstrated by the scope of the sessions. Sixty-four meetings were held in five days, and 60 of these were within three days. One hundred and ninety-six papers were presented—too many to reflect credit to a group whose business is teaching—and were delivered in a colourless and scarcely audible monotone. Seventy-eight formal discussions of the 196 papers piled Pelion on Ossa with dissertations on the papers they were criticising.

The preponderantly academic orientation of the meetings and something of the present academic frame of mind can be shown by a few more figures. Two-thirds of the sessions were presided over by professors and 84 of the papers were by those connected with educational institutions. Government servants took the chair at 10 of the meetings and provided authorship of 65 of the papers. Private business, though a large employer of analysts and the object of much of the analyses, had sparse representation; only five sessions were guided by business personnel and only 22 papers delivered by this group. Furthermore, many of these 22 were by persons connected with trade associations and statistical organisations; only a handful of direct employees of business concerns were on the programme. Labour union representation was also very sparse. If the programme was representative of an attitude, the academicians accept the bureaucrats and want to hear from them and from other academicians, but they are sceptical of any non-governmental voices.

*

The mental orientation of the analysts is toward the narrow and the technical, at least as represented by items on this programme. At least a third of the sessions were devoted to complex statistical and mathematical matters—to the multiplying little chapels where each group which has heard the call worships its own particular gods of technique and method. The new

idol with the largest following is that of econometrics with its regressions, its ratio analysis and its model-making.

The next most popular field in number of sessions—but perhaps not in attendance—dealt with methods of teaching economics to undergraduates. The fact that universities and colleges are swamped with ex-soldiers obtaining education under the "GI Bill" and that there is muttered questioning of the understandability and adequacy of the teaching in an era of the subject's high importance, stimulated attention. Consciousness has been growing among professional educators—and perhaps among the citizenry—that precise analytical research into the number of variations that may dance on the head of an assumption—or even into some aspect of more immediate interest—is not necessarily the ultimate qualification for a good teacher.

A very poor third in programme space was the prediction of the immediate economic outlook—though attendance at these sessions was large. Major vocal sentiment seemed to be that 1947 should be a "good" year, but there also seemed to be strong acceptance of the view that the boom phase cannot be expected to be perpetual.

At least one new economic specialty was prominent: emphasis on the use of psychological surveys to obtain more knowledge of the well springs of human behaviour and of the irrational aspects of human motivation. Such techniques, spurred by the success of opinion surveys in forecasting election results and demand for commercial products, were used extensively during war savings campaigns to gauge public response to Treasury financing and to some degree by other governmental organisations; the current "liquid asset" studies by the Federal Reserve Board are carried on by this technique. Here seem to lie great potentialities for a merging of the resources of statistics, economics and psychology.

Other problems of the day were touched upon but with less emphasis, at least in programme space: housing and housing finance, public debt, atomic energy, prices, money and international economic relations.

The small programme space given to international matters, the low attendance and the attitude of the speakers all combined to give an unhappy flavour to those concerned with world relationships. The major meeting, entitled "International Trade Organisation" was presided over by Mr Thorp, the Assistant Secretary of State, and was addressed by Mr Clair Wilcox, chairman of the American delegation to the recent London ITO meeting, and by other distinguished experts. Even though the session competed with eight others held simultaneously, it ought to have been better attended. Mr Wilcox's assertion that if the present effort to end restrictionism should fail, the conditions of the 1950s would make those of the 1930s look like pure free trade was a striking note. Professor Schultz of the University of Chicago pointed forcefully to the basic contradictions between the foreign commercial policy of the United States and its domestic commitments and pressures. A very well attended and enthusiastic dinner meeting heard the convention's most distinguished visitor, Sir Henry Clay, in a magnificent address, outline the unhappy position of England, and its outlook, and express the hope—though as one without confidence in its fulfilment—that America would soon come to occupy England's nineteenth-century rôle as the ultimate market for the world's goods.

As revealing as what the programme did contain were some of the things it did not. In other years the position and outlook

tions to remain aloof from international affairs, is no more isolationist than any other part of the country, less so, indeed, than the Great Plains or the Far West; and that it has moved more rapidly in the direction of international collaboration than any other region—perhaps, though Mr Hutton does not say so, because it had further to go. The conversion of Senator Vandenberg is a heartening symbol of this process.

But despite the revolutionary changes of the past fifty years, the people of the Middle West are still on the move; as Mr Hutton very well says:

Their great energies are as yet divided, as their minds and loyalties are confused. In this confusion they are not singular. They are singular only in the wealth of assets with which they can solve their problems.

The book blows away a lot of the hoary legends that have grown up about the Middle West: that it is uncultured, agricultural, backward, xenophobic. In fact, it is rapidly losing its identity as a region. In years to come Mr Hutton's book may be as valuable as the surveys of British architecture undertaken before the blitz.

"Midwest at Noon" has many virtues, but it would be idle to pretend that it is suited to be a reference book. It is a heady stream of sociology, politics, geography, personal reminiscence, description, history, analysis. A more rigorous discipline would not have been amiss. But if one has the time and patience to master its massive chapters there are very few phases of Middle Western, and American, life on which Mr Hutton is not both illuminating and stimulating.

Industrial Capital in India, 1938-9

"Industrial Capital in India, 1938-9." By M. V. Divatia and H. M. Trivedi. N.M. Tripathi Limited, Bombay, 1947. 91 pages. Rs. 5.

THE authors of this careful and ingenious statistical estimate have made an admirable attempt to provide a measure of the "real" fixed and working capital employed in factories using power and employing 20 or more workers, for India as a whole, in the year 1938-9. Incidentally they demonstrate how, by the use of indirect methods of estimation and the application of data supplied in other countries, and for India in allied fields, more meaning can be wrung from the existing but all too scanty Indian statistical material.

The first three chapters explain clearly the objects and methods of the inquiry, and give in a series of tables the estimates made for the four main groups of industries. Chapters IV and V discuss in more detail the salient features of the estimates for particular industries, and groups of industries, and the extent and efficacy of the checks and modifications adopted to test and increase the accuracy of the results attained. Throughout the work great ingenuity has been shown in devising checks of accuracy, especially by applying, wherever possible, several methods of estimation to the same industry. It is remarkable what close agreement has been achieved between the results attained by different methods. Chapter VI discusses uses to which these estimates might be put.

The final estimate itself—i.e. Rs. 675 crores, $\pm$ 6 per cent, in 1938-9—fills an important gap in our knowledge; whilst the construction and structure of this total figure provides information which might be used to help to assess (a) the nature of the existing structure of industry and territorial distribution of industrial capital in India; (b) the efficiency of existing industrial firms; (c) the extent of the wartime accumulated demand for replacement of capital equipment; and (d) the capital requirements for the fulfilment of particular industrial plans or targets. Above all, the inquiry shows how substance and concrete content might be given to the vague aspirations and ideal targets represented by the ever-growing number of economic plans for India.

Public Investment Survey

"Public Investment and Full Employment." International Labour Office. P. S. King. 347 pages. 10s.

THIS study, the third in the ILO's new series of *Studies and Reports*, provides an authoritative account of the public investment policies followed by a number and an analysis of the theoretical and practical problems arising out of them. (The term "public investment" is preferred to that of the old "public works.") The survey begins with an historical and theoretical study

of the unemployment problem and of the relations, past and present, of public investment and unemployment policy. The next section deals with the principles of counter-cyclical financing as applied both by central and by local governments; the next with the technical, legal and administrative aspects of the matter. The fourth section, entitled *The Lesson of the Thirties*, adopts the historical approach, studying in some detail the policies actually followed during the Great Depression by the United States, the United Kingdom, Canada, Australia, New Zealand and Sweden. The final section looks forward to make a similar survey of the post-war employment problems confronting a number of nations—Australia, Belgium, Canada, Sweden, Switzerland, the United Kingdom, the United States and a group (including India and Latin America) labelled "capital scarcity countries"—and of the policies which they appear likely to follow. A final chapter summarises the whole and sets out the agreed recommendations of the ILO's International Development Committee; and forty pages of appendices—texts of resolutions, statistical tables, charts and definitions—complete this encyclopædic work.

As a source book and work of reference it maintains the high standard of previous ILO publications. As a book designed for consecutive reading, as against consultation, it suffers like its predecessors from the unwieldiness which is inevitable when matter for at least three volumes is compressed into one. Could not the ILO take to publishing its *Studies* in sub-series, split into volumes of ordinary length? These would stand a better chance of being read by the ordinary citizen, and thus contribute more widely to that growth of informed public opinion the fostering of which is one of their purposes.

America's National Wealth

"National Product since 1869." Simon Kuznets. National Bureau for Economic Research, New York. 239 pages. \$3.00.

PROFESSOR KUZNETS'S latest report adds impressively to the edifice of his past work on the American national income and its components. Like its predecessors, it consists almost entirely of tables,

whose interpretation is left to the reader, the text consisting of technical elucidations of the statistical methods and sources used. To summarise its findings is of course impossible; the book has no thesis, but is purely a work of reference for statisticians, economists and historians. One or two significant points are, however, worth indicating even in a brief review. Thus several tables indicate the greatest rise in the national income, both as a total and per head, during the decades 1869-1888, with a severe slowing down as the twentieth century is reached and, of course, an actual reversal during the 1930's; others evaluate the upward trend of productivity, which turns out to be about 1½ per cent per annum on the upward slope of the trade cycle.

The components of the national output—perishable, semi-durable and durable consumer goods, net capital construction and consumption, and claims against foreign countries—are separately analysed. Other tables deal with land values and service expenditures; analyse consumers' spending as disclosed in a series of departmental inquiries; and summarise war expenditure. Not all of these tables are, of course, equally solidly based; some rest on assumptions (regarding continuity of conditions, similarity in spending habits, etc.) which the author admits may not be justified, others on regrettably small samples. The reader is most scrupulously warned against these shortcomings, both in the text and in the Director's foreword. The general reader is, in fact, warned off altogether.

The striking thing is, however, not that the evidence is occasionally inadequate or that statistical series covering the same period should differ, but that that evidence and those series should be available at all on anything like the necessary scale. Working in this country, Professor Kuznets would have found himself paralysed from the start. The raw materials for his massive compilations—particularly this one, with its range of nearly sixty years—are simply not available. It is one of the minor mysteries of national tradition and temperament that the Americans, with their deep-rooted dislike of controls and their comparatively makeshift Civil Service, should for many decades past have been willing to spend time, trouble and money on the collection and tabulation of economic facts and figures on a scale which not even a Labour Government bent on planning has seen fit to demand.

Communist China

"Report from Red China." Harrison Forman, Robert Hale. London, 1946. vii. + 247 pages. 15s.

MR FORMAN is an American journalist who paid a six months' visit to the Communist-dominated areas of North China during the autumn of 1944. His experiences were of the now rather stereotyped pattern, he had lengthy interviews with Chinese Communist leaders, and his hosts took him on a conducted expedition. He describes what he saw in a vivid and interesting fashion, and the careful and discriminating reader of his book will glean a good deal of useful information about conditions in the Communist areas and the political objectives of the Communist Party.

But while Mr Forman was always on the alert for any stage management or propagandist reports when he was dealing with officials of the Chinese National Government, his critical faculties seem to have deserted him as soon as he made contact with the Communists. In consequence, most of his chapters are simply reproductions of Communist stories about labour heroes and dauntless guerrillas. Mr Forman repeats the most far-fetched yarns with a faith and naïveté which make extremely amusing reading. He accepts Communist "statistics" without question, such as the 92,000 battles which they asserted they had fought during the seven years 1937-44, an average of over 30 "battles" a day. The relations between the Communist armies and the peasantry are presented as one long love feast.

There is an element of light comedy, apparently unsuspected by either the author or his informants, which pervades this work. The battalion of colonels and majors who were being drilled as privates, the cave "university" at Yen-an, where the married students are forbidden by the regulations to cohabit except on Saturday nights, and the exchange of gifts on festival days between the Japanese garrisons and their Communist foes are examples in point. Perhaps the best of all is the portrayal by Japanese Communists of the "tortures and iniquities" inflicted on new recruits to the Japanese Army; these included being made to crawl under a bed and imitate a cuckoo. Has Mr Forman never heard of ragging freshmen in an American university?

AMERICAN SURVEY

Mr Truman's Recovery

(From Our US Editorial Staff)

IN the months of 1945 after Mr Truman became President his popularity in the country was very great and commendation widespread. By the latter part of 1946 the condition was reversed: less than one third of the voters approved the way he was handling his job as President, according to a sample poll, and his party went down to resounding defeat, losing control of both the House and the Senate. Now in early 1947 another reversal is under way. His popularity has risen far (though it is well under the 1945 high) and is still rising; the opposition is on the defensive and not a little confused.

These shifts are interesting evidence of the continued mercurial nature of American politics and public opinion. But there is a still more interesting and significant aspect: the domestic prestige and authority of the executive have been much, if not fully, restored. The government is on a far better domestic base to face the Moscow conference and the world crisis than a few weeks or months ago.

How this alteration has come about is not altogether clear, though evidently many developments have contributed.

The ineptness which the Republicans have so far exhibited is clearly one of these. Billed last autumn as something like Superman come to save the country from a disintegrated administration, they simply have not performed that rôle. On the stage they have exhibited only disorganisation and have subjected their supporters to disappointment after disappointment.

Probably the most outstanding disillusionment has been their position on the budget and taxes. Having confidently promised in the election campaign vast reductions in expenditure, taxes

and debts, they have thus far seemed to be at a loss to know how to deal with the \$37.5 billion budget the President presented to Congress. The tax cuts have not come and on March 15th, as the taxpayers sent in their cheques, they still seemed far away.

The position many Republicans took in the reciprocal trade discussions have been no less than shocking to many of the voters; and although the party itself has yet no official position, so outstanding a member as Senator Vandenberg has seemed to threaten to espouse restrictionism when the Act is subjected to Congress next year. The House Republican leadership is clearly at odds with that of the Senate, and this week it has been revealed that the Republican Senators newly elected last autumn are in revolt against the autocratic procedure of the Senate Republican leadership and are resentful of being treated as "little boys." In short, after some two months, the Republicans have yet to score on any point.

But the Truman recovery by no means wholly results from the greater ineptitude of the opposition: it has certainly been aided by a substantial list of solid accomplishments. Beginning, perhaps, with the spate of annual messages, which gain in impressiveness with the passage of time, the record has been rapidly extended. The appointment of General Marshall as Secretary of State was viewed as extraordinarily good at the time, and lustre has been added to it since. The appointment of Mr Lewis W. Douglas as ambassador to the United Kingdom has brought almost universal acclaim; Mr Douglas is properly regarded as one of the most able, hardest working and fairest

From The Economist of 1847

March 13, 1847

We have [in the United States] quite a variety of temperance societies, some of which combine benefits in cases of sickness and death, with total abstinence. There are Sons of Temperance, Daughters of Temperance, Temples of Honour, Washingtonians, and a host of others; and last, though not least, the coloured people are coming to the rescue, and are forming societies, with the agreeable appellation of Brothers of the Fountain. One of the leading physicians of this city . . . last week had a brilliant evening party of 250 individuals, at which neither wine nor any alcoholic liquors were used.

It is estimated that not fewer than 800,000 persons in the United States have joined and belong to temperance societies, and a great number besides abstain from intoxicating drinks who do not belong to any society. Out of this immense army of water drinkers there are probably 100,000 persons who, previous to their reformation, did not obtain a suit of new clothes once in three years, and whose families were equally ill clad, but who now get one or two suits a year . . . and whose wives and children have likewise experienced the same advantages and improvement in their comforts and appearances. It is not an unfair calculation to say that 4,000,000 dollars a year are now spent in clothing which formerly went into the pockets of distillers, brewers, tavern keepers, and conductors of dram-shops . . .

*

A correspondent sends us the following simple mode of testing the purity of sulphate of ammonia, as at this season large quantities of this highly-fertilising manure is used, and which is sold adulterated to the extent of 30, 50, and even 70 per cent.

Heat a shovel or any plate of iron to redness, and place upon it a portion of the salt of ammonia; if the salt be pure the whole will go into vapour; if adulterated, the impurity will remain on the plate of iron.

for interest rates has been prominent, but there seemed to be acceptance, at least implicit, that this is a settled matter. Monetary policy was likewise a notable absentee, and the subjects of labour relations, taxation and competition appeared only incidentally and inconspicuously.

The responsibilities resting upon the profession were clearly put to the meeting by Dr Nourse, chairman of the President's Council of Economic Advisers, and by Dr Goldenweiser in his presidential address to the American Economic Association. Both said that present conditions required the economists "either to put up or to shut up."

American Notes

War Powers for Peace

In a message to Congress this week, President Truman requested the extension of certain controls authorised by the Second War Powers Act, which expires on March 31st. Seven main provisions of this omnibus bill have already expired or been replaced by permanent legislation. The authority which the President wishes to see extended relates in the main to those priorities and allocations essential for the fair sharing of short commodities inside the United States and between the United States and the rest of the world and the carrying out of American relief shipments.

The domestic controls which it is proposed to continue are few: those over the distribution of grain, to meet the export target of 10,500,000 short tons, over sugar, rice, and molasses, and over the sharp shortage of railway facilities. Both self-interest and American international obligations require continued allocation of fats and sugar, and import controls over meat and dairy products, and other protein foods. Allocations will also continue to be necessary for a short list of imported industrial materials, such as cinchona bark, rubber, manila, tin, and antimony. Export controls over automobiles and tractors are included.

In some instances, as Mr Truman was at pains to point out, the continuing of allocations is of positive benefit to the United States, insuring supplies to domestic industries. But it is far from certain whether this will induce Congress to approve the self-restraints in the international market which it has triumphantly abandoned at home. In some quarters it is prophesied that the only controls which will be continued are those over tin, natural rubber, uranium, and antimony. Already there is vigorous opposition from the sugar industry to continued control over its raw material and a demand that the American housewife should enjoy 10-15 pounds more sugar a year. The President has urged Congress for a speedy decision; but if the past is any guide, the results of this first specific test of the economic intentions of the new Congress will not be known until late in March.

The Budgeteers' Retreat

(From our US Editorial Staff.)—Since Mr Truman sent his Budget message to the Congress in early January proposing total federal expenditure of \$37.5 billions for the fiscal year 1948, a hasty and not very orderly retreat has been in progress by most of the groups whose election slogan was "cut government spending." An examination has confirmed Mr. Truman's statement that a high proportion of the total is untouchable—or touchable only by doing violence to the demands of some major pressure group. This, the Republicans seem to have decided, they are as unwilling to try to do as the Democrats. Consequently, they are busy seeking to escape from what many believed were promises to make a major cut in taxes and at the same time to make a start toward repayment of the national debt in a large way. The excise taxes are apparently to remain as the President requested and the hope many had for Mr Knutson's 20 per cent cut in personal income taxes has glimmered almost to extinction. The Republicans' first major encounter with Mr Truman and responsibility has therefore not been a happy one. Perhaps it will teach them hereafter to prepare their case a little more studiously before shouting from the housetops.

Students who have examined the budget with some care and who have at the same time given some attention to politics think that Congress will have a hard time indeed to get expenditures in the fiscal year 1947-48 below \$35 billions or to make a cut as much as 10 per cent in the expenditure proposed by the President. And the realisation of even this moderate saving probably requires that there be no consequential business recession

or unemployment in the next 18 months. Some few stand still on "principal" or emotion and demand that expenses be cut to \$25 billions or less and that Congress and the administration find out how to do it, but their admission that they do not know how and have no suggestions leaves them little audience.

One of the possibilities in the situation is that the government's informational and especially its statistical services will be mauled. "Needless statistics" is a good goat—and there is no pressure group to be offended. The savings would of course be small, but the "cut spending" groups, caught short by inadequate preparation of their case, must try to save some face. Probably there is no more unfortunate place to cut, since the elimination of statistical activities during the war has already brought a considerable void and since new information to see what the wartime shifts in this vast and complex country have been is needed for many purposes. But the statistician may have little support for his plea and in the bargain may be charged simply with joining the line of those chanting "cut everyone—except me."

Airways on the Spot

Despite fresh peaks in freight and passenger traffic for 1946, the domestic airline companies have met with an abrupt reversal of fortune during recent months, and there is now general agreement within the industry that fares must be revised to keep pace with rising costs. According to one responsible spokesman, the whole industry is now operating "in the red," and some of the major undertakings have been forced to secure loans to tide them over the present critical period. Moreover, the recent series of crashes has brought a general demand for revision of safety standards and regulations, and a full-scale Congressional investigation is now in progress.

At first sight, 1946 was yet another good year for the airways. The number of revenue-paying passengers rose by nearly 80 per cent, to 13 millions, and revenue mileage rose by more than two-thirds to 6 billions, while express and freight shipments came up by 60 per cent to 37 million ton miles. All operators reported a substantial increase in route mileage and seating capacity. Unfortunately, managerial optimism outran the near-term traffic prospect, and ignored the rising trend of labour, material, and service costs. Equipment purchases and development costs soared above budgetary estimates, and lucrative airmail revenues fell as demobilisation proceeded. And while the safety record, for 1946 as a whole, was better than ever before (1.24 passenger casualties occurred for every 100 million passenger miles), the last few months brought nine crashes on scheduled flights, and more than 70 civilian deaths.

For the time being, the average payload is below the "break-even" point. In 1945, the industry recorded net operating revenues of about \$43 million; in 1946, there was a decline to well below \$5 million. Over the year to September last, 16 companies recorded net profits below \$3 million, the comparative 1945 figure being nearly \$16 million, with Transcontinental and Western (TWA) sustaining a heavy net loss through strikes and technical troubles with its fleet of Constellation craft. The general slump on Wall Street, and the decline in traffic made it quite impossible for managements to carry out autumn plans for share issues. Pan American borrowed \$40 million from a banking syndicate, TWA secured a similar amount from insurance funds, and is now seeking further accommodation from the Reconstruction Finance Corporation, and several other lines are seeking temporary loans.

These troubles will be surmounted. So far as safety regulations are concerned, the Civil Aeronautics Administration will, probably, now secure from Congress an annual appropriation more in keeping with its task of standardising the best type of service equipment to assist bad weather control of airports. But wage and service costs are still rising, and it is becoming more and more apparent that the 1945 decision to reduce passenger rates to 4.5 cents a mile was a little premature, to say the least. Restoration of the earlier rate may retard expansion, but it would leave no ground for the present suspicion that some managements have at times neglected the risk factor in their records.

Crisis in the Schools

Since 1939, 350,000 teachers have left the American public (that is, state) schools. The plight of the teacher under inflation is similar to that of all white-collar workers under inflation, but the effects on the educational system are serious enough to make

this a special problem. As more than one-third of the pre-war teaching staff have left their profession for better-paying jobs, standards have declined. Over-age and under-qualified teachers are at a premium; many of those left in the schools are forced to take on after-hours work to augment their pay. The teachers' colleges are half-empty, while other colleges are turning away applicants. The unhappy story of the private schools is being repeated, with less excuse, throughout the country.

The lesson of last year's strikes in industry has sunk in. Strikes, or threats of strikes (in New York the phrase "mass action" saved injured professional dignity) have brought better rates in some instances, mainly in the big cities, where education is on a mass-production basis and the teachers' lobby counts for votes. But in teaching, the inroads of inflation have only aggravated existing ills. In wealthy New York City, the average salary is \$4,100. But the national average is \$2,000, and at the other end of the scale ten states pay an average salary of less than \$1,000. Negro teachers in the South may receive as little as \$300 a year.

The publicity and lobbying campaign now being carried on by teachers' organisations is a sign of the changing times. But salaries are only half the battle. In 1940 New York was spending \$157 a year per pupil, while Mississippi spent \$31 per pupil—yet many of the Southern states spend a greater proportion of their revenues on education than the wealthier units. To finance an adequate educational system for Mississippi might easily absorb the whole of the state's income.

Federal aid for education has long been recognised as the only solution if there is to be anything approaching equality of educational opportunity between a boy born in New York and another born in Mississippi. A long-pending Bill would appropriate \$300 million for this purpose. This would only mark the beginning. To maintain a national salary scale of \$2,340 for college-trained teachers (and an untrained daily labourer starts at \$1,700 under Civil Service rules) would absorb many times this figure. Even this modest Bill is bitterly opposed as the opening wedge of regimentation of text-books, thought, and teachers, particularly in the South, where the freedom to teach white supremacy and to abominate Darwin is still highly prized. Senator Taft is an advocate of limited assistance to state educational funds. The existence of a Republican Congress makes it possible that the growing crisis in education may yet be considered a national problem.

For Small Business

The Democrats have quickly lost another round in their struggle to curb the growth of special Congressional committees. As reported last week, the Senate majority voted early in January for re-establishment of the War Investigation Committee, despite individual Republican pleas that such actions were directly opposed to party pledges in respect of the Congressional Reorganisation Act. The Senate (again by a narrow majority and against a handful of Republican protests), has now voted for maintenance of the Small Business Committee, at the expense of Senator Tobey (Republican of New Hampshire), who declared with some vigour that under the Reorganisation Act, the work of the Small Business Committee should be transferred to his own Banking and Currency Committee. The new chairman of the Small Business Committee will be Kenneth S. Wherry, of Nebraska, who is also party whip in the Senate. Since both parties were quite willing to continue the work of the Small Business Committee in one form or another, there is probably plenty of evidence to support Senator Tobey's view that renewal of the special committee has been arranged as much for its support to the professional career of Senator Wherry as for its probable contribution to the cause of the small business man.

Though individual Republicans express increasing concern over the concentration of manufacturing industry in the United States, there was no general enthusiasm for President Truman's recent call for vigorous enforcement of the anti-monopoly campaign, and no evidence that Democrats themselves could be brought to share the crusading fervour apparent in the White House and the Justice Department.

Present evidence, indeed, suggests that the small business man may soon get even less assistance than before. The Reconstruction Finance Corporation, for example, has made some useful contributions to small business in the post-war periods, and its authority has been somewhat strengthened by powers transferred from the Smaller War Plants Corporation, under which RFC can arrange more liberal credits, arrange for surplus property deals on terms which favour the small man, and assist small firms when bidding for government contracts.

