Assembly renewed its constitution-making in New Delhi without participation either of the Moslem League or of the majority of the Princes. The Assembly was concerned with large issues of fundamental law, such as the abolition of untouchability, which was bravely decreed; the Viceroy's business was with the particular, concrete danger which has arisen as a result of prolonged rioting just inside India's most vulnerable frontier. The Frontier has its own special local politics, but these are of significance for the whole of India, both because of the area's key importance for India's external security and because the province has the highest percentage of Moslems of any in India, which makes it decisive for the cause of Pakistan.

The Frontier Provincial Government headed by Dr Khan Sahib dates from a time before the Pakistan issue became acute and is based on a bargain of a provincial group with the All-India Congress Party. The Moslem League demands that it be replaced by a League Ministry and claims that new elections would disclose a large majority for the League. As a further complication, the Afridi and Shinwari tribesmen who surround the Khyber pass have told the Viceroy that if there is no Hindu-Moslem agreement in India, they will negotiate treaties with Afghanistan in place of their present agreements with Britain.

Lord Ismay, who is fully informed of the Viceroy's views on the situation, is returning this week-end to report to the Cabinet in London, so that the Viceroy may receive fresh guidance in his arduous task. He is believed to have come to the conclusion that Pakistan in some form is inevitable, and Congress has now indirectly recognised this by advocating partitions of the Punjab and Bengal. Unfortunately the boundaries of the new States are liable to prove no less controversial than their existence. Britain is cast once again for the role of mediator. Meanwhile, the position with regard to British civil servants and Army officers in India has been clarified by a Government statement which has recognised (with concurrence of the present Government of India) the principle of compensation for loss of career and prospects. Those who continue to serve in India after the transfer of power will be entitled to retire with compensation at any time, and it is hoped that this guarantee will induce a number of them to remain during the transition period.

The Japanese Elections

On April 25th the Japanese nation went to the polls for a second time to elect a House of Representatives under Allied supervision. The first time was a year ago when Japan was called on to elect a House whose primary function was to adopt a new Constitution. This year's elections have been held under the new Constitution, but with the same principal parties, except that the most conservative party, the Progressives, have renamed themselves Democrats. The comparative figures are as follows:

	1946	1947
Liberals	143	133
Progressives (Democrats)	94	126
Social Democrats	92	143
Communists	5	4
Others	132	60

These figures show two main changes: first, an increase in the total strength of the three main parties relative to smaller parties and independents, and second, a swing of the electorate towards the Left Centre resulting in the emergence of the Social Democrats as the strongest single party.

On April 27th were held the first elections to the House of Councillors which replaces the old House of Peers in the new Constitution. The results were: Social Democrats, 46; Liberals, 41; Democrats, 33; Communists, 4; Others, 126. The proportion of independents was much higher than in the Lower House results, and as most of these were of conservative colour, the Upper House is more to the Right than the Lower.

*

The trend to the Left in Japanese politics has not been a matter for surprise in view of the growing unpopularity of the Yoshida Government and its inadequacy in controlling prices and ensuring the distribution of necessities to the people in the towns. Recent straw ballots conducted by newspapers indicated that the Social Democrats had been winning wide middle-class support in addition to their working-class backing. As believers in planning and controls, they are expected to tackle economic problems with more energy than the Liberal-Progressive coalition, if they can form a Government or take over key economic portfolios, though it seems that they cannot command enough parliamentary votes to carry through their big nationalisation projects.

The failure of the Communists to increase their representation has caused great satisfaction to General MacArthur and he expressed it in a post-election statement. He claimed with justice that the elections had been free and that there had been no interference with the Communists' candidatures or electoral campaign. There can be little doubt, however, that the Communists suffered indirectly from American disfavour. "Please Mac from whom all blessings flow!" is the guiding thought of the Japanese man in the street in this time of want, and how could Japan please Mac by electing a bunch of Reds who are known to give him a pain in the neck? If Japan had as much to hope and fear from Russia as from America, the number of Communists returned would probably have been larger.

Czechs and the Rule of Law

The welcome visit of a Czechoslovak Parliamentary delegation to London coincides with a step towards return to a normal legal system in their country. On May 4th, the so-called Peoples' Courts in Czechoslovakia cease to function, and all cases which have not been tried by that date will go before the ordinary courts. The tribunals now to be dissolved were set up under the Redistribution Decree after the liberation, to try cases of treason and collaboration. Each was presided over by a professional jurist, with two assistants; but the jury was composed of men with good resistance records who would hardly claim to take an objective view of collaborators. It is evidence of the Czechs' determination to maintain in their legal system a capacity for objective judgment above political passions that their Parliament last year succeeded in passing the law winding up the Peoples' Courts.

This is not the first victory which has been won for legality. Last summer the Communists organised a campaign to upset the verdicts passed against Hacha, the head of the "Protectorate," and his associates. Typically well-organised demonstrations expressed their rage that the old man who, after Munich, succumbed to Hitler's brutal threats, had not been condemned to death. Nevertheless, the verdicts stood. Again, after the recent judgment on the Beran Government, the Communist organ *Rudo Pravo* declared that General Sirovy (who led the famous Czech Legion home from Russia after the first World War) was "the most revolting coward among the Czechs," and that "the National Court sentence was a deep disappointment. It offended the people's sense of national morale and justice, and thus followed the inglorious earlier chapters in our national purge."

The end of the Peoples' Courts does not mean the end of the struggle for the rule of law in Czechoslovakia. The efforts of the Communists to be more revolutionary than the institutions established by the Revolution will go on; and every day brings incidents in which some local official, misled by constantly hearing himself referred to as "the People," overrides the law. A few weeks ago a crisis arose in the National Front Government over strikes organised as protests against the return of requisitioned factories to owners pronounced innocent of being collaborators or Germans. As the owners in these cases are usually Jewish refugees, the agitation against the return of their property has tended to appear anti-Semitic; here, as elsewhere, the Communists are more concerned with gaining support from the working class than with opposing anti-Semitism. The case which posed the legal issue most plainly was that of a factory at Varnsdorf, owned by an elderly Jew whom the Nazis had driven to Britain. His property had been placed under national administration and his former chauffeur, a Communist, installed as trustee. A court pronounced the refugee Jew the rightful owner, but the workers struck against the return of his factory. A small wave of similar strikes broke out. The matter was finally taken up by the National Front and the Trade Union organisation; a compromise decision was reached which condemned the strikes but shelved the question of returning properties.

In Czechoslovakia it can be seen more clearly than elsewhere that the crucial issue between Communists and their opponents is not nationalisation of industry, but impartial justice and liberty for the individual. The country's position between East and West makes the outcome of this struggle of great concern to the rest of Europe.

The Future of the WVS

An answer given by the Home Secretary to a question in the Commons last week has put an end to the uncertainty over the future of the Women's Voluntary Services that had existed since the war finished. Then the organisation had been requested to remain in being for another two years, with no certainty that any official use would be found for it at the end

of that period. The Home Secretary stated last week, and few will disagree with him, that there is

general agreement as to the desirability of keeping alive the spirit and efficiency of a Service which has proved so successful in mobilising voluntary help for numerous forms of public work. The Home Office will continue to provide office accommodation and office expenses for the organisation. For the rest, the organisation will find, as successfully as before, it is to be hoped, the voluntary labour, skill and enthusiasm that has marked its whole existence since 1938. Its paid permanent staff throughout the whole country number no more than some 125. Its membership, and membership implies active and continuous, if part-time, work, is now in the neighbourhood of three-quarters of a million women. In many ways the WVS is an epitome of all that is best in public life in Britain. It has contrived to be non-political. It has avoided attracting the disapproval of even the most doctrinaire trade unionist. It is flexible and unobtrusive. It has adapted its organisation and its methods of work to the existing framework of local government. It has been remarkably successful in preventing the rigidity of the social structure of the country from hampering its activities. It has found its own way of attracting the hard work of women of all classes by giving them the conviction that what they are doing is important and worth while. And what it has given them to do has been worth while.

Wait Until 1950

Last week's debate on British civil aircraft was muddled and somewhat inconclusive. One important statement of policy emerged, however, when it was announced that the Government had decided not to proceed with the purchase of more American aircraft for use on the main Empire routes, but to operate them with British interim types and bear the initial disadvantage in competition with American types rather than inflict upon the British aircraft industry a blow to its prestige and development which it is considered the purchase of further American aircraft would involve. Also several interesting items of information were given. In the year ending March 31, 1947, for example, the British aircraft industry produced 738 civil aircraft, of which 49 were four-engined air-liners, 8 four-engined flying boats, 68 twin-engined medium air-liners and 46 twin-engined "feeder" types.

The prestige argument for buying no more American aircraft is a weak one. The Minister of Supply himself drew attention to the difficulties of a quick conversion from the production of military to civil aircraft. It is well known—and was emphasised in the debate—that it will be at least three or four years before satisfactory long-range British aircraft are available in adequate numbers. And an extension of the arguments used to support the earlier purchase of Constellations would cover any purchases of American types deemed necessary—that they are the best at present available for the work.

More cogent was the point that the purchase of further American aircraft would discourage the British aircraft industry from producing interim types and deny it several years' valuable constructional and operational experience. This handicap, added to the wartime loss of experience in building big civil aircraft, would be very serious, particularly since the size, speed, pressurisation and other requirements of aircraft appearing five years hence would, in any case demand the widest possible experience. That the British industry has the best jet-engines in the world and is shortly to put into production the first of several promising propeller-turbine engines is not enough. It must have the experience in building air-frames worthy of such engines. By the indirect subsidy represented in the decision to buy no more American aircraft British manufacturers are encouraged to gain it.

Into these things also comes the difficulty of the dollar position. Last year aircraft worth nearly \$6 million were bought from America and another \$12 million worth are on order. The purchase of sufficient aircraft to meet the demands of the Empire routes would cost a lot of dollars. The operating costs for each aircraft would be less than for the interim British types, since they would be more efficient. Figures given in the debate estimated the operating costs of present British long-range types at from 60 to 234 per cent greater than those of an ideal aircraft. But in the face of a desperate shortage of dollars the acceptance of a considerable deficit (largely in sterling) in the operation of long-range air services rather than the use of more dollars in buying more efficient types than those now flown is necessary, however unfortunate. It is necessary to have Constellations on the North Atlantic route in order to get a fair share of the dollar traffic; elsewhere British civil aviation—and its passengers—will have to exercise patience.

DELTA SHOES

MADE BY LOTUS
SUPPLIED THROUGH RETAIL AGENTS

Have you a problem in industrial or commercial control—manufacturing, selling, servicing? We cover the ground, if not from A to Z, then certainly from A to Y.

Here under one roof we have a group of divisions—each one specialising in some facet of industrial or commercial control—the whole covering virtually every need in Office Machines, Systems, and Equipment.

The value and comprehensiveness of this service become more apparent during a visit to our systems display rooms.

Accounting Machines; Adding Machines; Calculating Machines; Filing Equipment; Production Control Charts; Kardex Visible Records; Certified Safe Equipment; Remington Typewriters and Supplies.

Letters to the Editor

Propaganda Platform

SIR,—Your editorial comment in *The Economist* of April 19th on the Report of the Scarborough Commission contains some animadversions on the action of the School of Slavonic Studies in affording hospitality to the Polish Government's Exhibition on Poland's Western Territories: indeed the School is referred to in your editorial as having been used as "a platform for a piece of highly fraudulent political propaganda." As the person responsible for granting the use of a room to the Polish Government and as the opener of the Exhibition, I feel sure you will permit me to answer what seems to me to be a most misleading statement, and one which calls in question the academic integrity of the School of Slavonic Studies. I am not, of course, here concerned with your strictures on the educational efforts of the Polish Government, though their language might have been less ungracious without loss of force.

In my opening speech I described the Exhibition as "a selection of facts, historic and economic, designed by means of maps, excerpts from documents, the opinions of certain experts, and graphs, to show the aims and the achievements of the new Polish Government" in the Western Territories. I also emphasised that the question of Poland's frontiers on the West was a matter now *sub judice*, upon which it would not be proper at this time to express any opinion. I pointed out that we, at the School of Slavonic and East European Studies, are a body of *students*, whose business it is to study the new Poland—as indeed all the Slavonic countries—and to try sympathetically to understand its ideas, not as politicians but as students.

The School of Slavonic Studies must, by its very nature, seek always to cultivate the friendliest and the most real contacts with all Slavonic governments. Only thus can it fulfil its academic mission and maintain high standards of culture of the living languages it studies. Provided that it is always made clear that we are not in any way committed to a political doctrine by close relations with the lands of the renaissance Slavonic world, such hospitality as was afforded to the Polish Government's Exhibition seems to me entirely proper, though clearly it risks the kind of misunderstanding shown in your editorial.

Though neither an economist nor a politician, I satisfied my own conscience, before consenting to the Exhibition, that it was not mere "political propaganda," though it was clearly an effort to prove a highly controversial thesis. I also was convinced that it was an appeal only to an educated public with some technical knowledge, and no mere aiming at the less informed masses. In enabling the educated public to see this Exhibition while in no way implying that the Slavonic School either accepted or denied its main thesis, I think we were acting in accordance with the high academic purposes for which the School exists. The policy advocated by implication in your editorial paragraph would inevitably lead to the isolation of the School from those countries which it is its special aim to study—indeed ultimately to the teaching of the living Slavonic languages and cultures as if they were dead.

I would add that I write this letter entirely on my own responsibility, and not necessarily to commit the School to my opinions.

Yours faithfully,

C. L. WRENN, *Chairman of the Council.*

School of Slavonic and East European Studies, W.C.1

[Although the administrators of the School of Slavonic Studies may be sincerely convinced that they are "not in any way committed to a political doctrine" by sponsoring exhibitions of this kind, the emphasis on the School's need always to cultivate close relations with Slavonic governments means that it can in practice only give such publicity to official versions of controversial issues, for which the governments concerned are well able to provide in premises owned or hired by them without involving a British academic institution. It must also be pointed out that the School does not afford similar facilities to Slav points of view in opposition to the existing governments, as the mere study of contemporary affairs, without the overriding consideration of relations with governments, would require.—EDITOR.]

The Tobacco Duty

SIR,—I wonder if any of your readers would be interested in a Marshallian approach to the problem of cutting down consumption of cigarettes?

It is true in my experience, and, I believe, in that of other people, that the law of diminishing marginal utility begins to operate at a fairly early stage in the smoking of a cigarette. We can draw a schedule of the marginal utility of successive lengths

of cigarette smoked (Fig. 1). A cigarette is assumed to be 3 inches long.

Now it would appear that if we cut each cigarette in two and smoke the two halves separately, there is a net gain in utility equivalent to OABC—CBDE (Fig. 1) or to the area ABDE (Fig. 2) (in which CBDE from Fig. 1 has been superimposed on OABC).

But this assumes that all of the whole cigarette and all of the two halves are smoked. If the length of the stub is CF, we must subtract CDGF from the total utility of the whole cigarette and twice CBHF from the total utility of the two halves.

The net gain from smoking our cigarette in two halves is thus equal to:

$ABDE - (2 \text{ CBHF} - CDGF) = AEGH - CBHF$, and will, of course, be positive if AEGH is greater than CBHF.

The shorter the stub, the greater AEGH, the smaller CBHF, and the greater the net gain. If this new method is adopted, therefore, we can expect that cigarettes and pins will become commodities in joint demand.

A word on cork-tipped cigarettes. The length of the tip is normally longer than the minimum length of stub for an ordinary cigarette, particularly if the pin-impaling method is adopted.

Let the length of the cork tip be CI. The net gain from bisecting our cigarette is now:

$ABDE - CBHF - (CBKI - CDJI) = AEGH - CBHF - GHKI$.

Cork-tipped smokers are therefore less strongly recommended to try the new method than others (unless, of course, they remove the cork-paper).—Yours faithfully, H. A. JOHN GREEN

44 Carlyle Road, Edgbaston, Birmingham, 16

The Capital Budget

SIR,—The article on "The Capital Budget" in your issue of April 26, 1947, is extremely interesting. However, whilst I do not quarrel with its general conclusions, there appear to be some flaws in the analysis, partly arising from defects in the treatment of depreciation in the Economic Survey and the National Income White Papers. The first flaw, which is not excusable on this score, is in the statement that, "If the figure of £600 million for depreciation is considerably out, however, it would mean that the gross capital formation would be correspondingly out too." This is untrue, because whilst net capital formation is a balancing figure in the National Income White Paper, it is the difference between national income and certain other elements of the tables, national income being stated after deduction of these assumed figures of depreciation. In other words, if depreciation is understated by £100 million, national income is correspondingly overstated, and net capital formation is hence over-stated by this amount. The figure of gross capital formation, £1,314 million for 1946, is not therefore affected by any error in the assessment of depreciation.

My second point is that since the depreciation figures are based largely on income-tax allowances for wear and tear, they are calculated on the original cost of equipment, and are quite inadequate to meet the greatly increased present-day replacement cost. The rise in prices has been so substantial that it seems to me that the gross expenditure of £1,314 million is not very much more than the amount required to meet the wastage of old equipment measured, as for this purpose it should be measured, at current prices. The authors of the White Paper on National Income and Expenditure are unquestionably aware of this factor, and would probably regard it as a defect in their figures, a defect which, owing to lack of data, it is difficult to remedy. But the Economic Survey was seriously at fault in leaving unqualified the

figures of the proportion of the national income devoted to asset formation—the net addition appearing as rising from 6½ per cent to 13 per cent from 1938 to 1947. The inference that net additions are to double is so far from the truth as to be dangerous.

Your article refers to the remark in the National Income White Paper that depreciation allowances have increased because of the introduction of special initial allowances for tax purposes on new plant. Whilst net assessable profits have certainly been reduced by these additional allowances, it is not true that industrial depreciation provisions have been increased. There may be a few cases in which the taxation treatment is permitted to influence business accounts, but, in general these additional allowances are regarded as deferrals of tax liability for the encouragement of capital outlay; they do not influence accounting profit as distinct from taxable profit. The assumption appears to have been made that the Income Tax Act, 1945, will reduce business profits; but the measurement and the true amount of these are not affected quite so directly as this by an Act of Parliament, although net profit after tax is naturally influenced—in an upward, not a downward, direction.

I will not attempt to trace the effect of the foregoing points on the argument of your article. Obviously, the corrections required are in the adverse direction—so much so that I hope there is a large error in the official estimate of gross capital formation for 1946 and 1947. But it is not an adjustment of the depreciation allowances which could be responsible for any such error.—Yours faithfully, HARRY NORRIS

26, North Circular Road, N. 13

[Mr Norris may be right in the conclusion of his first paragraph, but our reading of the treatment of depreciation in the National Income White Paper is supported by the Notes to table 18. As for the effect of the Income Tax Act, 1945, on business profits, it is of interest to note that part of the increase in the net income of Imperial Chemical Industries in 1946 is attributed by the chairman to this cause.—EDITOR.]

The New Statesman

SIR,—In your article, "The New Statesman," in *The Economist* of April 19th, you stated that Russia refused to attend the United Nations Sub-Committee on Devastated Areas. Being a member of the Polish Delegation to that conference, I had the opportunity to note the presence of representatives of Russia and the Ukrainian S.S.R., who took part in the deliberations of that conference.

I also wish to mention that while you were quick to observe the Russian refusal to co-operate in the allocation of European coal supplies (Russia is not a member of the European Coal Organisation), it would be only just to state that she is taking a very active part in the European Central Inland Transport Organisation, an equally important body in the field of European transport.

I hope you will agree with me that these facts should have been mentioned in an objective analysis of the Russian attitude at the lower level of international co-operation.—Yours faithfully, STEFAN ROLAND

Polish Embassy, 47, Portland Place, W.1

[The correction is accepted. It was the Emergency Economic Committee for Europe that the Russians refused to join. Their delegates attended the meetings of the Devastated Area Sub-Committee—but without instructions. On September 25th Mr Feokov, the Soviet delegate, attacked its report and demanded a complete re-draft, arguing among other things that "Europe does not constitute a single economic unit."—EDITOR.]

The Cost of Fire Services

SIR,—The Fire Service Bill received its second reading on March 26th. The explanatory memorandum attached to it states that whereas the total expenditure by local authorities on fire services in the year 1939-40 was approximately £3,000,000, the annual expenditure when the new Act operates will be no less than £13,750,000.

It is typical of the times we live in, when politicians talk casually about expenditure running into hundreds of millions, that very little light was thrown during the debate on the second reading on the justification for increasing the cost of fire services by 375 per cent above the pre-war level, and I suggest that this matter deserves closer scrutiny than it has so far received.

It is true, as the Home Secretary pointed out, that a Fire Brigades Act was passed in 1938 (but never came into operation owing to the war) which would have increased the annual cost very slightly above the basic figure of £3,000,000. The explanatory memorandum attached to the 1938 Bill stated that it would involve little, if any, additional cost in London and other large towns where, generally speaking, efficient fire services were already provided, but that in certain other areas additional services were

required, the cost of which was not likely as a rule to exceed a penny rate locally.

The present Bill provides for the transfer to county councils and county boroughs of the existing National Fire Service, which they are to operate under Home Office control. The NFS was a purely wartime organisation, planned to deal with the enormous dangers of incendiary air raids. While NFS personnel has been considerably reduced since the war ended, it seems obvious that the new fire services now proposed must be much more costly than the services contemplated under the Act of 1938. During the committee stage Mr Shurmer, the member for Birmingham (Sparkbrook) stated that Birmingham before the war had a first-class fire brigade which cost them a 5½d. rate and that the estimated cost to Birmingham of the new Bill will involve a rate of 18. 1d.

I suggest that it is not too late to amend the present Bill in Committee so as to bring the total expenditure down to a level similar to that envisaged by the 1938 Act, namely, a little more than £3,000,000 plus the necessary additions for increased rates of wages and other costs which have occurred in the meantime.—Yours faithfully, R. C. HAZELL

52 Long Acre, W.C.2

The Profits Tax

SIR,—By section 21 of the Finance Act, 1922, certain small companies are subjected to surtax (there called super-tax) if they do not distribute a "reasonable" amount of their profits in dividend. Larger companies are not liable to surtax in this way, but the statutory stigma of unreasonableness must apply to all alike. Now the pendulum has swung the other way, and successive Chancellors have encouraged the retention of profits in businesses, but hitherto the high rate of Excess Profits Tax has made it superfluous to penalise the so-called "frittering away" of profits in dividends. But the blow has now fallen, and the directors of small companies must choose between Scylla—the tax on distributed profits—or Charybdis—surtax on profits unreasonably retained. Is the Chancellor to have it both ways? Or must the Commissioners of Inland Revenue adopt a new criterion of unreasonableness in assessing the surtax payable by small companies? If the latter is the answer, the Chancellor may lose in surtax a substantial part of what he hopes to gain by the tax on distributed profits.—Yours faithfully, JOHN MONROE

13 Old Square, Lincoln's Inn, W.C.2

From *The Economist* of 1847

May 1, 1847

Without the abolition of all preference by the State, the voluntary system [in education] . . . neither has had, nor can have, a fair trial. Such, however, is not the opinion of our opponents. They build their new system on the alleged insufficiency of the voluntary system, declare that it has done comparatively nothing in the past, and cannot be relied on for the future. When objections, however, are raised to their system, then we learn from Lord John Russell, that it "only comes in aid of the voluntary system" . . . In principle, the public money is only to be granted, when private subscriptions are previously advanced. Thus we have both parties—vehement in condemnation of the voluntary system, vehement in deploring the present evils of ignorance—deliberately proposing . . . Minutes of Council and grants of money which are wholly based on the voluntary system . . . They condemn the voluntary system, and yet adopt it. They decry it, and yet have no hope but in it . . . On such an all-important subject, did ever the groping little minds of red-tapist men of detail fall into more glaring and lamentable inconsistencies?

Reader, the folly and the contradictions are but half exposed. The voluntary system, . . . has carried the light of knowledge and the Book of Revelation to the miners of Cornwall and the colliers of Durham. John Wesley, and his associates and followers, . . . visited the dark underground workshops and dwelling-places of the children of damp and dirty toil, and effected in their manners and morals a great reform. What, however, must be done to get aid for the voluntary system from the Privy Council? Money must first be subscribed by the rich. The consequence will be, as Sir W. James . . . remarked, "an unhappy colliery village, such as were scattered over the county of Durham, which had not the courage or the means to raise subscriptions," and then would want it most, would get none of the public money. "No grant could be made to such a village, because no voluntary subscriptions had been raised."

Books and Publications

Crustacean or Vertebrate Planning?

"Central Planning and Control in War and Peace." By Sir Oliver Franks, KCB. The London School of Economics and Political Science. Longmans. 61 pages. 2s. 6d.

THE three lectures delivered by Sir Oliver Franks at the London School of Economics last February are a model of what such things should be. They are clear without over-simplification, stimulating without meretriciousness, and based on first-hand experience; and they preserve throughout a nice balance between theoretical speculation and observed fact. The mainspring of his argument is the belief, based on the international trade situation, that "no Government in the United Kingdom in the foreseeable future will dare to do without some measure of central planning and control." This implies no preference for the planned economy as such; "the inevitability of a minimum, not the desirability of a maximum," is Sir Oliver's neatly stated thesis. Accepted publicly as ground common to all parties, it would considerably clarify the political air.

There must be programmes, then, of import and export activity; and programmes imply not merely targets and aspirations, however intellectually impeccable, but the will to carry them out and the technique of communicating that will to others. The problem of constructing and implementing programmes had to be solved, and was solved, during the war, but although wartime experience yielded valuable lessons, it cannot be applied wholesale to peace. For in war, national purpose is single, simple and universally understood and agreed; in peace it is multiple, fluid and controversial. Moreover, the characteristics of peacetime purpose, economically revealed as demand, make more objectionable the notorious diseases of very large organisations—woolliness, inertia and rigidity. (Sir Oliver is particularly good on these occupational hazards of the bureaucrat.) The citizens of this country might patiently endure the economic effects of these qualities; but one cannot expect Britain's foreign customers to do so. Intense centralisation using dictatorial methods can only be justified by the sudden and acute scarcities of wartime. Something better must be found to meet the needs of peace; a relationship, between Government and industry or commerce, wherein a firm "agreement to agree" underlies all controversy; where plans are evolved by a dialectical give and take, not by dictatorial steam-rolling; where there grows up a "sense of the meeting" which dissentients accept on principle; in a word, a democratic relationship, a method of agreement rather than compulsion.

For this relationship to grow up, several prior conditions are needed. The central purpose, the comprehensive general picture within which the minimum, centrally controlled export-and-import programme makes sense, must be crystallised out by the Government. They must use expert evidence, but they cannot shuffle off responsibility on to experts. Their policy must be positive and coherent; and it must be put across as a practical proposition, not as pie in the sky. To be intelligent and effective in its public relations is in fact not merely a Government's electioneering wisdom, but an essential part of the duties of office. Finally, the Government must, in the practical carrying out of its programme, aim at a wide diffusion of initiative; its central decisions should be as few and as general as possible, its responsibilities must be known and limited, and outside their range individual initiative should have full scope. The organisation should, in fact, "resemble the structure of the vertebrates rather than the crustaceans," having a firm and closely articulated skeleton for unity and strength, and a flexible and sensitive exterior for adaptability and range, rather than a squashy inside and an unadaptable and insensitive carapace.

A good many changes are needed; charges of heart and changes of organisation. Sir Oliver's third lecture is largely concerned with these. They make a discouraging list, less because of any inherent impracticability than because of the extreme unlikelihood of their coming about. It is not impossible that something might be done on the lines of his suggested advisory joint committees to help the harassed senior of the Civil Service, or in the reform and galvanising of the trade associations with which the Civil Service deals. But can one imagine the present Government, or any Tory alternative, acting on the assumption that it is better to be a vertebrate than a lobster? Lobsterdom is the very essence of the Labour mind; possibly a better emblem for the Tories would be the lowly hermit crab, bumping along the bottom in someone else's discarded shell. The crustacean structure symbolises admirably the precise negative to all Sir Oliver's desiderata;

the controls without planning, the irrational aggressiveness matched by irrational timidity, the inconsistency and intolerance. If the country is to be saved, the social counterpart to the millennial processes of revolution will have to be considerably speeded up.

How the Stock Exchange Works

"The Stock Exchange." By Harold Wincott. Sampson Low. 164 pages. 4s. 6d.

THIS is a modest little book which tackles a difficult task and succeeds. There are a number of well-known standard text-books on the history and organisation of the Stock Exchange, and there is also a growing literature on the principles of investment. But hitherto there has been nothing—certainly not within the compass of a small book such as this—which sets out to explain not merely how the Stock Exchange works, but also why a Stock Exchange is needed in a modern Western community, even a modern Socialist community. This is a book, then, which looks at the Stock Exchange as a British institution, attempts to provide a technical survey of the Stock Exchange which can be readily understood by the intelligent layman, and also gives an account of the part which the Stock Exchange has to play in marrying the ideas of "investment" in the narrow sense of that word in Throgmorton Street with the wider concept of investment which the economist now applies as a matter of course in his analysis.

Mr Wincott is a financial editor who has a high regard for the Stock Exchange at its best, but is capable of pointed criticism of certain of its shortcomings. In his earlier chapters on the history, functions and machinery of the Stock Exchange, he does not attempt to break into new ground, though he handles these aspects of the story with a refreshing lightness of touch. It is in the last two chapters, on the critics of the Stock Exchange and the future of the "House," that Mr Wincott has to offer a valuable 40 pages to his lay readers and also to many people who have an intimate knowledge of the Stock Exchange. He is anxious that the critics should criticise the right things. He is concerned to show how far the Stock Exchange authorities have moved in the last two decades in their conceptions of public duty, improvement of Stock Exchange practice and protection for the investor. He disposes—let us hope for ever—of the ideas that the Stock Exchange is an instrument for "fixing" prices and that its dealing arrangements result in the basic industries being starved of capital while the luxury trades get all that they want. But Mr Wincott's case is that the Stock Exchange, as at present constituted, is uneconomic; that much of its work could be centralised and mechanised; and that the cost of investment could be reduced appreciably without impairing the close personal relationship between broker and client. He also argues that the gradual emergence of the Stock Exchange as a national institution should be accompanied by professional training for its members. On these points there are some shrewd comments which may not be altogether to the liking of some of its members or even of some of the gentlemen on the Council. Mr Wincott has not written with the object of solving investment problems, but he has produced a book which investors, large and small, will read with interest, instruction and profit.

Shorter Notices

"Le Contrôle des Changes." Tome I. Rapport Générale par A. Piatier. International Institute for Intellectual Co-operation. Paris. 198 pages.

THIS report was drawn up for consideration by the eleventh session of the Permanent Conference for International Studies, at Bergen, in August 1939. It went to press last year, without revision apart from the addition of a few footnotes, but having lost virtually none of its appositeness. A theoretical discussion of the exchanges and of the balance of payments is followed by a general survey of possible types of exchange control, whether acting directly on exchange rates or indirectly through control of imports and exports, a more detailed examination of the measures taken by different nations, and a summing up of the prospects for a return to economic liberalism, which are unhelpful.

"The Bankers' Almanac and Year Book for 1946-47," Thomas Skinner and Co. 2051 pages, 70s.

THE latest edition of the Bankers' Almanac provides, as usual, up-to-date information on the banks of the world and other valuable material on currency and related topics.

AMERICAN SURVEY

The States and Labour

(From a Correspondent in Iowa)

"I THINK this demonstration has been a great success," the leader of the Congress of Industrial Organisations told the Press after thousands of union members from his own federation and from the rival American Federation of Labour met on the steps of the Capitol to protest against a Bill sharply regulating labour unions. But the demonstration had not been a success. The special trains and buses and workers' automobiles had poured in from 200 miles around in vain; heckling the Chief Executive had been in vain; packing the House galleries all day had been in vain. The next day the House of Representatives passed the Bill in even sharper form than the Senate had, and the Senate concurred in the revisions the day after that. The Iowa Senate and House, these were.

The Federal Congress in Washington has been agonising at great length over labour legislation and the prospects of another Presidential veto. The House passed the Hartley Bill, the Senate is working on an alternative. During all this, one State legislature after another has been passing its own restrictive labour laws. Forty-four of the forty-eight State legislatures meet in 1947; more than half have completed their work and gone home. Altogether 16 States have passed some kind of legislation directed against labour unions this year.

At least ten States have passed laws this term making it illegal to deny employment to anyone because he belongs or does not belong to a labour union—laws which overturn many established customs, many existing contracts, reopen many old sores. The federal Hartley Bill bans only the "closed shop," "maintenance of union membership," and compulsory deduction of union dues from pay by the employer. Fourteen States now have such laws. Several are constitutional amendments, approved by popular vote. Another State passed a law prohibiting secondary boycotts by labour unions—as when union lorry drivers will not make deliveries at a place of business where there is a labour dispute, or working men in a processing plant will not work on materials from a non-union producer. Two States passed laws regulating labour disputes in public utility industries, and New York has prohibited strikes by public employees. Three States passed laws restricting picketing in labour disputes, in order to prevent picketing developing into great human walls around a closed plant, and to define intimidation by pickets more specifically than does the law of assault. A great many other restrictive labour bills have been introduced into State legislatures, including each of the items in the omnibus federal Hartley Bill. Some legislatures are still sitting.

Except for New York, none of the 16 which has acted this year is a seaboard industrial State; only Indiana and Ohio out of the 16 are of the industrial Midwest. The South and the inland Trans-Mississippi West are the homes of this new wave of anti-unionism—the same largely rural States whose representatives in the Federal Congress favour restrictive labour laws there. Their home States do not have to reckon with a President who must hold the votes of industrial areas to win elections. Their Governors are subject to the same influences that they are themselves.

"AMERICAN SURVEY" is drawn from three sources. Articles described as "From Our U.S. Editorial Staff" are the work of a small group of regular correspondents, resident in the United States. Articles with some such attribution as "From An Industrial Correspondent" or "From A Correspondent in Ohio" are from outside contributors. Everything printed without attribution is prepared in London.

The strength of labour unions in the United States resembles somewhat the strength of the Japanese armies in China during the war. The big cities and industrial areas they often control; the suburbs dislike them but tolerate them; the small towns and open countryside rarely see them, and dislike intensely what they do see; the scattered medium-sized cities are unionised islands in a hostile sea.

Farmers were furious when strikes made the shortage of farm machinery worse during and after the war. Farmers are chronically furious when strong transport unions in market towns force them to hire unneeded drivers, or pay "initiation fees" to bring their produce to town. Rural and small town people who worked on big wartime construction jobs or in the big war factories were indignant when they had to pay union fees and submit to union discipline. It is such a struggle to keep a union going in this climate of hostile employers and unclass-conscious workers that unions all too often fall into the hands of either leftist zealots (chiefly Communists) or selfish racketeers. No one else wants to bother, and these eager beavers alienate good union members as well as outsiders. New rural recruits to unionism may support the strongest, most militant union for a while, accept retroactive pay rises it bludgeons out of employers—and then denounce unions in their next job or next election. Ordinary monopolistic union practices born out of fear of unemployment often strike them as outright swindles. "Selling the right to work," they cry out at straight union dues as well as the more exorbitant initiation fees and temporary work permits some unions exact. These feelings existed even before the coal strikes, the railroad strike, the telephone strike.

Before 1932 the field of labour legislation was almost exclusively a State matter. In 1947 the States are trying to reclaim their own. Federal labour legislation since 1933 has been limited to labour regarded as affecting interstate commerce, but since the late '30s Supreme Court decisions have vastly enlarged that rubric. Doubt remains whether the States still have the right to legislate for workers employed in interstate commerce now that Congress has done so. But sponsors of the "right-to-work" laws claim they do, and State Attorneys-General and assistants from 15 States petitioned Congress to say so in so many words. Several lawsuits to test the constitutionality of State "right-to-work" laws are before the Courts now.

Whatever happens to federal legislation, one-third of the 48 States have determined to control their own labour problems, and until their laws are repealed or declared unconstitutional, they can put them into effect locally.

Mr Dewey, Governor of New York, appealed for the labour vote in the 1944 Presidential election on the ground that the worst working conditions, the worst labour laws, the worst anti-labour politicians were in the Democratic South. Republican States had passed the advanced labour codes, Republican States had the successful union movements. That was true—but about all it means is that the industrial North-east has been Republican most of the time—Republican not so much because of working men's votes (though they were important at times and always had to be courted) as because of the steadfast Republicanism of the employers, black-coated workers, rural and small-town people. Out where Republicans could win on their votes alone, the Republican party is a willing ally of the anti-union forces of the rural and small-town South.

The system of representation favours the rural and small-town areas. Iowa's 2½ million, Nevada's 100,000, have the same two senators apiece in Washington as New York's 13½ million; and in the State legislatures the same sort of disparity is common. Some States have not revised the voting constitu-

cies for their lower houses for years, so that rotten boroughs are not confined to the Senates. Georgia's "country unit" system for electing its Governors is not common, but in state legislatures rural counties quite generally have more than their proportionate share of votes through rules fixing the maximum and minimum representation for any county.

Iowa is the most rural state in the union if you go by percentage of area in cultivation. But it has actually more labour

union members than farm organisation members, and almost as many union members as farmers altogether. But this could hardly be deduced from the way the legislature and the State's delegation in Congress behave. The State Farm Bureau Federation won most of the positive legislation it asked for; the labour unions fought in vain against hostile restrictions on their own activities, and their support in general welfare bills was a handicap rather than an advantage.

Prices on the Balance

(From Our US Editorial Staff)

PRESIDENT COOLIDGE, according to legend, was asked after attending church what the sermon was about. "Sin," he replied. Pressed as to what the minister said: "He was against it." A reporter of the American scene given to the brevity to which Mr. Coolidge was addicted, could make an equally brief report. The preponderant subject of conversation is prices, and everyone in the least vocal is against them. President Truman has just made a speech calling for lower prices. Mr. Snyder, the Secretary of the Treasury, has spoken sharply on the subject. Mr. Chester Bowles has emerged from months of silence to head the National Committee on Economic Stability, set up by the progressive body Americans for Democratic Action; and he has harsh words to say. Mr. Henry Ford 2nd refers to the "insane spiral of mounting costs and rising prices" and to the "un-American spiral." Mr. Alfred M. Landon, the Republican presidential candidate of 1936, has publicly bemoaned the level of prices.

The critical chorus speaks in the name of both future domestic welfare and of international relations. Present high prices are harmful to both. Furthermore, present high prices enhance the risks of serious depression, which would also be harmful to both. Pocketbook and conscience alike are outraged.

The general outcry from both public and private sources resembles the late-1936-early-1937 period and the late-1920-early-1921 episode. In both instances the high cost of living came to be regarded as the chief threat to welfare, and to be the object of considerable vituperation.

Political motives are also involved, as they were then. The Truman administration does not want the illwill, now or in future, for present high prices and their possible results; and the President wants the voters to be reminded that he gave in unwillingly—and said so at the time—to Congressional determination to abolish price controls last summer. The Republicans do not want the blame either. Nor does anyone else. Hence the universal protestations—plus an effort to pin the blame clearly elsewhere.

But here the unanimity stops. The solutions vary widely. Mr. Truman indicated at a press conference shortly after his address that the government plans no forceful action, and he rejected Mr. Bowles's proposal for a federal committee to try to work out price reductions. The President stands firmly against tax reduction and in favour of using all available funds under present conditions for debt reduction. The Republicans are pursuing their drive to reduce taxes but to compensate by reductions in expenditure, which the Administration thinks are not feasible. Monetary policy is increasingly criticised, and while a gradually tightening procedure is being followed, it is moving very slowly indeed. Labour's continuous drive for wage increases is roundly criticised, both for expanding purchasing power and for increasing costs. Corporate profits and monopoly are blamed. The Government's support of agricultural prices is blamed. Buying for foreign distribution and for foreign account are blamed. And so on.

From this welter of controversy a few facts can be extracted. Wholesale commodity prices are up about 30 per cent higher than in May last year, just before price control was ended, though in recent days they have been declining. Retail prices were still rising when the latest index numbers were computed, though reductions announced in recent days may have stopped the rise; the cost of living index is about 55 per cent above

pre-war and probably understates the case. Consumer buying has been declining for some weeks: while dollar figures still show gains, volume is moving downward. The cost of construction, which in some areas and for some types is probably double pre-war, is causing major curtailments in building operation and even more marked cuts in plans. Supplies are growing in an increasing number of lines. Items scarce only a little while ago are now freely available. And producers report with complete conviction that this trend will shortly be much more widely pronounced.

These facts, or apprehensions of them, cause the two-minded situation which is widely evident. The Government is apparently reluctant to take really forceful action against high prices—as it did in 1920-21 and 1936-37—for fear that it will presently be charged with having brought about a depression. Labour is fearful of a depression and bases demands for higher pay on the desire to prevent one. The numerous forms of restrictionism are defended on the ground that they will give protection should a depression ensue. In short, a great many persons and interests fear both the present situation and a slump, and alternately—or even in the same breath—advocate policies which attempt to curb a boom and cushion a slump. That the result is strange is inevitable.

In view of the facts, it would not be surprising if the current outcry "called the turn" at least for a time. Only a widespread stoppage of production or major accentuation of demand for foreign supplies, or a change in the public attitude towards holding money—which is, of course, still in large supply—would be likely to prevent such a result.

But it is not likely that exhortation, which is the main content of the press stories, will have had much to do with causation of whatever is to happen. For if supplies are to remain short, the problem is one of allocation of resources either by price or authority, and no significant voice is proposing any solution within this area. And if the economic balance is soon to shift from a sellers' to a buyers' market, the exhalations from the platforms are unlikely to have weight on the balance.

American Notes

To Veto or Not?

Three Bills which will shortly reach the President's desk promise to provide the occasion for that clash on domestic issues between Congress and the White House which was implicit in last November's election returns. One is the measure prohibiting suits for "portal-to-portal pay." Differences between the House and Senate versions are now being ironed out. Opponents of the Bill insist that it goes far beyond its immediate purpose, and tends to undermine the whole Fair Labour Standards Act. The Secretary of Labour has announced that he will advise Mr. Truman to veto it.

Even more momentous decisions must be reached by the President on the general labour Bill and the tax reduction Bill. Both these measures have been passed by the House; the same subjects—though not the same Bills—are being debated by the Senate. On the issue of labour legislation, Mr. Taft is struggling, with the aid of Senator Byrd and other Conservative Democrats, to retrieve the defeat he suffered in his own Committee when pro-Labour Republicans and Democrats combined to soften the measure. The proponents of a mild Bill are strengthened by the argument that a harsh measure will simply run into a Presidential

veto, with the consequence that nothing at all will have been done to solve the labour problem. On the national finances, Mr. Truman and his Secretary of the Treasury are even more adamant in their refusal to sanction an "inflationary" course, despite the awkward appearance of a budgetary surplus instead of the anticipated deficit. Mr. Truman has insisted that any surplus should first be applied to debt reduction and only later to tax reduction.

On both sides there are the inevitable charges of "playing politics." The Republicans specifically decided to present Mr. Truman with a single omnibus Labour Bill, rather than three separate measures; the Democratic deduction is that the Republicans want the President to be forced to swallow the whole Republican recipe, or take the responsibility for the failure to grapple with Labour. On the other side, the Republicans suspect the Administration of being tempted to thwart their campaign promise of tax reduction. And it is suggested that the President will be influenced, in his decision on Labour, not only by the nature and provisions of the Bill, but by his hopes of holding the left-wing of the Democratic Party in line for 1948. Will the Truman Administration swing left again? The acceptance or rejection of the Tax and Labour Bills will be taken to set the Democratic course for the next eighteen months. Their rejection, incidentally, would leave the United States without a policy on the two most important domestic issues of the year.

* * *

Gagging the Voice of America

It was not until the middle of the war that the United States became convinced that there was a need for publicity about America which could be supplied only by the Government; and after several false starts, the Office of War Information was born. Since the end of the war, a budget about one-quarter the wartime size has supported the projection of the "American way of life" to 67 countries by means of news handouts, background material, reference libraries, and more recently, the ambitious short-wave broadcasts billed as the "Voice of America." It now appears that unless the Senate decides to come to the rescue, all these State Department information functions are doomed to a speedy end. Acting on a technical point, an Appropriation sub-committee of the House has wiped out the entire budget of \$21 million for the fiscal year 1948.

The information activities of Mr. Benton have been conspicuously non-political. They have not approached the controversial nature of the Government broadcasts advocated, recently, by the Commission on the press. Yet to Congress they are suspect as possible carriers of Democratic propaganda. It is argued that private agencies could do the job just as well; and above all, it is a comparatively painless way of saving an item in the budget of \$37 billion.

Over a year ago Mr. Byrnes, then Secretary of State, testified that "there was a time when we could afford—or thought we could afford—to be unconcerned about what people thought about us. That time is past." It would be hard to argue that in the year since Mr. Byrnes spoke that carefree time has returned. The United States is embarked on a vast export of the American way of life, floated on loans, and spearheaded by technicians. In Eastern Europe and Russia itself the broadcasts and activities of the Office of International Information have alone penetrated the iron curtain. They may err in carrying the music of Benny Goodman; but recent testimony by Ilya Ehrenberg and Russian press officials show that at least the broadcasts are not ignored.

Since Mr. Marshall has come home with the apparent determination to make the retreat from Moscow the point of departure for renewed emphasis upon ties with the Western World, he is not likely to view with equanimity the disappearance of the only means by which American policy can be authoritatively explained to the world.

Brake on Mergers?

Some impressive evidence of an accelerating pace in the growth of industrial mergers has been given in a special report by the Federal Trade Commission. The report lists 1,658 mergers in manufacturing and mining industry over the war years, and declares that more than one-third of these operations represented deals by the largest corporations—those with assets exceeding \$50 million. In other words, the more powerful units in the traditional area of "small business"—more especially food, non-electrical machinery and textiles—are moving rapidly along the path of economic concentration now so strikingly apparent in steel, automobiles, tobacco, etc.

In calling for legislation to arrest this growth of Big Business, the Federal Trade Commission is not now seeking any general revision of the Sherman Anti-Trust Act. The growth of economic concentration has been discussed and analysed at great length within the last few years, and although the evidence is now very impressive, no clear-cut policy has emerged, and the present Congress seems most unlikely to make any radical move. What the FTC now wants is a simple revision of the Clayton Act of 1914, which imposes a nominal ban on industrial mergers "where the effect of such acquisitions is to lessen competition . . . or restrain commerce . . . or create monopoly." In 1926 the Supreme Court ruled that the acquisition of assets (other than of actual securities) was not covered by the Clayton Act, a decision which left the FTC without any effective powers for monopoly control. Revision of the Act as sought by the FTC would bring all mergers within the jurisdiction of that body, and corporations would be called upon "to demonstrate" that future acquisitions were: (1) in the public interest; (2) not restrictive or monopolistic; (3) not bringing under group control more than such proportion of any trade or industry "as Congress may determine"; (4) not impairing efficiency and competitive vigour.

The Clayton Act would thus become a stop-gap measure with a statutory prohibition on size alone, and would clearly have little relation to the broader problem of relative efficiency. It is not very difficult to imagine situations in which the proposed Act might have damaging repercussions for individual industries; but the growth of the giant corporation, as disclosed by the Temporary National Economic Committee, and subsequent Congressional reports, is certainly disturbing, and while the general anti-trust programme is so loosely defined, revision may well be beneficial on balance.

Though statutory powers are lacking, the Justice Department has recently established a special "Merger Unit" to watch industry, and to "afford timely warning of mergers which may result in illegal combination." It is suggested that "current clamour for revision of the Anti-Trust Laws" is providing at least a temporary barrier to mergers. But the Department admits examining "10 to 20 proposals a week, and finding no grounds for prosecution in 75 per cent of pending mergers." The Merger Unit will thus do little more than to give an official blessing to most of the operations now under way.

Three Bags Full

(From Our US Editorial Staff).—That American wool growers are trying to leave the Government holding a very full bag is indicated by a Bill originating in the Senate and currently before the House Agricultural Committee. It would require support of this year's wool clip at 42 cents a pound and permit the Secretary of Agriculture to put an additional import fee on foreign wool entering the country over and above the 34 cents per pound tariff that already applies to wool of apparel quality. Over 400 million pounds of wool are currently in the possession of the Commodity Credit Corporation, which began a policy of stock-piling and price support in 1943. This is not all the wool that the CCC has owned. Losses on its sales to date have cost the American taxpayer \$38 million. Earlier this year the Secretary of Agriculture announced that the wool price-support programme would cease on April 15th unless its continuance was specifically authorised by Congress. Hence the present Bill.

Prices for greasy wool received by farmers averaged 23.8 cents for the years 1935-39. During the war they averaged around about 41 to 42 cents, considerably above "parity": in March, 1946, the actual price was 40.5 cents while "parity" was 32.9 cents. (The 1947 clip has not yet come to market.) The wool which the CCC took over, at Boston ceiling prices for cleaned wool (around \$1.19½ for top quality), allowed for such a return.

Meanwhile the sources of mill consumption of apparel wool, as estimated by the Bureau of the Census, have changed as follows, with cleaned wool coming in from abroad over the 34 cent tariff but under the Boston price:—

	1935-39	1941	1943	1946
Domestic.....	508.6	493.9	430.4	240.6
Foreign.....	83.4	483.2	631.0	831.7
	592.0	977.1	1,061.4	1,072.3

THE ECONOMIST BY AIR

Express Service to U.S.A. and Canada

Readers of *The Economist* in the United States and Canada can receive their copies within a day or two of publication for an annual subscription of \$24. They should apply to:

The Publisher, *The Economist*, 15 Lancaster Place, London, W.C.2.

A battle of the sections is now on. The Rocky Mountain region—all of whose major industries depend on Government subsidy or tariff protection, though its representatives are among the loudest in inveighing against Government interference and control—is politically strong. New England, the centre of the woollen textile industry, has a less incisive influence in a Congress where the farmer is idealised. But New England is making an effort to rally the currently very price-conscious consumer; the evidence is ample that he—and she—are about to be shorn.

* * *

New Stars for the Banner?

Room may soon have to be found on Old Glory for new stars, although a renewed invitation from Senator Russell for Great Britain to join the Union seems to have fallen on unresponsive ears. Hawaii, after 49 years' apprenticeship, has at last found an eloquent advocate of statehood in Mr Krug, the Secretary of the Interior. Back from a 24,000-mile tour of the Pacific, Mr Krug testified recently that by any test—population, wealth, ability for self-government, or devotion to American ideals—Hawaii was ready to become the 49th State. This cluster of 20 islands has a mixed population of 465,000; it exceeds three of the existing 48 states in area, and 4 in population. Its Japanese population of 125,000 was completely loyal during the war. Hawaii has a lower illiteracy rate than the American average, and pays more taxes than fourteen states. In 1940 a plebiscite showed a two-thirds majority for statehood. This has been endorsed by President Truman, and by both the Republican and Democratic platforms; fourteen bills favouring statehood for Hawaii have been introduced in the Eightieth Congress alone. Even more effective is the support now given by military figures like Admiral Nimitz and General MacArthur, who see Hawaii as a vigorous democratic, as well as military, outpost in the Pacific.

Similar yearnings are stirring far north in Alaska. A referendum held in October, 1946, showed a heavy majority in favour of statehood, and Mr Krug also extended his blessing to Alaskan aims. Alaska, however, is undeveloped, compared with Hawaii; it has only about 85,000 inhabitants, and it is only at the beginning

of the development of its rich mineral resources. Veterans of the past war, numbering 25,000, have settled in Alaska, stirred by the vision of a last frontier; but they have been sadly disillusioned, this past year, by shortages, high costs, and the disabling effect of high freight rates to and from the United States.

Both Hawaii and Alaska are Organised Dependencies of the United States; they are governed jointly by Congress and their territorial administrations. Their citizens are citizens of the United States, and each of them sends a delegate to Congress, who may speak but not vote. They enjoy other benefits reserved for American citizens, such as the right to pay federal taxes and to be paralysed by strikes, originated by American unions. A strike led by Mr Harry Bridges reduced Hawaii to a state of importing sugar; while last year's shipping strike had a disastrous effect upon the Alaskan economy. With this demonstration of essential unity, the old cry of taxation without representation is not likely to go long unheeded—particularly at a time when world events force the United States to exhibit the benefits of a model colonial system and the virtues of the democratic way.

Shorter Notes

Henry Ford left the controlling share of voting stock in the Ford Motor Company to his four grandchildren and the bulk of his personal fortune to the Ford Foundation. Valuation of the estate, on present estimates, ranges between the extremely wide limits of \$200 million and \$500 million, with estimates on the voting stock ranging from \$5,437,000 to \$18,041,000. The Ford Foundation, with present assets of \$109 million, will now secure stock valued at between \$104,640,000 and \$432,807,000. Treasury experts estimate the value of the stock at \$190 a share, against a valuation of \$58 a share given for the estate of the late Edsel Ford, only son of Henry Ford.

The State Department has threatened to withdraw authority for the \$500 million Export Bank credit to China by June 30th "unless it receives reconstruction plans from China by that time."

THE WORLD OVERSEAS

Russian Power Moves East

(By a Correspondent)

ABOUT fifteen years ago, almost the whole of Russia's heavy industry was based on the iron ore mines of Krivoi Rog, in southern Russia, and the coal of the Donetz Basin. The production of steel was entirely concentrated around that base. So were the Russian engineering industries, though a proportion of these were located in Leningrad and Moscow, to which steel and coal had to be hauled over long distances from the south. In the course of the last fifteen years Russia's economic geography has been changed almost beyond recognition. New metallurgical centres have been created in the Urals, at Magnitogorsk, and in Siberia, near Kuznetsk. The geographical redistribution of industry was a salient feature in the second and third Five-Year Plans. At the outbreak of the Russo-German war, the process had been advanced to a stage at which the new industrial centres were able to supply the Russian forces with the most essential equipment and munitions. During the war itself, the process was carried a long step further by the exaction to the east of no fewer than 1,300 plants and factories from western Russia and the Ukraine. Between 1942 and 1945 the industrial output of eastern Russia was doubled; and the output of the armament industries proper increased by five to six times. Together with the 1,300 plants and factories, nearly 15 million people, most of the industrial population of the western provinces, were shifted beyond the Urals.

This quite unprecedented migration of machines and workers was a feat of "lightning" economic strategy which in the end proved to be more decisive than the lightning advances of Hitler's armies towards Moscow and Stalingrad. The consequences of that wartime migration have outlasted the war itself. Through it, the colonisation and industrialisation of eastern, that is predominantly Asiatic, Russia has been accelerated to an extent that would hardly have been possible under normal conditions. The first post-war Five Year Plan aims at consolidating that advance; and at opening up new eastern areas for the development of industry.

A small statistical table, recently published in the *Bolshevik*, the authoritative organ of the Politbureau, gave quite a revealing picture of the geographical re-distribution of Russian industry that is to be achieved by 1950. The table reproduced below, compares the shares of the eastern industrial centres in the total output of the Soviet Union in 1940 and 1950:

	1940 Per Cent.	1950 Per Cent.
Iron ore	29	44
Steel	34	51
Rolled steel	33	51
Coal	36	47.5
Oil	12	36

To this table the *Bolshevik* added the remark that "in such branches of heavy industry as light metallurgy and in a number of important branches of the chemical industry the specific weight of the eastern areas will be even higher than in the industries shown in the table." Thus, in three or four years' time just over half of Russia's steel and engineering industries and nearly half of her coal production will be located beyond the Urals. In absolute figures, the lands "beyond the Urals" are expected to produce nearly 13 million tons of steel and about 120 million tons of coal by 1950. This would make of the Urals and Asiatic Russia the main industrial centres of the Soviet Union, even in peacetime. The relative importance of the old industries of the Ukraine would shrink accordingly; and what was Russia's main industrial base only fifteen years ago would produce only 49 per cent of the pig iron, 37 per cent of the steel and 34 per cent of the coal produced in the whole of the Soviet Union.

In planning so intensive a development of the eastern provinces the Soviet Government has been guided by economic, political and strategic motives. The idea of Russia's "internal colonisation" has been much older than the Soviet regime or even Bolshevism. Russian Liberals dreamt of "internal coloni-

sation" as the way out from many of Russia's difficulties under Tsardom. In the early years of this century Lenin, in his underground periodicals, argued that the dream was perfectly legitimate, but that it would never come true under Tsardom; and that only revolution could open up the backward areas of Russia for colonisation and modern industry. It cannot be said that Lenin's promise has not been honoured by his successors. When the shift of industry eastwards began, it was criticised by many as being economically inexpedient. Indeed, the costs of the shift were at first so enormous that only an industrial management not concerned with any short-term balance-sheet of profit and loss could carry them.

The foundations of the new industries had to be laid with the help of the "mother industry" in western Russia. For years, machines, raw materials and fuel had to be hauled over distances of thousands of miles. Even beyond the Urals a distance of 1,250 miles separated the iron of Magnitogorsk from the coke of Kuznetsk on which the "Ural-Kuznetsk Combine" was originally based. To get a parallel to this, one would have to imagine a single industrial combine stretching over a distance from the Pyrenees to the centre of Poland, and possessing only one highly inadequate railway connection between the two outlying fringes where coal and iron were produced. But the overhead expenses were decreasing as the new industries expanded. The eastern centres gradually became almost independent from the "mother industry" in the west. In the last years before the war, the Siberian steel plants were already supplying all the steel needed for the building of the great Trans-Siberian double-tracked railway, with its many subsidiary lines. The long-distance between the Magnitogorsk iron and the Kuznetsk coke has proved a more lasting handicap; but this, too, has been gradually remedied by the opening up of coal mines in the Urals and in Karaganda, roughly half-way between the Urals and Kuznetsk, as well as of iron ore mines around Kuznetsk.

New Siberian Railways

In the end the new industries have been working more cheaply than the old, largely because of their more favourable natural conditions. The ore of Magnitogorsk costs less than that of Krivoi Rog—it is open cast. Similarly, the coal pits of Kuznetsk are more productive than those of the Donetz—the average thickness of the Siberian coal seams is twenty odd feet compared with less than two feet in the Donetz mines. The costs of transport between the inter-dependent industries in the east are still very high, but the general costs of production there are so much lower than in the west that they more than make good the overhead expenses on haulage. The average output, say, of pig iron per worker at Magnitogorsk is 250 per cent of the average output per worker in the rest of Russia. And, if the *Bolshevik* is to be believed, the better distribution of the metal industry will result in such a

"The Wild East"

Whatever the gaps in the industrial progress of Soviet Asia—such as the lack of light industries—the following conclusions can be drawn from this brief survey: Russian internal colonisation is expanding eastwards—just as the United States expanded westwards over several generations. In the United States the pioneer farmer had opened up the Wild West—in Russia the pioneering work is done predominantly by industry. By the end of this Five-Year Plan the balance of Soviet industry is likely to be finally tilted in favour of the "Wild East." Though the main concentration of the new industries is along the "backbone" of the Urals, in the border zone between Asia and Europe, Soviet Asia emerges from this development as the leading industrial country of Asia.

saving of capital that the economy alone will, within ten or twelve years, make total capital investment in both Magnitogorsk and Kuznetsk. On the other hand, the network of highly modern railways in Soviet Asia is growing rapidly—the chief feat in the current Plan is the laying of the Southern Trans-Siberian Railway connecting Kuznetsk in Siberia with Kuibyshev on the Volga.

The social and political motive for the redistribution of industry is the great importance which the Soviet regime attaches to the development of the backward lands and peoples. While the regime has in many important respects lowered the standards of European Russia it has energetically raised the standards of Soviet Asia. The wartime migration of great masses of western Russians beyond the Urals has not only increased the labour reserves in the east—it has also infused elements of a more European way of life into Soviet Asia. It so happens that these economic and political considerations coincide with the paramount need for the strategic dispersal of industry; and so the new Plan aims at killing quite a few birds with one stone.

"The Second Baku"

There are obvious shadows in this very impressive picture of the ascendancy of the Soviet East. Even from the table quoted above it can be seen, for instance, that the development of the oil industry is lagging behind. The so-called Second Baku—situated between the Volga and the Urals, that is on the European side of the Urals—will be producing far less than official publicity has suggested. By 1950 the total output of all the oilfields outside the Caucasus is to amount to not more than 12.5 million tons. The Baku oil fields will still remain decisive for the Russian economy for quite a few years. The newly-opened deposits are rather shallow and their exploitation is much less profitable than that of the old Caucasian fields. Their advantage, from the strategic viewpoint, is that they are dispersed over hundreds of miles and do not constitute such a single and vulnerable target for attack as the highly concentrated Baku fields. A number of new pipelines are being laid to connect the oil fields of the Second Baku with its new refining centres, but these will not be completed for two or three years; and in the meantime the long hauls of oil will add to the strain on Russian railways. The relatively slow rate of development is characteristic for the whole of the Soviet oil industry, not only for the new oil fields. The target figure for the total output in 1950—35.4 million tons—is only 3 million tons higher than the actual output in 1938; and the target figure for the Caucasus itself—22.8 million tons—is even 6 million tons less than actual production in 1938. (Last year the output of the Caucasus was not much more than 16 million tons.) In the course of this Five-Year Plan the main effort will probably be devoted to re-equipping the oil industry; and the effects of the re-equipment will perhaps be seen in the next Five-Year period, during which the eastern oil fields may already produce half of Russia's oil. The fact that the Ministry for the Eastern Oil Industry has increased the funds for housing oil workers in the East by 60 per cent seems to support this suggestion.

Northland of Canada—II

Oil, Gold and Uranium

[FROM OUR OTTAWA CORRESPONDENT]

CANADIANS must think and learn more about the Northland, Mr Mackenzie King told the House of Commons on February 12, 1947. The defence of Canada, he said, must take the North into consideration as well as the East and the West. "Our primary objective should be to expand our knowledge of the North and of the conditions necessary for life and work there with the object of developing its resources."

If one defines Canada's Northland as that portion of Canada not embraced within any of the nine provinces, and stretching from the 60th parallel of latitude west from Hudson Bay to the boundary of Alaska and north to the northernmost tip of Ellesmere Island about 500 miles from the North Pole, it comprises an area of 1,516,758 square miles (of which the Yukon represents 207,076 square miles). The population, according to the census of 1941, was only 16,942 (of whom 4,914 lived in the Yukon and the remainder in the North-West Territories). Indians numbered 5,560, Eskimos 5,400, and the remainder were whites.

The fact that an area so vast still supports such a tiny population is itself an eloquent commentary on the paucity of readily exploitable resources. Until 1920, the only exportable surplus

of any consequence in the North-West Territories was furs. The Yukon, however, had ceased to be primarily a fur trading preserve in the late 1880's, and by the end of 1946 gold valued at \$214 million and other minerals valued at \$29 million had been produced there. Gold production in the Yukon continues to average well over \$1½ million a year, but other mineral production has fallen to a negligible figure. But in the meantime, since 1920, mineral production has been steadily rising in importance in the North-West Territories, and appears likely to exceed the value of fur production very soon, if indeed it has not already done so. (The lack of any figures on uranium production since the Great Bear Lake deposits were taken over by the Canadian Government makes exact comparison impossible.)

Prospects for Settlers

The importance of the recent strikes of oil, gold and uranium (in the pitchblende-silver finds at Great Bear Lake) cannot be over-emphasised; and the extent of unprospected territory, coupled with new techniques of sub-surface prospecting (such as the air-borne magnetometer), make it rash to venture any guess as to the mineral wealth of Canada's north-west. But the hope of founding extensive new settlement rests at the moment almost exclusively upon such mineral development. Lacking such valuable deposits, a very large part of the 1,516,758 square miles of Canada's Northland can be for ever dismissed as unsuit-

able for large-scale settlement. It lacks soil, climatic conditions and vegetation for any extensive increase in population. The annual catch of furs is already maintained at a level which makes it necessary to reserve hunting and trapping licences almost exclusively to Indians, Eskimos and white settlers of long standing. As a whole, the region is taxed to feed the 11,000 Eskimos and Indians who are resident within it; and it has been necessary to introduce herds of reindeer from Alaska to provide a more reliable source of food and clothing for the aborigines than in the past. There are a few pockets of soil along the Mackenzie River system within a climatic belt capable of maturing vegetables, small fruits and even grain; but the fact that the total cultivated area in the whole of the North-West Territories still does not exceed 300 acres, despite the new demands of such mining settlements as Yellow Knife, disposes of any idea of large-scale farming east of the Rockies. (Preliminary estimates of total available acreage of good soil near the present posts of the Mackenzie Valley and the Yukon are both able to supply local demand with most of the fruits and vegetables needed. A few small dairy farms are operated in the Yukon. Along the Mackenzie River, however, and in the new mining settlements of the North-West Territories, milk, butter and eggs are still as a rule imported from the outside.)

There exists the possibility of developing new hardy strains of plants, or even radical new techniques of soil heating in Arctic regions by atomic energy; but until such innovations arrive the agriculture of the Northland seems bound to be confined to the limited local supply of hardy vegetables and fruits for consumption within the Territories. There are scattered stands of timber in the Yukon territory along the Alaska Highway, and patches of merchantable spruce occur along the larger rivers in Mackenzie District. These trees are of the greatest importance locally, and even the smaller stands serve as an invaluable habitat for game and fur-bearing animals, but there appear to be no resources of timber for export on an important scale.

The fur trade has for 150 years been the staple wealth of that country, and with proper conservation measures it should continue to provide several million dollars of wealth for export annually.

One returns, however, to the importance of minerals as holding the major hope—the only immediate hope—for any increase in permanent settlement.

Extensive Oilfields

Oil prospects appear bright. Dr Charles Camsell, formerly Deputy Minister of Mines and Resources, recently wrote that "One of our expert investigators reports on this subject: 'Here, then, we have the essentials for potential oilfields covering an area of over one thousand miles in length. This is probably the largest comparatively unexplored potential petroleum region in North America, and surface evidence of oil in the form of seepage occurs in several places.'" Chief Inspector Mackay Meikle, of the North-West Territories Administration, told a Toronto audience in March, 1947, that "When the Canol Project operations were discontinued in March, 1945, an estimated reserve of 36,250,000 barrels of crude petroleum had been established by drilling. During the calendar year 1946, more than 180,000 barrels of crude oil were produced, a figure which greatly exceeds the total production of the field prior to 1942." Mr Meikle stated that the production of pitchblende concentrates was continuing at the mine of Eldorado Mining and Refining, Ltd. (operated as a Crown company since January, 1944). He added that at Contact Lake, about six miles south-east of the Eldorado mine, International Uranium Mines have commenced operations to reopen their property.

Gold production at Yellowknife, which exceeded \$3.8 million in 1942, but was then forced to slacken operations due to wartime labour problems, is again on the increase. The mill serving the Con-Rycon mines of the Consolidated Mining and Smelting Company of Canada re-opened on August 20, 1946, and by the end of the year had produced 9,480 ounces of gold. Total production of the Yellowknife area for the year 1946 was 24,260 ounces, which was three times the 1945 figure.

Significant mineral discoveries in the North-West Territories have been confined to the Yellowknife-Port Radium-Norman Wells triangle. Precambrian rocks extend over a very

much larger area, but so far prospecting in the eastern portion of the territory and in the Arctic Islands has failed to reveal any important bodies of ore. There are numerous showings of coal within the Arctic Circle which would only become of value if other development nearby made them useful as sources of fuel. Similarly, there are numerous possible power sites which await mineral discoveries to give them potential significance. A large part of the north-eastern Arctic region is covered with permanent ice or glacial drift; and other portions consist of sedimentary rocks of Palaeozoic age which are not promising sources of metallic deposits. Moreover, a large part of the Canadian Eastern Arctic is inaccessible to ships because of ice conditions. The most promising areas for continued exploration appear to be the Precambrian rocks of the Canadian Shield on Baffin Island and the mainland.

China's Check on Imports

[FROM OUR SHANGHAI CORRESPONDENT]

THIS year's first quarter has failed to bring any improvement of import prospects in China. For most foreign manufactured consumption goods imports are either officially "suspended" or practically ruled out because the Import Control Board and the Central Bank fail to approve applications for licences to import the goods of this category not yet "suspended." For raw materials, fuels and basic foodstuffs, quotas for February-April shipment have been promulgated amounting to a value of £12,500,000 sterling. But the Central Bank of China for the past five weeks has excused itself as having not sufficient exchange to meet even these quotas; it has either delayed indefinitely the issue of licences under these quotas or issued licences "without exchange." Even for the importation of some capital goods—presumably enjoying priority over all others—recent licences were issued "without exchange." Importers more and more realise that, if long delay is to be avoided, they had better mark their applications for licences "value prepaid," as an indication that they will content themselves with licences "without exchange."

The recipients of such licences are officially supposed to have already the exchange they require to finance the imports for which they apply; in practice, the Central Bank in their case simply closes both eyes to the illegitimate ways and means by which importers given such licences have to raise the exchange in the black markets. Officially, again, there are no such black markets, and the Shanghai manager of a leading American exchange and share broking firm is at present jailed and on trial accused of having dealt in unofficial foreign funds after February 17th last. In practice, of course, there occur clandestine transactions in foreign funds, at rates from 10 to 25 per cent higher than the Central Bank's official rates. But the black market is the mere aggregate of numbers of separate illicit transactions. It is no true market; many would-be buyers lack the connections and facilities to allow them to contact would-be sellers.

Little Capital Investment

This year imports into China meet with greater obstacles and difficulties than at any time since the end of the war. Their value for the first half of this year will show a considerable fall below that of the corresponding period last year. The Chang Chun Government have taken over the main body of their predecessors' foreign trade and foreign exchange restrictions. They may allow a few minor alleviations and adjustments in technique; but there is no prospect of any large-scale relaxation unless China obtains the large American loan for which she is trying so hard. To American exporters China unofficially holds out the hope of import concessions in case the loan should materialise. Chinese big business meanwhile sits back and watches developments. At the CN\$12,000 for US\$ rate, many imports have lost their attractiveness to Chinese wholesalers, who are spoiled by past windfalls and take little interest in anything promising a mere 10 to 20 per cent profit. There are practically no private investors in capital goods; Chinese capitalists generally consider the present uncertainties far too great to warrant fresh capital investment. The feeling that the post-war boom is over, that business conditions have deteriorated, and that still less prosperous days lie immediately ahead, is taking hold of the entire business community, both foreign and Chinese.

Prosperity for Wool

THE Yorkshire wool textile industry has always prided itself on settling its affairs at home and not taking them to Westminster. When Westminster fourteen months ago decided to submit it to ordeal by Working Party, some of its leaders declared that there had never been anything wrong with the industry that could not be put right by enterprise, initiative and competition. In November last year, the main conclusions of the Working Party were completed, and their report—published after a leisurely interval of five months—shows that the Party spent its eight months of work to excellent advantage. In its presentation and its findings the Wool Working Party Report* (which is summarised, together with a selection of statistics, in this week's issue of the *Records and Statistics* supplement) is one of the best of the series. It is a pity that its publication has been so long delayed.