There is an even chance, however, that this agency will disappear in the general scramble to reduce the size and scope of Federal operations. Liquidation of the RFC has become more likely following a proposal from Senator Tobey that the Federal Reserve Banks shall now replace it as the prime guarantor of small business loans. Under the proposals, the Reserve Banks will guarantee approved loans for small business up to 90 per cent of outstanding commitments, and will not need to work under existing restrictions which confine such credits to reinforcement of working capital for "established enterprise." These proposals are supported by Mr Marriner Eccles, chairman of the Reserve Board, and look like going through Congress. But the weight of the big battalions of industry suggests that there may still be room for an independent agency where private finance is lacking.

Rail Rates Again

Monopoly charges may soon attract more attention in Congress, where House and Senate committees are now examining proposals designed to relieve the railroads and all common carriers from possible charges under the Sherman Act in respect of rates and service agreements approved by the Interstate Commerce Commission. If such immunity is granted, the Justice Department will be forced to abandon charges it is now making against rate agreements covering a great part of the main freight services in the west, and dating back to the early days of the New Deal. These charges are scheduled to come before a Nebraska court during April, and it is interesting to note that they will concern many of the business interests of Mr Averill Harriman, now Secretary of Commerce.

The carriers can claim powerful backing for their cause in Congress. Last year Senator Reed (Republican, Kansas) pushed his proposals through the Senate Commerce Committee, although the Bill was abandoned in the summer scramble for adjournment. This year, the Committee has given priority to the Reed Bill, which would leave the railroads open to anti-trust action only where rate and service agreements were obtained "by the employment of coercion, duress, or intimidation." A similar Bill has been put forward in the House by Representative Bulwinkle (Democrat, North Carolina). Passage of the Reed-Bulwinkle legislation would, of course, leave rail rates subject to the jurisdiction of the ICC. But, in the view of the Justice Department, the broad structure of rates can easily conceal restrictive measures. Passage of the Bill by Congress will present Mr Truman with yet another delicate political problem.

Apart from such relief measures, the railroads are now determined to make a fresh bid for higher freight rates, although the 17.6 per cent advance became effective only on January 1st. In their view the rate increase, which would yield about \$1 billion on the 1946 traffic level, will be less than sufficient to safeguard their financial position when business activity falls below its present record peace-time level. Despite the more conciliatory tone of labour leaders, they are worried by the threat of further wage claims. The claim for further relief is based on the fact that this was the first permanent adjustment of freight charges since 1939, that wage rates have since risen by 50 per cent, and that material and other costs are substantially greater.

Rent Ceilings

At the eleventh hour last week, a firmly expected order from the Office of Temporary Controls was cancelled. This order, it is believed, would have authorised an increase in rent ceilings of 10 per cent, and a companion-piece would have alleviated the hardships of landlords whose income, but not costs, are controlled by Federal law. By cancelling the order, Mr Truman determinedly returned to Congress the thorny problem of what modifications should be made in this ideologically outmoded, but popular remnant of a controlled economy.

At the hearings now being conducted in the Senate, the main drift of the Republican majority is toward a reluctant extension of controls for a year or fifteen months, with an immediate concession to the landlords in the form of 10-15 per cent rise in ceiling rents. Controls would apply only to existing units; there is a strong feeling both in Washington and in states which have their own laws that to apply ceilings to new projects would discourage building of new apartments and houses for rent. Theoretically, the majority of Republicans and some Democrats would like to consign rent controls to the oblivion which now covers the main body of controls; but 60 million tenants—among whom many Congressmen must be counted—are a formidable body to offend.

of public figures and his competence has been demonstrated in private, public and international capacities. The Hoover mission to study and to report on Europe so as to assure objectivity and bolster the bipartisan conduct of foreign affairs has been very well received. The rescue of the International Bank from the condition of serious deterioration which had followed Mr Meyer's resignation has been felicitous. The team of Mr McCloy as President, Mr Black as the American executive director, and Mr Garner as Vice President has almost instantly restored confidence in the institution in all quarters except the extreme left, and the addition of Mr Graham Towers, Governor of the Bank of Canada, as that nation's executive director further increases confidence.

But it is not the quality of these major appointments alone, important as they are, that is the full story. The President has fully and gracefully accepted the clearly expressed wish of the electorate to dismantle government controls, even though he has obvious reservations, and the Price Office Administrator, the most unpopular of the lot, is going fast. Mr Truman's acceptance is contrasted with President Wilson's attitude in a similar situation. The public also was clearly annoyed with organized labour. Mr Truman found Mr Lewis and his United Mine Workers out on a limb and skilfully sawed it off: the government's sweeping victory in the Supreme Court has benefited the President's prestige. The Presidential conferences with the press, which earlier had brought unhappy results, have taken a wholly different and far better tone. And the impression grows that the government is much clearer—and wiser—about

foreign policy. Thus, while the Republicans have failed to score, Mr Truman has done so repeatedly.

Whether this rather chance collection of developments is purely fortuitous and perhaps implies little for the future, time alone can reveal. Mr Truman's record of earlier months causes not a little scepticism about whether he has changed basically or is having a run of luck—though even the sceptics are willing to hope. Furthermore, major problems are upon the President, or looming, to subject him to rigorous tests. The Moscow Conference is one. Greece, and all the related matters which the new phase of world crisis presents to America, are another. Domestically, the problem of work stoppages and labour legislation is not solved; the present quiescence is generally viewed as precarious. And the new violent upsurge of commodity prices, reported more fully in an accompanying Note, threatens not only labour, but other forms of equilibrium.

The Republican showing so far likewise is not to be taken as final. A two-month period is by no means conclusive, and does not make a summer. Their poor and slow start does not yet determine the history of this Congress—nor of the Presidential race next year, in which they are still given the odds. But regardless of the many ifs which the future always presents, the major restoration of the executive's prestige for the present state of affairs is certainly fortunate. One big if does not have to be faced: what would have happened had the British crisis and the Moscow Conference occurred at last year's low point of the executive's esteem?

The Vandenberg Tariff

IN terms of foreign policy, the "Vandenberg line" has for some time provided a clearly-demarcated boundary beyond which the Administration cannot venture, unless it is prepared to abandon every hope of continuing bi-partisan support. Now, under the lead of Senator Vandenberg, the boundary lines are being drawn in respect of economic policy, and the result of recent negotiations between President Truman and the Republican Party leaders is the "modification" of the reciprocal trade agreements programme, confirmed by Executive Order in the closing days of February.

This new phase in tariff policy follows intense pressure within the Republican Party for outright repeal of the Trade Agreements Act—which, in any event, will expire next year unless renewed by Congress. The Republican leaders proclaim the new agreement as a considerable concession to Democratic policy, and Mr Truman has welcomed the "compromise" by declaring that the provisions of the Executive Order "do not deviate from the principles outlined by Mr Cordell Hull, the former Secretary of State."

It is more than a little difficult, however, to determine the nature of the concessions made by the Republican Party. The Trade Agreements Act will stand for its present term, and with benevolent formality, the party managers declare that the Geneva talks next month can go forward without any interruption. But the "escape clauses," which are now part and parcel of the trade agreements programme, can nullify any concessions made by the US delegates at Geneva, or at any subsequent conferences. Behind those delegates, with their formal power to reduce existing rates by as much as 50 per cent, there now stands the Tariff Commission, ready to determine "if such concessions threaten serious injury to domestic producers," and a government pledged to invoke the clause by which the American producer can secure the withdrawal of any reduction which seems likely to make him meet the test of competitive costs. The procedure may be a little more enlightened than the earlier log-rolling in Congress by each and every pressure group, but the practical consequences, in a world which is crying for a revolution, rather than a revision, in US tariff policy, will not be very different.

According to many Republican spokesmen, the Cordell Hull

policy of bilateral tariff negotiations left a weak and weaponless United States to struggle against a flood of imports, which form a constant menace to the American producer—a view which scarcely serves to reinforce Washington's well-meaning reassurances in respect of new procedure. But it is important to remember that the Hull policy followed directly from the excesses of the Hawley Smoot Act of 1930, and that its successful development was based, certainly not upon the need for fostering imports, but upon the realisation that a Mormon apostle and an Oregon lumberjack were not, after all, the best available experts for tariff policy. Before the war, the corridors of the State Department became something like a Wailing Wall for repentant officials, eloquent in their denunciation of Congressional procedure, and convinced, not so much that Messrs Hawley and Smoot had damaged the interests of foreign nations, but that they had ruined the prospect for American exporters.

Since 1934, no drastic changes have taken place in the Chinese wall of the American tariff. Mr Hull himself declared time and again that export considerations dominated every phase of tariff negotiations. The precise measurement of concessions made from 1934 onwards is not an easy task. But it would be generous to assume that, over the entire range the tariff barrier had been cut by more than one-quarter, and more than generous to assume that over the range of dutiable imports, the *ad valorem* rate could be assessed at less than 40 per cent. The ultimate goal of the Hull programme was certainly a measure of freer trade within a pattern of unconditional most-favoured-nation treatment, and a ban on all forms of discrimination alleged to be harmful to American enterprise. And there was certainly a retreat from the most vicious forms of log-rolling, and a new barrier against the rising structure of tariffs in the depression years.

In the bilateral negotiations, however, Mr Hull took the greatest care always to work within the pledge that tariff revision would not be allowed to injure domestic industries. The meticulous re-definition of products and commodity groups became a process by which the American Government matched principle and practice with the exclusion of all commodity grades which might bring any substantial benefit to outside

parties, and the State Department did not hesitate to employ every possible device that could be used to buttress the tariff—quantitative regulations, quarantine restrictions, health laws, etc. Perhaps one of the best examples of Mr Hull's caution was the Anglo-American Trade Agreement of 1938, in which, perhaps, something like \$100 million of UK goods were concerned and, in respect of which, the State Department spent months in the patient reclassification of import groups. In those years, the Hull policy no doubt served a useful purpose. To-day, a far more revolutionary lead is wanted, and the United States Government has met the demand by declaring that Mr Hull went too far.

There can, of course, be no possible guarantee that some imports will not damage American producers, or that some American businesses will not suffer as the result of tariff cuts. But the extremely small part played by imports in the American economy is more than a sufficient answer to such individual pleas. The Tariff Commission itself, in 1945, surveyed almost the entire range of imports in an effort to estimate the changes that might follow the revision of tariff rates in post-war years. The dollar estimates then given are not very valuable indicators to-day, since they were based upon an assumption of post-war price levels not more than 10-15 per cent higher than in 1939. But as an indicator of the respective share of trade between home produce and imports (assuming a 75 per cent advance in *per capita* income from that year) they offer a useful ready-reckoner:—

PRODUCTION AND IMPORTS (Billion Dollars)			
	1939	Post-war Duties down by	Post-war Duties up by
Output for home market	41.2	50%	50%
Imports (foreign value)	2.0	74.9	76.7
		4.4	3.2
Imports (% of home output)....	5.0	5.9	4.2

The limits of the Hull policy, on the best available evidence, would thus represent an increase in the ratio of imports to home production of less than one per cent. Can it, therefore, be assumed that the Tariff Commission will in fact operate more or less in line with the earlier policy of the State Department, which, it may be remembered, was also acting in due consideration of the possible injuries that might be brought by tariff cuts? Unfortunately, there is no evidence to support such a view. The State Department may have been bound quite rigidly by the pressure of interested parties, but once decisions were made, it was never subject to the clamour which will now greet the Tariff Commission on every occasion that domestic trade shows some signs of falling away, on each occasion that an individual business finds that it has fallen below its sales quota, or upon any day when an American producer finds himself at a temporary disadvantage through the technological progress of foreign competitors, operating well within the limits of "legitimate" bidding.

It has always been recognised in Great Britain that no conceivable change in American tariff rates could, by itself, bridge the "dollar gap." But given a bold and imaginative policy in Washington, the assistance that might be given by tariff changes alone would not be unimportant in a world now threatened with a more constant, and more damaging, dollar shortage than ever before. Moreover, the revision of tariffs forms only one factor in that dollar problem. The authority of the US Department of Commerce has underlined the need for the United States to:—

Maintain domestic trade and employment "at a high and reasonably stable level."

Make large-scale loans abroad.

Reduce tariff barriers.

Stimulate imports by conservation measures, and by contra-cyclical stock-piling programmes.

It must not be forgotten that the groups, which earlier this year called for outright repeal of the Trade Agreements Act and which seem likely to press their present advantage a year hence, were those which, in the main, have also fought against every measure which might tend to stabilise the domestic

American economy. Even those among them who refrain from denouncing the World Bank, as yet another drain for American dollars, will be among the last to press for practical measures designed to correct that dis-equilibrium between foreign lending and the balance of payments, which is quite inevitable without some Federal direction. They regard stock-piling programmes simply as a bonanza bonus for every domestic producer of high-cost, uneconomic resources.

The Vandenberg tariff, when judged by the practical working needs of 1947, and when related to the world-wide dominance of US manufacturing capacity and industrial power, is no less pernicious than any earlier schedule approved by the Congressional lobbies, and is the worst possible introduction to the Geneva talks next month. President Truman may retain his sturdy faith in the leadership of the United States "for freeing world trade," but if he does so it can only be due to the fact that he has not begun to appreciate the implications of the Executive Order. The search for compromise and bipartisan agreement quite certainly cannot provide the minimum requirements for the restoration of world trade on such a basis as this.

American Notes

The Debate on Greece

The United States this week is very conscious of standing at an historic crossroads. Ever since the note was received explaining that Britain could no longer sustain the burden of financial aid to Greece, the President has been discussing with the leaders of both parties to what extent the United States should step into the breach. On Wednesday Mr Truman went in person to request from a joint emergency session of Congress (the first since the railway strike last spring) a grant of \$400 million to bolster up the economies of Greece and Turkey, and to propose the sending of American personnel to both countries to supervise the spending of the money. A loan to Hungary is also being discussed. America, Mr Truman said, does not condone everything the Greek Government has done or will do, but the very existence of the Greek State is threatened by terrorists. The United States must give support to all free peoples resisting outside pressure; direct or indirect aggression undermines peace and thereby the security of the United States. It is a pity that the speech had to be so highly coloured, but presumably Mr Truman's advisers felt it was necessary to touch the anti-Russian spring to secure the support that would not have been forthcoming for a measure represented to be purely humanitarian.

In the American press and in Congress, some very big phrases are being used to describe the situation: the emergence of a global foreign policy, a fateful decision, an historic turning-point for America. Isolationists declare it marks the road to eventual war; the internationalists welcome it as the fulfilment of American destiny. On both sides of a debate which cuts across party lines, the imagination has been seized by the grandeur of the alternatives. The United States feels that this is the great decision between isolation and involvement. In the dismay and sense of shock with which the proposal has been greeted is a measure of the degree to which America, up till now, has felt that it was not really involved in the affairs of Europe; that it was still free to pull up stakes.

The proposal to underwrite the governments of two small far-off countries as a step in world political strategy would have been inconceivable in the United States before the war. But does the proposal involve anything very different in practice from what the United States has been doing since the war? The truth is that the United States has been involved up to the hilt in the Middle East, but that until now it has been possible to maintain a public pretence of no commitments. That the crisis is largely

"AMERICAN SURVEY" is drawn from three sources. Articles described as "From Our US Editorial Staff" are the work of a small group of regular correspondents, resident in the United States. THE WORLD OVERSEAS

Famine in Russia

THE latest communiqué of the Gosplan on the results of the first year of the Fourth Five Year Plan contains a highly dramatic piece of information—the story of the devastating drought that swept the plains of the Pruth, the Don, the Dnieper and the Volga in 1946. News about the calamity was known even before. The Press had hinted about it; Mr. Zhdanov spoke about it gravely on the anniversary of the Revolution; and more recently an open letter of the peasants of the Kursk region to Mr. Stalin shed some light upon the plight of the countryside. But the tragic dimensions of the drought have only now become known. In a few sparingly worded sentences the Planning Commission describes the progress of the drought,

which commenced in early spring [the end of March, 1946] in Moldavia, rapidly spread to the South-Western districts of the Ukraine and then swept all the regions of the central Black Soil Zone, including the northern regions of the Ukraine. By the middle of May the drought spread to areas on the right bank of the lower reaches of the Volga. Such drought had not occurred in the territory of the USSR in the past 50 years. The territory affected is larger than that stricken by the drought of 1921, and nearly as great as the area affected by the drought of 1891.

The two dates evoke ominous memories. In 1921 nearly 25 million people suffered from famine. Cases of cannibalism were recorded on the Volga. The disaster found Russia exhausted after seven years of war, revolution, civil war and intervention. The drought struck exactly those areas that had previously suffered the greatest devastation. In this respect, the situation now is very similar. The drought has spread, in the main, over the lands formerly occupied by the Nazis. The drought of 1891 was even more severe; but its consequences were perhaps less disastrous because the economic organism of Russia was at that time less exhausted. Even so, the calamity initiated a period of misery and social ferment which sapped the strength of the Tsarist Empire.

How is Russia going to take this new blow? The Planning Commission hastens to mitigate the shock of its announcement by drawing a distinction between the present situation and that of 1921. It states that "the gross harvest and the marketable grain output in 1946 were incomparably higher than in 1921." The difference is attributed to the superiority of mechanised, collective farming over the old forms of agriculture. In addition, there are the newly developed granaries in the Soviet East, especially those of Western Siberia and Kazakhstan, where last year's grain crops are reported to have been 50 per cent higher than in 1945. This report may or may not conflict with another, published in *Pravda* only a few weeks ago, according to which the sown area beyond the Urals is now smaller than it was before the war. The Planning Commission may have over-emphasised the hopeful features of an admittedly grave situation in order to boost the morale of a sorely tried people; but it would certainly be wrong to dismiss the whole statement as mere propaganda. The food administration can now certainly draw on granaries in the East which were not open to its predecessor of 1921.

Fat and Sugar Shortages

It is also almost certain that the war stocks, at least of bread, which were accumulated in the thirties, have not yet been entirely exhausted. This seems to be borne out by the preparations for the abolition of rationing that were announced early last year and were later cancelled only after the extent of the drought had become quite clear. But it is not known how big those reserves really are. Only rough guesses can be made about the 1946 grain crop on the basis of hints in the Russian press. It would be very surprising if the total crop exceeded 50 million tons—which is 50 per cent of the average harvest of the last pre-war years. It may be considerably lower. If properly distributed—and the "if" is a big one—the year's crop and such reserves as are available may be just enough to tide the country over till the next harvest.

What is certain to be much more disastrous is the already existing fat famine. The drought has spoilt the crop of oleaginous plants in the Caucasus, especially of sunflower seeds, which were

expected to mitigate the extreme shortage of animal fats. The rehabilitation of the sugar industry in the Ukraine, which produces the bulk of the country's sugar, has suffered a severe setback through the loss of the sugar beet crop. The Russian meat rations have long been almost as low as the German rations are now; and prospects for the near future are bleak.

It is a tragedy that Unrra relief in the Ukraine and in Byelorussia is coming to an end just at the time when those devastated lands are about to feel the full impact of an unexpected calamity. The great mass of Ukrainians and Byelorussians inevitably feel that they are entitled to continued assistance from more fortunate Allied nations; they contrast the withdrawal of that assistance with the much-publicised scheme of British and American credits for Germany; and they see themselves as the victims of a treacherous game in Western power politics. The view expressed in some quarters that Russia's plight may be the Western Allies' opportunity and that this is the right moment for hard bargaining, in which relief ought to be held out as a reward for far-reaching political concessions, is almost certainly based on a miscalculation of the mood in Russia and of the probable Soviet reactions to such a policy. The Kremlin may or may not be inclined to diplomatic conciliation. But the one thing almost certain to cause a definite stiffening in its attitude vis-à-vis the West—and a stiffening for which there would be genuine popular support in the country—would be an attempt by any Power to derive political benefits from Russian or Ukrainian starvation.

Lessons of 1921

The story of relief to Russia during the 1921 famine contains a lesson and a warning. At that time the Western Powers attempted to make relief conditional upon the recognition by the Soviet Government of the Tsarist debts to foreign creditors which the Bolsheviks had refused to honour. A conference of twenty European nations that took place at Brussels in October of that year addressed an offer to that effect to Moscow. At another conference, held in Paris, the Western Powers demanded effective control over the distribution of food inside Russia. Both demands were rejected by Lenin, who was then issuing desperate appeals for help to the peoples of the world, in which he admitted frankly that his "Government was not in a position by its own means to save the starving population from death." Mr. Stalin's Government is in an incomparably better position. It has not made a similar confession of impotence; and it has no need to make one. Far from producing Russian concessions, political bargaining over relief would only inflict on Russia a grievance and a wound likely to rankle, just as did the memory of 1921, over the life-time of a generation.

The comparison between 1921 and 1947 implies also a sad reflection on the moral and political standards of 1947. In spite of the attempts at bargaining over relief made in 1921, two relief organisations then hastened to the rescue of the famine stricken areas—the League of Nations' Relief Organisation headed by that great humanitarian Nansen, and the American Relief Agency, headed by Mr. Hoover. Russia then was not a member of the League. Its Government had not yet been recognised by the Western Governments. Mr. Hoover was the spokesman of the most extreme anti-Soviet tendency in American politics; and he was still prophesying that "no resumption of production was possible in Russia under the Bolshevik regime." The Soviet rulers were ostensibly everybody's foes and nobody's allies—the "defection of Brest Litovsk" was fresh in Allied memories; and the last shots in the wars of intervention had only just been fired. Yet the strength of humanitarian feeling was still great enough to make Mr. Hoover's ARA play the most active part in relieving the famine on the Volga. To-day, while famine may be stalking the famous battlefields of the recent war, the plains of Stalingrad, Kursk and Kharkov, Unrra teams are packing up and leaving. The Russians may be pardoned if they find Western charity very cold.

North of India

[BY A CORRESPONDENT]

ONE of the attributes of a sovereign state is to have frontiers. Between long-established states frontiers have usually either been fixed by specific treaties or have been defined by traditional usage with boundary posts and customs barriers. Where there is no agreed or recognised frontier, it is not a question of changing a boundary line, but of making one where none existed. In certain parts of the world there are undemarcated frontiers because the neighbour states have been unable to agree on a line, but such a state of affairs seldom persists for long except in wild and inaccessible regions of no economic or strategic importance. There is, however, one contingency which is particularly liable to produce undefined and disputed frontiers; this is when a new state is formed. If a state is a new creation, it cannot legally claim treaty rights and boundaries belonging to an earlier state which it replaces. The new state must seek new agreements with its neighbours—a task which may not prove at all easy.

Such a situation threatens soon to confront the new sovereign republic of India, which the Constituent Assembly in Delhi is now constructing on paper. Independent India is likely to have considerable difficulty with problems arising almost everywhere along its northern land frontiers from Persia to Burma. Not only do three independent neighbouring states—Afghanistan, Nepal and China—have latent claims on what is now recognised territory of "India"—that is to say, India subject to the "paramountcy" of the British King-Emperor—but most of the frontier is fringed with "Indian States" and "Tribal Areas" bound to the Government of India by treaties and agreements which lapse with the end of the British connection, unless they have been meanwhile re-negotiated with the new regime in Delhi. The British Government has taken its stand on the principle that rights of paramountcy based on specific agreements with princes and tribes cannot be transferred along with authority in British India except by voluntary adhesion. For the greater part of India this constitutional point is formal. For the frontier states, however, who are directly exposed to influences from outside India and can take advantage of their marginal position, the position is quite different.

"... I need hardly remind you, Gentlemen, that in times of scarcity the best is always hardest to obtain."

Not least among the reasons for the present shortage of WHITE HORSE WHISKY is the fact that its quality was never finer than now.

MAXIMUM PRICES:—Bot. 25/9, 1-Bot. 13/6 as fixed by the Scotch Whisky Association.

Such considerations apply, above all, to the states and tribal areas of the North-West Frontier and Baluchistan. The system of political relations throughout this region is highly artificial, having been evolved by the British rulers of India through a long series of expedients and adjustments. The "frontier" under this system is not so much a line as a zone, with the tribes and principalities forming buffers between British India and Afghanistan.

The Afghans see no reason why conquests made by the British, or even by the Sikhs, should be inherited by Mr. Nehru and/or Mr. Jinnah. The minimum Afghan aspiration is the recovery of Peshawar. Afghanistan has a useful army which was not deterred from making war on Britain alone in 1919. The Moslem League promoters of Pakistan, however, have no intention of bringing in the Afghans, for the Moslem lowlanders are not at all keen on being looted by their poor and predatory co-religionists. But Congress-Moslem tension is nevertheless preparing the way for Afghan-Pathan penetration into India. If Pakistan were to be set up in the Punjab and Sind and had to defend itself against Congress attempts to suppress it, how could it defend its rear against Afghans and frontier tribesmen, if indeed it did not call them in to its aid—at a price which would in the end almost certainly be much higher than Moslem League politicians bargained for? If, on the other hand, there is no Pakistan and Indian federal unity is somehow preserved, the Pakistan agitation has already reached such a point of intensity that Moslem extremists are likely to look to Afghanistan as a base for the struggle against what they will regard as a Hindu Raj. In any case, it appears probable that north-western India is going to be a region of great political instability.

Unstable Kashmir

In the extreme north of India the State of Kashmir presents a special problem. A recently constructed polyglot realm, owing its survival and expansion to clever policy during the Sikh wars, with a Hindu ruling dynasty and a Moslem majority of the population, Kashmir has very little prospect of surviving long in its present form. But the heritage of Kashmir is one to arouse the most bitter rivalry. The Moslem League, relying on the Moslem majority, hopes to get it for Pakistan, to which, as part of the basin of the Indus, it would geographically belong. Congress has made

psychological does not make it any easier for the Administration and the internationalists in the Republican party to overcome the scruples of the idealists, the prejudices of the isolationists, or the cheese-paring of the economy bloc. In any other country, however, the build-up which the proposal is receiving in the press could only be accorded to a declaration of war.

The Judgment on Lewis

The Supreme Court, in a 7-to-2 decision, has upheld the conviction, on the grounds of contempt, of Mr John L. Lewis and the United Mine-Workers. The \$10,000 fine on Mr Lewis was sustained, but the \$3,500,000 fine on the union was reduced to \$700,000 on condition that the strike call issued in December is withdrawn. The Court has thus ruled that nothing in the Norris-LaGuardia Act or in the War Disputes Act invalidated the injunction secured by the Government. But on this crucial issue the Court was sharply divided, Justices Murphy and Jackson, Frankfurter and Rutledge dissenting. Justices Murphy and Rutledge dissented *in toto*, Justice Murphy arguing that Congress did not intend private labour disputes to be adjudicated by the courts. Justices Black and Douglas joined Justice Rutledge in condemning the fine as excessive.

The decision of the Court does not settle the original problem: whether the union has the right to terminate the contract it had signed with the Government. This is still before the lower Court, but the issue has become largely academic, for when the Smith-Connally Act expires on June 30th the Government must return the mines to the owners. It is unlikely that Mr Lewis will take the risk of calling a strike on March 31st—his previously appointed deadline—when by waiting three months the Government contract will be a dead letter. What Mr Truman has achieved by employing the injunction is to postpone a coal strike from December to July—a not altogether trifling achievement. The naive hope that the decision of the Court might modify the demand for restrictive labour legislation has now proved illusory. It has merely given Congress a further breathing-spell.

Negotiations for a new coal contract had been suspended until the Supreme Court should announce its decision. But there are no signs as yet that the owners have agreed on a common front, or that they are prepared to accept the health and welfare fund which they have refused, in the past, to take over from the Government. In this they are supported by growing opposition in other industries to the creation of similar funds.

The unprecedented peace with labour of the past three months may be about to dissolve. The hope that declining prices would soften labour's wage demands has been disappointed. The rise in the cost of living, particularly in food, and the threatened statutory rise in rents, provides an unfavourable situation for the negotiations in steel, rubber, telephones and railways.

Soaring Prices Again

From Our US Editorial Staff.—Last autumn, when the pros and cons of price decontrol were being hotly debated in the United States, Americans were frequently reassured with the prediction that, while decontrol would produce a sudden spurt in prices reflecting long-delayed readjustments, the economics of abundance would soon assert itself and exert downward pressure on the price structure. Until five weeks ago the prediction was uncannily accurate. Prices rose sharply immediately following decontrol, but it seemed evident to most people that agricultural prices had reached their peak in November, and the general trend was almost steadily downward until the first week in February.

The beginning of February saw a sudden reversal of these trends. A wildfire advance in prices, chiefly of farm and food products led by such major commodities as wheat, cotton, and hogs, raised the BLS index of wholesale prices from 140.3 on February 1st to 146.4 on March 1st. This represents an increase of 4.3 per cent in a month, and the trend of basic commodity prices indicates that a further accelerated increase of 2.0 per cent occurred in the week ending March 7th. Wheat, at \$2.87 a bushel, is close to its all-time high in 1920, and rye, at \$3.93 a bushel, has set an all-time record. Among the industrial group, lead, at \$15 a pound, has hit an historic peak.

The reasons advanced for the upsurge vary from delayed shipments resulting from the weather and equipment shortages, to the impact of the Hoover report, government purchases, and higher sights for exports. In the case of many commodities special factors

are at work. The record price of hogs, for example, which indicates pork chops at \$1 a pound, is a belated effect of the senseless slaughter during last summer's price control interregnum.

Current price trends raise at least three basic questions which events must answer. The first is their possible effect on current or prospective labour negotiations in steel, automobiles, transport, rubber, and coal. The second asks whether monetary policy can continue to stand pat when the value of the dollar is depreciating at a rate of more than 50 per cent a year. The third wonders whether 1948 may not reflect the fact that Mr Truman may have been a better prophet than his opponents at the time of decontrol last autumn.

* * *

Wall Street's Course

The Federal Reserve Board's index of industrial production is still reaching new peace-time peaks, the January level of 188 (1935-39 = 100) comparing with a December figure of 181. Steel ingot operations have been running for some time at more than 90 per cent of rated capacity, automobile output has recently regained a weekly level of 100,000 cars and trucks—the best since 1941—and crude oil output, another key indicator, is maintaining the high daily average of nearly 5,000,000 barrels. Autumn fears of a sharp deflation in farm income for the current year have vanished, temporarily at least, as advancing grain prices reflect new crop uncertainties, and the still-clamorous demand for US grains in overseas markets.

Under such conditions industrial profits are running at high levels. The gross national product details, recently released, give the following outline:—

	1939	1944	1946
Gross business income	21.6	48.3	45.5
Depreciation and reserves	7.0	8.7	8.5
Profits before taxes	14.6	39.6	37.0
Less Taxes	10.4	29.7	25.0
Net business profits	4.2	9.9	12.0
Distributed	3.8	4.5	5.0
Saved	0.4	5.4	7.0

The very conservative dividend policy at this level of income may have acted as something of a brake on security values, but dividend payments have for some time exceeded the best levels, attained in the pre-war years, while equity prices are still some way below the 1937 peaks. Despite all the favourable news from September onwards, the Dow Jones industrial average has never pushed far above the 180 mark without inviting a bout of liquidation such as occurred last week, and is still far below the early 1946 top of 212.50.

Not many days ago Wall Street sustained its worst selling session since last November, and the market found a ready excuse in news from abroad—more especially in terms of British difficulties, and of the problems thus posed for US foreign policy. The news that Mr John Lewis found the Supreme Court decision mild enough to encourage a new bout of aggressive declarations was also a gift to the bears. But these factors do not explain the wariness of Wall Street throughout the winter months. Present indications notwithstanding, the market is apparently convinced that, at some time in the fairly near future, business activity and profit margins must decline.

Ordeal by McKellar

After a hearing lasting five weeks, the appointment of Mr David Lilienthal to be chairman of the Atomic Energy Commission has been approved by 8 to 1 by the Senate members of the Congressional Committee. Senator Bricker provided the one dissenting vote. Mr Truman's four other nominations to the Commission and the appointment of Mr Carroll Wilson as general manager were approved at the same time. Presumably the committee vote forecasts approval by the Senate as a whole, though Senator McKellar predicts the "damnedest fight ever." It is one of the oddities of the American system that Senator McKellar, though not a member of the Atomic Energy Committee, was permitted, by senatorial courtesy, to monopolise the hearings, mustering every accusation that frustrated malice could devise against

Mr Lilienthal, his ancient enemy in the Tennessee Valley Authority. Weeks were spent attempting, and failing, to prove that Mr Lilienthal had tolerated the activities of Communists in the Authority. Even the sinister fact was brought out that some seventy-odd years ago Mr Lilienthal's parents were born in a part of the Austro-Hungarian Empire which later became Czechoslovakia, and notoriously pro-Russian.

The red herrings of Mr McKellar's grudge fight were less damaging to Mr Lilienthal than the last-minute decision of influential and so-called moderate Republicans like Senators White and Taft that the candidate was "temperamentally unfitted" by his New Deal past and because of insufficient respect for the wishes of Congress. Nevertheless the defendant (and how else can one refer to Mr Lilienthal?) mustered an impressive list of character witnesses from the industrialists and scientists associated with the development of atomic energy.

It is disheartening that the effort made in passing the McMahon Act to free atomic development from military control has not been able to free it from partisan politics. This is surely a prime case for the bi-partisan approach. The nature of the hearings is bound to have a discouraging effect upon the recruitment of scientists and administrators—already one of the major obstacles faced by the Commission. The Army regulations which affronted so many of the most distinguished scientists who worked on the atom bomb may prove to have been less disastrous than the effect of the past five weeks. Great public servants are rarer in the United States than in Britain. After an ordeal like Mr Lilienthal's one wonders that they survive at all.

* * *

The Decline of Tammany

Mr O'Dwyer, the Democratic Mayor of New York, has added one more triumph to his record by forcing the resignation of Mr Edward Loughlin, the leader of Tammany Hall. For the past eight months Mr O'Dwyer has withheld all patronage from Tammany in an effort to destroy its underworld connections. Tammany, founded, like the Republic, in 1789, is the oldest and the most notorious of the city machines which provided the raw material for Lincoln Steffens's "Shame of the Cities" at the turn

of the century. In its long heyday it was invulnerable, firmly rooted in the affections and loyalties of the poor and bewildered immigrants who depended on Tammany not only for blankets and food and coal, but for extra-legal help in coping with the hardships of life in a strange city. Three powerful Democratic Presidents, Cleveland, Wilson and Franklin Roosevelt, were frustrated in their attempts to break the power of Tammany.

This does not mean that as a hunter of tigers, Mr O'Dwyer is more redoubtable than they. He may have administered the *coup de grâce*, but Tammany was already very nearly toothless. It suffered a setback from which it never recovered in the scandals which finally forced Mr James J. Walker to resign as Mayor. Under the New Deal it was cut off from Federal patronage, and its pickings during the LaGuardia Good Government era were slim. But it is also true that the soil in which it had flourished for so long was becoming sterile. The Immigration Acts after the first war put an end to the stream of immigrants who gladly traded their votes for trifling favours from the "Wigwam." Today the former immigrant and his sons and daughters are better able to look after themselves; they are less willing to pay the price of a benevolent and corrupt despotism.

The pattern of city migration has also undermined Tammany. Its strength has always been in Manhattan, and failed to cross the water. But like almost every other large city, New York's population has been moving steadily outward. Manhattan is now a hollow shell politically, compared to the massed forces of Brooklyn, the Bronx, and Richmond, the other boroughs that make up New York City. These great satellites pay no allegiance to Tammany.

These boroughs have their own bosses. The effect of the good government movement in New York has affected their scope of operations. But a report from Mr Robert Allen, in a book entitled "Our Fair City," which brings muck-raking up to date, finds no grounds for believing that the shame of the cities has lifted very much since Steffens's day. American cities are still corrupt because Americans are still unwilling to take the trouble to give them clean government. Conditions in McMinn County, Tennessee, which recently was the scene of a veterans' revolt, suggest that rural counties, and small towns as well, are not immune from that corruption which Lord Bryce detected sixty years ago to be the chief weakness of the American system.

50 Years of American Banking Service in England

On 1st March, 1897, the Guaranty Trust Company of New York established its first London Office in Plough Court, Lombard Street.

So commenced a new chapter in the history of American banking, and in the course of fifty eventful years since that day this Company has endeavoured to play its full part in the development of Anglo-American trading and financial relations, and in doing so to uphold the best traditions of the great monetary centres on both sides of the Atlantic.

a determined effort to capture its people for the Congress cause by giving a lead to popular discontent; this was the aim of Mr Nehru's spectacular intervention in Kashmir affairs a few months ago. Finally, Afghanistan is interested in Kashmir and especially in its western borderland which adjoins the Swat and Kunar valleys and would be involved in any reshaping of the north-west frontier.

From Kashmir eastward to the Burma border the great range of the Himalayas provides India with a natural frontier which still interposes a virtually impassable barrier against invasion from the north. But the range itself is the homeland of a warlike, independent state—Nepal. The Gurkha kingdom was one of those formed by military adventurers on the dissolution of the Mogul empire; it has always had a strongly military character. Nepal provides recruits for the famous Gurkha regiments of the Indian Army; as Nepal is not part of India, these troops are, strictly speaking, foreign mercenaries serving in India. The subsidy paid for Nepalese support in the 1914-18 war and the pay and pensions of the Gurkha mercenaries are important factors in the economy of Nepal, and their future under the new regime is uncertain; the Indian Government may have neither the will nor the financial capacity to continue the subsidy and may wish to include the Gurkhas in an Indian national army in a way not acceptable to Nepal. Congress nationalists regard the Gurkhas as simply a part of the Indian people and are not disposed to agree to the sovereign independence of Nepal which Britain has formally recognised. Nepal, on the other hand, is very likely to take any opportunity afforded by disorder or disunion in India to renew the expansion which the British Raj has for so long held in check, and its geographical position gives it a chance of sudden irruption into some of the richest and most densely populated areas of India.

North of Nepal, beyond the Himalayas, is the sparsely inhabited high plateau of Tibet. Its international status is peculiar. In the nineteenth century it was reckoned a part of the Chinese (or rather Manchu) empire and was subject to a loose Chinese control. After the Chinese Revolution of 1911 the Tibetans refused allegiance to the new Chinese Republic and drove out the Chinese garrisons. Britain continued to recognise Chinese "sovereignty" over Tibet, but gave diplomatic support to Tibetan autonomy, and civil wars in China prevented a serious Chinese attempt at reconquest. The Tibetan Government in Lhasa has direct contact with British and Nepalese representatives, but China has long been dissatisfied with this state of affairs and is anxious to control Tibet's foreign relations. As Tibet has never been internationally recognised as an independent country and British interest in it will disappear with the transfer of sovereignty in India, China may well at any time succeed in reasserting its authority in Tibet. One result of this would be dispute over the frontier of Assam, for, though a boundary has been agreed between the Indian Government and Tibet, it was never recognised by China. There is also a great stretch of undemarcated China-Burma frontier to the east of Assam, and during the war

a Chinese Government spokesman claimed the whole Hukwaung valley as belonging to China. Hitherto nobody has worried about such uncertainties, for the wild forest-clad highlands of the easternmost Himalayas have not been under any effective national administration and arguments about frontiers have been academic. But the making of the Ledo Road during the war has brought Assam into a new relation with northern Burma and, with the Chinese province of Yunnan, and frontier questions in this region are now no longer so academic. China at present is hardly in a condition to pursue a very active foreign policy, and Chinese territorial aspirations on India's north-eastern rim cannot be compared in immediacy with the pressures to be expected from Afghanistan or Nepal in the event of disunity within India, but in the long run they can be a cause of much trouble.

Some of the possibilities mentioned in this survey may never come near to realisation, and indeed there would be little ground for expecting any important upset of the *status quo* on India's northern frontiers, if there were the prospect of a strong, united India to take over from British rule. But India's internal strife has already gone to such lengths that it is difficult to see how all the latent tendencies to disintegration can be overcome. Inward disruption, if it occurs, cannot fail to give scope to marginal military factors long repressed by British power, notably the Afghans and Gurkhas, and the political map of India might quickly be altered out of all recognition. The fact that Indian civilian politicians have been blind to these possibilities does not prove their unreality. Only the actual course of events can put Indian nationalist theory to the test of success in the political unification of a sub-continent.

Problems of Italian Reconstruction—IV.

Crisis in Foreign Trade

[BY OUR SPECIAL CORRESPONDENT]

THE Italian economy has been precarious for the last 50 years at least. Since industrialisation began it has supported a steadily growing population on a meagre agriculture and an almost total lack of industrial raw materials. The maintenance of an (admittedly low) standard of living has depended in the main upon importing vital raw materials such as coal, iron ore, pig iron, petrol, cotton and wool and selling the finished manufactured products abroad. Since the end of the war, everything has conspired to make this basic economic transaction excessively difficult. The dislocations of war have reduced Italian productivity. In 1946, industrial production was restored to only 65 per cent of 1938. Devastation has had to be made good, and the process has absorbed materials which might otherwise have been used for export. War has decimated the mercantile marine. In 1938, Italy had 3,720,409 tons of merchant shipping and of its annual

NATIONAL INDUSTRIAL POLICY

● The present inflationary tendency can be arrested and reversed only by common sense and action. Mounting costs and rising selling prices harm everybody. Their effects upon export trade are pronounced.

Ford has always applied the principle that higher wages and a higher standard of living for all depend upon lower costs and lower selling prices through increasingly efficient large-scale production.

WHEN POST-WAR SELLING PRICES OF FORD VEHICLES WERE ANNOUNCED, THIS FORWARD VIEW WAS TAKEN AND DESPITE SUBSTANTIAL RISES IN COSTS OF SUPPLIES THE COMPANY HAS SUCCEEDED IN HOLDING DOWN ITS PRICES AT HOME AND FOR EXPORT.

The tendency is for the cost of supplies to rise, but the Company hopes to avoid any increase in the prices of its products.

The Company also hopes that its suppliers and its employees will support, each to his own ability, its attempt to establish a pattern of efficiency that will contribute to the future prosperity of the nation.

FORD MOTOR COMPANY LTD., DAGENHAM

imports of some 20 million tons, 16 million tons were carried in Italian bottoms. In May, 1946, total tonnage had fallen to 579,301. Fifty Liberty ships are being added to this figure, and during 1947, the Italians should dispose of about 1,000,000 tons. But this reduction of the merchant fleet to nearly one quarter of its former size means that they will have to spend an extra \$110 million in freight charges. (The size of this figure is also due to the necessity of bringing coal all the way from America at a freight rate as high as \$12 a ton. Before the war, Italy bought coal only in Europe.)

The outcome of the war has further upset the Italian balance of payments by depriving them of their foreign assets, interrupting the flow of remittances from emigrants abroad, putting an end temporarily to tourist traffic, imposing a still unspecified lien on all Italian property abroad, and, in the shape of reparations, placing a burden on future current production whose effects cannot yet be measured. To these internal dislocations must be added the external dislocations of the world market. Italy's pre-war trade was to a great extent with Central and Eastern Europe. There the Italians sold the bulk of their processed foods, textiles and mechanical goods. Now Germany, the great food market, has disappeared. The Balkans have not recovered sufficiently to trade. The result of these limitations may not be felt immediately, for in the present seller's market, Italian industry can sell anything it produces. The immediate problem is the fact that the vital supplies Italy wants to buy in return for its exports—wheat, coal and oil—are in short supply and can on the whole be bought only with "hard" currencies. For instance, when the Italian Trade Mission visited London in December, their problem was not to boost the sale of Italian goods in Britain, but to find some British supplies upon which to spend Britain's accumulated debt to Italy of about £20 million. But coal, iron ore, timber, hides, alloys are as scarce in Britain as in Italy. The problem of foreign exchange, therefore, resolves itself inevitably into the problem of dollars, and the Italians find their short-term and their long-term interests in collision. In the long run they need to develop their markets in Europe and the Mediterranean, for the United States is directly competitive with them in industry and offers only a poor and jealous market for farm produce. But in the short run, the need for dollars makes it necessary to press every possible sale in America.

Confusion in Controls

Working in such an unfavourable atmosphere, the most efficient Governmental machine might falter. The Italian machine is not efficient for, like everything else, it is suffering from the consequences of war, liberation and a prolonged political purge. It is short of experienced men and the men with experience are often enemies of the whole idea of control. The point can be illustrated from the development of exchange control. Since the spring of 1946, exporters have been permitted to retain 50 per cent of the foreign exchange resulting from their transactions. The other 50 per cent is taken by the Government to finance essential imports. The consequence has been on the other hand a very rapid increase in exports, but the officials of the Government's exchange control complain that the private balance is used in part to import non-essential goods selling at a high profit in the restricted wealthy market and that its existence makes possible a steady flight from the lira. In this situation, the exporters demand the removal of all controls, the Government officials the introduction of complete control. The likelihood is that the present awkward system will be maintained.

Its operation might be simplified if there were not several rates of exchange for the lira. Hitherto the official rate has been 100 lire to the dollar. Exporters receive 225 lire for their foreign exchange from the Government, and the price of the 50 per cent retained by them has been roughly 600 lire on the free market. It appears, however, that the Italian Government is now on the point of abolishing the lira, and the new rate will reflect the lira's "free" value.

Given this background of confusion and uncertainty, it is not surprising that the Italians expect a serious trade deficit in 1947. Two sets of estimates have been prepared, by the Unrra Italian Mission and by the Italian Government. The Unrra estimate, being less optimistic, is probably the more reliable, but the divergence between the two is not very great.

The difference in estimating food imports is due to the Government's inclusion in the 1947 account of an earlier Unrra food programme for which neither funds nor grain may be available. The higher Government figure for industrial imports springs from a

more hopeful picture of the availability of such vital raw materials as lumber. More detailed examination of the Unrra figures reveals that the most costly import figures, including freight costs, are: Cereals (\$215,400,000), fats and oils (\$51,150,000), solid fuels (\$202,156,000), mineral oils (\$67,575,000), iron and steel (\$38,600,000) and raw materials and textiles (\$155,260,000). On the side of exports, the largest earnings are from the textile industry, with estimated exports valued at \$313 million, food processing at \$50 million, the chemical industries at \$20 million, and agricultural exports at \$44 million.

ESTIMATED ITALIAN BALANCE OF PAYMENTS IN 1947

	(million shares)			
	Unrra Estimates		Government Estimates	
	Payments	Receipts	Payments	Receipts
Food and agricultural imports	414	...	356	...
Industrial imports	719	...	940	...
Miscellaneous	100	...	100	...
Exports	...	505	...	520
Remittances, tourists, etc.	...	80	...	130
Shipping gains	...	45	...	120
Total	1,233	660	1,396	770
Balance	...	-603	...	-626

The Italian Government is left with a deficit of between \$603 million and \$626 million. The actual problem is probably more urgent than the figures suggest, since the most vital raw materials have in the main to be bought with dollars, and of the 19 billion lire which exports will earn in 1947, only about 5 billion represent dollar savings. True, 3.5 billion are hard currency in the shape of Swiss francs and 1 billion Swedish crowns, but nearly half the lire represent currencies which cannot be used for financing the most urgently needed imports. The Government's problem is thus more complex than the chart of estimated exports allows.

Hitherto the grave deficit in the Italian economy has been covered by direct external assistance, of which the Unrra programme has naturally been the most important. In 1945 and 1946, Unrra has spent on direct relief and the beginnings of rehabilitation about \$550 million. In addition, over the same period, the Allies (especially the Americans) have spent \$160 million under their military civil affairs programme and the so-called "Troop Pay Account," and a further \$100 million was spent by the American Foreign Economic Administration in 1945. In all, Italy has received nearly a billion dollars in outside assistance.

The core of the problem in 1947 is that the Italian economy has to find its balance without further direct relief. It is true that Unrra will continue to bring in wheat and coal for the first months, but these shipments have not been included in the Unrra estimates of the 1947 trade balance. The deficit of over \$600 million must be met either by credits or by increased exports. But the export estimate is already as optimistic as it can reasonably be made. The only hope of some balance in the country's external economy lies therefore in credits. The importance of the Italian Prime Minister's recent visit to Washington lay precisely in his hopes of receiving substantial dollar loans.

At a press conference, given on January 20th on his return to Rome, Signor de Gasperi was able to announce reasonably favourable results. A further \$130 million would be transferred to Italy under the Troop Pay Account. A credit of \$100 million would be made available by the Import-Export Bank. The Prime Minister admitted that some pressure had been needed to secure even this amount. As for the uncovered gap of about \$370 million in Italy's trade balance, he said that Italy would have to look abroad for further help and credits, but that these would not necessarily be forthcoming.

The kernel of the problem was whether our democratic system is stable or whether a return to chaos or to dictatorial conditions is to be feared. That is why we had to deal mainly with a question of confidence.

And this "question of confidence" in the present uncertain state of Italian politics is a very doubtful quantity. Most of the steps necessary to increase productivity at home or to create trust in Italian stability abroad demand a firm and vigorous administration, and this is the one thing which the Italian democratic system at the moment seems unable to provide.

THE BUSINESS WORLD

Unanswered Electricity Questions

AN established pattern can be discerned in the Government's nationalisation measures. First comes the Bill, with its Commission or its Board, its powers of Ministerial appointment and intervention, its niggardly compensation for existing owners, its aloof suspicion of the directors of the concerns which are to be taken over, and its vague principles and safeguards for the consumer's interest. Then follows the Second Reading, which ought to afford the opportunity to the Minister to expound the policy of the new authority and to demonstrate its technical advantages over private ownership cum public control, but instead is largely devoted to exposing the shortcomings of the past rather than the substantial promise of the future. Thirdly, the Bill is whisked upstairs to Standing Committee, where amendment and improvement rest not on the persuasion of logic but upon the temper of the Minister.

These are the stages which determine the pattern of legislation, for major changes on the Report stage or in the House of Lords have not, so far at any rate, been of importance. And of all these stages the Minister's Second Reading speech is of first importance. It cannot be said that Mr Shinwell made the best use of his opportunity to explain and justify the Electricity Bill on Monday. Parts of his case can be at once admitted. Legislation of some sort is needed for electricity, because many supply company franchises are expiring and, if local authorities exercised their rights of purchase, the electricity supply industry would undergo complete disintegration. Mr Shinwell made much—indeed, far too much—of the variety of charges and diversity of voltages and frequency. Progress in these things, he said, has been "much too slow"—which is a remarkable understatement of what has been achieved during the last twenty years. Again, different undertakings have different ideas about the design of their appliances and plant—engineers display great divergence of views in these matters—and in the end "it is the consumer who has to pay."

His opening, then, was a recipe for an integrated electricity industry with a stagnating technique allowing no room for the "divergence" of engineers' views. He went on to declare that the public electricity service must do "everything possible to rationalise its method of charging," and that prices for industrial and domestic use should be "strictly related to costs." These are the only references in his speech to charges, which are surely the most important aspect of the Bill, and its professed *raison d'être*. He dealt in two short passages with the responsibilities of the British Electricity Authority and its fourteen area boards, and noted—though he did not expand—the point that the Minister may give directions on matters of "national interest." Then followed the polemics, and in particular a lengthy passage to justify the Minister's determination to give the Authority and the Boards power to manufacture and instal plant and fittings. The companies had either failed to do this satisfactorily, or had been in league with the suppliers of equipment. But the new Boards will be in a position to afford facilities like "major domestic electrical appliances" which Mr Shinwell believes to be beyond the reach of working-class families. Consumers will not be sold appliances "which are often unreliable and expensive."

Next, on compensation, Mr Shinwell—having dismissed the claims of local authorities for fair compensation ("local authori-

ties have always displayed a sense of public duty and will not wish to make any profit from the transaction")—admitted the complexity of the compensation problem for the supply companies. A company might have a number of franchises expiring at different dates, and the work of calculating net maintainable revenue for each portion of the undertaking for its unexpired franchise "would be so involved that in fact it is quite out of the question as a practicable proposition." Moreover, the companies were earning monopoly profits and paying dividends which were out of line with those appropriate to public utility undertakings—a charge which blandly disregards the effective capital invested in their businesses. Mr Shinwell concluded that in these circumstances compensation by reference to Stock Exchange values was "not only practicable but fair and even generous. . . . Too long has the electricity consumer been made the victim of financial speculation."

Finally, Mr Shinwell addressed himself to the programme of capital development, for which the Bill provides £700 million for the Central Authority and £100 million for the North of Scotland Board. It was remarked in these columns on January 18th that the setting aside of £800 million for electricity development suggested an intention to go forward with rural electrification on the grand scale. So it appears from Mr Shinwell's speech. Some £200 million will be required for power stations (earlier in his speech Mr Shinwell suggested that these would require such a high proportion of the national resources that, if only for that reason, one body must be responsible for their construction and operation), but no less than £400 million is earmarked for improvements in the distribution network, of which "a substantial proportion" will be used for rural electrification. And unless this rural programme is proceeded with quickly, Mr Shinwell sees no hope of checking the decline in the rural population.