Prosperity for the wool textile industry in the next decade hinges on three major considerations. First, the industry has to decide whether to keep to the manufacture of high quality goods, on which its export reputation has always been based. Secondly, it has to relate the prospective demand for its products to the labour force that it hopes to attract. And thirdly, this force must be put to the best possible use and associated with mechanical re-equipment to give the largest increase in output per head. These problems are common to the whole industry—wool and worsted in the West Riding, harris tweed in Scotland or overcoatings and serge in the West Country. These regional centres of the industry receive proper recognition in the report. But the West Riding of Yorkshire employs about three-quarters of the workers in the industry; a prosperous woollen and worsted industry in the dales of Yorkshire would supply the prescription for prosperity for the whole of the industry.

Wool is not a simple, integrated industry. It combs tops and spins yarn for export to the Continent; it has a growing trade in hosiery yarns supplied to home knitters; and in woven tissues it met practically the whole demand for home consumption before the war, and exported well over a quarter—in 1924, a half—of total production. About one-seventh of the tops went abroad before the war; British tops fed the worsted spinning mills of the world even during the depression. Most woollen yarn was used for weaving in this country but in the case of worsted yarn, some 15 per cent was exported. The rest was divided, in order of importance, between the worsted weavers, the hosiery industry and yarn, for hand-knitting. Of the woollen and worsted tissues exported, about two-thirds were woollens. These exports of tissues declined heavily between the wars, but thanks to the prosperity of the thirties, the home market took up the slack comfortably—the consumption of tissues increased by a third between 1930 and 1937. The industry's pre-war pattern was not one of lush prosperity; nor was it one of abject depression comparable with cotton.

For this state of affairs, high quality production deserves most of the credit. Good quality woven tissues cost more, but the difference in final cost of the made-up garment by using good quality cloth is comparatively small and generally thought to be worth paying, even in the cheaper ranges of suitings. The war has compelled the industry to give closer attention to

standardised utility cloths, and the question now arises whether the industry should incorporate this wartime production experience in a permanent policy of compromise between the highest quality output and a higher proportion of sound staple lines. This poses a number of issues. Can a range of cloths be produced which will appeal alike to the export and domestic market and so provide the economies of a reduced range of designs and longer weaving runs? Should the expanding domestic market take a reasonable share of good quality cloth, or should this be largely sent to export markets where it will enjoy a ready sale? These questions primarily concern the weaving trade, but they would obviously react on the earlier processes of production.

The Working Party have been impressed by the higher physical output per head achieved by the industry in the United States—though they offer some sensible reservations about it—but they have come down in favour of only those measures to increase output per head which are consonant with preserving the reputation for high quality enjoyed by British woollen goods. They formed a favourable view of the general level of efficiency of the industry, but are satisfied nevertheless that valuable economies could be secured by longer, standardised runs on automatic looms in the weaving section. The report presents some evidence that the export market has benefited from the home demand for high quality goods. But this evidence is rather inconclusive and one of the first tasks of the proposed statistical office might be to collect further data on quality in relation to the potentialities of standardised output.

This is, in one sense, a long range question. More immediately, a production target for the industry is needed, even if it has to be tentative. The Working Party suggest that the level of demand, after the post-war period of restocking, may be between 10 and 15 per cent above the 1937 level, including in this estimate a, possibly optimistic, 20 per cent expansion in exports. In putting forward this comparatively modest estimate of expansion in demand, the report has accepted as inevitable a contraction of the industry's labour force, compared with pre-war levels. Its best expectation for the post-war labour force is 200,000, some 15 per cent below the pre-war level. It follows, therefore, that if the estimated expansion in demand is to be met, there must be simultaneous improvement of between 20 and 25 per cent in the industry's productivity. There are few pointers which offer real assurance that these targets can be reached within the next few years. The total number employed in the industry in January was 163,800, and employment was expanding rather erratically during the winter by only a few hundreds a month. Since the end of the war competition for labour, especially female labour, has been keen in the West Riding and in other wool producing areas. The labour force is growing old and there is an acute shortage of juvenile recruits. The entire process of production has been disrupted by a shortage of female spinning labour. Finally, the interruptions and short-time working caused by the fuel crisis have had a severe effect on output from the mills, which are large coal users.

To combat the labour shortage requires an imaginative recruitment drive and improved amenities. But certain special methods are worth persevering with, such as extra evening

shifts and the tapping of pools of labour in rural and urban areas (which has brought about 700 workers in the Huddersfield area into the town each day to work a shift in the mills). In urban areas, numbers of unemployed men can still be found, many of whom could be trained to work in the mills provided that traditional barriers between men's and women's work could be broken down. But these palliatives will not bring young blood into the industry, and that is essential even to maintain the present reduced labour force. Some relief might be obtained by dispersing factories to the coal mining areas of South Yorkshire where limited reserves of unemployed female labour exist, but the wool industry would have to compete with the hosiery and boot and shoe industries which are moving up from Nottinghamshire on the same quest.

If the supply of labour should continue to be inelastic, despite improved wages, shorter hours and better working conditions, can the gap be closed by further mechanisation of the industry? There is little or no scope for deliberate concentration of men and machines in the larger mills, for all sections of the industry have maintained a comparatively high standard of efficiency—compared, that is, with the rest of British industry. There is therefore no supply of underproductive labour to "re-deploy"—as they say across the Pennines. The Working Party have examined the relative efficiency of different firms; there are divergences in efficiency between mills, but they follow no definite pattern in relation to size. This lack of any proved relationship between size and efficiency is appearing with increasing frequency in Working Party reports—it was a feature of the Furniture Industry Report published some time ago—and it presents a perplexing question which is overdue for solution. Baulked by the lack of data from reaching any firm conclusion about the origins of efficiency—although some interesting cost analyses are presented in their report—the Working Party have recommended that further investigation be conducted into costs and output per man-hour, and that American methods should be studied further.

Prospects for mechanical re-equipment are not good. According to the report, orders on machine makers' books at the end of 1946 totalled £11 million, of which half was for export. These orders will take three to four years to deliver. The industry feels that it is being starved of new equipment for the benefit of its overseas competitors—a natural if slightly exaggerated point of view. It underlines, nevertheless, the need for a constant review of home and export deliveries and a greater display of imagination than in the past on the granting of import licences. Even if delivery rates improve, re-equipment must be a slow business. The Working Party points out, for example, that deliveries of automatic looms on even reasonably optimistic assumptions will only be sufficient to meet replacements—if old machines are, in fact, to be replaced. Obviously, the first need, as the Working Party suggest, is to

encourage delivery of new machines to the points where economy of labour can be quickly secured—in particular to the winding, warping and weaving sections. Only 6 per cent of the industry's looms are automatic, but their advantages over the old standard types is suggested by the fact that 60 per cent of new looms ordered are automatic.

The labour shortage in spinning is particularly acute. No important changes in technique to relieve the shortage of female labour in worsted spinning can be expected for some years. In woollen spinning, where mule spindles predominate, improvements in output per machine were effected before the war and no further important developments are at present likely. If therefore the balance of the industry is to be preserved and full advantage is to be taken of technical development in other sections, more labour must be attracted to spinning—which means special incentives, better conditions, the recruitment of ex-spinners and the offer of reasonable prospects for young workers to make a well-paid and attractive career in the mills.

The Working Party have produced a lucid and comprehensive report, full of fair comment and well-marshalled fact, but they have no ready-made solution to offer. They call, naturally enough, for greater emphasis on research, backed by a levy to produce £150,000 annually for scientific and market research, in which Universities and Technical Colleges teaching textile subjects should share. Manchester, Bradford and Nottingham may look askance at the recommendation for an Advisory Council covering all the textile industries—a point which has incidentally been under broad review in the Committee Stage of the Industrial Organisation Bill. It is only too easy to see the difficulties of an organisation covering all textiles, and the risk that its early career might be blighted by trade rivalries and jealousies. But there are many textile problems which call for urgent joint discussion. How, for instance, is the capacity of the textile machinery industry to be shared between cotton and wool? How are the wool textile and clothing industries in Yorkshire going to compete against other industries for a limited number of new entrants into industry? If the wool mills move to South Yorkshire, how are they going to share the new-found pool of labour with the industries from the Midlands?

To raise these questions is not to solve them. There are black spots—an inadequate labour force and some out-of-date mills. There are some unanswered questions—such as the lack of facts (not confined to wool) about the causes of efficiency and low costs. Here is an industry which but for shortage of labour and fuel would be in a state of high boom. The first task is to increase the labour force to the recommended size of 200,000—which will not be easy. After that, the improvement of efficiency and working conditions would be a much simpler task.

Facts on the Subsidies

IT has been an open secret for some time past that the Government has been showing increasing concern about the growth of the cost-of-living subsidies. A short-term increase would be of small consequence, particularly if it avoided the need for temporary changes in wages; but the Government's policy of stabilising a moribund index number has meant that the volume of subsidies has in fact been tied to the rise in world prices. Doubtless it was hoped that the increase in food prices in the international market would be only temporary and that the Treasury's payments in one period might be recouped in the next. This optimism, however, has so far proved to be unfounded and world prices have continued to rise. Even now hopes are being pinned to a bumper world wheat harvest this summer, though there is no present sign of a collapse in grain prices. According to the Chancellor of the Exchequer, the policy of stabilising an out-of-date cost-of-living index has hitherto been justified; and only now have conditions made it desirable to recast this policy. The new factors which have appeared to alter the situation so abruptly have not been officially revealed, but the Treasury's main problem is clearly to find some palatable method of limiting the total expenditure on subsidies. This problem is bound up with the supply of hard currencies, for a large proportion of Britain's larder has to be filled from the Western Hemisphere.

The cost of subsidies on certain foodstuffs was recently given by the Minister of Food; full details are published in the current issue of the *Records and Statistics Supplement*. Some interesting calculations, which are embodied in Table I, can be made from these figures. The foodstuffs covered form the staple rationed commodities, and taking into consideration the amount of each item that can be purchased on the ration, the total weekly cost per adult consumer comes to 5s. 3½d. In addition, the Treasury pays 2s. 3d. per person a week in the form of subsidies. The most heavily subsidised commodities are eggs, cheese, sugar, flour and potatoes. In each of these cases the subsidy represents more than 50 per cent of the consumer's weekly net expenditure. The cost of the schools' and welfare milk schemes have been excluded; it is estimated that these probably amount to about £20-£30 million a year. If the subsidies were removed from the foodstuffs listed in Table I, so that the consumer had to pay their full price, the weekly expenditure per head would rise from 5s. 3½d. to 7s. 6½d. Proportionately this is a large increase, and for the consumer with a small fixed income or the old-age pensioner it would be a heavy burden. But, measured in terms of present earnings of those actively employed, it could hardly be represented as a major hardship. For a family with 4 ration books, the increase in expenditure would be from about 21s. 3d. to 30s. 3d.

The saving in Government expenditure from the withdrawal of subsidies would be surprisingly large, though it is impossible to calculate this saving precisely without knowing the quantities sold at the appropriate subsidised prices and the corresponding changes in stock levels. But a fair impression of its magnitude can be obtained from published weekly consumption figures for the various foods. Allowance has to be made for exports, where they are included in the published data, but it is impossible to separate the sales of certain commodities to manufacturers at unsubsidised prices from those to domestic consumers at domestic prices. The totals for the weekly cost of subsidies given in Table I, therefore, tends to set an upper limit. On the other hand, no allowance has been made for the increased prices for home produced foodstuffs which were recently announced. On the basis of consumption during the first two months of this year, the Government would save £7.2 million

a week, if it decided to withdraw the whole of the subsidies from those foodstuffs listed in Table I. On the basis of average weekly consumption for 1946, the saving to the Exchequer would be £7.4 million. Judging by these figures, it would seem that a net saving to the Government of over £300 million a year (or about 2s. 9d. in the £ in terms of income tax) would result from increasing the weekly expenditure per head on food by 2s. 3d. This is the balance between the financial relief to the Budget and the extra cost to consumers which the withdrawal of subsidies would entail.

By increasing food prices and reducing income-tax, the upper and middle income groups would benefit, in real terms, at the expense of the lower. But the prices of rationed foods in the United Kingdom are notoriously out of line with all the other elements in the existing price and income structure, and it could hardly be argued that a policy of gradual reduction of the subsidies would distort the British economy still further, for its shape is already bulging as the result of a large inflationary potential. The figures in Table I, based on current rations, clearly show that the subsidised foodstuffs

TABLE I—WEEKLY FOOD RATION COSTS AND SUBSIDY VALUES

‡ Weekly consumption estimated at 1½ eggs per person.

provide only the staple elements in the consumer's diet. Points goods and unrationed foods have to be purchased, not merely to give variety, but to provide adequate nourishment. These goods, however, are not, on balance, subsidised; some are, but on others a counterbalancing profit is made. All the 4½ million people whose incomes have been tied to the Ministry of Labour's cost of living index are familiar enough with the fact that the stabilisation policy has meant no more than the stabilisation of an archaic index number, and has not provided a stable cost of living by the recognised standards of to-day. The stabilising effect of food and other subsidies would be much more important if the rationed quantities formed a major proportion of total diet.

Foodstuffs are not the only commodities subsidised. Utility clothing and footwear have also to be taken into consideration. An attempt has been made in Table II to subdivide the total cost of living subsidy for 1947/48 (given by Mr Dalton as £425 million) into its component parts, with comparable data for 1946/47. These figures have been taken from the Civil Estimates. In column (3), the annual costs of subsidies on individual foods, based on Table I, are given; the total figures in this column may not be so accurate as those of columns (1) and (2), partly because column (3) is not so comprehensive, but the individual items are, nevertheless, considered to give a truer picture. Comparison of the three sets of figures is

indeed striking. During the current year some notable changes are likely to occur in all items, except milk, potatoes and sugar. The tremendous increase in the cereal subsidy reflects higher world prices. The £24 million difference between the flour subsidy (£81 million) and the total for cereals (£105 million) is no doubt accounted for by a trading loss on other grains, such as barley, oats, maize and their by-products. The reduction in the subsidy on egg and egg products must, in part, be

* These estimates have been calculated on the pattern of 1946 consumption with the food subsidy as at April 1st, 1947. Overheads and other expenses are allotted to commodities.

† This comprises the balance of items in the trading deficits and overhead expenses of the Ministry, less any specific capital expenditure.

‡ Estimated at 10 per cent. of Ministry of Food trading deficit.

** Included in "other items."

*** Estimated.

due to the removal of the subsidy for dried eggs some months ago. Indeed, by comparison with column (3), it would seem that the present profit obtained from the sale of dried eggs goes a long way to pay for the subsidy on shell eggs. The provision

in the Estimates of £2 million for meat and livestock during the current year seems very peculiar. It is not known how this figure is calculated and what profits have been included to offset the subsidy, which on the basis of Table I must cost between £50 and £60 million, of which probably about half represents home-killed and the remainder imported meat and corned beef. It may mean that Government purchases during the current year will be severely restricted. If so, the consumer is in for a thin time as meat stocks are known to be limited. The £46 million shown in column (3) for sugar appears to be rather high, as total United Kingdom consumption has been treated as going to domestic users at subsidised prices, which is not so; the trading deficit (column (2)) of £21 million is therefore, probably, a more accurate guide. In the case of tea, there is a remarkable difference between the estimated subsidy (£19 million) and the trading loss (£3.5 million), particularly as allowance has been made in the former figure for re-exports. Indeed, it may still be a little high, for it takes no account of possible sales at unsubsidised prices. But in any case it is unlikely to be less than £15 million. It would be interesting to discover the reason for this discrepancy. Are large profits made on other beverages, such as coffee and cocoa, and offset against the tea subsidy?

The utility clothing and footwear subsidies total some £33.7 million for the current year. The apportionment to both cotton and wool has nearly doubled compared with 1946/47, while the hides and leather subsidy is thought to have remained fairly stable. It seems a pity that the Government has not yet seen fit to publish, periodically, accurate details of the cost of living subsidies, including the basic prices and quantities to which they are related. There can be no case for secrecy in this matter, particularly as fairly reliable estimates—subject to some margin of error—can be calculated from published data. The discrepancies that exist between individual items in columns (2) and (3) of Table II clearly shows that the data contained in the Civil Estimates could be presented both more frankly and more realistically. The form of presentation used in the Estimates may be consistent with Treasury accounting methods, but it is enlightening neither for the consumer, who enjoys the subsidies, nor the taxpayer (broadly speaking, the same person), who foots the bill, nor for the economist, who attempts to relate the advantages of stabilisation of the cost of living to its reactions on the body economic.

Business Notes

Nationalisation and Steel Policy

If recent reports are to be believed—and there is good reason to accept them—a decision has been taken by the Cabinet to proceed with the nationalisation of the steel industry during the next session. On Monday last, the Minister of Supply was asked to say when he expected to be able to make an announcement about the Government's plans for taking over the steel industry—to which the self-evident answer was given that no legislation on this subject will be introduced during the present Session. For several weeks past there have been rumblings of dissension from the Cabinet room about steel policy, and apparently the decision to go ahead with nationalisation was not reached without a struggle. If the opposition was based on nervousness about the disturbing effects of nationalisation on steel output and the post-war development of the industry, it was certainly justified. The Government shows an astonishing hardihood in proceeding with the nationalisation of steel in 1948, for in that year a crop of major economic problems will in any event have to be reaped.

It will be many months before the public and the steel industry know for certain exactly what "a large measure of public ownership" in "appropriate sections" of the industry will mean. These are the formulas used by the Government a year ago, and they still appear to stand. Obviously, they are capable of many interpretations, and it will be for the Government to show, when the

Bill is introduced, why the interpretation they have chosen is better than any other, and what the real benefits and consequences of the nationalisation of the steel industry will be. Nationalisation Bills unaccompanied by any statement of Government intention and policy have become common form during the present Parliament; it will be a matter for severe censure if the Steel Bill lacks explanation and justification.

Meanwhile, the post-war development of the industry goes forward under the guiding influence of the Iron and Steel Board. Sir Archibald Forbes, the chairman of the Board, has this week explained the considerations which the Board has applied to plans for development submitted by the industry. Most of them are obvious enough—for example, the relationship of the proposals to modern practice at home and abroad "on the criteria of maximum efficiency and fullest economy in cost," economics of location, and availability of labour—though there are cases where these economic questions "have to be subordinated in some degree to wider considerations such as the social disturbance factor."

In other words, minimum cost is to some extent being compromised by the doctrine of "taking work to the workers"—an issue which has again been raised in connection with the South Wales scheme. Broadly speaking, the Board has endorsed the Iron and Steel Federation's post-war development plan which contemplated an extension of steel capacity to 15-16 million ingot

tons as a first stage, and was originally estimated to involve a capital expenditure of £168 million over a period of 7½ years. Projects estimated to cost £100 million—at current prices—have been generally approved by the Board, and further projects involving £20 million are under consideration now. Roughly speaking, about half of the Federation's plan has been approved, and work is under way on most of the projects. Sir Archibald's review of the Board's work unfortunately did not reveal to what extent it had become an independent body, with expert views of its own on steel policy, nor the degree of influence which it has brought to bear, as a Board, upon the industry's development. On steel prices the Chairman had only one brief sentence to utter, which showed that the Board's independent adviser has "under continuous examination" the costs of production of controlled products, while the adjustment of prices, up or down, is kept "under constant review." Here again it is difficult to measure the development of policy and principle from the Board's work during the past eight months. Now that steel policy is again in the centre of controversy, this apparent reluctance of the Board to explain the realities of its work is the more unfortunate.

* * *

The Old Lady Finds Tongue—

The "Old Lady" has ever been the most silent of all central banks. Except for the evidence of her officials before the infrequent Parliamentary enquiries into financial matters, she has never in any official statement told the world anything of her domestic affairs. One of the few visible effects—and, in the opinion of many, almost the only advantage—of nationalisation was to ensure that at last the Bank would begin to issue annually a report at least more informative than the statutory form of the weekly statement of account which is all that has been furnished in the past. And since, in point of curiosity about the Bank's affairs, Labour politicians have been rivalled only by the economists and students of finance, there seemed a sporting chance of quite intriguing revelations. But those whose appetites may have been thus whetted are to be disappointed. The silence of two hundred and fifty-three years has indeed been broken, but the voice which breaks the stillness is discreetly modulated and its utterance no less discreetly censored.

This first report extends to fifteen pages (of paper whose quality *The Economist* will not be alone in envying, though the White Paper version is a more austere affair), yet tells nothing that is both new and significant. The "accounts" of the Bank itself are, indeed, confined to the customary Bank Return, of which a special issue appears for the final day of the financial year, Friday, February 28th; there is no profit-and-loss account. And the "report" is mostly couched in austere formal shape, wholly devoid of anything which might suggest opinion or subjective analysis. With three exceptions, all the information on domestic finance is already easily obtainable from the usual official sources (or, for that matter, from past issues of *The Economist*). The exceptions will interest the financial student in search of detail, but have little relevance to the larger issues. We are told, for example, the gross turnover of notes—issues and cancellations; the distribution of the circulation between the various denominations (in 1939 and annually since 1943); and the composition, in those same years, of the public debt for which the Bank acts as registrar.

In this last context, however, the report shows a refreshing tendency to become the human document which high policy so patently barred. The redeemed Local Loans stock had been held on 97,000 accounts, and in the eight weeks before the register was closed more than 25,000 transfers were received. Between these lines the imaginative will readily smell the midnight oil and sense the Bank's justifiable pride in its achievement. Again, as evidence of the effect of Mr Dalton's cheap money drive upon activity in the gilt-edged market, there is the interesting fact that, in all, 640,000 transfers were registered during the year, no less than 34 per cent more than in 1945-46. There is evident significance, too, in the disclosure that although the volume of debt managed by the Bank expanded by 108 per cent between 1939 and 1947, the number of "accounts" rose by only 14 per cent. The only other developments upon which the new figures throw light are the exchange of bearer into registered securities between 1939 and 1944 and the withdrawals of notes of large denomination.

* * *

—But Does Not Speak

But though the report contributes only these minor titbits to the fund of knowledge, it is none the less a valuable document, and

will certainly be much appreciated by bankers and students abroad. For the home reader who is concerned with matters of high finance but is not in day-to-day touch with detail, the most useful feature will probably be the section on external finance, with its thumbnail sketches of the changes in monetary relations of the United Kingdom with other countries—summarising each of the monetary and financial agreements concluded during the year and briefly explaining the manner in which the availability of sterling has been extended. There is nothing here which has not already been presented in the press, but it is helpful to have the salient details assembled briefly and authoritatively.

In sum, the report is a welcome addition to official sources on finance, but it is impossible not to feel that an opportunity has been lost. The appearance of the report breaks with tradition, and yet in a sense its form upholds it. If the authorities hold firmly to the evident rule of telling nothing that is new unless it is of little account, and equally eschew both opinion and secondary analysis, future reports obviously cannot significantly better this first attempt without simply duplicating material that is on record elsewhere. But even if these constricting limits are maintained, it would be well not to take the dangers of duplication too seriously; there is always useful scope for intelligent re-presentation of material. In this context, one cannot help feeling that the Bank may have been discouraged by the virtual absorption of its former *Statistical Bulletin* into the Government's *Digest of Statistics*, and has felt inhibited in the matter of secondary analysis of statistics. Yet the *Digest's* finance section, though well above its initial standard, is still exceedingly sketchy, and is obviously hampered by the need for keeping the whole volume within reasonable compass. There is still a field for the Bank here; but, apart from that, by becoming a little more venturesome, the authorities could open up much more promising territory. As it is, it can be said that the Bank has found tongue, but she has hardly yet spoken.

* * *

Budget Leakage Inquiries

The Stock Exchange Council have appointed, at the request of the Chancellor of the Exchequer, a special committee to establish the facts about dealings in certain securities in connection with the premature disclosures of Budget changes in the tobacco and rayon duties alleged by Mr J. Gurney Braithwaite in the House of Commons. Mr Braithwaite's allegations referred to the sharp rise in the price of British Celanese and Courtaulds shares during the two hours before Mr Dalton rose to make his Budget speech, when, according to information he had received from jobbers, there was heavy and influential buying. In the tobacco market he found that dealers were accurately informed before the Chancellor rose of the exact amount of the increased duty on tobacco, though he stated that no share dealings appeared to have taken place in the tobacco market.

The special committee appointed by the Council will presumably call for jobbers' records and investigate the source of buying orders during the period cited by Mr Braithwaite. It is only fair to add that there is no widespread belief in the City or elsewhere in the likelihood of a leakage of Budget information. Mr Dalton himself pointed out in the Budget Debate that the withdrawal of the rayon Excise duty was a probable concession, for it was in direct line of descent from his 1946 Budget; and he claimed, with equal force, that the fact of an increase in tobacco duty, as distinct from its precise amount, could have surprised very few people. But clearly allegations of this kind must be investigated, and the special committee will have no difficulty in establishing the facts. So far as can be ascertained by informal inquiry, business in rayon shares on the afternoon of Budget Day did not amount to more than a few thousand shares, and the fact that the extent of the increase in the tobacco duty came as a general surprise is fairly conclusively suggested by the falls in tobacco shares on the morning after the Budget.

* * *

The Solicitor-General on Profits—

"There is something about the speeches of the Solicitor-General which leaves me with the impression that I am Alice and that I have passed through the looking-glass." These words of Mr Boothby, after Sir Frank Soskice had concluded his explanation of the Budget Resolution on the Profits Tax on Wednesday night last week, are certainly appropos. In the debate, the estimates of industrial profits and their distribution which were given on page 591 of *The Economist* of April 19th were freely referred to, but in the hands of Sir Frank Soskice, they took on new shape,

and he concluded a remarkable arithmetical demonstration with words which deserve quotation:—

I ask the House, if that is the position, and if these companies that paid out any form of dividends were placing only half the amount of their earnings to reserve, what stronger argument could one have for some discouragement of that sort of thing? That is the very object which this tax is designed to achieve.

Sir Frank clarified these words in phrases of more precise meaning in his later remarks. *The Economist's* figures ("if they are correct") proved that far too much profits were distributed; therefore, since the amount distributed was larger than the amount placed to reserve, the necessity for the increased tax on distributed profits was proved. Law Officers of the Crown are not appointed because they are qualified in investment or economics, but their comments on such matters need not be jejune. "No company," declared Sir Frank "need pay a penny more in respect of this tax"—provided, he might have added, that it has no preference capital, and that its ordinary shareholders are creatures of such docility that they are indifferent whether they receive dividends or not. Nor did he explain how the increased tax would ensure the ploughing back of an increased amount of profits for capital development; in many cases, the result will be precisely the reverse.

As for holding a balance of justice between the rentier who has suffered the cuts of cheap money and the ordinary shareholder "on whom, hitherto, no burden has been placed," and who has "got off scot free," the Solicitor-General failed, as well he might, to make a case for the tax. This new variant of the "equality of misery" doctrine is simply irrelevant to the position of the preference shareholder (whose income position has been largely unaffected by cheap money) and that of the ordinary shareholder—who will bear, directly or indirectly, the whole burden of the increased profits tax on his own dividends and also on those of the preference shareholder as well. Yet only a few minutes earlier Sir Frank had been arguing that the ordinary shareholder does not take any risk.

On two points, the Solicitor-General had precise matters of importance to reveal. The first was the consolidation of parent and subsidiary profits for the purpose of the tax, either by election on the part of the parent company, or by administrative action. The second covers the application of the increased tax from January 1st this year. Obviously, the apportionment of distributed profits for the purpose of the tax for concerns whose chargeable accounting periods ended after that date (thus taking in part of 1946 for EPT and part of 1947 for the profits tax) was to be expected. But company directors are evasive animals. They might increase their dividends in respect of the financial year 1946 in the hope of escaping the 12½ per cent tax; they might even describe them as being declared in respect of 1945. So the Finance Bill will provide that any increase in the dividend "over such period" (by which Sir Frank apparently means the period after the Budget announcement, though it is far from clear what he really meant) over the figure for the previous year will be treated as relating to the period in which it is declared, and not to that in respect of which it is expressed to be declared. In other words, the extra 2 per cent bonus to be distributed by the directors of ICI will cost the company 12½ per cent less tax, to be drawn from its ploughed-back profits. The attitude that company directors are not fit to be trusted is common enough—in the Transport and Electricity Bills, for example—to need no comment. But the incidence of this provision on many honestly managed companies will be retrospective and spiteful.

—And on Preference Shares

The legal mind at work can be impressive—and it can be dismaying. Some general remarks on preference shares which Sir Frank Soskice offered in the debate should not go unnoticed by investors. Here again a quotation is called for:

If a company thinks that the ordinary shareholders are unfairly dealt with (Sir Frank was speaking in connection with the profits tax) there is nothing to prevent the company altering its capital structure so as to alter the rights to dividend as between the ordinary shareholders and the preference shareholders by going through the usual process as applied by law. They can decrease the rights of preference shareholders, and they can increase the rights in relation to the ordinary shareholders A company can do it, if it takes the necessary steps.

This proposition is so fantastic that it is difficult to believe that the Solicitor-General was doing more than to take a rather indifferent legal point, which might have supported a poor case in the Courts but was quite inappropriate in the House. Does the Solicitor-General really suppose that this is a practical step for equalising the burden of profits tax between different classes of shareholders? Does he imagine that the preference shareholders would be willing to abate their contractual rights merely for the sake of the ordinary shareholders on whom the burden now falls? He should know that something of this sort has been tried frequently before, though it is not very successful nowadays. And apart from this, are companies seriously supposed to undertake the cost of a spate of schemes of this sort and inflict them upon the Courts? The Solicitor-General has on previous occasions revealed the innocence of a Parsifal in matters of ordinary business. His opinion on the rights of preference shareholders might be welcomed by a handful of company directors who have particular reasons for inflicting harm on their preference shareholders, but they will be acceptable to no one else.

Drawings on the Loan

Another draft on the American credit was announced at the end of last week, this time for £62½ million, which is the largest instalment since the first draft was made last July. This new drawing, moreover, follows a period of very heavy expenditure—since February 22nd drawings have been made at three-weekly intervals for rising amounts. Against this there is the minor consolation that pressure on the Canadian credit seems to have been somewhat relaxed, for apparent drawings in the past six weeks have amounted to only £10 million. This explains, to a slight extent, the increased reliance upon the American Loan, because the arrangements made with Canada early this year for the use of sterling in international payments have had the effect of switching to New York some of the pressure caused by Britain's expenditure in Canada. It is very clear, however, that the effects of the fuel crisis, which have hardly yet been reflected in the Trade Returns, have already had their impact upon dollar resources.

The table in page 686 shows the extent of the drawings on the credits to date and the approximate weekly rate of drawings calculated in periods between each draft on the US credit. The calculation is necessarily made on the assumption, which may be unduly pessimistic, that Britain's dollar balances have been allowed to reach a minimum working level before each fresh draft is made.

* Average for 9 weeks to March 8th.
† This heavy initial rate reflected debts accumulated owing to Congress delay in ratification.
‡ Six weeks from March 8th.

Washington authorities stated last week that Britain is planning to withdraw a total of £475 million—that is half the original amount—of the US credit by about the end of the first year of the Agreement. This postulates a further drawing of £87½ million and a further spending (including the amount just drawn) of £150 million in the next two months, which at first glance looks an extravagant estimate. It represents, however, an increase of about 10 per cent over the apparent rate of expenditure in the six weeks to April 26th—excluding the latest drawing of £62½ million. It may well be, therefore, that the Washington statement is not far from the truth, for Britain's import costs are only now beginning to feel the full effect of last year's steep rise in American prices. Certainly it is now all too apparent that the estimates made last February, on the basis of the rate of expenditure up to that date, that the dollar credits might last until well into 1949, were too optimistic. It now seems that it will need careful husbandry to make them last until the middle of next year.

Corporation Loan "Failures"

This week has provided further evidence of the unwillingness of investors any longer to take Mr Dalton at his word when he tries, by the familiar technique of 1946, to stampede the gilt-edged market into a further rise. In his Budget speech he taunted holders of local authority stocks with "slow-wittedness" for their failure to respond eagerly to the successive conversions, declaring that their inactivity had simply provided profits for the taxpayer through the operations of the official underwriters. But investors seem quite perversely to have become even more "slow-witted" since the Budget speech than they were before it. The conversion offers to holders of the £1,300,000 of 5 per cent Derby Corporation stock and the £1,493,944 of 5 per cent Newcastle-on-Tyne stock, the lists for which were closed last week, have produced an even smaller response than was achieved in the previous series.

It will be recalled that these two conversions, though launched after the fuel crisis had undermined the level of gilt-edged, were offered on precisely the same terms as had ruled earlier in the year—namely 2½ per cent stock, 1970-75, at par. It seemed at the time a foregone conclusion that virtually the whole of the new issues would have to be taken up by the National Debt Commissioners, but Mr Dalton must at least have hoped that his defence of cheap money in the impending Budget speech would make them look more attractive before the conversion period ran out. As it is, conversion applications were received from holders of only £149,000 of the Derby stock and £255,000 of the Newcastle, so that the proportions left with underwriters were 88½ per cent and 81½ per cent respectively, much higher percentages than even the worst of those recorded earlier in the year. It is very evident that the gilt-edged market is no longer susceptible to the bluff tactics of the past. If Mr Dalton really intends to establish the level of gilt-edged which is appropriate to corporation conversions on such terms as these, he will need, once again, to bring the weight of created money to bear upon prices.

Transport Travesty

At 9.30 on Wednesday evening, the guillotine fell on the Report Stage of the Transport Bill; guillotine then gave place to steamroller, and the remaining Government amendments were pushed through, amid scenes of indignity and disorder. There now remains a day for a general discussion on Third Reading before the Bill goes to the House of Lords. The Report Stage has introduced no major improvements which had not already been promised in Committee, no new concessions, and few new

arguments. The final appeals for an improvement in the terms of compensation for private stockholders have been rejected. The obscurity about future charges schemes is as dark as ever. Municipalities will obtain improved compensation, beyond the niggardly taking over of their net debt charges, to the extent of £2½ million. Wagon owners will be paid according to a new schedule of prices, which are at least an improvement upon the scrap values originally contemplated in the Bill. But the Government were unwilling to make any concessions on the compensation to the road hauliers which Mr G. R. Strauss described as erring, if at all, on the side of generosity. And the road passenger operators, whose appearance in a co-ordinated system of transport is likely to be long deferred, have no knowledge of their position for compensation, which is entirely at the discretion of the Minister.

The Bill, then, remains substantially in the same stage as it emerged from Standing Committee, and the comments offered in a leading article on April 12th remain unchanged. The majority of voters, who did not support the Labour Party, will long remember, with railway stockholders, Mr Barnes's declaration that "the Government of the day, if it has the will of the people behind it, can do anything it likes with regard to the services that are necessary to the interests of the whole community"—without arbitration if it feels that arbitration is unnecessary. It is worth repeating that Part V of the Bill on transport charges—which is crucial for the whole issue of nationalisation—has been given quite inadequate consideration. The improvements on "C" licences, and the treatment of docks are important, but they suggest that, given an adequate opportunity for discussion, other improvements could have been extracted from the Government. As it is, the Bill goes to the House of Lords drafted in isolation, discussed in haste, and amended in few important matters of principle.

Canada's Exchange Position

Ever since Canada revalued her currency to parity with the US dollar last year doubts have been expressed whether the move might not have been precipitate and might not have to be undone in order to ease the growing strain on the Canadian exchange position. Fuller data, by which to judge these doubts and fears, are now provided by the report of the Canadian Foreign Exchange Control Board for 1946, which was issued in Ottawa this week and of which cabled reports have been received in London. The report shows that the Canadian exchange position was undoubtedly under some strain last year, during which the country's gold and US dollar reserves fell by \$263 million to \$1,245 million. The current account deficit in transactions with the United States amounted to \$603 million. This was covered as to \$237 million by gold and US dollars received in the transactions with other countries and as to \$366 million by a net inflow of capital from the United States. Canada's current trade account with the sterling area showed a surplus of \$650 million, of which \$150 million was financed by sales of gold by Britain to Canada. The bulk of the balance was represented by drafts on the Canadian credit by Britain. These figures conform to the traditional pattern of Canada's balance of payments, a surplus with sterling area countries and a deficit with the US dollar area, the two dovetailing and offsetting each other only in so far as sterling is convertible into dollars. During the past year the pressure on the Canadian balance of payments could not, of course, be regarded as due to the absence of such convertibility, because, instead of receiving sterling as the counterpart of sterling area expenditure in Canada, the Canadian authorities themselves largely provided the requisite dollars under the Canadian credit to Britain.

The position has in it elements of danger, first, because it seems all too likely that the Canadian surplus with sterling area countries will for some time to come continue to be financed out of Canadian credits; secondly, because the deficit with the US dollar area is still growing (last year's figure was the highest on record, and indications to date suggest that it may even be exceeded in 1947). The report of the Foreign Exchange Control Board mentions the various methods by which the position could be strengthened, and in the course of the discussion definitely turns down a fresh devaluation of the Canadian dollar which would merely turn the terms of trade against Canada and in present conditions would fail to achieve its purpose. Greater restriction of exchange allocations is considered a more promising course. This could be achieved by curtailing allotments of US dollars to Canadian tourists and by a more selective restriction of imports from the United States. These methods, however, will be difficult to reconcile with Bretton Woods and ITO. The real solution to the Canadian balance of payments problem will be found only when Canada's surplus with non-dollar countries is effectively

All the business of War and, indeed, all the business of life, is to endeavour to find out what you don't know by what you do

available to cover her deficit with the United States. Until that point is reached, Canada can presumably claim to be in balance-of-payments difficulties, and, therefore, to evoke selective import controls and other defensive devices with which to maintain her gold and exchange reserves.

* * *

Texas City and British Insurers

It is now clear that the explosions and fire at Texas City are the largest disaster that the London insurance market has had to meet for many years—perhaps since the great San Francisco fire. The total loss is believed to be over \$50 million; some part of this falls directly on those London companies that transact business in the United States; and a good part of the rest will, by one channel or another, be found to be reinsured in London. The largest part of the loss arose from the virtually complete destruction of the Monsanto chemical works. These were covered through one of the pooling arrangements familiar in America, by which all the risks of an industry are underwritten by a single association, in which the insurance companies, British as well as American, participate. In this particular case, it is reported that the Monsanto works were not treated as a single risk (as they turned out to be), but as several risks, which had the result that less was reinsured and that a heavier loss accordingly falls on the original participants.

Payment even of claims as large as these will not, of course, present any difficulty to British insurers. But they will make it difficult to present favourable results for 1947. Last year, as the reports of the British companies are showing, was a difficult one in American business. A heavy increase in business (involving substantial additions to reserves for unexpired risks) was combined with rates of premium which, in many lines, were definitely unremunerative. Even before Texas City blew up, the present year did not promise to be much better.

* * *

Australia's Sterling Balances

The imminent arrival in London of Mr S. G. McFarlane, Secretary of the Federal Treasury, will be the prelude to negotiations for an arrangement concerning Australian accumulated balances in this country. These balances, together with a certain amount of gold held by Australia, amounted on January 15th last to close on £175 million. From this figure there has to be deducted the £20 million free gift which the Commonwealth Government is making to Britain as part of its contribution for

the expenses of the war waged in the Pacific. This contribution, no doubt, must in this context be regarded as an indirect way of writing down the balances in accordance with the vague and tentative provisions of the Anglo-American financial agreement. The arrangements for dealing with the rest of the accumulated balances will hardly deserve the name "negotiations." They are expected to be made in the friendly and generous atmosphere in which for many years now financial relations between Britain and the Commonwealth have been handled. There seems to be no need for funding the accumulated balances and arranging their release over a period of years. The amount in question would hardly justify such a move. Australia will have need of considerable sterling in the immediate future in order to meet maturities of sterling loans. The optional maturities of loans carrying 3½ per cent and more amount to no less than £85 million for the next six months. Moreover, the Australian authorities with the bitter experience of the 1930's still fresh in their minds (sometimes all too fresh) will wish to maintain in London a larger reserve of sterling funds than was previously regarded as normal.

In the case of Australia, as with other countries which have accumulated balances during and since the war, the arrival of July 15th will call for an interesting book-keeping transaction. A rule will have to be drawn through the sterling accounts. Previous accumulations will then have to be treated in accordance with arrangements made in each individual case. Subsequent current accumulations of sterling will be freely expendable and transferable in any currency area in the world.

* * *

Anglo-Polish Trade Expansion

After discussions lasting for two months, a provisional understanding has been reached between the British and Polish Governments about the import needs of the two countries. It is intended that after a month's interval the talks will be resumed and that a trade agreement may emerge from them. This rather tentative arrangement is to give each side the opportunity of gaining experience about placing orders with the other. The pattern of trade between the two countries would provide a good economic "fit," for Britain's requirements are mainly food and raw materials, while Poland is in need of other raw materials from British sources of supply, such as wool and rubber, and also capital goods. The month's breathing space may be useful because both British exporters and importers will be trading with the Polish Government, while the British Government as a purchaser of food may be dealing jointly with the Polish Government and with the producing co-operatives. It is intended that all transactions will be in sterling, and export credit guarantees should be available to assist exporters of British machinery.

For neither side will the provisions of supplies which the other needs be easy. Poland has joined the long queue for British machinery rather late, and its possibilities as a long-term market are now rather obscured by the ease with which British manufacturers can sell in other countries without going to the trouble of undertaking special trading arrangements and also by the need to increase exports to hard currency areas. As for British needs, timber is the most urgent, but it may well be that timber will be more difficult for Poland to export than supplies of food, particularly eggs and poultry. Indeed, the first consequence of the agreement is a contract for 30 to 50 million eggs to be shipped from Poland by the end of September. Reconstruction work after wartime devastation is making great demands on Polish home-produced timber, and losses of pigs and cattle can only be gradually restored; for some time to come, therefore, Poland's traditional exports of timber, bacon and butter are likely to be restricted. Britain may be able to obtain some supplies of china, glass and furniture. The discussions appear to have contemplated the export this year of 250,000 tons of coal from Poland to Britain at a cost of £800,000, but this would presumably be conditional upon a successful application by Britain to the European Coal Organisation for an import allocation. No application has been made to ECO, but the possibility that coal might be imported by this country from Poland in this year is indeed portentous.

One of the factors involved in any trade agreement which may be drawn up between the two countries is that the Poles will naturally try to integrate their foreign trade development with their three-year economic plan. In fact, they contemplate importing British goods to a total value of £35 million over the three-year period and to export in return £5 million this year, £8 million next and £10 million in 1949. The prospective deficit of £12 million would be met to the extent of about £4 millions from

gold and sterling assets in London, which might be released as part of a general financial settlement, and partly from credits. There is an evident need for the British Government to seek supplies of food and essential materials wherever they can be got, and if necessary to finance them by foreign credits. This, roughly speaking, is the pattern of the Spanish agreement which was recently announced. The Polish suggestions, on the other hand, amount to the financing of Polish recovery by a further extension of sterling credits by Britain to Europe. If a Polish payments agreement could be brought within the orbit of the Western European currency arrangements, much could be said in favour of this course. But since such a development would seem rather unlikely, the British authorities will obviously have to hold a balance between the extension of credits to Poland with the advantages that a resumption of trade would have for both sides.

* * *

Subsidising Small Savings

Amid the Budget debates and the discussion of Mr Dalton's defence of cheaper money, an important change which is impending in the status of the Savings Banks has largely escaped attention. The cryptic proposal in the Budget speech—described by the Chancellor as a small technical point—to "put the backing of the Consolidated Fund" behind the savings banks is, in fact, a proposal to subsidise the depositors. Following the Budget resolution adopted last week, the Finance Bill will empower the Treasury to make payments out of the Consolidated Fund, both direct to the Post Office Savings Bank Fund and to the Fund for the Banks for Savings, and to defray the expenses of the inspection committee for the banks and certain expenses of the National Debt Commissioners. Since the Chancellor has now categorically reaffirmed that he has "no intention of altering the 2½ per cent rate of interest allowed to Savings Bank depositors," the Government is itself running into precisely those difficulties which the cheap money policy is causing for institutional investors such as the assurance companies. Obviously, earnings from new investment of the Savings Banks' Funds no longer suffice to meet even the interest cost of deposits, and an overall loss is likely to arise soon. Mr Glenvil Hall explained last week that, to avoid loss after providing for overheads and management expenses, it is necessary for the Post Office Savings Banks to earn 2½ per cent, and for the Trustee Savings Banks to earn 2½ per cent; hence the prospective loss "if the cheap money policy progresses well."

Thus the principle of paying differential rates to small savers is now to be crystallised in statutory form, instead of merely emerging, as it does in the case of Savings Certificates, from the rate which the Government chooses to offer on its direct obligations. Now that Savings Bank depositors have absolute assurance that their 2½ per cent will be maintained, the chances of reaching this year's target for small savings, formally announced when the "Silver Lining campaign" was launched this week, look even more uncertain. The National Savings Committee is basing its hopes of a bigger savings effort this year principally upon the drive for subscriptions to the new (reduced rate) Savings Certificates. But, except to those who have money to lock up for the full life of a Certificate, savings bank deposits are obviously more attractive—and are, obviously too, more likely to be spent.

* * *

The Chancellor and the ICFC

A reply by Mr. Dalton to a Parliamentary Question at the beginning of last month conveyed the impression that the Chan-

cellor of the Exchequer had the intention of making changes in the role of the two industrial finance corporations. The question raised the issue whether the Industrial and Commercial Finance Corporation was conforming to the original conception of its duties of providing capital for undertakings which would have had difficulty in raising money through the usual market channels and it arose because, in a small number of instances, it did not appear that this condition had been fulfilled. The Chancellor of the Exchequer then suggested that even if that had been the intention when the two Finance Corporations were created in 1945, he "reserved the right" to make any change in the arrangements which had then been made.

In Mr. Dalton's absence, it has fallen to the Financial Secretary to the Treasury to expand the Chancellor's observation, which had suggested that the original functions of the Corporation might be in process of change. On Tuesday Mr Glenvil Hall declared that Mr Dalton did not claim to exercise control over the activities of the Industrial and Commercial Finance Corporation, that no alteration of the Corporation's memorandum and articles of association came into question and that a distinction should be drawn between "the right to change any arrangements and that to take control." Thus the matter has scarcely been taken much further, though it is perhaps permissible to infer that no change in the general character of the Corporation's work is contemplated. It will, however, be interesting to see if the recent modest extension of its frontiers into what appears to be the normal territory of the capital market is consolidated.

* * *

Rupee Melting Point

Since the authorities in India banned the private import of silver last March, the price of that metal in Bombay has been appreciating, and early this week rose beyond the figure of 180 rupees per 100 tolas, though it subsequently reacted to 173 rupees. The movement has gained significance from the fact that the quotation has recently been approaching the theoretical silver melting point. With a 50 per cent silver content in rupee coins now in circulation, this point will be reached if and when silver touches 200 rupees per 100 tolas. It should, however, be added that the point is decidedly a "theoretical" one. To melt and refine silver coin which is only 500/1,000 fine is a very difficult operation. The melting point of the rupee does not, therefore, have the same significance to-day as it had in 1920, when the silver rupee was 11/12 fine and when the melted metal could in fact be used for ornaments and was accepted as good delivery in the bullion market. It was at that period that the rise in the world price of silver beyond the rupee melting point caused the exchange value of the rupee to rise to over 2s. The same sequence of events should not be expected if on this occasion the rupee price of silver rises beyond the theoretical melting point of 200 rupees. Given the virtual cessation of silver imports it is, however, probable that a good deal of the silver coinage is now going out of circulation and into hoards. That development has not been circumvented by the decision taken last year to begin the conversion of subsidiary silver coins into nickel coins. A start was made with the 4 and 8 anna silver pieces in 1946, following the issue of an Order in Council.

In order to extend the re-coinage to full rupee coins, special legislation had to be passed, and this has only recently been completed. The Government of India now have power to substitute nickel for all silver rupee coins, namely, 1 rupee, 8 annas and 4

In addition to the short "Statistical Summary" which appears weekly in *The Economist*, a full service of statistical and factual information appears weekly in

Records and Statistics

Supplement to *The Economist*

Records and Statistics is a separate, self-contained weekly publication of from 16 to 24 pages. It includes not only many statistical tables but also factual records of public affairs, including Parliamentary activities and digests of state papers, and industrial and commercial reports from home and overseas. It is believed to be the most comprehensive statistical and factual report appearing weekly anywhere in the world.

The *Records and Statistics* Supplement to *The Economist* is available by postal subscription only. The subscription, which may be sent direct to this office or through a newsagent, is 30s. per annum. For those who are already direct postal subscribers to *The Economist*, the economy of posting both publications together makes it possible to quote a combined subscription of £4. Subscribers to *The Economist* who wish to receive *Records and Statistics* should notify this office as soon as possible, but are asked *not* to send any money until an account is rendered. It is regretted that it is no longer possible to supply back numbers of *Records and Statistics* or to date subscriptions back.

Paper shortage also makes it impossible to supply sample copies. For a limited time, however, subscribers to *Records and Statistics* will be allowed, if they wish, to cancel any unexpired portion of a subscription.

Pointers from ICI

There are some valuable investment pointers from the Imperial Chemical Industries report which merit a wide application even beyond the 125,000 ordinary stockholders of that company. The report itself is reviewed in the "Company Notes" section of this week's *Records and Statistics* Supplement, where some assessment is given of the prospects of the ordinary stock in 1947. Lord McGowan's statement which accompanies the accounts emphasises two important points which have general relevance. The first is the disorganisation of output and the reduction of profits which must be laid to the charge of the fuel and power shortage. In the popular view, the fuel shortage did not assume crisis proportions until last February. But already by last autumn it had been responsible for a rationing of alkali and heavy chemical exports by ICI. As for the recent power cuts, their repercussions will be felt for many months to come, and they will have a serious effect upon the group's profits for the current year. This forecast underlines Mr Dalton's estimate of the effect of the power cuts on business profits in his Budget speech. The outlook for equities in this first year of freedom from EPT has been chastened to some extent by the distributed profits tax, but to a much larger extent by the failure of earnings to reach normal expectations owing to the power breakdown.

The second point in Lord McGowan's review is concerned with export prospects. The chairman doubts whether it is now possible to reach the desired volume target of 140 per cent of 1938 exports by the end of this year. He points out that, for manufactured products, that target itself means 165 per cent of the 1938 figure, and the disruptive effects of the power cuts have put it out of court. This is particularly unfortunate, for the need for increased exports was never more pressing. And at this moment, the first signs of international competition are appearing in export markets. So far, neither the quantities offered (which have been small) nor the quoted prices (which have been high) have caused ICI much concern, but they are portents of more serious competition when the sellers' market comes to an end. This point is of particular importance for ICI, for the smart recovery in chemical exports was an outstanding feature of the resumption of normal trade soon after the end of the war.

* * *

World Rubber Supplies

The tone of the London Rubber Exchange has not been too cheerful this week. Spot dealings are still relatively restricted,

however, owing to the continued absence of adequate stocks in this country. But the current world rubber position should not at the moment give cause for pessimism. Production of natural rubber in the principal territories during 1946 has been estimated at 850,000 tons compared with 240,000 tons in 1945 and a pre-war output of 977,000 tons (1936-39 average). The majority of Far Eastern producers have recovered from the effects of the war and Japanese occupation, one notable exception being the Netherlands East Indies. Current production was estimated last week by Mr F. D. Ascoli at the annual meeting of the Rubber Growers' Association as between 850-900,000 tons for the "settled areas," with a further 350-600,000 tons from the "unsettled areas" (China and the Netherlands East Indies) depending on the political situation. Prospective supplies of natural rubber for 1947 should therefore range between 1,200,000 and 1,500,000 tons.

World demand for rubber of all types during the current year has been estimated at 1,700,000 tons, giving an apparent shortage of 200-500,000 tons. Allowing for the full replenishment of stocks, this year's deficit might well be between 500,000 and 800,000 tons. Synthetic rubber production in 1946 totalled 806,564 tons of which 740,026 tons were produced in the United States. Comparable figures for 1945 were 866,069 tons and 820,352 tons respectively. The rise in synthetic output has been phenomenal during the war, from 147,500 tons in 1941 (when the main producers were Germany and the Soviet Union) to a peak in 1944 of 900,500 tons of which almost 800,000 tons came from North America. For 1947 it is estimated that 200,000 tons will be available from countries outside the United States leaving a consumption deficit of 300,000-600,000 tons to be filled by American-produced synthetic rubber. There is thus a reasonable probability that world supply and demand will be balanced during the current year.

* * *

London Transport Developments

London's return to something approaching peacetime conditions is reflected in the operating experience of the London Passenger Transport Board in 1946. According to the annual report for last year, traffic carried was the highest on record. Estimated total passenger miles were 11.5 billion, compared with 9.8 billion in 1945 and 8.6 billion in 1938-39. The increase over the last pre-war year was thus 33 per cent.

The increase over the whole system is mainly due to the continued flow of population back to London, which began on a large scale in 1944. The biggest proportionate increase in passenger journeys originating continues to be recorded in the area beyond the 12-mile radius which is covered by the country buses and coaches. The Green Line coach service was gradually introduced over the first six months of the year, and by December passenger journeys originating had already returned to 70 per cent of the 1938-39 level. The way in which the transport system has

been following London's population out into the home counties is shown in the table below:

Year	MILES TRAVELLED BY PASSENGERS Percentage Distribution by Forms of Transport				
	Railways	Central Buses	Country Buses and Coaches	Trams and Trolley Buses	Total
1938-39.....	26	44	6	24	100
1945.....	28	41	7*	24	100
1946.....	26	42	8*	24	100

* Coach services not re-introduced until first half of 1946.

During the year the first extension of the Central Line, from Liverpool Street to Stratford, was opened. Work on the remaining extensions to this line is proceeding as fast as available men and materials will allow. The Board has decided that the remainder of the trams in service will be replaced by fuel oil buses, not by trolley buses. Time has shown that the advantages in operating costs of trolley buses over buses have largely disappeared, while the comfort of passengers and the desirability of keeping the transport system as flexible as possible have told in favour of the buses. Over 1,100 new buses will be needed to replace the trams. Experiments with the new 8-ft. wide bus have now begun.

Record passenger loads have accentuated the peak-hour travel problem. The 55 local transport groups in the LPTB area assisted materially by organising staggered hours during the war. In collaboration with the Ministry of Transport and the main-line railways, their organisation has been used for a scheme for staggered hours in central London offices, which started in January. If even a quarter of the traffic flow could be retained by as little as a quarter of an hour from the peak period, valuable reliefs to congestion would be achieved.

Shorter Notes

The chairman's address at the International Nickel Company's meeting this week stressed the effect of the increase in operating costs, which has been partially offset by improvements in processing. The higher price for nickel now current in the United

States should also help to offset rising costs. The new price now comes into line with the world price, which remains at £190 per long ton in London. International Nickel filed in October, 1946, its denial of any violation of the United States anti-trust law. On copper, the chairman states that 75 per cent of the company's exportable production in 1947 has been sold to the Ministry of Supply and he suggests that a permanent removal of the US copper duty of 4 cents per lb. (which might with even greater reason be accompanied by the removal of the import duty of 2½ cents on nickel) would lift from Canadian producers the burden of transporting copper to distant markets.

* * *

In a written answer in the House of Commons on Tuesday, the President of the Board of Trade announced that the re-equipment offer to the cotton spinning industry would come into operation formally on May 1st. The statement pointed out that the preferential treatment of approved schemes applies to spinning (including preparatory) machinery. It will probably not be possible to extend it to other forms of equipment.

* * *

Five preference shareholders are seeking the compulsory winding up of the Eastern Telegraph Company, on the grounds that since 1929 the company has carried on no business and that its substratum has disappeared. The main asset, 10,750,660 shares in Cable and Wireless, Limited, has been vested since January 1, 1947, in nominees of the Treasury. Interests are held in other telegraph companies. Of the £7 million of capital, £2 million is in 3½ per cent preference stock and £5 million in ordinary. Of the latter 99.78 per cent are held by Cable and Wireless (Holding). No provision is apparently made in the articles of association governing the distribution of assets between the two classes of capital.

* * *

Japanese bonds have been active in London following a notification from J. P. Morgan and Co. to holders of the five issues of Japanese dollar bonds to file claims with the Alien Property Department of Justice in Washington. Either \$1 million or \$2 million were set aside before the war on Japanese account in the United States for serving the bonds and may be available.

MORPHY-RICHARDS LIMITED

SHARE CAPITAL.
Authorized: £55,000 in 550,000 Ordinary Stock Units of 1/- each and 550,000 Ordinary Shares of 1/- each. Issued and Fully Paid: £27,500. There are no Debentures, Mortgages or Loan Capital.

OFFER FOR SALE BY ROBERT BENSON & COMPANY, LIMITED, OF 150,000 ORDINARY STOCK UNITS OF 1/- EACH AT 25/- PER UNIT

The Offer for Sale shows (inter alia) that—

1. The Company carries on a business as manufacturers and distributors of electrical appliances, which includes the well-known "Morphy-Richards" Automatic Heat Controlled Iron.
In June, 1944, A. Reyrolle & Company, Limited, acquired a substantial share interest in the Company after allowing for the Stock Units sold and included in this Offer. A. Reyrolle & Company, Limited, will hold approximately 30 per cent. of the Issued Capital of the Company. The Company has already derived, and expects to continue to derive, considerable benefits from working arrangements with A. Reyrolle & Company, Limited.

2. The profits of the Company, as shown by the Auditors' Report, from 8th July, 1946, to 31st December, 1946, before charging Taxation, Directors' and Managing Directors' Remuneration, War Risks Insurance on premises and Plant, A.R.P. Expenses and other expenditure directly attributable to war-time conditions, but after charging War Risks Insurance on Stocks, and after making such other adjustments as were considered appropriate, were as set out in column (2) below—

COMPANY MEETINGS

ANGLO-PALESTINE BANK,
LIMITED

EXPANSION OF BUSINESS

MR L. BRAUDO'S STATEMENT

The ordinary general meeting of the Anglo-Palestine Bank, Limited, was held, on April 29th, at the offices of the company, 6 Gracechurch Street, London, E.C.

The following is the statement of the chairman Mr. L. Braudo which had been circulated with the report and accounts for the year ended December 31, 1946.

On the occasion of the presentation of the bank's report and accounts for the year 1946 some additional information both on the bank's business and on present conditions in Palestine will, I presume, be welcome.

The controversies on the country's political future, the Government's attempt to enforce for the time being the policy laid down in the year 1939 under the shadow of the threatening war, and the violent reactions against this policy, are apt to obscure the fact that even under these adverse circumstances Palestine is continuing to make considerable economic progress.

Government finances show the impact of the political complications by the high amounts appropriated for security purposes, but, even so, each succeeding year shows a surplus. The 1945-6 accounts produced a surplus of £2,300,000. The surplus in the 1946-7 accounts can hardly be smaller than some £4,500,000.

IMPRESSIVE TRADE FIGURES

The trade figures are impressive. Net imports show a figure of £54,600,000, as against £30,400,000 in the previous year. In volume they are double that of the year 1945, and 117 per cent. of the 1939 volume. Exports amounted to £24,500,000, as compared with £20,400,000 in 1945. As the adverse trade balance revealed by these figures is covered by large capital imports and by Army expenditure, the balance of payments shows a satisfactory picture. Unfavourable comment on the adverse trade balance, which is often enough heard, tends to overlook the fact that, broadly speaking, it is not (in the case of Palestine and similar young countries) the import surplus which calls for capital import, but the capital import which causes the import surplus.

Deposits in all banks (including our own) went up by £8,200,000 and deposits with the local loans and savings societies by £2,400,000. The note circulation went down by £5,020,000; one may, perhaps, see in this decrease a welcome indication of a return to normal conditions.

Whilst in the season 1945-6 4,600,000 cases of citrus fruit were shipped, the total export for the present season, now drawing to a close, is estimated at 7,800,000 cases.

The consumption of electric current went up from 216,000,000 kw hours in 1945 to 252,000,000 in 1946.

GENERAL PROGRESS

The general progress to which I have referred is reflected in the bank's accounts.

Deposits are up again by £5,300,000, and the growing demand for credit facilities has enabled us to expand our business by nearly the same amount. The aggregate amount of our liquid means (including short-dated Government securities) has in consequence remained practically unchanged at somewhat over £36,000,000.

Our main subsidiary, the General Mortgage Bank of Palestine, Limited, has again shown satisfactory results and has, for the first time since the outbreak of war, resumed lending on a large scale. It has paid a divi-

dend of 6 per cent., subject to Palestine income-tax (5s.).

The Otsar La-Taassiya, Limited, which specialises in the granting of medium and long-term loans to industry, and the Otsar La-Hagla-uth, Limited, which grants similar credits to agriculture, have found employment for the whole of their available means and expect to increase their capital in the course of the present year. It is intended, for the present, to allow them to retain their profits in the business instead of distributing them by way of dividends. We are the main shareholders in these two companies.

NEWEST SUBSIDIARY'S GRATIFYING RESULT

Our newest subsidiary, the A.P.B. Investment Company, Limited, of which I made mention last year, has made a gratifying start. Its present available means amount to £750,000 and profitable investment has been found for the whole of this amount. The company is beginning to attract the attention of many investors in the sterling area.

The profit and loss account shows a profit of £177,950 for the year, after a generous allocation to the contingency accounts. This has enabled the directors, as will have been observed from the report, to appropriate an amount of £125,000 to the reserve fund and to recommend the payment of a final dividend of 4½ per cent. (free of income-tax) on the ordinary and "A" ordinary shares, thus bringing up the total dividend to 7 per cent., tax free.

The report and accounts were unanimously adopted.

The retiring directors, Mr L. Braudo and Dr George Halpern, were re-elected. The General Manager, Mr S. Hoofien, who had recently been co-opted as a member of the Board of Directors retired in accordance with the Articles of Association and was re-elected as a director. The auditors, Messrs Jackson, Pixley and Co., having been re-appointed, the proceedings terminated.

NORTH BRITISH AND
MERCANTILE INSURANCE
COMPANY, LIMITED

FURTHER PROGRESS

The annual general meeting of the North British and Mercantile Insurance Co., Ltd., will be held, on the 8th instant, in Edinburgh.

The following is an extract from the circulated statement by the chairman, the Rt. Hon. Lord Brand:—

Life Department.—In 1946 the net new business completed amounted to £5,921,105. This constituted a record for the company and represented an advance of no less than £2,822,539 over the previous year's total.

Fire Department.—Premiums have increased by over £1,000,000. Losses have again been very heavy, particularly in the United States. The profit is £79,700 as compared with £148,753.

The premiums of the Railway Passengers Assurance Co., which transacts our Casualty business, totalled £2,069,225, an increase of 28 per cent. The underwriting profit amounted to £56,950 compared with £68,214.

The accounts of The Ocean Marine Insurance Co., Ltd. by whom our Marine business is transacted, show premiums for the year 1946 of £765,232 against £674,618 in 1945. We have transferred £200,000 to profit and loss account from profits of past years now closed.

In The Fine Art & General Insurance Co., Ltd., the premium income amounted to £533,604 against £473,333. The underwriting profit was £50,190 compared with £63,408.

Consolidation of Profit and Loss Accounts.—Summarising the results of our various sections, underwriting profit amounts to £386,840, compared with £430,375 in the previous year. Net interest shows an increase from £433,652 to £448,260. After allowing for allocations the aggregate balance to be carried forward is £7,686,254 against £7,619,925. A dividend of 7s. per share less income tax is again recommended, payable one-half on May 15th and the other one-half on November 11th. This dividend, with the preference dividend, will absorb £462,000.

ENGLISH ASSOCIATION OF
AMERICAN BOND AND
SHAREHOLDERS, LIMITED

A SATISFACTORY REPORT

MR J. F. A. SWANSTON'S SPEECH

The sixty-second annual general meeting of the English Association of American Bond and Share Holders, Limited, was held on the 30th ultimo at 5, Great Winchester Street, London, E.C., Mr J. F. A. Swanston, the chairman, presiding.

The secretary (Mr George Cooper) read the notice convening the meeting and the report of the auditors.

The chairman said: Gentlemen, unless any shareholder signifies to the contrary, I will assume it to be the wish of the meeting that the annual report be taken as read. (Agreed.)

However much I might be tempted to dwell on investment possibilities in Canada and the United States, the present controls and restrictions make it incumbent upon me not to discuss them on this occasion, but all those who in the past have been interested in business relations with the U.S.A. and who hope to be able to take a like interest in the future, can derive hope from the speech delivered by the American Ambassador at the Pilgrims' Dinner on April 22nd.

As he expressed it, "The links of the chain which binds Britain and the U.S.A. have been forged upon a common furnace of experience." He gave an impressive list of "the Golden Coins of our Common moral currency." By its economic policy his country hoped to open markets and make the world less divided. The closer relationship and co-operation between this country and the U.S.A. will hasten the time when we can expect to return to normal reciprocal trading relations.

IMPORTANCE OF EXPORTS

Before this can be accomplished, we, in Great Britain, must see to it that our production is vastly increased, firstly in coal and subsequently in all other industries, in order to increase our world trade and have a substantial balance of exports over imports. We shall then, but not till then be in a position to invest money abroad.

I might add that both Canada and the United States have progressed in wealth and prosperity, although, of course, they are not without their problems in both countries. And I am sure you will agree that both are keenly concerned for the rehabilitation of their old customer—Great Britain. Upon that unity, understanding and close co-operation of the British Commonwealth of Nations and the United States of America rest the peace and the hope of the world.

We are presenting what we feel we may call, from every point of view, a thoroughly satisfactory report, as a result of our activities in the year 1946, and your board are very sensible that such results can only be attempted by the team work of officers and staff in our various departments. We are sure you will wish to join with us in paying this tribute to their work.

The report and accounts were unanimously adopted; the proposed final dividend of 9 per cent., making 12 per cent., less tax, for the year, was approved; the retiring director, Mr. Hubert Smithers, was re-elected; the auditors, Messrs. Peat, Marwick, Mitchell and Company, were re-appointed, and the proceedings terminated with a vote of thanks to the chairman.

THE ROYAL LONDON
MUTUAL INSURANCE
SOCIETY, LIMITED

INCOME - - - £12,400,000
TOTAL ASSETS - £72,000,000

The eighty-sixth annual general meeting of this company was held, on the 29th ultimo, at Winchester House, London.

Mr J. K. Wiseman, F.C.I.I., chairman and joint managing director, who presided, in the course of his speech, said:—

We have made our customary valuation of the investments at the end of the year. The market value of Stock Exchange securities substantially exceeds the book value, and the investment reserve remains intact.

Turning now to our accounts, the total income for the year amounted to £12,430,000, an increase of £744,000 over the previous year. The combined premium income amounted to £9,770,000, an increase of £578,000 over the previous year.

The total claims and surrenders paid during the year amounted to £4,656,000. This, however, only partially represents the amount applied for the benefit of policyholders, as a proportion of the premiums being paid now are set aside to provide for sums assured which emerge for payment in the future. In this way, in addition to the £4,656,000 paid to policyholders during the year the sum of £4,293,000 has been added to the funds as provision for future payments to policyholders, these two items together making a total of £8,949,000.

The premium income in the ordinary branch (including consideration for annuities granted) amounted to £2,659,000, an increase of £216,000 over the previous year.

During 1946 new policies for a sum assured of £7,743,000 were issued. This is a record in the society's history.

In the industrial branch the premium income for the year amounted to £7,110,000, an increase of £362,000 over the previous year. Claims and surrenders amounted to £3,130,000.

The amount added to the fund during the year was £2,888,000, which includes £1,818,000 interest on investments. This addition to the fund is money put aside as a provision for future payments to policyholders. Adding this item to the actual disbursements to policyholders during the year the total is £6,018,000. Thus the actual amount paid to policyholders, plus the amount added to the fund, which provides for future payments to policyholders, together make up a sum equal to 85 per cent. of the premiums received.

The premiums received on the fire and accident and general insurance business amounted to £320,000, an increase of £72,000 over the previous year, but as the whole of this business has been reinsured it does not appear in the accounts.

The report and accounts were unanimously adopted.

RICHARD COSTAIN, LIMITED

HOUSE BUILDING RESTRICTIONS

MR R. R. COSTAIN'S SURVEY

The fourteenth ordinary general meeting of Richard Costain, Limited, was held, on the 1st instant, at the Chichester Room, Dolphin Square, London, S.W. In the absence of the chairman, Mr R. R. Costain, C.B.E., Mr A. P. Costain, joint managing director, presided.

The following is the statement by the chairman circulated with the report and accounts:—

Before referring to the accounts of the company, it is with sincere regret that I have to advise you that Mr R. A. Costain has decided to resign his directorship of the company, his action being prompted by the recommendations of the Cohen Report. It was only last year that he resigned the chairmanship. This loss to the company will be very great, but I am sure he has the good wishes of us all in his well-earned retirement.

I referred last year to the uncertain trading outlook, and your directors are gratified that while the consolidated trading profits show a small reduction compared with 1945, the net balance available after taxation is well maintained. You are able, for the first time, to compare the consolidated profit and loss account with that of the previous year.

POSITION STRENGTHENED

The financial position of the group has been consolidated and strengthened by the issue during the year of £1,469,000 mortgage debenture stock by Dolphin Square, Limited, a subsidiary company, which enabled existing mortgages and bank overdrafts to be repaid.

The accounts show a net profit for the year of £86,183 which, with the amount brought forward, and after having made the necessary provisions for the dividend on Preference shares and Preference share capital redemption reserve, gives an available balance of £127,501. Having regard to the exceptional trading losses sustained in this country in the early part of 1947 (due to weather conditions and the fuel crisis) and developments taking place overseas, the sum of £50,000 has been transferred to a special provision account, to be used, if necessary, in respect of these contingencies. It is proposed to ask the meeting to approve a dividend of 10 per cent., less tax, on the Ordinary shares, which leaves a balance to be carried forward of £49,562.

HOUSES AND FLATS

Before considering future prospects, I would first like to refer to the large amount of property owned by your company and its subsidiaries, including a considerable number of houses, all covered by the Rent Restrictions Act. You are no doubt aware that this Act precludes the raising of rents to meet increased costs, but, in spite of this, your company has endeavoured to maintain as high a standard of repair as is possible today. A far more momentous problem, however, is that of the flats owned by your subsidiary company. Here, of course, I refer to Dolphin Square. It is a debatable point whether the Rent Restrictions Act applies to this building, but up to the present your directors have not proposed any general increase in rents as such, although present and possible future increases in rates will, in the meantime, have to be passed on to tenants.

Day-to-day costs of operating this important undertaking have, during the last war and the post-war period, shown a considerable increase, and they are still rising. At the present time they are more than £25,000 per annum in excess of 1939 costs. Local authorities have already raised their rents

and it is to be hoped that the Government will soon permit the burden of the additional costs of maintaining and running private properties to be shared by the tenants in increased rents.

FACTORS IN THE OUTLOOK

During the last 12 months, we have ceased our private house-building. The restrictions imposed by the Minister of Health, and the negotiations necessary in order to build even a few houses, make the proposition entirely uneconomical for the private house-builder. Nor does the new Town and Country Planning Bill clarify the position—indeed, the reverse is true. From the personnel angle alone, it will be extremely difficult to find enough men capable of administering it, and lack of skilled personnel invariably leads to confusion and delay. In fact, this Bill can hardly fail to be the cause of a definite increase in the cost of houses to the nation and to the individual.

In considering the future prospects of your company, your directors have not been unmindful of these difficulties, and they have taken every opportunity of widening the scope of the company's business. You will recall that I made reference last year to the establishment of factories for the production of reinforced concrete products. These, during the course of the year, have been extended in size and are now operating as fully productive units. It is the intention of your directors to open a further factory in another part of the country, should business prospects in that area prove satisfactory.

OVERSEAS ACTIVITIES

I must make particular reference to the work that your company has for many years carried out overseas, as, apart from the ordinary business angle of these ventures, we believe that work performed abroad by British building and civil engineering firms is one of the most satisfactory channels available to this country for the invisible import of foreign currency, and has an important role in maintaining our national prestige. I trust that the Government will do everything in its power to encourage British firms in their development in other countries. The considerable reputation that your company has achieved overseas has resulted in requests from several of our clients to extend the areas in which we are operating and, in consequence, we have opened offices in Ankara, Turkey, and Salisbury, Rhodesia. You will appreciate that it would be unwise to expect financial benefits from these projects in the current year.

In spite of my gloomy prognostications, I would like to assure the shareholders of the very considerable strength of the company's position as reflected in its balance-sheet and in the well-balanced organisation which has been built up and of my confident hope that, while the immediate future may not be entirely satisfactory, the diversity of the interests held by your company will enable your directors to take every advantage of opportunities as they arise. My remarks would not be complete without referring appreciatively to the loyal and devoted service of the company's employees, whose unremitting efforts have been one of the main causes of the success of the year's work.

The report and accounts were unanimously adopted and the proposed dividends were approved.

The retiring directors, Brig. A. G. Bonn, C.B.E., M.C., and Mr J. K. Costain, were re-elected, and the auditors, Messrs James Worley and Sons and Messrs Peat, Marwick, Mitchell and Company, having been re-appointed, the proceedings terminated.

CLERICAL, MEDICAL AND GENERAL LIFE ASSURANCE SOCIETY

The annual meeting of the Clerical, Medical and General Life Assurance Society, was held, on the 30th ultimo.

The chairman, Sir Francis E. J. Smith, in the course of his address reported the resignation from the board of Sir Percival Horton-Smith Hartley, C.V.O. M.D., and of Sir John B. Lloyd, both of whom had rendered valuable services to the Society over a long period. To fill the vacancies so caused the Society had been fortunate to secure the services of Sir Arnold Stott, K.B.E., F.R.C.P., and the Right Hon. Lord Courthope, P.C., M.C.

The Society's total holding of British Government securities remained, during 1946, virtually unchanged at about £5,000,000 and increased holdings of ordinary and preference shares compensated for a reduction in mortgages and property investments.

The gross rate of interest—£4 9s. 11d. per cent. as compared with the 1945 rate of £4 11s. 5d. per cent.—reflected the general fall in interest rates during the year. The fact that the net rate had risen from £3 7s. 9d. per cent. to £3 8s. 4d. per cent. was due to the incidence of taxation in a year when, largely as a result of the bonus declaration, there was a specially high expense claim.

One agreeable effect of the fall in interest rates had been to produce a rise in capital values generally and it was possible to report that the margins between market values and book values, for which no credit had been taken in the Society's accounts had been further increased in 1946. These margins constituted a substantial hidden reserve to meet possible future adverse changes in capital values.

NEW BUSINESS

Net new life assurances in 1946 reached the record figure of £3,515,620, a gratifying result for which the Society was largely indebted to its agents, including those established by the Society's association with The Employers' Liability Assurance Corporation Limited.

The outset of the year 1946 marked the beginning of a new quinquennial bonus period and also the introduction of the Society's revised and simplified bonus system applicable to new policies issued in that year and thereafter. The rate of intermediate bonus at present allowed on any such full-profit policies as become claims by death was £1 10s. 0d. per cent. per annum. That this new system was proving popular was shown by the fact that, of the new whole life and endowment assurances issued during the year, about three-quarters had been effected on the profit-sharing basis.

THE VALUE OF LIFE ASSURANCE

The chairman concluded his address by referring to one of the Society's forms of policy which, after being suspended during the war, was once again available.

This was the supplementary units scheme, under which, for a comparatively small additional premium, the immediate cover of a whole life or endowment assurance could be trebled. The scheme included valuable options by the exercise of which the cover could be adapted in ways most suited to the policyholder's subsequent requirements.

The scheme was specially suitable for those under the age of fifty, and was extremely popular with many of the Society's younger policyholders who could, by taking advantage of it, secure adequate life assurance protection on terms which placed no undue strain upon their incomes.

DAVIS AND TIMMINS, LIMITED

RECORD ORDER BOOK

The forty-eighth annual general meeting of Davis and Timmins, Limited, was held, on the 28th ultimo, in London.

Mr F. Le Neve Foster (chairman and joint managing director) said that the net profit for the year, after making provision for depreciation, taxation and other items, was £42,388 as against £39,192 for the previous year. Gross trading profits were £68,004 as against £63,344 last year. The results of the group as a whole showed the net profit for the year at £43,568 as against £41,268. Depreciation had been provided for at the substantial sum of £18,682, which was £5,600 more than last year. That was due to the substantial increases which had been made to plant during the year.

It had been the hope of the directors that they would be able to recommend the repetition of the 10 per cent. additional bonus on the ordinary shares, and the results presented in the accounts and strength of the balance certainly would well justify such a distribution. In view, however, of the effects and consequences of the recent electricity cut-off, the directors had decided that it would be prudent to confine the distribution on the ordinary shares to the usual final dividend of 20 per cent., making 30 per cent. for the year.

STRONG FINANCIAL POSITION

The consolidated account showed a thoroughly sound and strong financial position. The total of reserves and undistributed profits had now reached the remarkable figure of £280,246, approaching nearly three times the nominal amount of issued ordinary capital of £100,000.

He did not intend to emphasise the current difficulties with which they were contending in common with all industry under present conditions. On the labour side, although still short of women, their training schemes were working well and bearing fruit. Generally, the morale and efficiency of their labour force was excellent. When last he had addressed the shareholders their raw material situation had looked reasonably comfortable, but since then conditions had deteriorated. They were, however, on excellent terms with their suppliers and could count on their goodwill.

The recent electric power shut-down in February had lasted three weeks in their area and was disastrous in effects to industry. As they were dependent on electricity for the whole of their power at all their works it had resulted in a complete cessation of production, though in the later stages by various expedients they had got a certain amount of production going again and in the last week were achieving nearly 40 per cent.

The board had decided at the outset that the company would continue to pay wages for the full 44 hours. The psychological effect of that gesture on the workers had been excellent and they were now all working overtime to make up the considerable leeway lost. It was confidently expected that by the end of June they would have made good the whole considerable production loss during the shut-down period, which would be a remarkable performance.

HEAVY DEMAND

They had a record order book at the present time and everything pointed to the heavy demand for their goods continuing for a long time to come. They had excellently equipped works and a happy and skilled band of workers. The results achieved during the last six months in spite of the difficulties encountered were most encouraging. Given a fair chance by external conditions he had the utmost confidence that, with the benefit of their unrivalled goodwill and experience in the trade and the efficiency they could demonstrate, the company would continue to give a good account of itself.

The report was adopted.

INTERNATIONAL NICKEL COMPANY OF CANADA, LIMITED

A NEW PRODUCT

The annual meeting of this company was held, on the 30th ultimo, in Toronto.

Mr Robert C. Stanley (chairman and president), in the course of his address, said: The year 1946 was the first full post-war year. During this period much has been done in all parts of our company. Markets for the metals we mine have changed. A new major nickel product has been developed, prices of our output have been adjusted and much has been accomplished by our Development and Research Division.

During the past four years intense research in our laboratories and plants in Canada developed a new product, nickel oxide in sinter form. A plant to produce this material is being constructed at Copper Cliff and should be completed this year. The Nickel Oxide Sinter will afford a new form of nickel for alloy steel and stainless steel making.

SALES EQUAL PRE-WAR MAXIMUM

For the greater part of the year nickel production was about 50 per cent. of capacity but during the final quarter output was raised to over 75 per cent. of capacity. Sales were low during the first half of the year due to strikes in our principal consuming industries, such as steel and automotive. Sales of nickel in all forms amounted to 201,103,234 pounds compared with 201,572,987 pounds in 1945, about equal to the maximum sales in the pre-war years.

Our refined copper sales in 1946 were 149,777,060 pounds comparable with 215,723,220 pounds in 1945. The major portion of our sales of export copper is being made under contracts with the United Kingdom Ministry of Supply and these contracts for the year 1947 now cover 75 per cent. of our exportable production. Sales of the platinum metals in 1946 were 320,794 ounces, comparable with 381,741 ounces in 1945. The total of our world sales of mill and foundry products in 1946 was 70,528,539 pounds as compared with a yearly average of 69,721,798 pounds during the year period.

The Nimonic alloys developed in the Mond laboratories were adopted in Great Britain during the war as standard material for blades and other parts in jet engines and gas turbines. Aircraft equipped with Nimonic blades hold the world's speed record. The use of Nimonic is being extended to engines designed for commercial development.

The difference between total income and total costs shows \$29,681,352 of net profits for 1946 as compared with \$25,010,938 for 1945. Quarterly dividends on the common stock were paid at the rate of 40 cents per share. The 1946 profit, less \$1,933,899 paid for preferred dividends, left \$27,747,453, which, after disbursing \$23,325,070 for common dividends, left \$4,422,383 for earned surplus.

RESEARCH

Research has played a very important role in the progress of this company and it has proven good insurance for its prosperity. We have a striking example by comparing market conditions today with those which existed after the first world war. Modern industry progresses more effectively with nickel and its alloys.

A major aspect of our research programme is the development of process improvements in our own plants. We now have three large international research laboratories and seven plant laboratories, all located in Canada, the United Kingdom or the United States.

The report was adopted.

GOVERNMENT RETURNS

For the week ended April 26, 1947, total ordinary revenue was £54,333,104 against ordinary expenditure of £37,925,637 and issues to sinking funds, £110,000. Thus, including sinking fund allocations of £349,015, the deficit accrued since April 1st is £2,856,085 against £101,074,000 for the corresponding period a year ago.

Is Britain Finished?

THERE is a sense in which the Moscow Conference can be said to have been decisive precisely because it decided nothing. It ended the phase of post-war history in which the victors clung to the belief that they could work out agreed policies. Henceforward, the two opposing groups of states will more and more go their respective ways. Willy-nilly, world politics moves back towards the balance of power, and issues will now tend to be determined by the relative strength or influence of the two groups. This has not been willed by the Western powers—and possibly not consciously willed by the Russians either. But it has happened, and it therefore becomes a matter of some relevance to assess the relative weights and influences. How strong are the powers? In this and the succeeding issues of *The Economist* it is proposed to pass in brief review some of the data that go to make up the answer to the question. Next week an attempt will be made to take a clear view of Russia, free either of romantic idealism or of alarmist fears.

But in these matters, clarity begins at home, and the first question to be asked is obviously that which has been set at the head of this column and which has so often recently been answered in America with a finality that is as solicitous as it is maddening. The fact that the downfall of Britain has been falsely prophesied so many times before does not of itself make the prophecy untrue this time. There are at least enough data in the present state of things to make it necessary for the question to be solemnly posed. Is Britain finished?

It is not proposed to try to guess here how Britain would fare in another war. It is only in the last resort that even the argument of power politics becomes one of power to make war; the more interesting question is whether Britain will be able, by remaining a great power, to help in preventing the last resort from arising, or whether it is our lot in future to join those who wait on the sidelines to learn their fate.

The case for the prosecution rests on two arguments. The first is that Britain is an imperial power or nothing; that the overcrowded island of Great Britain, shorn of its imperial estate, so far from being a great power, would be a great weakness to all its associates; and that the British Empire is dissolving before our eyes. The second argument is that because of shifts in the economic currents of the world the British people can no longer support themselves in the style to which they have become accustomed and that the enforced reduction of living standards to which they will have to submit will undermine their vitality. The two arguments are clearly connected; but they can be dealt with separately.

It would be foolish to deny that the Empire has been, and is, a source of wealth to Great Britain. But the relations between Britain and the Empire are, in overwhelming measure, those of mutual interest. What Britain gets from the Empire is paid for in full—sometimes more than fully. It is true that the formal ties of sovereignty are being loosened, but in neither of the two aspects that really matter—strategy or economics—have any of the ties been severed, or even seriously frayed. It does not at present seem likely that the approaching end of the British

Raj in India will have catastrophic economic consequences for Britain; India, after all, has long had its full economic independence. It is still less likely that the independent Indian state or states will be unwilling to play their part in the design of Commonwealth defence. The other area where evidence of the collapse of the British Empire is often found is in the Middle East. In the Eastern Mediterranean the retreat is undeniable; but it is very doubtful whether that area is still vital for Britain, and further east, in the Persian Gulf countries, where the interest is certainly vital, there is no retreat. The vital interests of the British Commonwealth, economics marching with strategy, lie in the oceanic fringe of the Continent of Europe, in the Atlantic Ocean, in the African Continent and in the Indian Ocean. Not one of them has been abandoned, not one of them is more seriously threatened now than before the war, except by the cosmic threat that overhangs all civilisation everywhere. The Commonwealth is a loose-jointed organisation; but it is still a very effective one.

★

The second argument cannot be so summarily dismissed. Even though the outer limbs of the Empire are as strong as ever, the central heart-beat is painfully irregular. It is manifest that the country is in a serious economic mess at the moment. It is also manifest, as has so often been insisted here, that an even more difficult economic crisis is coming next year. These things cannot be laughed off or waved aside; they are serious, far more serious than the British people realise even yet. But are they permanent weaknesses?

Many of the economic afflictions of the moment are clearly no more than the inevitable after-effects of wartime distortion. This is true, above all, of the maldistribution of labour. Men and women were moved into the wrong places during the war, and it is proving a more difficult job than was expected to move them back to where they are most needed. It is almost inconceivable that this situation should last very long. It can be corrected in one of two ways, either by the compulsory direction of labour or by the reappearance of a certain degree of unemployment. Both are distasteful and would be unwelcome. But sooner or later, one or the other will do the trick. There is no reason to suppose that the purely wartime distortions will be permanent, however slow they are in taking their departure. Much the same applies to the additional distortions and scarcities produced by the fever of inflation in which the country now finds itself. Inflation cannot last for ever; if it is not deliberately deflated, the bubble will burst, and the public will be astonished to discover how many things then fit into place. The months of waiting for the adjustments to be made may well be weary, and the method of adjustment, when it comes, painful; but unless all past economic history is misleading, it will surely come.

Underlying these temporary difficulties, however, are two more serious: shortage of coal and shortage of dollars. Neither of these is a temporary phenomenon, though the effects of both are aggravated by temporary conditions. Neither the shortage of coal nor the shortage of dollars can be expected to correct itself automatically. The shortage of coal ought nevertheless to be curable in time. It is a technical problem; the requirements are known and the method is agreed. If the coal mines could be properly concentrated and properly equipped, there should be no difficulty, in time, in raising the necessary quantity of coal or even in lowering the real costs of getting it. Moreover, in the National Coal Board, the instrument of a deliberate policy exists. How much time will be required is the crucial question and one that is difficult to answer. But it will be very surprising, and a sign of very bad management indeed of the nation's affairs, if the decade of the 1950s is, on the average, one of coal shortage.

The problem of the balance of payments is far more complex, far more intractable and possibly still more catastrophic in its

effects than the coal problem. Indeed, over the period of the next year or two it is very difficult indeed to see how it is to be solved. But in the longer context of ten or fifteen years it is less frightening. The size of the problem, after all, is not overwhelming. Of the total output and expenditure of the United Kingdom before the war something like one-fifth entered into some form of international trade. The basis of exchange has not been destroyed, but only distorted, and a regrouping of the national resources affecting only about one-tenth of the total would be ample, if it were successful, to balance the account. The task is a very heavy one to impose on an exhausted country at a time when it has many other adjustments to make and when the world is upside down. But in a longer-term context it is probably a smaller adjustment than was successfully accomplished by, say, Australia in the Great Depression.

Moreover, the balancing of the British accounts will some day be powerfully assisted by a turn in the world conjuncture. It has become a truism to say that the whole world is now a sellers' market; but it is perhaps not fully realised how much this affects the British economy. There is every reason to expect before long a fall in the world prices of primary products—especially of foodstuffs, but also of many raw materials—that will be second in sharpness only to those of 1921 and 1931. Not only will Britain gain in relative prices, but there will also be a great gain in the availability of supplies. This will not make low costs and high quality of British export goods, or aggressive salesmanship in disposing of them, any less necessary. But it will bring the solution of the problem of the balance of payments well within the range of possibility.

The chief reason for believing that the balance-of-payments problem will be solved, however, is that it must be. It is not the sort of problem that can drag on from year to year. No country can live on credit indefinitely, or even, in Britain's position, for very long. If the patient does not naturally recover, he must be operated on. The solution may be relatively painless or it may be very painful. But a solution will have to be found, and no Government, however hesitating or divided, can postpone it. Thus the very intensity of the crisis that faces Britain in the remaining years of the 1940s is itself the strongest reason for thinking that it will be surmounted before the 1950s are far advanced.

The conclusion towards which these arguments point is not in itself wholly reassuring; but it has the elements of reassurance in it. Nothing can wave aside the difficulties of the next few years. But there is nothing equally ineluctable in the external framework of the long-term problem. The two major problems—coal and foreign exchange—ought to yield to careful policy and hard work. Indeed, it can be argued that the greatest menace to British strength and influence in the world lies not in the catastrophic stoppages that the public mind now fears but in something far less dramatic and more insidious. The danger is not that Britain will never be able to recapture the place it held in the world before the war, but that it will be content with mere recapture and will not make the effort to keep up in the race. In this technical age, all strength ultimately depends on productivity; productivity depends on keeping up the rate of capital formation; and that in turn depends on habits of thrift and enterprise. America and Russia will both certainly go on creating new productive capital at a rate sufficient to keep their economies progressive, the one by sheer superabundance, the other by deliberate restriction of consumption. But in Britain it is still too early to say whether the retreat from individual organisation of economic affairs—a retreat in which both major parties are engaged—will succeed in substituting collective providence and enterprise for the individual virtues. This is the real question. There is nothing in their present external circumstances that need defeat the British people or lower their estate in the world. Their fate lies in the future, and with themselves.

No Teeth for Uno

N EARLY two years have passed since there was general rejoicing over the decision of the victorious Allies at San Francisco to "put teeth" into the Charter of the United Nations. It would be more accurate to say that they conceded to the Security Council the right to have and use teeth; Articles 41 to 51 laid down how armed forces—and facilities to use them—would be provided by member nations, under special agreements and according to plans recommended by an expert committee. There, until last week-end, the matter publicly rested; and anyone who regards as metaphysical the distinction between the Security Council's teeth and those of its members should study the report just presented by the Military Staff Committee of Uno. It is in several respects incomplete—for instance, it gives no estimate of cost—but it offers most illuminating glimpses of agreement and disagreement between American, British, Chinese, French and Russian military experts "on the general principles governing the organisation of the armed forces" to be made available to the Security Council. In the jargon of the day, it gives a blue-print of that body's dentures: for dentures they will be, to be put in and taken out as emergencies come and go.

It has taken the representatives of the Allied chiefs of staff nearly fifteen months to get this far. Not until Mr Truman and Sir Alexander Cadogan had expressed curiosity about the progress they were making and anxiety about the toothlessness of the Security Council did their discussions show signs of crystallising. What has now appeared will shatter many illusions but not all hopes. For there is more agreement than disagreement, and the way lies open to useful work. But, as is the way with the Security Council in its present phase, the few disagreements threaten to cancel out the agreements, or at least to frustrate them. Not for the first time the Russian representatives have exposed their government to the suspicion of playing for time. For there are several important points of disagreement at which they stand inexplicably alone against their allies the British, the Americans, the French and the Chinese. The outstanding instance is the failure to decide how big a Uno force should be and where and how it should be held ready.

The Military Staff Committee make no mention of sizes and numbers. In spite of persistent rumours from New York that they have talked in terms of a "Uno force" two million strong, the tendency of their report is to recommend that it should be as small as possible. In spite of wide-felt hopes that there might be a permanent international police force always ready for swift action, they lay special stress on the swift withdrawal and disbandment of the force once its work is done. It is argued that, even when under their United Nations supreme commander, the national contingents will retain their own commanders and their "national character," and be subject to their own discipline and regulations. There appears to be no question of allowing an American contingent which has lost its aircraft carriers to be reinforced by carriers from the British contingent; or of allowing French infantry to reinforce a Russian unit which has suffered losses at the hands of Uno's enemy. And although the Service experts agree—as they must—that the Uno forces should be ready to start operations "in good time," the degree of readiness of the national contingents is to be fixed by the politicians of the Security Council. Indeed, there runs through the report an almost comic eagerness to ensure that the five Great Powers which are permanent members of the Security Council, and which will "contribute initially the major portion" of Uno force, shall never get away to anything but an exactly fair start—better no start at all than

anything that looks like a handicap. Suspicion of motives and reluctance to surrender sovereignty, or even to make temporary loans of it, crop up on every one of the eighty pages.

Yet the Big Five succeed in agreeing on 16 articles out of 41. They agree that the contingents maintained for Uno force shall be taken from the "best trained and equipped units" they have; that no member nation should be asked to increase its forces in order to do more for Uno force; that some nations need furnish only facilities; that the special contingents may be used only for Uno force and only for the time which the Security Council lays down as necessary to carry out their international task; that each national contingent shall provide its own reinforcements, supplies and transport; that each shall be based during operations wherever the Security Council decides; that they will be for that time under the "control" (the French draft says *autorité*) of the Security Council and under the strategic direction of the Military Staff Committee.

It does not take a military expert to see the farcical effect of many of these agreed principles. They assume a united and determined Security Council, deliberating and deciding with lightning rapidity—and forgetting all about the veto. They assume concerted and secret staff plans for the concentration of forces in any quarter of the globe at short notice; which in turn—as the French point out—assumes that the supreme commander of Uno force will know the locations, state of readiness and strength of all the national contingents ready for use. They further assume that the measures "not involving the use of armed force"—such as economic sanctions and cutting of communications—recommended in Article 41 of the Charter to precede the use of armed force, will have been concerted beforehand. But these assumptions underlying the agreed clauses are nothing compared with those implied in the articles of the report over which the Big Five failed to agree.

★

The chief points of disagreement are five: about the relative strength and composition of the national contingents to Uno force; about the strength of the air forces to be kept "immediately available for combined international enforcement action" in accordance with Article 45 of the Charter; about the offer of bases and facilities to Uno force and the control of them while in use; about the location of the contingents when they are not under Uno command; and about the time to be taken over their withdrawal when their job has been done. Obviously, agreement on each of these points is essential to the planning of operations; without it Uno force, as a whole, could neither take the initiative, nor concentrate, nor indeed move at all.

The first difficulty arises because the Russians insist on interpreting literally Article 2 of the Charter, which says that "the Organisation is based on the principle of the sovereign equality of its members"—the principle which, one day, may kill Uno. General Vasiliev uses this article to insist that the contingents contributed by the Big Five shall be equal in strength and composition. His four colleagues merely suggest that there should be "comparable initial overall contributions." In other words, the Russians want each of the Big Five to contribute the same amounts and types of men, machines, ships and equipment. Presumably, this is intended to ensure—among other things—that nations with conscription do not have to provide all the infantry while nations without it provide only aircraft and ships. The Russians, it is true, concede that in practice differences might be permitted in the contingents contributed, but only by decision of the Security Council and

only if asked for by one of its permanent members. Until this point is settled, the Russians refuse to allow the Security Council and the Military Staff Committee to begin estimating the overall strength that Unoforce will require.

On bases again the Russians hold a lone view. The British and Americans are ready to give the Security Council on paper the run of bases and facilities. The French and Chinese agree that mention must be made of those bases which Unoforce may require (are all the bases of the five Powers to be kept ready for Uno?—ask the French). The Russians reply that Article 43, of the Charter—which is the basis of the Military Staff Committee's work—does not mention bases; why then should this report? And whereas the other four agree that members shall retain sovereignty over bases and facilities placed at the disposal of the Security Council, the Russians do not. It is difficult to see why.

*

When they come to the question of where the national contingents for Unoforce shall be located, strategic and political suspicions become blatant. The Russians say these forces should be kept within national territories and territorial waters or in ex-enemy territories. The Americans, British and Chinese say they should be based in any territories or waters to which they have legal right of access. The French would like to add ex-enemy territories and agreed strategic areas of their own and other people's territories. The wording of the drafts shows that the Russians feel strongly on this matter, and still have in mind the dispute over British troops in Greece and Indonesia. The French politely point out that, while they have a world-wide federated Union to look after, Russia "is territorially and constitutionally united"—which goes to the heart of the whole matter.

Then there is the most urgent question of the air forces to be kept "immediately available" for "combined international enforcement action"—as laid down in Article 45 of the Charter. The Russians say: work out first of all the full implications of the more general Article 43—which means, in fact, settling the whole problem of Unoforce—get agreements signed between the Security Council and individual governments, and then let the Security Council determine what portions of national air forces shall be held ready for action. There is no doubt that the Russian interpretation of the Charter is here formally correct; but by insisting on it against their colleagues they are postponing indefinitely the day when the Security Council will have some teeth to bite with.

Clearly the important differences, which might hold up progress indefinitely, are those on the constitution of the force and the location of its contingents in quiet times. The Americans point out that the Russian insistence on equal contributions by the Big Five means a levelling down, of the most doctrinaire Socialist kind, with the weakest setting

the standard. If one of the Big Five has no four-engined bombers, then Unoforce must have no four-engined bombers. The Chinese—very appropriately—point out that nothing will alter the fact that national forces are at different levels of quantity and quality, and the British argue that by maintaining these discrepancies equality of sacrifice is ensured. But the Russians stoutly maintain that no member should have any advantage at all—presumably in case the contingents of Unoforce fall out among themselves as used to happen among allies in the Balkan wars.

It has of course to be remembered that the Security Council, besides planning its own armaments, is studying proposals for everybody else's disarmament; and that if in time the Great Powers did disarm to any significant extent, notable discrepancies in certain types of armament—say between American and Russian long-range aircraft—might have dangerous possibilities. But to remove such discrepancies is clearly a task for general political negotiations, not to be undertaken in a first draft of general principles for an international force. Until diplomatic efforts have been made to overcome the major differences, there is clearly no point in the Military Staff Committee continuing its work on present lines. Fifteen months spent in producing such a document is a nonsensical waste of time. While the deputies of the five chiefs of staff have sat and wrangled in New York, the chiefs themselves have gone on—as chiefs of staff always must—considering plans against their potential enemies, who are only to be found among the Big Five. And their Ministers have made hypocritical speeches about the necessity of maintaining large national forces in order to fulfil their commitments under the United Nations Charter.

*

It would be more honest, more realistic and pacifying if the British, French and Americans went on with the regional arrangements for defence and economic co-operation, which are provided for in the United Nations Charter. The Russians have already made theirs in eastern Europe—a point which is often overlooked—and there is no reason why Mr Molotov should be either surprised or irretrievably estranged if similar arrangements were set in train in western Europe, the Mediterranean and the Pacific. Sooner or later any international security system will have to be based on such regional plans, and Article 53 of the Charter recognises the fact. It is true that Article 53 provides that "enforcement action" under regional arrangements shall be taken only with the approval of the Security Council. But approval by the Security Council means now agreement between the Americans and the Russians. And that agreement will not come about inside Uno until it has been vigorously and earnestly sought outside it. Meanwhile it will do the Security Council no great harm to remain toothless for a couple of years or more; the likely bones of contention are still too large for it and are likely to remain so.

Planners' Opportunity

THE Town and Country Planning Bill, having been digested—so far as a ruthless employment of the guillotine permitted—in twenty-five sittings of Standing Committee, is expected to be returned to the Commons for third reading next week. The Bill is better and fairer than it was, but the impact of the alterations made in committee will be slight. That this is so, despite the energy of Opposition Members and the conscientiousness of Mr Silkin, is due to the omnibus nature of the powers that the Bill confers. For years, proper planning has been thwarted for lack of powers; and now a superabundance of powers is being bestowed on the Government at one stroke. It may be as well to recapitulate the position that the Bill creates. Effective control over all types of physical development—including any change in the use of buildings or land—will be universally established. The local planning authorities, who are to be the counties and county boroughs, are to be able to prohibit development without any liability to pay compensation—which rids them of their worst boggy; and they are given facilities, on a wholly unprecedented scale, to acquire land compulsorily and to use it as they choose. Private development will have its wings clipped, while public development is set free—to do better if it can. Behind the local authorities stands the Minister, empowered to plan both by direct interference with local schemes and by giving instructions over the levying of development charges to the Central Land Board.

It is an impressive edifice of planning control, which gives to the planners a great and unique opportunity. The Bill itself is the barest of skeletons, whose success or failure will depend upon the administrative reality with which it is clothed. The acid test will be whether, with the flying start that the Bill provides, physical planning can show itself to be both effective and popular—or whether it will turn out to be just another control to weary the citizen, this time in the guise of improving his amenities. At any rate, the opportunity is there.

The part of the Bill that has been left most vague is its important financial provisions. The Government has made a welcome concession in abandoning the 1939 basis of compensation for land that is compulsorily acquired, or is subjected to restrictions on its existing use, and in substituting a formula that relates compensation fairly closely to current market values. This removes the Bill's worst anomaly. But how the central provisions relating to the compensation and betterment tangle will work out in practice remains something of a mystery. The Bill sets up a Central Land Board, which has the duty of paying compensation for the State's acquisition of all existing development and redevelopment values in the country and of levying a development charge, if it elects to do so, whenever building or change of use is permitted in future. But this is only the machinery; how the Board will operate, on what principles it will pay compensation and levy development charges—which is the important thing—is left to be settled by instructions that will proceed both from the Minister of Town and Country Planning and the Treasury, and of whose nature only a glimmer could be discerned after the most strenuous efforts by the Opposition. This is a new field of administration, in which policy—especially where development charges are concerned—needs to be experimental and variable; but such wholesale obscurity should not be necessary. Mr Silkin would agree to little more than that his directions should be of a general character, and should not amount to interference in individual cases.

The total sum available for compensation is indeed fixed at £300 million, a figure whose adequacy has never been demonstrated and which was not debatable in committee. The scheme

for its distribution is to be drawn up by the Treasury, and there is something to be said for delaying its final form until most claims have been ascertained. But the Government's whole attitude—which regards these payments as being made not of right but of its own grace and which envisages that they should be graded according to whether the prohibited development would have offended against "good neighbourliness" and so forth—has created legitimate fears about their intentions. Certainly if Mr Glenvil Hall—on his showing in committee—has anything to do with the Treasury scheme, the worst may be expected. The Government should have the decency to recognise that they are getting a good bargain, imposed by themselves, out of the transaction. They will draw all the income from site values that is obtainable from development in future, to a tune that should certainly surpass the £300 million paid out now in compensation, a sum which most emphatically excludes the unfair "float" element in land values.

There are admittedly a number of exceptional claims, such as land held by builders, where the element of "float" is less than elsewhere. In such cases, as in the case of the private citizen who means to build a house on land which he already holds, it is only fair that the compensation payable should be related closely to the development charge which will later be levied. Mr Silkin is bringing in some late amendments intended to meet this point. There are other cases—such as estimates which, in the light of the Bill, have been overassessed for death duties—where extra compensation is again necessary in equity. But all the cost of meeting these special claims is apparently to come out of the £300 million and reduce the sum available to satisfy more normal claims. This is all the more reason why the Government should not add any fancy discriminations of its own, about the deserts of owners. After satisfying the fairly exceptional claims, it would surely be best to share out such compensation as is left as a flat proportion of duly assessed claims. It is most unsatisfactory that no suitable principles for compensation have been written into the Bill.

*

The levying of development charges raises a wealth of issues that have economic as well as planning repercussions. Theoretically, the collector's net can be cast very wide, taking in even small improvements to private houses where the addition to cubic content is over 10 per cent; but Mr Silkin has promised to bring in a clause that will exclude small claims for development charge—just as these are excluded from participating in compensation. The Opposition have accepted the Government's view that this charge should be varied from place to place and time to time according to the degree of desirability of encouraging development. The development charge is not envisaged as a tax at all, but as the freely negotiated price of permission to develop. It is hard to say if this idea will work well. One danger arises from the fact that the Central Land Board, unlike the private landlord, has a complete monopoly. But the Opposition's remedy of providing for an appeal against the Board's charges to an independent tribunal would hardly be appropriate in this instance, since it is of the essence of these charges that they are partly arbitrary and not governed simply by commercial considerations that are reasonably uniform.

Mr Silkin envisages that the Board will be governed by "commercial considerations tempered by public interest." This is a nice conception, which can lead to some awkward tussles. Since the Board is accountable to Parliament, it may be subjected to strong political pressure to keep down its charges, but there will equally be pressure from the Treasury to keep them up in the interest of redeeming the compensation fund. There

will also be differences between commercial and planning needs. It is reasonable to vary development charges for broad purposes such as the encouragement of building in a development area. But the Board as an instrument of detailed planning control must be highly suspect. After all, the Minister has perfectly adequate powers of direct control, without needing to make much use of this further device, which might even serve to undermine and estrange the local planning authorities.

All in all, the advantages of flexibility in fixing development charges have been greatly overstressed. Nothing would so discredit the scheme and discourage desirable building as too much uncertainty about the Board's principles and the suspicion of unfairness which always arises when individuals are dealt with very variously. As far as possible, then, the Board should be made to act on clear and uniform principles, which should not be change over-frequently; and it is a great pity that some suitable principles have not been written into the Bill.

Whatever the impact of the Bill's financial provisions may be in practice—and it is by no means certain that land values will respond as desired or that the financial burden of development charges will always fall where it is intended—this can make little difference to the effectiveness of the new planning powers that are handed to the Minister and the local authorities. These powers, it may be repeated, are completely adequate to clear away any obstructions arising from private interests and to enable the authorities, not only to draw up whatever development plan they like, but also to execute it on their own. But this fact alone cannot make planning successful. Town planning is involving both the businessman and the householder in a new and quite onerous crop of controls, and it is essential that in return it should be made worth the candle. This is primarily a matter for a high degree of intelligence and of real devotion to the public interest (not merely to the planners' interest) among Government departments and local authorities and for properly agreed policies consistently pursued by all of them—and the Bill does very little to see that any of these things are forthcoming in due measure.

There is room here to point out just two instances, where the citizen needs to be given—and could quite well be given—

Divided Dominion

ON Monday, the Royal Family return to London after their strenuous and exacting tour of South Africa, during which they visited, not only the Union, but the self-governing colony of Southern Rhodesia, the protectorate of Northern Rhodesia and the High Commission territories as well. The tour was arranged many months before the United Nations Assembly opened last autumn. But between the time it was arranged and the time *HMS Vanguard* left Portsmouth, the Union had been arraigned at the bar of the Nations and publicly reprimanded for its policy towards its coloured population. It was thus not only an ancient adversary of Great Britain that the King set out to visit. It was also a country whose people had been made angry and resentful, hurt and conscience-stricken, or even openly triumphant—according to their several outlooks. The Union of South Africa is not a united country even in normal times, for no common purpose animates the three big racial divisions—Africans, Europeans, and Indians. But the blow to its prestige administered by the United Nations had accentuated and increased its internal dissensions.

The Royal Visit was, therefore, of more than usual significance; for the Crown is the one link binding together Africans, Indians, "Coloureds" and the different brands of Europeans, and the strength of the link was now to be tested. There were

a fair return for the controls he is accepting. The first concerns the delays that are involved in getting permission to make any change, even a comparatively minor one, in the use of land. Not only does planning permission have to be asked of the local authority—which, as a matter of fact, is not normally a slow process—but the development charge will have to be agreed and security for it given, and, in the case of industrial buildings, a certificate will have to be obtained from the Board of Trade; all this is additional to the securing of the normal building permits. There is a danger that all of these permissions will wait on each other. Mr Silkin has talked of introducing a centralised licence, which would give on one document all the permissions required, together with the amount of the development charge and other details. He should make it a point of honour to introduce it at an early date.

The other instance is more fundamental. The new development schemes of local authorities will designate all the land that is liable to compulsory purchase for Government use over a ten-year period. This is a satisfactory method of planning in the open; but although the designation will be extensive, it will not be inclusive, since Government departments can come along later and acquire different land under their existing individual powers. Thus the public authorities, unlike the private owners, are not bound—even for a short period—to follow their own plan, and the security and harmony which the plan should beget is thwarted. The obvious solution is to centralise all powers of public land acquisition in one Ministry, which should presumably be Mr Silkin's. If a large degree of discipline is necessary in the private enterprise sector, a small amount of self-discipline cannot be out of place in the public sector.

This Bill is the planners' opportunity. But it will not add to the Government's popularity, unless its powers are used with courage and strength, with vision and imagination. Half-baked planning, which stops everybody else's ideas without having any of its own, is the worst of all alternatives. It is not worth its cost in controls. It will be up to Mr Silkin—having got the powers over the public that he needs—to prove that his department really can plan well and carry the other arms of Government with it, and is not just confined to stopping up the worst abuses that ran riot through the land before the war.

some who argued that, after the proceedings at Uno, the tour should have been cancelled in order to register disapproval of the Union's attitude over South-West Africa and the Indians. Those who did so showed a complete disregard for the constitutional position of the monarchy. The King is not a symbol to be lent by Great Britain to deserving Dominions. His constitutional position is the same in South Africa as it is in this country. In South Africa, he is not the King of England, but the King of South Africa. He is neither responsible for, nor approves or disapproves his Ministers' policies, wherever the seat of government. In point of fact, those on whose behalf concern was expressed at the United Nations Assembly, Africans and Indians, showed themselves loyal supporters of the monarchy. African enthusiasm for the Royal Family is always touching and can always be relied upon. But the attitude of the Indians, whose sympathies are still with India rather than with the land of their adoption, was more doubtful. Except, however, for one or two small incidents, demonstrations of loyalty were much greater than might reasonably have been expected.

Yet in one respect the King in South Africa is not above politics, for republicanism is a political issue between the two main parties. On the question whether the Union should remain tied by the Crown to the British Empire, the clash is not

between white man and coloured man, but between white and white. The doubtful factor in planning the Royal Tour was the attitude which would be taken by the supporters of Dr Malan of the Nationalist Party. How would the republican section of the Afrikaners welcome the royal visitors? This was not the first time that its attitude had been put to a personal test, for the Prince of Wales had visited the country in 1924. But it was interesting for other South Africans to speculate how people who had openly sided with the King's enemies would comport themselves in the King's presence.

As with the Indians, Royal charm seems to have won the day. Dr Malan absented himself from the Capetown ceremony of the address of welcome—even though the wording of the address, which made no mention of loyalty, was agreed upon between the parties. Other prominent Nationalist leaders were absent from the official opening of Parliament, Mr Strydom—Dr Malan's probable successor—making his absence conspicuous by remaining in the lobbies while the speech from the throne was being read. On the other hand, against these and similar incidents must be put the captivity of "General" Marsh, a local leader of the extremely republican *Ossewabrandwag*, the hospitality shown by the Nationalist mayor of Pretoria, and the attitude of the Nationalist press, which, with the exception of *Die Transvaler*, gave full space to stories of the visit. And the cheers of the Nationalist rank and file more than made up for the coolness of their leaders.

This, however, could be attributed, as it has, in fact, been attributed by Nationalists, to traditional Afrikaner hospitality, hospitality which is accorded to every visitor, august or humble. The attitude shown to royalty before the war gave no indication of the attitude of the Nationalist party when war came. The party has accused General Smuts of arranging the Royal Tour in order to strengthen his political position before next year's general election. Even if the issue of the monarchy were to be the dominating one, this accusation ignores the transient nature of the impact of Royal charm. It is highly unlikely that General Smuts was guilty of this kind of political manoeuvre. It is even less likely that he could have hoped to gain anything from it.

In any case, next year's election will not be fought over the monarchy so much as over the colour problem. And it looks as if it will be a straight fight between the Nationalists and General Smuts's United party. The Dominion party, the pro-British party, is gradually being eliminated. The Labour party, which bears little resemblance to the Labour party in this country, is hopelessly divided. The Afrikaner party, founded by General Hertzog after he broke with General Smuts in 1939, and led by the moderate Mr Havenga, who was Minister of Finance in the Smuts-Hertzog Coalition, has joined forces with the Nationalists. Neither party will lose its identity, but they will co-operate at the general election, for—so their leaders declare—"the foremost national interest of South Africa demands the rejection of the Smuts-Hofmeyr regime and the harnessing of the utmost and united efforts of their respective parties to attain this end." There is no doubt that at the next election General Smuts will have to face a formidable challenge.

His trouble is that his so-called United party is anything but united. It comprises people with pro-British sympathies who vote for him rather than for the Dominion party because they see no prospect of the latter ever being returned to office, a centre section which valiantly strives to foster a nationalism that is neither British nor Afrikaner, but South African, and Afrikaners with Nationalist sympathies who cannot accept the republican and isolationist views of Dr Malan. General Smuts's difficult task is to avoid offending any section of his varied following, in particular his near-Nationalist supporters. That is why his attitude over the United Nations, or over native and

Indian policy, often seems equivocal. He is too much of an international statesman not to realise how the tide is flowing in a world which is shortly to see an independent India. But his political acumen is too great for him to risk his leadership of his country by taking too pronounced a liberal line which would drive many of his Afrikaner supporters into the Nationalist camp.

An example of his difficulty may be found in *apartheid*. This word is not found in Afrikaans dictionaries, and it was first introduced into the South African Parliament by Dr Malan in the debate on the United Nations proceedings. It may be translated literally as "separation"; but it actually implies far more, and it is applied indiscriminately to the question of South-West Africa, the Indians and native policy in general. It epitomises the growing consciousness of European South Africans that, white immigration notwithstanding, their numerical inferiority to non-Europeans is being rapidly intensified.

When Dr Malan first used the word *apartheid*, General Smuts's followers sought to query its meaning. Recently, however, General Smuts himself used it in Parliament, declaring that it is not a new word and not a new thing. With the industrial development of the Union, the drift of the natives to the towns would grow, he said, and they would have to be accommodated next to European communities on the basis of separatism (*apartheid*). He presumably hoped to disarm his near-Nationalist followers by associating himself with a policy of *apartheid*, while at the same time removing its sting. He cannot forget that a statement by his deputy, Mr Hofmeyr, to the effect that natives and Indians would eventually be represented in the Union Parliament by members of their own race, is commonly thought to have lost him the Hottentots-Holland by-election.

It is impossible, however, to decide from the by-elections exactly how dangerous is the Nationalist challenge to General Smuts. Against the defeat at Hottentots-Holland, thought to be a safe constituency for the Government, should be set a victory in the Zululand constituency of Natal where, in spite of the discontent over the Government's Indian policy, the United party candidate defeated a strong Nationalist candidate. Altogether, since 1943, out of eight by-elections the Government has lost three seats to the Nationalists.

But although on the colour question, public opinion in South Africa may be moving towards the Nationalist party, Dr Malan has to overcome the disadvantage that he backed the wrong side in the war. This fact may sometimes be forgotten today, but in the heat and dirt of a general election, the Nationalists' prayers for a German victory and their published text of a republican constitution, that bore a distinctly Fascist stamp, will be recalled and flung back at them. On the other hand, if they live this down and are returned to power on the colour question and on general dissatisfaction with a Government that has been a long time in office, will they dare to bring this constitution into force? For all the symbolic moves towards republicanism that have characterised recent years—the disappearance of the King's head from postage stamps, the elevation of "Die Stem" to be co-equal with "God Save the King," and many similar changes—there is one consideration which must give any South African Government pause before it renounces the monarchy. The Union, outside the British Empire, would no longer have even the medium status it enjoys today among the powers. It would be condemned to be a small nation, cut off even from its neighbour, Southern Rhodesia, to which along with the white settlers of East and Central Africa General Smuts once looked to make his bulwark against black domination. South Africans are not likely to forget, moreover, that in foreign trade Britain is their best customer. Nor are they likely to forget that their security depends on Britain's control of the seas. Memories of the Royal Family may be short-lived. The symbolism of *HMS Vanguard* may endure.

NOTES OF THE WEEK

The First Five Days

Whether in the spirit of Dunkirk, the spirit of Stakhanov, or the unregenerate human desire to show those so-and-so's, the miners have got away to a flying start on their five-day schedule. Of course it is far too soon to say whether they will keep up the pace; in spite of the exhortations and warnings of Mr Horner and Mr Shinwell, whose promises to reconsider the five-day week if necessary show a welcome realism, it is painfully possible that the enthusiasm of the start will go the way of the average smoker's post-Budget resolution. Certainly, as is argued at greater length in an article on page 723, no complacency is justified; from now on, the weekly output figures will be watched with much the same feelings as the statistics of ship and submarine sinkings during the Battle of the Atlantic. Moreover, it was nothing less than brazen of Mr Horner to announce fantastic demands for higher wages—including compensation and superannuation at the same level as the guaranteed wage—before the effect of the five-day week on the cost of coal has been made clear.

Exasperating and inexcusable as is the winders' strike in Durham, there is some satisfaction to be derived from the way in which the miners themselves have reacted to it. A depressing feature of the recent crop of unofficial strikes has been the blind support of rank-and-file labour outside the immediate storm centre—a specific strike reflex, no more rational than a knee-jerk, impelling every working man with a job even remotely connected with that of the really, or supposedly, aggrieved to down tools in sympathy, regardless either of his own interests, those of the Labour movement, or those of the public. In the minefields this form of contagious St. Vitus's Dance has been emphatically avoided; if the public and the National Coal Board are unsympathetic to the winders, the miners themselves are reserving for them the sort of feelings generally entertained for scabs, and have thrown themselves wholeheartedly into the job of frustrating their knavish tricks.

If this is the beginning of a new and more rational view of labour solidarity—the solidarity of the responsible, democratic and productive against the frivolous, anarchic and destructive—then the prospects of the whole British economy are on the mend. This change of heart, if it be one, does, however, need supplementing by an improvement in labour organisation. No one has as yet really thought out the implications, in this field, of state ownership or operation. Here if anywhere, for instance, may be the justification of the closed shop; although irresponsible trouble-makers can make mischief enough without official standing of any kind, their power for harm is vastly enhanced if they are in fact officials of a splinter union. Here is food for thought during the miners' long week-end.

* * *

National Service in Committee

Proceedings in Parliament are often mystifying. Last week, by the use of the guillotine, the Government cut short the debates on the Transport Bill, in spite of the inadequacy of the similarly curtailed discussions in Standing Committee, and in spite of the fact that it is the most important and the most controversial measure of the session. This week, they allowed three days to the committee stage of the National Service Bill, taken in a committee of the whole House, of which the first was largely wasted. Since the principle of peacetime conscription had been fully discussed during the second reading, there was only one amendment of note to be debated—the Government's decision to reduce the period of service from eighteen months to twelve. Actually, there was interminable discussion on, first, an amendment to raise the age of conscription from 18 to 21, and then on proposals to leave out Wales and Scotland, to add Northern Ireland and to confine conscription to England. Since most of these amendments called in question the principle of conscription, these surely were obstructive tactics if anything was.

In moving the big amendment, the Government, as represented by Mr Alexander, cut a sorry figure. No longer did he try to pretend that the decision to reduce the period of service was taken in agreement with the Chiefs of Staff. He now explained that it was taken for economic and industrial reasons—as a result of "further study of the economic situation." This explanation will convince no one. It was easily demolished by Mr Churchill, who was in his element. Of course Mr Alexander was right in saying that the period of eighteen months had never been visualised as

an "irreducible minimum." The size of the armed forces since demobilisation began never has been an irreducible minimum. It has been successfully reduced after pressure from public opinion, and the reason why this new *volte face* on the part of the Government came about more quickly than on other occasions was the size of the adverse Labour vote on the second reading. However, the tactics worked. Labour opposition, except for a few extremists, disappeared. The Conservatives voted against the Government on the motion that eighteen months should be retained, and, when it was defeated, with the Government on the motion that twelve months should be substituted, thereby registering their disapproval of the Government's hasty switch but their support of the main principle of the Bill. But the small political advantage secured by the Government can hardly compensate it for its loss of face in the country as a whole.

* * *

Horse Sense in Lewisham

Mr Herbert Morrison has probably, during the months of his illness and convalescence, chafed a good deal to get back into the firing-line; but it cannot have escaped him that, however unwillingly, he has enjoyed some political good fortune in being out of it. He returns with prestige unimpaired, indeed heightened by contrast with that of his less fortunate colleagues, and with the added advantage of a renewed freshness of impact on public opinion. Of all the Labour leaders, he has always had the most outstanding gift of popular exposition (which is not the same thing as either spell-binding or lecturing), together with a convincingly firm personal grip on the things to be expounded.

These qualities were typically displayed in his speech to his Lewisham constituents last week. The argument between planners and anti-planners, controllers and anti-controllers, is dead; what plan, what controls, and how operated are the questions that matter. A good, sound, clear plan obviates the need for many controls, and, conversely, many and irritating controls are often a symptom of inadequate planning. Plans must put first things first, so that shortages, even if uncomfortable in the present, should not wreck the future; and they must be plans for future prosperity, not for merely making the best of present poverty. Thus one may have to plan economy in the use of electricity, but more to the point is the planning of standard electrical generating equipment. Sectional ideas, hangovers from the pre-war world, must be scrapped, whether they are held by trade unionists, employers, particular industries, or Government departments. Unofficial strikes undermine the Labour movement. Nationalisation must be carried through, where necessary, in the interests of efficiency, but most of industry should remain private and prosperously enterprising. Such were Mr Morrison's main points. How true! How sound! How eminently worth saying! How different from . . . but comparisons are odious.

Were these reasonable, well-balanced and far-sighted views recognisable in practice throughout the activities of the Government, Labour's adversaries would be disarmed, its critics, all but the wholly unreasonable, silenced, its supporters inspired, and a magnificent example set to Social Democrats the world over. But are they? Contrast with the condemnation of sectionalism, the Government's wriggling on the closed-shop issue; with the criteria of nationalisation for efficiency, the farce of the Transport Bill; with the call for overall planning, the planless Economic Survey for 1947; with the principle of first things first, the total absence of a man-power policy; and set beside Mr Morrison's opening appeal for the "right spirit" the class war catcalls of Mr Shinwell and Dr Summerskill. Admittedly the Opposition's manners are as bad or worse, but those who appeal for national unity should set an example.

Altogether, Mr Morrison has come back none too soon. More power to his elbow—and more action to match his words.

* * *

French Communists Take a Rest

Once again M. Ramadier has avoided a breakdown by the skin of his teeth. Having got rid of the Communist Ministers who on Sunday voted against the Government but refused to resign, he had to secure on Tuesday from the National Council of his own party a change of their previous ruling that Socialists must not take part in a coalition which did not include Communists, either

in the Government or in the majority supporting it. The change of that golden rule he eventually secured, but only by 2,529 block votes against 2,125, and not without a resolution forbidding the Socialist Party to join in any anti-Communist coalition which might divide the workers of France, or to stay in power supported by a reactionary majority. This, of course, puts the retiring Communists in a strong position for the future; but there is every sign that they intend to use the next few months as a "creative pause." They cannot afford to lose any of the credit that may come from improved economic prospects. They can therefore hardly provide opposition in the ordinary sense of the word.

It is early to say how much the Socialists will gain by their handling of the latest governmental crisis. M. Ramadier can have no real sense of security, for he has virtually accepted "the enemy on the left" by putting national before party principles. But he and President Auriol have done a great service to the Fourth Republic by showing that the executive can rise above party pressures, that the collective responsibility of the Cabinet can be asserted, and that the new constitution has a flexibility which was little suspected, least of all by General de Gaulle.

From the British point of view the important thing is that M. Ramadier and M. Bidault remain to deal with the ticklish German problems that will arise during the next three months. Sooner or later the invitation to bring the French Zone into the Anglo-German fusion arrangement is bound to come; and it may make some difference whether it comes from the British or the American side. The directors of French foreign policy want to work with the British on Germany, but are convinced that the revival of its western industry in the near future must be bad for France. Only the very few who are convinced that occupied Germany will never be united and that a clash between east and west is inevitable are prepared to let French policy give up its insistence on international control of the Ruhr. There is, of course, the further complication that, by one means or another, the French Zone is made to pay its way; no French Government would dare shoulder part of the financial burden created by the British and Americans in their zones.

The French are rapidly becoming export-minded, partly as a result of watching British techniques; and they see their salvation in creating a great French industrial machine with the help of specialised imports from America. Any suggestion that such imports of equipment, tools and raw materials should be shared with the Germans would cause the greatest bitterness among all sections of opinion. International control of the Ruhr is therefore seen not only as a guarantee of French security but as a condition of French industrial power.

* * *

Progress at Geneva

Reports from Geneva this week indicate that the delegates have been concerned with both aspects of their curriculum: tariff negotiations and discussions on the proposed charter of the International Trade Organisation. On the tariff front the main, and certainly most explosive, event appears to have been the intimation by the United States to the Australian and New Zealand delegations that the United States would regard it as a generous gesture to "bind," i.e., stabilise, the tariff on imported raw wool at its present level. Since this tariff is one of the highest in the world, reaching, according to quality, a figure of 70 per cent *ad valorem*, and since the Southern Dominions had counted on a substantial reduction in the American wool tariff as part of the consideration for dismantling Imperial Preferences, the effect of this intimation was unfortunate and irritating. It may well be that the American "offer" was merely in the nature of an opening gambit in the long game of negotiation which is now opening. Even so it cannot be denied that it has struck a very odd note in the American chorus of praise for the objectives of freer trade with which the Geneva Conference was launched.

The debate on the Charter has taken place between British Commonwealth delegations which this week held their first joint meeting since those which took place in London before the opening of the Geneva discussions. At this meeting the more controversial aspects of the Charter were discussed and further attempts made to arrive at the greatest possible unity of views between the Empire delegates before the full 18-nation debate on the Charter opens towards the end of this month. This general debate is being anticipated by a study group which has been set up to consider a memorandum prepared for the Norwegian delegation by Professor Ragnar Frisch, of the University of Oslo, on the general problem of international trade equilibrium and non-discrimination. The memorandum argues that discrimination is not always reprehensible, and that in certain

circumstances a careful, selective application of discriminatory methods may cause a far smaller contraction of total world trade than would result from the rigid application of non-discrimination. This plea for a flexible approach to the problem of quantitative restrictions to international commerce has aroused some approving echoes with other delegations. The Norwegian thesis clashes head-on with the American philosophy, and will prove valuable in crystallising differences on these basic issues.

* * *

International Air Standards

Organisational matters and the planning of future work are occupying the first Assembly of the International Civil Aviation Organisation (ICAO) which met in Montreal last Tuesday. Once these questions and the status of ICAO as a specialised agency of Uno have been settled its progress should be rapid. For its way has been thoroughly and skilfully prepared by the Provisional International Civil Aviation Organisation which was established in June, 1945, under the terms of the Chicago Convention on international civil aviation. The provisional body, which became permanent early in April when the requisite number of countries had ratified the Convention, has for various reasons been mainly concerned with the technical problems of aviation. The political divergencies revealed at Chicago between Britain and America on the rights of through air-lines to local traffic, or on the desirability of multilateral agreements on commercial rights and the refusal of Russia to participate in the organisation's activities indicated clearly that, until the attitudes of these Powers changed, effort would be better spent on more technical matters.

There are now signs that the attitudes of Britain and America at least are coming nearer together, although the British proposal for an international company to own and operate the main air lines of the world, first raised last May and now repeated this week, envisages a much greater degree of internationalisation than America is likely to accept for a long time.

Meanwhile much valuable work has been done by various committees and technical divisions. Particularly important is the formulation of "international standards and recommended practices" which, after submission to member states, become effective within three months, unless rejected by a majority. In this way the consensus of expert technical opinion is enabled indirectly to exercise control over the design and performance of aircraft, to standardise navigational procedure, in short, in the words of the Convention, to "promote generally the development of all aspects of international civil aeronautics." The process is necessarily slow, since it must allow for the transition from existing types of aircraft, auxiliary equipment, and procedures; but it does mean that eventually uniform standards—the highest considered feasible at any given time—will obtain on all the air routes of the world.

* * *

The Dockers' Return

It was perhaps fitting that the Glasgow dockers should have decided to return to work on the very day that the Transport and General Workers' Union was celebrating its jubilee in London—the bulk of the London dockers, who had come out in sympathy, had been back at work since Saturday. Otherwise the celebrations would have had a very unfortunate background. Even so, the strike and its underlying causes must have given Mr Bevin, chief architect of the mammoth union, and Mr Deakin, his successor, plenty to think about in their review of twenty-five years of the Transport and General Workers' Union. Many questions have lately been arising in the public mind: has the union grown too big for its boots; in the amalgamation of heterogeneous organisations has it lost sight of the interests of individual sections; do its leaders retain sufficient control over their rank and file; and is a general union the best form of trade union organisation for these types of workers?

The dock strike was only one in a long series of troubles among dock and road transport workers. Although it was brought to an end when the Minister of Labour promised that the constitutional negotiating machinery would enquire into the Glasgow men's grievances and gave an assurance that there would be no victimisation, the danger of similar unofficial action in the future has by no means been removed.

Mr Isaacs has for some time been considering how to speed up and improve the industrial negotiating machinery, so as to remove the opportunity for disaffected elements to play upon the workers' grievances, legitimate or otherwise. The Liberal Party's sug-

gestion for a commission of enquiry into the trade unions has much to commend it, but much speedier action is required to investigate the whys and the wherefores of unofficial stoppages.

The Boundary Commission's Decisions

Hot on the heels of the Local Government Boundary Commission's first annual report comes its first batch of decisions and opinions in particular cases. The report held out hopes that these first decisions would be no more than provisional, while a major policy for local government was being evolved; and to a certain extent this seems to be the case. Certain county boroughs—Liverpool, Hull, Southampton, Plymouth—and one non-county borough, Luton, all of whose housing problems are acute, have been given boundary extensions "on account," without prejudice to some more drastic reorganisation of county boroughs and counties at a later date. Grimsby's claim has been turned down, and Luton's application for county borough status has been rightly deferred. The permitted boundary extensions are a great deal smaller than was claimed by these authorities, but for all that they are quite appreciable. Plymouth, for instance, is doubled in area.

This is all as expected. But some of the Commission's observations give rise to the belief that, if and when its wider policy for local government is formulated, the large-scale expansion of county boroughs will not be found to be part of it. In other words, from the county borough's point of view, some of these first decisions are more nearly final than provisional. Liverpool's claim to expand to a point that would give it a total population of 912,000 is rejected on the grounds that this is too big for one all-purpose authority—rather strangely, since its pre-war population was almost this size. Plymouth's claims have been heavily scaled down on the advice of the Ministry of Town and Country Planning that the council has overestimated its desirable overspill of population; so there is to be no more than one satellite town allowed to Plymouth. But in any case the Commission regards any large-scale expansion of Plymouth as being inherently undesirable.

These decisions may not be unreasonable. But they should not be treated as final until the Commission can produce a satisfactory alternative long-term policy. It is continuing its investigations into the possibility of creating some new and mainly urban counties, by reviewing in conjunction Manchester and Salford county boroughs, together with nine non-county boroughs, 11 urban districts and one rural district that surrounds them. This sounds an imposing area to be grouped together; but in fact it is comparatively small, with a pre-war population of 1,460,000 (or twice that of Manchester itself), an area one-twelfth that of Lancashire, containing little countryside or provision for a "green belt," and abutted on several sides by other county boroughs that are excluded from the scheme. This is not at all the sort of county that is wanted. The whole purpose of setting up a county instead of an enlarged county borough would be to cover a much wider area and to bring some measure of unitary control to a large conurbation and its countryside—which, in this instance, is the whole of South Lancashire. The Commission may include other authorities in this review, and it is essential that it should do so. The Commission is producing some interesting ideas and has shown good intentions, but there are already signs of a timidity that would be fatal to both these assets.

Next Move over the Sudan

The Egyptian delegates who are being tough at Lake Success in support of the Palestinian Arabs show less aplomb when questioned about their intentions toward the Sudan. Are they or are they not going to refer the question of their "permanent sovereignty," as a dispute, to Uno? At home in Cairo, their premier, Nokrashy Pasha, says yes. His prestige, possibly even his retention of office, depends upon it. The nationalist press is whipping him into a course that, in his personal interests, he does well to pursue; but does it redound to Egypt's credit? Some of his colleagues think not. They know that there is only one item in dispute with Great Britain and that is whether the Sudan has or has not an ultimate right to decide its own future. They foresee how the Egyptian contention that it has not will seem to come ill from a state which champions the right to self-determination of Palestinians, Libyans and others.

Sensing this difficulty, Nokrashy Pasha intends to base his main

case against Britain on another point altogether: the illegality of maintaining troops in a foreign country against its will. But here too he is on bad ground. He intends to base his contention upon the part of paragraph 7 of the General Disarmament Resolution passed by the last Assembly, which advocated withdrawal without delay of armed forces stationed in the territories of members "without their consent freely and publicly expressed in treaties or agreements consistent with the Charter." Accordingly, he will question the validity of the freely negotiated and public Anglo-Egyptian treaty of 1936. For in his mind, and in that of all Egyptian nationalists, is the conviction, first, that Egypt is capable of defending itself; secondly, that even if it is not, no one is wanting to fill the vacuum that would be left by a British exodus; and, thirdly, that even if an unwanted third party appeared before Egypt was "ready," the British, and now also President Truman's Mediterranean forces, would be first upon the scene.

After a delay that was impolitic but is now over, all British forces in Egypt are now fulfilling the 1936 treaty conditions. To Nokrashy's claim that the 1936 treaty has become invalid, the British answer will therefore be that it has not expired; that it was signed not under duress, but eagerly, by an all-party delegation which, rightly enough, feared Mussolini; and that the remedy for a treaty that one party no longer likes is not to dub it invalid but to seek a substitute.

Egyptians who want to return to this search are busy sowing rumours that American mediators are offering their services. This is untrue. Next, they suggest that the British Government may suggest some face-saving concession, such as greater Egyptian participation in the administration of the Sudan. But such an offer would be a half-measure serving no useful purpose. It would not satisfy Egyptian nationalists. And, inside the Sudan, it would have manifest drawbacks. As anyone who knows Egyptian homesickness for Cairo can foretell, it would introduce discontented officials into a contented administration. Worst of all, it would upset the Sudanese by retarding Sudanisation of the administration. If a new treaty is to be the way out of Egypt's dilemma, it is for Cairo, not London, to make the first overture.

"Greater Syria"

The treaty ratified this week between the Cousinly Kingdoms of Iraq and Transjordan goes farther than is agreeable to King Ibn Saud—who dislikes Hashimite family solidarity—but not nearly so far as King Abdullah of Transjordan would wish. Drafted in the main by the Iraqis, it is to be valid for ten years and is renewable at the end of the term, during which the two states will train their armed forces on parallel lines and will undertake "mutual consultation and united effort" in all their relations with third parties. Beyond this, it does nothing to further the so-called "Greater Syria" project of closer unity—if not fusion—with Syria also, a project so dear to King Abdullah's heart

that he is said to be behind the issue of a new 294 page Arabic publication on the subject.

But 294 pages of wishful thought do not make a kingdom, and he is a long way from his objective. In the first place, many Syrians are not monarchists and those that profess the doctrine—chiefly the tribesmen—are by no means sure that King Abdullah is the monarch they would choose. And Syrian republicans would,

if there were to be fusion of any kind, prefer a Greater Syrian Republic. Secondly, the conception is not popular with other members of the Arab League. The Christian Lebanese are not sure that so large a Moslem neighbour would be an advantage. The Egyptians, scenting in the scheme an intention to create a power that would rival Egypt in size and importance, lose no opportunity of sowing discord among its potential components. They were well able to do this at the time of the Turco-Transjordan treaty, since Syria is still in disagreement with Turkey over Alexandretta. And King Ibn Saud does not want an "axis" all along his northern frontier. Curiously enough, the only outsiders in favour of the idea are the Zionists, who see in King Abdullah's ambitions a chance of rendering a partition of Palestine acceptable to one, at least, of the Arab rulers by throwing the Arab part of Palestine and Transjordan together.

But, at bottom, the biggest handicap to development of the Greater Syria project is a lack of funds. Its sponsors enjoy enough for single publications but not for publicity campaigns. Still less have they the means of staging the royal splash without which it would be difficult—even among Arabs, who relish a monarchy—to found a new kingdom in the nineteen-forties or fifties.

* * *

Automobile Vital Statistics

A study of demand and supply in the motor industry, published in *The Motor* of April 30th, deserves publicity outside the specialist press. It draws on the White Paper on National Income (for an estimate of the number of potential car-buyers); on statistics of production, pre-war and present; and on reports by the Society of Motor Manufacturers and the Ministry of Transport on the rate of wastage of existing cars. The argument starts from the increase in the number of incomes between £500

and £2,000 (which has more than doubled since 1938), estimates that at 1938 prices this would mean a potential car population of 4.5 million, takes increase in car prices into account, and concludes that 2.4 million—an increase of some half-a-million on actual numbers—represents the total needed. This would hardly satisfy a statistical purist, no allowances having been made for the competing demand, also unsatisfied, for other things—such as houses; but it gives an idea of the size of the deficit. Given that the car population is 500,000 short of the optimum, what of birth and death rates—not forgetting emigration under the export drive?

Pre-war output capacity was for about 400,000 cars a year, and has probably doubled; but a ceiling is set by shortages of manpower, steel and fuel. In 1946 output was under 220,000, and the very best that can be expected is an increase to 500,000 by 1949, half the total being earmarked for export. So much for the birth and emigration rates, which yield a gross addition, in five peace-time years, of some 1,350,000 cars. But the death-rate

is rising, too, as the car population, overwhelmingly pre-war, grows older. Of every 100 cars, it has been calculated, 97 survive for 2½ years, 80 for 5½, but only 10 for 10, and even allowing for war-time hibernation, many cars now running are senescent if not senile, as half-an-hour's observation on any main road will confirm. Taking the fairly predictable death curve and the admittedly optimistic birth curve together, one reaches the conclusion that supply will fall shorter and shorter of demand between now and 1952; that buyers will continue to wait two years or so for delivery; and that drivers will continue to use—and to buy and sell at fancy prices—the superannuated menaces now infesting the roads. The prospects for the private motorist, in fact, remain fairly grim.

* * *

Half-Cooked Tripe

The report of the Committee of Enquiry into the closing hours of shops attempts to codify, simplify and rationalise the horrid muddle resulting from successive legislative attempts (in 1912, 1928, 1936 and under Dora) to combine the incompatible aims of closing the shops and allowing the public to buy. Of that muddle the famous provision of the 1928 Shops (Early Closing) Act, under which tripe may be sold after hours half-cooked but not raw, is the quaintest but not the least rational example. To deal with the anomalies which now bring the law into contempt two lines of action are possible. Parliament can abolish or drastically reduce the concessions which permit the after-hours sale of fish and chips, cigarettes, tripe in an adequately cooked condition, and other immediate public necessities, and so remove or lessen the awful temptation to buy or sell a writing pad with a packet of cigarettes or a pair of herrings with a parcel of fish and chips; or it can abolish statutory closing altogether and, while enacting whatever fresh provisions may be necessary to ensure decent working hours and weekly rests for shop assistants, leave the shops to open and close as their owners please.

This latter course the Committee rejects with finality, in three lines and without discussion. Even if the interests of shop assistants can be otherwise taken care of, shopkeepers need to be protected from themselves. The Committee does not explain why the sluggish should need protection against the ambitious, the lazy against the hardworking, more urgently in the field of retail trading than in those of, say, taxi-driving, restaurant-keeping, or the professions; but as the safeguarding of those least willing to serve the public against those more willing, whom the public might otherwise prefer, has in practically every context been elevated into a first principle of national economic policy, the Committee's decision is hardly surprising. All the more appreciation is due to them for their recognition of the painfully obvious fact that six o'clock is too early a compulsory closing hour to meet the needs of the people who must both work and shop. "It is now the public's turn for consideration," it says, and reports itself as struck by the "tendency on the part of some witnesses to assume that the wishes of the shopkeeper should be regarded as conclusive."

Given the overriding principle of statutory hours, no serious quarrel is possible with the detailed process of codification applied to the exemptions under the various Acts; even though the changes are mostly in the direction of further restriction. "We cannot have it both ways," says the Committee. How painfully true.

* * *

Manpower in the British Zone

The talks on bizonal administration and the level of German industry which are now proceeding in Berlin have as their background a shortage not only of food and fuel, but of manpower. This may seem strange in a country where lack of coal is keeping most of industry running on short time, and it is certainly true that while unemployment is limited to the virtually unemployables, there is a great deal of under-employment in the British Zone. Yet shortage of effective manpower is one of the most pressing problems now facing the Control Commission.

The total registered working population in the zone is 8.9 million, of whom 6.8 million are working for employers. The latest figure for unemployed is 391,000. According to official estimates, out of every ten of the pre-war male population between 18 and 45, only four can be considered fit for employment, four being dead or missing and two disabled as a result of the war. The return of prisoners of war, many of whom are in the most productive age-groups and are in relatively good physical condi-

tion, should make an appreciable difference both in quantity and in quality. But the need is urgent to increase the labour force and its productivity. The authorities are trying unsuccessfully to recruit more women to industry. Tradition in Germany—even before Hitler's "back to the kitchen" movement—is against the employment of women in factories, and many employers need a great deal of persuading before they will take on women. In any case, many of the women themselves, particularly the married ones, are too preoccupied with getting food and of keeping themselves and their families alive to think seriously about factory work.

Apart from mining, which has absolute priority in labour, the occupations which most need strengthening are building, clearance work and timber production. The labour force in the steel industry is sufficient to meet the present production level, but it will have to be raised if more fuel becomes available. There are too many people working on the land, since many people registered as agricultural workers in the hope of obtaining extra food. In theory, military government has powers of direction, but in practice it is unwilling to use them; it is, moreover, reluctant to place this weapon in the hands of the German authorities. At the moment, of course, shortage of fuel is hampering industrial recovery, and the general shortage of food will make nonsense of any attempts to raise productivity. But, on a longer view, what is clearly needed is that the economic experts should draw up a man-power budget for the two zones, relating the available labour force to the labour requirements and forming the essential basis for any kind of economic plan.