Such is the Minister's plan for developing an industry in which progress has "too often been impeded by sordid financial considerations." It can hardly be described as convincing—indeed, it clearly failed to satisfy many Government supporters in its references to compensation for the local authority undertakings, of which some have considerable experience and a clear understanding. But there are far wider aspects of the case which have gone unargued in the Second Reading debate. Perhaps the most important issue is that of charges. Mr Shinwell devoted much of his time to attacks—some of which found their mark—on certain features of holding company finance in the electricity supply industry. But he does not appear to have appreciated the fact that under the Bill, and with his connivance, the capital accounts of the Area Boards could be so engineered that the grossest excesses of holding company finance would look like amiable borrowing. The charges which will be applied in any particular area will be determined in large part by the apportionment of the Authority's capital charges which it has to bear. These are the most important elements in the costs to which, according to Mr Shinwell, prices of electricity for industrial and domestic use are to be related. What are the public safeguards for seeing that each area bears its fair share, and no more, of those charges?

Again, the relationship between urban and rural electricity prices requires full elucidation. Mr Shinwell refused to be-

politicians at Westminster attempt to prove that British control is the mainspring of Indian progress.

What must be clearly understood in England is that the Indian revolt is against the system and not against the individual. Mr Churchill's suggestion that British troops in the country be used as a rearguard to cover the evacuation of British families to the sea caused loud guffaws all the way from Bombay to Calcutta. True, there are some timid souls in the English community who continue to live in isolation from Indian thought currents and are scared easily by riots. For them the British soldier has been a supposed guarantee of safety. They will probably leave with the troops; so will those whom the transfer of power leaves without work. But the majority of non-official Europeans have no intention of leaving. They believe that, providing there is no hold-up in present plans, anti-British sentiment will evaporate; that even if Indian rule proves erratic the country is not going to be more dangerous to live in than it was in 1942, or than it has been during the past year, when members of Bombay's Yacht Club ate tiffin facing the guns of the mutinous British-controlled Indian Navy.

Though British rule has fallen into disrepute, the status of the individual Englishman is probably improving. Shorn of the pomposity of a ruling race he is judged, usually very accurately, by his own character. Personal integrity means nearly everything and is respected. On the material side the fact that he is the representative of a community which is technologically progressive means he can have a great value in a country which wishes fervently to progress in every activity, from publishing to public works. From now the Englishman is a foreigner in a foreign land. His privileges will not come automatically as in the past; they must be earned. But to those who deserve them they will be freely given.

As for the chances of securing a peaceful settlement among Indians within sixteen months, Mr Attlee's statement was undoubtedly a leap in the dark. Lord Pethick-Lawrence said the Cabinet wished to administer a shock to Indian leaders. That aim has been achieved, though it is perhaps optimistic to say that all suspicion has been dispersed. The appointment of Lord Mountbatten as Viceroy, assisted by Sir Eric Mievill and General Lord Ismay, is viewed with suspicion in some quarters as evidence of hated Churchillian influence persisting.

Alliance with the British

As for the suggestion that British troops might have to intervene to keep order in the new India, it is worth pointing out that that is precisely what is happening, with doubtful results, at present. The maintenance of law and order is the responsibility of provincial Ministers who are all Indian, so that the position of British troops as arbiters between the communities is already far from satisfactory. As for strategic considerations, the Indian leaders, and especially Pandit Nehru—who is in charge of External Affairs—are by no means blind to the position in Asia. The fact that they refuse publicly to commit themselves beforehand does not mean that they will not seek a British alliance once they are free.

Of the Indian Princes, on whose account so much indignation is shown in London, most realise that they have got to move with the times and that fine legal points do not count for much when public opinion is roused. They, too, are ready to make their peace with British India's new rulers. They realise that to expect British defence of their privileges is to invite trouble both inside and outside their states.

Will there be one India or two? It is too early to make a forecast. It is reported that if Congress will accept the League's authority in making the constitutions for the "B" and "C" Groups of provinces (North-West and North-East India); the Cabinet Mission's Indian Union will come to pass. Otherwise Mr Jinnah may insist on a separate Constituent Assembly for Pakistan. But Mr Jinnah is old and embittered. It is generally believed that but for him there would be no Muslim League. How far he can lead his supporters into the wilderness if Congress proves conciliatory remains to be seen. It may not be very far.

Trade Paralysis in China

[FROM OUR HONG KONG CORRESPONDENT]

THE headlong plunge of the Chinese national dollar has forced the Nanking Government to action which ought to have been taken months ago. Whether such action will be effective remains to be seen. Confidence in the officials conducting rescue operations is at a very low ebb, and although the statement issued in the name of the Generalissimo takes into account most of the factors of a baffling programme, it leaves out possibly the most important of all—the immobility of exports.

Until China's produce can be moved at a reasonable cost to ports of shipment from the interior the country's economy will remain unbalanced. Selfish interests in patriotic guise have prevented the employment of foreign shipping along inland waterways. As China's own shipping is quite inadequate to cope with the demand for space, stocks which the world requires are piled up in collecting centres or, where movement is possible, reach ocean ports at enormous cost. Admittedly, a large portion of exportable produce is cut off by the Communists, or originates in Manchuria, over which the Nanking Government has no control. Nevertheless, through the blindness of her leaders China has thrown away a great opportunity of developing her export trade.

From a sanctuary where trade is based on a stable currency, Hong Kong has been casting an apprehensive eye in the direction of Shanghai. A crash has been imminent for many months past; yet, Chinese fashion, one crisis after another has so far been surmounted. Now the greatest crisis of all has to be faced, and Hong Kong, which depends for its existence upon the free flow of trade with its neighbour, is wondering to what extent the paralysis of China's commerce will affect the fortunes of this colony. It was feared that the Chinese import regulations introduced last November might lead to the dumping here of cargo refused admission to Shanghai. So far no such dumping has occurred, but one now hears of shipments being arranged on optional bill of lading Hong Kong-Shanghai. If this practice becomes general, there is a possibility of a strain on storage space, now below pre-war standards, and goods being thrown on an overstocked market.

Movements of Bullion

Although the subsequent history of local imports is usually ignored, there is no doubt that a considerable percentage enters China through irregular channels. All the efforts of the Hong Kong Government and the Chinese Customs officials on the border and at the coast ports have a very slight effect on the volume of this illicit trade. The greater the restriction the more incentive there is to smuggling. So the Hong Kong community will cross its fingers and hope for the best, making the most of the capital seeking refuge here and catering to the wants of the Chinese from Shanghai, whose resources seem limitless.

Treasure shipments in days gone by played a big part in the trade of the colony, but since China went off silver and Hong Kong adopted a managed currency the movement of precious metals has been on a small scale. Six months ago a brisk business sprang up in gold coins from Mexico. The Government of that country found buyers at the equivalent of \$US40 per ounce and were able to replace their stocks of minted coins by buying gold from the United States at \$US36 per ounce. After several large shipments had arrived in Hong Kong from San Francisco, the Government decided to impose a ban on further imports. This led to local operators transferring their headquarters to Macao and the Portuguese authorities there readily granted import licences for the gold which now had to be transhipped in Hong Kong. Air lines saw an opportunity of profiting by the trade, but a projected service between Hong Kong and Macao was frustrated by the inadequacy of the airfield at the latter terminus. However a certain amount of gold was flown across the Pacific via Manila and one aeroplane which crashed on the island of Hong Kong within a few miles of the airfield is reported to have been carrying gold to the value of \$US1½ million, most of which was successfully salvaged. In January alone gold valued at £1½ million was exported to Macao.

Silver has also been in demand and, for the first time for many years, sycee (silver shaped like a shoe) was to be seen here, presumably having come from the interior. The favourable price in Bombay has attracted the metal out of hiding, and during January silver to the value of \$HK12 million was shipped to India. During 1946 the total imports of treasure were valued at over \$HK20 million and exports at \$HK57 million.

Investors Notes

City men speculating on a turn in the weather will find we are able to offer a certain amount of cover either way. At our Fenchurch Street and Cheapside branches we can produce some warm underwear, full length woollen socks, scarves and an occasional heavy overcoat or two. Spring wear is in the shape of gay neck squares and ties, lighter vests, socks and pullovers. Blithe spirits wishing to have holidays in spring suits are advised to make early enquiries as the supply of these is as unpredictable as March sunshine.

Budget Targets for 1947—1

A Prospective Deficit?

THOUGH little is ever revealed about the inner routine of budget-making, it is perhaps a safe bet that by about this time of the year, at least the main framework of the budget has taken shape. If, as the *Economic Survey* strongly suggests, Mr Dalton really did intend to "contract out" of the wider economic policies which the Government is planning, he will have to do some quick thinking if he is to devise the anti-inflationary fiscal policy that informed opinion is now increasingly advocating. Certainly there is still time to make a change, but if the job is to be done properly, the time available is very short. A mere change of emphasis, involving a postponement of tax reliefs already contemplated and a little lopping and pruning here and there, would be relatively simple. But what is needed now is a comprehensive survey of the fiscal armoury, to produce a highly selective policy designed not merely to curtail inflationary pressures, but to exert maximum effect where the pressures are greatest, and at the same time to create the minimum of "disincentives" to effort in general. The broad lines of the policy required have already been indicated in *The Economist*, and an attempt will be made in a subsequent article to fill in the detail. That can hardly be done intelligibly except against the background of the budgetary position as it stands at present. This article, therefore, will survey the budgetary experience of the past year and indicate the prospect for 1947/48 as it emerges from the existing basis of taxation and expenditure at present projected.

The out-turn of the year 1946/47 will be substantially more favourable than Mr Dalton expected last April, but a good deal less so than seemed possible at the end of 1946. After bringing into "ordinary" revenue certain non-recurring or quasi-capital receipts, and by pushing much of the corresponding expenditure "below the line," he budgeted for an "ordinary" deficit of £726 million. Two months ago there seemed a chance that, on this accounting basis, the deficit might be around £200-£250 million. It will, in fact, be a good deal more than that. The original estimates for 1946/47 contemplated a fall in expenditure by 29 per cent—from £5475 million to £3887 million—but in the first nine months of the year this rate was appreciably bettered. The decline then was over 35 per cent, and had accelerated to 38 per cent in the third quarter. But that marked the peak of the movement; in the first two months of 1947 the decline was less than 21 per cent. Unless last-minute payments are much lighter than usual, the year's expenditure is likely to reach, and may exceed, £3,690 million—£200 million lower than the budget estimates, but fully £100 million more than was hoped two months ago.

The revenue story is similar. Although Mr Dalton's estimates looked optimistic last April, their total will be comfortably surpassed—thanks partly, no doubt, to the inflationary influences which have sustained the national income in terms of money. But the rate of improvement achieved in the first nine months has not been maintained in 1947—even though the inflationary factor was presumably more potent then. In the first three-quarters of the year, total tax revenue, which had been expected to decline by £279 million in the full year, dropped by only £84 million, or 4.3 per cent. In the first two months of 1947 it dropped by 8.3 per cent, owing mainly to a change of trend in receipts from surtax and EPT. If experience in the final month is similar, the year's total will be a little over £3,000

million, roughly £100 million above the budget estimate of £2,918 million, and less than £200 million below the 1945/46 level, despite the tax reductions. Non-tax revenue is difficult to estimate, for the receipts depend to a considerable extent upon internal policy, but if the miscellaneous items bring in as much as they did in March, 1946, and if the two special items—sales of surplus stores and surpluses from Government trading—yield the £27 million by which they at present fall short of the year's estimate, the total for the year will be £284 million. On this basis, ordinary revenue will approach £3,300 million—a little more than in 1945/46 and about £130 million more than the budget estimate.

The 1946/47 "ordinary" deficit, therefore, looks likely to be around £400 million, or a little less; though it should be noted that there is still room for perceptible error in these estimates. This will not, however, be the whole deficit, for

below-line expenditure has been very large. It is a matter of opinion which of these items can be regarded strictly as capital payments and which of them have budgetary significance, but it is reasonable to regard at least four main groups as falling into this second category—EPT refunds, war damage payments, issues under the Housing and Building Materials Acts, and reimbursement of post-war credits. In the first ten months of the year these groups absorbed over £410 million (the repayment of post-war credits to elderly folk rather inexplicably required more than double the estimate); and, among other items, it may be noted that advances under the Coal Nationalisation Act have already required £39 million; advances to Local Authorities, £36 million; and the Civil Contingencies Fund, £34 million. If all these items were reckoned in, the final deficit for the year would be well over £900 million.

What, now, of 1947/48? The prospect, fortunately, is for a much closer approach towards equilibrium than has been made this year—on whatever basis the deficit is calculated. A large part of the 1946/47 expenditure, as the original estimates made plain, represented terminal payments, especially in the defence sector. Of the £1,667 million voted for defence twelve months ago, £576 million was estimated as non-recurring, and the 1947/48 defence budget, set out in last month's White Paper (Cmd. 7042) shows a reduction of £768 million on the 1946/47 estimates. The £899 million to be spent on the Forces and Supply in the coming year, when the armed Forces will still be substantially larger than they are scheduled to be twelve

months hence, includes a further £118½ million for terminal charges (including contract settlements and requisitioning compensation) that the requirement for 1948/49 ought to be well under £700 million.

Unless budgetary policy changes, however, an appreciable part of the savings on defence and on war services outside the defence budget will be absorbed, both in the coming year and in 1948/49, by additional civil expenditure, principally upon social services. A change in the method of accounting defence production in 1947/48 (in future the Service departments will reimburse the Ministry of Supply) creates a little uncertainty about the requirement for that Ministry, but it appears that the £135½ million included in the Civil Estimates embraces the £100 million of defence expenditure (chiefly for research, inspection and contract termination) which will remain to be borne on the Supply vote. On that assumption, and assuming also that £130 million of the £147 million needed for the Post Office will be self-financing, the true estimate for Civil expenditure in 1947/48 is £1,741 million—an increase of £89 million on the original estimates for 1946/47. Consolidated Fund Services might, perhaps, be put at last year's figure, except for the omission of the non-recurring £50 million provided last year for the new National Land Fund, and prudence might dictate a further small increase in the fixed debt charge (raised in 1946/47 from £465 to £490 million). On these bases, as the accompanying table shows, ordinary expenditure would total £3,165 million—a decline of about £525 million on the probable expenditure for the current year.

Revenue in 1947/48, on the basis of taxation as it exists before any changes that the Chancellor may make next month, will certainly be less than in 1946/47, but the extent of the decline will depend chiefly upon whether there are further substantial non-recurring receipts to be brought in. The effect, for the first full year, of post-war tax reductions will reduce income-tax by £43½ million (principally because of the exemption of employees' national insurance contributions from tax) and excise receipts by £3½ million, but death duties should rise and surtax by a similar amount. The main loss, however, will be in receipts from EPT, partly because of the reduction of the rate to 60 per cent in respect of the calendar year 1946, but chiefly because of the effect of 1945-46 contract cancellations and reconversion outlays. The gross loss may be around £140-150 million, but perhaps £40-50 million of this will be offset by a consequential increase in income-tax and profits tax (NDC). The effects of the abolition of EPT as from the end of 1946 will not be fully felt until 1948/49.

The effect of changes in national income upon tax yields is hard to assess, but will probably not be large. PAYE receipts in 1947/48 may be adversely affected by the unbalanced state of industry after the fuel crisis, but average wage rates, even without any further advance, will be higher than in 1946/47.

Payments assessed on the previous year's incomes are likely to be a little higher. Unless the cheap money policy is reversed—which, after Mr Dalton's statement of faith this week, seems quite unlikely—death duties should rise further. Finally, the present import programme for 1947 is one-third larger than in 1946, which promises a substantial increase in customs revenue, though excise receipts (which are unlikely to reach the estimate this year) will doubtless fall further.

In sum, the receipts from all forms of tax revenue may fall by about £75 million. But there may be a bigger fall in non-tax revenue. Disposal of surplus stores, which in the first eleven months of 1946/47 brought in £133 million (£150 million estimated for the full year), will produce much less, and there may also be a sharp decline in surpluses from Government trading (£40 million, up to March 1st, against £50 million estimated). The decline in these two items next year might easily be as much as £125 million from this year's estimates.

On these various assumptions, the prospective revenue, on the existing basis of taxation and without assuming any changes in economic policy (such as a further revision of the import programme or a complete reversal of the cheap money drive), would be around £3,100 million. In other words, on the figures given above, the Chancellor would still be facing a small "ordinary" deficit—say, between £50 and £75 million. In addition, there will still be substantial "below-line" expenditure. About £65-70 million of (net) EPT refunds will remain to be made; payments for war-damaged chattels have been promised early in the year; release of "value" payments for damaged properties is to start later this year; and there will be further advances for housing and for the Civil Contingencies Fund. Expenditure under these heads could readily exceed £200 million, even if payments for all forms of war damage were kept within the 1946/47 limits, and even if nothing more were released from the post-war credits, now totalling about £750 millions.

These various estimates, it should be emphasised, are liable to a considerable margin of error. They are made strictly on the bases stated, and some of them (e.g. receipts from surplus stores) are mere guesses. And since Mr Dalton last year was more optimistic in his estimates than any of the unofficial estimators—and, on the whole, he was right—it is possible that the figuring here will again prove to be a little too cautious. But the broad conclusion seems plain. The Chancellor will need considerable ingenuity, if he is to show any surplus available for overall tax reduction within the limits of a balanced "ordinary" budget. To provide incentives by selective reductions while maintaining an overall balance will be correspondingly more difficult. And even if the "ordinary" budget is balanced, the prospect is that the State's total outgoings may still exceed its receipts.

Export Needs and Possibilities

THE Government has set an export target of 140 per cent of the 1938 volume to be reached by the end of 1947, as against the end-1946 level of 110-115 per cent of 1938. . . . It will be extremely difficult to reach this target." These two extracts from the "Economic Survey for 1947" speak for themselves. Were it only "extremely difficult" to achieve the target, it might be a stimulus and a challenge. But there is a world of difference between a target which is "extremely difficult" and one which is remotely possible. This is not merely a quibble on words; it affects the practical reality of the target, for an export programme which is on all probable demonstration unattainable may introduce a new psychological burden of despair. The problem which lies behind any analysis of post-war export aims involves the distinction that while the balance of payments is concerned with values, export objectives must be stated in terms of volume in order to compensate for the depreciation of sterling during the war years. This in turn raises other problems, such as adding together quantities of different commodities. A general target is a statistical abstraction which has to be translated into an export policy for each exporting concern in this country. Only now are detailed discussions to this end being undertaken by the Government with industry. The fact that the target is an abstraction means that comparisons between different industries or different markets, showing their potential contribution to the target, must be made cautiously, the only way of resolving these difficulties is to resort as far as possible to percentage movements.

The expansion in the volume of exports during 1946 was a creditable achievement, though it still left—and was expected to leave—a wide disequilibrium in the balance of payments. In the first quarter exports represented 84 per cent of the 1938 volume, in the second quarter 98 per cent, rising in the third to 104 per cent and finally to 111 per cent. Taking the year as a whole, the volume of exports for practical purposes was equal to that of 1938. The 1947 target, therefore, can be roughly translated into the requirement that by the end of 1947 exports must be at the rate of 40 per cent above the annual volume rate for 1946, without laying down any specific targets to be aimed at during the course of the year—a realistic omission, perhaps, in view of the damage done to exports during the coming months by fuel and power cuts and industrial dislocation. But given the end-year target, a more accurate assessment can be made of the pattern of exports required during the current year, both as regards commodities and destinations.

As a preliminary step to examining the target for 1947, the course of exports in the three main groups during 1946 deserves a quick review. There was a fairly considerable increase in the value of shipments of food, drink and tobacco, but the increase in volume, if indeed any increase was gained, was scarcely significant. The set-back in exports of raw materials was mainly due to the negligible shipments of coal, but the downward trend was common to practically all primary commodities, apart from rubber and artificial silk waste. The main force of last year's expansion was concentrated on manufactured articles, and of these the chief items in terms of value were machinery, vehicles, iron and steel (including manufactures), chemicals and cotton yarns and tissues. But reckoned in terms of volume, as distinct from value, the increases over the pre-war levels were confined principally to vehicles, certain chemicals, and to a lesser extent to iron and steel and machinery. The divergence between value and volume increases is shown in Table III below.

Last year also showed some illuminating changes in the direction of trade, which can be seen from Table I. The "hard currency" countries in 1946 absorbed 12 per cent of British exports, compared with 16 per cent in 1938. Within the "soft currency" group there have been few notable changes. Exports to Australia and New Zealand formed a smaller proportion of the total last year than in 1938, while South Africa's share was unchanged. The increase in 1946 was, in fact, spread over a fairly large number of countries, mainly European or in the Colonial Empire.

Against this background, in what groups and countries are possibilities of expansion to be sought this year? Shipments of coal will be further reduced to the barest minimum, and bunkers sought abroad. Exports of iron and steel and wood manufactures are equally certain to be reduced below the 1946 level. Pottery, textiles, leather and paper may possibly show a slight increase during the current year, but it would be rash to assume that they will be able to play any significant part in this year's expansion, unless their manpower shows a remarkable expansion—and of that there is no present sign. This leaves the responsibility for achieving the export target to a limited group of manufacturing industries: machinery, vehicles, chemicals, electrical goods, non-ferrous metal manufactures, rubber manufactures, cutlery and hardware.

If it can be assumed that the relative export values of the main export groups will remain the same in 1947 as they averaged in 1946, then those industries which have already

enjoyed a considerable export success last year, will have to produce a further increase. In fact, if other exports can only be maintained at the 1946 level, the "expandable" industries will have to increase their shipments overseas to a figure approximately 85 per cent above last year's level. Exports of machinery, particularly the smaller equipments, could expand, although they will hardly be sufficient to reach this target; if they do, it can only be at the expense of urgent home needs for the products of this group. The shortage of metals alone will probably preclude any expansion in output in non-ferrous metal manufactures and cutlery and hardware. The export "hopes" thus narrow down to vehicles, chemicals, electrical goods and rubber manufactures. If this group of industries is to carry the whole burden of the 1947 target, their own exports must expand to about 115 per cent above last year's figures. But in none of these cases is expansion a certainty except perhaps in the case of rubber; its exports, however, form such an insignificant proportion of the total that it cannot possibly play the sole role in attaining the target. Steel supplies according to the "Economic Survey for 1947" are only expected to be adequate on the assumption that there is no continued expansion in demand from the main steel consuming industries; that is, supplies are adequate for a restricted, not a full, demand. If exports expand, therefore, home industry must go without. The vehicle group requires large amounts of steel and in addition other scarce materials like non-ferrous metals; the present restricted supplies of basic materials may well limit their production. The chemical industry is limited by its productive capacity as well as material shortages. The electrical group in addition to being hindered by the general lack of coal, non-ferrous metals and other materials, provides in any case only 4 per cent of total exports so that it would be physically impossible for it to expand its output on a sufficient scale to meet the export target unassisted by other export groups such as machinery and vehicles. Other limiting factors must also be taken into consideration. No priority system for export will insulate these industries from, at any rate, part of the consequences of the one-third deficiency in industrial coal supplies this summer. They will suffer at the very least from a dislocation in the smooth supply of components, spares and the thousand and one "bits and pieces" which is the essential guarantee of balanced and efficient production. In addition, there are the problems of inland transport and shipping, although if the goods are produced, these could be overcome by emergency measures.

As regards the direction of trade, it is not merely necessary to increase the volume of exports; it is equally important at least to maintain the proportion shipped to the "hard currency" countries. In 1946, 10 per cent of the chemical exports went to this area, just under 10 per cent of the vehicle group, about 8 per cent of machinery and less than 5 per cent of the electrical goods exports. Sweden and Argentina would no doubt be willing to take increased supplies of all these manufactures, but a large expansion in the American and Canadian markets is still problematical.

Statistics are not available in sufficient detail to enable any accurate assessment to be made of the increase in output per man-year in the "expandable" industries, which will be required if the export drive is to have any chance of success. According to the "Economic Survey" the labour force in civil employment at the end of 1946 amounted to 18,122,000 persons and its normal increase in 1947, without special measures of recruitment being taken, would be at the most 1 per cent. Even if the 100,000 foreign workers which the budget assumes are set to work in British industry, the increase in the labour force would be remarkably small to provide the expansion in production which is envisaged. In any case, coal-mining is taking first priority on extra labour supplies, followed by agriculture and the textile industries. There is thus very little chance of the "expandable" export industries getting any considerable increase in manpower, without attracting it from other industries. The only method, short of a dramatic increase in production per man, by which increased supplies can be made available to assist the expanded export programme in 1947 is therefore by a further reduction in supplies for the home market. That would be an unfortunate policy, and perhaps even a dangerous one, because the British public are already experiencing austerity conditions of great severity and further cuts might well have direct repercussions on industrial efficiency and labour incentives. But unless productivity in the export industries can be increased greatly, from what other source are the required exports to be found this year?

The conclusions to be drawn from this review are two-fold. Firstly, real doubt must be entertained whether the export target is within the realms of practical attainment within the current year. Secondly, any substantial increase in output can only be obtained by greater effort and better use of existing resources of manpower, capital equipment, and raw materials.

Business Notes

Summer Coal Budget

Sir Stafford Cripps produced his promised coal budget for the summer months in the debate on the economic situation on Monday. His figures were presented on a different basis from those put forward in last week's article on the coal target, but essentially they fit into the same statistical pattern. The details of the budget are shown in the following table:

SUMMER COAL BUDGET—MAY-OCTOBER, 1947 (mn. tons)

Bracketed figures are for corresponding months of 1946.			
	1947	1946	
Stocks	10.0 (3.7)	1.2 (1.2)	
Electricity	11.4 (11.6)	1.5	
Gas	9.7 (10.2)	0.5	
Coke ovens (a)	5.3	1.2 (4.6)	
Water	0.2	0.5	
Railways	7.6 (7.5)	1.3	
Collieries	5.3 (5.2)	17.6 (18.9)	
Miners' coal	2.1 (2.2)		
House coal	12.8 (12.8)		
Other merchants disposal		87.9	
Larger non-indust. consumers		5.1	
Coastwise bunkers		91.0	
N. Ireland		2.0	
Service depts.			
Miscellaneous			
Iron and steel, coke ovens, and other industries		89.0 (b)	
Total			
Exports and bunkers			
Oil conversion			

(a) Supplying town gas. (b) Of which 83 mn. tons deep-mined and 6 mn. tons open-cast.

EXPORTS FROM THE UNITED KINGDOM—1946 COMPARED WITH 1938.

TABLE I
Exports by destinations shown as percentage of total exports, calculated on a value basis.

	1938	1946
Argentina	4.1	2.2
Canada	4.8	3.6
Sweden	2.5	2.3
United States	4.4	3.9
Total "hard currency" countries	15.8	12.0
Australia	8.1	6.1
British India	4.0	3.6
New Zealand	7.2	8.8
Union of South Africa	4.1	3.0
Belgium	8.4	8.3
Denmark	1.7	3.0
France	3.4	5.2
Netherlands	3.2	3.8
Others	2.8	3.4
Total "soft currency" countries	45.3	46.4
Total	84.2	88.0
GRAND TOTAL	100.0	100.0

TABLE II
Exports by commodities shown as percentage of total exports calculated on a value basis.

	1938	1946
Food, drink and tobacco	7.6	7.0
Coal	7.9	1.0
Iron & steel & manufactures	8.9	8.8
Non-ferrous metal and manufactures	2.6	4.1
Cutlery and hardware	1.9	3.0
Electrical goods and apparatus	2.8	4.1
Machinery	12.3	12.5
Textiles	21.6	20.4
Vehicles	9.5	12.4
Chemicals	4.7	7.3
Rubber manufactures	0.3	0.6
Others	19.9	18.8
TOTAL	100.0	100.0

TABLE III
1946 Exports of certain commodities expressed as a percentage of 1938.

	Quantity	Value
Chemicals	%	%
Ammonium sulphate	89	185
Caustic soda	159	175
Sodium carbonate	112	217
Cotton		
Yarns and threads	25	55
Tissues	37	126
Iron & steel & manufactures thereof	116	192
Machinery	109	197
Vehicles		
Motor vehicles	199	369
Motor cycles	271	428
Bicycles	187	385
Locomotives	210	487
Ships	39	55

budget; the amount of 17.6 million tons for current use is the difference between the estimated available inland supply of 89 million tons and all other forms of consumption included in the table. Sir Stafford might well remark that it is unfortunate that when all other users have been cut to a minimum industry must content itself with what is left over; in fact the supplies for the iron and steel industry for industrial coke ovens and for all other industrial purposes will, according to his estimates, be exactly two-thirds of the total estimated requirements if industry were running full out. The extra margin to ensure full industrial production is 8.8 million tons, and to achieve it would involve an increase of 10 per cent in available output during the six summer months. These figures conceal a strange contrast between the "planned" increase of 10 million tons in coal production this year, and the anticipated production during the summer; Sir Stafford is, in fact, budgeting for 91 million tons, compared with an output of 94½ million tons during last summer. If the projected increase in manpower in the mining industry can be secured; if the number of face workers can be increased; if output per man shift is increased and voluntary absenteeism reduced; if the five-day week does not affect productivity adversely—if all these factors contribute during the summer there may be a chance of exceeding the target. But the revolution of thought which these things imply suggests that Sir Stafford may be wise to pitch his expectations on a more modest plane even at the expense of throwing doubt on his own "Economic Survey."

The Merits of 2½ per Cent.

Ever since the fuel crisis burst upon the country, investors have been awaiting a sign from the Chancellor of the Exchequer about his cheap money intentions. His brief intervention on Monday evening in the economic debate ranged widely over the question of inflation and claimed that any unrestrained inflationary outburst matching that of 1918-20 had been successfully prevented. He turned finally to interest rates and cheap money—against which, he claimed, a "certain agitation" has recently been conducted by "a number of persons," including writers in the financial papers—and, he might have added, several of the bank chairmen. Here again Mr Dalton argued by historical analogy, rather than by present principle; his promised explanation and defence of the cheap money policy in his Budget Speech should give a welcome opportunity for examining its full implications.

But, "to dispel any uncertainties which may have arisen in the City of London or elsewhere," Mr Dalton reiterated that he still regards 2½ per cent and not any higher rate "as the appropriate long-term rate, in present conditions, for British Government borrowing." He repeated also the references in his Mansion House speech last October that the cheap money policy should continue to be resolutely pressed home. Perhaps it would be unwise to make much of the omissions from his short discussion of cheap money—though the absence of any reference to any further cheapening of gilt-edged rates is not the first in his recent observations on cheap money.

The reaction of the City to the Chancellor's further calling of his book has been significant. There was a time when Monday's statement might have produced a boom in gilt-edged stocks. But

its effect has been the purely negative one of arresting—and then only temporarily—the falling tendency, particularly in the "longs" and undated stocks, where falls of up to ½ were recorded. The new Treasury Stock, whose 2½ per cent yield for a minimum term of 29 years was described last October by the Chancellor as a "reassuring thought," fell as low as 95, before recovering to 99½ on Thursday. Evidently there are many investors who do not share the Chancellor's views about the advantage of the lack of a final date. In their scale of calculations "long-term" means redeemable at the latest by 1975, and not at Government option thereafter. The accompanying table of yields shows that in the "middles" Mr Dalton is where he was last October before his drive to established 2½ per cent without a date. And in the "longs" he is in a much less favourable position.

Industrial Resumption

Industry has now been running-in for varying periods up to three weeks. But many firms are still working short-time owing to lack of fuel and components. Last week-end, new basic coal quotas were announced for industry. Instead of the 50 per cent of original allocations which firms were allowed in theory immediately before the fuel crisis, quotas have been fixed at 33½ per cent until May, which begins a new coal year. The only exception is the iron and steel industry, which is to receive its full allocation as fixed on January 20th.

The first statistical hint of the cost of the shut-down comes from the February iron and steel output figures. Transport difficulties and a shortage of coal, especially of coking coal which feeds gas to the blast furnaces at integrated works as well as providing coke for pig iron production, combined to reduce pig iron production last month compared with January, from 150,100 tons to 126,200 tons and steel ingots and castings from 239,800 to 206,300. Corresponding reductions in annual rates of production in pig iron were from 7,806,000 tons to 6,560,000 tons and in steel from 12,470,000 tons to 10,726,000 tons—reductions of 16 per cent and 14 per cent respectively. Compared with February, 1946, the annual rate of output is down by 14 and 17 per cent in each case. These results are bad enough, but the effects of dislocation are likely to be reflected even more seriously in the March figures when they become available. Disruption in output indeed was probably at its peak just at the turn of the month. And steel, like other industries, is likely to be on short-time until improved weather and transport conditions allow even basic supplies of coal to reach the works.

Industry is now negotiating the terms on which double day-shift, night work and staggered working hours can be introduced in different industrial areas. Production is restricted by coal supplies, transport difficulties and shortage of electricity generating capacity. The changeover to summer time and improvement in coal deliveries should enable firms gradually to expand their output. But the spreading of the industrial labour force over a 16-hour day and a seven-day week is bound to be an intricate and tedious process of negotiation between employers, workers, electricity supply undertakings and those larger transport undertakings which have to cater—with difficulty, if at all—for a wholesale change in passenger movements.

Second Thoughts on Guaranteed Stocks

On Thursday last week the Standing Committee on the Transport Bill turned, under the shadow of the guillotine, to the compensation clauses—in particular Clause 16, which Mr Glenvil Hall described as "one of the key clauses of the Bill." In the general debate on the justification of using Stock Exchange prices as a basis for compensation, little emerged that was new. This ground has been so trodden over since the Minister of Transport issued the terms of compensation in advance of the Bill that the two sides can only agree to differ—there is certainly no way of reconciling their views. The point about compensation by Stock Exchange values which is most damaging to existing holders is not that capital values calculated by this method are necessarily unfair—they may or may not be, in particular cases—but that in a controlled capital market suffused with cheap money the opportunity for reinvesting the sums received in compensation must inevitably result in the hardship of reduced income.

Mr Glenvil Hall confirmed the Government's view—though it had long been self-evident—that compensation calculated by reference to net maintainable revenue would have set any arbitration tribunal an intractable task. "To complete its work in anything

like reasonable time," said Mr Hall, "it would require a large number of technical advisors, which is not available in this country at the present time." Speed and simplicity are, in fact, the only virtues which can be claimed for the method of compensation by market values. The City does not, as Mr Hall suggested, accept the compensation method as being the only one which is fair and reasonable—no consideration whatsoever has been given to any alternative scheme providing for annuity payments, for example—and the steadiness of the railway market since the compensation terms were announced adduces, for all Mr Hall's argument, no proof of that supposition. On one important point, however, the Government have given ground—and wisely. They are now prepared to issue a special type of Transport Stock to holders of London Transport 3 per cent guaranteed stock, 1967-72, which will carry, until the due date of redemption, the same guarantee as to principal and interest as the present stock. This *ex gratia* settlement—for the Chancellor of the Exchequer does not admit that his legal case for breaking the guarantee on the termination of the London Transport Board was defective—suggests that there is still some tenderness at Treasury Chambers when charges of a breach of covenant are raised. In fact, Mr Glenvil Hall demolished the Chancellor's case for him: "It is true," he said, "that the stock was not based on the credit of the London Passenger Transport Board, but on that of the State." The Government have indeed been wise to avoid the appearance of not keeping their bond.

Sterling Debt Talks

The Eady-Cobbold mission returned home this week from its strenuous labours in New Delhi, Cairo and Baghdad. They failed to bring back with them specific agreements on the sterling debts which they set out to discuss, but it would be wrong to deduce from this that their long journeys were in vain or their labours abortive. In the first place, the negotiations with the three countries they visited were never intended to be more than exploratory, though any opportunity of their development beyond that stage would no doubt have been eagerly seized. The talks will have been of considerable educative value, especially to the creditors. These should now be fully seized of the facts of the British economic situation and of the limitations on Britain's capacity both to pay and to transfer any service on these wartime debt accumulations.

Secondly, the long journeys of the British Mission will have provided the United States with clear evidence of the British endeavours to arrive at a settlement of the sterling balances, and thus to comply with the requirements of the Anglo-American financial agreement of December, 1945. That is almost as important an outcome of the talks that have taken place as the mutual enlightenment which they may have brought to creditor and debtors alike. In each of the three capitals the talks were not broken off but left suspended, to be resumed later. Little has been heard of the Iraq Government's views on its sterling balances, but there is no mistaking the vehement protests with which any suggestion of scaling down has been received in India and Egypt. It must be hoped that in all three cases negotiations will be resumed in the near future, for it would be most unsatisfactory to leave the availability of these large sterling balances in the present undefined and unsatisfactory position.

Indian Silver Embargo

The silver market situation has been fundamentally changed as a result of the decision of the Indian Government to place an embargo on imports of silver. That decision has at one stroke removed the principal mainstay of the market, for it is on the Indian demand for the metal that the market has for months past been depending. The operations which led to the Indian Government's decision appear to have been the astute arbitrage operations described in *The Economist* last week by which Continental interests (principally Belgian) contrived to buy silver in New York against dollars, and shipped it to Bombay where it was sold against rupees which were then converted into sterling. Owing to the substantial margin between the dollar and rupee prices for silver these operations—to which the term "washing" would seem to apply better than "arbitrage"—yielded substantial profits. It is not clear whether the greater disapproval of these operations came from British or Indian sources. British authorities could look askance on these silver deals because they involved the conversion of dollars into sterling at a rate of about \$3 to the pound by the Belgian operators concerned. The direct result of the operations as far as London was concerned was to see Indian

sterling balances reduced (owing to the conversion of the rupee proceeds of these sales into sterling), and Belgian holdings of sterling increased. That may have been an innocuous enough movement, but it veiled the fact that if the Belgians, as the operations indicated, were short of sterling and had dollars to spare, they should, in accordance with the spirit of Bretton Woods, have obtained sterling by selling dollars to the British authorities at the official rate.

Whatever may have been the exact cause of the decision, the Indian embargo has for the time being removed the main prop underpinning the market and the New York price has fallen this week from 86½ cents to 77 cents per fine ounce. The price fixed for silver for essential users in London has followed the New York quotation to 46½d., but very little business appears to have been transacted.

An interesting feature of the silver market is the continued drain of the metal out of China. Most of this outward flow is canalised through Hong Kong and has, in large measure, been finding its way to India. Despite currency chaos and political uncertainty in China, that country has ceased to be a magnet for silver. The metal "lost face" with the demonetisation of 1935 and in Chinese eyes has not recovered from that blow. One very practical reason for this is that silver is a decidedly bulky hoarding medium for a people subjected to such mass migrations as the Chinese have experienced in recent years. Something more portable and more easily hidden is called for in the circumstances, and these alternatives have been provided by gold coins and foreign notes, especially dollar bills.

End of Dual Control

In June, 1944, the first steps were taken towards unified government of the Stock Exchange, to end the system of dual control by which the Trustees and Managers had hitherto owned the building and the Committee for General Purposes had governed the interests of members. The Trustees and Managers and the Stock Exchange Council have now put forward a financial scheme intended to complete the unification. The scheme proposes that each of the 20,000 Stock Exchange shares, on which £36 has been paid up, should be converted into two £4 cumulative redeemable annuities. The property and assets of the undertaking will, if the scheme is approved, be owned by the Stock Exchange Council, which will assume responsibility for the annual payment of £160,000 to satisfy the annuities. The Council will have the right to buy annuities at any time and at any price in voluntary sale, and five years after the date of issue to redeem them at £100 per annuity. Since the annuities will not carry uncalled liability or voting power (save on questions which affect the annuities themselves), it is proposed to allow non-members to hold them up to any amount. Members will not be required to hold annuities as qualification for membership.

The annuities will be payable by the Council out of the net income of the undertaking, subject to the interest on the £250,000 3½ per cent debentures now outstanding, and subject further to the right of the Council to raise new funds for acquiring additional properties or rebuilding the present premises, and they are amply covered by present Stock Exchange revenues. In 1938 the proprietors agreed to an amendment to the Deed of Settlement which enabled the Trustees and Managers to place to reserve additional sums from net revenue. Thus the dividend on the Stock Exchange shares, which had been as high as £15 and averaged £10½ between the two wars, would after the 1938 amendment in any case have become more conservative.

Younger members who purchased their Stock Exchange shares at high prices during the high dividend era may perhaps feel sensitive about the proposal to replace them by annuities; if so, they would do well to recall the decisions of 1938. For the moment, members, as distinct from proprietors, are asked to express their views on the scheme to the Council, and the reception generally appears to have been favourable. The Council will, in effect, acquire, out of future revenues, assets capitalised under the annuity scheme for £4 million. To have purchased these in any other way would have involved writing up the property, and the proposals, which inevitably involve some elements of compromise, holds a fair balance between members and proprietors, and concentrates complete control of finance upon the Council.

Falling Bank Deposits?

Fare certainly dealt Mr Dalton a lucky hand this week. When he wanted to belittle the critics' fears of a rising volume of money—which he contemptuously dismisses as a "statistical

phenomenon"—there, beneath his nose, were the clearing bank figures for February, showing a violent reversal of the recent trend of bank deposits and one of the largest declines on record. These figures were indeed a statistical phenomenon. The Chancellor, in implying that this early swallow makes a summer, omitted to point out that its movements are most strictly seasonal. February is the only month of the year which, through the whole seven-year period of credit expansion, has always shown a substantial contraction. This year, moreover, the February statement was especially favoured, for the accident of the calendar, in conjunction with the banks' new make-up rules, dated the previous statement as early as January 15th. Hence the latest statement, dated February 19th, covered the very five weeks of the year in which the surplus of Exchequer receipts is largest—in the last week of February surplus was turned to deficit. It is dangerous to base long-term argument on such figures, however true it may be that, as the Budget at last begins to approach equilibrium, the curve of bank deposits will flatten out.

The heartening feature of the February bank statement is that, at last, the effects of improving budgetary trends upon the banking position have not been obliterated by extra-budgetary operations. There are no other grounds for satisfaction. The fall in "true" deposits, by £90.7 million to £5,349 million (compared with £4,541 million twelve months earlier), is twice the fall for February last year. But the seasonal budget surplus, in the nearest comparable five-week period, was no less than £187 million, more than double the surplus for the first eighteen days of January, in which bank deposits barely altered. Below-line expenditure was substantial, but probably only a modest part was of a kind to require immediate bank finance. On the other hand, effective receipts from the dollar credits seem to have been large. Roughly £40 million was drawn upon them in the third week of February, so that the £54 million drawn at the year-end had presumably been exhausted (and thus had provided the Treasury with the equivalent in sterling) principally in the period covered by these banking figures. It is little wonder that deposits fell so sharply.

Certainly, we are now passing out of the period in which Treasury deficit financing, as such, has put heavy strain upon the financial system, and the large reliance upon overseas borrowing will continue to give relief. But how far this easing of strain is reflected in bank deposits will depend partly upon the Chancellor's own policy. After the knocks which the gilt-edged market has taken during the past few weeks, there is no doubt that an attempt to hold fast to the original cheap money programme would require a lavish creation of money, and this would quickly obscure any declining tendency attributable to budgetary factors.

* * *

Builders' Blackmail

The building trade unions are up in arms against the rejection of their claim for increased wages by the National Arbitration Tribunal; their indignation is increased by the fact that the Minister of Health has decided to raise the price limit on houses by £100. The executive council of the National Federation of Building Trade Operatives has issued a statement, which is not confined to expressions of regret and indignation, but which carries a thinly-veiled threat to the Government that "it will be difficult to carry out the housing programme already fixed by the Government for the present year, now that the claim for improved wages has been rejected." Is the Federation's threat of "no houses without more money" far removed from blackmail?

The Federation accuses the Tribunal of being influenced by "politicians' speeches" and of reaching a political rather than an industrial decision. This, of course, is nonsense. On sheer economic and industrial grounds no other decision would have been possible. The union claim, which was for an extra 6d. an hour for craftsmen and 9d. an hour for labourers, would, it has been estimated, have cost about £65 million a year and would have entailed a great addition—how much is a matter of dispute between the two sides—to the cost of houses.

There may be industries in which a claim for higher wages might reasonably be justified as a spur to recruitment and an incentive for greater output. For building, no such pretext can be advanced. The industry's present labour force of 1.3 million is in no danger of imminent contraction and is certainly adequate—and probably more than adequate—to handle the present flow of material supplies. Building workers were granted a wage increase early last year and they undertook, by a specific clause in the agreement, to maximise their production. It is impossible to get any measurement of productivity in building,

but there is no evidence to show that last year's wage increase was followed by increased production per man—on the contrary, it seems that productivity is low by pre-war standards, even when due allowance is made for the special post-war difficulties. The unions have put off any decision about payment by results and their general attitude to piece work is distinctly hostile, although it would undoubtedly provide an incentive to increased effort. Increased building production is not a matter for labour alone—much has still to be done to raise the efficiency of the building industry by the introduction of mechanical aids and labour-saving devices. But to concede the union's demands would increase the industry's present difficulties beyond all bearing.

Cloth to Lancashire

The cotton textile industry's chronic reconversion difficulties have been demonstrated again this week by the announcement that negotiations are afoot in Washington to import 50 million yards of grey cotton cloth from Japan into Lancashire, where it will be processed, finished and then re-exported. Already broad official hints have been expressed that the export quota of cotton cloth from home production in the current period cannot be maintained at the same level as in the last period of 1946. Fifty million yards of cloth from Japan may help to fill the gap and to keep the finishing end of the trade better employed, but its contribution will not be very large. It represents roughly two weeks of Lancashire's production and one month's exports of cotton cloth at 1946 levels. It could, therefore, be regarded as an offset to the immediate effects of the fuel crisis on production for export.

As a short-term palliative to counteract the fall in Lancashire's production, the scheme has some merits. While the sellers' market abroad continues—and particularly in the colonies where finished Japanese cloth will find its readiest market—there are strong arguments for shipping cloth from Japan to Britain. In the longer run, more finished cloth exported to the colonies should mean more foodstuffs and primary commodities for Britain and world markets. But it has yet to be decided whether the cloth would be paid for in dollars or in sterling. If the unfinished cloth has to be bought against dollars, the only dollar receipts to which the finished re-exports will give rise will be the eventual increase in the production of dollar-earning commodities such as tin and rubber which might result from a better supply of consumer goods in producing areas. Even on these assumptions the scheme will involve an immediate drain on Britain's slender dollar resources.

Lancashire is now suffering from the full rigours of the coal shortage. There are reports of mills spraying oil over their coal dumps to raise the calorific value, and of rubber tyres being used as fuel. Now that basic quotas for industry have been fixed at one-third of the original allocation instead of a half, the cotton mills will for the next six weeks get slightly less than 50 per cent instead of the 65 per cent of their original quota under the "Cripps" plan. Even if the new quota is met, the industry is faced with a grave threat of curtailed production. Unless this setback to production is rectified as quickly as possible—theoretically it should last only to the end of next month—it will tend to overshadow the realisation among operatives of the long-term need for higher productivity. On this, the trade union side is moving with extreme delicacy. After several meetings, delegates are to give further consideration to double-shift working under the Cripps re-equipment scheme next Sunday.

Chemicals from Petroleum

The developments in specialised refining foreshadowed by the then chairman of Shell Transport and Trading Company last year have now been carried to an advanced stage of preparation. This week's announcement by Shell Petroleum Company of their plans for producing chemicals from petroleum reveals that the company is erecting new plant on an 85 acre site at Thornton-le-Moors, Cheshire, at which the newly developed refining processes can be applied on a large scale. This plant is being financed from internal resources at a cost of several million pounds and is expected to be ready for production late this year or early in 1948. Output from the new plant will permit a consequential reduction in imports from the United States amounting to some 4 million dollars a year. In addition the company is extending its two specialised refineries on the Manchester Ship Canal and at Shell Haven. At the former it is intended to double the present production of 24,000 tons of

synthetic soaps and other cleansing and wetting agents, while at Shell Haven an eventual production target of 30,000 tons of insecticides, fungicides and other agricultural products is contemplated.

The development of chemicals from petroleum—on which much work had been done in Germany before and during the war—has hitherto been left largely to the independent Manchester Oil Refineries Group. The new expansion schemes of the Shell Group will bring a welcome extension of the benefits of petroleum research and enterprise. The range of chemical products which can be produced covers the widest industrial field—including paints and plastics, textiles, rubber, leather, chemicals, pharmaceutical and horticultural preparations. The raw material of the new plants will be provided from sterling sources and there should in due course be an opportunity for building a new export trade for Britain in products for which hitherto this country has been largely dependent upon the United States.

Two additional points are perhaps worth noting: first, that the plants will be constructed almost entirely from British materials and second, that they will be an outstanding example of a combination of a large amount of capital with a very small demand upon manpower. The Government's wisdom in exempting from duty hydrocarbon oils when used as raw material for chemical synthesis is now apparent.

Australia and Bretton Woods

Australia's ratification of the Bretton Woods agreements and membership of the International Monetary Fund and International Bank are clearly foreshadowed by a majority decision of the Australian Parliamentary Labour Party recommending that this step be taken. This reverses a motion passed by the same body towards the end of last year, a decision which prevented Australia joining the Bretton Woods institutions by December 31, 1946, the dead-line for joining on "foundation member" terms. The recommendation to adhere was made subject to Australia being allowed to join as an original member. There is very little, other than prestige, involved, since Australia will not be one of the "big five" and will not, therefore, be entitled even if she joins as an original member to nominate a permanent executive director. Any decision to change the articles and further postpone the dead-line will presumably have to wait till the meeting of Governors in London next September. By then, in view of what may happen in Moscow, it is possible that Russia will be prepared to join, and there is no question that the Soviet Union would also insist—and in this case with more solid reasons—on "original membership" terms. If things were to turn out in this way the Governors would no doubt prove amenable to a further change in the date. Australia's imminent ratification will no doubt be followed by similar action on the part of New Zealand.

The debate on the Bretton Woods issue has been long and passionate in Australia and, as the latest voting indicates, it is still a very live issue. The view which is about to prevail was well expressed by the Governor of the Commonwealth Bank of Australia in the following passage of the last annual report of that institution:

In appraising the issue of joining the Fund or of remaining outside it, the national interests must be studied. No country can for long be expected to make disproportionate sacrifices or to yield up lightly some measure of control of its destiny to fresh international agencies which are as yet untried. Nothing is more certain, however, than that in this atomic world a purely self-regarding nationalism will be the surest road to the destruction of all the things which constitute in the long run the real national interest. The basic fact has to be borne in mind that in economic matters particularly, the countries of the world are mutually dependent. Complete freedom of action is in reality quite illusory. Freedom to resort to currency depreciation, to impose exchange controls, or to discriminate through various trading devices may confer short run advantages, but past experience indicates that other countries quickly follow suit in self-protection. No country can expect to have it both ways. It is my view that by active participation in the International Monetary Fund, where she may be successful in obtaining a voice on the governing body, Australia would be playing her proper part in shaping the future and at the same time safeguarding her own interest by helping to ensure that the problems of young and developing countries receive due consideration by the larger powers.

That very wise counsel is at last being heeded.

Brazil's Sterling

Brazil's decision to suspend purchases and quotations of sterling continues to excite a good deal of surprised, and even

angry, comment. This week the Chancellor of the Exchequer was moved to state in the House of Commons that the decision of the Bank of Brazil to cease buying sterling "is regarded by the British Government as a contravention of existing arrangements" and to add that the Bank of Brazil had been requested to resume such purchases. When asked whether the Brazilian move was not an attempt "to browbeat the British Government over sterling balances," Mr Dalton replied that "if it is such an attempt it will not succeed." Brazil's answer to all this has not yet arrived.

Meanwhile, more light has been shed on the preliminary discussions which have been going on in London for the settlement of the Brazilian sterling balances which are now stated by Brazilian quarters to amount to about £65 million. The discussions have covered the possibility of outright sales to Brazil of the considerable British investments in Brazilian utilities. The offer of the Brazilian Government to pay £6,638,000 from its sterling balances for the purchase of the San Paulo Railway has been accepted by the British Government and discussions are proceeding in Rio on the additional amount due for the auxiliary assets. But the Brazilians would like to spread the net of their purchases much wider. Discussions for the sale of the Leopoldina Railway are proceeding and other utilities under the hammer are Ceará Tramway Light and Power, Para Electric Tramways and Light and Manaus Tramways and Light. The preliminary discussions between officials of the UK Treasury and the Bank of England and of the Brazilian Embassy have revealed great determination by the Brazilians to push a deal through. The shares of Brazilian utilities in London have been booming this week; but these are portents of little cheer for the national interest. They merely herald the sale of another external asset sacrificed in a war waged without counting the cost.