* * *

London's Population

The steady flow of population back to London has already brought its size to a level rather above that envisaged under the Government proposals set out in the County of London and Greater London Plans. Figures published by the London Passenger Transport Board in its annual report for last year show the growth since 1921 of the population in the Board's area. The wartime decline persisted up to September, 1944, but by the end of last year the population had risen again by 2.3 million and was less than 500,000 below the pre-war figure. There are some striking changes in the distribution over the area. The population in the Administrative County of London, which had been thinning out steadily before the war and, of course, dropped sharply in the early part of the war, had risen again by the end

of last year and had practically reached the planned ceiling of 3.33 million. In the remainder of the continuously built-up area, bounded roughly by a circle of twelve miles radius from Charing Cross, the figure has already exceeded its planned limit by 500,000. The growth in the outer country zone has increased rapidly since the war, and the proposals allow for a further increase of only 0.33 million from the end of 1946.

The post-war growth of the London population was losing its impetus in the latter part of last year, but nevertheless was con-

tinuing and the question must arise whether it can be restricted to its present level. Even if it can, it is evident that an appreciable redistribution of the population must take place if the proposed planning for the Greater London area is to be realised.

Shorter Notes

Concessions were announced this week in the restrictions on domestic fuel consumption. Gas and electric heating will be permitted, without a medical certificate, in households "where it is necessary in the interests of the health" of children under three and old people over seventy. It will also be permitted for the drying of clothes and household linen, and for drying premises affected by floods. In other words, people are now legally permitted to do what they would have done in any case.

*

The Agriculture (Emergency Payments) Bill fulfils the Government's promise to provide a special subsidy for farmers who, in response to the need for increased production, have sown crops this spring on land damaged by floods. The payments will vary from £3 to £15 an acre, according to the crop, and are expected to cost not more than £2½ million. The Bill also enables claims for the hill sheep subsidy to be assessed on the number of eligible sheep last December, instead of on the reduced number after decimation by snow. These are modest contributions to those farmers who were very hard hit by last winter, but farmers as a whole should gain greatly from the general increase of prices announced recently.

*

Mr. Silkin has made an able defence of the proposed Bankside power-station. The power-station will take up little room, will be set well back from the river, will use oil instead of coal, and its chimney will be a good deal lower than St. Pauls; still more convincing was his argument that London's electricity requirements were so great that Bankside was necessary as well as—not instead of—the alternative site at Rotherhithe. What the Minister could not demonstrate successfully was that the power-station would fit satisfactorily with the LCC plan for the South Bank.

*

In a speech last week-end the Minister of National Insurance stated that by the end of April, 1947, there had been 2,735,500 claims for family allowances, compared with 2,600,000 by the end of 1946 and 2,300,000 by August 6, 1946, when payment began. New claims are arriving at the rate of 7,000 a week. Claims rejected amount to approximately 3 per cent of the total, and allowances are being paid in 2,553,000 cases, that is, in respect of just over 4,000,000 children.

*

In the House of Commons this week, the Attorney-General gave some figures on the number of divorces. In 1945, 25,000 petitions were filed and 20,000 disposed of. In 1946, the figures were 43,000 and 33,000 respectively. It was because of this that the Denning Committee recommended that undefended cases should be heard by county court judges sitting as Special Commissioners, and that this recommendation, which was implemented, was justified is illustrated by the fact that, in the first three months of this year, about 17,000 petitions were filed and 16,820 disposed of. The Attorney-General added, however, that it might be two years before the "really frightful arrears of Service cases" were wiped out.

The Economists' Bookshop

(jointly owned by the London School of Economics and Political Science and by *The Economist*)

is now open for business at

11/12 CLEMENT'S INN PASSAGE,
ALDWYCH, LONDON, W.C.2

The Economists' Bookshop specialises in books on Economics, Sociology, Psychology, History, Political Science and Current Problems, to which some carefully selected general literature is added. Particular attention will be given to the supply of books to and from any country in the world. Postal orders are welcomed. The difficulties of the book trade at the present day are well known and it is impossible to promise to supply any book on demand. Inquiries, however, are invited. Orders for books for which there is a reasonable chance of re-issue will be kept on file and the books supplied as soon as they become available.

Letters to the Editor

Bonus Issues

SIR,—In your leading article on the Budget, in the issue of April 19th, you said that "there is a case for some taxation on bonus issues, many of which are undeniably devices for evading surtax." In the debate on the Budget resolutions on April 23rd, I said that I proposed to ask you to give me instances of bonus issues being used to evade surtax. That I now do. What did you mean?—Yours faithfully,

House of Commons

DAVID ECCLES

[On further examination, it is apparent that our statement, as a general proposition, cannot be sustained and should be withdrawn. It is true that, before the war, when bonus issues were permitted, shares of companies that were believed to have the intention of making a bonus issue, especially a regularly recurring one, were often sought after by investors, and recommended to them by their professional advisers, as a means of reducing liability to tax. It was this widespread opinion that misled us. But it is really based on a fallacy. Take the case of a company whose profits steadily rise from year to year. It could raise its dividend from 5 per cent to 6 per cent to 7 per cent. Or it could keep the dividend at 5 per cent and issue a 5 per cent capital bonus every year. If it chose the second course, a surtax payer could sell his bonus every year and keep his income, and accordingly his tax, steady. But he could achieve the same result, if the company pursued the first course, by selling part of his holding every year. In either case, he would be taking his capital profit every year and reducing his proportionate share in the company. His tax liability would be the same in either case.

This is the simplest case. But much the same reasoning applies in other instances. There may, or may not, be highly ingenious ways of dodging tax liability which involve at some stage the issue of bonus shares. But the general argument that bonus shares are a method of avoiding liability to tax is incorrect and should be withdrawn. It follows that Mr Dalton's stamp duty on bonus issues is not only defective in detail, as we argued at the time, but also wrong in principle.—EDITOR.]

The Tobacco Duty

SIR,—The shorter the stub . . . the greater the net gain" in cutting a cigarette in half, says Mr John Green, and his demonstration seems convincing. But what of a man who throws his cigarette away after half-a-dozen whiffs? Evidently half a cigarette will serve his turn as well as a whole one; so by cutting it in half he doubles his profit, a far greater gain than that envisaged by Mr Green. Therefore the longer the stub the greater the gain!

Of course, there is a catch in it. This appears to be that the length of the stub depends in part at least on the rate at which the marginal utility diminishes, and this varies greatly for different smokers, whereas Mr Green assumes it to be constant.—Yours faithfully,

W. W. GREG

River, Petworth.

SIR,—If you put out half your cigarette and light it again you lose only one CF, instead of two, as your correspondent suggested in your last issue. Thousands of soldiers and workers have relied on this method of maximising their personal utility. If the re-lighting method be adopted the cork-tip is an asset instead of a liability.—Yours truly,

A. M. DE NEUMAN

University College of the South West, Exeter

Prosperity for Wool

SIR,—The article in the issue of May 3rd gives a very clear and fair résumé of the Wool Working Party report, but a critical reading of the report suggests some further points of vital importance to the industry to which more consideration should be given.

Manufacturing requires a mixture of artistic imagination and commercial ability in the management—usually this means one man of a very small team owing to the size of the average business—many examples could be given of one man having made all the difference between a mill running or not. Therefore the quality of training and choice of suitable men is particularly important, especially so after the period of difficult trading conditions between the two wars, when many good men went into

other industries, where hard work would give more certain results.

A reduced labour force means that quite a considerable quantity of machinery may be unemployed. Under conditions of more normal trading, this might result in price-cutting, to the detriment of both employers and employees.

The relationship of the basic wool price with other fibres and its stability has an effect of considerably greater importance than casual reading of the Report would suggest.

Machinery in the textile trade is mostly slow-running by modern standards and consequently lasts a long time. As the nature of the raw material puts a definite ceiling to the possibility of considerable speeding-up, it is difficult to make new machines, which are worth the considerably increased extra cost.

A comparison with the textile trade in other countries suggests the possibility of improvements in finishing, in fine crêpe-twisting, and in styling for fashion. Finishing is hardly mentioned in the Report and will probably be one of the most important sections of the trade in the future.

Finally it is almost certain that more output could be obtained at present with the existing fuel allocations, if the trade were not so hampered by regulations—for example the utility programme requires the production of a certain yardage of a given weight cloth at a fixed maximum price—by coarser spinning a greater yardage of a heavier cloth might be produced but, owing to the weight, at a greater cost.—Yours faithfully,

EDWARD GLENDINNING

Tanfield Mills, Huddersfield

Italian Financial Agreement

SIR,—On my return to this country from a short visit to the Continent I hasten to write and protest against the fantastic settlement made with Italy and in particular with the glib satisfaction with it expressed in your issue of April 26th.

When are we going to realise that we are no longer a rich creditor nation, but owe money left, right and centre? What sort of impression will the gift of £100 million of war-time supplies and stores for a mere £8,000,000 have upon Egypt and India when the question of the sterling balances comes up for serious dis-

From *The Economist* of 1847

May 8, 1847

[Most of *The Economist* of this week was given up to an analysis of the financial crisis of the time and to its own proposed remedy—the substitution of a paper circulation for gold.]

The awful predicament in which the country is now placed, and the still more awful predicament into which it is fast hurrying, from causes over which human power can now exercise little or no direct control, render it the imperative duty of all to exert every effort of mind in order to avert, or at least to ameliorate, if possible, the disasters which impend over us. But, above all, it is our duty, while suffering under the severity of a great pressure, to be careful that we do not yield to mere empirical palliatives, which, while they may afford some immediate ease, must terminate in increased disorder and aggravation of the evil. At the same time, while this caution is necessary, it is our duty, as intelligent beings, to discard every prejudice which former abuses have created, and to bring all our intellect and experience, uncrippled by preconceived notions, to our aid at such a moment. . . . The question—how are the *hundred millions* of people which inhabit these islands and the adjacent countries to be fed during the next four months? remains still without the slightest solution, while every market-day witnesses fresh advances in the price of grain. And the almost equally important question, how are our artisans in the manufacturing districts to be employed during the remainder of the year? it is difficult to answer. And, lastly, the great and essential question: how is our public revenue to be kept up amid such prospects? forces itself upon us. It is a period when common danger demands that all party or other considerations should be set aside, and a great effort made to avert the serious calamities under which we suffer, and which time will only aggravate.

cussion? It may be so much easier for the diplomat and the Foreign Office, when faced with awkward problems involving the payment to this country of large sums of money, to say in lordly fashion "Forget it," but it is not now our money we are giving away so generously, but the money of our creditors, unless, of course, the people of this country are prepared to export an extra £92 million of goods for the pleasure of hearing Count Sforza say a few nice words about this country. I heard several expressions of opinion on this settlement from people on the Continent, mostly our Allies, and in every case they wondered whether our Government had lost its senses in being so outrageously generous to Italy, particularly after the niggardly treatment meted out to Denmark on the question of food prices.—Yours faithfully,

Whitewebbs, Margareting, Essex

A. P. ASHFORD

The Fire Services Bill

SIR.—In your last issue Mr R. C. Hazell suggested that little light was thrown, during the debate on the Second Reading, on the justification for increasing the cost of the fire services above the pre-war level. In order correctly to estimate the need for this increased expenditure one must examine the services obtained by the public for the £3,000,000 pre-war annual expenditure. The total full-time establishment of the pre-war service was around 5,000 officers and men, almost half of these being employed by the London Fire Brigade, which Brigade was also responsible for about £2,000,000 of the £3,000,000 total expenditure.

Outside London, with the exception of a few local authorities, the standard of fire protection was exceedingly poor—in some cases almost non-existent. An analysis of pre-war fire cover discloses the wide diversity which existed between local authorities of similar area, rateable value, population and fire risk. For example, the Borough of Barking, with a pre-war population of 80,000, employed 37 full-time firemen and officers, properly trained and adequately equipped. Gateshead, with a population

of 234,000, employed 8 full-time firemen, reinforcing its brigade when the occasion arose by police constables acting as firemen. Oxford, with a population of 90,000 and a rateable value of nearly £1,000,000, just prior to the war, employed no full-time firemen, maintaining a volunteer fire brigade. Bearing in mind the extensive, densely populated areas with hopelessly inadequate fire cover, few professional firemen and officers believed that it would be possible to operate the 1938 Act merely at the cost of an extra penny rate.

Before the war, "permanent duty" was commonplace. The men (and their families) were on duty day and night for seven days a week, having every eighth day free. A national system of 60 hours' duty per week is about to be introduced. Rates of pay of firemen before the war were inadequate and out of keeping with the professional status of the fire service. Those rates have been replaced by a national scale equal to that of the police forces.

The functions of fire brigades are to be extended. Now, firemen and officers must be trained in order to be competent to advise factory managements and owners of property on fire prevention. This long-delayed extension of the duties of firemen involves new fields of research and technical development. Moreover, a personnel of fire brigades will be required to undertake the salvage duties for which fire insurance companies have maintained their own salvage corps.

There is no reason why fire insurance companies, who unquestionably will benefit from the new brigades, should not contribute to their upkeep. The proposal is right in principle and easy of application.

The direct and indirect fire losses suffered by industry must call for an efficient, well-planned, well-manned and properly trained modern fire service. The firemen's contribution towards our country's production needs is to reduce these losses. To go back, as Mr Hazell suggests, to 1938 would be to throw away the lessons of the war and to deny the present needs of industry.

Yours faithfully,

JOHN HORNER,

General Secretary, the Fire Brigades Union

First Avenue House, Bedford Row, W.C.1.

Books and Publications

Mirror to Mussolini

"Ciano's Diary 1939-43." Edited with an Introduction by Malcolm Muggeridge. William Heinemann. 575 pages. 21s.

MUSSOLINI'S son-in-law, Italy's Foreign Minister, Count Ciano, looked, but did not write, like a vain buffoon. He was in fact an abler, more rational and more detached man than the Duce; but he had little of the dynamic swagger, will-power and ruthlessness of his chief. He tried to develop all three, and in the process discarded every shred of principle and independence. Such a man was bound to write a diary directly he got into power; losing round after round in the struggle between his own commonsense and the Duce's megalomania, he felt each day the need to confess his failure, to record that he had done what he could and to argue that, if Mussolini should lead Italy to disaster, here would be the evidence of his efforts to save her. And if, after all, Italy rose to new imperial heights on Germany's back, then the diary could always be rewritten.

It is the fact that some such thoughts were in Ciano's mind that makes this diary such a valuable and interesting document. It gives over the period January, 1939, to December, 1943, the day-to-day reaction of this young Foreign Minister to a whole gallery of rogues and a whole range of plots: Mussolini and Hitler first and foremost; then Ribbentrop and Pavelic, the Croat puppet leader; Laval's unofficial emissaries; incompetent Italian generals and admirals, with their optimistic lying reports when all went well and their last-minute qualifications and warnings when a crisis was upon them; some memorable diplomats; François-Poncet, watching Ciano enjoying the same illusions about the Germans as some Frenchmen; the German Bismarck and his entourage, always encouraging the belief that German morale was shaky and the High Command split from Hitler; Sir Percy Lorrain, grateful for small mercies but succeeding through all the painful appeasement period in impressing on Ciano's mind a picture of British determination to fight—if fight she must—to the end.

There can be no doubt of the authenticity of the document, or of the greater part of it. Where there are strange omissions, as at the time of the Battle of Britain, they are in character; where

there are strange changes of view, for example, about the wisdom of fighting side by side with the Germans—they, too, are in character. There are the makings of great tragedy here, if farce were not so often breaking in; and if the real tragic hero, the Italian people, did not appear in so minor and so ludicrous a rôle. Mostly they are ignored, although Ciano frequently reminds the Duce that they would rather fight against than for the Germans, and there are depressing reminders of the widespread hatred there was for the French. They are the tools of the empire-builder; nowhere does Mussolini or Ciano show any sense of responsibility towards them. The master said one day to the son-in-law:

The Italian race is a race of sheep. Eighteen years is not enough to change them. . . . We must keep them disciplined and in uniform from morning until night. Beat them and beat them and beat them.

And the son-in-law, visiting Poland and finding Beck incapable of understanding that Italy might be a valuable ally, writes:

Too many painters, sculptors and architects have represented Italy in Poland in the past. . . . They love in us our artistic nature rather than the strength of our arms, in which they still do not completely believe.

The *obiter dicta* of this diary are memorable, in many cases because the gem of dictatorial thinking has a setting of Ciano's dry and quiet humour. Ribbentrop, in October, 1941, returning from a shoot, says: "Hitler's New Order in Europe will ensure peace for a thousand years"; Ciano suggests that a "couple of dozen generations" is rather a long time and Ribbentrop gives in: "Let's make it a century then," he said. And Ciano, interpreting the impulsive intuitions and wayward moods of Mussolini which made Italian foreign policy so unaccountable, declares just before the war that "it is becoming more and more difficult to work with these democracies."

One has the impression that these two Italian bosses never really cleared their in-trays, or only read those papers which were likely to strengthen views already formed. It is remarkable how scant is the attention paid in this diary to Italy's desperate economic weaknesses both before and during the war, how wrong they were about "Roosevelt's bluff," how they were completely surprised by the German attack on Russia, how little they understood the British strength that lay behind the "tired

sons of a long line of rich business men." The point is of interest because Stalin has once or twice given a similar impression; if one has to answer to nobody for one's actions, why bother to brief oneself adequately? Ciano in fact—particularly in his war-time entries—presents a fascinating display of all the familiar symptoms of personal tyranny.

The tone of the book is summed up by a sentence that François-Poncet wrote from Rome to Paris: "I have to deal with servants who have become masters."

The real villain is of course Hitler—or rather the Hitler-Ribbentrop combination. It would have helped the ordinary reader if the editor of the diary had taken a rather wider view of his duties and illuminated by footnotes the significance of many of the German events. Otherwise he has done his job very well and the index is a model of its kind.

American Health Insurance

"Health Insurance in the United States." By N. Sinal, Odin W. Anderson, Melvin L. Dollar. The Commonwealth Fund. London: Geoffrey Cumberlege. 1946. 8s. 6d.

WITH the recent large expansion of social insurance schemes in this country it is interesting, by way of contrast, to read an account of the position in the United States of America, where a national health insurance scheme does not exist. The place of the State and of compulsory insurance is taken in America by voluntary services which have developed rapidly. In the 'thirties, when the health insurance movement was given renewed attention, the hospital associations and medical societies were in a position to initiate and operate their own plans: they pressed for special enabling legislation and from 1933 to 1946 the number of plans so developed by the largest, the Blue Cross hospital organisation, increased from 1 to 87 and the enrolment (in round numbers) from 2,000 to 20,000,000.

The problems connected with this development and other matters concerning "voluntary group prepayment plans" are analysed with care and in great detail by the three authors, their book being one of a series of monographs published as part of an intensive study of medical care in the United States by a special "Committee on Medicine and the Changing Order" of the New York Academy of Medicine. It is interesting to discover from the chapter dealing with the attitudes of professional government and lay groups towards health insurance that since the early 'thirties the American Medical Association has actively opposed compulsory health insurance under governmental auspices, but it would have been still more interesting, just because of this opposition, if the authors had compared the administrative machinery in countries with compulsory insurance under official or semi-official control with the American arrangements. There is much in the book which would have provided the basis of a detailed critical comparison between the American systems and those existing in most other countries. European readers will regret this gap in an otherwise commendable study. And so may Americans.

Distilled Erskine May

"An Introduction to the Procedure of the House of Commons." By Sir Gilbert Campion, K.C.B. Macmillan and Co., Ltd. 346 pages. 18s. net.

SIR GILBERT CAMPION is Clerk of the House of Commons. He is also editor of Erskine May's "Parliamentary Practice," that authoritative work with which the Speaker can quell even the most recalcitrant and resilient member of Parliament. In this book he gives a lucid but comprehensive summary of parliamentary procedure, including all the changes and developments that have taken place between 1929, when the first edition appeared, and the summer of 1946.

It is difficult to see how MPs, especially new MPs, could get along without this work. To the ordinary reader of *Hansard*, intrigued but perplexed by such phrases as "Getting Mr. Speaker out of the chair," it is a book of revelation. But it is far more than a guide through the intricacies of parliamentary procedure. It is also a constitutional study, for the chief value of his work is to show how parliamentary procedure is part and parcel of the English constitution. From the early days of Parliament, when the faithful Commons refused to grant money to the king until their grievances had been redressed, until to-day, when the Opposition criticises Government policy on the allotted supply

days, there can be traced an unbroken development of procedure. Before the present Government uses its majority in the House, as it proposes to do before this session ends, to carry through changes in procedure which the House's own Select Committee have turned down, it should reflect upon this indivisibility of procedure and constitution. Hear what Sir Gilbert Campion says about the guillotine, which the Government has applied to the Transport and Town and Country Planning Bills:

This drastic form of procedure is not popular in any part of the House. In 1935 a successful attempt was made to substitute for it a voluntary agreement, reached through representatives of the Government and of Opposition parties. The various stages of the Government of India Bill of that year were by this means allotted an agreed number of days, and its consideration was punctually completed in conformity with the schedule. It would be a triumph for the spirit of conciliation if this precedent comes in future to be generally adopted.

World Survey

"The Between-War World." A Short Political History, 1918-39. By J. Hampden Jackson. Gollancz. 10s. 6d.

THIS book is a revised and enlarged edition of a work on *The Post-War World*, first published in 1935. Mr Jackson's method is mainly descriptive. He begins with Western Europe, and then goes *via* the USSR to the Near and Far East, Africa and America. The allocation of space is on the whole satisfactory. At first sight, it may seem a little odd that a chapter on Iran, Iraq and Afghanistan should be as long as the only chapter directly on France, but the English reader needs more "background" explanation of the Middle East than of France, and this "background" could hardly be given in fewer pages. Indeed, the merits of the book lie in these short accounts of large countries. Mr Jackson has a clever way of selecting essential facts and presenting them, without overcrowding, in an easy, readable style.

The treatment of controversial questions is not always free from the partisanship which the author deplores in his preface. Mr Jackson is too much inclined to "lean over backwards" when he is judging his own countrymen. He thinks of capitalist imperialism as the preacher to whom Mr Calvin Coolidge once listened thought of sin. This may be the right view, but it is a little too simple for a historian. For example, the book would gain in fairness if, without taking out any of the criticisms of British rule in India and elsewhere, more were said about the other side of the picture. Mr Jackson himself realises that the capitalist imperialists did not break into an idyllic Africa or India, and it is not quite certain that Chinese civilisation was or is (Mr Jackson is here quoting Earl Russell) "superior to ours in all that makes for human happiness."

The book also tends to be a little out of focus, in spite of revision and enlargement; the world is seen as it appeared to Mr Jackson ten or twelve years ago, and many of his judgments have a far away ring about them. Nevertheless, once the reader is aware of this slight distortion, he can make his own corrections. A more serious fault is the partisan treatment of political history in the strict sense of the term. The chapter on the Treaty of Versailles and the penultimate chapter, "Internationalism on Trial," are the weakest in the book. Mr Jackson repeats uncritically many of the German legends of the 1930's about the treaty, and is even kinder to the first stages of German rearmament. Thus, after misstating the terms of the Disarmament Convention rejected by Hitler in the last phase of the Disarmament Conference, Mr Jackson makes the astonishing comment that "Germany very properly walked out of the Conference and resigned from the League on October 14, 1933."

Shorter Notices

"The American Individual Enterprise System: Its Nature Evolution and Future." By the Economic Principles Commission of the National Association of Manufacturers. McGraw-Hill. 2 Vols. 1,119 pages. 50s.

This colossal manifesto (described as "a vital message for every red-blooded believer in American democracy") covers virtually the whole field of economics, practical and theoretical, with enough history and statistics thrown in to make a book in itself. Valuable reading for Socialists; others, particularly "red-blooded believers," should handle with care. The only gap in its otherwise comprehensive scope is the absence of any treatment of America's rôle (except as pacemaker) in world economic affairs, apart from a page of obloquy directed against intergovernmental commodity agreements, and a small dose of free trade argument for the exclusive benefit of farmers.

AMERICAN SURVEY

Waging World Peace

(From Our US Editorial Staff)

THE title of Mr Walter Lippmann's address to the convention of the US Chamber of Commerce on April 29th symbolises the mixture of motives behind the very general public support of Mr Marshall's summary of the Moscow conference, particularly in relation to its forecast of action in Western Europe. (The three phrases most often quoted in editorials were those in which the Secretary said that this country will not "compromise on great principles for the sake of agreement," that "action cannot await compromise through exhaustion" and that "the patient is sinking while the doctors deliberate.")

The Secretary gave no indication of what is going to be done to help the patient rise again: press speculation, drawing in part on Mr Dulle's broadcast and on Senator Vandenberg's speech, is anticipating a merger of the three Western zones of Germany, the raising of industrial levels, and the revitalisation of the Ruhr. How does such a programme fit with the long-term American objective for Germany? In 1945, at the end of the war, the announced American purpose was to denazify, to demilitarise, and to deindustrialise, especially in respect of war potential. Since then, unannounced short-term US objectives have accumulated out of a series of case-by-case decisions. They are not necessarily compatible with previous declarations, even though attempts at reconciliation are being vigorously made.

The major reliance in such attempts is on the approach through the stomach. Mr Hoover has documented the fact that the Germans, to use Mr Roosevelt's famous phrase, are "ill-housed, ill-clothed, ill-fed." Mr Hoover apparently also subscribes to the thesis that of the Four Freedoms, freedom from want is the most important as preparation for the understanding and practice of democracy.

Once accepted, the point that the Germans must have more in order to be good democrats—that no one can eat the Bill of Rights—leads to an upward revision of the level of industry. Reindustrialisation affects the other two American short-term objectives regarding Germany. More fertilisers would mean more food. But the elements that go into fertiliser, as a recent event in Texas City has illustrated, are also effective explosives. A stepped-up operation of fertiliser plants and other industrial capacity, moreover, would be more practicable if fuller use were made, in responsible positions, of the men whose know-how was evident under the Nazi regime.

This desire to give the Germans more, in order to aid them to be good democrats, runs wholly parallel to three desires which are not primarily related to the Germans: to provide some of the goods for which the whole of Europe cries out, to erect an effective bastion against the Russians, and to lighten the load on the American taxpayer and consumer. The editorial comment of the Patterson group's Washington outlet, the *Times Herald*, summarises succinctly:

Marshall, we're glad to see, doesn't fall for that One World piece of wishful thinking.

Our own feeling has long been that the best thing we could do would be to get out of Europe as fast as possible, leave it to

go Communist if the Europeans haven't the guts to resist the Reds, and devote ourselves to girding the Western Hemisphere against any possible future attacks.

However, it is a safe bet that our present rulers have no idea of doing that, and the Vandenberg "Republicans" are going to go along with the Truman plan to fight Communism with dollars around the world.

Under these circumstances it seems to us that the best thing we can do is to get Western Germany merged economically as soon as possible and help its industries step up non-military production as fast as they can.

In doing all this, the Western Allies would not be acting out of any sob-sister pity for the Germans, who, after all, let Hitler lead them into that 1939 attack on Poland which precipitated World War II.

The object would be the cold and businesslike one of taking some of the present crushing loads off American, British and French—especially American—taxpayers, and stopping some of the drain on US food which is helping to keep our own food prices so high.

The cost to the United States of the future of Europe is a recurrent consideration. The *New York Times* may urge that it is "up to us to make it clear to Russia that whatever happens the United States will never again disinterest itself in Europe, and will never again attempt to stay aloof from conditions which twice involved us in Great Wars," but the *Detroit News* is thoroughly pertinent in noting that "the validity of this [the hopeful] view depends altogether on whether, in the long run, the policy agreed on by the American delegation will be given adequate financial support by the American people through their Congress." Three instances of financial reluctance in relation to Germany have recently occurred. During consideration of the War Department deficiency Bill, an attempt was made in the Senate to attach an amendment requiring wider use of the fertiliser plants in the US zone. The item of half a billion for non-military expenditures in occupied areas has roused considerable protest. Secretary Marshall's first crossing of swords with Congress concerns his hope of restoration, by the Senate, of the \$150 million cut the House made in the \$350 million foreign relief programme.

Along with consideration of such costs, go queries whether the money spent and to be spent, if and as applied under the short-term objectives, is being applied in such a way as to give the maximum yield. The *New York Herald Tribune* declares that to "hold Europe for democracy a policy of boldness in generosity is the only practicable course." Where is the boldness to go with the generosity? When the Greco-Turkish proposal was laid before Congress, there was general awareness that this was a first instalment on a very large order. A good many people wished they could get a look both at the whole bill, and at the design for reconstruction which it could facilitate. If aid were not to be rushed, country by country, and only after "armed minorities and outside pressures" were already active—if aid were not to be a counter-measure—toward what positive result should it be directed?

It is quicker to get foods for Europe by rebuilding Germany along the old lines, to become for a third time the dominant industrial area of the Continent. But what about the slightly longer run? That Germans will work more on fuller stomachs seems likely; that within any brief period they will also think differently awaits proof. Before the war, Germans had a higher standard of living than any of their neighbours. But did this make the adolescent game of "Follow the Leader" less attractive?

The idea of European federation—economic, political, or both—keeps cropping up. It has appeared in the form of the concurrent resolution introduced on March 20th by Senators Fulbright and Thomas and Congressman Boggs: "that the United States hereby favours the creation of a United States of Europe within the framework of the United Nations," and in the declaration of 81 prominent Americans assembled by Count Coudenhove-Kalergi, and again in Mr Truman's interview with Mr George Creel. The converse of General Eisenhower's comment that "weakness cannot co-operate; it can only beg" is

Mechanisation in Coal Mining

(From an American Correspondent)

WITH the ending of the post-war reconversion period, the coal industry in the United States is initiating a programme of research. One firm located in the Pittsburgh area has announced plans for a project designed to perfect a commercial process for making petrol and gas fuel of high heat value from bituminous coal. Research in the gasification and liquification of coal is also being pushed at experimental plants scattered throughout both the eastern and western coal regions. Keeping pace with research in processing, the coal mining industry is studying means of increasing the efficiency of mechanisation both underground and on the surface. The American Mining Congress has recently held its first post-war Coal Convention and Exposition and it is here that the latest equipment, most of it designed during the last two years, was displayed for the first time.

Mining activities in coal fields throughout the United States have in the past been concentrated mainly on seams easily accessible to strip mining, outcrop entries, or shallow shaft openings. Regardless of the type of mining, past production has come from beds containing the highest quality coals and from seams of greatest vertical thickness. Although coal reserves are enormous—one authoritative estimate places them at over 3.2 trillion, that is, 3,200,000,000,000 tons—it is generally agreed that beds close to the surface and those ranging from five to seven feet in thickness result in lowest mining cost. Reserves in this category are less, and as depth and thickness are only one phase of the problem relating to coal reserves, quality being of equal importance, it is virtually impossible to predict accurately the significant tonnage of coal reserves or the exact length of time a given deposit will suffice for a stated purpose.

However, increased labour costs and the necessity of maintaining a high standard of product have resulted in the extensive use of mechanical equipment to supplant the man with pick and shovel both underground and in strip coal operations. Today more than half of the coal produced from underground comes from mines that are entirely mechanised. Where machinery can be used to special advantage, as is the case with surface or strip operations, output has increased so sharply that in 1945 it was possible for 370,000 strip miners to produce the same tonnage that 615,000 miners produced in 1936.

The total soft coal production in the United States is about 530 million tons annually. Strip mining accounts for about 110 million tons of this total. A similar situation exists in the anthracite industry where stripping methods account for 10 million tons of the total output of 55 million.

The growth of strip mining is logical; it is free of hazards inherent to underground operation, less skill is required of the miner, work in the open air is more attractive than work underground, and stripping is cheaper. Although the quality of the coal thus mined is frequently inferior to that secured by the more selective underground operations, the differences in cost more than offset this disadvantage, as coal from the majority of all operations requires some processing today to meet the exacting demands of both industry and the home. Cleaning and screening plants are generally required irrespective of mining method. In 1945 a ton of coal mined by stripping

noted in the joint ITO delegation to the Geneva Conference on International Trade of the Netherlands, Belgium and Luxemburg.

The case for making decisions further ahead than the next crisis has been repeatedly urged since the Truman Doctrine was announced. The impression exists that the major positive result of the Moscow meeting is an improved working basis among the Americans, the British and the French. Is it strong enough to support the kind of boldness that would make Europe's 200 million people and 2 million square miles a balanced and productive economic area?

methods averaged \$2.33 against \$2.83 per ton for machine-loaded coal underground. Equipment now available for stripping operations makes it possible to mine coal with fewer employees than ever before and, equally important, to go after coal at greater depths. Gigantic shovels capable of handling fifty cubic yards of overburden at one scoop are now on order. Shovels of this type will be able to dig to a vertical depth of eighty feet to clean off the dirt and rock that lie over the coal seam. Today it is considered economical to strip off as much as fifty feet of waste soil and rock to reach a five-foot seam of coal.

Strip mining is carried on extensively in Illinois and Indiana where the terrain is level, the seams are of required thickness, and equally ideal, they are for the most part flat-lying. In the hilly terrain of the Appalachian region stripping is less extensive but in Pennsylvania there are anthracite stripping operations extending to depths of nearly 200 feet.

Important though stripping has become, most coal in the United States still comes from underground mines. It is generally recognised that the best method of improving production per man-hour underground is by decreasing hand labour through the increased use of efficient machinery. It is further generally recognised that increased mechanisation of production, coupled with more efficient management of all other phases of the industry, is the only way in which maximum employment at maximum wages with a fair profit can be brought to the American coal mining industry.

One of the most interesting mechanical developments in 1946 was that of a timber setting machine. Available for both track and trackless mining, the use of these machines resulted in timber work being done with from one to four less men than when timber was set by hand. As timbering is one of the most important means of accident prevention underground, especially in mines where roof action is uncertain, it can be readily understood that the development of a machine that will eliminate much of the tedium of hand work in setting heavy timber props is an important development in safety and economy.

Improved cutting machines, used extensively to part the coal from the waste rock below and above the seam prior to blasting, have also been developed. Through use of alloy bits, the speed of cutting is being materially increased.

One of the most tedious tasks underground in a coal mine was formerly that of loading the broken coal at the mining face. In the past, this work was done by hand. A miner shovelled the coal into a mule car or a battery-drawn train of cars. Today, in most American mines, especially those producing high tonnages, loading is done mechanically either into railroad cars, on to belt conveyors, or into rubber-mounted shuttle cars, the

THE WORLD OVERSEAS

Scramble for Power in India

(From Our Bombay Correspondent)

ONE of the most serious drawbacks to the use of shock tactics as a political technique is that the results are unpredictable. This is already obvious in India, where it is generally believed that the Prime Minister's statement that British control would be withdrawn by June, 1948, was intended to jerk bickering politicians back to a sense of realities. The British Government evidently hoped that, under this new stimulus, the contending factions would coalesce to form the Indian Union outlined by the Cabinet Mission last year, or at least would produce some other plan for self-rule which would command general support.

So far, the results of the shock have been very far from British intentions. Instead of coalition there has been fission. Even agreement to disagree is still lacking. The real effect has been a mad scramble for power, based on a somewhat vague paragraph in Mr Attlee's statement saying that, if the Constituent Assembly did not produce a constitution in time, the British Government would have to consider to whom the powers of the Central Government in British India should be handed over—"whether as a whole to some form of Central Government for British India, or in some areas to the existing Provincial Governments, or in such other way as may seem most reasonable and in the best interests of the Indian people." It might seem unduly pessimistic to claim that this vagueness ended any hope of a peaceful settlement, but it certainly added impetus to a great many schemes which had previously been regarded as of doubtful value.

Not only did Pakistan, the Muslim League dream country, become a probability; but if the British were willing to hand over power on a provincial basis to the local government in office in June, 1948, the obvious thing to do was to grab that office and hang on to it. Those who were not enamoured of the Constituent Assembly and the Indian Union, as proposed by the Cabinet Mission and implemented by Congress, realised that they had only to maintain their stand for another 15 months to have a very good chance of being given their own way. For the Muslim League the vagueness of the Prime Minister's statement turned several awkward corners. The first was the anomaly that Pakistan, as originally planned, consisted of two completely distinct areas in North-West and North-East India. If power were transferred on a local basis that anomaly would no longer be so apparent. As for the authority of any constitution the Constituent Assembly might produce, it was automatically limited to those areas which recognised the Assembly; in other words, the A Group of provinces in peninsular India which are administered by Congress Governments. The statement, at least by inference, indicated that the Princes would be left free to do as they wished.

Land of Utter Confusion

The net effect has been to turn India in the past two months into a country of utter confusion. So much so that Mr Fazlul Haque, a Bengal Muslim politician, has suggested that perhaps it might be better if the British stayed after all!

Most serious are the determined attempts, still in progress, to drive at least two provincial governments from office and to prevent the formation of a third. The race for local power is the cause of the civil war which rages in the Punjab and the North-West Frontier Province, the intractable condition of Calcutta and the crises in Assam. So far, the main storm centre has been the Punjab, which, because of its economic strength, would be the most important section of Pakistan. Muslims have a majority of 53 per cent in the population of the whole province, the majority rising as one goes west. Despite the preponderance of Muslims the League has never succeeded in forming a government, mainly because the late Sir Sikander Hyat Khan and his associated rural magnates, who control a very large Muslim vote, refused to countenance the League and formed coalition governments with the aid of the important Sikh and Hindu minorities. Since Sir Sikander's death this admirable arrangement has broken down and the League has gained considerable ground, especially

as it was joined by a number of Unionist (coalition) Muslims. After the last general election in the Punjab the League was not powerful enough to form a Ministry without outside support and by default office went to a rump—all that was left from the old coalition days.

Inevitably the League's first move after the "Quit India" announcement was to attempt to drive this rump administration from office by launching a civil disobedience campaign. This campaign was successful and comparatively bloodless. The intention was to form an administration dominated by the Muslim League under the Khan of Mamdot. His summons to Government House, however, was a signal for a counter-offensive by the Hindus and Sikhs with the battle cry "No Muslim domination." This time the affair was very far from bloodless. The Muslims accepted the challenge and an unknown number of lives were lost and many millions of pounds worth of damage was done. The flourishing towns of Amritsar and Multan were virtually gutted, Murree hill station was razed and many scores of villages were wiped out. For a time anarchy broke loose, especially in the North-West. Roving armed bands practically besieged Rawalpindi for a time and cut off Kashmir from India. Some of the bands were sufficiently well armed to fight pitched battles with British and Indian troops. Meanwhile, the administration of the province passed under the control of the British Governor, Sir Evan Jenkin, and up to the end of April it had not been possible to form a new Ministry.

Troubles on the Frontier

The neighbouring N.W. Frontier Province was fairly closely involved in the Punjab affair (at one stage the Punjab Government protested to Peshawar that raiders from the Frontier were doing the damage). But the Frontier has got its own troubles. In population it is almost entirely Muslim, but the provincial government is in the hands of Muslims who are members of Congress and a few Hindu associates who are also Congressmen. In the event of the formation of an Indian Union under Congress auspices, the Frontier would become a member.

For the Muslim League such a development would be a calamity and the League is working hard to prevent it by attempting to drive the present Government from office. The League's influence in the province appears to be increasing and its civil disobedience campaign is having some effect despite determined attempts to suppress it. It is causing the exodus of large numbers of non-Muslims from the province. The League's refusal to co-operate in the provincial Cabinet indicates its unwillingness to compromise about the Frontier's place in Pakistan.

In Bengal the situation is, as usual, confused. Western Bengal is Hindu, Eastern Bengal Muslim, and it is from the Eastern Bengal votes that the present Suhrawardy Cabinet draws its support.

Mr Suhrawardy owes his own brand of allegiance to the Muslim League and, having no intention of being parted from office, has adjusted the Muslim League doctrine that Leaguers should administer Muslim provinces to meet his own needs. He is to-day a keen advocate of all-party governments with of course Mr Suhrawardy at the helm. The opposition, led by the equally experienced Dr Shyam Prasad Mukerji, the power behind the Hindu Mahasabha, is unconvinced by such great-heartedness and has replied with a campaign for the removal of Mr Suhrawardy and his colleagues, even going to the extent of claiming that a Governor's administration would be preferable to the present Cabinet. Mr Suhrawardy's efforts at accommodation have a double aim: to keep a Ministry dominated by the Muslim League in office in Bengal to receive power when the great hand-over comes, and, by widening the base of his Cabinet, to prevent the partition of the province, which the Hindus are now demanding.

The Congress contribution to this pull devil, pull baker situation is to come most of the way to admitting Pakistan ("cannot

force unwilling groups to join us"), to denounce Mr Jinnah's offer of a truce on the basis of Pakistan and to suggest the partition of the Punjab and Bengal (a complete reversal of its previous policy of resisting the "vivisection of India"). Congress is plainly in a quandary from which in earlier days it could have saved itself by launching yet another "movement" against the British. The chief problem is the Constituent Assembly, which Congress insisted on establishing, regardless of whether the Muslim League participated or not. The League having persisted in its boycott, the Assembly owes practically the whole of its inspiration to Congress and is in fact little more than a platform for that party. It was therefore losing its all-India character even before Mr Attlee's suggestion that local arrangements for power transfer might be made. Since then Muslim Leaguers have been canvassing a scheme to hold a separate Constituent Assembly for North-West India at Lahore. To counter the general decline in the original Constituent Assembly's status Congress has made high-pressure attempts to bring more groups into it without delay. Particular attention has been paid to the Indian states whose representatives were originally intended to enter the Assembly for the all-India union discussions after the groups of provinces had settled their constitutions. As it is, some dozen princes have agreed to send their representatives to the Assembly immediately. The states represent two-fifths of India, so their addition to the Assembly's strength would go some of the way towards giving it an all-India character.

Nehru and the Princes

Recently Pandit Nehru has alternately cajoled and threatened the rest of the Princely Order to join now. His extraordinary remark that states which did not participate would be regarded as hostile brought a rebuke from his Interim Government colleague, Mr Liaquat Ali Khan, who is also responsible for the opinion that the Constituent Assembly is dead beyond resurrection. The majority of the Princes appear to be unmoved by the impetuous Pandit, partly because they also realise that Congress is very anxious to compensate for the omission of the British to hand over paramountcy to an Indian Government at Delhi. At first Congress insisted that a new Indian Central Government must wield this power. Latterly the claim has been dropped and the attitude of some of the princes that they will be free to do as they please has caused increasing irritation in Congress ranks.

The continued silence of the really important princes like the rulers of Hyderabad, Kashmir and Mysore has led to a crop of rumours that they intend to set up as independent kings. In Hyderabad's case the most fantastic stories about his armament plans have gained currency. Sir C. P. Ramaswami Aiyar, the very astute Dewan of Travancore, indicated the general tendency when he announced recently that with the passing of paramountcy his Maharajah would revert to independent kingship. Many of these claims on behalf of the princes are no doubt bargaining points intended to keep Congress ambitions in check, and it is significant that Muslim League spokesmen lose no opportunity of applauding them.

Indeed from many points of view conditions in the British Indian provinces are parlous. The primary cause is Hindu-Muslim strife, but the activities of the Communists, the Socialists (who recently left Congress) and Dr Ambedkar's Scheduled Castes Federation are also blameworthy. Drastic legislation of all kinds has been passed, and in the name of law and order it is now possible for any administration to stamp out opposition, and even to

place the inhabitants of whole towns under virtual house arrest, by imposing curfews which have lasted as long as three days without a break. Long curfews are being used as an indiscriminate punitive measure against unruly localities, and—because of the way population is distributed in most Indian towns—against particular communities.

Draconian Methods

The press is tightly controlled in its handling of internal events, and freedom of speech and assembly is frequently suspended. Provincial governments claim that these steps are necessary to prevent deliberate trouble-raising, and in many instances this is no doubt true. On the other hand, even the worst anti-British demonstrations or pre-war Hindu-Muslim riots never required such draconian methods as the present-day Indian Ministries have shown themselves capable of using. The only possible conclusion is that the older leaders, particularly in Congress, are losing their influence and Sardar Vallabhbhai Patel, Home Minister in the Interim Government, did not indulge in oratorical fancy when he recently admitted as much.

If the provincial administrations are losing ground in the prevailing state of uncertainty, the Interim Government is no better off. Though a bold show is made of post-war planning, the fact is that no one can do very much when it is still not known whether there will be one India or two and whether the Delhi Government will be able to fulfil its promises of aid to the provinces. The fact that Congressmen and Muslim Leaguers still share the Interim Government seems to be because, so far, neither can gain anything by leaving it. Though Mr Liaquat Ali Khan's recent budget, with its heavy taxes on profits and capital gains, was virtually a direct attack on Hindu big businessmen (the chief financial support of Congress), his Congress colleagues were unable to resist him effectively because his proposals were the first step towards Pandit Nehru's socialist goal.

Up to the time of writing, Lord Mountbatten, the new Viceroy, has been occupied in fact finding, and since his inaugural announcement that the time had come for a decision his only public gesture has been to induce Messrs Gandhi and Jinnah to sign an appeal for communal peace.

But the appeal did not prevent renewed rioting in Bombay and Calcutta, and had no practical value. However, there is a growing feeling that the present chaos will be resolved in the very near future by a Viceroyal announcement on partition proposals.

Work and Politics in Italy

[FROM OUR ROME CORRESPONDENT]

FOR over a month now Italy has been writhing in the throes of an acute inflationary crisis, with inevitable repercussions in industry. The country has never been anything but potentially bankrupt since the liberation two years ago; but the discovery in March that the national deficit had reached 610 milliard lire created a situation that was new, even if long foreseen. After the orgies of autarky in which the Fascists indulged, a large schol of Italian economists, bankers and businessmen believes in *laissez faire* with the fervour of eighteenth-century rebels against worn mercantilism. According to these *liberisti* the root of Italy's economic troubles lies in the socialistic practices of the new state; on the other hand, the working-class leaders and all those

with Socialist inclinations find the fault rather in the half-heartedness of the present Government's Socialism.

The main causes of the crisis this spring may be summarised briefly: Firstly, the end of Unrra deliveries, which means that Italy has to pay henceforth vastly more for the food and raw materials which its economy compels it to import; there are, secondly, persistent signs of foreign competition likely to cut short the boom which certain industries have been enjoying; and, lastly, the weakness and inconsequence of the Italian Government's economic policy which have certainly aggravated an already difficult situation.

Last autumn almost every branch of the Italian textile industry was snowed under with orders and was working to full capacity; only the shortage of coal and electric power interrupted this activity during the winter. But now in the spring, when electricity is no longer restricted and work can go ahead, it is becoming increasingly clear that cheap American competition may capture Italy's markets in South America, while Czech, Belgian and Far Eastern competition is making itself felt in other parts of the world. A typical case is that of the wool and cotton industry of Prato; it employs 17,000 hands, and is at present working to full capacity, largely (as for many years) for the South African and Indian markets. Besides the general rise in prices, the cost of the dyes and grease required by the Prato industry is rising, and great fear is felt that here, too, foreign markets will be lost before the end of the year to Czech, Belgian and even Chinese competitors who can underbid.

As well as textiles, many kinds of machines, from steamships, railway engines and motor-cars down to typewriters, are in great demand either for the reconstruction of Italy itself or because six years of war have created a feverish world demand for them. So Italy's machine and metal industries may expect with the spring a flourishing season with, of course, the proviso that post-war reconstruction and replacement are jobs which, roughly speaking, come to an end and that, while raw materials (such as Swedish ore) are now arriving in Italy, they are still severely limited in quality and amount. It is characteristic of the present situation that a firm like Lancia's, of Turin, employing about 5,000 hands, has the raw materials and surplus of car orders at this moment to take on another 2,000. But the vacillations of the Government, the monetary crises and the general unrest make it unwilling to risk the uncertainties of the future.

Evasion of Taxes

To break the vicious circle—which means restoring confidence at home and abroad and attracting the capital resources which are so much needed—the Italian Government, for all its weaknesses, could take certain steps. It is notorious that the whole fiscal system requires revision, and that the wealthier classes habitually evade taxation; it is also widely believed that exporters are leaving a part of their profits abroad. A capital levy has at last been decreed on a steeply rising scale; since wealth in Italy is concentrated in relatively few hands this measure may be regarded as long overdue, and it should bring noticeable relief to the hard-pressed Treasury. The unequal distribution of wealth is reflected in the unequal distribution of food, and it is again characteristic of the situation that, immediately after announcing the deficit of 610 milliard lire, the Government declared its determination—not for the first time—to enforce economy by stopping the worst food abuses. Spartan restrictions upon the consumption of meat, cakes and sweets were announced, and a 50 per cent tax levied on every restaurant meal costing more than 500 lire; but the Rome restaurateurs struck against the tax, and the rest of the programme has been left hanging fire. Following the French example, a 5 per cent reduction of prices has been recommended, and is even announced in a number of shop windows of the larger cities. But what might otherwise be reassuring is lost in the mass of ineffectual regulations.

The partial abolition of the so-called "political price" of bread has actually come into force; bread has been the one almost adequately rationed food, on which the population could count at 30 lire the kilo, but the cost to the Government of maintaining its price made up 96 of the 610 milliard lire deficit. On April 15th, therefore, the price was raised to 43 lire provisionally, with a small provisional bread allowance of 104 lire to be added to monthly wages and salaries until a fresh system can be worked out. It is not clear that the saving to the Treasury will be very considerable, and the psychological effect of the campaign for the reduction of prices seems to be cancelled out.

What then is the present outlook? It cannot be said that there is any atmosphere of panic, in spite of the scepticism which is natural to Italians. The governor of the Bank of Italy has pointed out that the present problems are not very much more alarming

than the economic situation in Italy after the first World War which was overcome without tremendous difficulty. It is obvious that the country still possesses considerable real resources even if they have that ingenious elusiveness which is so specifically Italian. The peasants hoard their paper lire with deep conviction. A city like Milan rings with the sounds of building, now that the spring makes it possible to go ahead with reconstruction, and this activity is financed out of private savings. It is taking three years to construct hydro-electric plants; the big Edison electrical concern has a number under construction which will be of cardinal importance to the future of Italian industry. Edison alone have invested 4½ milliards of lire in new installations.

Vitality in Chaos

In every direction that one looks, Italian industry, which is bound to be the basis of Italy's economic health, shows signs of vitality. In the case of a key activity like the chemical industry, Montecatini is to-day employing 58,000 people in 136 factories, whereas two years ago it employed 25,000 people in 56 factories. But it is a vitality in chaos owing largely to the weakness of a Government based upon a predominantly Catholic-Communist coalition. It is difficult to see how the removal of controls, so ardently desired by the Right, could be justified in the Europe of to-day where a carefully planned distribution of raw materials remains essential. It would seem rather that a greater rationalisation of Italian industry is called for, with a systematic conversion of war and other industries for which the new Republic can have no use, and a readjustment of the proportions of raw materials, half-finished goods and machine-parts which Italy sets out to import. Certain concerns like the Fiat, which were nurtured on huge Fascist subsidies and have made ample Socialistic claims upon the Treasury since the liberation, should perhaps undergo some degree of contraction.

Many of the unhealthier industrial concerns in Italy are already controlled by the State which rescued them in 1933; in that year they were subjected to the control of the IRI (*Istituto per la Ricostruzione Industriale*) which was then taken over by the post-Fascist state. The plight of former war industries, such as Ansaldo and Ilva, which come under the control of the IRI is of course critical, and represents a heavy expense to the state. Conservative Italian opinion treats this situation as an anti-Socialist argument to be used in favour of demolishing the IRI. This perfectly logical attack from the Right may at last force the Government to face the contradictions in which it seems constantly to get involved. For Socialist opinion of every shade is well aware that the IRI is the thin end of a wedge, that it is a partial realisation of Socialist planning achieved on unfavourable terms, but capable of a more satisfactory development. Indeed, the only serious projects for industrial reform so far worked out in Italy are based on the expansion of the IRI. These emanate from the Socialist Minister of Industry, Signor Rodolfo Morandi, a prominent resistance leader.

Partnership in the Factory

Perhaps the gravest problem in the reorganisation which Italian industry needs is that of achieving a better distribution of labour. At present there is a huge unemployment figure—over 2½ million. Labour in employment shows bad production figures—a general post-war evil—while skilled workers tend to work overtime. A certain amount of labour needs to be transferred from unremunerative industries, and an enormous number of workers need the specialised training and experience which they could not acquire during the period of war. Signor Morandi attaches particular importance to stimulating the technical knowledge of the workers and their interest. He has done all that he could to transform the factory committees, which sprang up during the resistance to the Germans, into joint bodies representing both capital and labour and deliberating on the best technical methods of increasing production. Although not yet legally recognised on a national basis, these *Consigli di Gestione* now exist in many of the factories of Italy. Conservative opinion belittles their importance and there are sometimes difficulties between them and the parallel trade union organisation; but in a modest way progress is certainly being made, especially in the Montecatini factories and in those of the Breda machine industry. In the middle of April there was an interesting demonstration in favour of Morandi's plans, when a congress of representatives of the *Consigli di Gestione* met at Genoa to protest against the drive from the Right towards the liquidation of the IRI. Planning, together with the sharing of technical responsibility, would seem to offer a solid foundation for the future development of Italian industry; it is to be hoped that these bodies will be given their chance.

Frenchmen and their Social Services

[BY A CORRESPONDENT]

LARGE and gay posters, plastered by official order on the walls of Paris, inform the French worker to-day that he is free from insecurity and want and that his children and elderly relations will no longer be financial liabilities. In what one government critic calls "this orgy of useless coloured paper" the story is told of the provisions made by the Fourth Republic for a national system of compulsory insurance, old age pensions and family allowances. The enterprise is of particular interest in this country, and there is doubtless a link between the transformed conceptions of the State's obligation to the citizen in France and England, arising in both cases from the growing realisation that for social, economic and strategic reasons, human assets are those which each can least afford to neglect.

Misgivings are being expressed in Paris that the heavy expenditure on social services may divert available funds from the savings necessary to fulfil the Five Year Plan investment policy. It certainly will unless the present economic expansion arising from increased production can be maintained. The burden of the social services on the budget will be about one hundred billion francs (105 billion last year). This will cover: insurance, pensions and provisional indemnity for civil servants, war pensions and special subsidies to particular groups and institutions. While France's "ordinary" budget has less than trebled (allowing for the depreciation of the franc) since 1913, expenditure under the heading "social services" has multiplied by more than fifteen: constituting by far the largest single item of increase.

Even greater is the expenditure on various branches of social welfare financed by compulsory payments from private people (which includes the cost of paid holidays, recently extended to three weeks for young workers), expected to amount to some 237.5 billion francs in 1947. This is to say that the total of private and public contributions to social services will amount in the current year to well over one tenth of the national revenue (estimated in the Monnet Report at three thousand billion francs for 1947 rising to three thousand seven hundred billion for 1950).

Contrasts with Britain

Despite these heavy costs, all the benefits, which vary according both to the locality of payment and to the recipient's former earning capacity, command considerably less purchasing power than their equivalents in England. For example the basic rate for a single old age pensioner in a rural commune in France is only 1,000 francs a month, as compared to 26 shillings a week paid to his British equivalent. The French system is also, at present, less comprehensive than the British. Social insurance covers only salary and wage earners, and even among them important categories including miners, agricultural workers and civil servants have provisionally retained individual services of their own. For the rest, contributions are paid on a fifty-fifty basis by employers and employees, each paying a sum equal to six per cent of the latter's wage. The scheme differs again from the British in that it does not cover the unemployed, who are still provided for by local government relief funds, subsidised where necessary by the state.

The only two services for which non-wage earners qualify are family allowances and old age pensions. Both are covered from compulsory contributions from the employers, subscribing for themselves and their employees, while independent workers maintain a separate fund of their own. Old age pensioners not formerly insured are at present maintained by state grants.

In addition to this long-term social legislation, the state has recently intervened to protect the particularly needy. A special subsidy has been voted for those officially classed as "economically weak," mainly to enable victims of the inflation to keep body and soul together; while, for the first six months of the present year, all industrial employers are compelled to pay a provisional indemnity bringing salaries up to a minimum of seven thousand francs, pending a general wage revision.

But the principal difference between the French and British systems is in their administration: while the British entrust the management of their insurance scheme to civil servants, the French claim that their arrangement, by which the responsibility devolves on the elected representatives of those insured, is more democratic. "Ni étatsisme, ni fonctionnarisme" (neither state-control

nor bureaucratisation) declared Ambrose Croizat, Communist Minister of Labour until the present crisis.

Political Fight for Control

Accordingly, last week, twelve million people were called upon to vote by secret ballot, under the principles of proportional representation, for the local committees which form the pivots of the new French system: the *caisses primaires des assurances sociales*, to manage the funds for maternity, illness, accidents and death insurance, and in which workers and employees are represented in a ratio of one to four; and the *caisses des allocations familiales*, elected by those receiving family allowances.

The local committees are to be guided, and in some cases subsidised, by regional committees of which they will elect the majority of members. Old-age and disablement pensions will be administered directly by the regional committees, who, on the principle that prevention is better than cure, will also control a proportion of the funds set aside for social, sanitary and medical improvements. They in their turn send delegates to a National Council, on which all the economic Ministries will be represented, and will form the summit of the social service pyramid.

While theoretically the object of last week's vote should have been the selection of the best available administrators, in practice the campaign was fought from the outset on a political basis. Lists were presented, on the one hand, by the General Confederation of Labour, chief protagonist of the present system, supported by the Communist and Socialist Parties; and, on the other, by the Federation of Christian Workers and various private Mutual Aid Societies, supported by the MRP and the Right, who oppose the whole idea of a unified system and aim rather to revise than to administer the new laws. The anti-Marxist camp argue that the plurality in the administration of the social services is a necessary condition of plurality inside the Trade Union Movement—which they regard as a principal barrier to Communist control.

The elections of April 24th were prepared by bitter and lavish propaganda on both sides. A characteristic cartoon appeared in the current number of a Right-wing weekly, in which a sinister old pawnbroker says to the skeleton of a worker: "Just hand over your skin, and I will ensure you a comfortable old age." As a test of political strength they seem to have been indecisive, although there has been a curious delay in counting the votes, and a fortnight after polling, results are still incomplete. Official statistics covering three million voters show that one quarter abstained altogether and that, among those who did vote, 61 per cent supported CGT lists, 27 per cent CFTC lists, and the remaining 12 per cent other primarily anti-Communist lists.

While the CGT can therefore claim a straight majority, the CFTC argue that it has gained a much larger proportion of the total votes than its membership (about one-eighth of the CGT) entitled it to expect. This challenge to the supremacy of CGT control over the workers may have influenced the recent abandonment by the CGT and Communists together of the wage-blocking policy, evidently now considered too unpopular to sustain. Thus ten days ago the Communist *L'Humanité* was denouncing the Renault strikers as the victims of "a bunch of Trotskyist agitators," though last week-end the Communist Ministers left the Government to show solidarity with the strikers. In any case it is clear that the struggle between the CGT and anti-Communist elements to control the social services will now continue inside the newly elected committees.

Thus French social services, along with agricultural co-operatives, educational institutions, press and publicity organs, news agencies, production plans, and the Constitution itself have, in their turn, become the victims of what the French call *politisation*—a disease common to almost every creation of the Fourth Republic. The germ of this disease is perhaps to be sought in the angry disillusionment and discontent felt by the vast mass of French men and women, making them easy victims to any form of political agitation.

Record of Recovery

It is a discontent not altogether justified, for it is too easily forgotten that, since the liberation—when industrial production was at twenty per cent of its pre-war level, transport totally disrupted, the currency reeling under the effects of occupation and indemnity, the land scattered with a hundred million unexploded mines and the ruins of two million shattered buildings—very remarkable social and economic strides have been made. Coal, gas and electricity production and inland transport, to take only four key sectors, are to-day well above their pre-war level of activity. A million French prisoners of war have been socially

and economically reabsorbed. Financial calamity has so far been averted. And, beyond all this, social services have been extended on an unprecedented scale.

But the main difficulties remain, and the inhabitants of this once-favoured land, queueing for their recently diminished bread ration, seem to find it impossible to adjust themselves to the hard fact of poverty or to realise how far French fortunes have sunk, absolutely and relatively, as a result of two catastrophic wars, and of world industrial and demographic developments, largely outside their control.

Mood of the Ruhr Miners

[BY OUR CORRESPONDENT RECENTLY IN DUSSELDORF]

A FRESH wave of unrest is developing in the Ruhr, where the food situation is going from bad to worse. The bread ration, recently cut by two-fifths, has not yet been restored, and the shortage of potatoes is now beginning to affect even the miners' canteens, which had so far been guaranteed supplies. It remains to be seen whether the miners will once more withdraw their labour, as they did before Easter, to support a general protest against British and German handling of the food problem. This week's ration in Essen is 741 calories, mostly in bread, and on Saturday last only 219,500 tons of coal has been produced in the whole region.

Daily gross output of hard coal, which was only 191,000 tons at the beginning of the year, had risen to 238,000 tons in the third week of March, and it was hoped that this upward trend would be maintained. Since the one-day strike of April 3rd, however, production has been running at the rate of under 225,000 tons a day. The target, set by the North German Coal Control, for a daily output of 300,000 tons by September, is now beyond the bounds of possibility. Output per manshift, at the face, which was only 1.26 tons at VE day, was 2.31 tons in December, 1946, and had risen to 2.38 tons by February, 1947. It was estimated at one mine that the honouring of the official calory level for ordinary consumers would bring about an increase of 20-25 per cent in the miners' productivity.

As under the Hitler régime, the Ruhr miner is highly privileged. Whereas the current basic consumer ration is only 1,550 calories a day, the daily ration of a miner doing "heavy" work is 3,277 calories and that of a miner on "very heavy" work, i.e. at the face, just under 4,000 calories. Few miners, of course, receive their full calories, either because deliveries of such foods as fats and potatoes fall short of the programme, or because they share their extra rations with their families. The miners receive priority in the supply of scarce consumer goods, in order to honour the "points" system. Under this scheme, which was introduced in January to provide extra stimulants, the different categories of colliery workers are graded according to their productiveness and receive coupons to buy certain foods and articles in short supply, if they work a full week's shift. Bacon, coffee, sugar, schnaps and tobacco are all included in the list, as are various articles of clothing, shoes and household goods. A miner who works all the required shifts qualifies for a full allocation of points; if he misses one shift he loses a fifth of his points, unless his absence is excused; if he misses a second shift he loses a second fifth of his points; if he misses a third shift he loses all his points for the four-week period.

The points scheme has been successful in at least two of its objectives—the reduction of absenteeism and the recruitment of labour. Absenteeism, which was as high as 23.6 per cent—from all causes—in September, 1946, had fallen to 12.9 per cent by March, 1947. The inducements offered to the miners also helped recruitment; so that the powers of compulsory direction of men to the mines have only been exercised on a very small scale. The pre-war labour force of 346,000, which had fallen by two-thirds at the end of the war, has been raised to about 90 per cent of its 1938 strength, although the output of the individual miner is very much reduced. This is due partly to physical and partly to psychological factors. The miners' power of resistance and stamina have been lowered as a result of the bombing and post-war under-nourishment; three times as many shifts were lost through sickness last year as in 1936. The average age of the miners is higher—it rose from 35 in 1939 to 43 in 1946—and the normal labour force has been diluted to the extent of about 40 per cent by men from outside the Ruhrgebiet, with little or no experience of mining.

The recruitment of miners from other areas and the absorption of returning prisoners of war, many of whom have gained mining experience, is limited by lack of housing. In the North-Rhine Westphalia Land, as a whole, 75 per cent of the houses were damaged or destroyed. In some parts of the Ruhr, the proportion of totally destroyed houses is over 80 per cent. Repairs to miners' dwellings have priority over all other needs, and have been allo-

cated 55 per cent of available building materials. The aim is to provide "reasonable accommodation" for all miners by the end of 1948, and there is a plan for manufacturing prefabricated houses, which is held up at the moment by shortage of materials. Apart from miners, the rest of the population has little hope of immediate re-housing.

The miner has also been handicapped by material shortages and defects in equipment. Suitable timber for pit props has been in short supply and shortages of parts for machinery replacement and of good-quality rubber for belting have made uncertain the day-to-day administration of the pits. But it has been estimated by the North German Coal Control that the existing equipment is adequate for a production level of 350,000 tons a day, which suggests that the argument of defective machinery can be exaggerated. The overriding needs at the present time are to increase the labour force by another 70,000 workers and to raise productivity.

There are a number of psychological elements which have also to be taken into account. The trade union leaders maintain that until a decision is taken to socialise the coal industry, the miner will not give of his best. The miners are pressing also for much fuller participation in administration of the mines. The idea of "workers' control" still has many adherents, although most of the workers confine their claims to demanding a larger share in

management. The pit production committees now established at every pit have not been in operation long enough to enable any conclusion to be formed about their effectiveness. Denazification is still a burning issue, particularly among the extreme Left elements, who complain that Nazi managements have been reinstated and blame the British for this. Rather less than 10 per cent of mine management officials have been removed or demoted under the denazification procedure. A German panel, including trade union representatives, and under an independent chairman, was set up last autumn to review cases, so that if the process has not gone so far as it might have done, the Germans themselves, rather than the British, should be held responsible.

The whole question of the structure and organisation of the coal industry is in the melting pot. Indeed no decision on an issue of such international importance can be expected until some pronouncement of industrial policy is given from the highest level. The transfer of executive responsibility from the British to the Germans, timed for May 1st, has now been postponed for another month. While this will add to the period of uncertainty, it will at least give the Germans more time to prepare their plans for the future organisation of the industry, which have so far not been made available.

THE BUSINESS WORLD

Coal and Industry

THIS has been a fateful week for the British economy. The coal industry has embarked upon the experiment of the five-day week—though its launching has been marred, in some areas, by unofficial, and temporarily paralysing, strikes of certain surface workers. All the arguments about the wisdom of postponement have been swept aside, and the nation now looks with anxiety for the first results of the shorter week upon production. No one, indeed, is more anxious than the Government, about the consequences of the five-day week—or more lame on what has to be done if the experiment does not succeed. Here is Mr Shinwell on the subject, in last Thursday's debate:

I will tell the House quite frankly that, if we should find that the five-day week does not work out, even with a better atmosphere, in terms of production, we shall have to come to the House and say so, after, of course, having our conversations with the National Coal Board and with the mineworkers.

Every sensible person will pray that Mr Shinwell, having defined with such care the proper procedural channels for handling a national calamity, will be spared from using them. If the five-day week does not succeed, it will be privation, not procedure, which matters.

Yet the introduction of the five-day week takes place against a more auspicious background than seemed probable four months ago. For the week ending April 26th, there was a spurt in production of deep-mined and opencast coal to 4,107,000 tons—the biggest post-war figure yet touched, and one which would guarantee the 200 million ton target if it could be consistently maintained during the year. For the first seventeen weeks of this year, total production has increased by 5.2 per cent from 60.7 million tons to 63.8 million tons:—

	OUTPUT OF DEEP-MINED AND OPENCAST COAL ('000 Tons)		
	January to April, 1946*	January to April, 1947*	Increase in 1947 over 1946
Total Output:—			
Deep-mined	58,225	61,337	3,112
Opencast	2,461	2,509	48
Total	60,686	63,846	3,160
Average Weekly Output:—			
Deep-mined	3,425	3,608	183
Opencast	145	148	3
Total	3,570	3,756	186
	* 17 weeks.		

There should be no premature rejoicing about this improvement. But for the winter weather and transport difficulties, which cost between them nearly 900,000 tons of output, it would have been better still, and it is sufficiently favourable to have enabled Sir Stafford Cripps to revise his summer coal budget from 89 million to 93 million tons. But even so, the output achieved and in prospect for the first ten months of this year amounts to no more than 156.8 million tons, leaving 43.2 million tons to be won in the last eight weeks of the year if the target is to be hit. They will have to be "Bull Weeks" indeed.

Sir Stafford's revised summer coal budget is a good deal less precise than the earlier estimates which he announced on March 10th. His announcement last Thursday week in Parliament, covering the five summer months from June 1st, recognised the blunt force of the criticism of the earlier estimates, which left industry with two-thirds of its requirements (17.6 million tons) and threatened grave industrial dislocation throughout the summer months. The March estimate was framed in the period of

crisis, and it rightly put great emphasis on the need to build stocks up to a safe level. It would be comforting to be able to devote 10 million tons to this purpose, as was originally intended, raising the total level to 15 million tons by the beginning of the winter. But this is safety which can be insured only by the payment of an extortionate premium in terms of lost output during the summer. There is a clear risk in allowing more coal for industry, because the size of summer output will be so uncertain. But it is obviously wise to have taken the risk, for the alternative would have meant that industry would have little or no chance to recover during the summer from the severe blow which it suffered in February and March.

Industrial coal supplies for the five months June 1st to October 31st are to be "planned" at a level equal to the consumption during the summer of 1946—subject to certain exceptions, such as new factories, oil conversion, and special allocations for the building materials industries, which will give them 85 per cent of their solid fuel requirements. The summer allocation to industry on this basis (for six months) would be 25 million tons, compared with total requirements (including stockbuilding) of 28 million tons. The stock problem has been eased during the past month by the accumulation of a further million tons of coal, raising total stocks to 6 million tons. It will be for industrial concerns themselves to accumulate stocks equivalent to three winter weeks' supplies by the end of October. Roughly speaking, therefore, the amount available for current supplies during the summer will be 21 million tons, compared with 17.6 million tons under the original budget. It is an increase, but it will still leave over one-fifth of industry's requirements uncovered.

Moreover, to describe the increase as having been "planned" seems to force an excess of meaning upon that unfortunate word. The increase has been "decided," but it will have some peculiar differential effects upon various sections of industry. The employment figures given in the latest issue of the *Monthly Digest of Statistics* relate to January. They show an increase in the total number of employees in manufacturing industry from 6,274.9 millions last June to 6,704.3 millions in January. The metal industries have shown a moderate expansion, chemicals have remained roughly stable, textiles and clothing have shown promising increases in much-needed manpower, building materials (which receive a special allocation) show no exceptional expansion of manpower compared with last summer, though leather, wood and paper have considerably increased their labour force. If the best use of available labour was to be made, some of these industries would qualify for a greater share in the increase in solid fuel supplies, but all are apparently to be treated alike. The scheme has the merit of simplicity, but it also means more unemployment than last summer, either open or concealed, and seals the pattern of industrial output according to the summer of 1946 without adjustment for any subsequent changes in manpower, supplies of materials, or even demand.

It is, however, peculiarly difficult to thread one's way through the latest coal budget. There is a potential source of rich confusion in the use of figures for five months and six months—the industrial allocations are for five months, but they are illustrated by figures relating to six months; "industry" is defined as iron and steel, "coke ovens not supplying town gas" (are these the same as the brusquer heading for "coke-ovens" in the Ministry of Fuel and Power's statistics, which are not

rated as industrial consumers?) and "other industries." As for the contribution to stocks from industrial deliveries this summer (say 4 million tons), was allowance made for this in the earlier estimate for stock rebuilding of 10 million tons? Or is it greater or less? Sir Stafford's earlier coal budget was reasonably clear on these points, and it is a pity that his second calculation could not have been made more explicit. The time is indeed overdue for a thorough recasting of the coal figures; it needs the subtle mind of a metaphysician to handle the complexities of basic quotas, Cripps quotas, regional pool allocations and the rest. Is there any good reason why the provision of coal for different industries should not be disclosed in at least the adequacy of detail of the Ministry of Fuel and Power's monthly figures—indeed, the analysis of industrial consumption as "planned," coupled with the accrual of supplies to meet it, is one of the many lacunae in the existing coal figures.

These revised industrial allocations are a relief for industry, but they are no release. Whether they can be met from summer output will depend largely on the counterbalance between the expanding labour force in the mining industry and the consequences of the five-day week. The industry had 711,000 wage-earners on colliery books in the middle of April, compared with 692,000 at the end of 1946. In March the average weekly increase was 1,640, and in the first three weeks of April 1,330. There has been an inevitable fall in the number of ex-miners returning from the forces, but the new attractions of the industry have produced a large recruitment of ex-miners from other industries. This is hardly surprising, in view of the average earnings in the industry, which in the last quarter of 1946 amounted to £6 14s. 8d. per week for all grades, an increase of 116 per cent since 1938, compared with an increase of about 75 per cent in the wages of male industrial workers generally. But the increase in the total labour force has not produced a corresponding increase in the number of face workers; yet new faces have to be opened up on a considerable scale and new face workers trained. The increase in face-workers from 281,000 at the end of last year to 286,000 at a recent date indicates that a large part of the

increase in manpower is still employed on underground haulage or surface work, and that the proportion between face and surface workers has been further diluted. It is hardly surprising, therefore, that the output per manshift has been tending to fall slightly during this year—from 1.06 tons in January to 1.03 tons last month. There is a risk that the increasing labour force of the mines may have to be used to a larger extent on the surface than is desirable, in order to make up for loss of shifts under the five-day week. In recent months, surface workers have been doing six shifts, and face workers five. The output of the surface workers in the sixth shift will now be lost, unless absenteeism (17.76 per cent for all workers in February) improves, or output per manshift increases. Sir Stafford Cripps has also drawn attention to an unexpected difficulty—that the limit of winding capacity has been reached in some collieries, and that transport and siding facilities in others limit the amount of loading that can take place in a five-day week.

It would indeed be rash to make any estimate of the effect of the five-day week on output. But, on the face of the figures, it seems unlikely that the recent level of output can be maintained without a great improvement in productivity and attendance. If the five-day week—which has always been pressed on the ground that it would increase output—fails to do so, or produces only a transient recovery, the outlook will indeed be bleak. Clearly, it is still necessary to press on with recruitment, still necessary to obtain labour from foreign sources, still necessary to reorganise the pits according to the best technical practice, to proceed with mechanisation and mechanical haulage and loading and to introduce underground transport facilities. That these things will eventually be done can hardly be doubted, but they will not be done in a twelvemonth. Indeed it is estimated that it will take some thirty years to reduce the excessive number of pits and to put the industry on the thoroughly modern and efficient basis on the lines of the Reid report's recommendations. And it is the coming twelve months which will combine the weight of several economic crises—in dollars, in transport, in industry, and in coal. Given coal, some of these crises could be surmounted; without it, none of them will be.

Convertibility Ahead

JULY 15th, the date on which sterling currency earned by non-residents becomes "expendable" or "transferable" or, more commonly, "convertible" into any currency in the world, is now coming into focus. The exact timing of this move derives from the Anglo-American financial agreement of December, 1945, with its injunction on both countries to undertake that "not later than one year after the effective date of this agreement (it was ratified by the US on July 15, 1946) . . . they will impose no restrictions on payments and transfers for current transactions." The agreement further provides that "any sterling balances released or otherwise available for current payments will, not later than one year after the effective date of this agreement . . . be freely available for current transactions in any currency area without discrimination."

Those are the relevant clauses which require the British Government to take action on July 15th next; but they are not the compelling reason why such action should be taken at all. The return to currently earned sterling of the virtues and qualities of free transferability or convertibility was in any case inevitable. Paradoxically, it was an essential condition of Britain's continued ability to live for some post war years beyond the means of its balance of current payments. If Britain found it desirable or inevitable to live on external credit during the years of transition, that credit had to be raised either in the currency of the creditors (as is being done with the dollar credits) or in convertible sterling. The British Government would have found it more than difficult to induce Argentina, for

example, to continue to sell to this country. The financial agreement with Argentina and recent experience in payments with Brazil should be sufficient proof that convertibility of current sterling was an essential pre-requisite of the continued readiness of those countries to go on supplying Britain with more goods than they are obtaining in imports from Britain.

There may be certain countries, especially among the Dominions, which would be prepared to see their accumulated sterling balances increase further without any assurance that this additional sterling could be spent in any part of the world. But most of Britain's overseas suppliers are moved by less generous impulses and would, in any case, have had to be given the right of convertibility. As for the more generous, it will remain open to them to accumulate additional sterling and not to exercise the rights of convertibility that will be theirs after July 15th.

All that can be said against the Anglo-American financial agreement on this score is that by committing Britain to convertibility of current sterling by a definite date it removed a very valuable bargaining weapon that would otherwise have been available to the Government in negotiating with the more recalcitrant of its sterling creditors and overseas suppliers. But even this argument has little force to-day. The teeth that were drawn by this clause in the Anglo-American financial agreement would have been of no great worth in the present sellers' market. This is, unfortunately, hardly a time at which sellers can be bitten or bullied.

The transition to complete convertibility of current sterling will have been largely anticipated by July 15th. Convertibility or transferability of current sterling already exists as between the following countries:

<i>American Accounts</i>	United States, Colombia, Costa Rica, Cuba, Dominican Republic, Ecuador, Guatemala, Haiti, Honduras, Mexico, Nicaragua, Panama, Salvador, Venezuela.
<i>Transferable Accounts</i>	Canada, Newfoundland, Argentina, Belgian monetary area, Netherlands monetary area, Portuguese monetary area.
<i>Special Agreement</i>	Italy.

Financial agreements are still to be negotiated with Brazil and Uruguay. The strictly bilateral agreements operating with France, Switzerland and the Scandinavian countries will have to be adjusted to make current sterling accruing to those countries freely expendable. Finally, and most important of all, there is the whole group of sterling area countries with which no agreements anticipating July 15th have yet been negotiated.

In viewing not only the character of the technical arrangements that are still to be made but the cost of convertibility, when it is completed, it will be well to inquire what class of sterling will, in effect, become available for expenditure in any currency area in the world. According to the strict letter of the American agreement, it will be any sterling arising out of current transactions, i.e., the whole of the proceeds of exports and sales of services to Britain and income from non-residents' investments in Britain. But it should immediately be added that out of these current earnings of sterling there will have to be paid all amounts due to Britain for current transactions. In effect, therefore, it will be the net balance of each country's trade with Britain that will be convertible. It would be fantastic if, for example, countries with adverse balances with the sterling area were able to spend a seasonably accumulated gross surplus without providing for payments known to be falling due later for their imports from Britain. It should be noted, too, that since non-residents holding current sterling will be able to spend it anywhere in the world, their expenditure in Britain will be based not on any element of compulsion but on the usual competitive commercial considerations.

In order to ensure that convertibility does in effect apply only to the net balance it will be necessary to conclude agreements for the funding of balances accumulated prior to July 15th next and defining the conditions in which they can be released. Failing agreed arrangements, the only alternative would be for Britain to block these balances or—which comes to the same thing—the recalcitrants must be excluded from the sterling area.

The exact nature of the arrangements to be made with the sterling area countries will have to vary with the circumstances of each case, among them with the magnitude of accumulated balances and with the manner in which they are held. Where, as in the case of India, the bulk of the balances is held by the central bank, the simple device of transferring the accumulations to a special account may be possible. In other cases, where the assets in question are very widely held, this simple procedure of drawing a line across the account on July 15th will be more difficult and in some cases impossible to apply. The case of Eire is, perhaps, the best illustration of a sterling area country whose accumulated sterling balances are so widely dispersed as to rule out any hard and fast arrangement that would segregate accumulated balances from fresh accruals. The most promising solution in such cases, and it may well be applicable also to others, like those of India and Egypt, would be to introduce into the arrangements with the authorities of those countries the principle of a minimum global balance to be kept in London. This minimum would be scaled down from year to year to allow for the freeing and repayment of the accumulated

balances. The amounts outstanding would be calculated periodically, and if the minimum was not being observed, representations would be made to the country in question. If necessary, the creditor might be asked to make up the balance either by paying in gold or other currencies, or even by purchasing sterling from the International Monetary Fund.

The operation of any such arrangement would call for good will and there are, perhaps, some countries on whose sympathy and co-operation it might be unwise to depend. Certain countries may be tempted to use their rights of convertibility of current sterling to excess. If they do, they will later find themselves short of sterling to meet current obligations. The unpaid creditors in such an event will be the British exporters who have sold their goods to these countries. Since the non-payers will at the same time have substantial amounts of accumulated and unavailable sterling, it may be assumed that considerable pressure will in such cases be brought to bear on the British authorities to accelerate the release of these balances in order to meet outstanding debts in Britain. Such pressure will have to be stoutly resisted, and the country which by excessive exercise of conversion rights has run itself short of current sterling will have to be called to order and would then have to restore its current balance by reducing its imports from Britain, or increasing its exports, or by remitting gold or, finally, by recourse to the IMF.

Viewed in that light, the ordeal of July 15th loses much of its severity. In some respects the new situation will mean positive relief to the British balance of payments. Convertibility already exists with countries whose current payments with Britain show the largest surpluses. Countries such as India and Egypt are now running substantial sterling deficits with Britain, and, under the new situation that will arise next July, they will lose the facilities they now enjoy for running such deficits and for drawing on the sterling area dollar pool. After July 15th, their command over sterling purchasing power will be restricted to the amount of their sterling sales plus whatever portion of their accumulated balances may be freed year by year. Their command over current hard currency resources will, in effect, be defined by the total of their favourable balance of payments with the hard currency countries, plus any surplus of current sterling they may acquire.

The immediate outcome of the arrangements that have to be negotiated with sterling area countries will thus be to make sterling a much scarcer currency than it is at present. The degree of that scarcity will be largely determined by the terms on which accumulated balances are funded and liberated. But since the greater part of Britain's current deficit will be with the Western hemisphere and will be covered by the dollar credits, the balance of payments with the rest of the world will not provide the substantial deficit that would create a large volume of currently earned sterling liable to be converted into other currencies. To make assurance on this point doubly sure, the British Government has already begun to negotiate special agreements with countries like Spain which will, in the next few years, accumulate and will voluntarily hold substantial amounts of sterling.

The new position will make possible a more conscious and selective direction of exports by subtracting from the demand for British goods that appreciable element which is now represented by purchases financed out of accumulated balances. Admittedly certain types of transactions will be lost to British traders under the new conditions. They are the profitable three-cornered entrepôt operations which in fact have been based on the ability of certain countries, such as India, to buy in terms of sterling and pay relatively high prices by allowing their sterling balances to run down. But the loss of this somewhat exotic, though highly profitable business, should, in the long run, be more than made good by the growth of much more solid and enduring trade which a strong and convertible sterling will help to attract to this country.

Business Notes

The Debtor Speaks Out

An unambiguous warning by the British Government to its war creditors that they must accept a substantial scaling down of the sterling debts owing to them was given by Mr Dalton this week in a speech to the Brazilian Chamber of Commerce. The Chancellor's language could hardly have been bettered, or his meaning made clearer:

As a result of the war the people of this country who were fighting longer than any others against the common enemy now find chalked up against them in the ledgers war debts nominally amounting to more than £3,000 million. These are our fruits of victory; these vast debts nominally owed by us to those who fought with us in the great inter-allied effort. This vast accumulation of debt represents an unreal, unjust and unsupportable burden. If Lend-Lease and Mutual Aid had been applied among all the members of the Grand Alliance, as they were applied between the United States and the British Commonwealth, by far the greater part of these debts would never have been charged up against us.

Sooner or later—and it would be better sooner than later—this mass must be very substantially scaled down. Britain is strong, but one sign of her strength must be refusal to take on fantastic commitments which are beyond her strength and beyond all limits of good sense and fair play.

Nor could I, as the British Chancellor of the Exchequer, support financial arrangements which would mean that for years and generations to come this little island, which led the fight for freedom, would, through this peculiar war-time accountancy, carry a crushing load which even the defeated enemies of freedom—Germans, Japanese and the rest—would escape.

This declaration will evoke an unanimous chorus of approval in this country. But why should it come so late? This is the clear talking that should have been addressed to our so-called creditors many months ago, long before Sir Wilfrid Eady and his colleagues began their tour of the main creditor countries. Ever since the publication of the Anglo-American financial agreement in December, 1945, the question of cancelling part of these sterling debts has been approached by spokesmen for the British Government—if approached by them in public at all—only with a curious diffidence. It almost appeared as though the injunction to “adjust” these debts, which was tentatively incorporated in the text of that agreement, had made it an unpleasant and unwanted commitment shouldered by Britain. These doubts and uncertainties have now been cleared by Mr Dalton's forthright remarks. Though uttered on a Brazilian occasion, they were obviously meant to be heard by others as well—and first and foremost by the Indians and Egyptians.

Light on the Profits Tax—

After the bewilderment caused among investors by Sir Frank Soskice's “explanations” a fortnight ago, the main interest in the Finance Bill, issued on Wednesday, inevitably centres in the provisions for the Profits Tax and the new duty on bonus issues. On these matters some major obscurities are now elucidated, but there are also some unwelcome surprises and a few new puzzles which have not yet been resolved. Among the unwelcome features is the confirmation of recent fears about the manner in which the changes in Profits Tax are to be applied to accounting periods falling wholly or partly before January 1st last, the date on which EPT ended and the increase in Profits Tax on distributed profits becomes effective. Any dividend declared after Budget day which is expressed as payable for such a period will in fact be treated as relating to the current year to the extent to which it raises the total distribution for the earlier period above that of the comparable preceding period. To that extent, it will automatically be subject to the full provisions for the increase in tax.

Apart from this, the rules for apportionment of tax for broken periods look equitable, although, presumably because of the difficulty presented by interim payments made in 1946 for a period extending into 1947, the formula is complex. In such a case tax is computed for the whole period, first on the old flat rate basis and secondly on the new differential basis: the first notional liability for the full year is then apportioned *pro rata* to the months falling in 1946 and the second to the months falling in 1947.

The rules seem effectively to close any possible loopholes. Thus, in form, the tax on all profits is 12½ per cent, and

the 5 per cent rate on undistributed profits is achieved by giving a relief of 7½ per cent on the amount by which the “net relevant distributions” represent under-distribution. Over-distributions, however, will be taxed at 7½ per cent correspondingly, except that the aggregate sums thus taxed, including all past periods, will not exceed the corresponding aggregate of under-distributions which have secured relief. Distributions embrace payments in kind as well as cash, and also, for companies whose directors have a controlling interest, any amount applied “whether by way of remuneration, loans or otherwise, for the benefit of any person,” unless the payment is to redeem a loan or reduce share capital. Individuals and partnerships of individuals, however, become exempt from tax, while the principle is retained of granting abatements where corporate profits are small—exemption for profits under £2,000 and reduction for those between £2,000 and £12,000. Investment income is included in taxable profits, except to the extent to which it has already borne Profits Tax, and, where such “franked” investment income is present, there is a proportionate relief from the tax on distributed profits. Previously, investment income (subject to similar treatment of “franked” income) was included only for banks, assurance, investment and certain other institutional investors.

A contentious clause provides that a business which winds up will pay the full rate of tax on any distribution of resources beyond the nominal value of its paid-up share capital. This is an obvious safeguard against evasion, but may produce cases of genuine hardship and injustice. It looks as though companies thus placed may find it cheaper to make a capital bonus in their final year. Among many other significant points of detail, it should be noted that profits distributed to controlling companies (50 per cent interest or more) not resident either directly or indirectly in the United Kingdom do not rank for distributed Profits Tax.

A welcome feature of the Bill is its adoption of the same definition of profits for the purposes of the Profits Tax as for income-tax under the provisions of the 1945 Act, which gave special plant replacement allowances.

* * *

—And On Bonus Issues

The provisions governing bonus issues are comprehensive, and will inevitably create new variants of old controversy. They apply to all companies—including private companies—incorporated or formed in Great Britain, and liability to the new duty will extend not only to bonus issues in the usual sense (including variations in the nominal value of, or liabilities attaching to, existing securities), but also to any issue or offer made preferentially to members or debenture holders of a company as a class and to new issues made to members of other companies. The value of the bonus element to be taxed is to be taken as the aggregate value of the “rights” to the issue as first quoted on a recognised stock exchange, less the aggregate value of the consideration received by the company. The first day's quotation is also to be the basis where issue and allotment extend beyond that date. The term “rights” is obviously used in an unusual sense, yet, surprisingly, no attempt has been made to define it. Where there is no quotation, the taxable bonus is to be the difference between the aggregate value of the securities at the date of the allotment, less the value of the consideration receivable.

Hence the familiar anomaly in the Treasury's theory on bonuses—that it looks only to the apparent gross value of the bonus element itself, without taking account of the loss in value of the old capital, excluding any “rights”—is now to be firmly crystallised into law. But, in those cases in which there is no quotation of “rights” (however that may be defined), there is liberal scope for metaphysical argument about the meaning of “the aggregate value at the date of allotment.”

Britain's Shop Window

It was, perhaps, a foregone conclusion that the twenty-sixth British Industries Fair, which opened at Earl's Court, Olympia, and Castle Bromwich this week, would break records. In a world hungry for goods, this first post-war BIF was bound to

be a barometer of buyers' appetites, and this week's queues have duly marked the reading. So impressive a demonstration of the range of British production will serve, too, as a much-needed counterpoise to the impressions made abroad by the reports of Britain's crisis. It gives tangible proof that British goods hold their pre-war reputation for quality and yet have profited from the technical advances which the urgencies of war have accelerated. Such a corrective, if achieved, will amply justify the decision to hold the Fair this year—its successful staging so soon after the fuel crisis is something of a triumph both for the organisers and for the record number of exhibitors.

But it was not a decision which could be taken wholly without misgivings. The problems raised were analogous to those inherent in the controversy about whether the tourist industry should launch its main drive for foreign visitors this year. The BIF is a gigantic shop window, and window displays are invaluable, but there is plainly a danger that foreign customers will feel something of the frustration with which the home consumer is all too familiar, for the embargoes, “for export only,” which torment him are unhappily no guarantee that even the export deliveries will be prompt and abundant. The eventual solution of Britain's balance of payments problem, moreover, depends not upon how much British industry could sell now if the stock-rooms lived up to the shop window, but upon what can be sold in a few years' time after the pangs of world hunger for goods have been appeased and others are again competing for custom. That long-run solution, as Sir Stafford Cripps said on Monday, demands an expanding volume of world trade as a whole. It also demands that British industry shall gear itself more and more closely to the precise needs and preferences of overseas markets. On a longer view, perhaps the greatest benefit from this year's BIF is that it should have helped many manufacturers to understand just what those needs are.

* * *

Fuel Crisis Post-Mortem

It is now two months since the power was switched on again for industry and the acute phase of the fuel crisis came to an end. Since then, industrial activity has jerked and staggered back to normal—normal in the sense of recovery towards pre-crisis levels of output. There have been many and various estimates of the cost of the hold-up. Speaking at Bristol last week-end, Sir Stafford Cripps put the loss to British exports at £200 million—a heavy burden for the balance of payments, though not heavier than many unofficial observers have envisaged. Obviously the wider effects of the three weeks' switch-off cannot be estimated with precision. But from the *Monthly Digest of Statistics* and other sources it is now possible to obtain some idea of which industries were worst hit and which have recovered most quickly. The table below gives the larger groups for which production data is available for the first quarter of the year. Some important industries, such as chemicals and transport, have unfortunately not yet published their March figures. Output in January has been equated to 100, with February and March production expressed as a corresponding percentage:—

	VOLUME OF PRODUCTION (January, 1947=100)		
	January	February	March
Electricity.....	100	79	85
Steel ingots and castings.....	100	86	82
Bricks.....	100	65	73
Cement.....	100	44	83
Rainwater goods.....	100	67	89
Private cars.....	100	40	88
Commercial vehicles.....	100	44	86
Rayon.....	100	70	90
Cotton Spinning.....	100	50	101

Broadly, the industries dependent on a continuous flow of components from other manufacturers and those with a large electric power consumption per unit of output were those most severely hit. Some of the large coal consumers, such as cement, were heavily curtailed, too. Similarly, in the recovery phase, those dependent on external supplies of electricity, such as certain rayon producers, were the first to improve. Others, such as the cotton spinners, made special efforts to recover production by using makeshift substitutes for coal. Cotton has made a remarkable recovery. Production of yarn for March was 12.89 million lbs., compared with 12.71 million in January. But industries heavily dependent on coal supplies, such as iron and steel industry and brick production, recovered only slowly. Iron and steel lost further ground in March.

The official estimate made early in March that about 25 per cent of production had been lost to industry in the crisis seems

to have erred on the optimistic side. Some industries lost over half their output. From evidence available so far it would appear that shortage of fuel and dislocation in March, one week of which fell within the switch-off period, were still holding several key industries at around 20 per cent below January levels of production. But January itself was only a “good” month when compared with the two which followed. It is perhaps too soon to appraise the rate of recovery, for the March figures do not reflect the improved coal allocations to industry. But the fact that coal allocations for all industries shown in the foregoing table, except cotton and iron and steel, were working in April at 50 per cent of the November quota plus an unknown and variable supplementary ration, leaves little scope for any expectation of rapid recovery in the large coal-consuming industries, at least until the higher summer coal allocations to industry begin to take effect.

* * *

Drive for Generating Plant

It took the rigours and dislocations of the fuel crisis to drive home the lesson that shortage of electric power was due to a shortage of generating plant, grown cumulative through the war years, as well as to a shortfall in coal deliveries. Since the crisis, as Sir Stafford Cripps explained last Friday, a special effort has been made to give priority for materials and supplies to manufacturers of generating equipment. A Heavy Electrical Plant Committee has been set up, with the Minister of Supply as chairman, to organise emergency measures. Other interests on the Committee, apart from the Government departments concerned, are the Central Electricity Board, the Scottish Hydro-Electric Board, the plant manufacturers and two trade unionists.

This Committee, as Sir Stafford explained, is encouraging manufacturers to expand capacity by sub-contracting out more work than usual to the engineering and shipbuilding industries. Other measures to speed up delivery include increased standardisation of specifications, high priority for power station plant awaiting repairs, and efforts to obtain heavy electrical plant from Germany. Arrangements made for the manufacture and import of diesel sets for factories should increase capacity by about 200,000 kilowatts by next March and by about 300,000 kilowatts by August, 1948. A proportion of British manufacturing capacity will still be reserved for export orders.

The gap which exists at present between the orders outstanding for steam and hydraulic turbo-alternators and the rate of delivery is brought out in a new table published in the April issue of the *Monthly Digest of Statistics*. An abridged version of the table is set out below:

	ELECTRICAL GENERATING PLANT: STEAM AND HYDRAULIC TURBO-ALTERNATORS			
	Hydraulic Turbines		Steam Turbo-Alternators	
	Th. B.H.P.		10,000 k.w. and over	
	Deliveries	Orders on Hand	Deliveries	Orders on Hand
January, 1946.....	10.6	925.5	Nil	3,725.7
October, 1946.....	Nil	1,375.9	83.5	5,347.0
November „.....	34.2	1,224.6	163.6	5,428.4
December „.....	Nil	1,440.6	55.0	5,428.4
January, 1947.....	42.0	1,299.6	60.0	5,748.4

The month to month rate of delivery scarcely provides an indication of the amount of work under construction in the heavy electrical equipment industry, but it is a measure of the scope of the problem that in December and January, that is before the fuel crisis, average monthly deliveries of large steam turbo-alternators were about 1 per cent of orders outstanding.

If the Central Electricity Board's programme for new generating capacity during the period 1947 to 1950 is to be fulfilled, the rate of installation in the next year or two must be about 1 million kilowatts a year. Taking the capacity of the electrical plant manufacturers at about 1.5 million kilowatts a year, and allowing for the relief which may be expected from the 200,000 to 300,000 kilowatts of capacity from diesel sets which will ease the demand on the public undertakings' industrial load, there is ample capacity available for dealing with the required annual flow of equipment to the electricity supply undertakings. The urgent need is for better supplies of components, fuel and manpower to increase the flow of equipment through the manufacturing process. Standardisation of equipment and sub-contracting will help to increase the rate of output of components, but this is a concomitant, not a substitute, for more labour at the final stages of fabrication. Nor will it be a solution, in a period of general labour scarcity, simply

to hand on the manpower shortage to the hard-pressed engineering and shipbuilding industries. Targets for generating plant in 1947 may not have gripped the public imagination as the coal target has done, but they are no whit less important.

Bigger Bank Advances

Quite the most striking feature of the domestic banking figures recently is the large expansion in advances. The latest synchronised statement of the clearing banks—dated April 16th—shows the unusual increase of £32.8 million, a movement only once exceeded in the past decade, raising the total to a new high level at £1,054.8 million. Moreover, the seasonal pattern since the outbreak of war, even since the recovery in advances' business began some three years ago, has always shown a decline in April. This year's return to pre-war seasonal habits, to the days when rising advances were regarded not only as good for the banks but as indicators of active trade, might easily be construed as a hopeful augury.

It would be unwise, however, to try to read too much into this month's experience—for two reasons. First, the movement is not well spread: two-thirds of the expansion is attributable to two banks only, and three banks actually show fractional declines. Secondly, it is hard to resist the assumption that bank advances now are being strongly influenced by the aftermath of the fuel crisis. Even before February's paralysis, there was widespread evidence that much bank finance was employed in carrying large quantities of industry's work-in-progress precisely because the "progress" was impeded by bottlenecks in components, containers and the like. It would be surprising if industry were not further out of phase now than it was three months ago. Obviously, there is no means of distinguishing, by financial statistics alone, between healthy and necessary replenishment of stocks and mere delays in deliveries; but general observation suggests that there is little room at present for genuine restocking. Sharply rising bank advances at this stage may be simply the financial counterpart of short-time working and concealed unemployment. These, it must be hoped, are ephemeral influences. But the longer-run prospect for advances does not turn upon such adventitious demands for finance: the secular trend is strongly upwards, and the tailing-off of EPT refunds (to mention one of the more important factors) should alone ensure that this year's expansion will exceed that of 1946.

One other noteworthy aspect of the April return is the further expansion of bank deposits. The increase of £32.8 million in "net" deposits (now that this term has received official sanction in the Bank of England Report, it should perhaps be substituted for *The Economist's* version of "true" deposits, despite the confusion which results from the different sense in which "net" is employed in the National Income White Paper and the *Monthly Digest of Statistics*) is admittedly small by contrast with the leap which, in April, 1946, initiated the extravagant credit creation of 1946. But the current Budget position is in much better shape than it was twelve months ago, and, given the speed at which the Treasury is borrowing dollars, it might have been expected that deposits would have fallen, thanks to a reduction in domestic borrowings. Plainly, Mr Dalton's defence of cheaper money, by reference to a hypothetical change in the trend of bank deposits, is even less tenable than it seemed when he first advanced it two months ago.

Obtaining an SE Quotation

The new rules regulating applications for a quotation on the London Stock Exchange were adopted by the Council on Monday and now only await confirmation. Henceforth the distinction between securing permission to deal and obtaining a quotation disappears, and all companies seeking to introduce their securities to the public must comply with the full requirements for obtaining a quotation. The new rules (Rules 159-165 and a redrafted Appendix 34) contain very little which was not already established practice. But the arrangement is more logical, the intention more clearly evident, and some points only implied in the old rules are now explicit. In particular, "placings" are formally recognised and defined; it is made clear that dealings in placed stocks "subject to quotation" are no longer permitted. As is commonly the case, the rules themselves are short and simple compared with the detailed requirements to which they give rise. These are contained in Appendix 34 and its nine schedules. Here there is rather more that is new, although again the changes are mainly in arrangement and in the explicit demand for information which in the past has in practice been asked for.

From the standpoint of those seeking a quotation, the great advantage of the new document—apart from its being made available in a larger print than the old—lies in the fact that the requirements for each separate class of operation are set out in a special section restricted to that class.

Altogether, it is plain that the Council intends to live up to the reputation of the "House," which the Cohen Committee handsomely acknowledged, for keeping ahead of the Law. Whatever may be the dangers inherent in such an arrangement, it is in practice impossible to impose a control as stringent as is desirable unless the rules have a flexibility which would be inappropriate or impracticable in legal enactments. A case in point concerns the question of nominees. The attempt to enforce disclosure by law has been totally abandoned, but the Council lays down that, where the promoter or other interested party in an issue is a limited company or firm, a Statutory Declaration as to the identity of those who control or are interested in its profits or assets may be demanded. On the whole, the rules in their new form appear to have received a good reception from the leading issuing houses, while there is reason to believe that the associated Stock Exchanges and the other members of the profession are taking steps to bring their rules into closer accord with those of London. That is essential to the complete success of the programme in which the Council has been working for years. Meanwhile it is to be congratulated on the creation of what appears to be a very workmanlike instrument.

Cotton Export Allocation

As was to be feared, the fall in cotton yarn and tissues production during the February fuel crisis has dealt a severe blow to the cotton textiles export trade. It had been hoped at the end of January that the former export allocation arrangement, by which cotton goods were directed to special markets, could be scrapped in favour of a more open system. The new arrangement was to have been introduced with the allocation for the first period of 1947. The Board of Trade now announces that the fall in production has been so severe that export allocations for the first two periods of 1947 must be suspended entirely. The ban will not, however, affect export deliveries from production approved before the fuel crisis. By thus wiping out the accumulation of orders outstanding for the first two periods, a notable improvement in delivery dates should be achieved for the third period.

This decision has the merits of facing up to the facts of the situation. Not only has the fuel crisis reduced yarn and tissues output; inevitably, it has also upset the balance of production. But apart from the inconvenience which these inevitable cancellations cause to the trade, they make the export drive look even more difficult than it did at the time of the "Economic Survey," when it was admitted that cotton exports would shrink in 1947. In 1946 £63 million, or 7 per cent of total British goods exported, were cotton tissues and yarns. This proportion was maintained in the first quarter of 1947. Cotton textiles play as large a part in the total value of exports as chemicals and nearly as large a part as do iron and steel manufactures. Cotton exports are obviously going to be reduced to a mere trickle over the next few months; even though yarn output has made a remarkable recovery in March and there is no hope of any of the other large export industries expanding production over that period to fill the gap effectively.

Tea Prices and Supplies

The news that, as from June 22nd, retail prices of tea will be increased by 4d. a lb. has come as a minor shock to consumers, but it is, even so, insufficient to meet the prospective rise in purchase costs. The Ministry's price to the trade will be raised by the same amount, so that wholesalers' and retailers' margins are unaffected. The increase, in fact, simply provides for the extra export duty which the Ministry, in common with other purchasers, has to pay on Ceylon and Indian teas. The Indian duty is approximately 2½d. a lb. while in Ceylon it is 7d. On the basis of a prospective supply of 200 million lb. from India and 100 million lb. from Ceylon during the current season, the average extra cost per lb. of tea amounts to 4d. No allowance, however, has been made for the additional 3d. per lb. offered to Ceylon growers under the new contract. Possibly the Government has decided to incorporate this amount into the subsidy, so that even after the price change, the Treasury will be paying 1s. 2d. per lb. on tea instead of 11d. Alternatively, of course, Mr Strachey may decide to raise the retail price still further in a few months' time, particularly if, as it is thought, the Treasury desires to limit the total amount of subsidies.

May The British Industries Fair opens in London and Birmingham early in May, resuming the practice of pre-war years. This great display reflects the skill and resourcefulness of the people of this country and it brings buyers from all quarters of the world. Many exhibitors enjoying an international reputation can recall their first steps as small undertakings, and not a few the aid and support received from the Midland Bank. Over a century ago this Bank began as a local undertaking in Birmingham, side by side with other examples of early enterprise. To-day the Bank is as ready to meet the needs of those whose requirements are modest as it is of those of the great industrialists, and from stands at the exhibition offers its services to all having need of them. At any of its 1900 branches no account is regarded as too small, nor is any transaction too large.

British tea supplies, however, are at the moment in danger. The dock strike in Calcutta, which has been holding up shipments, is now over, but its effects will not be fully felt until this month. In the first quarter of 1947 some 93 million lb. were imported into this country compared with 100 million lb. during the corresponding period last year. Consumption during the first three months of the year averaged about 4,000 tons weekly, causing a take-off from stocks during the period of 10,000 tons. Ministry stocks at the end of March are therefore likely to stand at only about 4 months' supply. If these estimates are sound, there must be grave doubts whether the present tea ration of 2½ oz. a week can be maintained; but, in view of the ending of the Calcutta strike, the Ministry may perhaps feel justified in maintaining the ration at its present level. There are obviously many factors to consider in this matter, with the political factor probably predominant. But the long-term prospect also is hardly reassuring. Against the Ministry's invitation to Ceylon tea growers for tenders for 150 million lb., only 95 million lb. was offered, despite the 3d. increase in price. The Indian Government, however, has agreed that the Ministry may raise its tenders for Indian teas from the planned 150 million lb. to 200 million lb. But this is merely formal permission; the crux of the matter is whether the growers will sell this quantity to the United Kingdom. The recent response in Ceylon is hardly a promising augury. With the absence of supplies from the Netherlands East Indies, Britain may have to offer the Indians a substantial advance on last year's contract price if adequate supplies are to be ensured.

Earnings in 1946

Quite the most striking feature of the Ministry of Labour's latest periodical survey of average earnings of workers in manufacturing industries, relating to the last pay-week of October, 1946, is the rise in women's earnings relative to those of men. The general level of earnings in the industries surveyed has, of course, risen further, to a new peak of 101s. a week, which is 90 per cent above October, 1938, and compares with an average of 92s. 7d. in January, 1947. Men's earnings, however, averaged 120s. 9d., which, although 75 per cent above the level of October, 1938, is well below the wartime peak of 124s. 4d. reached in July, 1944. Women's wages, at 65s. 3d. in October last (101 per cent above October, 1938), compared with 59s. 10d. in January, 1946, and 32s. 6d. in October, 1938. The increase in the average earnings of girls bears the same relation to that of boys' earnings as that of women does to the men's. The official survey makes no attempt to explain this tendency towards a narrowing of the gap between men's and women's earnings. Presumably, the scarcity of female labour in some of the most vital and hitherto badly-paid industries, such as textiles and clothing, is having the effect of pushing up their rate of remuneration.

The *Gazette* shows some interesting changes in the composition of the labour force. The proportion of men employed in the industries surveyed rose from 61 per cent in October, 1938, to 69 per cent in October, 1946—it had, of course, dropped during the war—whereas the proportion of women, which had increased during the war, is now back at its pre-war level of about 20 per cent. The proportion of youths and girls fell by 6½ per cent and 3 per cent respectively, and will fall still further when the effects of the raising of the school-leaving age have been felt. Average hours worked in manufacturing industry have declined, not only from their peak war period, but from the pre-war level. The

hours worked in October, 1946, averaged 46.2 per week, compared with 46.5 in October, 1938, the biggest reduction being in the case of young workers.

Some details about the earnings of railway employees, dock-workers and miners are also given, although they do not form part of the survey. Average weekly earnings of railway workers in March, 1946, at 121s. 6d. for men, were above the average for manufacturing industry, although they had increased by only 77 per cent over pre-war. Dock-workers, who averaged, 141s. 3d. a week in October, 1946, were the highest paid industrial group. Miners, who averaged 134s. 8d. in the three months ended December, 1946, were the second highest group, and their increase of 123 per cent over the same period of 1938 represented the largest increase in proportion to pre-war earnings.

Cotton Scheme Begins

The Government's scheme for a £10 million subsidisation of re-equipment, subject to re-grouping and double-shift working, in the cotton spinning industry formally came into operation on May 1st. This formal launching of the plan, by fixing an opening date, was necessary to define the duration of the offer, for, to ensure eligibility for the grant of 25 per cent of the cost of re-equipment, all orders for machinery must be placed within two years and deliveries must be completed within five years.

But, for the moment, the fact that the scheme officially started ten days ago can have little effect on the rate of regrouping. Except among firms which have already started to negotiate terms of amalgamation and are therefore fully conversant with the facts of their own group of mills, the industry must be very much in the dark about the potential scope for amalgamation—until the Evershed report on textile machinery and the Cotton Board's report on redundancy in the spinning mills are available. Tact and patience will have to be exercised in explaining to workers the merits of regrouping and double shifts at a time when the industry is painfully recovering from the dislocation and low production levels of February.

The present scheme extends only to the various types of spinning equipment. Last week, however, Sir Stafford Cripps remarked that a similar arrangement might be considered for the weaving end of the trade, but the scheme as a whole would set no precedent for other industries. Cotton has been put in a privileged position. It is now under an obligation to justify this special treatment.

Wool Stocks and Top Prices

Empire stocks of wool at the end of the current season will be half-a-million bales smaller than had been expected. The Joint Organisation has issued an amended figure for the amount of its holdings of wool at June 30th last—the end of the 1945/46 season. The stocks are now estimated at 5,786,700 bales compared with the original estimate of 6,300,000 bales—a reduction which results from the fact that sales during the 1945-46 season proved to be 500,000 bales more than expected. Just over half of the total stock comprised Australian merino. Stocks by the end of January last had fallen to 5,018,000 bales, reflecting sales amounting to 813,000 bales in the first seven months of the current season. The Joint Organisation bought in 45,000 bales,

consisting of poor quality types which failed to make the reserve price at the auctions. Programmed sales for the remainder of the season are expected to dispose of 630-660,000 bales, leaving an end-of-season stock of about 4,400,000 bales. Full details are given in the tables below:—

* Excluding quantities bought in Feb.-June, 1947

Higher maximum prices for wool tops and merino noils became effective in the United Kingdom on May 5th to cover the increased prices for merino and fine crossbred wools as well as the recently authorised increase in combing charges. The sustained firmness of the wool auctions, particularly for the better types, made it almost impossible for topmakers to supply merino tops to the home trade at prices consistent with the utility cloth schedules. The high prices for merino wool have forced manufacturers to use the finer crossbreds as substitutes so that their prices have also advanced. Under the new Order the scheduled prices for tops have been raised by 10d. to 58½d. per lb. for 64's warp (merinos) and by 1½d. to 42½d. per lb. for 56's super (fine crossbred). The increase in the merino type will no doubt satisfy Bradford, although they expected a 12d. rise, but the rise in fine crossbreds seems inadequate. The temporary embargo recently placed on the export of tops has now been lifted, and this presumably will afford a much-wanted relief to topmakers. Its purpose was to ensure adequate supplies for the home trade in view of the fuel crisis. It has been found, however, that the additional supplies were not required, and that a considerable weight of tops was in fact being held up.

US Lead Supply Expanding

The position of lead in the United States, although still difficult, shows some signs of improving by the end of the year. The high price has at last evoked some response from producers, while at the same time consumers have been seeking and developing substitutes. Output of refined lead during the first two months of 1947 was at the annual rate of 475,000 tons, or roughly the level of 1945, compared with 370,000 tons in 1946. The labour force has recently expanded more rapidly, and now represents about 85 per cent of peak capacity. Output in other producing areas in the world is also showing a fairly strong upward tendency. In Australia, production totalled some 18,800 tons in January, compared with 12,500 tons in December and 10,400 tons in November. Mexican output in February amounted to 21,100 tons, against 19,000 tons in January and a monthly average for 1946 of roughly 12,500 tons.

In the United States, the consumption of lead has been affected by the substitution of other metals. As in the United Kingdom, copper is replacing lead in the building trade. Before the war copper was normally expected to be about twice as dear as lead, but this price differential no longer obtains. With lead at 15 cents a lb. and copper at nearly 22 cents a lb., there is a spread of

45 per cent in contrast with the pre-war 100 per cent. Aluminium is being used for lead to an increasing extent in the foil, tube and electrical industries, while the use of titanium for paint pigments is a long-term substitution.

US consumers expect to receive some 8,000 tons of lead this month from the Office of Metal Reserves stock-pile. The Government stocks are known to have been seriously reduced, and are expected to be exhausted by the middle of 1947. In recent years America has had to import about one-third of her annual lead requirements, and this proportion may well be maintained even when total quantities decline. The United States at present is therefore not only one of the dominant influences in the world metal market, but in all probability will remain so even when industrial activity in the United Kingdom expands to normal levels.

Steel Company of Wales

It was announced last week that the Steel Company of Wales, which is to provide the focal point of the far-reaching plan for the Welsh implate and sheet-steel industry, formally approved by the Government a fortnight ago, has now been registered—with a capital of £40 million and borrowing powers of the same amount. As expected, the chairman of the new company is Mr E. H. Lever, chairman and managing director of Richard Thomas and Baldwins. The board of directors has been drawn from the directors and staff of those companies whose assets will be taken over by the new company.

Apart from the question of the site for the third cold reduction mill, which is still being considered by the Government, interest in the scheme is now concentrated on the outcome of negotiations in America for delivery of key plant and the arrangements for financing the new company. When the project was announced in February the chairman expressed the view that the American engineering industry could make delivery if the order was received quickly. About \$35 million worth of equipment is involved, most of it for the new hot strip mills. Now that the scheme has received official approval there should be no delays from this end in placing a firm order. On the finance arrangements for the new company little has yet been revealed, but the companies interested in the new venture obviously cannot put up from their existing resources the whole of the £50 million eventually required. The Finance Corporation for Industry is expected to play a part.

Discount Company's Reserves

It falls to a discount company to give one of the first positive indications of the effects of Mr Dalton's anomalous tax on issues of bonus shares. Cater, Brightwen and Company, now fourth of the London discount houses in point of size, early last year raised £110,000 of new capital at a large premium, but, somewhat to the surprise of some observers, brought into its published reserves only a fraction of the additional resources. It now appears that the board intended, after the conversion into a public company and the introduction of the shares to the Stock Exchange, to bring the paid-up capital into line with realities by means of a bonus issue. The new tax, however, would be "so onerous as to make the operation impracticable." Hence the company now is contenting itself by simply bringing the hidden resources into the shop-window.

The transfer to reserve from share premium account is £800,000, which is apparently a good deal more than the amount of the premium on last year's issue, and brings the reserve to parity with the paid-up capital at £1,200,000, making total shareholders' resources of £2,458,000. The fuller use of the new money is reflected in a further increase in the total portfolio of bills and bonds, from £72.6 million to £84.1 million, compared with £63.9 million two years ago. Now, therefore, the relationship of the portfolio to resources is shown by the quite normal multiplier, for this class of business, of 34, in contrast with the abnormally high (but artificial) figure of 45 twelve months ago. In the past a notable feature of the balance-sheet has been its candour in listing the individual holdings of bonds, but this year, its first as a public company, the house most inappropriately takes three steps backwards: not only are investments shown as a single total, but "short-dated securities" are merged with bills, and there is no indication of what "short-dated" means.

This is an imitation of the obscurantist form which became general for the few discount company balance-sheets published in the 'thirties, when bill market bond dealing was still regarded as scarcely respectable. Now the market in general is moving

WHY DRY FLY? This world-famed Sherry (formerly called Findlater's Fino) could not be registered under that name and thereby protected from imitators. For the safeguarding therefore of our world-wide clientele we have renamed it—Findlater's Dry Fly Sherry.

Under Pressure

To keep a gas dissolved, or in contact with liquid at a pressure greater than that of the atmosphere, the chemist uses an autoclave. An everyday example is the syphon, which keeps carbon dioxide gas dissolved in water to form soda-water. Another is in the boiler of a steam-engine, where water is heated under pressure above its normal boiling-point. In research and industry autoclaves are employed for similar purposes, from small versions lined with platinum, designed for experimental work, to monsters in stainless steel like that shown here. Since its humble beginning in the dark ages of chemistry, 'the philosopher's egg'—as the autoclave was then called—has hatched into units which work at very high temperatures and at pressures twenty times as great as that in the boiler of the 'Flying Scotsman'. Autoclaves are vital to scientific progress. Without them many substances that are considered essential today could not exist. They help to produce synthetic rubber, to convert unpalatable marine oils into edible fats, and to turn out dyes, drugs and plastics. They form part of the 'armoured corps' of scientific equipment with which the British chemical industry is helping to fight the battle for cheaper and more efficient production in the service of the nation.

FEELING THE PULSE OF THE WORLD'S STEEL INDUSTRY

For the benefit of all those whose interests connect them with the Iron and Steel Industry, the Federation regularly makes its 'Monthly Statistical Bulletin' available on a subscription basis. This concise monthly survey contains basic information in tabulated form from the United Kingdom and abroad, and gives a comprehensive picture of the Industry's current activities. The annual subscription is £1.10.0, post free. Specimen copy on request.

THE BRITISH IRON AND STEEL FEDERATION
Steel House, Tothill Street, Westminster, London, S.W.1

Before fabrics can be dyed they need to be scoured and, even with soft moorland water, this causes formation of lime-soaps which prevent proper penetration by the dye and make the result streaky and blotchy. Research has produced a chemical—Calgon—which removes offending lime-soaps, thus allowing the dye to operate evenly on every single fibre, to the satisfaction of the textile manufacturer and the user. 'Calgon' is a product of Albright & Wilson Ltd.

49 Park Lane, London, W.1. Works: Oldbury & Widnes

annual instalments to be made available to the emigrant in his new country of residence; hence the second annual transfers arising from the earliest applications to which this scheme was applied are now being submitted for approval. The main lines of policy were explained in a notice issued by the Bank of England in July of last year, entitled "Guide to Emigrants from the United Kingdom to Countries outside the Sterling Area," which sets out the financial conditions attaching to the emigrant, i.e., for the purposes of the Defence (Finance) Regulations, he is considered as resident in the Sterling Area for the first four years in his new country, after which he may apply to be redesignated.

This "resident" status has the effect of limiting the scope for investment of the emigrant's remaining sterling funds; the income on permissible investments can, however, be remitted. In order to secure these "Concessions," as they are called in the notice, the emigrant must sign an undertaking that, during the four-year period, he will have all his sterling income paid into his bank account in the United Kingdom, and will offer for sale to the Bank of England all specified (i.e., "hard" and "semi-hard") currency received, except that arising from earnings. In addition, the emigrant must declare that he intends to reside permanently in his new country and that he has authorised his bankers in the United Kingdom to furnish the Bank of England, during the four-year period, with any information they may require about the entries on his account. The Bank of England then usually approves such applications, stating that four equal annual instalments of the emigrant's assets up to a total of £5,000 may be transferred; but if the total is below £2,000, then a remittance of £500 per annum is permitted until the emigrant's funds in this country are exhausted.

The treatment accorded to nationals other than those of the United Kingdom, and also to those British nationals who are returning overseas to resume a permanent residence interrupted by the circumstances of war, is somewhat different. In such cases, subject to satisfactory proof of ownership and reasonable explanation of the origin of the assets concerned, the Bank of England treats the account-holder, for the purposes of the Defence (Finance) Regulations, as resident in his new country immediately upon his arrival, and therefore permits the funds on his banking account to be made available to him there. This status, however, gives him the disadvantage, applicable under the regulations to any non-resident of the Sterling Area, that he cannot sell sterling securities except under licence, usually granted only for the purposes of re-investment, while the sterling proceeds of the sale in this country of capital assets are available for investment only in sterling securities with a tenure of 10 years or more. Applications in both categories continue to be made in a fairly steady stream, and it is thought that emigrant cases must number about 150 per week, while re-designation applications must be in the region of 120 per week. Official statistics concerning these two types of remittance would be interesting as throwing light on Britain's invisible imports.

SECURITY PRICES AND YIELDS

A fuller list containing 370 securities appears weekly in the *Records and Statistics Supplement*. Notes on the following company reports also appear in the Supplement: J. & P. Coats; British Oxygen; Stewarts and Lloyds; Rio Tinto; Cerebos.

* To earliest redemption, except £ flat yield and 1 assumed average life 17 years 6 months. Net yields after allowing for tax at 9% in 6.

(a) Interim. (b) Final. (c) Whole year. (d) Int. paid half-yearly. (e) Also a capital bonus of 2 1/2 per cent. free of income tax; yield worked on 15 per cent. basis. (f) Free of Tax.

Shorter Notes

Holders of the 5 1/2 per cent sterling bonds of the Union Company of Oslo are being offered by the company £121 net for each £100 bond. These bonds carry gross arrears of interest amounting to 38 per cent. Less than £100,000 is now outstanding. In 1942 the Norwegian Government purchased, mostly from institutional investors, at 49 per cent, a large proportion of the bonds. This purchase was concluded on the apparent understanding that no better offer would be made. An offer to purchase at 64 per cent of nominal value was made last year and later withdrawn by the Norwegian Government. The company's general meeting takes place on May 14th to consider whether the company should purchase the bonds which the Norwegian Government holds in the company, or whether the Government, which claims to hold a majority of the bond obligations of the company, should now be allowed to exert control over the company and re-arrange its capital.

Consumption of virgin copper in the United Kingdom during March amounted to 28,900 tons, while copper and alloy scrap (copper content) totalled 16,913 tons. These figures show a recovery on February, but are still below the peak of January. Consumption of virgin copper in the first quarter of 1947, which reached 75,400 tons, has been at the rate of 301,500 tons a year.

The Spanish-Italian mercury cartel is reported to be attempting to gather in Mexican quicksilver producers. At present the British price of £17 to £19 per flask delivered to consumer is slightly below the cartel price of £21 per flask. Because it is cheaper than Spanish mercury, Mexican mercury is being imported on private account, although this involves hard currency expenditure. British Government stocks are not at present being sold.

The Southern Rhodesian Legislative Assembly has approved the purchase of the equity of Rhodesian Railways, Ltd., as at March 31, 1947, for £3,150,000. The purchase was discussed in a "Business Note" in a recent issue of *The Economist*.

It has been reported from Washington that the United States Congress has approved the removal of the import tax on copper, other than sulphate, until April, 1949. The measure now awaits President Truman's signature.

The British and Yugoslav Governments are shortly to discuss compensation terms for nationalised properties, including Trepca lead zinc mines.

HOME AND COLONIAL STORES, LIMITED

ANNUAL REVIEW BY SIR LANCELOT ROYLE, K.B.E.

The fifty-second ordinary general meeting of the Home and Colonial Stores, Limited, will be held, on the 30th instant, at Winchester House, Old Broad Street, London, E.C.

The following is the statement by the chairman, Sir Lancelot Royle, K.B.E., circulated with the report and accounts for the 52 weeks to January 4, 1947:

DIRECTORATE AND ORGANISATION

Before reviewing the trading results of the year covered by the accounts, I wish to deal with the changes which have taken place in the constitution of the board, and in the organisation of the group. Shareholders will recollect that a vigorous programme of reorganisation was planned in the beginning of 1936 and that completion of this was interrupted by the war. When the war ended consideration was immediately given to methods for inaugurating a fresh phase of development as and when the relaxation of controls permit.

Sir George Schuster felt that the leadership of the group during this new phase required whole-time service which, owing to his other interests, he was unable to give. He accordingly tendered his resignation as chairman and director with effect from December 31st 1946, but I am pleased to say has agreed to continue to act as adviser to the group on questions of economic and public policy. Mr H. S. Frost also resigned his position as managing director and his seat on the board as from the same date, while Mr A. Greig, who had reached retiring age and whose services for the last few years had been placed at the disposal of the Ministry of Food as Retail Trade Adviser, also retired. The board wish to place on record their appreciation of the services which all three have rendered to the company during the time they have been associated with it.

In his review for 1944, Sir George Schuster referred to certain steps which had been taken to separate the functions of our main operating units. In furtherance of this policy it was decided to form a new company in which to centralise the manufacturing activities of the group. That company was duly formed, and its board is now responsible for all factory matters, although certain of the manufacturing units have not yet been transferred to it because of taxation difficulties. As a further step in the reorganisation of the group, the new company, H. and C. (Retail), Limited, has been formed to take over the retail undertaking of the Home and Colonial Stores, Limited, as from January 4, 1947. As will be seen from the balance-sheet, the Home and Colonial Stores, Limited, is now virtually a holding company, having as its principal assets its investments in its retail and manufacturing subsidiaries and also in its associated company, Maypole Dairy Company, Limited.

In reconstituting the board of the parent company it was considered desirable that each of the principal subsidiary and associated companies should be represented thereon. Various changes had necessarily to

be made in the boards of the subsidiaries, and Mr C. W. Stamford, who had been engaged on the retail side of the business, resigned his seat on the main board to join that of the new company, H. and C. (Retail), Limited. I was invited to accept the chairmanship of the group, and the other members of the main board are now Mr D. Hardwick (chairman of Maypole Dairy Company, Limited), Mr A. Purves (chairman of Meadow Dairy Company, Limited), and Mr Alan Sly (chairman of Allied Suppliers, Limited), who have been directors of the parent company for many years, and Mr Norman Bulow (chairman of H. and C. (Retail), Limited), Mr F. H. Lightbody (chairman of Food Products Investment Company, Limited), and Mr T. B. Scotcher (chairman of Lipton, Limited), who have been actively associated as directors in various sections of the organisation for a considerable time.

The chairmen of the respective boards are whole-time working directors who are individually responsible, with their boards, for their section or sections of the business and who, as directors of the main board, share responsibility for the group as a whole. In this way there is co-ordination of the various interests with a view to securing to the group and to its associated company, the benefits and economies which are made possible by reason of the working arrangements between them.

TRADING RESULTS

A statement showing the profits of the group is included in the directors' report, together with the comparable figures for the previous year, which covered a period of 53 weeks. The aggregate profits after charging debenture interest and dominion and foreign taxation have increased by £248,515 to £1,203,948. The increase, in round figures, has been derived as to £90,000 from retail branch trading in the United Kingdom and Eire, £90,000 from our manufacturing interests, £52,000 from overseas trading, and the balance of £16,000 from miscellaneous revenue. As regards the retail branches, the outstanding features of the past year are, first, a substantial increase in turnover by reason of a greater availability of certain classes of goods and the increased number of points available to consumers; second, a small decline in the rate of gross profit earned; and third, a sharp rise in expenses, particularly wage costs. This rise was inevitable with the rapid demobilisation of our staff from the Forces, along with advances in the Joint Industrial Council wage rates which became operative from July 1, 1946. It will be noted that these increased wage rates operated for only six months in 1946, but they will operate for a full year in 1947.

It is gratifying to state that despite the many difficulties that have confronted industrial concerns in reversion to some measure of peacetime activity, our associated factories, under the new management arrangements, have shown improved results. On the other hand, the success of these factories is bound up with the supply position of raw materials and packing materials, and it seems that difficulties in regard to these will probably continue for some time to come. In the year under review, while increased allocations of meat for sausages manufacture, sugar for table jellies, and additional supplies of coffee have been made available, there have been reductions in raw material

supplies for cakes and biscuits. Shortage of labour in our jam factories in the South continues, but our recent acquisition of a preserves factory in Glasgow has played its part in assisting us to get over this problem.

Our overseas business has shown a welcome expansion, due to a certain extent to less restricted markets for tea in India and Ceylon, and also to the further development of our internal trade in India and elsewhere. The profit margins earned have also improved and are now on a more satisfactory basis. The Indian Budget which has recently been introduced proposes the imposition of a tax on trading profits to operate as from April, 1946. Provision has been made in the accounts to cover our estimated liability. There has been a steady expansion in the volume of trade handled by the wholesale section of our business.

DEVELOPMENT

At home, while quantities and prices are controlled, and we have not direct access to our normal sources of supply, our opportunities for development are limited. Nevertheless, by the changes effected in the organisation and the greater detailed control which can now be given to the various sections of the business, we hope not only to see a continued increase in turnover, but to be able to take immediate advantage of relaxation of controls as they arise. It is only by obtaining extra trade that we can meet the rising trend of expenses.

We are taking steps to improve our factory facilities. In addition to our new preserves factory, we have secured a site in Liverpool for the erection of a cooked meats factory; we are negotiating for a site in Glasgow for the extension of our biscuit factory, and a plan was prepared for the rebuilding and extension on modern lines, of our war damaged London preserves factory, to incorporate in addition to jam, the manufacture and packing of coffee essence, cereals, custard powder, sausages and cooked meats, but permission to proceed with this work was refused by the London County Council. An appeal against this decision was made to the Ministry of Town and Country Planning and although, in the opinion of counsel, we submitted a sound case and there was strong local support for the project, the appeal decision went against us. As a result we have now made application for permission to reinstate a portion of the war damage which, if successful, will improve our factory layout.

Overseas, we have arranged, in conjunction with other food interests, to form a company in Australia to take over and develop the Lipton business there, while in India, notwithstanding the present unsettled political outlook, we are undertaking essential extensions to our factory and packing facilities to cope with the increased trade. Since the date of the accounts notice has been given by Lipton, Limited, to redeem its 4 per cent. and 4½ per cent. debentures and an issue of 3 per cent. debentures, secured by a floating charge on its undertaking, has been created to replace them.

DIVIDEND POLICY

Out of the additional profit of £248,000, taxation absorbs £138,000, and after small adjustments for previous years, the amount available is £105,000 more. Last year, however, we were able to bring in a special credit of £100,000 in respect of taxation over-reserved, which is not available to us on this occasion, so that the net difference is £5,000. Dividends of subsidiaries to holders outside the group require £7,000 more. Allocations to staff funds of subsidiaries are increased by £7,000; £11,000 more has been used to write off goodwill of businesses acquired by them during the year, while their appropriations to reserves and increased amounts carried forward on profit and loss account are £22,000 more. Last year we paid a dividend of 3 per cent. and a special bonus of 6 per

cent. to bring the average distribution during the war years up to 3 per cent., and we increased the carry-forward by £65,000, thus restoring it approximately to the figure at which it stood at the outbreak of war.

On this occasion we recommend payment of a dividend of 9 per cent. which will enable us to increase our carry-forward by £23,533. Our proposed distribution absorbs £99,561, while we have increased the reserves and amounts carried forward in our subsidiaries and in the parent company by £114,031. It is essential to strengthen our resources as, with a much higher price level, a greatly increased capital will be required to finance stocks as our trade develops. The formal resolution embodying the board's recommendations will be submitted to the annual general meeting.

While the trading results for 1946 justify a distribution of 9 per cent., we must emphasise that in the years immediately ahead there are many unknown factors over which your board may have little, if any, control, and these may adversely affect our earning capacity. The rates of future distributions may, therefore, possibly fluctuate as the results will largely depend on these factors and our ability to deal with them.

LOYAL SERVICE OF THE STAFF

I am sure you will be pleased to hear that, during the past year, we have continued to receive the most loyal and valuable help from all grades of staff both at home and abroad. Rationing regulations, which we all appreciate are necessary in some form, occasion difficulties and sometimes irritation to the shopping public, but our staff have to contend with this complicated and unproductive system, involving work which increases each year instead of becoming lighter. Our thanks are due to all our staff, especially to our buyers and the managers of our shops who bear the brunt of these extra duties.

SAN FRANCISCO MINES OF MEXICO, LIMITED

FAVOURABLE RESULTS

The thirty-fourth ordinary general meeting of San Francisco Mines of Mexico, Limited, was held, on the 30th ultimo, in London, Mr C. T. Port, the chairman, presiding.

The following is an extract from his statement, circulated with the report and accounts:—

In considering the year's work, stockholders should bear in mind that we operated for only ten months of the year, that we milled but 450,000 tons against 569,000 tons in the previous year and that we had to absorb nearly \$400,000 of loss—being the cash cost of a two months' strike of workmen. Bearing this in mind, I think you will agree that the results compare favourably with the year before.

The gross operating profit is £573,000, against £615,000, and the net surplus is £241,000, against £166,000. Your directors have placed £50,000 to exploration and development reserve and recommend the payment of a dividend of 2s. per unit. The undivided profits will strengthen the company's cash resources, which are increasingly being called upon to finance our stock of unliquidated metals at rising prices.

We labour under the burden of a system of Mexican taxation involving taxes on revenue regardless of profitability. Labour relations continue to be difficult. Throughout the war your company willingly concentrated on maximum production of metals, sacrificing underground development with consequent severe reduction of our broken ore reserves. We have now been able to restore our broken ore to a comfortable tonnage, and for the current year we are undertaking a much increased development programme. Development is giving encouraging results on all our main veins.

The report was adopted.

IMPERIAL CHEMICAL INDUSTRIES, LIMITED

PROGRESS DESPITE DIFFICULTIES

The twentieth ordinary general meeting of Imperial Chemical Industries, Limited, was held in London, on the 8th instant, the Rt. Hon. Lord McGowan, K.B.E., D.C.L., LL.D., the chairman, presiding.

The following is an extract from his statement circulated with the report for the year 1946:—

Twelve months ago the company was just emerging from the toils of war production, but within the year reconversion to the manufacture of materials for peace-time needs was completed. Increasing time and energy were devoted to the service of our customers and to the adaptation of products and processes developed in war-time to the changed requirements of industry and the community.

The company is continuing to play its part in the drive for higher production. The demand for chemicals of all kinds and in particular for plastics and dyestuffs has been pressing. Important contributions have been made to the housing programme, including aluminium light alloy sheets for the pre-fabricated houses erected by the Aircraft Industries' Research Organisation on Housing, and light alloy sinks, draining boards, cupboards and furniture. The need for an increased output of food has called for greater supplies of fertilisers and pesticides. More explosives and explosives accessories for industrial use were produced in 1946 than in any previous year in the history of the company.

EFFECT OF SHORTAGES

In many cases, unfortunately, our ability to supply fell short of demand owing to shortages of materials and manpower, the latter being accentuated by the difficulties of finding housing accommodation in most areas of the country. The transport situation is also a source of anxiety to the company.

The greatest impediment, however, to bringing output to its maximum is the grave shortage of coal. I deplore the spectacle of the country's very survival being imperilled by lack of a vital commodity in which the country abounds but which is not being made available in sufficient quantities to industry and to the community. In order to limit the uncertainty of our coal supplies in future years we have decided, in consultation with the Government Departments concerned, to carry out a major programme of conversion from coal to oil-burning. It will serve as a modest insurance against loss of our output, in spite of the increase in operating costs which will necessarily follow.

FACTORS RETARDING PROGRESS

Shortage of materials, particularly of stainless and other sheets, is a major limiting factor on the rate of progress of the company's new construction programme, but there has also been difficulty in recruiting the number of engineers and draughtsmen required. The task of overtaking arrears of work in the modernisation and improvement of our manufacturing progress has continued and, in addition, considerable exploratory work has been undertaken which it is expected will lead to new and profitable products.

During the year, demands for existing products were heavy; indeed, in the case of many products, for example "Perspex" and polythene, the very substantial capacities provided during the war proved insufficient to meet peace-time requirements. As a result, the development of new uses for existing products was hampered. The development of new products, too, has been retarded by delays in the design and erection of pioneer plants caused by shortages of manpower and materials. One notable achievement, however—a combination of

research and development—is the addition, during the last two years, of fifty important dyestuffs to the company's manufacturing range.

We considered the importance of automatic plant-controls to be so great that a complete survey of the instrument-making industry was undertaken during 1946, in collaboration with other major users.

OVERSEAS DEMAND

The overseas demand for the company's products remained high throughout the year, but full advantage of this situation could not be taken owing to shortage of supplies and the heavy home demands, especially those of other exporting industries, for the products of the company. Nevertheless, the total of the company's export business during 1946 exceeded both in volume and in value that for the previous year.

The total sales value of exports in 1946 was £32,300,000, which compares with a figure of £11,800,000 in 1938. Throughout the year, however, the difficult coal situation has cast a shadow over the company's export prospects, and early in the autumn it became clear that it would be necessary to ration some exports.

It is particularly unfortunate that at a time when the world is crying out for our goods we are unable to take the fullest possible advantage of the position to establish ourselves firmly in export markets against the time when competition is once again severe.

DIVIDEND AND BONUS

The accounts mark the completion of the first twenty years of the company's existence. You will agree, I feel sure, that the company's present reserve and liquid position and its general financial strength testify to the striking progress that has been made in that period. The net income brought to credit in the company's profit and loss account is £7,171,109, compared with £4,770,062 for 1945. In deciding to recommend on this occasion a bonus of 2 per cent. to the ordinary stockholders in addition to a total ordinary dividend of 8 per cent., the directors have been influenced by several factors.

Provided we can get the coal we need, your company will be able to contribute much towards the rebuilding of Britain's prosperity. It remains the company's policy to keep prices at a fair and reasonable level, but although we have tried to counteract the increasing costs of materials and services by greater efficiency in production, some increases in prices to our customers have been and will be inevitable.

NEED FOR RELAXATION OF CONTROLS

I view with concern the effect of controls upon industry. I suggest that the Government should now review all controls with a view to eliminating those in which the detailed work of administration is out of proportion to the benefits accruing from the control. I am not asking for the wholesale removal of controls, because in the present state of the country many of them must remain, but I think that the reasons for their continuance should be reviewed and only those which are absolutely essential should be retained.

I can assure you that your company is ready to face the competitive conditions, which will prevail as soon as the present sellers' market gives place to more normal conditions. Your company's position is such that, so long as the means of production are available, we need not fear the future.

The report was adopted.

ROYAL EXCHANGE ASSURANCE

227th ANNUAL REPORT

LORD BICESTER'S ADDRESS

The following is a summary of the address given by the Right Honourable Lord Bicester, Governor of the Royal Exchange Assurance, at the annual general court held at the office of the corporation, Royal Exchange, London, E.C.3, on the 2nd instant.

The life department issued 5,200 policies for sums assured amounting to £4,193,319 and the total premium income at £1,558,038 was some £94,000 higher than the previous year. The death claims paid are around £60,000 higher than in 1945, but are still well within the amount expected. The gross average annual rate of interest obtained by the life fund for the year 1946 was £4 6s. 2d. per cent., showing an increase over the two previous years.

During the war years almost the entire new resources of insurance companies were invested in British Government securities. In our own case the proportion of gilt-edged to other types of investment rose during that period from 15 per cent. to around 38 per cent. of our life funds. Although much of this money was invested on a 3 per cent. basis, if 2½ per cent. is to be the rate on which future Government borrowing is based, then, over the years to come, the overall yield on funds such as ours must be adversely affected. Your directors are naturally watching this position very closely, and are planning the corporation's investment policy towards mitigating the effects of the current financial position. We are determined, however, not to depart from the principle that the security of the funds we hold in safe keeping for our policy holders must be the paramount consideration.

FIRE DEPARTMENT

Our fire department has once more produced a good account. The premium income increased during the year to £2,372,063, the first time in the history of the corporation that the figure has exceeded £2,000,000. The progressively high values of buildings and commodities of every description lead me to stress once more the need for adequate protection, and we are continuing to bring to the notice of our policy holders throughout the world the importance of increasing their cover to meet present-day values, in order to avoid disappointment in the event of loss.

We have been able to transfer a sum of £181,339 from the fire account to the profit and loss account, and I know you will agree with me that this is most satisfactory.

MARINE AND ACCIDENT

The marine figures are again favourable. Our fund at the end of the year amounted to £1,183,355, representing a ratio of 323 per cent. to the premium income. Your directors have again decided to transfer the sum of £75,000 to the profit and loss account.

In our accident account the nett premium income of £1,548,639 is the highest in the history of this department. Each section of the business has increased, but the greatest expansion is shown in the motor vehicle department where our experience, in common with other companies, has been very far from favourable owing to the ever increasing cost of all classes of claims. As a result of the year's operations we are able to transfer £81,234 to the profit and loss account.

The interest income, after deduction of tax, amounts to £196,468, which is nearly £37,000 more than the figure of last year, the increase being principally due to the reduction in the rate of income tax. Transfers from the departmental trading accounts to the profit and loss account amounted in all to £348,493, as compared with £443,675 twelve months ago, and there is also the second instalment of life profits for 1941/5 amounting to £46,745. The balance of the year's working, namely, £320,241, has been carried to the profit and loss appropriation account, and with the balance from last year's account of £376,114 gives a total of £696,355.

CONSOLIDATED ACCOUNTS

The consolidated accounts and balance sheet, which summarise the results of the Royal Exchange Group of companies, are made out on the same lines as were first adopted in 1945. Your will see from the consolidated profit and loss account that, after making provision for United Kingdom taxation of £333,000, there was a surplus of £442,444. The nett interest is £307,384. The nett cost of the dividend for the year is £182,296, and after payment of this dividend, the profit and loss appropriation account shows a balance of £1,104,689, which represents an increase of £260,148 as compared with last year.

You will notice that the combined holding of the group in British Government Securities stands at a slightly increased figure on that of the previous year. The figure of £6,688,795 covers, of course, our holdings on general account only. If to this is added the almost identical figure of £6,693,733 held by our life fund, together with approximately £330,000 held on our annuity fund, and around £1,100,000 the holding of the British equitable life fund, you get a combined total approaching £15,000,000. In comparing this with the figure of £45,707,602 representing the combined assets of the group, it will be seen that holdings in British Government Securities constitute nearly one-third of the total. The rate of interest now received on this large part of our investments is a meagre one; nevertheless I doubt very much, in view of the pending diminution in the volume of other securities quoted on the Stock Exchange, whether it would have been possible to reinvest any large portion of this £15,000,000 to produce a more generous yield.

Your court of directors, after having given careful consideration to the figures and the results which I have just given to you, have passed a recommendation to pay a final dividend of 20 per cent., making 35 per cent. for the year.

BENEFIT OF TEAMWORK

There is perhaps little to be gained in stressing the difficulties encountered during the past twelve months; what matters most is the spirit in which they were met. Accordingly I would once again emphasise the great benefit we have reaped from the team work and co-operation that has always been in evidence throughout our world-wide organisation.

I am sure, therefore, it will be your wish that I shall, on your behalf, extend our congratulations and thanks to our general manager, executive, and staff; and to our local boards and agents both in this country and abroad for the valuable services they have rendered during the year under review. I know you would also like similarly to express our appreciation of the excellent work done

by the directors, executive, and staff of our associated companies.