The Railway Chairmen

The main topic of the chairmen's speeches at this year's annual meetings was bound to be nationalisation. Three of the companies set out in detail the reduction in income which will be suffered by stockholders when the compensation clauses are finally approved, and all the chairmen united in condemning the method of compensation and the principles of the Transport Bill alike. Sir Ronald Matthews in a particularly vigorous attack, declared that the Bill proposed to take over the transport undertakings of the country on terms "which would bring a blush of shame to the leathery cheek of a Barbary pirate." The other chairmen raised in gentler language points of equally effective criticism, and all fastened upon the absence from the Bill of any constructive principles by reference to which co-ordination of transport was to be secured.

Another common theme of the speeches is the acute difficulty in keeping abreast of maintenance work. Indeed, the reports for 1946 show how acute the rolling stock and the permanent way position has become. The amount of light repair work on locomotives, coaching vehicles and goods wagons last year testifies to the extent to which the railways have been compelled to "make do and mend" in order to keep services going. The Great Western had over 10 per cent of its locomotive fleet under or awaiting repair at the end of last year and 11 per cent of its coaching vehicles. The LNER figures for locomotives under repair as shown in the accounts are more favourable, but 18 per cent of merchandise vehicles and 27½ per cent of the coaching vehicles were out of service. The four companies together used 3.1 million sleepers and 182,270 tons of rails on maintenance of permanent way—both figures are much below the normal pre-war quantities—and arrears of maintenance work are accumulating faster than they can be made good, in addition to those which already accumulated during the war.

Indeed, the next problem which may confront a harassed nation is the possibility of a breakdown in transport. Speed restrictions will in any event be unavoidable this year. In addition, shortage of coal will compel cuts in passenger services, not merely in the summer services, as announced by Sir Stafford Cripps this week, but also in existing services, from Monday next. These cuts entail a reduction in the present booked mileage (that is, mileage before deduction for recent cuts in services owing to the coal crisis) by 61,000 train miles, compared with a total of approximately two million train miles at present booked for the four companies. This, it is estimated, will reduce the available service during the remainder of the winter timetables by 24 per cent of the pre-war service. The cut in the summer service, from June 1st, will represent 10 per cent of the mileage worked in the summer of

1946, and is equivalent to a reduction of 29 per cent compared with pre-war services. Railway passengers who suffer from these severe restrictions will hope at least that the railways will be able to achieve the budgeted reduction of half a million tons in their summer coal consumption.

War Damage Value Payments

A Treasury Order, under the War Damage Act of 1943, has been issued to give effect to "the certain escalation" recommended by the War Damage Commission for value payments. These are due to be made during the course of the present year, and the report of the Commission was prepared as a matter of urgency for Treasury consideration, so that decisions could be taken and preparations made by the Commission to settle some 200,000 cases. The Commission found, not surprisingly, that value payments by reference to prices at March 31, 1939, were inadequate, but they have declined to follow the precedent suggested by the Town and Country Planning Act of 1944 of giving differential treatment to various categories of property. The special treatment of owner-occupier property in particular under that Act (1939 prices plus 60 per cent) in any case involves a differentiation between various ownerships interested in a property which would not be permissible under the War Damage Act.

But the Commission have drawn a distinction between "original value payments" (that is, cases where the damage has involved total loss) and "converted value payments" (which concern properties which would qualify for cost of works payment but which, in fact, cannot be made good or rebuilt because of compulsory purchase). The original value payments, speaking with rough justice, are due in respect of buildings which before the war were out of date in amenity and often poorly maintained. The Commission, therefore, holds that original value payments should be increased by 45 per cent only, while converted value payments should be increased by 60 per cent (with a subsequent adjustment if payments under the Town and Country Planning Act are changed). These increases will carry interest from the date of damage (less income tax) and the Commission hold that they will do substantial justice to claimants. They are certainly a considerable improvement on the inequity of the original provisions of the War Damage Act, though it could hardly be claimed that they match the post-war increase in building costs.

Stewarts and Lloyds Expansion

In drawing up its long-term development plans the steel industry is showing a degree of activity unsurpassed by any other. The Steel Board now has before it a number of expansion schemes, which in two important areas at least—South Wales and the Midlands—call for a larger expenditure than was contemplated in the Iron and Steel Federation's report on post-war development which was submitted to the Ministry of Supply last year. On present indications, the industry's full modernisation programme will comfortably exceed the original estimate of £168 million.

For example, Stewarts and Lloyds announced last week that their expansion programme, worked out in 1944 and written into the Federation's report, has now been revised and enlarged. The original plan allowed for a 25 per cent expansion in tube capacity, matched by a corresponding increase in steel capacity; this plan has been approved and construction is in progress. But the company has since revised its estimates of export demands for steel tubes, and finds that the new calculations justify nearly doubling pre-war tube capacity and more than doubling steel capacity.

In the Federation's report, expenditure in the East Midland area (Northampton and Lincoln) was put at 39.2 million. In order to provide the additional steel for the proposed expansion in tube-making capacity, the Stewarts and Lloyds revised scheme concentrates at Corby almost the whole of the expenditure on new steel-making capacity which was originally to be installed in the East Midlands area. The company's revised estimates of demand have, in addition, provided an opportunity to instal semi-finished Basic Bessemer steel capacity at Corby. The timing of expansion elsewhere in the Midlands will naturally depend on the Steel Board's decision, which has yet to be announced, on the Corby scheme. Financial details of the programme have also still to be published.

Priority for expansion at Corby would have two advantages.

Economies of production should follow the integration of expansion at one site—and if the company's assertions are borne out by experience, capacity can be expanded more quickly by adding to the Corby plant than elsewhere. Presumably, accommodation for labour would be forthcoming. The clear gain from a national point of view in bringing steel capacity quickly into operation to aid the export drive needs no emphasis.

Rubber Price Trends

The recent undertaking of the Malayan Government to provide assistance for the rubber-growing industry is to be welcomed. Like the financial assistance recently offered to the Malayan tin mining industry for rehabilitation, the amounts to be made available to the rubber industry will be offset against any war damage claims admitted by the Malayan War Damage Commission. The Government is to provide through the banks loans to a total of £7,500,000 at 3 per cent. This will be a welcome gesture of assistance to an industry which has been hard put to it to finance the restarting of production out of its own resources, and in some cases has been forced to raise special finance for this purpose.

Meanwhile the Malayan Government has replaced the former 2½ cent export duty per lb. of rubber by an *ad valorem* duty on rubber and other vegetable products amounting to 5 per cent. Rubber additionally has to pay an extra ¼ of a cent per lb. basic duty, which in fact constitutes a levy for research purposes. These changes entail a net reduction of the former level of duty by about ⅓ of a cent per lb. The *ad valorem* tax is widely preferred to any form of specific export duty, but even so, it is no satisfactory substitute for a tax on profits. Hence the completion of the Malayan income tax plan must be awaited before the Malayan rubber estate companies can shed the more harmful consequences of present taxation arrangements.

The trend of rubber prices in London suggests that 1s. per lb. f.o.b. may prove to be very close to the ceiling price for the commodity in this post-war period, although special sole crepe prices are at present still strongly advancing and have reached 4s. 2d. per lb. The opinion of the United States rubber manufacturing industry is reported to be veering in favour of maintaining a total capacity for general purpose synthetic rubber of 250,000 tons and to be willing to submit to Government control of mixtures. The arguments adduced in favour of this policy are, first, that synthetic rubber can be produced for two-thirds of the present cost of natural rubber, and that consumers' goods made from it have a shorter life. American opinion is also attracted by the supposition that a large capacity for the production of synthetic rubber would check any tendency for natural rubber prices to rise. These arguments contain a curious mixture of defensive policy and special pleading.

The United States Government is now empowered to continue the allocation and controlled use of rubber until March next year, but Government purchase of rubber will cease at the end of this month. Thus the amounts of natural and synthetic rubber used in the United States will remain under Government control for another year. It would be surprising if, during that period, the price of natural rubber does not tend to decline in the direction of the much-publicised all-in cost of general purpose synthetic rubber. And it is doubtful, in the longer run, whether any but the most efficient estates in Malaya and the Netherlands East Indies will be able to compete effectively against native output, given no restraint upon production.

Record Building Society Advances

It is at first sight remarkable that for a year in which the amount of new house-building for sale was restricted to the bare minimum, the building society movement should have achieved record levels of new advance business and total assets. *The Building Societies' Gazette* for March gives figures relating to 119 Societies, which show an increase in new mortgage advances from £83.1 million to £161.6 million. The 1945 figure of advances for the entire movement was £97.2 million: it would seem, therefore, that the total advance figure for 1946 for all societies will be of the order of £190 million—a prospective total which exceeds the previous records established in 1936 by some £50 million. The total assets covered by the representative sample of

(Continued on page 400)

Before fabrics can be dyed they need to be scoured and, even with soft moorland water, this causes formation of lime-soaps which prevent proper penetration by the dye and make the result streaky and blotchy. Research has produced a chemical—Calgon—which removes offending lime-soaps, thus allowing the dye to operate evenly on every single fibre, to the satisfaction of the textile manufacturer and the user.

'Calgon' is a product of Albright & Wilson Ltd.

The truth game

"Glad you like this sherry—it's South African."

It's extremely good. I got some South African wine the other day . . .

I know. A good wine, but not of this quality.

Precisely, but why the difference?

Well, this is a truly representative South African wine. You see, though the Cape has been for centuries one of the world's finest wine countries, it couldn't compete in Britain with European countries until Empire wines got a duty preference twenty years ago. That bucked up the South African industry.

But why haven't we tasted such wines before?

Because really fine wines are achieved by selectivity, experiment and slow maturing. South Africa has done as much in twenty years with some wines

as the Continent has in generations.

Only certain wines, then?

So far. All are good, but not all are fine. The improvement is naturally progressive.

Were South African wines well-known here before the preference twenty years ago? Now you're delving into history. They used to be very popular. But in 1860 Mr. Gladstone removed the Colonial Preference and sent the South African wine industry into the wilderness.

Is that likely to happen again?

I hope not. Imperial Preference has encouraged the South African wine growers to tremendous efforts. The British Government is not likely to lead such an important Empire Industry up the garden again. It wouldn't make sense.

So we can look forward to several kinds of really fine wines from South Africa?

You certainly can, and very soon, too."

IT PAYS TO INVEST IN MILNERS TESTED SECURITY

MILNERS' SAFES had a proud record before the war—100 years of inviolability. But the war compressed centuries of searching trial into a short space of time—and MILNERS emerged triumphant. Time after time MILNERS' SAFES were recovered from the debris of great buildings—intact, and still preserving vital documents and valuables; high explosives, fire, the devastating effects of air-attack—MILNERS' SAFES withstood them all. We, at MILNERS, have always endeavoured to construct our safes to withstand treatment more severe than seems likely or possible. It has been proved beyond doubt, that MILNERS' SAFES thoroughly deserve their world-wide reputation for absolute security.

Whatever the risk, the long experience of MILNERS in combatting it, is available to all those who are responsible for safeguarding valuables. Our Technical experts are always ready to discuss any problem which you may encounter.

A record of **ACHIEVEMENT** in security from 1939 to 1945 Here is positive evidence of the reliability of MILNERS' equipment, presented in a recently published booklet. We shall be pleased to send you a copy on application. Just ask for Booklet B.9.

Milners are specialists in the manufacture of steel office and factory equipment of every description. No modern business can afford to overlook the advantages of this equipment—it is so constructed as to give long service and promote efficiency in every office and factory. Each article that carries the name of Milners has behind it a world-wide reputation for quality and reliability first established by Milners' Safes.

MILNERS — THE SAFEST SAFE INVESTMENT

LONDON AND NORTH EASTERN RAILWAY COMPANY

INJUSTICE OF TRANSPORT BILL SIR RONALD MATTHEWS'S VIEWS

The ordinary general meeting of this company was held, on the 7th instant, in London.

Sir Ronald W. Matthews, the chairman, in the course of his speech, said: After providing for all fixed charges and payment in full of dividends on the Guaranteed stocks, the directors recommend the payment of final dividends of 2 per cent. on the Four per Cent. First Preference stock and 2½ per cent. on the Five per Cent. Redeemable Preference stock (1955). This leaves a balance of £2,407,874, from which the directors recommend the payment of a final dividend of 2½ per cent. on the Four per Cent. Second Preference stock, making with the interim dividend of 1 per cent. already paid, 3½ per cent. for the year.

OPERATING DIFFICULTIES

There is no disguising the fact that 1946 has been a difficult year from the railway point of view. Operating difficulties have been increasing almost daily throughout the year, and I am sorry to say have been used most unfairly, I might say unscrupulously, in certain quarters to bolster up the case for nationalisation. Railwaymen who have been giving of their best to keep the wheels moving and to provide adequate services for trader and traveller will not readily forgive the Chancellor of the Exchequer for his slighting and ungracious references to the main-line companies in and out of the House of Commons.

THE TRANSPORT BILL

Historical Background—My Lords, ladies and gentlemen, I now approach the question which is uppermost in the minds of all of us to-day, the future of transport in general and of the railways in particular. The Government, backed—or perhaps I should rather say pushed—by a large and not too well-informed majority in the House of Commons, has decided that the transport services of this country can best develop under the inspiring direction of Whitehall, and as you are aware, a Bill to achieve this objective is even now being rushed, with a speed generally associated with panic, through Parliament.

I do not think that I exaggerate when I say that no major measure has ever received so lukewarm a reception from those whom it is supposed to benefit. It is in fact a thoroughly bad Bill. It achieves nothing which cannot be achieved by other and less restrictive methods. It clogs the wheels of a developing industry. It places dictatorial powers and almost unlimited patronage in the hands of the Minister of Transport and creates another immense bureaucracy. It destroys every vestige of esprit de corps and competition, and proposes to take over the transport undertakings of the country on terms which would bring a blush of shame to the leathery cheek of a Barbary pirate.

"SQUARE DEAL" MEMORANDUM

In 1938 the financial difficulties of the railways arising from unfettered road haulage competition had become so serious that the railway companies addressed a memorandum to the Minister of Transport, popularly known as the "Square Deal" memorandum, demanding the right to compete on completely level terms through the abolition of the various statutory restrictions applied to railways. As a result of this approach, discussions were opened with representatives of the road haulage industry and also with the national associations representing the most important users of transport, and provisional agreement was reached for a

simplification of the charging system, together with a relaxation of the legal obligations on the railways, coupled with certain safeguards to prevent cut-throat competition, or exploitation of particular industries which were dependent on rail transport.

The Transport Advisory Council, to which the Minister had remitted the railways' memorandum, reported in favour of the introduction of legislation to give effect to it on a modified basis, and it seemed as though the railways were at last in sight of obtaining a real commercial Magna Charta. Unfortunately, the war intervened before any steps could be taken to give effect to this recommendation.

The next and most important development was the constitution on January 1, 1945, of the National Road Transport Federation, one of the constituent bodies of which is the Road Haulage Association. It then became possible for the first time for the railways to open discussions with a truly representative body on the road transport side.

As a result of the discussions, a step of major importance was taken in July, 1946, when a scheme for the co-ordination of all road and rail freight transport services was agreed and submitted to the Minister of Transport.

The main provisions of the agreement were, briefly, that road hauliers would undertake the obligations of a public service to provide reasonable and, where appropriate, regular services, and to accept any traffic within their capacity to carry. A Road-Rail Tribunal would be constituted to settle standard conditions of carriage, the classification of merchandise and correlated road and rail rates schedules. Railway collection and delivery services and other road services would be organised on a co-operative basis to ensure their most economic use, and the railways undertook to arrange the provision of express railway wagons for the sole use of the road hauliers on selected routes.

The transport users would thereby be left entirely free to choose the form of transport most suited to their business, including the absolute right to carry their own goods in their own vehicles. The dangers of a transport monopoly would thus be completely avoided.

CONSTRUCTIVE PROPOSAL REJECTED

The transport industry had a right to expect that constructive proposals of this nature would bring a sympathetic response from the Minister of Transport, but his observations on the proposals were not forthcoming for three months, when he dismissed them in the following words: "I have studied the Memorandum, but the Government have other plans as to the solution of the problem."

This somewhat summary pronouncement was followed in November by the publication of the Transport Bill which, as is already well known, contains no indication of any sort or kind as to the manner in which the Government intend to deal with such fundamental questions as the correlation of road and rail rates, the classification of goods and the future basis of charging. And yet the Government never cease to proclaim that nationalisation is justified in order to obtain co-ordination.

To-day then we are confronted with this vast measure of nationalisation, without any preliminary examination of the facts of the situation as it exists to-day. The request for an impartial inquiry before any irrevocable steps were taken—a request put forward not only by the transport undertakers themselves

but by all the principal industrial organisations of the country—was in fact brushed aside by the Minister for the still unexplained reason that "inquiries could be dangerous." Dangerous to whom or what? I can only suggest to the reputation of Herr Karl Marx who decided eighty years ago that, in the conditions then existing, transport ought to be nationalised.

Be that as it may, I say once more that there is no justification whatsoever for the arbitrary manner in which this measure—described by Mr Barnes as "the largest and most intensive socialisation measure ever presented to a free democratic Parliament," and which, as such, might reasonably be felt to demand careful and exhaustive examination, clause by clause—is being forced through the House of Commons. Every day's discussion, indeed, emphasises the need for an inquiry of the widest character before the future of transport is decided.

COMPENSATION TERMS

Before I turn to consider the demerits of the compensation which the Government have contemptuously tossed to the railway stockholders, I would like to deal with the suggestion made by the Chancellor of the Exchequer, that "the Government was taking over a very poor bag of physical assets and that the railways were a disgrace to the nation." It is Mr Dalton and his colleagues who have forbidden or made it impossible for the railway directors to restore their assets to the same good condition in which they were at the outbreak of war. He entirely ignores the fact that the railway companies have set aside all the money required to bring these assets back to this condition, and have invested it in Government securities. Surely Mr Dalton is well aware that he is proposing to acquire these Government securities along with the physical assets themselves.

If Mr Dalton complains that some railway stations are dingy and uncomfortable, let him wander round those well-equipped and smartly run examples of public administration such as food offices, Labour Exchanges and Inland Revenue offices, and let him feast his eyes on their tasteful modern appointments.

Now with regard to the actual compensation terms proposed by the Government: there are, of course, two main issues—first, the basis for arriving at the total compensation value; second, the method of payment of this compensation value.

The total compensation value of the Railway securities is taken as the Stock Exchange quotations, averaged over six days in November, 1946, or alternatively the mean of the mid-month quotations for the six months February to July, inclusive, 1945.

The Minister of Transport has put forward no reasoned argument to justify this quite arbitrary valuation, although the Chancellor of the Exchequer has attempted to defend it by arguments which I can only describe as disingenuous.

Although it must be some months before railway stockholders know the fate which may await them in this connection, the cheap money policy of the Government fills us with apprehension that it is intended to enforce drastic cuts in the income of stockholders. In the case of the main line companies, the bulk of nearly one million proprietors are either executors, institutions or small investors who have saved to provide an income in their old age, or for their dependants. All these ordinary folk are faced with the possibility of approximately a 50 per cent. cut in their present incomes from railway stocks—a severe loss at any time, but crippling in these days of rising prices.

It is not too late to recover the ground that has been lost. It means hard work from every member of the community and the temporary sacrifice of much that is comfortable and pleasant. But the one sacrifice which will avail us nothing is the pouring of the blood of industry on the dreary altar of Karl Marx.

The report was adopted.

SOUTHERN RAILWAY COMPANY

COL. ERIC GORE-BROWNE'S CRITICISMS OF THE TRANSPORT BILL

The annual general meeting of the Southern Railway Company was held, on the 6th instant, in London, W., Col. Eric Gore-Browne, D.S.O., O.B.E., T.D., A.D.C. (chairman of the company), presiding.

The Chairman, after an exhaustive survey of the past year's working, said:

THE TRANSPORT BILL

I now come to a consideration of the Transport Bill. And before I examine its terms I wish to make some general observations. At the annual general meeting last year I accepted one challenge and issued another. You may remember that we had been told by an eminent spokesman of the Government that "It is up to the nationalisers to prove their case that there will be public advantage by nationalisation." I said:

(i) that your Board accepts the challenge to prove the case for private ownership before any impartial committee or commission which the Government may think well to appoint and charge with the duty to examine the efficiency of the Southern Railway.

and (ii) that your Board challenges the Government to prove that by nationalisation of surface transport a better or cheaper service will be given to the public or that the salaries or wages staff will be better off.

I said also that it is a principle of English justice that a man is held to be innocent until he is proved to be guilty, and I asked whether it was unfair to claim the same privilege for a public utility company with our record.

But the truth is that our existence in our present ownership violates a political doctrine of one of the Parties in the State, and for that reason and that reason only the noose has been placed round our necks and we approach the scaffold without having been given a hearing in our own defence.

PRIVATE ENTERPRISE IN ITS FINEST FORM

I have always thought the Southern Railway represented private enterprise in its finest form. I doubt whether the British Transport Commission will be capable of inspiring in its staff that sense of trusteeship of its good name and that pride of membership which we on the Southern Railway have always cherished as one of our greatest assets.

Now ever since 1939 our officers have been called upon to give unceasing and exacting service and the period since the war has been hardly less exacting than the war years themselves. The re-establishment of peacetime facilities in the present "worse than war" conditions has taxed them to the utmost.

The uncertainties and problems of this ill-conceived measure are adding a burden which only those of us who are closely associated with them can possibly estimate, and it is a burden which they ought not to be called upon to carry at this critical time in our country's history.

And this Bill is followed by the Economic Survey for 1947 which, after stating that during the war the railways carried nearly 450 million ton miles of traffic a week, that they are still carrying nearly 400 million ton miles, compared with 326 million ton miles a week in the summer before the war, to say nothing of a steadily increasing number of passengers, goes on to allocate to railways a fraction of 15 per cent. of the country's capital equipment programme and to reduce transport manpower by three thousand.

THE ROAD-RAIL SCHEME

As you all know, the railway companies, in conjunction with the road operators, have

produced a scheme of co-ordination which, while not claiming to solve all problems, does meet most of the objections to the present system of transport in this country and, at the same time, preserves the healthy competition which, in my view, is vital to efficiency. We claim that this scheme is the best yet put forward and that no better one is likely to emerge unless the whole matter is remitted to a thorough inquiry by the finest brains which this country can produce. It is significant to note that our scheme has received the wholehearted support of the traders who use the transport system. And it may be thought that any Government would at least have studied the scheme, put forward as it was by experts, and would not have dismissed it with the cold and confident rejoinder, "We have other plans." Very well then, what are those plans? We have the Transport Bill, but the Bill as it stands solves no transport problem. In effect it passes these problems to five men to be appointed by the Minister, and they are to be men who have had "wide experience and shown capacity in transport, industrial, commercial or financial matters, in administration or in the organisation of workers." If you look round the boards of the main line railway companies you will, I think, find that all these qualities are already represented.

Is this a plan? And is this the time? This country surely has problems enough and burdens enough to carry in its fight for existence without adding to these problems and to these burdens a complete upheaval of transport which, in my view, must follow for many years to come if this Bill becomes law.

Rehabilitation is an immediate necessity if this country is to survive; nationalisation is an experiment which may or not be worth while considering when the battle for survival is won.

DICTATORIAL POWERS OF THE MINISTER

After mentioning various of the powers the Minister would have under the Bill, the chairman continued: He has numerous powers, but I think I have mentioned enough to show that he has, in effect, dictatorial powers over the whole transport of this country.

Since the Ministry of Transport was formed in 1919 there have been no less than sixteen Ministers of Transport. Continuity of policy is essential to success in any great undertaking, and picture to yourselves the position of a future Minister of Transport armed with these vast powers and subject to all the uncertainties of political life. His position is transient and his power immense—surely an impossible combination.

The argument of its supporters is that if there is to be a monopoly, it should be a public one. Our reply is that there ought not to be a monopoly at all. The road-rail scheme, to which I have already referred, not only leaves the "C" licence holder the right to move his own goods in his own vehicles if he wishes to do so, but also leaves everybody else the right to choose between road and rail which he may not be able to do under the Bill.

"A democratic Government must conduct its economic planning in a manner which preserves the maximum possible freedom of choice to the individual citizen." I quote again from the Economic Survey for 1947. It is difficult to reconcile the Transport Bill with this laudable aspiration.

The chairman concluded by criticising the compensation clauses of the Bill.

The report and accounts were unanimously adopted.

SCOTTISH WIDOWS' FUND AND LIFE ASSURANCE SOCIETY

REVIVAL OF NEW BUSINESS

The one hundred and thirty-third stated annual meeting of the Scottish Widows' Fund and Life Assurance Society was held in the Society's Head Office, Edinburgh, on the 11th instant, Mr F. H. N. Walker, chairman of the ordinary court of directors, presiding.

The chairman, in moving the adoption of the report and accounts, in the course of his speech said: A year ago I said that for the society the end of the war meant that we could turn our thoughts to reconstruction and development, and I am now able to report a marked revival of new business. The society has shared fully in the enhanced volume of business, and new assurances were completed during 1946 amounting to practically £7,000,000, after deducting sums reassured with other offices. This creates a new record for the society considerably in advance of the highest figure recorded before the war, which was about £5,250,000 in the year 1938.

In addition, we have arranged a considerable number of staff pension schemes. There is a widespread movement among employers to make adequate provision for pensions to their employees and the introduction of the National Insurance Act has helped to stimulate the movement. There are many advantages to be gained by arranging schemes with an assurance society, and our expert staff will always be ready to advise those who contemplate some provision of this kind.

INTEREST INCOME

The interest income before deducting income tax is higher by about £100,000. In spite of the further material fall in interest rates which took place during 1946, the average rate of interest on the whole of the assurance and annuity funds was £4 17s. 9d. per cent. This is 1s. 8d. higher than in the previous year and practically the same as the rate in the year 1942, when the funds were some 10 per cent. lower. The rate, after deduction of income tax, has increased by 2s. 1d. to £3 10s. 10d. per cent. In view of the fact that there was an addition of about £2,000,000 to the funds to be invested on current terms, I think you will agree that this is a most satisfactory result.