To conclude my remarks I want to say this: The corporation is now in its 227th year and there have been many periods during its long history when the outlook both at home and abroad has been far from bright. At such times those in control of our undertaking perhaps may have pondered whether opportunities for further progress might be denied them. Clearly they surmounted their difficulties, and in spite of all the problems inseparable from the present times I am confident we shall do likewise, and that in the years to come the measure of the corporation and its associated companies will be even greater than it is to-day when its total assets exceed £45,000,000.

The report and accounts were adopted.

SOFINA REPORT

INCOME SUBSTANTIALLY HIGHER

The following data are extracted from the report submitted by the board of directors to the shareholders' meeting of April 24th.

In December last, the capital of the company was raised from 120,000,000 to 335,000,000 francs by means of the special reserve of 200,000,000 francs created on December 31, 1945, and by transferring 15,000,000 francs from reserve fund and tax provision. 420,000 ordinary shares were issued enjoying the same rights as the then existing ordinary shares except that they carry rights to participate in the company's profits only as from the financial year 1947. Delivery of the new share-warrants has been delayed by printing difficulties and other circumstances beyond the company's control.

The balance sheet at December 31, 1946, shows an increase of about 200,000,000 francs under the heading "Holdings." This increase reflects notably the constitution of American subsidiaries with a view to new activities in the Western Hemisphere.

Income was substantially higher than in 1945; however, general expenses also increased. A dividend of 400 francs net per share on the 210,000 ordinary shares entitled to participate in the profits of 1946 became payable in Belgium from April 28th, and will be payable in other countries, on or after the respective dates which will be published in due course. 20,000,000 francs are allocated to reserve fund and tax provision.

General conditions remain uninviting for new ventures despite the pressing call for reconstruction work throughout the world. A company such as Sofina is therefore obliged to maintain an attitude of waiting, while retaining ample reserves so as to be ready to proceed with new investments as soon as the situation is clarified.

IMPORTANCE OF SAVING

Besides giving the usual particulars concerning the principal undertakings in which Sofina has interests, the report comments on the progress of electricity production in various countries and technical developments in this field.

As on previous occasions, an essay on an economic problem is attached to the report. This year the subject is "Saving." The preamble to the report states with reference to this "Supplement": "Savings of durable producers' or consumers' goods were seriously depleted in some countries during the recent war and although they have been enlarged elsewhere there is no compensating balance between gains and losses of this kind in the economy of the world. Similarly, within each nation the distribution of wealth, including enormously expanded monetary assets, is greatly changed, and generally speaking the community benefits less from the enrichment of some of its members than it suffers from the impoverish-

ment of others. Consequently adjustments are required in order to restore the world's pre-war capacity to produce and to develop this capacity with the aid of technical progress achieved while the havoc of war was proceeding.

"In each of its aspects saving has undoubted merits. Yet even in countries where the means of production are not nationalised we find a tendency to regard individual saving as less useful than in times gone by: the state, it is held, will provide for the needs of each and everyone. Moreover, old prejudices against saving have been revived and have again come into fashion: the complaint is, in substance, that saving reduces consumption, which is the essential condition of immediate well-being. Again, in their anxiety to satisfy pressing demands and under-estimating the utility of private savings—except in the form of loans to the state—governments are impeding by their fiscal policies the accumulation of such savings."

Translations of the Report and Supplement are obtainable from Electric and Railway Finance Corporation Limited, Claridge House, 32, Davies Street, London, W.1.

DUBARRY PERFUMERY COMPANY, LIMITED

RELIEF FROM BURDEN OF E.P.T.

POSTWAR PROSPECTS

The annual general meeting of the Dubarry Perfumery Company, Limited, was held on the 22nd ultimo at Brighton.

Mr Kilby Pears (chairman and managing director), presiding, said that 1946 had been beset with innumerable difficulties which had been successfully surmounted.

The company had paid or reserved for Excess Profits Tax £249,714, a notable achievement when the entire capital of the company is only £200,000.

Had all the British joint stock companies contributed on a similar scale, E.P.T. would have defrayed three-tenths the cost of the 5½ years' war.

E.P.T. REFUND

Refund of E.P.T., estimated at £45,861, subject to income tax, will be paid on the condition that it is "ploughed back" into the business, a stipulation which will ultimately redound to the greater benefit to the shareholders than an immediate distribution as increased dividend.

ALL FACTORIES AND BUILDINGS FREEHOLD

The factories appear in the balance sheet at actual cost of erection and are freehold; their market value to-day would be conservatively valued at three times their cost.

Provision exists for extension of the factories as soon as building facilities are available.

NEW PRODUCTS READY

New products for which a very large demand is anticipated are ready to market at the first favourable opportunity, though it has been deemed advisable to postpone their introduction until an adequate supply of the necessary raw materials has been accumulated. The National Health Service should lead to a largely increased demand for the medical products of our wholly owned subsidiary, The Standard Tablet Company, Limited.

The meeting unanimously approved a final 10 per cent. dividend, making 25 per cent., as against 15 per cent. in the previous year.

THE UNION BANK OF SCOTLAND, LIMITED

SIR A. STEVEN BILSLAND'S REVIEW

The annual meeting of shareholders of The Union Bank of Scotland, Limited, was held, on the 7th instant, Sir A. Steven Bilsland, Bt., M.C., D.L., Chairman of the Bank, in the chair.

The Chairman, in the course of his speech, said that it would have been observed from the accounts that the balance sheet total had now reached £78,000,000, an increase of £9,200,000 over last year's figure. This was chiefly accounted for by the continued increase in the amount of deposits, which at £66,500,000 were £7,700,000 higher than last year. The volume of the Bank's note circulation continued to expand, and at £6,600,000 showed an increase of £977,000.

On the assets side cash and money at call amounted to £17,170,000, an increase of £945,000. Bills under discount at £1,614,000, which included £960,000 British Government Treasury Bills, were practically the same as last year, but their holding of Treasury deposit receipts at £6,500,000 showed an increase of £1,500,000. These liquid resources amounted, in all, to £25,284,000, or 35 per cent. of their liability on deposits and notes in circulation. British Government securities stood in the books at £37,370,000, an increase of £3,870,000 during the year under review.

For some years the steady decline in banking advances had been a matter of concern and had presented difficult problems in regard to the remunerative employment of a suitable proportion of their funds. As had been mentioned a year ago, however, there were indications that demands for banking accommodation were growing, and they were very pleased to record that their loans and advances at £10,670,000 showed a satisfactory increase of £2,280,000. There was no doubt that the continuance of the uncertainty in regard to the restrictions to be laid upon private enterprise was certain to place a definite check on borrowing for the purposes of reconstruction and the development of new undertakings.

PROFIT AND ALLOCATIONS

The profit for the year amounted to £339,000, an increase of £7,500, compared with last year, and this was arrived at after making full provision for taxation and for all bad and doubtful debts. A sum of £50,000 had again been placed to reserve fund, making it £2,150,000, and in view of the restrictions which still existed in regard to property outlays, it had been thought advisable to allocate £30,000 for deferred repairs and renewals, as against the sum of £20,000 provided last year. The directors again recommended that a sum of £40,000 be set aside in respect of their liability for pensions and allowances. After giving effect to these allocations and providing for the dividend of 18 per cent. recommended by the board, the carry-forward would amount to £160,000, an increase of £3,000.

SERIOUSNESS OF THE OUTLOOK

The outlook to-day must cause concern to everyone who appreciated the facts. The dislocation in our affairs caused by war had been far greater than the visible signs suggested, and had disrupted both our external and internal position. The most serious aspect of our national position to-day was that the extreme gravity of the situation was not generally understood and a strong feeling of complacency was more apparent than a due appreciation of our present-day problems.

At present we were living on credit; on the proceeds of our loans from the U.S.A. and Canada. A year ago we were awaiting the outcome of the negotiation for the American Loan. To-day grave concern was expressed that this facility was being expended

more quickly than had been originally expected. That situation had been brought about chiefly by the effect of the rise in commodity prices, through the drain of our commitments in Germany and because of our failure to expand our exports this year at the rate attained in 1946. There was no escape from the position that we must rebuild our export trade, not only to the volume of 1938 but to 75 per cent. above that level and do this before our credits were exhausted. Not only so, we must direct our exports in such a way that the "hard currency" so necessary to balance our accounts was provided. In this, so far, we had been less successful than our situation required. The time was short—the task was a heavy one—and if we failed to succeed we would be unable to sustain even our austerity standard of living.

If we were to compete successfully in foreign markets—and that was essential for our existence—it was necessary for costs of production to be held at an economic level. Towards that end it would seem that our resources of man-power and materials must be marshalled to obtain the maximum productivity and that could only be achieved by giving industry as much freedom as possible from controls and on the assumption that the Government was prepared to devote more time to administration rather than to the introduction of legislative measures.

The position was grave but, as already mentioned, it did not appear to be generally understood. The people of this country had never failed to rise to the occasion in perilous times nor to react to a plain statement of fact. There was great need today for real leadership to bring home to everyone the seriousness of our economic position. Given that leadership we could overcome our difficulties.

The facts of our national economic position were clear and inescapable. The demands on the people of this country after six years of war were severe. There never had been more need for concentration on our essential difficulties, for co-ordination and hard work among all classes to overcome them and for national leadership to direct our efforts.

The report was unanimously adopted and a dividend at the rate of 18 per cent. per annum declared.

THE LIVERPOOL AND LONDON AND GLOBE INSURANCE COMPANY LIMITED

111th ANNUAL REPORT

In a statement circulated with the 111th annual report of The Liverpool and London and Globe Insurance Company Limited, the chairman, Mr P. R. England, said that British Insurance had continued to maintain its contribution to the country's economic well-being, without the need to import or use raw materials or make any appreciable demands on manpower.

The company was actively re-establishing operations in liberated territories; in 1946 business was recommenced in Philippine Islands, Hong Kong, Indo-China, Siam, Malaya and Italy.

Total fire, accident and marine premiums, at £14,503,788—a record figure—showed a rise of £3,294,859 over 1945. Underwriting profit was £306,712.

General expenses represented 16.19 per cent. of Premiums.

Life new business at £4,042,000 was over £2,100,000 higher, and provided a new record.

Fire premiums advanced to the company's highest yet—£5,912,757 (against £4,441,287).

Accident premiums at £7,660,017—another record—compared with £5,846,805 in 1945.

Marine premiums were higher at £931,014. The directors recommend a final dividend of 13s. 6d., making 27s. per share, less tax, for 1946.

ROYAL EXCHANGE ASSURANCE

227th ANNUAL REPORT

LORD BICESTER'S ADDRESS

The following is a summary of the address given by the Right Honourable Lord Bicester, Governor of the Royal Exchange Assurance, at the annual general court held at the office of the corporation, Royal Exchange, London, E.C.3, on the 2nd instant.

The life department issued 5,200 policies for sums assured amounting to £4,193,319 and the total premium income at £1,558,038 was some £94,000 higher than the previous year. The death claims paid are around £60,000 higher than in 1945, but are still well within the amount expected. The gross average annual rate of interest obtained by the life fund for the year 1946 was £4 6s. 2d. per cent., showing an increase over the two previous years.

During the war years almost the entire new resources of insurance companies were invested in British Government securities. In our own case the proportion of gilt-edged to other types of investment rose during that period from 15 per cent. to around 38 per cent. of our life funds. Although much of this money was invested on a 3 per cent. basis, if 2½ per cent. is to be the rate on which future Government borrowing is based, then, over the years to come, the overall yield on funds such as ours must be adversely affected. Your directors are naturally watching this position very closely, and are planning the corporation's investment policy towards mitigating the effects of the current financial position. We are determined, however, not to depart from the principle that the security of the funds we hold in safe keeping for our policy holders must be the paramount consideration.

FIRE DEPARTMENT

Our fire department has once more produced a good account. The premium income increased during the year to £2,372,063, the first time in the history of the corporation that the figure has exceeded £2,000,000. The progressively high values of buildings and commodities of every description lead me to stress once more the need for adequate protection, and we are continuing to bring to the notice of our policy holders throughout the world the importance of increasing their cover to meet present-day values, in order to avoid disappointment in the event of loss.

We have been able to transfer a sum of £181,339 from the fire account to the profit and loss account, and I know you will agree with me that this is most satisfactory.

MARINE AND ACCIDENT

The marine figures are again favourable. Our fund at the end of the year amounted to £1,183,355, representing a ratio of 323 per cent. to the premium income. Your directors have again decided to transfer the sum of £75,000 to the profit and loss account.

In our accident account the net premium income of £1,548,639 is the highest in the history of this department. Each section of the business has increased, but the greatest expansion is shown in the motor vehicle department where our experience, in common with other companies, has been very far from favourable owing to the ever increasing cost of all classes of claims. As a result of the year's operations we are able to transfer £81,234 to the profit and loss account.

The interest income, after deduction of tax, amounts to £196,468, which is nearly £37,000 more than the figure of last year, the increase being principally due to the reduction in the rate of income tax. Transfers from the departmental trading accounts to the profit and loss account amounted in all to £348,493, as compared with £443,675 twelve months ago, and there is also the second instalment of life profits for 1941/5 amounting to £46,745. The balance of the year's working, namely, £320,241, has been carried to the profit and loss appropriation account, and with the balance from last year's account of £376,114 gives a total of £696,355.

CONSOLIDATED ACCOUNTS

The consolidated accounts and balance sheet, which summarise the results of the Royal Exchange Group of companies, are made out on the same lines as were first adopted in 1945. Your will see from the consolidated profit and loss account that, after making provision for United Kingdom taxation of £333,000, there was a surplus of £442,444. The net interest is £307,384. The net cost of the dividend for the year is £182,296, and after payment of this dividend, the profit and loss appropriation account shows a balance of £1,104,689, which represents an increase of £260,148 as compared with last year.

You will notice that the combined holding of the group in British Government Securities stands at a slightly increased figure on that of the previous year. The figure of £6,688,795 covers, of course, our holdings on general account only. If to this is added the almost identical figure of £6,693,733 held by our life fund, together with approximately £330,000 held on our annuity fund, and around £1,100,000 the holding of the British equitable life fund, you get a combined total approaching £15,000,000. In comparing this with the figure of £45,707,602 representing the combined assets of the group, it will be seen that holdings in British Government Securities constitute nearly one-third of the total. The rate of interest now received on this large part of our investments is a meagre one; nevertheless I doubt very much, in view of the pending diminution in the volume of other securities quoted on the Stock Exchange, whether it would have been possible to reinvest any large portion of this £15,000,000 to produce a more generous yield.

Your court of directors, after having given careful consideration to the figures and the results which I have just given to you, have passed a recommendation to pay a final dividend of 20 per cent., making 35 per cent. for the year.

BENEFIT OF TEAMWORK

There is perhaps little to be gained in stressing the difficulties encountered during the past twelve months; what matters most is the spirit in which they were met. Accordingly I would once again emphasise the great benefit we have reaped from the team work and co-operation that has always been in evidence throughout our world-wide organisation.

I am sure, therefore, it will be your wish that I shall, on your behalf, extend our congratulations and thanks to our general manager, executive, and staff; and to our local boards and agents both in this country and abroad for the valuable services they have rendered during the year under review. I know you would also like similarly to express our appreciation of the excellent work done

by the directors, executive, and staff of our associated companies.

To conclude my remarks I want to say this: The corporation is now in its 227th year and there have been many periods during its long history when the outlook both at home and abroad has been far from bright. At such times those in control of our undertaking perhaps may have pondered whether opportunities for further progress might be denied them. Clearly they surmounted their difficulties, and in spite of all the problems inseparable from the present times I am confident we shall do likewise, and that in the years to come the measure of the corporation and its associated companies will be even greater than it is to-day when its total assets exceed £45,000,000.

The report and accounts were adopted.

SOFINA REPORT

INCOME SUBSTANTIALLY HIGHER

The following data are extracted from the report submitted by the board of directors to the shareholders' meeting of April 24th.

In December last, the capital of the company was raised from 120,000,000 to 335,000,000 francs by means of the special reserve of 200,000,000 francs created on December 31, 1945, and by transferring 15,000,000 francs from reserve fund and tax provision. 420,000 ordinary shares were issued enjoying the same rights as the then existing ordinary shares except that they carry rights to participate in the company's profits only as from the financial year 1947. Delivery of the new share-warrants has been delayed by printing difficulties and other circumstances beyond the company's control.

The balance sheet at December 31, 1946, shows an increase of about 200,000,000 francs under the heading "Holdings." This increase reflects notably the constitution of American subsidiaries with a view to new activities in the Western Hemisphere.

Income was substantially higher than in 1945; however, general expenses also increased. A dividend of 400 francs net per share on the 210,000 ordinary shares entitled to participate in the profits of 1946 became payable in Belgium from April 28th, and will be payable in other countries, on or after the respective dates which will be published in due course. 20,000,000 francs are allocated to reserve fund and tax provision.

General conditions remain uninviting for new ventures despite the pressing call for reconstruction work throughout the world. A company such as Sofina is therefore obliged to maintain an attitude of waiting, while retaining ample reserves so as to be ready to proceed with new investments as soon as the situation is clarified.

IMPORTANCE OF SAVING

Besides giving the usual particulars concerning the principal undertakings in which Sofina has interests, the report comments on the progress of electricity production in various countries and technical developments in this field.

As on previous occasions, an essay on an economic problem is attached to the report. This year the subject is "Saving." The preamble to the report states with reference to this "Supplement": "Savings of durable producers' or consumers' goods were seriously depleted in some countries during the recent war and although they have been enlarged elsewhere there is no compensating balance between gains and losses of this kind in the economy of the world. Similarly, within each nation the distribution of wealth, including enormously expanded monetary assets, is greatly changed, and generally speaking the community benefits less from the enrichment of some of its members than it suffers from the impoverish-

ment of others. Consequently adjustments are required in order to restore the world's pre-war capacity to produce and to develop this capacity with the aid of technical progress achieved while the havoc of war was proceeding.

"In each of its aspects saving has undoubted merits. Yet even in countries where the means of production are not nationalised we find a tendency to regard individual saving as less useful than in times gone by: the state, it is held, will provide for the needs of each and everyone. Moreover, old prejudices against saving have been revived and have again come into fashion: the complaint is, in substance, that saving reduces consumption, which is the essential condition of immediate well-being. Again, in their anxiety to satisfy pressing demands and under-estimating the utility of private savings—except in the form of loans to the state—governments are impeding by their fiscal policies the accumulation of such savings."

Translations of the Report and Supplement are obtainable from Electric and Railway Finance Corporation Limited, Claridge House, 32, Davies Street, London, W.1.

DUBARRY PERFUMERY COMPANY, LIMITED

RELIEF FROM BURDEN OF E.P.T.

POSTWAR PROSPECTS

The annual general meeting of the Dubarry Perfumery Company, Limited, was held on the 22nd ultimo at Brighton.

Mr Kilby Pears (chairman and managing director), presiding, said that 1946 had been beset with innumerable difficulties which had been successfully surmounted.

The company had paid or reserved for Excess Profits Tax £249,714, a notable achievement when the entire capital of the company is only £200,000.

Had all the British joint stock companies contributed on a similar scale, E.P.T. would have defrayed three-tenths the cost of the 5½ years' war.

E.P.T. REFUND

Refund of E.P.T., estimated at £45,861, subject to income tax, will be paid on the condition that it is "ploughed back" into the business, a stipulation which will ultimately redound to the greater benefit to the shareholders than an immediate distribution as increased dividend.

ALL FACTORIES AND BUILDINGS FREEHOLD

The factories appear in the balance sheet at actual cost of erection and are freehold; their market value to-day would be conservatively valued at three times their cost.

Provision exists for extension of the factories as soon as building facilities are available.

NEW PRODUCTS READY

New products for which a very large demand is anticipated are ready to market at the first favourable opportunity, though it has been deemed advisable to postpone their introduction until an adequate supply of the necessary raw materials has been accumulated. The National Health Service should lead to a largely increased demand for the medical products of our wholly owned subsidiary, The Standard Tablet Company, Limited.

The meeting unanimously approved a final 10 per cent. dividend, making 25 per cent., as against 15 per cent. in the previous year.

THE UNION BANK OF SCOTLAND, LIMITED

SIR A. STEVEN BILSLAND'S REVIEW

The annual meeting of shareholders of The Union Bank of Scotland, Limited, was held, on the 7th instant, Sir A. Steven Bilsland, Bt., M.C., D.L., Chairman of the Bank, in the chair.

The Chairman, in the course of his speech, said that it would have been observed from the accounts that the balance sheet total had now reached £78,000,000, an increase of £9,200,000 over last year's figure. This was chiefly accounted for by the continued increase in the amount of deposits, which at £66,500,000 were £7,700,000 higher than last year. The volume of the Bank's note circulation continued to expand, and at £6,600,000 showed an increase of £977,000.

On the assets side cash and money at call amounted to £17,170,000, an increase of £945,000. Bills under discount at £1,614,000, which included £960,000 British Government Treasury Bills, were practically the same as last year, but their holding of Treasury deposit receipts at £6,500,000 showed an increase of £1,500,000. These liquid resources amounted, in all, to £25,284,000, or 35 per cent. of their liability on deposits and notes in circulation. British Government securities stood in the books at £37,370,000, an increase of £3,870,000 during the year under review.

For some years the steady decline in banking advances had been a matter of concern and had presented difficult problems in regard to the remunerative employment of a suitable proportion of their funds. As had been mentioned a year ago, however, there were indications that demands for banking accommodation were growing, and they were very pleased to record that their loans and advances at £10,670,000 showed a satisfactory increase of £2,280,000. There was no doubt that the continuance of the uncertainty in regard to the restrictions to be laid upon private enterprise was certain to place a definite check on borrowing for the purposes of reconstruction and the development of new undertakings.

PROFIT AND ALLOCATIONS

The profit for the year amounted to £339,000, an increase of £7,500, compared with last year, and this was arrived at after making full provision for taxation and for all bad and doubtful debts. A sum of £50,000 had again been placed to reserve fund, making it £2,150,000, and in view of the restrictions which still existed in regard to property outlays, it had been thought advisable to allocate £30,000 for deferred repairs and renewals, as against the sum of £20,000 provided last year. The directors again recommended that a sum of £40,000 be set aside in respect of their liability for pensions and allowances. After giving effect to these allocations and providing for the dividend of 18 per cent. recommended by the board, the carry-forward would amount to £160,000, an increase of £3,000.

SERIOUSNESS OF THE OUTLOOK

The outlook to-day must cause concern to everyone who appreciated the facts. The dislocation in our affairs caused by war had been far greater than the visible signs suggested, and had disrupted both our external and internal position. The most serious aspect of our national position to-day was that the extreme gravity of the situation was not generally understood and a strong feeling of complacency was more apparent than a due appreciation of our present-day problems.

At present we were living on credit; on the proceeds of our loans from the U.S.A. and Canada. A year ago we were awaiting the outcome of the negotiation for the American Loan. To-day grave concern was expressed that this facility was being expended

more quickly than had been originally expected. That situation had been brought about chiefly by the effect of the rise in commodity prices, through the drain of our commitments in Germany and because of our failure to expand our exports this year at the rate attained in 1946. There was no escape from the position that we must rebuild our export trade, not only to the volume of 1938 but to 75 per cent. above that level and do this before our credits were exhausted. Not only so, we must direct our exports in such a way that the "hard currency" so necessary to balance our accounts was provided. In this, so far, we had been less successful than our situation required. The time was short—the task was a heavy one—and if we failed to succeed we would be unable to sustain even our austere standard of living.

If we were to compete successfully in foreign markets—and that was essential for our existence—it was necessary for costs of production to be held at an economic level. Towards that end it would seem that our resources of man-power and materials must be marshalled to obtain the maximum productivity and that could only be achieved by giving industry as much freedom as possible from controls and on the assumption that the Government was prepared to devote more time to administration rather than to the introduction of legislative measures.

The position was grave but, as already mentioned, it did not appear to be generally understood. The people of this country had never failed to rise to the occasion in perilous times nor to react to a plain statement of fact. There was great need today for real leadership to bring home to everyone the seriousness of our economic position. Given that leadership we could overcome our difficulties.

The facts of our national economic position were clear and inescapable. The demands on the people of this country after six years of war were severe. There never had been more need for concentration on our essential difficulties, for co-ordination and hard work among all classes to overcome them and for national leadership to direct our efforts.

The report was unanimously adopted and a dividend at the rate of 18 per cent. per annum declared.

THE LIVERPOOL AND LONDON AND GLOBE INSURANCE COMPANY LIMITED

111th ANNUAL REPORT

In a statement circulated with the 111th annual report of The Liverpool and London and Globe Insurance Company Limited, the chairman, Mr P. R. England, said that British Insurance had continued to maintain its contribution to the country's economic well-being, without the need to import or use raw materials or make any appreciable demands on manpower.

The company was actively re-operations in liberated territories business was recommenced in Islands, Hong Kong, Indo-China, Malaya and Italy.

Total fire, accident and marine premiums, at £14,503,788—a record figure—showed a rise of £3,294,859 over 1945. Underwriting profit was £306,712.

General expenses represented 16.19 per cent. of Premiums.

Life new business at £4,042,000 was over £2,100,000 higher, and provided a new record.

Fire premiums advanced to the company's highest yet—£5,912,757 (against £4,441,287).

Accident premiums at £7,660,017—another record—compared with £5,846,805 in 1945.

Marine premiums were higher at £931,014.

The directors recommend a final dividend of 13s. 6d., making 27s. per share, less tax, for 1946.

FORD MOTOR COMPANY, LIMITED

STEADY INCREASE IN PRODUCTION

The eighteenth ordinary general meeting was held on the 8th instant in London. In the course of his statement to stockholders the chairman, The Rt. Hon. Lord Perry said:—

It is with the deepest regret that we have to record the death of our Founder, Mr. Henry Ford.

He was a man not only admired and respected, but beloved by everyone who came into contact with him. His was a personality so well-known throughout the world that everyone is acquainted with his life and career. By his genius the world-wide Ford organisation was created and built. This company is only one of the many establishments which demonstrate and record the results of his activities as a world citizen. In most countries on every continent, factories bearing his name stand as permanent monuments not only to his reputation and achievements as a pioneer, but of his service to mankind. We mourn his loss and sympathise deeply with his family.

Our sincere wish is that his grandson—Mr. Henry Ford II, President of Ford Motor Company of U.S.A., and a director of this Company—may enjoy strength to enable him to sustain the heavy responsibilities which are his. Already, at a young age, he is recognised by his countrymen as one of the outstanding figures in American industry, and is esteemed for his ability, courage and human understanding.

AN INCESSANT STRUGGLE

During 1946 we had an incessant struggle to secure steady increase in production. Within limitations imposed by shortages of material and labour we have not been unsuccessful. Towards the end of the year our volume of output compared favourably with pre-war achievements, but, as the allocation of steel and other materials was then restricted by the Government, our programmes have had to be curtailed and the situation has, at times, been extremely serious.

However, in terms of value, after adjusting price levels, the year's turnover was a peacetime record. Whilst this is something which warrants a justifiable pride, yet it is small consolation to the vast number of our potential customers at home and abroad who are chafing at long delays in delivery of vehicles and tractors.

I believe it to be accurate to state that there is genuine unsatisfied demand in our own country today for at least half a million new cars. Unfortunately, there is very little prospect of the industry being capable of satisfying this demand within any reasonable time.

During the twelve months under review, after exporting at Government instigation approximately one half of its passenger car production, the motor industry produced for the home market only 118,794 cars. We are told that because of reduced steel allocation it may not be possible to maintain even that small production during 1947. On the other hand, from certain Ministerial pronouncements, it is to be inferred that H.M. Government will press for the export of a greater proportion of motor vehicles. Whether or not Government mismanagement of the nation's labour and commerce is blameworthy for this state of affairs, I desire to assure everyone concerned that our company has done and is doing everything in its power to increase production and make a maximum contribution to the satisfaction of domestic needs for transport.

NO INCREASE IN PRICES

It is worthy of record that our company is, I believe, the only large producer who has not increased post-war retail prices.

In reporting to you on this matter I do not intend to commit the company to any

guarantee in this regard for the future, but, even should it involve incurring temporary loss, your directors hold the firm opinion that the best policy is to keep consumer prices as low as possible.

In January, 1946, the average delivery of tractors was 85 per day; by the end of the year the daily output was 110, and at the present time, this figure has been largely exceeded.

At the outbreak of war in 1939, the tractor "population" of this country was 55,000, of which approximately 60 per cent. were Fordsons. By last year the numbers had risen to 225,000, of which approximately 80 per cent. were Fordsons. So soon as the present exceptional demand for tractors for the home market is satisfied we look forward to a large expansion of overseas business in this department.

In conjunction with Ransomes, Sims and Jefferies, Limited, of Ipswich, we are producing at our Leamington foundry a range of mounted implements for use with Fordson tractors.

EXPORT TRADE

We shipped during 1946 to 125 ports throughout the world automobile products to the value of £6,558,064. For the same period our tractor and agricultural implement exports were £1,995,441, or a total overseas trade of £8,553,505.

In the field of industrial relations I am happy to say that the revised negotiating machinery set up last year has overcome successfully the inevitable minor strains. There has been no serious stoppage of work because of industrial disputes.

An advance in productive efficiency of our personnel has been achieved, but the improvement was not as thorough as we had hoped. With a greater sense of urgency and personal responsibility brought home to each one of us by the tragic events of the past few months, I sincerely hope and believe we shall achieve and surpass standards of which we showed ourselves capable in pre-war days.

Early this year we purchased the entire share capital of Kelsey-Hayes Wheel Company, Limited, who have supplied us with wheels and other essential components for the past 15 years.

Associated Companies have made good progress in their pre-war markets.

It gives me great pleasure to announce that the Rt. Hon. Lord Airedale, D.S.O., M.C., whose wise counsel on our board has been a source of strength ever since the formation of the company has been appointed deputy chairman. This, I may say, is a formal recognition of a function which he has, in fact, filled for some time past.

There is one other change which I bring to your notice. Sir Stanford Cooper has resigned as managing director in order to take from my shoulders much of the burden of co-ordinating the activities of our Associated Companies in Europe and Africa. Sir Stanford will, of course, remain on the board of directors, and his essential duties of supervising the financial and accountancy aspects of our business will continue as heretofore.

COSTLY EXPENDITURE

Before long considerable sums will have to be expended on buildings, machinery, equipment and tools for producing a new range of models. These expenditures will be costly, and accordingly your directors have allocated out of the profits of the year a sum of £600,000 to augment the provision made last year in this regard.

The report and accounts were adopted, and the payment of a dividend of 7½ per cent. and a bonus of 2½ per cent., both less income tax, was approved.

CALEDONIAN INSURANCE COMPANY

MR A. WALLACE COWAN'S REVIEW

The one hundred and forty-second annual general meeting of this Company, was held, in Edinburgh, on the 8th instant.

The Chairman, Mr. A. Wallace Cowan, J.P., in moving the adoption of the Report said:—

The net new life assurances issued during 1946 amounted to £2,184,110, the premiums thereon being £97,505, of which £21,631 were single premiums. The amount of the new life assurances constitutes a record for the Company.

Death claims for 1946 amounted to £197,090, the lowest total since 1926, as compared with £245,530 for 1945.

The average net rate of interest earned for the year 1946 on the Life Assurance Fund was £3 2s. 11d. per cent.

We are paying an Interim Bonus of £1 per cent. per annum in respect of each year's premium due and paid since 31st December 1944 under ordinary participating policies becoming claims by death or maturity during 1947.

FIRE DEPARTMENT

The premium income for 1946 was £1,429,037, which largely exceeds the record figure of the previous year of £1,206,265. The balance carried to profit and loss account for 1946 was £21,200, compared with £19,009 in 1945.

ACCIDENT DEPARTMENT

The premium income for the year 1946 showed a considerable advance at £1,064,359, compared with £690,310 for the previous year. The 1946 income is a record for the company, and, following the lead of the fire department, now exceeds £1,000,000. The balance carried to profit and loss account for 1946 was £33,336, compared with £12,359 in 1945.

MARINE DEPARTMENT

The account continued satisfactory, and a sum of £70,000 has been transferred to the profit and loss account, leaving the fund at £594,859, which is 254 per cent. of the premium income compared with 250 per cent. for the previous year. Out of the £70,000 transferred approximately £50,000 is required to cover the income tax and N.D.C. liability on the profit of the 1944 underwriting account now closed for taxation purposes.

TOTAL PREMIUM INCOME

The premium income for the above-mentioned departments was £3,411,968. The corresponding figure for 1945 was £2,786,035. The increase for 1946 was, therefore, £625,933, being 22.4 per cent.

PROFIT AND LOSS ACCOUNT

The amount of interest, dividends and rents (less tax) not carried to other accounts was £69,687. It includes certain arrears of interest in respect of the war years, but, excluding these arrears, the net interest more than covers the net cost of the dividend.

At a general meeting of shareholders held on 10th December 1946 a resolution was adopted sub-dividing the share and authorising the payment out of reserves of a portion of the uncalled capital. You will find the relative alterations in the capital of the company given effect to in the accounts which have been placed before you.

I beg to move that the report be adopted, that the allocation of £25,000 to the staff pension fund be approved, and that a dividend of 3s. a share, subject to deduction of income tax, be declared for the year 1946, payable in equal half-yearly instalments on 15th May and 11th November 1947.

The report and accounts were adopted.

ARMY AND NAVY STORES, LIMITED

INSISTENT DEMAND

The seventy-fifth annual general meeting of the Army and Navy Stores, Limited, was held, on the 7th instant, in London.

Major General Guy Dawnay, C.B., C.M.G., D.S.O., M.V.O., the chairman, said that the gross profits from trading and other sources amounted to £1,107,322 and the expenses to £620,017, leaving a balance of £487,305, or £26,803 more than in the previous year. They recommended a 10 per cent. dividend, plus a bonus of 10 per cent., less tax.

Although the gross profit was approximately £100,000 higher than last year, expenses had increased by no less than £73,542, and the tendency was for expenses to rise still further this year. Furthermore, on a large variety of goods the margin of profit permitted to retailers had recently been reduced, and a greatly increased turnover would be needed to counteract those two adverse features. Whether the increased turnover would materialise remained to be seen.

The demand for supplies was as insistent as ever, but the company was far from having a sufficiency of goods to meet it, and the immediate outlook in that respect was not encouraging. Supplies were not as readily available as they were last year. The shortages were attributed by the manufacturers to the recent stoppages through the cuts in power; they might be made good, but he greatly doubted it.

They had, however, sources of revenue other than from the sale of goods. From the figures before them, they would be able to see that last year those other sources amounted to no less than £115,460, an increase of £25,702 over the previous year and he had no doubt those figures of miscellaneous revenue would show a further advance during the current year. That revenue would act as a most useful "buffer" in the event of any setback in their normal retail business. The figure of £115,000 was equivalent to 14 per cent. on their issued capital. The return from their investments alone amounted to 4 per cent. on their issued capital.

FACTORS IN THE OUTLOOK

The position presented by the accounts was: a satisfactory year's operation of their home business, with warning signals ahead in respect of rising expenses, uncertainties about the prospects of replenishing their stocks of goods for sale, shortages of merchandise and curtailment of profit margins, but, over all, a very strong financial position from which to meet whatever the future course of events might bring forth. He would make no prophecies about the future; but he might say that during the first fourteen weeks of the current financial year results had been very satisfactory.

Over the years considerable amounts had been accumulated out of profits and used to increase the company's capital resources instead of being distributed to the stockholders by way of dividends. It was sometimes suggested by their present governors and their friends that the payment of dividends above a certain rate was in some way improper. The honest and logical way would be to capitalise accumulated re-investments in the business and to issue to stockholders additional stock corresponding to those re-investments. However, the Treasury, under the direction of the Chancellor of the Exchequer, would not permit that. He said that the effect of bringing a company's capital into true relation with the capital actually employed might be "misleading." That, however, was the opposite of the truth.

The report was adopted.

THE LONDON ASSURANCE

EXPANDING PREMIUM INCOME

The annual general Court of the London Assurance will be held at 1, King William Street, London, E.C., on the 28th instant.

The following is an extract from the statement by the Governor, Mr. R. Olaf Hambro, circulated with the report and accounts:—

The purpose of the extraordinary general Court following the annual general Court is the passing of a resolution modifying the present regulation dealing with the qualification for the office of director, reducing it from 400 to 100 ordinary shares. With regard to the life department, our new actuary in his first completed year is responsible for a record in two directions—the volume of net new life business, which at £3,717,178 is a record in the history of the corporation, and the fact that for the first time the annual premium income exceeds £1,000,000. The net interest yield has improved from £2 19s. 3d. per cent. to £3 2s. 4d. per cent. Expenses of management amount to 15.87 per cent. of the annual premium income. Claims by death and maturity show an increase. The life fund increased by £289,352 and stood at December 31st at £13,266,878.

In the fire department net premiums increased by £661,273, showing a total of £3,809,463. The amount transferred to profit and loss account is £135,802, or 3.6 per cent. of the income, compared with 5.9 per cent. in the previous year. In the accident department the account shows an increase in premium income of £282,386, the total being £1,829,425. Costs are 49.1 per cent., compared with 46.9 per cent. Commission and expenses at 33.4 per cent. show an increase from 32 per cent. The amount transferred to profit and loss account is £190,358, being 10.4 per cent. of the premium income compared with 15.7.

DIFFICULT CONDITIONS

Both fire and accident departments are going through a difficult transitional phase due to world conditions generally, quite apart from the phase from war to peace, though of course due to the war. Our experience during the year in the United States, Canada and Australia has been very disappointing. In my view there will be a period of some years before underwriting gets on a level keel. Motor business occasions us continuing concern. The position seems to be that rates are going to follow experience rather than the reverse during the next few years. Increasing costs of spare parts seriously affect the accident damage section and equally seriously is the third-party section affected by continuously increasing awards and damages.

The marine insurance account is a bright feature of our operations. Premium income at £1,755,515 shows an increase of £216,262. Losses show a percentage of 54.1 per cent. compared with 54.6 per cent. We have thought it wise to make a transfer to reserve for taxation of £500,000. There is a separate transfer of £250,000 to profit and loss account. This leaves the marine fund at £2,520,623 or 143.6 per cent. of the premium income compared with 172.2 per cent. This fund exhibits a very large measure of strength and its size implies that it contains a substantial proportion of non-transferred profit.

The total premium income from all departments was £3,451,795, an increase of £1,253,310. Taking the whole of the accounts by and large, you will no doubt agree that they represent something of an achievement during a period which obviously has been difficult, not only in the transaction of the business of insurance but generally. The position entitles us to believe that we shall surmount the difficulties.

ARGUS PRESS HOLDINGS, LIMITED

IMPROVED RESULTS

The eighteenth ordinary general meeting of the Argus Press Holdings, Limited, was held in London, on the 7th instant.

The following is an extract from the circulated statement of the chairman, Sir Herbert Brent Grotrian, Bt., K.C.

As in previous years I will deal first with accounts of the Argus Press, Limited. The gross profit, including interest and dividends, after charging working expenses, amounts to £161,876, compared with £145,428 for the previous year.

Ample provision for depreciation of plant and machinery has again been made, the total involved over the whole group amounting to £21,743 for the year under review.

OPERATING COMPANY'S DIVIDEND

The net profit for the twelve months ended December 31, 1946, after providing for directors' fees, depreciation and taxation, amounted to £80,844; the balance brought forward was £84,859, making a total available of £165,703. After allowing for the Preference dividend the balance was £156,967. Out of this balance an interim dividend of 10 per cent., less tax, on the Ordinary shares, amounting to £13,750 net, has already been paid and it is proposed to pay a final dividend of 21 per cent., less tax, amounting to £28,875 net, making a total of 31 per cent., less tax, for the year and leaving a balance of £114,342 to be carried forward, against a corresponding figure of £84,859 for the previous year.

In the consolidated balance-sheet the value at which the goodwill of the company's subsidiaries is included is £65,960. In the opinion of your directors, and as will be seen from the profits derived from them, the value of the goodwill of those subsidiaries is very considerably in excess of that figure.

Since I last addressed you, no relief from the stringent war-time restrictions has been granted to the publishing and printing trades in this country. Minor variations in the regulations governing the use of paper have been made, but the importation of pulp and paper remains at the same level as for 1946. In the meantime, the severe reduction in fuel supplies to the paper mills has brought about a very substantial falling off in output, the consequences of which cannot yet be clearly foreseen.

EXPANSION POLICY JUSTIFIED

In the circumstances, the improvement in the company's trading results shown by the accounts before you is very satisfactory and a clear confirmation of the policy of expansion consistently pursued by your board of directors.

Turning to the accounts of the Argus Press Holdings, Limited, as you know, the whole of the ordinary shares of the Argus Press, Limited, are held by the Holdings Company. The receipt from the Argus Press, Limited, of the interim dividend amounting to £13,750 net, together with the final dividend amounting to £28,875 net, which has already been declared, together with sundry revenue and tax recoverable, produce with the balance brought in of £16,191 a total sum of £59,677. After deducting fees and expenses (£1,747) and preference dividends for the year (£11,086 net), there is available for distribution £46,844. An interim dividend on the ordinary shares of 12½ per cent., less tax, amounting to £13,750 net, was paid on October 31, 1946. There is thus available a balance of £33,094, and it is proposed to pay a final dividend of 15 per cent., less tax, amounting to £16,500 net, when the final dividend from the Argus Press, Limited, has been received, leaving a balance to be carried forward of £16,594, against a corresponding figure of £16,191 for the previous year.

The report and accounts were unanimously adopted.

BRITISH ENKA, LIMITED

SATISFACTORY RESULTS

The twenty-second ordinary general meeting of British Enka, Limited, was held at the hall of the Chartered Insurance Institute, E.C.2, on the 2nd instant. Mr A. D. Carmichael presided, and in the course of his statement said:—

The working profit for the year 1946 is £215,101, to which is added £2,445 interest earned less interest paid. After deducting £35,000 for depreciation of buildings, plant and machinery, £7,416 for directors' fees and emoluments, and providing £101,553 for taxation, the net profit for the year is £73,577. Adding exchange provisions in past years no longer required, £25,359, gives an available balance of £98,936. The directors propose a dividend on the stock of 7½ per cent., less income tax, amounting to £51,563. After charging directors' additional remuneration, a balance is left to be carried forward to next year of £45,498. The directors consider these results to be very satisfactory.

HIGHER OUTPUT

Towards the end of the year, production reached in pounds weight a slightly higher output than in 1939. This reflects very great credit on the management, staff and workers, and has enabled us to meet the serious rises in cost of wages and raw materials.

We cannot now make further increases in production until additional machinery is installed, but our efforts are still directed towards increasing the general efficiency in the factory and overtaking arrears in repairs.

The disposal of our production is still under the direction of the Board of Trade and finds its way into the weaving trade for ultimate use as rayon dresses, fabrics, furnishings, etc.; to the hosiery trade for underwear and stockings; to the motor trade for tyres; and to the lace and elastic web trades, etc. Directly as yarn and indirectly as manufactured goods, between 30 per cent. and 40 per cent. of our output is ultimately exported.

During 1946, we were able to renew technical contacts with our parent firm, A.K.U., in Arnhem, and the whole of our senior staff and departmental heads were able to make most valuable visits to the various mills in Holland. In the autumn, the general manager and I and members of the technical staff visited the U.S.A. to study the latest types of rayon production.

In February, 1947, the stringent curtailment in the supply of electric current caused the closing down of the whole spinning plant for 14 days. Normally, we work continuously day and night throughout the year, and this is the first time in the 21 years' history of the company that spinning has completely ceased for such a period.

NEW POWER PLANT

We regret to report delays in the completion of the new power plant, which we had hoped would be running by this time. This big undertaking may not be in operation until late autumn, and we shall derive little benefit during the course of the present year.

Our other plans for increased production are well advanced. The factory building to house the new plant is now nearly ready, and most of the new machinery is promised for delivery in the second half of this year, and providing we have no further untoward setbacks, we hope to see the new production start in the early days of 1948.

The demand for our product is very strong, both in home and export markets. There is no appearance of overproduction. Subject to the all-important supply of adequate raw materials, including coal and power, I would say our prospects are encouraging.

The report and accounts were unanimously adopted; a dividend of 7½ per cent. declared; the retiring directors were re-elected, and the auditors reappointed.

GUARDIAN ASSURANCE COMPANY, LIMITED

ANNUAL GENERAL MEETING—MAY 5, 1947

Extracts from the Directors' Report.
Chairman: C. D. Medley, Esq.

LIFE DEPARTMENT

Net sums assured amounted to £2,694,000, being an increase over the previous year of £1,111,000. There was a profit from mortality during the year.

The Investment Reserve Fund of £80,000 has been merged in the Life Assurance and Annuity Fund, which has increased during the year by £392,000 to £10,965,000. The net rate of interest earned on the Fund was £3 7s. 3d. per cent. per annum.

FIRE DEPARTMENT

The net premium income showed an increase of £215,000 over the previous year, due largely to the re-establishment and extension of overseas business and to a less extent to increased values and new business at home. The loss ratio was 43.3 per cent. and the amount transferred to profit and loss £132,000.

ACCIDENT AND GENERAL DEPARTMENTS

There was a substantial increase of £345,000 in the premium income for the year, of which a considerable proportion was due to the development of the business of the Guardian Insurance Company of Canada. The loss ratio was 45.8 per cent. of the increased premium income and the amount transferred to profit and loss after providing for unexpired risks, £75,000.

MARINE DEPARTMENT

The increase of £131,000 in the net premiums in 1946 reflected the greater volume of goods in transit and the resumption of business in countries which were occupied by the enemy during the war years.

The first year settlements were equivalent to 19.9 per cent. of the premiums for 1946, and the claims settled during that year in respect of the 1945 account and for 1944 and previous years were less than the estimates provided for in the fund.

After transferring £83,000 to the credit of profit and loss, the amount of the Marine Fund stood at the end of the year at £776,000, equal to 154 per cent. of the premiums for the year.

PROFIT AND LOSS

After providing for all taxation, including that in respect of the profits for the year and transferring £41,500 to the Staff Pension Fund, £25,000 to the Staff Widows' Pension Scheme and £85,000 to General Reserve, and providing for the final dividend recommended by the director of 2s. (less income tax) on each Ordinary and Staff Share, the balance of profit carried forward was £227,000.

BALANCE SHEET

The value of the Stock Exchange Securities at December 31st last showed a substantial surplus over the total figure at which they appeared in the balance sheet.

The General Reserve stood in the consolidated balance sheet at £2,047,000, to which it had been increased by the transfer of £85,000 from the profit and loss account and by the increase in the surplus assets of the Guardian Insurance Company of Canada by reason of the appreciation in the Canadian Dollar.

All the principal classes of insurance transacted: also trustee and executor business.

Head Office: 68, King William Street, London, E.C.4.

CRAVEN BROTHERS (MANCHESTER), LIMITED

FULL ORDER BOOK

MR J. R. GREENWOOD'S REVIEW

The sixty-first annual general meeting of Craven Brothers (Manchester), Limited, was held on the 7th instant, at Vauxhall Works, Reddish, Stockport, Mr J. R. Greenwood (chairman and managing director) presiding.

The following is his statement circulated with the report and accounts:—

The profit and loss account shows a profit on operations for the year of £64,044 after meeting all manufacturing expenses. Last year, the corresponding profit was £111,335, so that the year under review shows a reduction of £47,291, which is perhaps not surprising, having regard to (1) the continued increase in the cost of labour and materials; (2) the shortage of supplies of all kinds; (3) stoppages of work due to failure of electricity supplies; (4) failure to get back to the pre 1939 tempo of working (although there is recently a marked improvement in this regard); and, (5) a shortage of skilled labour in all departments. The cumulative effect of all these difficulties is that the output of the works has been reduced to about 50 per cent. of the total capacity throughout the year.

A provision of £30,000 for refund of taxation is brought into the accounts for this year, making the gross profit £94,044. £15,000 is again provided for depreciation of fixed assets, and £6,105 for deferred repairs to buildings (nil last year), leaving a net profit for the year of £70,674, as against £73,041 last year, a reduction of £2,367. There is no need for any particular comment on the items shown in the balance sheet.

DIVIDEND AGAIN 20 PER CENT

The directors propose to pay a final dividend of 15 per cent., making 20 per cent. for the year (for the fifth successive year) and after providing the £60,000 required for this dividend, there is a balance remaining of £10,674 (subject to directors' fees) making the carry-forward to next year £186,606.

Again I am able to inform you that the company has a very full order book, and there is no reduction in the tremendous volume of inquiries being received for our products from all over the world. Last year I stressed our inability to deal adequately with the demands, for reasons stated in my report, and this year I can only say there is no change in this position. The company has the business and the capacity to employ at least 1,000 more workers than are engaged at present, and the orders on hand ensure employment to capacity for two and a-half to three years. In my opinion, the demand for the company's products will continue.

THE NEW CAPITAL

Last year I referred to the progressive policy of your directors, and since the completion of the accounts for 1946, the capital of the company has been increased by the creation of 200,000 Cumulative Preference shares of £1 each; these shares have been issued to the ordinary shareholders at 20s. 6d. per share. You have been informed that the new capital is required to finance the cost of additional workshops and plant required to enable the company to produce larger and heavier machine tools than have been previously manufactured in this country. The ordinary and preference shares of the company have now been converted to stock units.

The report and accounts were adopted; the proposed dividend was approved and the auditors, Messrs Edwin Collier and Co., were reappointed.

GOVERNMENT RETURNS

For the week ended May 3, 1947, total ordinary revenue was £87,568,220, against ordinary expenditure of £59,089,486 and issues to sinking funds, £180,000. Thus, including sinking fund allocations of £529,015, the surplus accrued since April 1st is £25,442,649 against a deficit of £108,868,000 for the corresponding period a year ago.

UNIVERSITY OF LONDON

The Senate invite applications for the Chair of Public Administration tenable at the London School of Economics and Political Science (salary £1,500). Applications must be received not later than July 3, 1947, by the Academic Registrar, University of London, Senate House, W.C.1, from whom further particulars should be obtained.

UNIVERSITY OF LONDON

The Senate invite applications for Examinerships in Economics and French for Intermediate Examinations in the Calendar year beginning 1st January, 1948. Applications should be sent as soon as possible to the External Registrar, University of London, Senate House, W.C.1, from whom further particulars and forms of application may be obtained.

UNIVERSITY OF BIRMINGHAM

DEPARTMENT OF ECONOMICS

Applications are invited for the post of Assistant Lecturer in Economics (Grade III), tenable in the Faculty of Commerce and Social Science. The appointment will date from October 1, 1947. Commencing salary £400 to £500 per annum, according to experience. Special qualifications in economic theory or modern economic history would be an advantage. Further particulars may be obtained from the undersigned, who should receive applications with three references, not later than June 7, 1947. No special application form is issued.

C. G. BURTON, Secretary.
The University, Edmund Street, Birmingham, 3, April, 1947.

THE UNIVERSITY OF LIVERPOOL

Applications are invited for the post of Assistant Lecturer (Grade III) in Economics, at a salary scale of £425-£25-£475 per annum. Applications, stating age, academic qualifications and experience, together with the names of three referees, should be received not later than June 13, 1947, by the undersigned, from whom particulars of the conditions of appointment may be obtained.

STANLEY DUMBELL, Registrar.

UNIVERSITY OF DURHAM—KING'S COLLEGE,
NEWCASTLE-UPON-TYNE

DEPARTMENT OF ECONOMICS

The Council of King's College invite applications for the post of Lecturer in Economics. There are three vacancies, and candidates for the posts should have special qualifications in one or other of the following subjects:
Economic History; Currency and Banking; Social Studies.
The salary rises by annual increments of £25 to a maximum of at least £800, and the commencing salaries of the successful applicants will be fixed at points on that scale in accordance with their qualifications and experience. Duties to commence in October, 1947.
Ten copies of applications, together with the names of three persons to whom reference may be made, should be submitted not later than June 28, 1947, to the undersigned, from whom further particulars may be obtained.

G. R. HANSON, Registrar of King's College.

CAPABLE and conscientious multilingual office staff of 5, at present operating busy semi-official scheme, offer combined services to any new or expanding organisation.—Box 478.

TREMAYNE, Deputy Secretary, 8, Waterloo Place, Pall Mall, London, S.W.1. May 2, 1947.

SUEZ CANAL COMPANY

Notice is hereby given that the General Meeting of Shareholders will be held at Salle d'Iéna, 10 Avenue d'Iéna, Paris, on Tuesday, June 24, 1947, at 2.30 p.m.

Holders of not less than twenty-five shares, who are desirous of being present or represented at the meeting, must prove at the Head Office of the Company, 1, rue d'Assolvi, Paris, before 2.30 p.m. on Thursday, June 19, 1947, that they have deposited their shares with the Company or with any of the Company's appointed Agents. Shares may be deposited in London with Messrs. N. M. Rothschild & Sons, who will in due course deliver a card of admission for the meeting.

Le Directeur Général, MICHEL HOMOLLE.

GOVERNMENT OF SOUTHERN RHODESIA

VACANCY—AGRICULTURAL ECONOMIST.

DEPARTMENT OF AGRICULTURE AND LANDS.

Applications are invited for the post of Agricultural Economist on the Staff of the Senior Agricultural Economist in the Department of Agriculture and Lands, Southern Rhodesia.

Applicants must possess a specialised degree in Agricultural Economics, involving at least a four-year course of an approved University. Experience of investigations into costs of production of agricultural products will be of value.

The successful applicant will be appointed in the Junior Professional Officers' Grade at a step on the salary scale, £495 by £27 10s. to £680 by £77 to £737 by £33 to £935 per annum. The commencing salary may be higher than the minimum according to qualifications and practical experience, not exceeding four steps in the grade. Consideration will also be given to allowing steps in the scale for time spent on military service.

The appointment is subject to Civil Service rules and regulations and the successful applicant will be required to serve a probationary period of two years before being eligible for the Fixed Establishment.

Leave, travelling and subsistence, cost of living, children's and marriage allowances will be subject to the rules and regulations of the Civil Service. Cost of living allowance (at present 10 per cent of the basic salary), marriage allowance, if applicable, at the rate of £50 per annum and children's allowance, if applicable, of £24 per annum for each subsequent child, are payable at present.

The successful applicant will be required to furnish a satisfactory medical certificate by a medical officer nominated by the High Commissioner, London.

Application forms may be obtained from the Secretary, Office of the High Commissioner for Southern Rhodesia, Rhodesia House, 429, Strand, London, W.C.2, and completed forms should be returned to his office not later than June 21, 1947.

THE SUFFOLK COAST in May and June. The Crown Hotel, Southwold (Tel. 2275), recommended for comfort and excellent food. Illustrated booklet on application.

Russia's Strength

SINCE the diplomatic correspondents returned from Moscow the British daily press has decided that the Soviet Union is weak, poor and in no state to risk conflict with the United States. With one or two notable exceptions the newspapers have proclaimed the belief, in rather naïve and arrogant terms; which probably means that yet another swing has taken place in the public view of the Russians. The exaggerated fears have given way to exaggerated relief; and those who wish to appear really in the know now mutter arrogantly: "No real trouble with the Russians for ten years."

Such an attitude is quite irresponsible, as irresponsible as that which seeks in the House of Commons to get from Ministers assurances that none of their strategic thought is devoted to the possibility of war with the Soviet Union. Those who give the matter their expert attention decided long ago what has just been discovered by the correspondents in Moscow—that the Russians have an immense, exhausting and exasperating task of recovery before them, demanding all their effort and concentration. For the statistics needed to assess roughly the economic strength of the Soviet Union can be read in London; so can the statistics needed to estimate the future military and industrial strength of America and Britain. And the assessment of Russian political strength has also to be made in London; for there are few sources of information open to the British correspondent in Moscow which are not open to him here, where he is likely to have more time for his newspaper researches. So long as the Soviet rulers persist in obstructing the expert traveller and in guiding the amateur investigator, British and American estimates of the vigour and skill of the Russian people, of their unity and confidence in their rulers, can hardly be more reliable than they are already. In other words, most of the articles from Moscow have been superficial and superfluous.

None the less a rough picture of Soviet strength and limitations has been emerging bit by bit. It might be entitled "Waiting for the Slump" and would show in the foreground an ageing Mr Stalin waiting in the Kremlin—just a shade impatiently—for an American slump in his time. For it is quite obvious that only a slump, only a first-class industrial and political crisis, could so undermine the present strength of the United States as to give the Soviet Union a reasonable chance of catching up in the next fifteen years. And only a slump could wrest from Mr Marshall the diplomatic initiative which has been gained by President Truman's boldness and his own grim poker-play.

Should the capitalist crisis come—and official Soviet doctrine declares it inevitable—it will be the first for which the Communist parties of the world have been fully prepared; the first which can be fully exploited for Soviet purposes without overt acts from Moscow. And it will be waited for patiently and calmly by men who fear no elections, whose vision is not bounded by the limits of any five-year plan, who have none of the democratic itch for quick results, and who may even feel grateful that a sense of crisis can be kept alive among their countrymen by official voices prophesying war.

The pure doctrine says that a crisis in western capitalism, a failure by the Americans to maintain their power by production and full employment, must lead to Fascism—or a new version of it. And Fascism, as the simplest Soviet citizen can understand, means war against the Soviet Union. For that he must be prepared. The goal is therefore industrial and technical equality with the Americans and their satellites. That equality, added to the disruptive power of Communist parties abroad, to the political strength of the Soviet way of government, and to the compact vastness of Soviet territory, would ensure military superiority. And with that alone can be achieved the security in which the Soviet Socialist state may advance towards that future condition of “withering away” which is the sole justification of its present tyranny.

Over-simplified though it may be, it is in some such deliberate view of the future that the main strength of the Soviet Union lies. Its planning aims at power for the state, power to reach the final stage where every external and internal human agency is under control; whereas western planning is so far content to aim at social justice, the good life, more money and less work—happiness for the individual, not power for the state. It is this ruthless concentration on power that lures efficient and intelligent men into the Communist party; it is the spell which holds eastern Europe, which fascinates the Germans and which spreads in most parts of the world that vague and irritable fear which is at once the enemy and the ally of Russia.

No one who has this fear is really reassured by recent symptoms of Soviet weakness: the disappointing report on the economic achievement of 1946, the passionate claim of Mr Molotov at the Foreign Ministers' conference that Germany must bear a major part of the burden of Soviet reconstruction, the impression of poverty and shabbiness, weariness and apathy which has lately come out of Moscow. In happier circumstances, of course, such impressions should and would have evoked sympathy, at least as much as is now shown for the Germans of Hamburg and the Ruhr. But Soviet diplomacy, ill-informed as always about public feeling in other countries, failed to appeal to the sympathy awaiting the Russian people; instead it concealed the devastation, the wounds and the exhaustion. Mr Molotov bluffed his way by crude and aggressive tactics through the crucial twelve months which followed victory. It was not until a year ago that Moscow's sudden abandonment of the forward policy in northern Persia—which seemed to be a capitulation before the United Nations—showed that the Colossus might be exhausted.

✱

In fact, the weariness was desperate. The proof lies in the evidence which the Soviet rulers themselves provided less than three months ago, evidence which was fully examined in *The Economist* of March 15. Firstly, the admission of the worst drought "since half a century"; then the revelation by the *Gosplan* that planned targets had not been reached in many branches of industry; then a series of alarmist speeches and statements during the Budget discussions in the Supreme Soviet; and on March 1st the climax in a Cabinet statement gloomy and critical in tone. It revealed a steep decline in productivity over the whole range of civilian effort. In the areas occupied by the Germans, industrial output was not nearly up to half of pre-war production. There were complaints that coal supplies had been insufficient, that only one-twelfth of the housing space scheduled in the Five-Year Plan had been made available in the first year, that grain production would not be back to pre-war levels for another three years. In human terms this meant that hundreds of thousands of demobilised men, who had seen the industrial achievement and household standards of the west, returned to find their relatives in western Russia underfed, poorly clad and living in ruins. And when they looked into the future they found that the objectives for

the next five years—perhaps even for ten or fifteen years—were to be the familiar ones of the thirties when they were preparing to meet Hitler's war: more tractors, power stations, coal, steel, oil, machine tools and railway equipment. Consumer goods—clothes, furniture, footwear, all the smaller luxuries seen in such abundance in the west—would not come till later. Belts would be tightened to the third and fourth generation.

That the Soviet Government should be able, against such a background, to appeal for the same shock-worker spirit and for the same effort to rebuild for power rather than for circuses that it did fifteen years ago shows the strength of its emotional and administrative hold over the people. There is clearly nothing comparable in this country or in the United States—a fact which is important in any weighing of relative strengths. That hold gets part of its strength from the confidence of the ruling group that they can achieve all their aims, provided they are left alone. They know that if security demands it the Soviet Union can be made self-sufficient; not only the Soviet Union but the satellite zones to the west in Europe and to the east in Asia. If trade with the outside world means bringing into their industrial planning an element of uncertainty, something beyond their control, then they can dispense with it. They have done so before. In 1929 their exports represented 3.2 per cent of the gross value of their output. By 1936, under the threat of Hitler's aggression, the proportion was down to 0.8 per cent.

But such autarky is only possible on terms, and the past has shown how onerous for the Soviet civilian these are: lack of balance between consumer and producer goods, chronic underconsumption, low productivity. And for Soviet industry complete isolationism and autarky would mean inefficiency and backwardness, loss of contact with the immense resources of American and British research into new techniques of production. Even if the door to the west were kept open in Poland, Czechoslovakia and Austria, such futile contacts would be no substitute for the technical collaboration of twenty years ago.

★

Those who make their assessments of comparative power by statistical calculations of national production and wealth will not have much difficulty in convincing themselves that it will be a very long time before the Soviet Union is likely to "catch up" the West in any real sense. Slump or no slump, the average annual volume of productive capital formation in North America will for many decades be much higher than in Soviet Russia. And if the countries of Western Europe—including Germany—should find their way to some coordination of production and resources, then the balance of economic power will be irremediably tilted against the Soviets. Indeed, still on the purely material plane, there is a real dilemma facing the Soviet leaders. Their best hope of "catching up" lies in seeking economic collaboration and exchange with the rest of the world and in devoting more effort and resources to raising the standards of living, and therefore in the not-so-long run the productivity, of their workers. But this runs directly counter to the instinct of maximum self-sufficiency, which prevailed in the face of the Nazi menace in the 1930s and apparently still prevails today. To attempt to "catch up" in isolation will impose a terrific strain. And any such policy will have the defect that, inside the Soviet Union, it will have to be represented as imperatively necessary preparation against imminent attack, while from outside it will look like preparation for imminent aggression. Whatever real distinctions there may be between defensive and aggressive preparations, they would, in practice be blurred: by the other Powers because information out of Russia is so scanty and misleading, by the Russians themselves because their diplomacy, which is unlikely to change its methods radically in a generation, will provoke in their neighbours the very behaviour they pretend to fear. An example

of this is the way in which British policy is being driven to consider reluctantly and clumsily the closer economic association of western Europe around the west German nucleus.

It is these economic and statistical arguments which, presumably, lie behind the current belief in the West that, whatever the ultimate menace, Russia will be too weak to constitute a threat for ten years. But when the analysis passes from economic comparisons to the political field, Russian diplomacy has enormous advantages. First and foremost, the Soviet leaders can be absolutely certain that no government which is in the Western sense democratic can suddenly declare aggressive war. It cannot even secretly prepare defensive war. It cannot even face the possibility of hostilities without discussion of the issue and the possible enemy. This means that the Soviet rulers (unless they are the slaves of their own propaganda) need only concern themselves with their own policy; they can move silently and fast towards any military or diplomatic action which they think security demands: it is sufficient to recall the invasion of Finland, the pact of 1939 with Germany or any of the major political moves of the last two years in eastern Europe.

Secondly, they need fear within the USSR itself no organised criticism through recognised constitutional or public channels—no strikes, demonstrations, passive resistance or sabotage. In their use of police methods they are as far ahead of the British and Americans now as they were behind them in industrial methods twenty-five years ago. They have the power to direct movements of industry and population where strategy demands—for instance east of the Urals—whatever the cost in money, efficiency or human life.

Thirdly, they can be certain of denying to the major industrial countries of Europe precisely those advantages; they can count on Communist parties everywhere, or effective sections of them, to play the fifth-column rôle if ordered to.

Lastly, the directors of Soviet foreign policy have an advantage of inestimable value: they can control most of the information on the outside world which reaches the Russian public.

Agreement to Separate?

JUNE 2nd has now been fixed as the date on which the Viceroy is to present to the Indian parties the British Government's new plan for the transfer of power in India. The new plan has been framed in the light of the report on the Indian situation brought back from New Delhi by Lord Ismay and submitted to the Cabinet. It is understood to be concerned with procedure rather than with actual terms of settlement, but for such a problem as now confronts India any scheme of procedure can hardly avoid involving a decision on certain issues of fundamental importance. It has been the British aim from the beginning of the transfer negotiations not to impose any constitution on India, but to help Indians themselves to work out a constitution so that there may be established and recognised authorities to whom delivery can be made when the day arrives. Normally, this would mean that an Indian Constituent Assembly would decide the political form of the new state and that Britain would then hand over to whatever government was thus legally constituted. According to the Congress Party doctrinaires, this is in any event Britain's duty, since they claim that the Moslem League's refusal to participate in the Constituent Assembly has not in any way impaired the latter's legal competence, as representative of the majority of the inhabitants of India, to legislate for India as a whole.

If Congress were to maintain unrelentingly its claim to establish the unity of India without regard to the Moslem League, while the League stood firm on its demand for Pakistan, there could be no other outcome than an appeal to force, for

They can therefore prepare the ground for any move that might be unpopular, or inconsistent, or unfamiliar. Whereas it is inconceivable—for example—that any French statesman should publicly work for or sympathise with a German nationalist point of view, Mr Molotov can and does so. What is more, Soviet statesmen can choose their own pace in policy; they need promise no quick results or neat compromises. The millions they rule will probably be content with an endless vista of hard and patient work, with low standards of life and if necessary personal sacrifice. In the last resort the Kremlin can count on an Asiatic capacity for endurance as astonishing as that of the Chinese or the Japanese.

There is, therefore, a real sense in which time is on Russia's side—though it is not the reason usually given. It is unlikely that time will raise their economic strength relatively to that of the West—it might even have the contrary effect. But time may well bring out some of the inherent weaknesses of the western position, the weaknesses from which any democracy, and still more a collection of democracies, suffers when it comes to the game of power politics. For that game demands patience, resolution, clear sight, a lack of illusions, a refusal to be frightened by tactical moves, a determination not to be taken in by appearances or to yield to emotions. If the Truman-Marshall policy were to be pursued without deviation for twenty years, the United States would be even stronger relatively to the Soviet Union than it is today. But will the policy be so pursued? To ask the question is to realise how right Mr Stalin is to be so interested in the prospect of an American slump, for though it would not undermine the sources of American strength (a slump is, after all, a phenomenon of plenty), it might well sap the bases of American policy. What made Hitler strong was not any great accumulation of economic resources but the flabbiness of the democracies, their lack, as Paul Reynaud told them, of *la lucidité et l'audace*—of clear thinking and courage. The answer to the riddle of Russia's strength is to be found in Washington.

the method of democratic majority decision applicable within a single state has been ruled out in advance by the party which denies the single state. But happily there have recently been signs of a loosening of the deadlock and of a conviction in the Congress leadership that, if the Moslem-majority areas cannot be included within a united India except by force, the price is too high to be paid. A main factor in the growth of this conviction has certainly been the British refusal to do anything to guarantee to Congress an enforcement of the Constituent Assembly's decisions against recalcitrant Moslem areas or a legal transfer of power to a central government not based on Congress-Moslem agreement. It has been made plain to Congress leaders that, if they decide to keep the unity of India by coercion, they will have to do the coercing themselves ; they cannot expect the British Raj to do it for them.

Coercion would not be an easy matter. It was only to be contemplated lightly as long as it was possible to believe that the Moslem League's stand was merely a bluff and that, when it came to the point, there would be little real resistance to central rule. A year ago this belief was still widespread and Congress felt it was safe to be uncompromising. But the series of communal outbreaks, amounting in total to a minor civil war and providing a foretaste of what a major civil war in India would be like, has led to second thoughts. Would it be worth while after all to start on the path of independence with a welter of violence and bloodshed, squandering India's economic resources and inviting foreign intervention? The Moslems,

in any case, are not going to rule in Delhi, Bombay or Madras; might it not be better to let them have some part of India to call their own and agree to separate?

It seems to have been on these lines that Congress opinion has recently been moving, reluctantly but surely. The principle of partition is no longer rejected outright; interest is more and more focused on boundaries and terms of division. The Hindu leaders are not willing to concede the Moslem claim to the separation of whole provinces—specifically, of Bengal and the Punjab—which has always been the basis of Mr Jinnah's Pakistan campaign and which was implicit in the Cabinet Mission's plan of last year. But they are willing to talk about the division of Bengal and the Punjab into Moslem and non-Moslem areas. This is quite a new angle of approach. Instead of the abstract legal dispute about the constitution-making powers of sections and provinces, controversy turns on whether Amritsar or Lahore are to be under Moslem or non-Moslem control. The new pre-occupation does not necessarily make for peace, but it is closer to reality than the old debate and indirectly it gets everyone accustomed to the idea of partition, even though it is not yet formally accepted.

Mr Attlee's policy of shock tactics in telling India that the British are going out next June whether Indians can agree among themselves or not has had its effect in forcing Indian politicians to make up their minds. The result has not been, however, as some observers hoped, to make both parties realise the need for a fair compromise which would preserve the unity of India. It has been rather to make Congress realise that the unity of India cannot be preserved except by force and that peace in India means agreement on division of the country with, perhaps, a residue of common services by arrangement between independent states. It is believed that the Viceroy, from his conversations with Indian leaders, has also arrived at this view. In spite of the Congress contention that the Pakistan agitation has never been anything but a device of wicked British imperialists for keeping control of India, the British Government has, in fact, been very unwilling to give up the idea of a united India, for if there had been enough real cohesion to sustain a Union, it would have been folly to have broken it up on any grounds of abstract ethnic or communal right. It is the actual strength of the Moslem League which alone is the justification for partition; it means that the opposition to a united India is too strong to be overcome without a coercion which Britain will not, and Congress cannot afford to, apply.