The assurance and annuity funds for the first time in the society's history stand at over £40,000,000. The balance sheet shows how these large funds are invested, and again the society has followed its traditional practice of stating in the balance sheet that the assets stand at or under market selling prices. The substantial reduction during the year in the rate of interest on Government securities naturally brought about a considerable rise in the market values of stock exchange securities in general. This has increased the margin between the market value of our stock exchange investments and the value at which they stand in the balance sheet to a very large sum. On the other hand, it has added still more to the difficulty of finding a remunerative outlet for the society's growing funds. Our policy during the year is reflected in important changes in the balance sheet. Government securities and securities guaranteed under the Trade Facilities Acts are about £3,750,000 less than the figure at the end of 1945. Preference stocks are higher by almost exactly the amount of the reduction in Government securities, while ordinary stocks are up by about £2,000,000. It can be said, therefore, that the amount realised by the sale of Government securities, together with the in-

crease in the funds over the year, has been invested in preference and ordinary stocks, giving a higher yield. The increased average rate of interest earned on the whole funds is largely the result of this policy.

In conclusion, may I say that, although there are many uncertainties ahead, the society is well placed to meet them. In the opinion of the directors, its financial position is stronger than it has ever been.

The directors' report and the accounts, as audited, were adopted unanimously.

JOHNSON AND PHILLIPS LIMITED

INCREASE OF CAPITAL APPROVED

An extraordinary general meeting of Johnson & Phillips, Limited, was held on the 11th instant, at the registered office of the company, Columbia House, Aldwych, London, W.C., to consider a resolution increasing the capital of the company from £1,000,000 to £1,067,000 by the creation of 67,000 new ordinary shares of £1 each.

Mr G. Leslie Wates, J.P. (chairman and managing director), presided.

The secretary (Mr Alfred B. Adam), having read the notice convening the meeting,

The chairman said: Gentlemen, In recommending to you the resolution which has just been read by the secretary, it will not be necessary for me to speak at length.

The story is very simple and straightforward and is fully set out in the circular letter accompanying the notice of the present meeting. Our nominal capital has been at the figure of £1,000,000 since May 2, 1935. The issue of 200,000 shares, bringing the total issued capital up to £1,000,000 was made in November, 1946, at the price of £3 5s. per share.

CLOSER LINK WITH TELEGRAPH CONSTRUCTION COMPANY

The idea of a close link with the Telegraph Construction & Maintenance Company Limited, is not new and has been within our general policy for many years, but has not hitherto taken a specific form. The desirability of a closer link has arisen from discussions between the technical staffs of the two companies, who found that each would be able to contribute quite a lot in knowledge and skill to the business of the other, and that we should mutually benefit by the exchange of technical and scientific information and knowledge of factory work and experience. Your directors felt some hesitation in approving so intimate an association of mutual assistance in the absence of some financial link between the two companies. Accordingly, after some discussions, and with the advice of Messrs Deloitte, Plender, Griffiths & Company, the basis of exchange of shares was decided upon as set out in the circular letter.

Each company will maintain its present identity, commercial contacts, trade names and general trading arrangements so that the tradition and goodwill which exist in both these old and well-established companies will remain unimpaired. The consent of the capital issues committee has been given to the exchange.

You will have noticed that the value on recent Stock Exchange prices of the shares to be exchanged, and the dividends receivable thereon, based on recent declarations, are substantially the same.

You must not see in this transaction more than appears on the surface—both boards of directors have agreed the scheme on its merits. There is no secret contract or bargain beyond what is stated in the circular. We shall watch with interest the result of the scheme and we have every hope and expectation that it will show itself in the improvement of each company's position and productivity.

The resolution was carried.

LEYLAND MOTORS LIMITED

A YEAR OF GREAT ACTIVITY OVER-FLOWING ORDER BOOK

MR C. B. NIXON ON THE TRANSPORT BILL

The annual general meeting of Leyland Motors, Limited, was held on the 12th instant at Leyland.

Mr. C. B. Nixon, the chairman, said: The year which closed on September 30, 1946, was one of great activity. Nevertheless, as a result of spasmodic and chronic shortages of almost everything, and of irritating frustration, we failed to realise what we planned, and to maintain the level of output reached earlier in the year. Many of the new models could not be marketed until towards the close of the year, and our medium series, of which a large output is planned, and for which our new factory at Farington, now approaching completion, is being built, cannot be released for several months.

Our export deliveries have been disappointing, and our quota has not been reached for a variety of reasons, the chief of which is that what is made as standard to comply with the peculiar regulations in force here is not generally acceptable overseas. Special models have to be designed and built, accentuating all supply difficulties. Shipping space and packing materials are also difficult to secure.

NEW ORDERS CONSTANTLY ARRIVING

Our order book is overflowing, and new orders are constantly arriving. The demand would suffice to keep us fully engaged for a long time if we could be assured of material supplies and political stability. We realise we are in a seller's market, but we have done, and will continue to do, everything in our power to maintain stability of prices which should ensure permanent business.

We now operate a five-day week of 44 hours. Production per £100 of wages is definitely not what it ought to be. Recent national statistics confirm that, generally, production per worker is considerably less than it was pre-war. The recent fuel crisis brought us to a complete standstill for several days and has drastically curtailed, and continues to affect, our supplies and production.

The net profit for the year is £378,159 against £380,588, and the Ordinary dividend is provided at the previous rate of 15 per cent. It is to be paid on the new issue made since the accounts were completed, as well as on the original £900,000.

On account of the development policy pursued by the board, the cash resources were becoming depleted, and the need arose to secure additional permanent capital. Your board took action in this matter at a very appropriate time, and you will be interested to learn that the issue proved a great success, 94 per cent. being taken up under the "Rights" offer. Applications for surplus shares amounted to £503,936, nineteen times the amount found to be available, causing, I am sorry to say, some natural disappointment.

GOVERNMENT'S METHODS

The Government, in its economic survey for 1947, rightly insists on the urgent need for concentration on production and efficiency, but exerts its energies on rushing through Parliament doctrinaire measures which are irrelevant to the vital issues of production, transport, export and efficiency.

Guillotine methods have now been applied to the Town and Country Planning Bill and the Transport Bill to force these measures, without proper consideration, through the House before Easter. The former Bill is doubtless essential to get the re-building of

the country properly under way, and industry has little concern with it except to ensure that development tax is not levied in respect of land acquired for extensions, and your company has a considerable amount of such land, when the development value has already been reflected in the purchase price. Industry feels strongly that whereas a tax on unearned increment may be just, one on earned increment discourages enterprise.

TRANSPORT BILL

The Transport Bill offers industry no advantage. The sponsors refuse to state, much less prove, their case. It is universally condemned by the responsible bodies representative of the users and operators. A Committee stage on the floor of the House was refused, and now discussion in Committee is to be cut short. We submit that the citizen's unrestricted use of the King's highway to transport himself, his goods and chattels, with due regard to public safety, is a primary freedom which has always existed in this country, and the violation of which every Britisher should stubbornly resist. The Bill as drafted will deprive him of this freedom. It cannot be shown that national ownership of transport anywhere in the world has brought about economy or a higher standard of efficiency; available evidence runs all the other way.

The Minister in charge of the Bill has accepted the principle of freedom of choice only within artificial conditions of the Minister's choosing, since he is specifically taking powers which will enable him to load the price of one means of transport to subsidise another and to fix charges compelling one type of user to subsidise another.

POSSIBLE ADVERSE EFFECT

The Bill concerns this company directly by the adverse effect it might have on our own efficient and convenient inter-works transport. As parents of the cruiser tank group during the war we built up a system of inter-works transport which was so necessary and so efficient that we were permitted to operate it outside the National Transport Pool. Conditions are similar to-day, and although we have an indication from the Ministry of Transport that the Commissioners will have power to grant us a licence to exceed the limited range of activity, there is no provision in the Bill which compels them to do so, and the Commissioners, in deciding such cases, are directed not to take action having the effect of sabotaging the national system.

A number of large and efficiently organised industries in this country operate their own transport on similar lines and are amongst the company's best customers. If these firms are, on the grounds of efficiency, granted licences of exemption, it cannot but be that the national system will be deprived of important highly rated traffic. We are also concerned, as the largest manufacturers of omnibuses and heavy transport, to keep open the widest possible market for our products. Any Commission responsible for the railways and for the control of road transport must inevitably be tempted to load up the railways to cover standing charges which cannot be reduced, and which are likely to increase under public ownership, at the expense of road transport.

There are many fundamental technical problems which affect the operation of road and rail transport respectively which have never as yet been examined by a properly constituted qualified Commission. It is on this account, and because at this time of crisis effort should be concentrated solely on industrial activity, that we support those who request the Government to withdraw this highly complicated and unnecessary measure until such time as a Court of Enquiry has been set up and has reported.

The report and accounts were adopted.

TEMPERANCE PERMANENT BUILDING SOCIETY

RECORD YEAR

MR. CYRIL W. BLACK ON SOCIETY'S PROGRESS

The ninety-third annual meeting of the Temperance Permanent Building Society was held on the 6th instant at the Caxton Hall, London.

Mr Cyril W. Black, J.P., F.S.I., F.A.I., chairman of the society, in the course of his speech said: The year which has recently closed and is now under review has witnessed further outstanding progress in the history of the society and the achievement of a number of new records.

LARGE INCREASE IN ASSETS

The total assets amount to a new record figure of £17,557,308, a figure exceeding any previously achieved by a margin of no less than £5,676,240. The great increases year by year in the amounts due to shareholders and depositors are an eloquent testimony to the continued and increasing confidence of the public in our shares and deposits at a medium of safe and profitable investment.

APPLICATIONS FOR MORTGAGES

The mortgage advances completed during the year amounted in the aggregate to £6,156,070, exceeding the previous record figure by a margin of no less than £1,217,005. Reference to the mortgage asset in the balance sheet reveals that approaching 90 per cent. of the total amount advanced on mortgage is in amounts of not exceeding £3,000 each, and it cannot be too strongly emphasised that the great bulk of our money is invested in mortgages on houses of moderate size and moderate value for which there is always likely to be a consistent and steady demand. I desire to emphasise that notwithstanding the large volume of mortgage business transacted, your directors have not relaxed in the slightest degree those rigid standards of prudence which it has always been their custom to observe. During the year applications were received for mortgages of an amount of upwards of £10 million, and such was the careful scrutiny to which these applications were subjected that the total amount actually advanced represents less than 62 per cent. of the total amount applied for.

Turning now to the profit and loss account, I would remark that after providing for all liabilities and for interest due to investors, the balance of profit for the year was £114,364, to which has to be added the balance brought forward from the previous year and a transfer from war damage indemnities reserve. Your directors are gratified at having been able during the year to make additions to general reserve fund of £100,000 and to contingency fund £10,175, as we have ever attached the greatest importance to the progressive strengthening of our reserves.

As our cash and investments total nearly three and a-half million pounds, we may fairly claim a satisfactory degree of liquidity.

TRIBUTE TO MANAGEMENT AND STAFF

I cannot conclude this review of the past year's work without paying a suitable tribute to our managing director, Mr. Ronald Bell, and to every member of the society's staff. They have had many difficulties with which to contend, not the least of which are the almost intolerable restrictions to which every type of business activity is subjected to-day, and they have acquitted themselves most excellently.

THE OUTLOOK FOR BUILDING SOCIETIES

The uncertainties to which I referred last year as making it more than usually difficult to forecast the shape of things to come are still with us in an aggravated form, and the

future continues to be dominated by political rather than economic factors. I repeat my conviction that the man who desires to purchase his home is equally entitled to be catered for in the scheme of things as the man who prefers to be a tenant. Nothing has contributed more to the political stability of this country than the facilities for house purchase which have enabled millions of our citizens to become the owners of their own homes. The present tendency to discourage the thrifty is, I believe, a passing phase and not a permanent trend, but it can and is likely to do much harm before the process is reversed. Attacks and discouragements levelled at the building societies are undeserved and contrary to the principles of wise statesmanship. We believe that the building society movement has yet a wider contribution to make to national well-being, and so we carry on, confident in our destiny.

The report and statement of accounts were adopted.

THE SCOTTISH LIFE ASSURANCE COMPANY, LIMITED

RECORD NEW BUSINESS

The annual meeting of the Scottish Life Assurance Company, Ltd., was held, in Edinburgh, on the 12th instant. Sir Iain Colquhoun, Bart., of Luss, K.T., D.S.O., chairman of the board of directors, presided.

In moving the adoption of the annual report and accounts, he said: Since our meeting last year the company has lost through death the late chairman of the board, Sir John Lorne MacLeod, and also a former general manager and director, Mr. Lewis P. Orr. Sir John was the finest type of Highlander, a faithful son of his clan, an outstanding figure in the national life of our country, and a capable and well-loved leader of our board over a long period of years. Mr. Orr's death severs the last direct link with the foundation of the company in 1881. He joined the service at that time, and during his association with the company he saw its funds rise from the original £50,000 to over £10,000,000—remarkable progress for which Mr. Orr himself was in great degree responsible.

A TRULY REMARKABLE INCREASE

The net new sums assured during the year show a truly remarkable increase, and at over £3,000,000 constitute a record for the company. That nearly four times as much new business was written last year as in 1945 reflects the return from the Forces of so many members of our energetic and capable Field Staff. Practically all have now come back to us, and it is with keen pleasure that I note how quickly and well they have adapted themselves to civilian life.

1946 has been a really good year, and one of the most satisfactory features is an increase of 11 per cent. in the net renewal premium income from £609,000 to £676,000. This is easily a record for the company. Naturally, as a result of the return of our men from the Forces, and of the very large increase in the new business, the items "Expenses of Management" and "Commissions" show a substantial increase. When these are properly allocated between new business and old business, however, the separate expense ratios for 1946 show no appreciable increase, as compared with pre-war years. One effect of this rise in expenses and commission is to reduce the rate of income-tax borne by the Life Fund, which is taxed on interest less expenses. This is largely responsible for an increase in the net rate of interest from £3 5s. 5 per cent. to £3 10s. 2 per cent.

MARKET VALUE OF ASSETS

Last year, my predecessor mentioned that the market values of our assets were in the aggregate greatly in excess of the figure at which they stood in the books. By the end of 1946, this margin of appreciation had—

naturally, in view of market conditions—shown a further very large increase. This is by no means an unmixed blessing from our point of view, because these same conditions have brought about a considerable reduction in the rate of interest which can be earned on new investments.

This state of affairs is to some extent masked in the 1946 accounts, partly by increased dividend distributions on certain of our existing holdings, and partly by the lower effective rate of income-tax; but it gives cause for some concern, and in common with many other life offices we are increasing our premium rates for new assurances in the very near future.

1947'S GOOD START

For the company, 1947 has begun very well; the flow of new proposals has increased still further. The need for life assurance is being more and more realised by the general public, and certainly our Field Staff lose no opportunity of emphasising alike its necessity and its benefits. There is no more foolish saying than that which we sometimes hear: "Oh! Life Assurance is a gamble!" On the contrary, the man who fails to provide adequate life cover is gambling with the lives and careers of those who are dependent on him. Death comes to us all, and strikes when least expected, as the records of many of our claims have shown.

The times through which this country, and the world in general, are passing are not happy. In difficulty and prosperity alike life offices have a great task to carry out and a great trust to fulfil. The task, to convince the public of the need for protection of dependants; the trust, to ensure that such protection is a real thing. In both respects I can say that our company is playing its full part.

The motion having been seconded by Sir Thomas Clark, Bart., the report and accounts were adopted.

CONSOLIDATED MINES SELECTION COMPANY, LIMITED

DIVIDEND OF 21½ PER CENT.

The fifty-first ordinary general meeting of this company will be held in London on the 18th instant.

The following is an extract from the circulated statement of the chairman, Mr S. S. Taylor, C.M.G., D.S.O.:—

With reference to the company's assets, the balance sheet shows that those having a London Stock Exchange quotation were valued in the books of the company at £859,232, whilst the market value as at December 31, 1946, was £2,332,018. In order to ensure that no quoted holding appeared in the books of the company at a value higher than the market valuation at December 31, 1946, it was necessary in a few cases to provide small amounts from current profits for the purpose of writing-down. The unquoted investments stood in the books of the company at £36,829.

Revenue from dividends and interest was approximately £9,000 higher than in the preceding year. This was partly due to the increased dividend paid by Rhodesian Anglo-American, Limited. The revenue from other sources was also approximately £12,000 higher.

The net profit for the year was £122,844, to which has to be added the balance brought forward from 1945 of £37,923, giving an amount of £160,767. The directors recommend a dividend of 21½ per cent., equivalent to 2s. 1½d. per 10s. unit of stock, less income tax at 9s. in the £, leaving 1s. 2.025d. net. After paying the proposed dividend for the year 1946 and providing for the directors' additional remuneration, there will remain the sum of £34,799 to be brought into the accounts for the current year.

CHARTERED BANK OF INDIA, AUSTRALIA AND CHINA

RECORD FIGURES

MR V. A. GRANTHAM'S REVIEW

The ninety-third ordinary general meeting of this bank will be held at 38 Bishopsgate, London, E.C., on the 26th instant.

The following is an extract from the statement by the chairman, Mr V. A. Grantham, circulated with the report and accounts:—

Further progress has been made during the past year in reopening agencies in countries which were occupied by the Japanese. There now only remain to be opened our agencies in Kobe, Yokohama, Sourabaya, Tongkah and Canton. That means that we have now very nearly a complete picture of the bank's position. The balance-sheet shows a general expansion, the total reaching the record figure of £118,174,870 6s., an increase of £28,128,960 12s. 3d. over that of last year.

On the liabilities side, the major increase is in current and other accounts, the figure being £22,849,522 higher. This increase has been achieved in spite of the fact that we have had to revalue our position in four different currencies owing to falls in the values of the guilder, the tical, the Indo-China piastre and the Chinese dollar. Acceptances on account of customers also show a welcome increase of £2,167,752, reflecting the greater use by our clients of this method of financing overseas trade. The increase in notes in circulation arises out of an expansion of our business in Hongkong.

On the assets side, our cash and Government securities are up £5,743,431 and £7,026,856 respectively, while advances are up £11,040,066. The first two items show that our liquid position has been well maintained, and the third item is eloquent testimony to the extent to which we are assisting our customers and taking our full share in the financing of world trade with the East. An increase is also shown in the item for bills of exchange.

The fall in the item for bank premises is partly due to the allocation made out of profits last year and partly to a revaluation of several of our properties in foreign currencies.

PROFIT AND LOSS ACCOUNT

After making provision for bad and doubtful debts and taxation and a transfer to contingency account, the profit for the year amounts to £378,632 12s. 4d. If we had made up our accounts as we have always done until now, and shown all dividends paid or payable on a gross basis, this profit figure would have appeared as £425,882 12s. 4d.; that is to say, an increase over last year's figure of £99,618 19s. 6d. We have still many outstanding items to clear up as the result of the Japanese occupation of our branches, and to a large extent this is due to the moratorium that still operates in various countries, but we have made substantial progress, and I would repeat my opinion that we are fully provided against all war losses. Our working costs everywhere have risen owing to the necessity to grant substantial increases in salaries, wages and cost of living allowances, but I am glad to say that the increase in our business has more than offset these increased costs.

DIVIDEND RESTORED TO 10 PER CENT

We paid an interim dividend in October last of 3½ per cent., less tax, absorbing £57,750 net, and we now propose to pay a final dividend of 6½ per cent., less tax, absorbing £107,250 net. The stockholders have been very tolerant with regard to the lower dividends which we felt it prudent to pay during the years of difficulty, and now that practically all our branches are working again there appears to be no reason why we should not return to a 10 per cent. level of

dividend without further delay. I mentioned last year the need for an increased annual allocation to both pension and widows' and orphans' funds, and your directors feel that this year a further special allocation should be made to those funds. They therefore recommend that £100,000 be added to the pension fund and £10,000 to the widows' and orphans' fund. They also recommend that £100,000 be allocated to premises account.

IMPORTANCE OF EXPORTS

In Great Britain, the year under review has been a year of increasing trade, and a great deal has been done, although much more remains still to be done, toward supplying the markets of the world with British goods.

Much attention has been directed to the loss of earning assets abroad, sacrificed during the war years to enable Great Britain to continue her struggle to the full, and this loss can only be made good by increasing the output of industry and devoting additional capacity to exports, facts already receiving the fullest publicity and widely recognised. But physical exports require large supplies of raw materials, and Britain, with few of these available within the country, must increase physical imports in order to increase physical exports, which are no longer augmented by considerable exports of high-quality coal, which in the past assisted so greatly in balancing Britain's external economy.

It is doubtful, however, in spite of the spread of knowledge regarding the economic aspects of this country's position, whether it is yet fully recognised what a great contribution to the British trade balance depends upon the efforts abroad of British shipping, insurance and banking, all leaders throughout the world in their own respective fields, consuming no raw materials and asking for no favours. If to their efforts be added the efforts of our merchants with world-wide connections, who brought to the free markets of Britain in London and Liverpool the products of the whole world, and while earning the reward of their labours in bringing the world's buyers and sellers together, placed the widest choice at the disposal of our own manufacturers and consumers at integrated prices, the importance to this country of re-establishing freer world trading will doubtless be appreciated, for on this depends, in some measure at least, the continued development of these world-wide services by which this country has been so well served in the past and to which this bank has made a well-defined and worthy contribution.

CONFIDENCE IN THE FUTURE

Although our business has so greatly expanded, there are, in the various countries in which the bank operates, currents of unrest and problems of real difficulty still to be faced, whether it be in the political or the economic sphere. These problems, although in some cases of long standing, have been brought to a head by the war. None of these difficulties are insuperable, but they do require the greatest degree of co-operation amongst the nations involved and a long continuation of mutual confidence. We, for our part, have to readjust our thoughts and methods to keep abreast of the times, and I am confident that our staff is proving equal to the occasion. We are still surrounded by restrictions of every sort and kind, but we have very considerably strengthened the structure of the bank, and I feel not only that we can be happy in the result of our past efforts, but that we can regard the future with quiet confidence.

INTERNATIONAL COMBUSTION, LIMITED

EXPANDING OUTPUT

The thirteenth ordinary general meeting of International Combustion, Limited, was held, on the 11th instant, in London, Mr G. R. T. Taylor, the chairman, presiding.

The following is an extract from his statement circulated with the report:—

Your directors consider the results for the year ended September 30, 1946, justify the recommendation of a final dividend of 22½ per cent. and a cash bonus of 5 per cent.

With the exception of the slight set-back last year due to reconversion problems, our output continues to expand. I am pleased to report a further considerable expansion of our work in hand, which has reached a new peak.

The following is an extract from the statement by the managing director, Sir George Usher, which was also circulated:—

The tremendous amount of research and development work which your company has done in developing the most efficient methods of utilising fuel is reaping its just reward and the opportunities that lie before us are immense. We have a vast number of orders on hand and the unfulfilled order book is more than ten times as great as when I last addressed you. Many of these orders are for export.

Aberdare Cables, Limited, in which we have an interest, has formed a subsidiary, South Wales Switchgear, Limited; both these companies are growing at a highly gratifying rate, and proving a real contribution to the vexed problem of absorbing the surplus labour in South Wales. In conjunction with Powell Duffryn, Limited, we have taken an interest in the Rhymney Engineering Co., Limited.

The report was adopted and resolutions to split the ordinary shares and convert them into stock were passed.

POWER SECURITIES CORPORATION, LIMITED

PROBLEMS FACING THE COUNTRY

The twenty-fourth annual general meeting of this company was held, on the 12th instant, in London.

Mr William Shearer, chairman and managing director, said that in spite of the disturbed conditions of the year under review, the business of the corporation had continued steadily and the accounts showed satisfactory results. The gross profit amounted to £128,312, an increase of £13,309.

Parliament had under consideration a Bill for the nationalisation of the electricity supply industry. That was of special importance to the corporation and its associated company, Balfour Beatty and Company, Limited, as both had been for many years actively engaged in initiating and furthering the supply of electricity in various parts of the United Kingdom. In several large areas they had been pioneers and but for the vision and enterprise displayed numerous districts would not have been enjoying the same extent a cheap and abundant supply of electricity. They were fulfilling the object for which they had been formed with energy and efficiency at home and abroad. In this country the success of the large supply companies with which they had been connected was a tribute to the sound lines on which the developments had been directed without asking for or receiving any State subsidies and indeed in spite of hampering legislation.

A large amount of work had been carried out during the year at home and abroad. Taking the electrical and civil engineering departments together, the works contracted for aggregated in value some £18,000,000.

The report was adopted and the proposed dividend of 6 per cent., less tax, was approved.

GOVERNMENT RETURNS

For the week ended Mar. 8, 1947, total ordinary revenue was £70,068,000 against ordinary expenditure of £101,435,000, and issues to sinking funds £570,000. Thus, including sinking fund allocations of £6,586,954, the deficit accrued since April 1st is £397,445,742 against £2,004,745,000 for the corresponding period a year ago.

THE MONEY MARKET.—Supplies of short loan funds in the money market have been more exiguous this week than last despite the gradual tailing off of revenue payments and the reduced amount of Treasury bills which the market took up. The reduction in the volume of bank cash is evident from the Bank return which shows a fall of £29,591,000 to £289,359,000 in bankers' deposits. Net repayment of floating debt this week amounted to £9,000,000, the whole of which was in respect of TDR's. Treasury bill payments and maturities balanced at £170

million. Official tenders for bills increased at last week's tender and total applications rose from £246,280,000 at the preceding tender, to £287,040,000. As a result the market's allotment was cut from 63 to 43 per cent. of its applications. The banks' TDR payments kept the volume of available money somewhat below the requirements of the market and recourse has had to be made to the special buyer who has bought March bills on a moderate scale throughout the week.

* To earliest redemption, except £ flat yield and £ assumed average life 17 years 6 months. † Net yields after allowing for tax at 9s. in £.

Bank is chiefly of significance as underlining the trend towards making directors part-time appointments.

A further \$200 million was drawn this week on the US line of credit to Great Britain. This drawing brings up the total so far drawn to \$1,100 million. At this rate of \$1,100 million in eight months, the \$3,750 million line of credit would last for just over 27 months and would be exhausted by November 1948.