That Congress has gone as far as it has towards conceding the principle of Pakistan—and its commitment so far has been a matter of hints rather than of definite statements—shows a flexibility of mind and a will to pacific settlement which does credit to leaders embarrassed by a fervent nationalist faith which they have long preached. For a convinced Indian nationalist it is no small matter to abandon the ideal of an India, one and indivisible from the Khyber Pass to the Burma border, as well as from the Himalayas to Cape Comorin. If, therefore, Congress can be induced to accept the principle of partition, British mediation should be directed towards reducing the Moslem League's territorial demands within reasonable limits. The principle that it is better for a state not to have a high proportion of unwilling citizens can be invoked against the unity of India, but it is applicable also to Pakistan itself. In an Indian Union there would be a case for keeping the present provincial boundaries, but if there is to be partition, then it is clear that the Punjab and Bengal must be divided so as to separate the definitely Moslem parts from the districts which are predominantly non-Moslem. The complexities of this problem were indicated in an article on the Pakistan claims in *The Economist* of March 22nd, which was written before Mr Nehru's announcement that both the Punjab and Bengal would have to be divided. It is now reported that in informal negotiations there has been tentative agreement on a line in the Punjab

which would give Lahore to the Moslems, but keep Amritsar in the Hindu-Sikh portion of the province. In Bengal there does not seem to have been as yet such an approach to agreement, but Congress will have a strong case for excluding the mainly Hindu city of Calcutta, as well as the Burdwan Division of the province, from the Moslem State. In Assam, also, a division would be practicable whereby a southern portion would be joined with Moslem East Bengal, while the more northerly part would remain attached to Hindustan, with a connecting strip of territory north of the Brahmaputra.

The Moslem League will doubtless resist these truncations of the two Moslem succession states, feeling that every square mile lost from the ideal boundaries of Pakistan will weaken their states in relation to the greater bulk of Hindustan. But apart from the gain to their cohesion by the exclusion of uncontrollably large non-Moslem populations, the economic viability of the two Moslem states would be much less affected than appears at first sight, even by the renunciation of Calcutta. In the north-west the exclusion of the eastern Punjab would still leave Pakistan in a very favourable position as regards export surpluses of wheat, rice and cotton, whilst East Bengal without Burdwan or Calcutta would still have nearly all India's jute crop. The Moslem states, indeed, would start off with a better position in self-supply of foodstuffs and in commodities suitable for competition in the world market than would Hindustan, in spite of the latter's present advantage in modern industry.

It is a general belief in Congress circles, and one held strongly it seems, by Mr. Nehru himself, that the North West and East Bengal as separate states of Pakistan would not be viable and would be compelled by economic pressure to reunite with the rest of India. There does not appear to be any good ground for this belief, but the Congress leaders may the more readily consent to a partition if they regard it as only temporary. On the other hand, in so far as the Moslem Leaguers themselves are worried about the viability of their creations, they are likely to struggle obstinately for places to which communal ethnography does not entitle them, in the hope that wealth will come with bigness. Some hard bargaining about boundaries must therefore be expected, but in the end it should not be too difficult to confine the Moslem states within limits which will be ethnically just without taking away the prospects of a successful economic life.

The Indian states must not be forgotten in any plan for India. Some of the princes are indulging in brave talk about creating a third India, a Rajistan to stand alongside Hindustan and Pakistan, and some of the larger states—Travancore and Hyderabad, for example—are said to be contemplating complete sovereign independence. Probably, this is not much more than talk. Even the largest of the states would be too small to live alone, especially as most of them would be entirely surrounded by the territory of either Hindustan or Pakistan. The idea of a princely federation would almost certainly come up against the obstacle of princely jealousy and suspicion. And both Congress and the Moslem League have an obvious interest in coming to terms with the princes whose states lie in their respective spheres. If Congress and the League can reach an agreement, the problem of the princes should not prove to be insuperable.

There remains the question of defence, and here too there are hopeful signs. In what is believed to be a well-informed account, the *Hindustan Times* recently outlined plans of the Interim Government for the defence of India, passed with the concurrence of both Congress and Moslem League Ministers. The policy appears to be one of relatively small total expenditure on defence based on the assumption of co-ordination of external defence, whether Pakistan exists or not, and of a defence agreement with the British Commonwealth. This would certainly be of great benefit to the Indian peoples, as it would mean

that funds otherwise absorbed by the armed forces would be available for economic development and social services. On the British side there is certainly a desire to continue a special connection with India, now on a basis of equal partnership and reciprocity, and also an earnest hope that no division of India will afford an opportunity for foreign aggression or intervention south of the Himalayas. Fortunately, the marked improvement in Indian sentiment (both Hindu and Moslem) towards Britain, which has followed the unconditional promise to hand over power next year, has created favourable conditions for co-operation in external matters after the end of all British responsibility for the domestic concerns of India.

It seems possible, therefore, to entertain rather more optimism about the possibility of a peaceful settlement in India than

seemed likely only a short time ago—and there can be little doubt that the British Government's tactics deserve the credit for this improvement. But the optimism is no more than a rift in the clouds that overhang India's fate. Indian politicians have a unique capacity for disagreeing at the last moment, and there will be plenty of opportunities for the Hindus to draw back from the concessions they have done no more than hint at, and for Mr Jinnah to stand fast on his demand for five whole provinces, from which he has never yet budged. And all the time the sands are running out. Judged by the ground still to be covered by negotiation, the date of June 30, 1948, is painfully near. But judged by the rapid deterioration of the structure of social order in India, it is perilously distant. Lord Mountbatten's job is to make the politicians hurry.

Then and Now

IT is twenty-one months since hostilities ended, and the frustration of the high hopes of the day of victory is so well recognised as to be hardly worth remark. A new world was to emerge from the struggle; Britain was to have more and better houses, more and better schools, work and food for all, a new spirit of comradeship and purpose forged in common danger; and instead the housing programme trails, crippled by shortages, the new crop of school entrants finds neither buildings, teachers nor books ready for it, the housewife's basket is harder to fill than ever, ominous patches are appearing in the employment picture, one coal crisis is past and another looms, and the spirit of comradeship has disintegrated in party strife and sub-merged class war. Prices, held fairly steady during the war, have since got out of hand; there is an acute dollar problem; and the monetary authorities have lately raised the bank rate to the punitive level of 7 per cent. . . . Yes. It is June, 1920, to the punitive level of 7 per cent. . . . Yes. It is June, 1920, and the post-war boom is just past its crest and sinking—though the indices do not as yet speak with one voice—into the sharpest slump hitherto recorded, a slump from which there will be no complete recovery until the guns sound again in 1939.

Perhaps the most striking thing about this description is the difficulty of framing it without immediately disclosing the fact that 1947 is not the year under discussion. Considering how closely, even if history does not repeat itself exactly, similar effects follow similar causes, and that the essential facts of a five years' major war remain the same for 1939-45 as for 1914-18, the dissimilarities between 1947 and 1920 are surprising. They may be traced and evaluated, by anyone willing to construct the parallels, with the aid of a new study by Professor Pigou*, which, written during the war for departmental use

* Some Aspects of British Economic History, 1918-1925. By A. C. Pigou. Macmillan. 248 pages. 15s.

and drawing on some material hitherto unavailable, has now, by leave of the Chancellor of the Exchequer, been published.

Professor Pigou divides his period into four parts; the Breathing Space, from the Armistice to the following April; the Boom, April, 1919, to April, 1920; the Slump, April, 1920, to mid-1923; and the Doldrums, the stagnant state of depression which continued until the renewed slump of 1930. The first dissimilarity observable between his period and that following World War II lies precisely in that it is impossible to draw any such dividing lines to-day. No breathing space interrupts, during 1945, the steady rise in prices; no steep or sudden upturn or boom ensued; no break corresponding to the 1920 slump has occurred in 1947, nor does one appear likely unless as a transatlantic import.

Evidently this dissimilarity is a consequence—not a cause. Comparing the evidence offered by Professor Pigou with that provided by to-day's statistics one finds further dissimilarities in the fields of employment, labour relations, production, the distribution of manpower, Government policy and foreign economic relations, all these being superimposed on the underlying postwar similarities of inflation, industrial dislocation, and real impoverishment internally and externally.

On employment the evidence is particularly hard to compare. With laborious ingenuity, working from the hitherto secret "Z8" departmental reports on the distribution of manpower, from trade union figures, and from whatever other evidence can be found, Professor Pigou pieces together a picture of the employment situation between the Armistice and the first regular publication of the employment figures. He arrives at a shrinkage in employment, during the five months of his "breathing space," of some 1,200,000 men and women, of whom perhaps 100,000 were not so much unemployed as

deliberately withdrawing from gainful employment. During the ensuing boom years about a third of this surplus labour was mopped up; the slump more than wiped out this gain, and the unemployment percentage soared in the summer of 1921 to 22.4 per cent—abetted, of course, by the catastrophic coal strike of that spring, which bedevilled the economic situation quite as thoroughly as the coal crisis of 1947. The corresponding figures for the present period show a shrinkage in the total working population, from mid-1945 to the end of 1946, of almost exactly 900,000, but an unemployment total never exceeding 400,000. Even if there be added to this the 300,000-odd demobilised men and women who had not at that date yet applied for civil employment, the picture remains brighter than even at the peak of the last post-war boom.

Partly, the difference reflects the slower speed of demobilisation; from 4½ millions to 658,000 last time, from 5,000,000 to 1,427,000 this time, a lag reflecting in turn a gloomier international outlook and a heavier burden of foreign commitments. For civil demobilisation no figures are available to Professor Pigou, who can only offer employment totals in the "war-swollen industries" and note their decline. And here at once there appears one of the key differences between the two periods; for one of the chief "war-swollen industries" of 1914-18 was coal-mining. The Census figures of mining employment in 1911 and 1921 are, respectively, 1,123,000 and 1,305,000; while the corresponding totals for 1938 and January, 1947, are 722,000 and 694,000.

*

The implications of these figures are written into a development of production, after World War II, considerably more uneven than after World War I; and if an index of total production by volume were available it would mark, even more than in 1920, abysses of unsatisfied demand—notably for housing. Some indices can be compared; iron and steel has risen faster this time, so (however unsatisfactorily) has housing, cotton has lagged by comparison, agricultural production—expanded, of course, in both wars—expanded further from 1939 than from 1914. Shipbuilding, already falling off in early 1920 in response to the decline in freights, is still rising to-day. Exports, fractionally above their pre-war volume to-day, were 30 per cent. below it in 1920. On the whole, a comparison of the productivity picture favours to-day rather than 1920; and on the face of it reconstruction, re-stocking and the improvement of living standards ought to be improving apace. In fact, they are, even more than in 1920, hanging fire; and two at least of the chief causes of this comparative deterioration lie outside the field receiving detailed attention from Professor Pigou. The grim facts concerning coal are too well known to need repetition; the other major influence is the change in Great Britain's balance-of-payments situation. In addition to the loss of external assets and the income which they yielded—a loss considerably though not incomparably greater than that suffered in World War I—and the accumulation of external debt on an immensely larger scale, there remains a factor whose movements during the two periods were in precisely opposite directions. That factor is the export-import rate of exchange; the terms of trade. Between 1913 and 1921 the prices of British exports rose in relation to imports by some 40 per cent—a good deal too much, in fact, for comfort; between 1939 and 1947 they fell by 10 per cent, and are still falling. With the coal shortage holding down home production and with the other constituent of consumption—that is, net imports—held down by the loss of foreign income, the worsening of the terms of trade, and more severe overall world shortages, an austerity greater than that following World War I is hardly surprising.

Coupled with that radical change in the political atmosphere which has placed a Socialist Government in the shoes of the

Lloyd George Coalition, these stringencies have maintained an apparatus of controls which dwarfs even the full-blown wartime structure of 1914-18, let alone those few relics of it which survived to 1920. By mid-1919 every wartime control except those over shipping and a few foodstuffs had been swept away; at that rate, Britain would this time have been free of controls by the end of 1945. As it is, hardly any relaxation is discernible, apart, significantly enough, from the lapse of the one outstandingly powerful weapon of positive planning, the direction of labour. Controls in World War I were built up piecemeal, *ad hoc*, with overlapping and gaps; they were never conceived, except by a few Socialist cranks, as possible tools of a deliberate and permanent peacetime policy. Those of to-day, more logically, comprehensively and efficiently constructed, will in default of another radical change of political climate be preserved—no doubt in a strategically pruned or streamlined form—as just such tools. Therein lies one of the main differences, alike in the field of causes and in that of consequences, between 1920 and to-day.

*

But probably the most important difference of all lies in the fiscal and monetary sphere. World War I showed no counterpart to the deliberate cheap money policy of World War II and the period following. Under the pressure of intervening events and Keynesian theory, monetary practice has moved far in thirty years. The aggregate rise in money incomes during the 1919-1920 boom was, as well as can be calculated, between 25 per cent and 35 per cent; after the second war, any rise in money incomes that there may have been in the course of 1946 has not been enough to bring back the total to its wartime peak. Inflation has, in fact, been curbed, steamrollered out of existence by price controls and rationing, or—to put it less optimistically—driven underground. In 1919-20 the price system was restored to free action, did its stuff, and produced an honest, above-board, runaway boom; it indicated by the orthodox methods—gold outflow and exchange depreciation when the dollar peg was removed—the need for the orthodox defensive measure, a swingeing increase in the Bank Rate; and, that measure once duly taken, it matched the boom with a slump and depression which is unlikely to be forgiven it unless and until the present-day alternative does worse. That may seem unlikely; but the truth is that that alternative has not yet met its full test. The rule of the Gold Standard is in abeyance; the rule of Bretton Woods has not yet been inaugurated; and the pressures of the interregnum have been cushioned first by Lend-Lease and then by the American and Canadian loans, luxuries which Britain did not enjoy in 1919-20.

When this apparatus of external cushions and domestic controls—of padded walls and strait-jackets—is contemplated, it is hard to be sure that the present economic situation is really more sane and balanced than that of a quarter-century ago. It may merely be that the elements of unbalance are kept beneath the surface, showing themselves on the surface only here and there in some sudden eruption, but all the time having their effect underneath in prolonging the period of scarcity and strain. If the post-war transition were really, this time, going to be more successful at the cost of taking a longer time, few people would begrudge the delay. It would be far better to go slow rather than face years of unemployment and short-time. But it is impossible not to wonder whether we may not get the short-time precisely because of the care that has been taken to prevent unemployment, whether an organisation that is once imprisoned in the padded cell and the strait-jacket will ever seem normal enough to be released. Perhaps the treatment has erred as much on one side this time as on the other side last time. Perhaps we are not so much cleverer than our fathers, just foolish in a different way.

NOTES OF THE WEEK

Tory Reformation?

The Conservative Industrial Policy, published under the title "The Industrial Charter," is a pleasant surprise—that is to say, it is certainly a surprise and will be pleasant to all except the right wing of the Conservative Party itself, who will be shocked to discover some of the things to which Mr Butler and his colleagues propose to commit their party. Like nearly all political manifestos, the document retreats far too often into vagueness and generalisation—it is full of such meaningless declarations as a promise to undertake "a powerful drive to increase the output of British farms and gardens." But when allowance is made for the difficulty that politicians who are seeking votes inevitably feel in expressing themselves very clearly on awkward issues, it is obvious that an honest attempt has been made to face the real issues of economic policy.

What is perhaps particularly gratifying is that the Conservatives have been thinking about the concrete and painful issues of this year and next as well as about the remoter concepts of long-range economic policy; they are facing the present as well as the future. Their prescription for the immediate crisis is threefold. First, productivity should be increased, both by providing greater incentives to labour and capital and by rationalising the overgrown apparatus of control. Secondly, the crucial bottlenecks in power, transport, food and capital equipment should be widened. And thirdly, an end should be put to inflation. The only nationalisation project already consummated which they would wholly reverse is the closing of the Liverpool Cotton Exchange, though they would amend the transport and civil aviation schemes. They would attempt to nationalise the apparatus of controls, but they would not remove the control from any necessity of life so long as it is in short supply. As short-term policies these are both moderate and attractive.

It is the long-term policy, however, that shows the most striking change in Conservative thinking. For the report comes out unequivocally for what may be called the two-storey design of economic policy—a foundation structure deliberately planned by the Government coupled with the maximum freedom for enterprise elsewhere. There must be planning for the maintenance of full employment, for the management of external economic relations and for the guidance of capital development. But outside these fields, there is to be incentive for enterprise and rewards for efficiency; and even with the ambit of conscious policy the aim is stated to be "co-operation in making the plans and competitive enterprise in carrying them out."

All this is very sensible, and if it really were to become the policy of the Conservative Party, and if future Conservative Governments were to fill in the practical details in the spirit of the present report's admirable generalisations, the face of British politics might well change after the next election. But it is here that the doubt creeps in. Can Mr Butler and his colleagues carry their party with them? Can they persuade it not merely to talk this way in opposition, but to act this way in power when all the pressures of the interests will be on it? Perhaps the supreme test of the sincerity of the new policy will be provided by the attitude of the Tories to organised labour and to organised capital. The report includes an ambitious proposal to set up standards of security and status for the wage-earner—and of competence for directors—which many employers will not like. And it also includes some passages on restrictive practices which will be still more unpopular in Tory business circles. These passages are not strong enough—they still leave the onus of proving harmful restriction on the Board of Trade, instead of putting the onus on industry of proving that there is public benefit in restriction—but it is a considerable advance to find the Conservative Party saying "We condemn out of hand any price agreement designed to keep prices above the costs of the most efficient producers, or levies on more efficient firms to keep the least efficient in business." Do they realise just how many of their own supporters they are thus "condemning out of hand"?

Mr Churchill is probably right in holding the opinion (as he is reported to) that no amount of policy-drafting will have much effect on the results of the General Election, which will, as usual, be an inquest on the Government's policy, not a vote on a "mandate" for the Opposition. But a policy will be very necessary for the Conservative Party when it is next in office, and it is by its actions then, not by its words now, that it will be judged.

The Tinker's Curse

The padlock that was evidently applied to Mr Shinwell's lips after the fuel crisis—whether by his own hand or another—has now been broken open. It is one of the less welcome signs of spring that the flow of rancorous oratory is now again in spate. At Edinburgh two weeks ago Mr Shinwell misquoted the dying words of Christ on the Cross to express his dislike of the Housewives' League, a choice of language on which it would be a mild comment to say that it exhibits a lack of taste surprising even in this orator. Then a few days later, at Margate, addressing trade unionists from the electricity industry, he delivered himself of the statement that the Government were supported by the organised workers of the country and that the rest did not matter a tinker's curse. Of this utterance (which the Minister's friends have made a wholly unconvincing attempt to explain away) there are three possible explanations: that he really thinks the "organised workers" are a majority of the nation; that he wants to commit political suicide by telling the majority he cares nothing for them; or that he was so carried away by the inebriation of his own verbosity that he did not know what he was saying. No one thinks he is stupid enough for the first or second explanations to be true, so he must be silly enough for the third.

The Prime Minister must by now be well aware of the great incubus that Mr Shinwell is on the Government, whose campaign for national unity in the face of economic peril he is defeating single-handed. Why, then, is he not removed from office? The explanation may be found in that streak of stubborn obstinacy that runs through Mr Attlee's character, an unwillingness to admit a mistake, especially when the Opposition points it out. Or is there perhaps some truth in the persistent rumour that Mr Arthur Horner, the secretary of the Mineworkers' Union, has imposed a veto on any change at the Ministry of Fuel and Power? Mr Horner has recently been boasting of the ultimatum that he delivered to the Prime Minister on the subject of miners' wages—the miners, he said, "expected action" by December 31st. If an ultimatum, why not a veto?

Another incident of the week that can only deepen suspicions of the reasons for which men are appointed to, or retained in, posts of high importance is the strange translation of Lord Citrine. Lord Citrine was formerly General Secretary of the TUC and thus *ex officio* a grandee of the Labour movement. But he is also a very difficult man to work with, and the persistent reports of dissensions on the Coal Board have invariably been associated with his name. It has been rumoured for weeks that if he did not leave the Coal Board some of its other members would. Now he goes—but only to become chairman-elect of the Board that is to run the electricity industry when its nationalisation is complete. Is this promotion by merit? Or is it job-finding for one who must not be left unemployed? Whether or not "the rest" count for more than a tinker's curse, they clearly count for less than the TUC's power.

* * *

The Planning Bill

The situation under which only 12 of the 108 clauses, and none of the schedules, of the Town and Country Planning Bill were discussed in the Commons on Report stage is the worst example to date of the use of the guillotine. Some 175 Government amendments even then passed without discussion. It is quite true that the large number of Government amendments was due to the sincere efforts of Mr Silkin to improve the Bill and to meet minor points of criticism raised by the Opposition, while one of the three days debating was spent on the series of new clauses which provide a much fairer basis of payment for land acquisition. This is well and good, and a fairly effective answer to those who say that Parliamentary discussion has ceased to get results. But why will the Government turn even its concessions sour by these rush tactics? It is no good complaining that Opposition members talked too much; of course some MPs did, and always will, but occasional verbal exuberance is inseparable from the Parliamentary process. The plain fact is that three days was not nearly enough for a long Bill that has been substantially redrawn and re-drafted.

Mr Silkin laid down an excellent principle when he said that

We are buying land and buildings and we have to pay compensation on the basis of what we are buying, and not on the basis of who happens to own it, or even when he bought.

During the near future, while war damage payments are being settled and before the Bill's new clauses come fully into force, his words will be completely belied. The transitional arrangements for land compensation have been left complex and inequitable. But in a year or less the position should be reached that all property will attract, broadly, its current "existing use" market value, irrespective of who owns it—a great advance in Labour's ethical thought. But will Mr. Silkin apply his principle to the division of the £300 million compensation fund for loss of development value? It is every bit as applicable.

The Government also introduced amendments to strengthen its position in face of recent challenges in the law courts. It means to make it clear that a public enquiry is an administrative and not a judicial proceeding. This is reasonable—but it adds to the case for requiring full publicity for the Minister's conclusions. Another amendment strengthens planning powers to designate a comprehensive area for compulsory acquisition. This will be more readily conceded if the Government will ensure that no more land is designated than is really necessary, and will consider centralising its powers of acquisition in one department. The Government also rejected pleas from both parties that the amalgamation of planning authorities into joint boards should require Parliamentary confirmation. It is rapidly becoming impossible to guarantee any degree of independence to local government.

Truce in the Battle of Minden

There has been much coming and going in Germany in the last week, partly due to the release of Mr. Bevin from the cares of Moscow, partly to the effects of Lord Pakenham fitting on his new harness, partly to the Government's acute sensitiveness to the charge that they can neither feed nor administer their zone of Germany. The prominence Germany has enjoyed in the press has resulted from the general feeling that Mr. Bevin, after the complete failure of Moscow, must do something rather novel and drastic in the west, and from the knowledge that all was not well with Anglo-American relations in the zones.

For the time being the "battle of Minden" seems to have ceased. So far no distinguished casualties have been reported, and there seems to have been a generous and sensible American advance towards the British standpoint on central economic controls. Mr. McNeil has already hinted in the House that the bi-zonal economic agencies—which have so far been ministries without real executive power or responsibility—may have the assistance of a representative advisory council drawn from the *Länder*. That would be a concession to the American—and south German—insistence on democracy and federalism. The American concession to British—and north German—insistence on central controls would probably be the grant of further powers to the agencies, powers to be drawn neither from national nor provincial German law, but which could presumably be delegated by military authority.

These changes in the administrative set-up of the two zones will paper over some of the cracks, and the move of the economic agencies to Frankfurt should simplify their procedure and expedite their work. But it would be a great mistake to imagine that they will improve the food situation. Careful investigation has shown that even the most drastic enforcement of farmers' deliveries and the most successful campaign against the black market would not make any decisive difference in the present deplorable food situation. The main relief must come from overseas; and that means that the British Government have to concentrate immediately on two tasks: quicker buying and delivery of grain from America, and the provision of dollars to pay for it. This might mean a complete overhaul of present arrangements, even the financial ones. But the reports that Mr. Marshall is ready to take over entirely the further financing of German recovery if the British give up their socialisation plans are certainly premature.

Mr. Churchill's Challenge

It would be interesting to know whether any connection is to be traced between the Foreign affairs debate that began on Thursday afternoon in the House of Commons and the Albert Hall meeting of the previous evening, which Mr. Churchill addressed on the subject of a United Europe. The earlier discussion was, of course, non-party; but there was a pleasing irony in the spectacle of Mr. Churchill, with the Archbishop of Canterbury in the chair, and supported by Mr. Victor Gollancz and Mr. George Gibson of the TUC, stealing the thunder of

Mr. Bevin's critics. His oratory turned the shrill imperatives of Mr. Zilliacus into solemn warnings from an ancestral voice. The result was very impressive, although much of it had been said before in Zurich nine months ago.

Briefly he argued that the Charter of the United Nations provides for regional organisations for defence and other purposes; that Europe—"fairest, most temperate, most fertile area of the globe"—naturally formed such a region; that precedents already existed in the British Commonwealth, in the Soviet Union and in eastern Europe. He might have added that the latest of them, the Slav system of security pacts, has never been submitted for the approval of the Security Council, as the Charter provides. But he was in conciliatory mood, and insisted that a "healthy and contented Europe" was the "first and truest interest of the Soviet Union."

Mr. Churchill was quite right to point out that if Europe could not attain some kind of federal government the world certainly could not. Otherwise he made no attempt to deal with the practical difficulties which face such a scheme. It can, of course, be argued that the statesman creates the public mood first and that then all difficulties fall away. But in this case it is dangerous to arouse the mood first because the practical difficulties are immense and beyond public control. Only for western Europe is there at present the barest possibility of a federal arrangement; out of the lands occupied by Hitler a powerful union could be made. And within western Europe there are powerful political elements friendly to Russia which would work against union. Even if they were outvoted or overridden they could, for example in Italy and France, sabotage the economy of the union by strikes and passive resistance. And on the purely financial and economic side—even assuming American support for European union—there are immense technical and policy difficulties. Nevertheless they should be examined and brought to light in London, for quite obviously the lead in this matter lies with the British and not—this time—with the French.

Italian Cabinet Number Nine

It is misleading to suggest that Signor de Gasperi, by resigning with his third ministry on Tuesday, was just trying to drive out the Communists. It is true enough that the crisis arose immediately from the refusal of Signor Morandi, the very competent Minister of Industry, and the pro-Communist Socialists to support the Prime Minister's plan to broaden his ministry into a kind of government of national union. Such a move they regarded as unparliamentary and as unjustified by the election results of last June. A deeper cause of their revolt was the suspicion that recent decisions in favour of a capital levy would be shelved under pressure from the right and centre.

Without the support of the Communists Signor de Gasperi, or for that matter any Italian prime minister, would find the trade unions unmanageable; but it is known that Signor di Vittorio, chief of the Italian TUC, had been spoken of as a possible minister and that the Communist ex-minister Signor Scoccimarro had been included in lists for a possible "brains trust" to help the Cabinet tackle the economic crisis. Even Signor Saragat, the leader of the anti-Communist Socialists, has expressed willingness to join any national government, provided the Communists are in too.

The crisis had been brewing for at least two months. Signor Morandi, the governor of the Banco d'Italia and the Minister of Finance had all warned Italy loudly of the extreme gravity of the economic situation, with the national deficit mounting fast. And when, on April 3rd, a fourteen-point emergency programme was adopted, the Government enforced little of it and were unable to check the fall in the value of the lira. So since May demands have been loud and insistent for two things: a full-dress debate on the economic situation in the Assembly (fixed for the day that Signor de Gasperi chose to resign) and a change in the make-up of the government.

Ever since Signor Saragat flounced out of the Socialist Party Congress in January and went into isolation with his anti-Communist followers, the Cabinet team has been unhappy. The Socialist split weakened the indispensable buffer between the Christian-Democrat and Communist ministers and recent allegations against the Ministers of Finance and of Foreign Trade must have turned the Prime Minister's mind to ways of dropping them. He is, of course, a right-winger of the Christian-Democrats, has always hankered after the presence in his Cabinet of Italy's political veterans, Orlando, Nitti and Bonomi, and also of younger rightish (but non-party) technical experts. Only last week the suggestion was openly made that there should be a government

of national concentration with representatives from all parties, or a "brains trust" alongside the Cabinet. It was then the trouble started. With representatives of the Export-Import Bank just arrived in Italy to consider the allocation of dollars to Italian industry, the need to stop the trouble quickly is obvious. For beyond the political quarrel is the economic crisis, insoluble without strong government.

The Jarrow Result

The result of the by-election at Jarrow—Miss Ellen Wilkinson's seat—has given much more pleasure to the Labour Party than to the Conservatives. Some Conservatives had built high hopes on the combination of a local candidate, of the disappearance of Miss Wilkinson's personal following and of the disillusion produced among the electors by the economic crisis. But in the result, the Labour majority fell only from 11,007 at the General Election to 7,616 last week, which is still more than three times as large as the Labour majority in 1935. There is clearly no sign in these figures of any significant weakening of the Labour hold over the industrial constituencies. The Government can continue to claim that the economic crisis has not affected their remarkable record of not losing a single by-election in 22 months, and the Conservatives are likely to abandon any thought of aggressive tactics during the summer and continue perforce their waiting game.

Nevertheless, it is by no means certain that this is the right conclusion to be drawn from the Jarrow result. After all, Jarrow is a natural Labour seat, and to prove that the Government can hold it does not, of itself, prove anything very much. At the General Election two years ago, Labour polled 66.1 per cent of the total poll in Jarrow; this time they polled 59.3 per cent. The Conservative (masquerading as a Liberal National on the first occasion) raised his vote from 33.9 per cent to 37.5 per cent. Or the figures can be put in another way—Labour lost one-twelfth of its 1945 vote and the Conservatives put on one-eighth. Now let these ratios be applied to the total vote for the whole country at the General Election. The Labour vote was then 12,050,000. If Labour lost 6.8 per cent of the total votes cast (as they did last week at Jarrow), their vote would come out at about 10,340,000; if they lost 8.7 per cent of their own vote (again, as they did at Jarrow), the figure would be almost exactly 11,000,000. The two methods of calculation give total votes for the Conservatives of 10,900,000 and 11,200,000. By either method, in other words, the application of the Jarrow ratios to the whole country would give the Conservatives a slight edge. What the Socialists forget who rejoice over Jarrow is that the margin of their victory two years ago, measured in terms of the total popular vote, was a narrow one, and even so small a swing that it cut the majority in one of their safe seats by only one-third, and is therefore dismissed as negligible, might nevertheless be enough to cost them scores of more delicately balanced seats. It would be foolish, of course, to base very much on one constituency. It may be that the loss of Miss Wilkinson's personal following has led to a bigger loss of Labour votes in Jarrow than would be true at this moment in the country at large. Or it can be argued that since Jarrow is a formerly depressed area which is now more prosperous than for a generation past, it could be expected to be kinder to the Government than the typical constituency. But at least the Jarrow figures cannot be ascribed to "apathy," since the total of votes cast at the by-election was actually slightly higher than at the General Election.

Looked at in this way, the Jarrow result does not justify any Labour complacency. Rather, it seems to show that the two major parties are about equal in the popular esteem—with perhaps as much as three years more of this Parliament to run. And if one thing is more certain than another, it is that at least two of the three years will be full of economic trouble.

Housing Target Abandoned

The announcement last week of the abandonment of the 1947 housing target may have caused disappointment: it could not cause surprise. Memories of the crisis in February and March are too recent for its repercussions on house building to have become blurred; it is, therefore, improbable that the Government is being much blamed at this moment, and they were wise to time the announcement now. The repercussions hereafter are more difficult to foresee: nobody can be blamed for the direct effects of frost and flood on the laying of one brick upon another, but the hold-up in the production of materials for which the Government must take considerable responsibility will continue to affect

deliveries for many months. From a political point of view it will be of great importance to the Government to have steered the housing programme into more open waters at least by the summer of 1948, for with other difficulties ahead they will need every favourable factor they can mobilise to get them through.

Wisely the Government have refrained from announcing a new target before the full effects of the coal crisis on production have become apparent. This aspect of the matter is discussed in an article on page 768. Meanwhile the target of 240,000 permanent houses by the end of the year, which was always precarious because it was based on the assumption that materials would be adequate and that manpower was the bottleneck, has given place to the objective "to complete this year as many as possible of the 218,783 houses already under construction." During the first three months of 1947 only some 16,000 new permanent houses were completed. Even allowing for all the advantages of summer weather there is still likely to be a large proportion of the 218,000 unfinished by the end of the year. In the two years March, 1945, to March, 1947, 370,000 families have been rehoused in repaired, converted or new houses. Inadequate though it may be compared with requirements this is not an insignificant number.

World Farmers Meet

This week the first annual general meeting of the World Farmers' Federation has assembled in Holland, attended by delegates from 28 countries. The creation of this body is a minor triumph in constitution making (especially for Mr. James Turner and the British delegation who have done much of the spade work) in view of the variegated character and interests of the farmers' organisations—some of them independent, others government-sponsored or government-assisted, others again with some religious or political bias—that have been brought together. But good diplomacy is not sufficient for the meeting's success. The farmers will want some concrete results for their expenditure and travelling time if the Federation is to become a permanent institution. This they can certainly have, if they settle down to comparing notes and to formulating a programme of technical and economic research. The economic cost of soil erosion, and the best method of combating it, are typical problems that could very profitably be studied by a world-wide farmers' organisation. Unfortunately, indications from the agenda and elsewhere are that the farmers are set on devoting nearly all their time to playing politics.

It is natural that the Federation should wish to establish liaison with the Food and Agriculture Organisation, to get recognition from national governments, and to have its say on the various world food schemes that are being tossed about. But it would be foolishly sanguine to base the Federation on the assumption of its capacity to become an effective international trade association, advancing the income and status of farmers throughout the world. Farmers from different countries may agree together reasonably well in a time of food scarcity; but it will be a different tale when glut returns. The interests of the British farmer, seeking protection, and of the overseas farmer, seeking markets, are inevitably divergent—and so are the interests of producers in different nations competing for exports. It may be possible—it must

certainly be hoped so—to get a measure of world agreement on the distribution of future food surpluses; but the eventual plan will be the result of hard bargaining between governments, and any pressure coming from the Federation, supposing it is able for the moment to speak with a united voice, will make a negligible impact.

This is not meant as a warning to the Federation to keep out of politics. It is bound in any case to have its say, and there can also be no denying that so far food producers, through their lack of organisation, have been in an unfavourable position compared to the representatives of industry. The Federation is a very modest move to even accounts. But this kind of international body has a very high mortality rate; if the Federation wishes to survive, it had best build a modest but solid basis of practical research and not trust overmuch to success in political campaigning.

Hunger for Books

Because those two categories of persons who feel strongly about books—teachers and discriminating readers—are in a minority, the case for a more favourable treatment of the book-publishing trade is liable to go by default. The debate on the adjournment, initiated by Mr Wyatt on May 9th was, therefore, the more welcome.

The book publishing trade suffers from difficulties common to most industries at the present time: it is short of labour by some 20 per cent; there is an acute shortage of machinery, particularly for book-binding, and replacements by manufacturers in this country take anything from 18 to 30 months to appear, although some relief will be permitted by imports of book-binding machinery from America; printer's ink and glue are insufficient; fuel cuts in March during the coal crisis were heavy; the import of esparto grass is essential for most books, and the stocks, which had been rising steadily last summer, after their complete depletion during the war have now fallen to a third of what they were last October.

All these facts have their counterparts in a thousand other places. The point at issue is to decide whether there is a better case for giving books preferential treatment than other scarce commodities. Is there something which differentiates book production from other kinds of production? There almost certainly is. For the schools books are an essential pre-requisite of a proper education; the shortage is so acute that the education of many children may be said to be seriously suffering—with repercussions which are obvious for the future. The needs of the adult reader are less obvious only to those who either do not read or read entirely haphazardly: during the war the development of adult education caused a great increase in the demand for books, which cannot be met by libraries nor by the bookshops, and those processes of self-education which are of immense value to the nation and earn rich dividends are being curtailed. In the field of exports the special value of books is even greater. The raising of the shutters which enclosed Europe has resulted in an avid and unsatisfied demand for information about the ideas and events outside those barriers, but exports, which amounted to 2,550 tons a month in 1938, were only some 1,000 tons a month in the first quarter of this year. Yet it is well known that books are the forerunners of other more material advantages.

Some recognition has been given to these facts by the Board of Trade, and the allocations of materials have recently been increased to 80 per cent of the pre-war level provided that certain quantities are reserved for educational and export purposes. But this is not enough. Yet further steps should be taken to overcome the bottlenecks particularly of machinery, and then to increase the allocations. The total resources used on book production are so small that the adverse repercussions elsewhere would be insignificant.

* * *

Palestine Parley

It is by no means safe to say that nothing will come of the United Nations proceedings on Palestine. It is noteworthy that the terms of reference of the new Committee have been made wider than the original British proposal. The experience of South Africa at the last session was a warning that Britain, and America, may have cause to remember. The United States delegates, more sensitive than most others to the howling mobs outside, and conscious that the armed infiltration of the disputed territory is being steadily pushed forward, with publicly raised funds, by groups of their own fellow-citizens, will continue to do their best to keep things safe and non-committal.

But even if a "neutral" committee were to bring back a "neutral" report, the Assembly would still have its own decision to make, and there is no certainty that Mr Bevin or Mr Marshall would be very much happier.

If official America is now worried about the protection of an area hitherto left to Britain, is concerned about her growing need for Middle East oil and Arab friendship, her Jewish pressure groups, and the temporarily repressed dislike of her masses for overseas commitments, there is still not much comfort in all this for Britain. America needs Middle East oil, but Britain absolutely depends on it. The base in Egypt became untenable though secured by a freely negotiated treaty. That in Palestine rests on a mandate which the British Government itself has declared unworkable, and which, in any case, never authorised its use for a purely strategic purpose.

None of these points has escaped the notice of the United Nations. And their first plunge into the turmoil of Palestine has left them in no doubt of its violence. The Arab States, appealing to a right of self-determination which the smaller nations will feel it dangerous to ignore, have shown that a stubborn manipulation of procedural niceties or a righteous abstention is no monopoly of the Soviet bloc. Yet they, too, have been reminded, for all their defiance, that their own order would be tried to the utmost by a war with militant Zionism. For behind Shertok, whose Jewish state might so easily become a Levantine ghetto, loomed the Irgun, regarding it more as a base for further conquest.

Mr Asaf Ali's interventions have been judicious, in keeping with Congress India's aspirations to spiritual leadership of an independent Asia. But he was one of those who voted to include independence for Palestine in the terms of reference. Turkey, too, still aloof, but in more friendly relations with Arab succession states than formerly, spoke quietly for independence.

Russia and her satellites have taken their inevitable stand on unconditional withdrawal of British power, and have fought stubbornly for inclusion of other Great Powers, but not Britain, on the Committee. They lost, but there were many abstentions. Despite the embarrassment of agreeing with Russia, many delegates seem to have felt that this time she did succeed, from whatever motives, in putting first things first.

Peace in Palestine is at best unlikely, but delegates have seen force in the argument that British insistence, backed by America, on ruling it as a British base, makes peace impossible.

With most members of this new Committee strategic considerations will not weigh as it is said they did with the Anglo-American body, and it may be that partition will end by appealing as strongly to the United Nations as it did to Mr Crossman. Britain would have made a more dignified showing at the United Nations, and the present discussions been much clearer, if she could have firmly announced a date for the transfer of power as she did in India and for ending an intolerable period of quasi-military rule, which with the best of intentions has become alien. Whatever the strategical consequences, they could hardly have been more difficult than the situation now is.

Symbol and Knight-Errant

The Emperor of Japan recently paid a call on General MacArthur to thank him for his part in the inauguration of the new Japanese Constitution, and they conversed together for an hour. An Allied Headquarters spokesman subsequently explained to journalists that under the new Constitution the Emperor was no longer a "ruler," but only a "symbol of state"; he was not an "officer of the Government" and had "no independent authority." This being so, it might have been supposed that the conversation of the two men would have run on light and pleasant matters suitable for foreign visitors to Japan, such as the tea ceremony, flower arrangement or views of Mount Fuji. It would hardly have seemed worth while for the Supreme Commander of the Allied Powers to discuss controversial political issues with a mere symbol. But according to "authoritative Japanese sources" quoted by the Associated Press, it was politics that they talked about. The Emperor is said to have told the General that the Japanese people was much concerned about its future security now that the Constitution had permanently abolished all armed forces in Japan, and did not believe that the United Nations was able to guarantee protection. The General is said to have reassured the Emperor by telling him that the United States would guarantee the defence of Japan.

All this is quite logical if one considers the situation in which Japan has been placed by its new laws. If a country is entirely incapable of self-defence, it can be taken over at any time by a foreign Power with a few armed "tourists" or parachutists.

TI

in to-morrow's world

As soon as the war in Europe ended, special missions were started by TI to every country where they saw a possible market for British light engineering products—during the past year no fewer than seventeen such visits were paid.

These were much more than trading missions in the immediate sense of the term. They were composed, not of salesmen, but of technicians. Their task was not to exploit the abnormal shortages which obtain to-day, but to ascertain the long-term needs, the special problems, in each market and to decide how those needs and problems could be met. They were to found a technical service which would endure.

The mass of information gained by these experts will be put to increasing use as production expands. Theirs were embassies to the world of to-morrow... for TI believe that to-morrow only value and service will tell, and that to-morrow is coming fast.

TI is a team of engineering industries which serve in more ways than may be realised. The component companies have made their own reputations in the fields of precision tubes, bicycles, electrical appliances and cables, wrought light alloys, pressure vessels, metal furniture and paints—the whole is TI.

Tube Investments Ltd., 3 Grosvenor Square, London, W.1

Between the manufacturer and retailer the wholesaler is a stabilising influence. He cushions the effect of trade fluctuations both on the maker of the goods and on the retail distributor. The wholesaler gives bulk orders to the manufacturer and holds stocks ready for delivery to the retailer in quantities to meet individual requirements. He reduces the number of transactions, lessens the dispatch worries of the manufacturer, and saves time-wasting interviews for the retailer.

The wholesaler is a vital link in the economic chain of industry; he is the channel through which goods flow from the manufacturer to consumer via retailer with the minimum of waste and the maximum of result.

or by a mere threat of invasion, unless it has effective protection from some other external source. The United Nations cannot as such guarantee protection to anybody, for the veto can always paralyse its action. If, therefore, American occupying troops are withdrawn soon from Japan, as General MacArthur wishes them to be, the United States can only make sure that no other Power will interfere in Japanese affairs by openly guaranteeing Japan against such interference with a pledge not subject to any veto. But has Congress yet given any thought to this matter, and, if not, what authority had General MacArthur to commit the United States to so vast a liability? A cynic might say that, as he was only talking to a symbol, he promised only symbolic aid. But such a suspicion is surely unjust; it probably has not occurred to the General that the United States might "buck" its manifest destiny. Even if it does, the victor of Leyte is quite capable at any time of fighting a private war for the succour of a distressed damsel. Dragon-slaying is his profession.

Slight Thaw in Korea

Just one year ago American-Soviet negotiations for the creation of a Provisional Government in Korea broke down, and since then a heavy political frost has blocked all intercourse between the two liberating Powers in the unhappy peninsula. To-day, however, there are again signs of movement. As a result of an exchange of letters between Mr Marshall and Mr Molotov the Soviet Union has accepted an American compromise proposal as a basis for new discussions, and the Joint Commission is to resume its work in Seoul on May 20th.

The mere renewal of negotiations does not, of course, bring any solution unless the two sides now find it easier to agree than they did before. The previous breakdown occurred because the Soviet Union insisted that participation in the Provisional Government should be confined to political parties which accepted the Moscow agreement of 1945 which provided for a period of Allied tutelage in Korea. As only the Communists and their auxiliaries accepted this agreement so damaging to Korean nationalist pretensions, while the other parties denounced it, American agreement with the Soviet thesis would have meant handing over power in Korea to the local Tito exclusively. So the Americans dug their toes in, no Provisional Government was formed, and each occupying Power continued to do as it pleased in its own zone. The Soviet Union has now agreed that any Korean party now willing to sign an undertaking to co-operate with the American-Soviet Joint Commission shall be admitted to consultation, but persons or groups still considered hostile to the fulfilment of the Moscow decision or to the Joint Commission or to one of the Allied Powers may be excluded by American-Soviet agreement. Much will depend on the interpretation of the new clauses. If the Russians continue to press for the exclusion of anti-Communist leaders on various pretexts, the talks are likely soon to run into a new deadlock, and even if a Provisional Government is at last successfully formed, there will still be the formidable task of holding fair elections under the existing zonal conditions.

In so far as Moscow has made a real concession in Korea, it may be claimed as an achievement for the Marshall "tough" policy. Such fruit is the more refreshing because of its rarity, and it is probably no accident that it has ripened in the Far East—the region of the world outside the Western Hemisphere where American sentiment is traditionally most involved and where excessive tension with the United States would be most risky for the Russians.

DP's into Refugees

The committee that is preparing the way for the International Refugee Organisation has taken a leap of faith. Theoretically, the organisation cannot assume responsibility for the displaced persons when Unrra expires on June 30th, because one further signature and a further 1.5 per cent of the total budget required, must be promised before it can be born. But its preparatory commission has had the sense to ride above theory. Advised by Sir Humphrey Gale, of Unrra, and Sir Herbert Emerson, of the Inter-Government Committee on Refugees, that the decision to maintain some organisation caring for D.P.'s must be taken at least six weeks before Unrra's closing date, it has this week agreed to assume as from July 1st operational responsibility for the necessary assets and staff. For the moment, some important human values have been saved.

But they are not yet saved for good. Stateless persons have always constituted a distressing factor in international relations. They threaten to remain so for so long as organisation works, with Russia and its satellites pointing at its camps as unholy sanctuaries for war criminals and for fugitives who ought to come

"home" and get their deserts. Moreover, the Jewish aspect of the problem may create its own peculiar set of complications if no one is ready to clarify the statement made by Mr. Shertok at Lake Success on Monday that the 100,000 Jewish D.P.'s have "nowhere but Palestine to which to go."

It is claimed that the IRO will only succeed if it is enabled to do its work quickly, to transform the refugees into candidates for naturalisation and to plan its own liquidation when its work is done. Only the member governments can help it to do this. And of these the United States has the biggest role to play. Because it is rich in wealth, great in population and was immune from war damage, "Many experts have concluded," reports its Foreign Policy Association, "that the fair share of D.P.'s for the United States is 4,000,000, to be admitted over the course of the next four or five years." (The proportion would be less in relation to the total number of D.P.'s—say 850,000—than was the United States contribution to the total budget of Unrra, which was 75 per cent.) Propaganda is afoot for action towards this humanitarian end. Population experts are being quoted on the declining American birth-rate, which will be static by 1970. In the light of this fact, runs the argument, was it not foolish to admit only 6,213 refugees in 1946 instead of the 39,000 contemplated under the presidential directive of 1945?

Several methods of making an exception to the quota laws are being publicly discussed. Mr Earl Harrison's idea of using up the unfilled quotas of the war years was outlined in *The Economist* of April 12th. A plan finding wider support is that of passing temporary legislation which would not affect the pattern of the quota laws but would admit as an extraordinary measure 100,000 displaced persons per year in the next four years. Britain's birth-rate is also dropping. The British Trade Unions might well note that both the American Federation of Labour and the CIO have arrayed themselves on the side of groups supporting such legislation.

Anglo-Soviet Trade

Mr Harold Wilson's statement in Parliament on Monday about the Moscow trade talks was cautious. Indeed, after the long and chequered history of Anglo-Soviet trade negotiations, caution is hardly surprising. But the Secretary for Overseas Trade has returned from Russia in an optimistic frame of mind, and convinced that, whatever differences between the two countries may exist on the political plane, the Russians are genuinely anxious to develop commercial relations. The forthcoming negotiations in London may be less smooth, since they concern the more complex and controversial questions of the terms and conditions of trade, while the issue of a credit, it is understood, is again to be raised. But if the Kremlin is, in fact, anxious to do a deal with the British Government, the existing obstacles should not prove insurmountable.

Timber and wheat are the main commodities which Britain hopes to get from the USSR, although a large number of other items (which are discussed in a Note on page 774) are under review. On the British side, it is expected that the main articles Russia will take are electrical equipment and machine tools.

If the London talks are successful, the agreement should be concluded some time this summer, and thus provide some immediate relief for the bottleneck in Britain's housing and industrial programme, although deliveries on any appreciable scale could hardly start before next year. The importation of timber, and more especially of wheat, from Russia would enable Britain to economise in its imports from dollar areas, at a time when the American loan is beginning to run out. But, quite apart from the concrete benefits that should result, a trade agreement at this juncture might have important political effects, and should result in a loosening of the diplomatic tension. Combined with the projected Anglo-Polish trade agreement and the talks which have begun with the south-eastern European countries, it should assist Mr Bevin when he faces his left-wing critics at Margate.

Shorter Note

The attempt by Lord Woolton and Lord Teviot to arrange for joint action in the constituencies by the Conservative and Liberal National parties is on terms superficially generous to the latter, considering the relative standing of the parties. But whether the proposals will work in practice will depend on how far the true liberal ancestry of the Liberal National party has become diluted by mixed marriages: it is unlikely that the grass-root conservatism of the local parties, which is very different from the brand of conservatism voiced in public and in Parliament, will be palatable to those who were bred in other traditions.

Letters to the Editor

Is Britain Finished?

SIR,—In your leading article last week you commented on the solicitous and maddening answer which is being given to this question in the United States. I have recently returned from an extensive tour of universities in the East and Middle West, and the most popular motion for debate was "that the formal dissolution of the British Empire would contribute to the maintenance of world peace." It was our experience that, despite the popularity of this subject, the youth of America did not support this motion, and in fact we won this debate both on audience votes and judges' decisions on all occasions.

The average American undergraduate is extremely interested in, and well informed on, the Empire. The case for its "dissolution," which they all confessed was an extremely difficult one to make, was not based on the old arguments of imperialism, but on the present economic plight of Great Britain which they considered inconsistent with the burden of a colonial Empire. There was universal sympathy for the plight of this country during the last winter, and great admiration for the determination which they believe the people of Great Britain are showing in the present crisis. There was no suggestion anywhere, either in public questioning or private conversation, that Britain was "finished." There was justifiable concern over the methods being employed to hasten recovery, in particular over the use of the American loan, and the news of the tobacco tax which reached the States while we were there had a salutary effect on that section of American opinion with which we came into contact. There was widespread appreciation of the effect of inflation on the value of the loan, and a request for a further loan is expected.

The American Press does not seem to be an accurate mirror of American opinion on this subject. Reference during the course of the debates to the *Time* obituary of the United Kingdom invariably provoked roars of laughter.—Yours faithfully,

I. S. LLOYD, President, Cambridge Union

Kings College, Cambridge

The Battle of Minden

SIR,—What you appear to be saying in the article in your issue of April 26th is that the first objective of British and American policy in Germany should be the economic restitution of that country, and that this is being delayed because of the American insistence upon confederation as opposed to federation and free enterprise as opposed to social planning. Even assuming that your objective is a proper one (and with this I do not for a moment agree), it seems to me that economic prosperity depends on neither social planning nor free enterprise, but upon an understanding by all Germans that they, if they work hard enough at peaceful pursuits, will eventually be able to improve their lot. This being true, surely, of the two alternatives you state, free enterprise holds out more personal and immediate hope. Indeed, it would seem, judging by present conditions and leaving aside the reasons for them in which the Germans are, in any case, uninterested, that American free enterprise today holds out greater hope to the individual than British social planning ever will.

However, if our objectives in Germany look beyond economic self-sufficiency, which is a very mediocre goal and one that I should have thought had been proved in 1919, may easily lead to a new German war, then it occurs to me that it is far better that the British adopt the American plan of loose confederation and state's rights than that the Americans adopt the British plan, which will certainly lead to industrial centralization. All history indicates that a loose confederation of selfish states is incapable of waging war or doing anything else very effectively. Having served in the armed forces for seven years, I consider that this was one of the purposes of my service, as far as Germany was concerned. So, in the long run, I think it would be a good thing if there were an independent Bavaria, an independent Confederation of the Rhine, and if the differences were emphasized between the Catholic South and the Protestant North. Without a militarist Prussia to unite these *Länder*, you would have a permanently weakened Germany, which, after all, is what we want. And suppose this does cost us some money for the moment? Surely any money we spend now will be infinitely less than we should be forced to spend to oppose an aggressive Germany, which is the inevitable result of the type of economic centralization which you advocate.

If the separate states are set up, they will find a means of existence. They did before 1866; they can again.

To sum up:—present economic policies, which do not look beyond the restoration of German self-sufficiency for the sole purpose of saving money for the American and British taxpayer, seem to me to be a repetition of the mistake of 1918 and one which in the end, will cost both taxpayers infinitely more money than they now must expend, to say nothing of sorrow, heartache and lives.—Yours faithfully,

MARTIN PHILLIPSBOHN

Administration Building, Zion, Illinois

Development or Welfare?

SIR,—We should like to support the point of view, put forward by Dr M. Fortes in your issue of April 19th, that the East African Groundnuts Scheme cannot be regarded as the model for future agricultural development in East Africa.

The scheme raises the question: Is colonial development simply a question of capital investment? We suggest that it is not. The scheme, as it stands, will make the economy of these territories even more dependent on one or two raw material exports. It is not accompanied by a plan for rapid industrial development which could do so much to bring about a steady rise in the standard of living. Finally, as Mr Fortes says, the scheme "will not work in a Kikuyu reserve—the sort of area in which an agricultural revolution is most needed."

To say all this is not to imply that it is undesirable to increase the production of groundnuts in East Africa; but to do it in a way that will demonstrably assure the Africans that they will be the chief beneficiaries. The scheme would appear to overlook the vital need for winning African support. A number of things seem calculated to lead to African distrust. (1) There was no preliminary consultation with the Africans, surely a negation of democratic planning. (2) The employment of the United Africa Company even for a short period may arouse suspicion and hostility in view of the Company's unpopularity in West Africa. (3) The processing is to be done in Britain for an unspecified length of time and the nut residue to be used as cattle food in this country while the African's acute cattle fodder problem remains unsolved. (4) There is no mention of the wages to be paid. Will the Government pay wages which would compete with the

From *The Economist* of 1847

May 15, 1847

The event of the season, and indeed of many seasons at HER MAJESTY'S THEATRE, has been the debut of Mademoiselle Jenny Lind. Few who take the slightest interest in musical matters, or in the common topics of the day, are ignorant of the result as chronicled by the morning journals, but still fewer are aware of the real extent of Jenny Lind's success, which, while we conscientiously admit that it was great and deserved we make no hesitation in declaring to be overrated.

The character of *Alice* in *Robert Le Diable* is not one on which the opera depends in any manner for support; the romance in the first act, "va dit elle," and "quand j'ai quitté La Normandie," in act III . . . form the whole of the music in which a vocalist can hope to distinguish herself, though there are opportunities for the display of dramatic talent in the duet with *Bertram* and also to the *trio* of the last act. Lind's impersonation of the character was very admirable. The merits of her singing consist in perfect intonation, exquisite expression, and a most refined perception of all that is beautiful—or that, by her talents, can be rendered beautiful—in the music entrusted to her. The florid embellishments praised in such high terms by some of our contemporaries, were only audible to themselves: her shake appears almost perfect, from the very natural manner in which it is given, but the varied *floriture* with which the imagination of a Persiani can embellish a melody were certainly not observable; they were not altogether required; but it has been asserted that they were given, and we, therefore, repeat that Lind has hitherto not evinced the possession of the faculty attributed to her, and which only one living singer possesses to perfection. Jenny Lind has nearly justified all that has been said of her in her first character; we are anxious to see her in another.

notoriously low (approximately 15 shillings a month in cash) wages paid to African plantation labour at present by European settlers? (5) The Africans have little control over their Governments and therefore can scarcely influence the way in which profits from the scheme are spent. (6) There is nothing which would give the Africans, who have a very deep attachment to their land, a feeling that the scheme is their own. There are no clear proposals nor a time limit mentioned for the transfer of the scheme to African farmers.

We suggest that if the support of the Africans is to be gained certain measures will be necessary. First, whatever direct labour is used for clearing the ground should be paid at rates which would lead the way to a new wages structure throughout East Africa. For the first time in history the African should earn a living wage. Second, when the clearing work has been done, opportunity should be given to African farmers to work the scheme on a co-operative basis without interposing a number of indefinite intermediary stages. This would give Africans the needed feeling of ownership. Third, processing should be carried out in East Africa thus providing the urgently needed cattle fodder. If machinery for ground clearing, etc., can be so speedily transported to Africa because Britain needs fats, could not processing machinery be equally speedily transported to meet African needs?

Finally, we feel that the main criticisms of the scheme can only be met if there is an extension of democracy in East Africa involving increasing control by Africans over the economic as well as the political aspects of their life.—Yours faithfully,

K. and S. AARONOVITCH

64 Lissenden Mansions, N.W.5

Sterling Balances

SIR,—I can understand the Chancellor of the Exchequer wishing to scale down the war debts owed by this country to India, Egypt and other countries. But I do not understand the morality of the process which borrows the debts on a freely negotiated basis and under the hypothesis that they will be repaid, but now discovers the belated argument that they must be "scaled down" because they represent "an unreal, unjust and unsupported burden." Were the lenders ever informed while the borrowing

was going on that the debtor must be free to decide how much of the debts he will repay? Has everybody forgotten the odium incurred in the USA as the result of doing the same sort of thing after the first world war?

The task of repaying these debts would undoubtedly be very onerous, and possibly crushing, and every step within the range of what is honest should be attempted to lighten the burden. But don't let us pretend that the Chancellor's declaration and its accompanying "chorus of approval" (which is not "unanimous") fall within the category of fine gentlemanly things.—Yours faithfully,

A. D. WEBB

47 Northway, Golders Green, N.W.11

Sweet Rationing

SIR,—It is argued with encouraging frequency nowadays that the time is ripe for ending sweet rationing, and recently Mr L. J. Cadbury suggested (see *The Economist* of April 19, page 606) that an increase of one ounce per week on the present ration would be sufficient to meet demand at the present price levels.

While the removal of sweets from the ration would please everyone except possibly the 5,000 officials employed on it in the Ministry of Food an estimated consumption of only 5 oz. per week compared with 7 oz. before the war is surely an extraordinarily low one.

The first effect of raising controls would be to create an enormous run on sweet shops, and the only factor which would end such a state of affairs would be the firm belief on the part of the consumers that all their demands could be met at once, just as the only way for a bank to stop a run on it is to meet all demands for cash without hesitation.

Apart however from the necessity of ensuring that shopkeepers had ample stocks for the abnormal initial demand, the level to which consumption would then fall would rarely be at least double the 5 oz. estimated by Mr Cadbury. With so many avenues of personal spending barred by shortages and rationing there is a vast amount of purchasing power available for absorbing any luxuries that appear on the market, as is shown by the absurd prices paid for uncontrolled fruit, and until sweet production is greatly increased rationing will remain the only way of ensuring a fair distribution of sweets.—Yours faithfully,

42 Dalkeith Road, Edinburgh

A. R. SINCLAIR

Books and Publications

Pattern for World Revolution

"Pattern for World Revolution." By Ypsilon. Jeff-Davis Publishing Company. 479 pp. \$3.50.

THE two authors of this book conceal themselves under a pseudonym; they claim to be ex-Communists and to "present to the American reader the political psychology of those men and women who, since the foundation of the Communist International, have fought for its aims in all corners of the globe." The interest of the book is indeed psychological. As history it is sketchy and often inaccurate, but its reminiscences of personalities and work in the Comintern afford a peculiarly vivid picture of a world which remains incomprehensible to the Western democrat largely because he is always trying to interpret it in terms of his own conception of politics. The Russian "professional revolutionaries" were men whose politics had the force of religious inspiration. As Nechayev wrote in 1877: "The true revolutionary must regard himself as consecrated. . . . Everything in him should be absorbed by one exclusive interest, by one single idea, by one passion—the revolution." From this state of mind comes the blind obedience to the party which is everywhere characteristic of Communism. The Communists of Western countries have acquired it from Russia, but, according to this book, they have never been more than "apprentices" of the Russian professional revolutionaries; they "could never rid themselves of the faults that originated in a democratic labour movement." The influence of Communism in the West, however, is exerted not only through active revolutionaries, but also through "fellow-travellers," and of this type the authors make a very penetrating analysis. The "fellow-traveller" is not a positive revolutionary at all; his attitude is a purely negative and passive one; he is the product of a breakdown in Western civilisation, for whom "only a mystery to which one can submit without having to think . . . offers peace and rest."

The authors hold that Stalin, in contrast to Lenin and Trotsky,

is "not a world reformer and philosopher, but a ruler and a conqueror." They give the name of "the Stalintern" to the informal international which has replaced the Comintern since the latter's dissolution in 1943; the new institution is "not a working-class international, but the international instrument of Russian expansion." It has no "general and universal programme" except in its relation to Russia, which is its only constant. The Comintern from its foundation, being bound to Russia, reflected the changes which took place within Russia, and its successor is an arm of the autocratic empire which has emerged from the Russian Revolution.

In the opinion of "Ypsilon," the decisive zone of conflict for the "Stalintern" is now in Western Europe—in France, Germany and Italy. It is argued that a Communist Party cannot co-exist for long on equal terms with other parties in a parliamentary system once it has attained a certain strength; it must either grasp supreme power or decline. For a Communist Party to win over a quarter of the voting electorate in a democratic country does not mean a proportionate parliamentary strength, but simply "indicates that the political and social conflicts are of such a nature as to exclude a parliamentary compromise." We may hope the authors are wrong in their gloomy forecast of the near future of French democracy, but it has still to be proved by the event.

National Housekeeping

"Public Finance." Ursula K. Hicks. Cambridge Economic Handbooks; Nisbet. 387 pages. 10s. 6d.

THE very high standard of the Cambridge Economic Handbooks series is more than maintained by this, its latest volume; though it is only fair to warn the reader whose ideas of that series are derived from Mr Henderson's *Supply and Demand* or Mr Dobb's *Wages*, that the newcomer is both considerably longer and very

considerably stiffer than the average. This is partly because Mrs Hicks, while certainly not an obscure or confusing writer, lacks that specifically light (and enlightening) touch which enables Mr P. H. Robertson, for instance, to make the forbidding topic of money positively entertaining; and partly because her subject, swollen to bursting-point by a dozen years of Keynesian theory, really includes as much matter as—to choose other examples from the Cambridge series—*The Structure of Competitive Industry*, *the Control of Industry and Monopoly*, all rolled into one. It is really rather a pity that *Public Finance* should not have been twins.

This being said, negative criticism is virtually exhausted. *Public Finance* atones for length by comprehensiveness; it ranges from a most useful account of Parliamentary and departmental procedure in financial matters, through a searching analysis of taxation in general and particular, which includes a study of rates, and an evaluation of the current (i.e., 1945) British tax-and-expenditure structure, to a pioneering synthesis of full-employment theory and administrative practice. The only omissions (for which the author apologises) are a detailed discussion of the price policy of socialised industry, the technique (though not the effects) of public borrowing, and international fiscal relations. The structure of the book is logical and convenient. A nice balance is held, throughout the descriptive and historical chapters, between straight information and critical evaluation; and the two things are kept unmistakably separate, which is a most valuable virtue in a book destined largely for students. To the general reader, the most interesting section is likely to be Part III, entitled *Public Finance in the National Economy*, and covering the relations between public finance and economic activity, the possibilities of planned public investment, the significance of the public debt, and the need for reform in the presentation of the nation's accounts; but there is no part of the book which does not contribute to the highly necessary purpose of clarifying judgment on its vital and difficult subject-matter.

Migration

"Economics of Migration." By Julius Isaacs. Kegan Paul. 285 pages. 18s.

TO the student of international affairs, who is seeking some solution to the conflicting claims of displaced persons for refuge, of under-development countries for skilled labour, and old-countries with falling birth-rates for labour of all kinds, this book will come as something of a disappointment. To the student of the economic theory it provides a gold-mine of evidence about the application of labour theories in the international labour market. The book is one for economists, and is fairly heavy going at that: as such it achieves its purpose in setting out exhaustively all the economic forces which have or can be at work to effect the volume of migration. But it leaves almost untouched the situation as it is to-day, and does not attempt to assess the present capacity of different extra-European states to absorb labour, nor to consider the practical effects of a drain of labour from countries such as Great Britain who are struggling with reconstruction problems. The background of policy, not policy itself in the politician's sense, is therefore the author's theme. Another book remains to be written about the practical solutions to the problems of emigration as the ordinary man sees them.

Given this context Mr. Isaacs is certainly thorough, in spite of the extremely inadequate or incomparable statistics which are available. The historical background, the factors determining the volume and direction of migration, the bearing of natural population changes on migration movements, the measures which states have taken to control migration and the effects which immigration and emigration have had on the states concerned are all carefully gone into. The pros and cons are fully set out, and given their due weight, but the only glimmer of Dr Isaacs' own views one is permitted to have is in those sections dealing with planned migration, which he regards favourably, especially, if planned internationally. Such impersonal impartiality is all very well for a text-book. But the author would have done his own cause greater service if he could have given it a heart and some other human organs.

Swiss Anxiety

"Überbeschäftigung und Frankenparität" Aussenwirtschaftliche Probleme der Nachkriegskonjunktur Mit Beiträgen von Alfred Bosshardt, Max Ikle, W. A. Jöhr, Charles La Roche (Handels-Hochschule St. Gallen). Fehr'sche Buchhandlung. St. Gallen, 1947. Fr. 9.50.

REPORTS from travellers returning from Switzerland describe it as a country in which milk and honey flows. The Swiss themselves, though enjoying the boom, are worried.

Their problem of "over-employment" is not due to reduced hours of work, unaccompanied by higher efficiency, but to internal and external demands for Swiss goods. Dr Ikle (Aussenwirtschaftliche Aspekte der Konjunkturellen Überbeschäftigung) and Dr Charles La Roche (Konjunkturpolitik bei Übersättigung und Überliquidität) discuss the reduction of over-employment by throttling exports, contracting internal investments and the balancing of budgets. Dr Jöhr (Soll der Schweizer Franken aufgewertet werden?) and Professor Bosshardt (Die Kaufkraftparität des Frankens und die internationale Wettbewerbsfähigkeit der Schweiz) deal with the question whether or not the value of the Swiss franc should be raised. Rightly, they say no. For the Swiss price level is above that of its Anglo-Saxon competitors—the United States may have caught up since these chapters were written. An increase in the purchasing power of the franc would hardly secure more imports of raw materials and foodstuffs owing to all round scarcities, nor would it contract exports, which to-day depend on ability to deliver rather than on prices.

The four essays closely connected with one another deserve a careful study, both by planners and anti-planners. They are dealing with international problems from the point of view of a small, efficient country, whose economy is closely interwoven with world affairs. They are written with full knowledge of the facts, national and international, and of the relevant theories, and in the sane, realistic spirit in which the Swiss excel. Their authors suggest courageously, though not very hopefully, that the boom should be held in check by balanced budgets and reduced credits. They realise that timely deflation, which prevents business from going over the top, is different from a deflation which is the result of collapse.

The Last Hundred Years

"The Age of Revolution." A Survey of European History since 1815. By J. J. Saunders. Hutchinson. 18s.

MR SAUNDERS has written a book to describe what the last hundred and thirty years were about. He makes no claim to new discoveries or to a new interpretation of the nineteenth and early twentieth centuries, but he has taken care to go to the most interesting authorities and to bring sound judgment to bear upon his reading of the facts. Here and there he is in danger of being too much impressed with the Great Scribes who know how to number civilisations and to explain why each one of them has collapsed. In the main, however, Mr Saunders' good sense keeps him away from far-fetched hypotheses and attempts at oversimplification.

The book is divided into three main sections, dealing respectively with liberal romanticism, nationalist democracy and "Armageddon and After." Within these sections Mr Saunders shows the interconnection of things; the effects of technical change upon literature or the influence of works of imagination upon political movements. It is not easy to cover so much ground in just under 200 pages, and Mr Saunders is to be congratulated upon the skill with which he produces a coherent picture of an age. One word of caution is perhaps necessary. The pattern is right, but the colouring is at times over-violent. Thus Mr Saunders is a little harsh towards French romanticists and even harsher towards French realists (incidentally, he might have spent less space upon Zola and allowed himself to discuss more significant names, such as Rimbaud or Bann). On the other side, the "philistine" ways of the bourgeoisie are over-emphasised; Mr Saunders might have had something to say about the *snobisme* of professional critics, such as Ruskin and Arnold, and their blindness to the new forms of beauty created by the engineers. Even on the political side, it should be remembered, for example, that a "brutalised urban proletariat" existed long before power-driven machinery and factories became

common. The figures in Hogarth's pictures, the Gordon rioters, and the Sansculottes were not the products of *laissez-faire* industrialism. Finally, Mr Saunders sometimes exaggerates a political mood. It is difficult to recover the atmosphere of a period, but certainly on the standards familiar to us in the years immediately before 1939 the term "nervous hysteria" hardly applies to the temper of English opinion before 1914. These are, however, minor corrections, and do not detract either from the general merits or from the interest of Mr Saunders' survey. Anyone who reads this book will certainly get from it a clear presentation of the general background of our time.

Shorter Notices

"The International Who's Who, 1947." 11th Edition. Europa Publications, 960 pages. £4.

This new edition of International Who's Who is like its predecessors, a comprehensive and valuable reference book; its title is self-explanatory and its reputation established.

"Full Employment and Free Enterprise." By John H. G. Pierson. Public Affairs Press. Washington. \$3.00.

THIS is a collection of lectures, articles, etc., written between 1942 and last year, and dealing mostly with the principle of "national income insurance." As described, it is a variant of fiscal trade cycle policy, consisting in the underwriting by the Government of consumer spending, which should be maintained by the payment of a national dividend when the employment figures seem likely to sag, and restricted by additional taxation when inflation threatens. The novelty lies in the setting up of a known and definite total of expenditure and in the emphasis laid on a concurrent campaign against such restrictive practices as might cause the extra spending power to be diverted into monopoly profits instead of extending production and employment. While the latter element is outstandingly valuable, the former calls for a degree of close and sensitive contact between fiscal policy makers and the public which not even the American statistical services, markedly superior as they are to those of Great Britain, seem likely to provide. Dr Pierson does not neglect this problem, but his conclusions look optimistic.

THE WORLD OVERSEAS

Bretton Woods Begins

(From Our US Editorial Staff)

WITH the \$250 million loan to France, announced on May 9th, the International Bank for Reconstruction and Development has started operations. On the same day, M. Camille Gutt, President of the International Monetary Fund, predicted early activities by the Fund. Thus both the Bretton Woods twins are at the starting-point.

The formative period has been long and sometimes agonising. But it has not been by any means all wasted. Both the Bank and the Fund have been able to collect staffs of high quality, especially the Bank. Working relations have been established between the Bank and the Fund and between both of them and the US Government. Their location in Washington—the building they share is one block from the State Department, two from the White House and three from the Treasury—proves to have more advantages than was generally realised when the question of location was still under argument.