The Powell Duffryn group have created a subsidiary, to be known as Powell Duffryn Technical Services, to act as independent consultants throughout the world on problems of fuel production, distribution and utilisation. The Group will, of course, retain its existing marketing organisations, including Stephenson Clarke, Cory Brothers and other subsidiaries. The new subsidiary is intended to supplement the general work carried out by the Fuel Efficiency Division of the Ministry of Fuel and Power by providing specialised consultant services to industry at home and abroad on fuel economy, coal mining and technical research. The parent company has now lost its coal mines and is developing its work on coal derivatives. It may also be prepared to back the technical work of the new subsidiary in overseas countries with financial investment for opening up new coal deposits.

The estimate of the Australian wool clip for 1946-47 has been revised by the National Council of Wool Selling Brokers of Australia. It is now expected to total 3,107,878 bales, compared with the initial estimate of 3,000,000 bales. Supplies from New South Wales and Queensland where clips are predominantly merino are expected to be about 5 per cent less than was first anticipated. Increases are recorded for Victoria (mainly crossbred wool) and South Australia (where the broader types of merino are produced). Last year's clip totalled 2,895,391 bales, of which 77 per cent was merino.

Shorter Notes

Another change of personnel at the International Bank for Reconstruction and Development is the appointment of Mr Graham Towers as Canadian executive director, in the place of Mr R. B. Bryce. Mr Graham Towers remains Governor of the Bank of Canada and his appointment to the board of the International

The Tough Line

TEN days have passed since President Truman, standing before both Houses of Congress, launched his 400 million dollar policy in the direction of Moscow. General Marshall, who presumably knew it was coming, was equalled in composure by his fellow Foreign Ministers, who did not. They must be congratulated—especially Mr Molotov—on resisting the temptation to disperse and take cover, or at least to show themselves nervous and irritable in their set debates on Germany. In the conference room they have held with admirable tenacity to the problem they came to discuss; how much they will talk together off the record remains to be seen. But their first reaction was the right one; Mr Truman's rather melodramatic gesture was neither so significant nor so dangerous as it sounded. It takes a Senator Taft to ask for an official opinion whether there is risk of immediate war as a result. There quite obviously is not.

There are, however, circumstances in which another such speech, followed by the arrival of an American task force in the Eastern Mediterranean, might be as inflammable as was Emperor William's use of his cruisers. It contained bold and far-reaching words, the full significance of which can hardly be estimated until the Greeks and Turks have spent the dollars and received some of the advisers, supplies and equipment for which Congress has been asked. About Greece, Mr Truman said that the situation is one "requiring immediate action"; about Turkey, that its integrity "is essential to the preservation of order in the Middle East." He was fully aware, he said, of the "broad implications involved" if the United States helped these countries. It should be done "primarily through economic and financial aid," which he would not recommend "except that the alternative is much more serious." (Both the President and the Secretary of State had already explained privately to leading Congressmen their view of the alternative.) Then, in broad terms, recalling the forgotten Atlantic Charter: "Totalitarian regimes imposed on free peoples, by direct or indirect aggression, undermine the foundations of international peace and hence the security of the United States." Those who point out that all this had already been many times said by President Roosevelt forget that he was speaking either to a nation at war or to governments that seemed bent on war. President Truman spoke to a world in which the only great Powers are allies; it was the timing and the manner of his declaration that were disturbing, not its content.

Those who fear the Americans as enemies will find nothing worse in the speech than the phrases quoted; those who fear the Americans as friends will find them challenging enough. The former will comfort themselves, the latter perplex themselves with this thought: that if the President of the United States has to use such solemn tones and such bold claims to persuade Congress to lend money and send advisers to the Greeks and Turks, then the American people have not begun to understand the international responsibilities claimed for them. If they have to be roused to half-measures of foreign policy by speeches claiming world leadership, how many speeches will have to be made, how many

dangerous challenges thrown out, to maintain their support for an army of occupation in Germany, to say nothing of a Four Power Pact stretching into the next century?

The speech before Congress can hardly be separated from the speech delivered in Texas five days earlier; it raises the same questions about the relation between American claims and American performance. In Texas Mr Truman urged his countrymen to realise that their political relations with other countries could not be separated from their economic relationships, that their economic policy must be above party, that they could lead the world to economic peace by accepting the rules of the international trade organisation proposed by their State Department and by preparing to receive larger imports from abroad. The first paragraphs of the speech were grandiose: "We are the giant of the economic world. Whether we like it or not, the future pattern of economic relations depends on us." "We can lead the nations into economic peace or we can plunge them into economic war." Only towards the end came the sober assurances that "tariffs will not be cut across the board," that "freer trade not free trade" would be the slogan, larger markets the objective. Mr Truman did not mention the escape clause which each American tariff agreement must contain, or the new procedure and public discussion on tariff agreements which the Republicans forced on him as the price of a bi-partisan trade policy. He could no more be expected to draw attention to these strings on his economic policy than he could be expected to draw attention in his speech before Congress to the fact that conscription for military service ends ten days hence.

But the British bystander, as he watches the economic giant feeling his biceps, has to persist in his questions. How far is the State Department ahead of the American people as it plans and defines their political, strategic and commercial commitments? Are they dropping behind, or are they being taken along at a pace which will leave them weary five years hence? Do they understand what they are talking about when they interpret their President to mean that Britain has stepped out of the line in the Middle East and that the United States has stepped in? Have they compared the scale and impudence and effectiveness of their offer to Greece and Turkey with the Soviet handling of Persia? To suggest the comparison may seem offensive, but it will certainly be made by those governments of Eastern Europe and the Middle East who have to weigh the risks of accepting American aid. These governments must realise that, in the short run, it is still the British who face the Russians on the line from Athens to Teheran; if they do not, the attempts being made in Congress to prevent the despatch of American troops should convince them. They may even recall that Britain has spent on Greece nearly £90,000,000 with little fuss, and that it is most explicitly bound by treaty to defend the integrity of Turkey, Greece, Egypt, Iraq and Transjordan.

To appreciate the dilemma in which, say, the Turkish and Hungarian governments might one day be placed by this policy of limited liabilities, an Englishman may consider how he is affected by the Texas speech. Britain too, having received its dollars, is asked to accept American leadership in a liberal ideology, economic not political. Britain too has been told that its independence and prosperity are a vital American interest, as was nobly proved by American fighting men. Now the first reckoning is approaching. If at Geneva next month the Americans offer tariff concessions and pledges of economic co-operation, is Britain to surrender imperial privileges for the hope of freer trade and bigger markets? The offer is tempting. But the British are asked to commit themselves, perhaps beyond recall, in return for an unratified promise. Will the American voter support more liberal trade policies now and maintain them later? The same doubts arise on both of President Truman's speeches for the same reasons. In the political sphere the foreigner doubts whether the development

of long-range weapons has convinced Americans of their interest in European peace; in the economic sphere he doubts whether, for all the talk, the average American really believes that his prosperity is bound up with that of other peoples.

It can, of course, be argued that President Truman's speech was something more than an attempt to shock Congressmen out of their campaign to cut down military and relief expenditure. It may have been aimed over their heads at Mr Stalin. It may have been part of a plan prepared by General Marshall, the strategist turned diplomat. If so, it may be the American intention to seek agreement with the Russians on a definition of vital interests, to clear up the half-understandings and ambiguous drafts of Yalta and Teheran. The speech then appears in a new light and this becomes the key sentence:

The world is not static and the *status quo* is not sacred, but we cannot allow changes in the *status quo* in violation of the United Nations Charter by such methods as coercion, or by such subterfuges as political infiltration.

This is language which the Russians will understand; it does not bring in that contentious word "democracy." It covers the world and not a particular part of it; it deals with power politics and not with political conceptions. It draws a line which the Russians are told they can cross only at grave risk. Read with the offer of aid to Greece and Turkey, it seems to challenge any attempt to divide British and Americans. It points to the need for a general understanding—without which, indeed, it will be impossible either to plan American strategic and commercial policy or to educate the American people in the sacrifices which a resolute and effective world policy will demand.

If the speech means these things, the British reaction can be not nervous but confident. In this country, too, the planning of strategic and economic policies is impossible so long as it remains uncertain whether the Russians want a general long-term settlement, outside as well as within Germany. An Anglo-Soviet agreement alone, without an American-Soviet agreement, would have little value; for British interests are involved at every point where Russian and American interests clash. But if there is to be nothing more than an American imitation of Soviet diplomatic tactics, an exchange of defiant gestures and ringing denunciations, we shall have to cross our fingers and build our shelters. A "tough line" clearly aiming at agreement with the Russians, and prepared, when the time comes, to meet them halfway, is something we can support; a "tough line" seeking to humiliate the Russians and destroy their society, in a fight in which we take the first blows, is, for any British government, a policy of despair.

The next American move will be watched for anxiously, not only in the Middle East, but also in Eastern Europe. Before this year is out the peace treaties with the satellite countries should come into force; and intervention in their internal affairs will become interference with the *status quo* to which Mr Truman referred. Dollar diplomacy will invite a headlong collision with Communist policy unless General Marshall and Mr Molotov can get on to terms of confidence. A permanent split across Europe between east and west could hardly be averted.

It is a clear British interest to support the eastward advance of American policy provided that two things are clearly understood: that loans of dollars and advisers, even visits of aircraft-carriers, do not automatically relieve Britain of alliances, loans and responsibilities already pledged; and that American diplomacy must have for its ultimate aim a firm understanding with the Soviet Government about vital interests within and outside Europe. For better or for worse, we cannot deviate far from America's course. But it will be for better precisely in the degree in which America's policy is defined and resolute, and in which its aim and effect are the reconciliation of the powers and not the challenging of conflicts among them.

NCOs of Industry

THE manifesto on the economic situation issued last week by the National Acting Committee of the Shop Stewards' National Council casts, as might have been expected, more light on shop stewards than on the crisis. In terms curiously paralleled in the Prime Minister's broadcast on Tuesday night, it asks that every British worker should be able to assure himself that his product is a genuine necessity, and not "some knick-knack being produced because of its profitability." But what is a necessity, at least when the limited range of basic needs for food, shelter, warmth, and industrial raw materials is left behind? Not everyone can be a miner, farmer, or cotton operative; and, once other trades come into the picture, how and where is the line to be drawn? Are greyhound tracks a necessity while Stilton is not? Are Coty and nylons superfluous knick-knacks or essential inducements to the marginal woman? Is it correct to say that beer is essential (except in British Restaurants), gin is immoral, and whisky is tolerable only across the Border? No doubt there is a great deal of honest Puritanism behind the shop stewards' attitude, as well as of class-conscious malice. But the main cause is quite clearly a misunderstanding of the difference between planning in current conditions and the type of restrictive control familiar during the war—a misconception in which, to judge by Mr Atlee's broadcast, the shop stewards are in high company.

The vital factor is, of course, the change in the destination of production, to which the shop stewards fail to pay even the lip service offered by the Prime Minister. The great consumer during the war, and above all the great consumer of new products, was the Government itself. The multitude of private consumers had to take what they could get; and what they got was based, by and large, not on their current preferences, but partly on an estimate of genuinely basic needs and partly on what they used to prefer before the war. The new demands to which the structure of industry had to be adapted made themselves felt through a few official channels; and the Government planner, through whose hands the great bulk of the orders that mattered was in any case bound to pass, was able to make his overall plan effective without much more regimentation than was in any case inevitable.

To-day, by contrast, the consumer is coming back into the centre of the picture, and with him there returns a great confusion of tongues over what should and should not be produced. There are, it is true, certain basic needs which can be roughly assessed—the need for a minimum supply of bread, or fats, or coal, or of furniture for newly-married couples. But, beyond this, it is necessary to reckon with an enormous and increasing variety of consumer preferences which, unlike the preferences of the Service departments, have no need to express themselves through Government channels. With the help of a free price system the consumer, the retailer, the wholesaler, and the manufacturer can in general settle their affairs for themselves. The official controller, dethroned from his strategic position in the flow of war orders, is bound to appear in the vast majority of cases as a bureaucratic and ill-informed outsider struggling in the rear of manufacturers' initiative and consumers' preferences, and successful only in sabotaging both.

The Government has certainly a duty to weight the voting-power in the free market by redistributive taxation, and to adjust the level of global demand—that is, at the moment, to disinflate it—to a level which allows the price system to work smoothly over at least the greater part of the field. It has also, in circumstances like the present, a duty to intervene directly to deal with bottlenecks in management, labour, and materials which the free working of the price system is unlikely to overcome, or at least to overcome without either severe

dislocation or political discontent. The shop stewards have every right to complain, as they do, that the Government has failed in this respect where the engineering industry is concerned. But to interpret this as a mandate for a general policy of eliminating "knick-knacks produced because of their profitability"—in other words, of eliminating consumer's choice—is to show a complete misconception of both the purpose and the practical possibilities of current planning. England even in 1947 is not Russia in 1921. Time was when an average working-class family was reckoned, as in the old cost-of-living index, to spend £8 ros. a year on anything beyond the bare essentials of life. By 1937-38 the figure for miscellaneous spending alone, at the same price level, was approaching £70 (say £100-£120 at present prices), to say nothing of "inessential" spending under other headings. The shop stewards are living in a past age.

Jeune and misconceived the shop stewards' manifesto certainly is; and yet it would quite clearly be wrong to dismiss it as valueless in the present crisis. It is a reminder of the great fund of good will and eagerness to help which still remains to be drawn upon in the lower ranks of industry. Its real and substantial point is that better use needs to be made of the NCOs of industry; and there is enough meat in it, for all its faults, to show that they have something of value to offer. It is also a warning of the need, if this fund is to be drawn upon, for a much more effective and detailed educational campaign than has yet been attempted. Ignorance is as big an obstacle to efficiency as any other.

To a great extent, no doubt, the responsibility for action on this lies with managements or the trade union movement. But, against the background of ignorance and prejudice, the unaided efforts of managements and trade unions are likely to take far too long to produce results. If the shop stewards' manifesto proves anything, it is that the patient cannot be trusted to write his own prescription in reasonable time. The problems of industrial relations need to be focused and their solution speeded up; and for that the responsibility can rest only on the Government. Three main conclusions emerge.

First, the time is long overdue for a real declaration of industrial relations policy. The White Paper on Employment Policy published in 1944 was far from ideal; but it did emphatically mark the acceptance of full employment as a matter of national concern, and at the same time served to focus discussion and bring it down from semi-political principle to more earthy and substantial questions of ways and means. The need to-day is for a similar analysis of the problems of industrial relations, squarely tackling the problems of wages and profits policy, of incentives and of workers' representation. The Government has insisted in its first eighteen months of office, as is its right, on redeeming its election promises to the letter, and in so doing has built up a claim to the confidence of the industrial workers such as no Government before it has possessed. Is it not time for it to cease to present such miserable spectacles as that of Mr. Barnes piously washing his hands of responsibility for the labour policy of the future Transport Commission, and to exploit this well-earned asset to the full?

Secondly, the declaration should be followed up with much more vigorous steps to improve the machinery of labour relations within industry than have yet been seen. Sir Stafford Cripps rightly emphasised, in the economic debate in the House of Commons, the need to leave a wide measure of autonomy to employers, workers, and their joint organisations.

But it is no easier in industrial relations than in India to abandon authority in a vacuum; the machinery must first be there. What steps are being taken to reinvigorate the joint production machinery, and to accelerate its spread to industries where it has not yet taken root? What is the answer to the pointed questions raised by the shop stewards on this issue, and what use is being made of their valuable and practical suggestions? And when will something actually happen at the next higher level of organisation? It is just short of a year since the Pottery and Cotton Working Parties signed their reports. How much longer will it be necessary to wait for concrete results? Recent discussion has fastened on the need to improve the quality of the Government's central planning machinery and to cut out superfluous intervention lower down. But the accent should be on "superfluous." Unsupported Ministerial sermons, however admirable, will be even less effective to-day in bringing workers to the right place and in the right frame of mind than they were during the war. What is needed is more effective machinery to bring home to each individual in each industry, at the highest level as well as on the floor of the factory, what the national interest requires of him or her in person.

Thirdly, the shop stewards' manifesto brings out clearly the interaction between industrial and general political and economic policy. There is still blind loyalty to the Government in certain quarters, and in many others the almost pedantic adherence to "Let us face the future" has paid good dividends. But is there a corresponding policy for the next stage? And, if so, what is being done to bring it to the notice either of the public or of the lower ranks of the Labour movement itself? The lack of a clear lead in the "Economic Survey for 1947" has caused almost as much comment inside the Labour movement as outside it, a view which the trade union group of MPs are reported to be actively pressing on the Government; and, so far as industrial relations are concerned, the lack of a general policy may prove to be as big a liability

in future as its presence was an asset in the past. Is it perhaps, as Mr Attlee's broadcast only too evidently suggested, that the Government has no clear outline of policy even in its own mind?

In all this the responsibility rests on the Government; but the Opposition has also at least a negative part to play. Hopes that the Conservative Party might arrive at a clear and positive line of economic policy wilted in the hot air of last week's Conference of the National Union of Conservative and Unionist Associations. But Conservatives can at any rate do something to avoid increasing the economic confusion and political suspicion which the shop stewards' manifesto discloses. It does not really help matters when a section of the Conservative Press clamours for the quite unnecessary withdrawal of recent reforms in education or health or social insurance. The worker who is advised that the only way to prevent the recurrence of a coal, electricity and transport crisis is to refrain at all costs from overhauling the coal mines, power supply, or the railways not unnaturally suspects a measure of special pleading. The pre-war difference between British and American standards of productivity was due not only, and probably not nearly as much, to lack of effort by the individual worker, as to defective equipment and defective industrial and commercial organisation; and the worker whose contribution to reconstruction is assessed by the politicians in blood, sweat and tears is sometimes inclined to wonder whether a little more emphasis on the need for good management might not be as much to the point. The Government has been often and rightly criticised for failing to provide genuinely national leadership. But is it so unfair to invite Conservatives to examine their own consciences in this same matter of putting party prejudices first? Volcanic displays of classical eloquence are all very well in their place. But a volcano is an uneasy neighbour in a Council of State; and it is liable to spread more alarm and confusion in the country than the display is worth.

Pakistan

DURING the next few months one of two things must happen in India: either the Congress Party and the Moslem League will reach agreement on the future of the country or else the Viceroy, in accordance with the British Government's recent declaration, must take in hand preparations for separate regional transfers of the remaining legal powers of the British Raj. As such divided transfer will involve problems of the greatest complexity and difficulty, only a short time can now be allowed for Congress-Moslem agreement to be reached before preparations for the alternative course begin; the measures required for the latter can no more be postponed to the eve of the departure date in June of next year than a tenant who has given notice can leave his removal preparations to the day on which he is due to be out of the house. Britain has in no way rid itself of India's problems by the resolve to quit next year, as some people now imagine; on the contrary, unless matters take an unexpectedly favourable turn, the supreme crisis must come before British responsibility ends.

If agreement is reached between Congress and the Moslem League, the solution will be an Indian one and Britain will merely accept it. But if there is no agreement, the decision how to transfer power, to what authorities in what areas, will rest with Britain and the decision will be one of appalling difficulty. It is plainly implied in the Government's statements of policy that, if there is no Congress-Moslem agreement, a Moslem State or States will be recognised as regional legatees of British power; this may sound simple, but the trouble begins

as soon as one asks what are to be the boundaries of these Moslem areas.

Five of the eleven provinces of British India are involved in the Moslem League's separatist projects. Of these, four contain Moslem majorities, while the fifth, Assam, though without a Moslem majority, is drawn in because of its geographical position. The figures of population and Moslem percentages in the five provinces concerned are as follows:—

	Population in millions.	Percentage of Moslems.
Punjab	28	57
Sind	4	70
North-West Frontier	3	91
Bengal	60	54
Assam	10	33

It will be seen that the highest percentages of Moslems, and therefore the most solid popular bases for a Moslem State, are in the relatively little populated provinces of Sind and the Frontier, while in actual numbers the great mass of Moslems is to be found in Bengal (33 millions) and in the Punjab (16 millions), in neither of which provinces does their majority much exceed half of the population. Moreover, the geographical distribution of the Moslems in India means that the Moslem-majority provinces could not in any case form a single state with continuous territory, for between the Punjab and Bengal lie the United Provinces and Bihar with massive Hindu majorities. On the other hand, Assam, though not a Moslem-majority province, lies in a situation of peculiar isolation on the landward side and has access to the sea only through Bengal,

so that it could hardly be separated from Bengal in any grouping of provinces. As a result of these facts the Moslem League claim is really for two distinct Moslem States—one in the north-west roughly equivalent to the basin of the Indus, and the other in the north-east including the Ganges-Brahmaputra delta. The name "Pakistan," often used loosely for the general principle of Moslem separatism, applies strictly only to the first of these conceptions, while the second may be distinguished as "North-east India."

As the Indian provinces are now constituted, the combination of the Punjab, Sind and Frontier would still leave the Moslems with less than a two-thirds majority in the whole territory, while in Bengal and Assam combined the Moslems would count only just over the total population. The Moslem leaders recognise that these majorities are not sufficient to assure the regions a definite Moslem character on a basis of democratic political rights, and even if such rights were in practice denied, the minorities would still be so large as to threaten the stability of the states. It has therefore been proposed to detach from the Punjab the easterly Ambala Division where the Moslems are in a minority; in the rest of the Punjab the Moslem majority is 62.7 per cent, whereas in the Punjab including the Ambala Division it is only 57.1 per cent. The Moslem League also hopes further to raise the Moslem percentage in Pakistan by the ultimate inclusion of Kashmir, where the Moslem majority is 76 per cent, and of the Frontier and Baluchistan States and Tribal Areas, which are almost purely Moslem. In North-east India it is similarly proposed to exclude the Burdwan Division of Western Bengal where the Hindus are in a heavy majority; the Moslem majority in Bengal would then be raised to 65 per cent. Such mutilations of provinces, even if they were sufficient to sort out the communal majorities in a satisfactory way, would involve considerable difficulties of administrative reorganisation. But the detachment of the Ambala and Burdwan Divisions from the hypothetical Moslem States would not touch the crucial questions of assignment of the Lahore-Amritsar area of the central Punjab and of the Calcutta area of Bengal.

In the Punjab the Moslem majority is concentrated in the western part of the province; in the extreme east it declines to a minority, while in the central area the numbers of Moslems and non-Moslems are approximately equal. But this central area contains Lahore and Amritsar, the two principal cities of

the province, and the non-Moslem section of the population includes the main part of the close-knit Sikh community, whose prominence in the Indian Army gives it an importance out of all proportion to its numbers. The attitude of the Sikhs towards Pakistan is similar to that of the Moslems towards a unitary India; they fear Moslem domination, just as the Moslems fear Hindu domination, and they threaten to secede from Pakistan just as the Moslems propose to break away from Congress India. Congress, working in alliance with the Sikhs, has now proposed a division of the Punjab into two parts so as to separate the Moslem-majority area from the rest of the province, and it may be presumed that in any such partition they will demand the exclusion of Lahore and Amritsar from the Moslem share. Amritsar is of paramount importance to the Sikhs, as it is their holy city in addition to being a great commercial centre, and it is hardly possible to draw an international frontier between Lahore and Amritsar, which lie close together in an open plain. But without Lahore and Amritsar Pakistan would be shorn of its most important urban area, and it seems very unlikely that the Moslem League will agree to excluding more than the Ambala Division from the Punjab. From the Sikh point of view, on the other hand, exclusion of the Ambala Division by itself would actually be a disadvantage, for it would reduce the relative strength which the Sikhs have in the province as now constituted.

In Bengal the problem of provincial division is similar. Calcutta, the commercial and industrial metropolis and natural administrative capital of the whole region, is overwhelmingly Hindu in population, together with the whole surrounding district; within a Moslem-controlled North-east India it can only be a discordant element, yet without it North-east India would be condemned to poverty and backwardness and would hardly be viable as a separate state at all. Pakistan proper would at least have the great port of Karachi as its outlet to the sea, whereas a state composed of Eastern Bengal and Assam without Calcutta would only have the secondary port of Chittagong for contact with the outer world.

These are some of the problems which will confront the British Government if it has to carry out the policy of regional transfers. Nor are the difficulties territorial only. There would be the questions of allotment of India's public debt and sterling balance among the legatees, of apportionment of the personnel and liabilities of the various centralised services,

above all of the division of the Indian Army and its equipment. About 30 per cent of the Indian Army is Moslem and this part of it might be re-enlisted by the Moslem States, but the disintegration of the unified defence system of India would be a most dangerous process for all concerned, even if there were no civil war, for Pakistan would inherit India's most vulnerable land frontier and would have to shoulder the main burden of defence with quite inadequate financial resources.

The nearer one gets to the partition of India, the more disastrous it looks. Nobody really wants it. Britain certainly does not, whatever Congress may believe about the diabolical cunning of British imperialism in dividing peoples who would otherwise live in harmony. Nor does even the Moslem League want it except as a last resort. Pakistan was invented by a group of young Indian Moslems in England as recently as 1933, and it was not taken seriously by any Indian politician before 1937; the Moslem delegates putting their case before the Joint Select Committee in 1933 dismissed it as "only a students' scheme." The adoption of territorial separatism as a policy by the Moslem League and the sweeping successes of the League in getting the mass support of Moslems (which

it had not previously had) were direct consequences of the attitude and behaviour of Congress after the elections of 1937. In the provinces where Congress Governments were formed there were various forms of discrimination against the Moslem community which the Moslem element in the Congress membership was unable to prevent, and the fear that Congress ascendancy at the centre would produce similar results for India as a whole led to a rapid spread of the belief that the interests of Moslems would only be safe if they had a territory of their own of which they would be masters without interference. The Moslems are of course a minority, but there are 94 millions of them in India (including the Indian States and Tribal Areas) and a minority more numerous than any European nation outside the Soviet Union cannot be set aside simply by appeal to the democratic principle of majority rule. This has been clearly recognised by the British Government, which has pledged itself to effect a partition of India if there is no other way by Moslem consent. But the prospects of partition are so forbidding that even now no effort should be spared in a final endeavour to persuade the two parties to an agreement which will preserve the federal unity of India.

CRICKET has been reprieved. Last week, when Mr Chuter Ede announced that a ban would be placed on mid-week sport, on football, greyhound racing and some horse-racing fixtures, it was feared that, in the name of equality, cricket, too, would have to go. The Home Secretary has, however, listened to the arguments that the attendances at first-class cricket matches are so small that they do not interfere seriously with production, and has exercised his prerogative of mercy.