Now, with the first loan announced, developments are likely to come much faster. The Bank's statutes provide that 20 per cent of the subscribed capital is to be paid in at the start, the rest remaining uncalled except in the event of losses. The payment of the 20 per cent will be completed this month and will provide about \$725 million in US dollars and gold. The rest is in currencies of the other members, and is not convertible into US dollars, but is available for loans in those currencies. But all loan demands at present—and probably for some time to come—are for US dollars. The French loan alone obviously earmarks a substantial portion of the total stock of dollars. Hence the Bank must soon determine its ability to obtain more dollars,

which of course can only be done by borrowing in the American market. It must do so soon, because a number of other loan applications are now in an advanced stage of negotiation.

Consequently, extensive explorations are under way with the market. The Bank hopes to make its first sale of debentures fairly soon, and the amount of the first borrowing most frequently mentioned is \$250 million. But the Bank approaches a market still filled with inhibitions about past adverse experience with foreign loans and present numerous adversities in international relations; furthermore, the Bank is new, and meets all the proper scepticism that anything new, whatever its merits, encounters from persons risking their own or fiduciary funds.

The Bank has, and is telling, a strong story to the market. First, it contends that the obligation of member countries to pay up the uncalled portion of their subscriptions, in the event of losses by the Bank, is absolute on each member, regardless of the action of any or all others. This means that the additional sum of about 2½ billions of US dollars would be forthcoming to make good losses even if the Bank's assets proved entirely worthless and every other member failed to meet the calls. The Bank further contends that it cannot in any way delay such calls to meet losses on the one hand, and, on the other, that the US Congress has already appropriated the total, so that there can be no delay by the Government in meeting calls. The US Government agrees with this statement of facts. This contention means in effect that dollar obligations of the Bank up to some \$2½ billion are obligations of the United States.

Secondly, the Bank contends that American investors have

complete control of whether its dollar obligations shall ever exceed the liability of the US Government—that is, of whether they are willing to place any reliance whatever upon any of the institution's assets or upon the liability of any members other than the United States. This control will be exercised automatically by willingness or refusal to buy any obligations in excess of that amount.

Thirdly, the Bank contends that the disbursement of funds, and thus the need to raise dollars, will be slower than much earlier discussion indicated. This will necessarily result from the tight supply of available materials to be purchased with the borrowed dollars, and the probable slowness with which specific reconstruction and redevelopment projects can be completed. Considerable time will therefore pass before the Bank's borrowings will reach \$2½ billions. That time will permit an evaluation of its operations and of international developments.

Whether and to what extent American investors will be satisfied of the validity of these contentions the next few months will show. Needless to say, every comma and nuance will get the severest legal scrutiny. The conclusion will determine the willingness of the private market to supply dollars and the rate. (The rate of 3½ per cent on the French loan may infer an expectation of ability to sell obligations at about 3 per cent, with ½ per cent for expenses. The borrower pays an additional 1 per cent into the guarantee fund.)

Severe Scrutiny of Plans

The same nearby period that will test the supply of dollars will subject the borrowing demand to test. What is the volume and nature of reconstruction and development projects in the world which can pass the numerous examinations imposed by the Bank's mechanism: by the borrowing government, by the Bank's lending staff, by the Board of the Bank (which, of course, includes representatives of many other countries than the borrower), and by the American or other market? What volume will stand such scrutiny, but at the same time be unable to be financed elsewhere—the Bank being empowered only to do financing that cannot reasonably be done through other channels? What volume of appropriate materials can be obtained, and how fast can they be put in place?

The relationship to political finance is also yet to be clearly defined. Relief for the needy—funds for Greece, Turkey and Iran, for example—are deemed to be outside the scope of these international financial organisations. But the line is not clear. Conversely, if the Bank's loans are strictly limited to what can be justified by purely economic arguments, will they be so small, in comparison with the need, that accompanying or corollary political loans by governments will be necessary?

Finally, and most important of all, what is to be the environment in which the Bank will operate? To what extent will the world's financial mechanism be willing to finance international transactions? If the entire or preponderant burden is to rest upon the Fund and the Bank, both will shortly be engulfed; for their resources are sufficient at most only to do a marginal job. Undoubtedly, the determination of success or failure of the new adventure, even on the assumption that all else goes well, will be made in Geneva at the International Trade Conference, at Lake Success, by the Council of Foreign Ministers, by the commercial policy enacted by the United States Congress, by the outcome of the present trials of the United Kingdom. Excesses and deficiencies in international balances of magnitudes even approaching present sizes will overwhelm the international organisations in not too long a time. The new adventure may help, but it cannot determine the outcome.

The voices of the hopeful and the pessimistic mingle in foretelling the outcome of these many tests. All that can be said in fact—and it is encouraging that so much can be said—is that the adventure is well launched and that it has the good wishes of men of goodwill, who, despite some appearances to the contrary, are numerous.

The French Socialists

[FROM OUR PARIS CORRESPONDENT]

THE French Socialists entered a new stage in their career last week in consenting to form part of a coalition government in which the Communist Party no longer finds a place. Their reluctance and self-examination are some measure of the way the

position has changed since the great pre-war days of the Popular Front. Then, too, they governed without the Communists, even if with much greater self-confidence than success. Since then they have lost their hold on working-class France, and the great industrial unions of to-day vote Communist. Their economic policies can succeed only if the Communists—while excluded from the Government—nevertheless refrain from active opposition. This curious paradox has led many people to wonder where the present Socialist leadership wishes to take the party. It is, indeed, one of the great questions of the day whether Socialists will interpret the act of governing without the Communists as synonymous with government against them.

No group of French politicians has played a more outstanding part in politics since the end of the war than the Socialists. Few who were present will forget the sense of drama and achievement that invested the election of M. Auriol as President of the Republic in January. The Tricolour unfurled upon the Fourth Republic as a Socialist Prime Minister led a Socialist President through the gates of the Elysée that had been locked for so long. It was almost a family occasion. Never had the party stood so high.

A Party Without Drive

Four Governments have ruled in France since General de Gaulle resigned; and three of them were led by Socialists. The presidency of the Constituent Assembly was held successively by M. Gouin and M. Auriol. A single-party government of 21 Socialist ministers was formed by M. Blum, and might well have outlasted its month of office if M. Blum had been younger or less shaken by German gaolers. M. Ramadier, the present Prime Minister, presides over a cabinet which is predominantly Socialist. The party's leaders have held every sort of office, have gone abroad to negotiate and sign important economic and political agreements, have often represented France. And they have done all this with a flourish and spate of oratory that recall the more gorgeous days of the Third Republic.

Yet the appearance is misleading. Indisputably, the French Socialists are a declining force. The three general elections since the autumn of 1945 have shown a progressive loss of Socialist votes to the gain of both Communists and M.R.P. (Progressive Catholics). The party now is by far behind both its rivals. Declining prestige from the implication, or suspected implication, of Socialists in wine, food, and other "scandals," would indicate that another general election, were one to be held this year, would leave the Socialists once again weaker than before. All too clearly, the party of 1947 lacks those qualities of dynamism and self-confidence which made it great, and which, today, are the driving forces behind the other two big parties.

Inquiry into reasons for this decline would show that the weakness is not new. The *Section Française de l'Internationale Ouvrière*, as the party is officially called, suffered the same split in loyalties and doctrines as the other parties of the Second International. The fateful congress at Tours in 1921 hived off a majority who were to form the French Communist Party. Ever since then the Socialists have been fighting on two fronts a battle that nothing, probably, could have prevented them from losing. For a brief moment the great days of the Popular front and the common fight against the Fascist leagues masked the truth of Socialist weakness; but the moment passed, and with the war the internal divisions which were sapping the party's strength were intensified to the point of disaster. At the first post-war congress in 1944, about 80 Socialist deputies were expelled from the party for having voted for Pétain, only 10 or 15 voting against.

Workers Lost to the Communists

But, far more serious than the split in the leadership, the party also lost a great part of its rank-and-file. The gradual inroads which the Communists had made into the Socialist voting power before the war became a great gap during the heroic days of the Resistance. While Socialist veterans like Paul Faure were preaching pacifism before the German invaders, and trade union leaders like Belin collaboration with Vichy, the Communists stood firmly and as one man for armed retaliation. This they linked to a broad programme of social reform with which France might face the future hopefully and solvently. By the end of the war the *clientèle* of the left-wing parties had significantly changed. The Socialists, incomparably weaker in numbers than in 1939, recouped their strength from the Radical petty-bourgeoisie; the masses of the working-class they lost to the Communists.

This telling shift in the electorate has played havoc with the doctrine, tactics, and organisational coherence of the party. They hold the balance between the Communists and the MRP, true

enough, and have thus been able to secure leadership even in spite of their inferiority. But they no longer know what they are after.

A Socialist party is founded necessarily, and in the narrow sense of the word, on a class basis. The idea of class, of the struggle between classes, is both its *raison d'être* and its method of operation. Once this basis is lost the party's energies run into the sand and lose themselves in a confusion of words and meanings. The 3½ million French electors who still vote for Socialist candidates may want social change, may feel opposed to what they understand by capitalism, may take pride in being "left wing republicans": manifestly, they do not want socialism. They are people who used to vote Socialist-Radical: small shop-keepers, white-collar workers (the only unions in which the Socialists retain a majority are the clerical organisations of bank and postal clerks, and some others) together with a large number of school-teachers and professional workers.

In these circumstances it is scarcely surprising that the party leadership has come to resemble something like a private *Interessengemeinschaft*, while the driving force behind the party's doctrines is now the negative hostility of anti-communism. It is the Communists who have campaigned for national policies of wages and production, led the miners to remarkable efforts, withheld from nation-wide strikes, bargained for higher wages and better living conditions, taken the initiative in demanding structural reforms such as the nationalisation of key industries; it is the Socialists who, more than once, have frustrated and hampered these efforts in a vain attempt to recover their former supremacy.

Contrast with British Labour

With many of the Socialist leaders the hostility to Communism has driven them far to the right, so far indeed that more than a few would probably be willing to throw in their lot with General de Gaulle—as, indeed, they did in 1945. The left wing of the party pull hard on the coat tails of the party's leaders, but with uncertain effect. While M. Moutet, the Socialist Minister for Overseas Territories, proclaims his loyalty to the principles of the French Union, of a union of states freely associated with each other, his actions are acclaimed by the colonialists of the Right. Internal contradictions have become chronic.

It will be clear from this that the comparison of the French Socialists with the British Labour Party is open to a number of important reservations. Ideologically, perhaps, the two parties still stand for much the same thing. Both are anti-capitalist, both anti-communist. But the composition of the two parties, clearly, is radically different. The Labour party stands firmly on its trade union backing, is still a party of the working-class. The French Socialists have weak trade union backing (the last Congress of the *Confédération Générale du Travail*, held in Paris last April, showed that the Socialist minority commanded about three-elevenths of the block votes cast); they can no longer be said to be a party of the working-class.

It is conceivable that this balance of forces may change. If so, this will not be by a shift of the working-class electorate in France back to the Socialists, but by the formation of a new Popular Front in which Socialists and Communists would join forces and grow strong together. For years now the French Communists have campaigned for a single left-wing party, the *Parti Ouvrier Français*, in which Socialists and Communists would sink their identity on a footing of equality. If that were to happen, the comparison with the British Labour Party would bear examination and might well bear the strain of a close alliance between the two countries.

Australia's Search for Oil

[FROM OUR CANBERRA CORRESPONDENT]

THE Australian Federal Government are convinced that oil in commercial quantities lies beneath the unsettled areas of the continent. In May, 1946, the Minister for Supply (Senator Ashley) announced that under Labour Party administration a new approach to the search for oil would be made immediately. Instead of subsidies to private companies the Federal Government would equip and staff the mineral resources survey section of the Supply Department more thoroughly, use the RAAF wartime aerial surveys with a new national mapping council and give private companies the greatest possible assistance technically.

In the year that has elapsed considerable progress has been made. Among private petroleum entrepreneurs there is such a degree of confidence that on the Sydney Stock Exchange this month shares in Oil Search, Ltd., a holding company in Australasian Petroleum Company Pty., Ltd. (comprising the Vacuum Oil Company Pty., Ltd., D'Arcy Exploration Company, Ltd.—a subsidiary of Anglo-Iranian—and Oil Search, Ltd.), rose from 7s. 10d. to 9s. 7d. and Papuan Apinaipi jumped from 6s. to 10s. 5d. For the first time, a systematic attempt has begun to produce detailed maps of Australia. This has developed from the wartime work of Australian airmen. Groups of RAAF air-

craft are being retained for this purpose, so that the geological and geographical charting may have as a base defence policy as well as the Chifley Government's anxiety to secure up-to-date data on the continent's resources.

Two senior officers of the Supply Department, with Dr. H. G. Raggatt, the Australian geologist, have recently returned from studies of oil resources in the United States of America and Canada. They found that there were in certain parts of the American continent, notably in Wyoming and Montana, sedimentary basins for which counterparts exist in Australia—apart from areas about which geological data is incomplete. Acting on the report of these officers; upon information submitted by the Shell Company and the Vacuum Oil Company derived from private investigations before the war; upon the opinions of visiting American Army men associated with oil as civilians, who helped to build aerodromes and other defences deep in the Australian interior, the Chifley Cabinet decided unanimously that previous disappointments and the loss of £5,000,000 in earlier searches should not deter them.

"It is true to say that most of these past investigations were superficial, that drilling was undertaken on too little evidence and that the technical oversight of the drilling was inadequate; . . . Nevertheless, the work of the past has not been altogether a waste, since a great deal of information has been gathered together, much of which could only have been obtained by drill-

ing. The history of oil exploration throughout the world provides a satisfactory answer to objections that absence of surface indications of oil on the Australian mainland makes further search futile." This was the statement made by Senator Ashley when he announced the Government's new policy.

The chief inspiration for the Government's new policy, which will cost the taxpayer more in technicians and technical equipment than the method of subsidies, lies in the fact that kerosene-bearing shale has been tapped in New South Wales since 1865. Production has steadily increased, making Australian production of shale and spirit, including benzine, benzoline, gasoline, pentane petrol and naphtha, a major item during the war. Oil was found at Lakes Entrance, Victoria, in 1945. In 1922, Mr J. L. Stevens, from London University, reported that the discovery of true mineral oil in "the striking geological area of Kimberleys, of Western Australia," might eventually make the district "one of the world's great oil fields."

The Strike at Roma

The Government is also impressed by the enthusiasm of scientists, who show that there are many areas with a considerable thickness of marine sediments worth testing for oil and gas possibilities. Conditions similar to rich oil areas on the American continent are found not only in the Tertiary rocks of Papua and New Guinea, but in several sedimentary basins on the mainland. The most important of these basins are: the Great Artesian Basin with its marine formations underlying its eastern border, the Main Coal Basin of eastern New South Wales, the small Tertiary basins in Victoria and South Australia, and the very large basins in the Kimberley and North-West districts of Western Australia.

In particular, the most encouraging signs of oil have come from Roma, in Queensland, where artesian bores, sunk in 1900 for water, struck natural gas (always associated with petroleum) sufficient to light part of the town. One well, drilled since, discharged millions of cubic feet of wet petroliferous gas, which yielded thousands of gallons of petrol sold to local residents. Experts now contend that Roma has not been satisfactorily explored, that only 10 wells have been sunk to bedrock, whereas in a similar field in America there would have been hundreds. Four Australian oil companies announced in March that they

would prospect 10,000 square miles in the Roma District. These companies are the Roma North Oil Co., the Australian Oil Development Co., the Roma Blocks Oil Co. and the Kalimna Oil Co. A joint report from these companies claimed that in the past drilling had not been deep enough.

The Government's own surveys in the area have convinced the Cabinet that success will follow geological and geophysical surveys with magnetic equipment and the reflection seismograph.

The Vacuum Oil Co. has set aside £1,250,000 for oil search throughout Australia, following the Government's new assurances of technical assistance. The Shell Oil Co. through its subsidiary, the Shell (Queensland) Development Co., Ltd., has spent £250,000 in the Roma area, including some work before the war. The company now plans to spend at least £750,000 there in the next four years.

The Prime Minister (Mr J. B. Chifley) has announced recently that all hindrances, including the dollar problem, will be set aside to expedite the import of essential equipment for the oil search. All recent maps of the area will be re-drawn. Commonwealth geologists will be made available on the spot and the Federal authorities will work in the closest co-operation with the Queensland State Government.

Although the oil search is now concentrated on Queensland, the RAAF will carry out a photographic survey of north-western Australia from Broome, beginning in June. Permits have been issued to the Australian Mining and Smelting Co. to search for oil in the Victoria River district of the Northern Territory, and the Minister for External Territories (Mr. E. J. Ward) has announced "the closest support for efforts to tap the undoubted oil resources of Australian external territories, especially Papua and New Guinea."

This search for oil is linked with the general policy of re-assessing Australia's natural resources. The Minister for Post-War Reconstruction and Minister for Defence (Mr J. J. Dedman) is directing all his Scotch caniness into the search for uranium "so that atomic energy may be used for industrial purposes and the Australian coal problem reduced."

Australia's present rulers have set their minds on developing the secondary industry, which alone can support a large population. They believe the fuel and energy needs can be guaranteed. They have high hopes of oil as abundant as the gold discovered in 1851.

Privileged . . .

Since 1834, we have imported the world's finest cigars. This experience has brought with it many privileges. For privilege it is, indeed, to be able to smoke and recommend to others a cigar so delicate in flavour and so delightfully mild as *La Tropical de Luxe*. Knowing that this cigar has met the demand of critical taste for over 70 years we can, and do, (as sole importers of this brand in the United Kingdom) recommend it unreservedly.

AMERICAN SURVEY

Recent Developments in PMH

(From an American Correspondent)

EVERYBODY, as is well known, talks about the weather, but nobody does anything about it. In the two years since the war began to end, much the same remark could be made about production per man-hour in American manufacturing industry. Everyone favours its rapid rise, hopes for it and predicts it, but the figures on PMH for all US manufacturing have stubbornly refused to budge appreciably from their 1941 level. This result closely parallels the experience of 1914-19, when PMH after the war's end turned out to be slightly lower than when the war began. But in 1920-22, the sequel to the wartime levelling of productivity gains was a series of three successive ten per cent yearly gains; PMH in 1922 was one-third higher than in 1919. After a slight interruption in 1923, another one-third gain was recorded by 1929, and still another from 1929 to 1939. Back in 1945 the reason for Mr William H. Davis's sudden removal from the chairmanship of the War Labour Board was said to be a statement he made to the press that PMH could be expected to increase by 50 per cent in the first five post-war years, and that consequently wage rates could be increased by 50 per cent in the five-year period without increasing prices. Mr Davis may have looked up the record of the years following World War I; at any rate, he was far from alone in expecting rapid post-war gains in PMH, which have been predicted almost as universally as a 1947 recession.

Whether the 1920-22 experience of a rapid rise in productivity is about to be repeated depends primarily on two sets of factors: the long-range development of technology and mechanisation which has accompanied the steady advance in PMH since before the turn of the century, and the temporary factors leading to deviations above and below the trend. The reasons and cures for these shorter-term variations must be sought in the attitudes of workers toward their jobs and in the occasional shortcomings of plant operation.

The state of workers' morale, of course, directly affects the efficiency of their operations. A feeling that the employer's (or the immediate supervisor's) attitude is one of fairness to and personal interest in the workers is indispensable to an enthusiastic attitude on the part of employees toward their work. The atmosphere of bitterness and distrust which has characterised employer-employee relations in recent years demonstrates widespread lack of such a feeling, and can scarcely have been conducive to enthusiastic effort.

High labour turnover is another factor contributing to reduced PMH. Dilution of the average level of ability and experience of a working force by inclusion of an abnormal proportion of "green" help means lower efficiency until the training and experience of the new workers is brought up to a normal standard. As greater selectivity in selection of new employees becomes possible, and as the average experience of employees increases with reduced turnover, such wartime losses in PMH as have occurred because of high labour turnover are likely to be regained quickly.

On the side of plant operations, the most frequent cause of erratic productivity records in recent years has been the erratic

flow of materials in many plants. The time lost in waiting for materials and parts is not only seriously detrimental to worker morale and costly in terms of payroll and idle facilities, but can seriously distort the record of PMH. Improvement has already been noted in the availability of many materials and parts that were previously hard to get, and substitutes have been developed for others; further progress in solving this problem is probable in the coming year, and a decline in demand, even a fairly modest one, would remove it in most cases.

The dilution of plant management which was forced by the rapid rise of war production, by the inroads of wartime conscription and by increased switching of supervisors from one employer to another also served to reduce plant efficiency, and hence PMH, during the war years. Lack of experience and training in supervisory work meant at least a temporary period of inept leadership and direction by many rank and file workers who found themselves suddenly transformed into supervisors. Here again, however, added experience and training, coupled with the weeding out of misfits and the return of experienced supervisors from the armed forces, indicate that whatever wartime loss of efficiency resulted from the dilution of plant management, either has already been, or soon will be, regained.

Several of these short-range factors point to the probability of improvement in PMH in American manufacturing over the next year or so. But despite the importance of the human element in the day-to-day and month-to-month operations of industry, there is little reason to suppose that the average inherent aptitude and effort brought to the job by millions of workers has been multiplied to any extent from one decade to the next. Yet in the forty years preceding World War II, PMH in American manufacturing more than tripled. Clearly this longer-range upturn requires some other explanation.

It is not necessary to look far among the nations of the world to see that more than willing hands and raw materials are required to achieve a high level of *per capita* output, and hence of *per capita* consumption. The missing link is machinery, and the whole complex of transportation, communications, technical skill, ingenuity and human drives required to bring machinery into being and to harness it effectively to production requirements. It may be of interest to recall that over the same period in which PMH in American manufacturing slightly more than tripled, installed horsepower per wage earner very nearly tripled, and that productive capacity can be approximated much more closely by the number of horsepower-hours available than by the number of man-hours available (granting, of course, the need for enough of both).

The outlook for progress on this longer-range sector of PMH is brightened by the fact that production of producers' equipment in the United States is now proceeding at nearly three times the average level of 1935-39, accompanied by the expansion of electrical generating capacity also at about three times the pre-war rate. While this high rate of capital formation may also be considered a factor of unbalance in the American economy, it appears likely to continue for at least some months to come, and will lay the groundwork for a later advance in PMH as the equipment now being produced is brought into operation. Similarly, improved processes developed during the war to reduce production time will come into more widespread use.

The greatest single step which could be taken toward a quick increase in PMH appears to be solidly blocked. This is elimination of the conscious restrictions on output per worker known in America as "featherbedding." These restrictions,

developed in part to maintain employment against the inroads of technological development and in part as protests against "speed-up" pressure by managements, are practised openly by some unions and informally (but very effectively) by others. These rules include such examples as extra trainmen going along for a ride (on full pay) in railroad operations, the required employment of standby musicians where recordings are played, the limitations on the width of brushes painters may use or the number of bricks a hod-carrier may carry, the prohibition of spray guns for painting, the establishment of low quotas as the agreed definition of a day's work, and the whispered "slow down, buddy," in the manufacturing plant. It has been variously estimated that PMH in American industry could be increased overnight by one-fourth to one-half or more by eliminating such practices and bringing workers generally up to standards demonstrated as practical and humane. There is, however, no early prospect of their elimination; in fact, they serve frequently to prevent technical innovations known to be practicable and economic in themselves.

A Southern Liberal

(From a Correspondent in Alabama)

THE failure of liberalism, for want of competent leadership, is being demonstrated in the southern state of Alabama. Mr. James E. Folsom took office as Governor of Alabama on January 20, 1947, under circumstances of extraordinary promise. Only 37 years old, a handsome giant towering six feet eight, he had been chosen last June by the greatest majority in the history of the state. He had campaigned on the most liberal platform ever offered in Alabama: minimum annual pay of \$1,800 for teachers; \$50 old-age pensions; a gigantic rural road programme; abolition of the poll tax; a new, modern state constitution; and reapportionment of representatives in the Legislature among the counties for the first time since 1901. Soon after his election people were acclaiming him as the most popular public figure in generations; his followers were calculating the exact year when he would sweep aside all opposition for the US Senate; and talk even went around that this sensational Southern liberal might make a fine running mate for President Harry Truman in 1948. But in the few months since the inauguration, things have gone badly. As the Legislature comes into regular session this month, the Folsom programme looks hopeless and the Folsom promise has faded.

"Big Jim" was reared in rural Coffee County, the son of a county politician. He spent one year at the University of Alabama, and one year at Baptist Howard College, in Birmingham, distinguishing himself at neither institution. After two years as a merchant seaman, and three more in small government jobs during Roosevelt's first administration, Mr Folsom in 1936 campaigned for Congress. He was soundly defeated. In 1938 he ran for Governor on a liberal philosophy, he ran again in 1938, but suffered a worse defeat. Having established a small insurance agency as a means of livelihood, the irrepressible country giant in 1942 was a candidate for Governor. This time, offering a clear-cut progressive platform and appealing shrewdly to labour and the small farmers, he astonished everybody by running second. Most of all he surprised the third candidate, whose followers actually gave Mr Folsom financial support in the belief he could do no better than fourth or fifth and might take votes away from the leader.

After brief wartime service in the army and then in the Merchant Marine, Mr Folsom offered himself as delegate-at-large (i.e., elected by the whole State and not by any one subdivision of it) from Alabama to the 1944 Democratic National Convention and captured one of the four places. In the convention he was one of only two Alabama delegates out of 22 who voted for Henry Wallace as vice-presidential candidate. For this he was denounced at home, critics charging that this was an open bid for support by the Congress of Industrial Organizations in his next campaign.

While PMH in 1946 for all US manufacturing industry averaged almost exactly the same as in 1941, the makings of future gains exist in both the short-range and longer-term factors mentioned. None of the shorter-range factors tends further downward, while some show prospects of early improvement, and will probably account for the first gains. Progress as rapid as the ten per cent a year pace of 1920-22 seems too high to expect; at the other extreme, the one-third advance from 1929 to 1939 is likely to be exceeded over the coming ten years. Within these limits of 3 per cent and 10 per cent per year, any of the middle figures seems an equally reasonable guess for the average gain over the next several years in manufacturing industry. These ratios, of course, are not applicable to the whole output of the country, in which manufacture—precisely because of its rapid progress—tends over the years to play a proportionately smaller role, and the various form of service occupations, where PMH cannot rise so quickly, a larger. And for the same reason, ratios of this nature can hardly be applied to the general level of wages throughout all occupations.

When the campaign for the Governorship started early in 1946, one candidate, Handy Ellis, lieutenant-governor and a middle-of-the-road veteran politician, seemed to hold an insurmountable lead. He had the support of many of the strongest organised groups, such as the teachers and the municipal and county office-holders. The only real obstacle for Ellis seemed to be Joe Poole, extreme right-wing voice of the big farmers and industrialists.

But Folsom was undaunted. Brandishing a corn-shuck mop and suds bucket, "Big Jim" delighted the voters with promises to scour out the State capitol in Montgomery. Stopping often on his campaign tours to let his "Strawberry Pickers" string band play hillbilly tunes, he capitalised on the prevailing post-war dissatisfaction with those in office. He promised to throw out "the old ring" and run the government for the people—"for you and you and you," he would say, pointing around the audience. He talked very little about his platform, preferring to generalize on the virtues of his mother's cooking. He cannily avoided attacks on any individual or candidate; Ellis and Poole hammered away, each seeing the other as his major adversary. But when the votes were counted, Folsom held a strong lead in the field of five, Ellis was second and Poole out of the race, a poor third. In the run-off (the second election between the two leaders), Ellis pictured Folsom as the candidate of the CIO, who would be controlled "by Sidney Hillman in New York." "Big Jim" denied nothing, lumbered right ahead with his mop and bucket, his string band, and his recital of joys on the farm. The people gave him 205,000 votes with a record-breaking victory margin of 60,000.

It was a stunning defeat for machine politicians and conservative business. Mr Folsom won with few, if any, political obligations to selfish interests. He won without a word against labour, without a sneer at the Negro, and with a liberal programme previously regarded as unpopular in the conservative-voting South. Here was a political miracle, a chance to prove that with forthright liberal leadership the South could advance rapidly. But did "Big Jim" mean what he promised, and did he possess the capacity to get the promises carried out?

While Mr Folsom's good intentions are now accepted, the failure of his administration began long before he ever took office. He spent time in night clubs and on Gulf of Mexico beaches that should have been spent meeting members of his legislature and whipping together a coherent administration programme. Continuing his campaign practice of kissing every pretty woman in sight, he found that what had seemed to the public jolly showmanship in a candidate on the hustings was vulgar exhibitionism in the governor-to-be. A Justice of the US Supreme Court advised him: "If you are a conservative in politics, you can live as gaily as you please and get by with it."

"AMERICAN SURVEY" is drawn from three sources. Articles described as "From Our US Editorial Staff" are the work of a small group of regular correspondents, resident in the United States. Articles with some such attribution as "From An Industrial Correspondent" or "From A Correspondent in Ohio" are from outside contributors. Everything printed without attribution is prepared in London.

but if you choose to be the people's man, you must walk the straight and narrow path." Folsom laughed it off at the time, but he gets the point now. Matters were not helped by a speech in which he referred to "the lying newspapers" of Alabama. His lack of love for the press was understandable—only three papers out of more than 150 dailies and weeklies had supported his candidacy. But after the election most editors were ready for peace; Folsom's "lying newspapers" speech sounded like war.

Following a tumultuous inaugural parade, which the 67 counties made impressive with floats emphasising education, Governor Folsom proceeded rapidly with the engineering of his downfall. He expressed dissatisfaction with the quality of the Executive Mansion, and with the size of the Governor's yacht at Mobile. He placed many new names on the payroll at fancy salaries, not a few of whom were members of his own family. He permitted his top executives to circumvent the State Civil Service in making appointments to pay off political debts. He himself named obscure inexperienced young men to posts that required reasonable experience and maturity. He demanded of the Legislature an increase of more than \$57 million annually in State appropriations for various good causes—principally education, welfare, and roads. To provide funds on this scale, he suggested taxes of many kinds, affecting virtually every organised group in Alabama. Conservatives for the most part received all this in silence, but prepared for the showdown. It came unexpectedly.

Alabama has long suffered politically and economically from an undercover alliance between the big industrialists (popularly known as the Big Mules) of Birmingham, many of them representing Eastern capital, and the Farm Extension Service at Alabama Polytechnic Institute, Auburn. The Birmingham financial interests, politically helpless without some farm support, found it in the agricultural and mechanical college, whose executives have been able to control the leading farmers' organisation, the Farm Bureau, turning its influence away from co-operatives, cheap farm credit, and liberal politics. Of course, this group had fought Governor Folsom. He moved to clean house.

With his first objective the control of Auburn's Board of Trustees, the Governor made appointments to fill three vacancies. These, together with members already friendly to him, were enough. The new board met, heard charges against the offending Extension Director and his Assistant, but decided to give the defendants a few weeks to prepare their case. Then the storm struck. The Farm Bureau president initiated court action restraining the three Folsom appointees from service on the Board until the Senate confirmed them. Senate approval had always been perfunctory in such cases. Whereupon Governor Folsom, on just two days' notice, called the Legislature into special session to confirm his appointments and consider a new State Constitution. He had not polled sentiment. He thought the Legislature would bow to the people's Governor.

When the Legislature gathered in Montgomery, the House and Senate refused even to consider a new constitution. In Senate manoeuvres related to the Auburn trustees the Governor never had more than six of the 35 votes. He had to withdraw his nominations and send up others satisfactory to the opposition. After only two days the Legislature adjourned without even notifying the Governor.

This abortive special session ended the prospect of a militant liberal Folsom administration. The "Big Mules" took heart. Some of them, overly exuberant, began talking of impeachment, but wiser heads said, why risk public indignation when the situation is in hand? To-day the *status quo* at Auburn seems assured, the legislature is under reactionary control, and the Folsom rebellion is dormant if not dead.

To liberal Alabamians, many of whom did not vote for Folsom because they feared his inexperience and untried personal

qualities, the débâcle is disheartening. Accustomed to conservative if not reactionary state administrations, by a strange political upheaval they were handed a liberal Governor; now they wish they did not have him. His failures may discredit the progressive cause in Alabama for years. The State's two liberal US Senators, Lister Hill and John Sparkman, openly supported Folsom. Unless "Big Jim" makes an unexpected come-back, his weight may be a heavy drag when Senator Sparkman runs for re-election in 1948, and Senator Hill in 1950.

American Notes

Mr Acheson's Swan Song

Mr Dean Acheson was entrusted last week with the task of acquainting the American public with the magnitude and the duration of the world's economic needs, and of driving home the unpalatable conclusion that only the United States can, by meeting those needs, avert an economic and political crisis of the first order. In Mr Acheson's analysis, the prime facts of international economic life are the staggering predominance of American production which has followed the destruction of the war, particularly as it affected the workshops of Germany and Japan; the slow rate of world recovery, delayed as it has been by "Acts of God" like last winter's ordeal; and the world's desperate need for American goods, for which it cannot pay for several years. This demand is reflected in expected American exports of \$16 billions in 1947, while imports are expected only to reach \$8 billions. Taking all other means of payment into account, there will still be an international dollar deficit of \$5 billions in 1947, which is being covered by emergency financing by the United States. But these appropriations will run out toward the middle of 1948, and there is no prospect that the need will have diminished. To a sympathetic audience of cotton exporters, Mr Acheson submitted a five-point programme. Every effort must be made to encourage imports into the United States; the United States must be prepared to continue financing foreign purchases of American goods, through the Export-Import Bank, the World Bank, and, in cases which cannot be met by these institutions, by direct loans from the American government. Every measure must be taken to rebuild the German and Japanese productive machines. Meanwhile, because even American resources are not limitless, the United States should direct its aid to countries where it will promote economic and political stability and free institutions. In order to carry out this programme, it will be necessary to renew this June those domestic and export controls which are needed to assure the movement of goods out of the United States and into the right hands abroad.

This in substance, is the new foreign policy which Mr Marshall brought back from Moscow in lieu of a Russian settlement; though there is no reason to believe a political reconciliation would have solved the growing dollar shortage. For the first time, it puts the facts of international life in their proper perspective. Mr Acheson's speech is a synthesis of the President's speech at Waco, and the Truman Doctrine, with the further fundamental recognition that the contributions America has already made to European recovery can only be cut short at the cost of an economic and political crisis of incalculable proportions. The Administration has thrown down the gauntlet to the whole economy drive in Congress (in passing, it might be noted that Mr Acheson is leaving government service precisely because it does not pay enough to keep its best men). It is trying to stem the tide that is running against tariff reduction. It points a stern finger toward heavier burdens abroad at precisely the moment when Congress is most irritated and frustrated by the delays in tax reduction at home. If the much advertised recession arrives this year, the opposition to both these proposals will harden to concrete. That it was Mr Acheson, and not Mr Truman or Mr Marshall, who made the speech, suggests that no very hospitable reception is expected.

The first responses show that commentators, still bemused by the Truman Doctrine, have with few exceptions seized upon the "selectivity" of foreign aid, rather than the magnitude of the gigantic underwriting proposal, which if the policy were wholly accepted, would probably run to an annual figure of \$5 billion. To convince Congress of the need for these vast new commitments, nothing less than a fully bi-partisan policy will be needed, in the sense of a policy agreed upon by the leaders of both parties, rather than an agreement not to make party profit out

of foreign issues. Yet many observers report a deterioration, in recent months, in consultation and co-operation between the Administration and the Republican leaders on foreign affairs, and there is every certainty of a tightening of the party lines over domestic affairs. The solution to the biggest issue which Mr Truman has ever laid before the American people lies across a steadily widening political divide. If the world's need were not so pressing that some alleviation must be found, it would be hard not to regard Mr Acheson's swan-song as a noble might-have-been, a trial balloon punctured almost before it has been launched.

Bank Loan Expansion

The biggest peacetime boom on record has brought a vigorous expansion of bank loans which, during 1946, recorded the largest yearly gain (\$5 billion) since the inflationary period of 1919-20, and to the highest level attained since 1930 at nearly \$32 billion. Over the first quarter of 1947, moreover, the pace of expansion was equally rapid, on the basis of partial figures supplied weekly by reporting member banks. At this rate, the 1947 record would surpass the all-time loan peak of \$36 billion recorded in 1929. But the latest business reports throw considerable doubt on the life of the upward tendency.

The 1946 figures, which were discussed in the March *Bulletin* of the Federal Reserve Board, mark an important, though far from decisive, reversal of wartime banking trends. The *Bulletin* notes that the importance of bank loans, both in relation to gross national product, and to the balance-sheet totals of the banks, is today far below that of 1919-20, or 1925-30. The severe process of liquidation which began in 1929 had four years later eliminated two-thirds of the earlier volume. Not until 1941 did loans again develop vigorously, and wartime activity reflected in a very large measure the role of the banks as underwriters to the Government deficit. "Bank investments consisting primarily of Government securities are now the major form of bank assets and account for about three-quarters of total commercial bank credits outstanding, compared with one-quarter in 1940." Preliminary 1946 figures, with those of earlier years, are compared below:—

Dec. 31 :—	ALL COMMERCIAL BANKS (in million dollars)			Deposits
	Loans	Investments		
		US Govt.	Others	
1939	17,243	16,300	7,124	57,702
1941	21,711	21,788	7,223	71,248
1943	19,117	59,842	6,136	105,923
1945	26,076	90,613	7,331	150,227
1946	31,250	74,900	8,050	138,300

Expansion in 1946 covered all the main groups of loans, apart from farm loans, which, with the prosperity of the agricultural community, showed no significant change, and loans against security operations, which totalled about \$7 billion at the close of 1945, and which were almost halved in the course of 1946. The ban on margin trading in Wall Street through most of 1946 was partly responsible for the decline, but the main contraction followed from the reversal of the wartime pattern of credit expansion in the shape of Government securities. The resultant uncertainty concerning short-term money rates was sufficient to bring about a heavy fall in loans on Federal securities which had accounted for no less than \$5 billion of the end-1945 total.

Funds for Industry

The feature of 1946, however, was "the widespread revival in demand for credit by commercial and industrial concerns," particularly from June to December. The rise in the loan total for this group was almost 50 per cent and carried it to a new peak level of \$14 billion, accompanied by a substantial advance in real estate and consumer credit advances. This business loan in volume deserves emphasis in the light of the vast growth in business assets from 1940 onwards, and of the extremely conservative financial policy adopted by industry—no less than \$33 billion was put to reserve in the years 1939-46 out of net corporate profits totalling \$68 billion.

It has now become strikingly apparent that the growth in liquid assets (far from evenly distributed) has been by no means sufficient to cope with the problems of expansion within a period of strong inflationary pressure. The physical volume of production is 75 per cent higher than that of 1939, and the wholesale commodity price-level has more than matched this pace. Heavy costs for re-equipment, inventory growth, trade credits, even strikes and

transport delays, have contributed their quota to the demand for working capital. These are normal features of any inflationary period. So also are those activities less directly concerned with productive effort, and concerning which the *Bulletin* notes:—

Some funds were used to bid for scarce material and labour resources or to swell demand for goods in short supply without resulting in any substantial addition to the national product. Some were encouraged by inflationary price advances to seek loans for inventory speculation, and these loans not only added nothing to production, but tended to reduce total output.

In any event, the banking system in 1946 met a major part of the business demand for fresh working capital, although security issues, for new capital, soared above any recent year:—

DOMESTIC CORPORATE ISSUES* (in million dollars)

	Notes and Bonds	Stocks	Total
1937	817	408	1,225
1939	287	97	383
1941	889	173	1,062
1943	282	92	374
1945	607	657	1,264
1946	2,038	1,468	3,506

* Excludes refunding operations.

Low money rates have put a sharp premium on bond financing. But the stock market collapse of last autumn put a heavy brake on security issues. Through the summer of last year, when corporate issues for new capital were running at an annual rate of fully \$4 billion, preferred and common stock offers exceeded the dollar volume of notes and bonds offered. More recently, there has been evidence of a greater demand for more permanent finance, but the scales still seem to be weighted against any marked revival in equity financing.

The Labour Bill

The Senate, by a vote of 68 to 24, has now passed its own version of the reforms necessary to redress the "bias toward labour" of the Wagner Act of 1935. It begins to look as though Mr Taft may yet persuade the Senate to join the House in passing a labour Bill over the President's veto. The final vote in the Senate was larger than was suggested by votes taken on the "stiffening" amendments proposed by Mr Taft from the floor. One of these, which would have allowed private employers to secure injunctions against unions, was withdrawn entirely in the interests of Republican solidarity. Another, which would have curbed industry-wide bargaining, was defeated by 44 to 43. On this vote, 16 Republicans joined the Democrats, while 12 Democrats supported Senator Taft. Two other amendments adopted restrict and supervise corporate contributions to union welfare funds (the United Mine Workers' Fund is said to have reached \$10 million since last year) and prohibit union coercion of members.

Despite more victories than defeats for Mr Taft, the Senate Bill remains very much less punitive than that adopted by the House, which seeks to outlaw industry-wide bargaining, jurisdictional and secondary strikes, the collection of union dues by employers, mass picketing, and the election of Communists as union officers. The two Bills are alike in banning the closed shop, in giving the government the use of the injunction to delay serious strikes, in establishing a new mediation board, in listing unfair union practices, and in requiring financial reports by unions.

Even such friends of labour as Senator Pepper have agreed to the provision requiring a 60-day cooling off period and giving the government the power to secure injunctions to deal with nation-wide strikes like that which may break out in coal after June 30. The central question is whether the Bill which emerges from the conference between the Senate and the House will retain so many odious features that the President will feel compelled to veto it, and leave the government without powers to halt large-scale stoppages, which, as in the case of coal, might undermine the foreign policy of the Administration. This would be throwing the baby out with the bath-water. Mr Truman will have to balance considerations like this against the damage the Bill may do to labour relations, and to his own political future. Should the President decide to veto, and the veto be sustained, the Administration would then press for a mild measure already sponsored by Senator Murray. The vote in the Senate does, indeed, suggest that a veto is unlikely to be upheld. But it is never possible to assume that every Senator who may have voted for a Bill "for the record"—that is, for the edification of his constituents—will necessarily persist in voting it on to the statute-book in the face of a Presidential veto.

THE BUSINESS WORLD

Housing and Industry

THE housing target for 1947, announced, after repeated delays, on the very eve of the fuel crisis, has been abandoned. The target then, or at least the hope, was to complete 240,000 permanent houses this year and to make a start on a further 200,000 for completion in 1948. This target is now demonstrably unattainable, but no new one takes its place. The programme now, is much less ambitious; it is also very vague. "The object," so runs the unobtrusive statement which accompanies the March housing returns for England and Wales, "must be to complete this year as many as possible of the 218,783 houses already under construction." Generals January and February have secured a clear tactical advantage over the builders, as over other sections of industry, but it will be some time before the full effects of their winter offensive can be measured.

Their victory is not, indeed, unexpected. Even in January it was clear that the programme erred on the side of optimism. The target, or the "reasonable estimate," to quote the official phrase, was a rather uneasy compromise between wishful thinking on the one hand and cautious planning on the basis of known trends, on the other. It was an invitation to the building industry to show what it could do; but it was evident even then that success would turn less upon the efforts of the building workers themselves than upon the output of components and materials, already depressed by shortage of fuel. Labour had ceased to be the limiting factor, as the "Economic Survey," issued in February, frankly admitted when it discussed the possibility, should materials run short, of preventing dispersal of the labour force by relaxing restrictions upon maintenance work.

These second thoughts were more realistic than the first, but even they did not envisage February's extreme dislocation. Before the builders could give any earnest of their response to the Government's appeal, January's optimistic assumptions about the flow of building materials to sites had been hopelessly upset by the severe weather, the fuel crisis and the disappointing level of timber imports. Table I compares the actual output of certain representative building materials in the first three months of 1947 with the estimated production for the whole of 1947, on which the original housing programme for the year was based.

TABLE I.
ESTIMATED TARGET OUTPUT FOR 1947 AND FIRST QUARTER'S PRODUCTION

	Bricks	Cement	Rainwater Goods	Plasterboard
	(mn.)	('000 tons)	('000 tons)	('000 sq. yds.)
1. Year's estimate*.....	5,300	7,000	80.0	48,000
2. 1st qtr's output.....	901	1,108	15.9	7,802
3. 1st qtr. as per cent of year's target.....	17%	14%	20%	16%

* Housing programme for 1947.

In no case, it will be seen, is the quarter's output better than one-fifth of the year's target, and these instances are typical of other materials. Even with a recovery in output and some increase in capacity, it is clearly impossible to expect the key building materials, such as bricks and cement, to make up their arrears of production before the building season slackens off in the autumn. The trend of output and the drawings on stocks

are set out in tables II and III. A selection of the most important materials has been made from the *Monthly Digest of Statistics*, comparing production in the critical first quarter of this year with that in the corresponding period of 1946. Table II shows that manufacture was severely interrupted in February, but had made a partial recovery by the end of March. On the other hand, the stoppage of building construction, caused both directly by the weather and by the dislocation of transport, prevented any large depletion of stocks. Indeed, at the end of March they were in many cases higher than in January, but it needs to be emphasised that supplies of key materials such as bricks had reached famine levels by the eve of the February hold-up. Obviously, the building industry this year will be even more dependent on current production than it was in 1946.

Building activity, then, will be geared to the flow of materials direct from the kilns, foundries and timber seasoning ovens. The substantial expansion which is still needed to restore production of materials to around the January levels, when coal supplies were already irregular, is perhaps attainable. But whether a steady improvement can be expected beyond that level will depend upon the extent of secondary dislocation from the fuel crisis, and especially upon the chances of maintaining a smooth and balanced flow of materials and parts to the manufacturers of building components, and on the supply of coal.

The extent of secondary dislocation cannot yet be assessed. But a major consideration is that the flow of materials to the sites comes from a large variety of industries, it would obviously be unwise to expect a smooth balance to be rapidly restored. The effects of the summer coal allocation are hardly less imponderable. In his announcement of the general scheme for industry, Sir Stafford Cripps made it plain that the building materials industries will get an extra allowance to match the large expansion of production they have achieved since last summer, after their long and difficult climb through the post-war transition period. A global tonnage will be available, but the effect upon production will depend upon its detailed allocation to individual firms. As there cannot be any rule-of-thumb formula related to a basic period, there may perhaps be scope for some discriminating system which would concentrate part of this allocation upon those firms and industries which might be expected to make the best use of it. While these uncertainties remain, it will be impossible to guess either the extent of the probable shortfall of output below the original 1947 estimate, or the materials which are likely to be most affected. The facts, however, so far as they are known, clearly require a severe scaling-down of the original estimates of new housing accommodation to be completed and made available by the end of the year.

The target, then, had become demonstrably unattainable. But to admit that is not simply a confession of failure. It is an important administrative act, indispensable as a first step towards ensuring that the new accommodation effectively made available this year will be as great as the limited resources permit. The original target of 240,000 houses to be completed in 1947 was only 37,000 more than were actually under construction at the beginning of the year, and there was from the outset a clear risk that the programme would suffer, though in less degree, from the major weakness of last year's effort—that

of spreading the available resources over too large a range of building in progress, with the result that the optimum of completed work was not achieved. Now—or, rather, at the end of March—the number of houses under construction is 218,783, but it is already clear that not all of these are likely to be completed this year. To provide the maximum of actual accommodation rapidly, it was obviously necessary to face the facts frankly, to soft-pedal work which stands little chance of completion, and to restrict the starting of new work to projects of the highest priority. The policy, now, therefore—and it is a sensible policy—is to concentrate, without any specific target, upon completing as many as possible of the 218,783 houses already begun. Local authorities will be discouraged from entering into new contracts for houses, in an effort to restore the balance, at present lacking, between the rate at which houses

TABLE II: STOCKS OF BUILDING MATERIALS

	Bricks	Cement	Asbestos Cement Sheet	Rainwater Goods†	Stoneware Pipes
	(mn.)	('000 Tons)	('000 Tons)	('000 Tons)	('000 Tons)
1946 Jan.	140	414	28.1	3.2	23.8
Feb.	142	374	22.8	3.3	23.5

† Excluding aluminium goods.

are being licensed or on which construction has begun and the rate at which houses are being completed. The tap is being turned off—or, at least, severely turned down—at the beginning of the housing pipeline.

This very necessary effort to prevent uneconomic diffusion of resources available for housing has coincided, moreover, with rising priorities for industry and industrial building. Bricks, cement and other materials are urgently needed now for new power stations. The railways need more timber for sleepers. More factory space and accelerated industrial re-equipment are wanted to speed the export drive, and to relieve the balance of payments in other ways. But there are fewer materials to go round. Who is to go short? The housing decision has no doubt been taken on its merits; but the crucial issue which it poses is whether more than a moderate housing effort can for the present hold its own in the scale of national priorities. The sand in the dollar hour-glass is running out fast.

*

The admission that the original housing target is, in any case, unattainable clearly affords an opportunity for second thoughts. Now is the time to review the relative urgencies of social and industrial investment, to weigh again the crying need for dwelling houses against the crying need for power houses, and industrial equipment more generally. The inescapable slowing-down of the housing effort may, in any case, bring some easement for the industrial programme, but, apart from that, it would be remarkable if the balance between the two which seemed right last summer, before the extremities of the balance-of-payments problem became apparent, were right now. There was, indeed, a hint in last week's housing statement of a recognition that industrial priorities are becoming increasingly important.

But to say that the time is ripe for review is not to offer any dogmatic suggestion of the order of priorities. The diversion, especially temporary diversion, of resources from one urgent task to a more urgent is in any case very difficult to achieve. Even if building materials specifically for housing are so scarce in some areas that industrial buildings ought obviously to take precedence, and even if building labour in other areas becomes unemployed through a temporary cessation

of work on preparation of sites for houses, there is no assurance that the temporarily redundant labour in house building will promptly join contractors engaged on industrial work. In industrial areas, many of which have suffered heavily from bomb damage both to properties suitable for residential purposes as well as to industrial premises, diversion of resources would in any case present particular difficulty. But these are precisely the areas in which, *prima facie*, there would be least justification for switching labour to industrial work, even granted a more stringent approach to housing priorities. Indeed, one lesson from this bottle-neck situation in building materials is surely that every effort should be made to ensure that optimum results in terms of new accommodation are being achieved from work on renovation and conversion of existing properties suitable for popular housing. The pull which conversion work is already exerting on the distribution of the labour force is evident from the latest figures. In January there were 952,000 male workers in the building industry. Of these 256,000 (27 per cent) were building new houses, 227,000 (24 per cent) were at work on converting and repairing existing houses, 26,000 (3 per cent) were on other damaged buildings and 443,000 (46 per cent) on industrial, agricultural and public buildings.

In all the circumstances, it may be that measures to divert existing resources, whether of materials or manpower, from housing to industrial expansion would require so selective and comprehensive a system of licensing and rationing—even if this could be practicable without direction of labour, which is ruled out on political grounds—as to be scarcely worth while, when account is taken of administrative frictions and administrative manpower. Even so, the labour force available for the industrial building effort should be larger than the original investment targets indicated. According to the housing White Paper, the target employment figure for December 31st next was one million men, of which 320,000 would have been on permanent house construction. In January last, the actual figures corresponding to these were 952,000 and 256,000 respectively. It is quite clear that the building industry as a

TABLE III: STOCKS OF BUILDING MATERIALS BY VOLUME.

	Bricks	Cement	Plasterboard	Softwood Timber
	(mn.)	('000 tons)	('000 sq. yds.)	(Th. Standards)
1946 January	913	289	357	567.2
February	825	261	449	533.6
March	712	257	429	498.7
1947 January	361	263	399	171.8
February	347	244	215	144.1
March	375	253	430	144.1

whole will not require all the 50,000 recruits which were scheduled in the original programme for this year; yet some 34,000 of them are already in the training pipeline. Obviously there should now be an easing off in the building training programme. The aim should be to get the best results from the existing (or even a reduced) housing labour force, first by better incentives designed to increase output per worker, and secondly, by ensuring that labour is concentrated upon work that will produce new accommodation this year.

The housing prospect, as it emerges from last week's decision, will inevitably involve much hardship for many families. But the question now is not simply whether there should be more accommodation for the people in 1947 than in 1946 but whether a sacrifice of extra accommodation in 1947 and 1948 is necessary to ensure minimum reasonable supplies of food, clothing and raw materials in 1949 and 1950. Only the fainthearted would suggest now any longer-term pruning of the housing programme. But it may become apparent very soon that there is a stark choice between food and shelter—or, rather, between maintenance of present standards of essential consumables and better standards of accommodation.

Britain's Larder

OBVIOUSLY, the primary concern of any Government must be the assurance of adequate food supplies for its people, and adequacy implies not merely an appropriate calorific value, but bulk to allay the pangs of hunger and variety to ward off listlessness and apathy. In these wider terms there is no doubt that the British food position has deteriorated seriously in the past two years—for reasons which, admittedly, have been largely beyond the control of the Government—although the calorific value of the ration has been maintained. But, in last week's debate in the House of Lord's on the food situation, Lord Woolton went so far as to claim that the country is in danger of a food crisis "that will be as serious as was the coal crisis"; and the public has not, apparently, been altogether reassured by the bland, almost complacent, denials from the

ESTIMATED STOCKS OF FOODSTUFFS AS AT END OF MARCH, 1947.

	Average Weekly Consumption Jan.-Mar., 1947	Estimated Stocks at End of March, 1947	Number of Weeks' Supply
	Tons	Tons	
Butter	4,890	10,000	2
Margarine	6,350	22,000	3½
Cooking fat	3,280	20,000	6
Cheese	3,980	20,000	5
Meat (carcase)	32,100	110,000	3½
Tinned meat	9,020	160,000	17½
Bacon and hams	4,080	10,000	2½
Flour	92,500	300,000	3
Sugar	30,100	530,000	17½
Tea	3,980	50,000	12½

Government spokesmen. The fact that the Minister of Food continues to withhold the detailed statistics of the British food position from the public is hardly calculated to alleviate the uneasiness. There are still all too vivid recollections of the assurances given by the Minister of Fuel and Power on the very eve of the fuel crisis.

Reticence about food stocks was, of course, imperative during the war, but the habits justified by security considerations still persist. Mr Strachey now defends his attitude on the ground that the countries with which Britain bargains for food supplies would be in a more favourable trading position were they to know the state of the British larder. But what country—other than the Dominions, which are doubtless informed of the true stock position—has not raised its prices against the United Kingdom? It is, of course, coincidental that by not publishing this information—not to mention the lack of financial information—the Ministry of Food, like the Ministry of Supply and the Board of Trade, effectively precludes any informed and constructive criticism of the Government's trading operations. At a time when food subsidies cost around £400 million per annum, the lack of opportunity for such discussion, both within and without Parliament, is surely indefensible.

The Government's reply to Lord Woolton was that the danger period has passed, or is passing, and that it does not "anticipate any disastrous increase in food shortages" in the ensuing months. There may, however, be temporary cuts in the rations of certain commodities, which will be compensated by increases in others. To show the position in perspective, an attempt has been made, in the table above, to estimate the level of Government stocks of food as at the end of the first quarter of 1947.

It must be emphasised that these figures are not official; they are merely estimates framed on the basis of data published in the *Monthly Digest of Statistics*. Where no initial pre-war stock figures were available, estimates have been obtained from the trade, or made independently, based on information given

in answers to Parliamentary questions. Although the figures are subject to an incalculable margin of error, they are nevertheless thought to be reasonably reliable.

It will be seen that the position at the end of March was far from satisfactory. There was less than a month's supply of butter, bacon and hams, flour, carcase meat and margarine; less than two months' stock of cheese and cooking fat, and three or more months' supply of tea, sugar and tinned meat. The Government claims—at first glance, reasonably—that, as overseas shipments no longer have to run the hazards of hostile attacks, stocks in this country need not be maintained at such high levels as were necessary during the war. Experience of the post-war transition period has shown, unfortunately, that the possible dislocations of supplies through strikes and other disturbances may be equally embarrassing. It would seem that, if current ration quantities are to be assured, stocks for at least 2-3 months need to be maintained in this country.

The figures given in the table relate to Government stocks only. In the case of flour, the inclusion of wholesalers' stocks would probably add a further 100,000 tons to the figure given, making 400,000 tons in all. Similar figures for sugar and tea are estimated at 600,000 tons and 70,000 tons respectively. Some of the stock figures are rather surprising. It was generally thought that the butter and bacon stocks were higher than 2-3 weeks' supplies, while tea stocks were considered to be at a rather low level, particularly as consumption exceeded imports during the first three months of 1947 by some 10,000 tons. Moreover, it was reported that the Minister of Food was anxious about the tea ration in view of the strike at Calcutta. There has been a heavy off-take of meat from stocks in recent months. It has been officially announced that for the six months period October-March, consumption exceeded supplies by 151,000 tons. Although the three-week stock of flour may seem abnormally low—Lord Woolton gave it as five weeks' supply—the figure is thought to be correct, as it represents an increase of some 100,000 tons on the end-of-year stock level; it will be remembered that, in January last, Mr Strachey thought it might be necessary to reduce the bread ration. Assuming that the published data are accurate and comprehensive, the figures in the table can vary from the true position only by the amount of any error in the initial stocks or by unaccounted losses and gains.

To assess the future position it is necessary to consider prospective supplies. But here, too, the Ministry of Food has been very reticent—it has preferred not to give any exact details of quantities of food purchased under contract. According to Lord Henderson, the chief Government spokesman in last week's debate, the future supply position of wheat is considered to be satisfactory, with major shipments already arriving from Canada, 500,000 tons from Argentina and 300,000 tons promised by the United States during the months of July-September. These quantities should bridge the gap until the new crop arrives. The butter and bacon rations also seem safe, in spite of the low level of stocks at the end of March. Shipments of dairy produce from the southern dominions will presumably be tailing off, but supplies should be arriving from Denmark and Holland, with additional shipments of bacon from Canada. Although the world position of oils and fats remains difficult, it is understood that adequate supplies have been contracted for to maintain the present level of production of margarine and cooking fat. The sugar position also seems satisfactory. Indeed, provided that supplies from hard currency areas do not have to be curtailed, there is at least a prospect

that civilian rationing of sugar might be discontinued. The present stock position, considered in relation to prewar consumption, certainly suggests this.

The tea stocks at the end of March appear to be adequate, but they have no doubt been reduced during April and possibly during May, too, owing to the hold-up of shipments from India. Moreover, future supplies are by no means secured. There was a poor response from Ceylon to the Ministry of Food's contract offer, and present indications show no better prospects from India, unless the United Kingdom agrees to a substantially higher price. The position is made all the more difficult because of the lack of supplies from the Netherlands East Indies; no large-scale shipments are expected from there until 1948.

Meat has the darkest future. Nearly all the imported supplies come from the southern hemisphere and the normal shipping season is drawing to a close. Moreover, there is a small chance of alternative supplies from either Europe or America, although the Ministry of Food has made purchases in both continents in an attempt to bridge the gap. Home production, which in any case will not be available until the late summer, is expected to be reduced by 130-140,000 tons owing to increased killings last autumn and the loss of sheep and lambs this winter: the total production is estimated at about 580,000 tons. In 1946, home produced meat formed 45 per cent of total supplies. A reduction, at least in the carcase ration, seems inevitable in a few months' time, with possibly a compensating increase in tinned meat.

It would seem, therefore, that the food crisis is passing and that the prospective position of most foodstuffs except meat is

satisfactory. If the estimated stock figures are correct, the Government certainly took a gamble at Easter—and won. But the position will require constant vigilance. The current ration quantities should be at least maintained, but the stock position in general is such that temporary shortages may occur if supplies do not arrive according to schedule. The policy of taking a risk by maintaining rations can be justified so long as it is not adopted so often so as to become the rule rather than the exception. The Ministry of Food undoubtedly have accurate details of stocks with wholesalers and retailers, as well as food in transit or in ships docked but not unloaded. Such supplies form an emergency reserve. With large quantities in dock and in transit and small quantities in store, the risk may not be so great as it seems.

But the most depressing feature is the fact that there is little chance of any increase in rations—except, perhaps, in sugar. The Government, indeed, appears to concern itself only with obtaining sufficient supplies to maintain them; additional quantities will be purchased only if the price is favourable. This policy presumably reflects the preoccupations with the balance of payments problem, besides being a necessary corollary to the policy of subsidising food prices and stabilising an out of date index number, which the Government still seems to be pursuing. To enable the low-income groups to purchase adequate quantities of food is socially admirable, but it does not necessarily follow that the method of subsidies is the best one to adopt. Again, the system of bulk purchasing has many advantages. But it is unsatisfactory, to put the issue at its lowest, if such a system involves the withholding of the only information by which its efficiency can be judged.

Business Notes

The Creditors' Chorus

Mr Dalton's outspoken declaration that Britain's war debts must sooner or later—and sooner rather than later—be scaled down, has produced the expected response from the leading creditors. Their reaction has embraced all the emotions from anger to apprehension, with just a touch of sympathetic understanding in one solitary case. India, to judge from unofficial but obviously inspired comment, is determined not to be "brow-beaten" by Britain, and will "resist to the utmost" any reduction of Indians, and "no fair-minded person" would "what is justly due." These claims may indeed be based on blood, tears and sweat, but India's counterpart is a credit, whereas the counterpart of Britain's blood, tears and sweat (and, it might be added, of the human and physical losses through air attack) is a sterling debit. If India appeals, not to the letter of the rights emerging from contracts entered into in the stress of war, but to justice, there is no doubt about the direction in which the scales are tilted.

Egypt, it seems, is prepared to go even further. It has the effrontery to treat Britain as a potential bankrupt upon whose assets the creditor is fully entitled to foreclose. The Finance Minister has not specifically repeated the threat to descend upon British share holdings in the Suez Canal and the Anglo-Egyptian Oil Company, and has indeed declared that this idea originated with the Under Secretary of State; but his remark that the Government has "other plans," if Britain does not acknowledge the whole debt, leaves little doubt about what is at present in the wind. Even Norway joined the chorus with the declaration that any scaling down was "out of the question"—though, admittedly, the origin of the Norwegian sterling balances provides a moral basis of a kind that can hardly be urged for the much larger claims of the Middle East territories.

The one refreshing exception to these indications of a stiffening attitude comes from Australia, where responsible press commentators have argued that on a moral basis even the recent gift of £A.25 million does not represent a sufficient scaling-down, or as large a contribution as Australia could afford. It is suggested that the debts should be re-examined to ascertain how large a sum would have been outstanding if lend-lease and mutual aid had

run through the whole of Australia's relationships with Britain; and that this portion should be cancelled.

The truculence of the principal creditors no doubt represents a natural manoeuvring for position in readiness for the negotiations which are to be resumed shortly. But it does seem that the chances of any early agreement on scaling down are rather slender, which underlines the shortsightedness of the Government in not making its position daylight clear at a much earlier date. Mr Attlee stated this week that there was "nothing new" in this policy, yet India still persists in claiming that it results simply from a press campaign, which is "goading" Mr Dalton into "a shady deal." If, however, it were necessary to rule out an immediate agreement with the principal creditors upon scaling down, two conclusions would emerge. First, it is clear that the year-by-year burden upon Britain must be kept within reasonable proportions; if that cannot be done by reduction in the capital sum it must be achieved by limitation of the rate of release from the old balances and of the interest rate payable on those which remain. On a short view it is from a practical point of view almost a matter of indifference for Britain which method of limitation is adopted. Secondly, it is clear that any agreement reached now, if it cannot be really comprehensive, must be for a short term only—as, for example, has been arranged in the case of Argentina.

Preparing for July 15

Meanwhile, the negotiations with foreign countries, in anticipation of convertibility on July 15th next, are now reaching a frenzied tempo which is taxing the expert man-power available to the Treasury and the Bank of England. The necessary arrangements have already been completed and made public with the Netherlands, Belgium, Argentina, Portugal and Italy. In the case of the United States, Canada and Newfoundland, and the numerous Central and Latin American countries which are authorised to operate American accounts, the rights of effective convertibility have long been conceded, and nothing more remains to be done. This week Mr Ellis Rees of the Treasury completed arrangements with Norway and Sweden and is, at the time of writing, engaged in discussions with Denmark. The problem to be solved with the Scandinavian countries was to arrange for the full expendability of their current sterling earnings, and, in the case of Norway, to settle the status of accumulated

balances. Discussions are also now proceeding with France and Brazil, and in each case appear to be within sight of agreement. In the case of Brazil the main point at issue is the rate of release of accumulated sterling. The question of sales of British assets to the Brazilian Government does not appear to have been broached.

The reverse position obtains in the case of France, and the question that has to be decided in these discussions is the manner in which the continuing French deficit in the current balance of payments between the franc and sterling currency areas is to be met. There appears to have been some discussion of the convertibility of sterling acquired by France as a result of sales of sterling securities to the British Government. This seems to be a somewhat academic point of discussion since it may be assumed that France will not sell more sterling securities than are needed to cover her current deficit. That being so, the question of expendability or convertibility of the proceeds of these sales does not arise since they will have been spent before they materialise.

So far as European countries are concerned, this leaves only Spain and Switzerland to deal with. The recent agreement with Spain represents the first phase of the arrangements to be made with that country. It provided for bilateral payments between Spain and Britain and also introduced the interesting voluntary undertaking by Spain to hold sterling up to the amount of its current surplus with the sterling area. The stage is therefore set for the second part of the negotiations which would merely put the seal of expendability on the accruing balances—a gesture which should be costless, since Spain has undertaken to hold this sterling for a time. Switzerland, which is the hardest of all the hard currency countries and which refuses to accept dollars and even gold unconditionally, will probably have to be left to the last. Representatives from Uruguay are on their way to Britain to discuss the problem of accumulated balances and to explore the possibilities of utilising them for repatriating capital now in British ownership.

This still leaves the hardest negotiations of all, namely those with the largest of the sterling creditors, India, Egypt and Iraq. It is likely that the talks with Egypt will be the first of this series and that they will open in the first half of June. The representatives of the Indian Government are likely to plead for delay in the hope that the constitutional position in their country will have clarified before definite arrangements have been made about accumulated sterling balances and the availability of current earnings.

In the case of the Dominions it is unlikely that any formal agreements will be entered into. All that is in fact necessary with these countries is a continuation of the war-time gentlemen's agreement not to spend accumulated sterling too fast, fortified perhaps by an undertaking that their global sterling balances will be maintained at a minimum level which will decline from year to year.

World Bank's First Loan

The International Bank for Reconstruction and Development has got away at last to its very belated start. Towards the end of last week it was announced that it had granted a loan of \$250 million to France. This loan bears interest at $4\frac{1}{2}$ per cent, and the capital is to be repayable on a graduated rising scale over a period of 30 years beginning in November, 1952. The amount is exactly half that for which France made a formal request last October. The terms appear decidedly stiff, especially in view of the fact that the loan is evidently being financed from the Bank's capital resources and not by an issue of bonds in the open market of the United States. Such an issue is, however, planned for the near future, and as this initial operation may, according to Washington reports, amount to \$250 million, it would serve to reimburse the Bank for the loan which it is about to make. The $4\frac{1}{2}$ per cent rate is presumably the lowest at which the Bank will find it possible to make loans which have to be financed by borrowings in the open capital market. The discussions which have been going on between Mr McCloy, the president of the Bank, and representatives of New York banks, issuing houses and insurance companies have not yet succeeded in defining the investment status and rating of the Bank's bonds. The most optimistic estimates at present appear to indicate that the Bank may be able to place its bonds at 3 per cent or slightly over. Since the Bank will be compelled, during the first ten years of its operations, to charge a guarantee commission of not less than 1 per cent and not more than $1\frac{1}{2}$ per cent per annum, the minimum rate of interest at which it would be able to lend to borrowers will probably be the $4\frac{1}{2}$ per cent rate which applies to the French loan.

This loan will bring some much-needed relief to the exceedingly strained French foreign exchange reserve, but it will do little to solve France's external problem, since its import programmes have been based on the assumption that France would be able to borrow from the World Bank at least twice the sum that has now been fixed. Of the \$250 million loan, about one-third has been earmarked for the purchase of machinery and other capital goods, while the other two-thirds will finance purchases of coal and raw materials. Negotiations will probably take place later in the year for a second World Bank loan for France. It is hoped by then, first, that the political and economic position in France may have been clarified somewhat, and, secondly, that the New York market will have had its first test of a bond issue by the Bank.

Meanwhile, the Bank has issued an account of income and expenditure for the nine months to March 31st last. This shows that expenses exceeded income by \$680,177. This is not surprising in view of the extremely late start which the Bank has made in its loan operations, and also the excessively heavy burden of overhead expenses which it has to shoulder.

Five-Day Week's Debut

Output figures for the first five-day week in the mines—the week ended May 10th—are, on the whole, encouraging. In spite of the unofficial strikes in Durham and Lancashire, and the two days' holiday in Scotland, which together accounted for a loss of 263,190 tons, the miners produced a total of 3,752,000 tons. But for these two factors, output would have exceeded the 4 million mark, although it would still have been nearly 100,000 tons below the previous week's figure of 4,108,300 tons. Figures for output per manshift and absenteeism are not yet available, but the district reports suggest that there has been a sharp fall in absenteeism, which in most areas has thus been reduced to absenteeism of an "involuntary" nature. Naturally, there were considerable variations in the experience in the different areas. The best records were achieved in Yorkshire, the Midlands and Kent, all of which exceeded their last week's output. Production in the Durham and Northumberland region, where the pits were not affected by the strike, was remarkably high. The following table shows the output last week, compared with the previous week and with the corresponding week in 1946.

	('000 Tons)		
	Last Week	Previous Week	Last Year
North Eastern.....	812	801	779
North Midlands.....	717	726	689
North West.....	254	273	258
Midlands.....	360	352	338
Wales.....	463	476	457
Kent.....	29	27	27
Scotland.....	271	271	271
Northern.....	643	643	643

This rate of output, however—cheering the position only by being appreciably bettered if the target of 200 million tons of average output of 4½ millions has been estimated as next. Obviously, it is too early to reach any conclusions about the effect of the five-day week, and no estimate would be valid before the end of this month. Summer holidays and possible disputes over anomalies due to the five-day week agreement may have an adverse effect on output. On the other hand, the gradually rising rate of recruitment and the growth in skill and experience of the workers may counterbalance any loss from these causes. What is needed from the miners is a steady and sustained output, rather than a series of spurts towards a weekly target. Last week, the miners, in the limelight of public attention, were very much on their mettle; it remains to be seen whether their interest and enthusiasm can be kept up. What is needed from the Coal Board is a speeding up of all possible measures to increase productivity—the Board is said to have both short-term and long-term plans, but so far there has been no indication of what they are. And surely the National Coal Board and the Ministry of Fuel can reach a more satisfactory understanding about who is to issue figures, and how often?

Profits Tax—Further Points

Closer scrutiny of the Finance Bill has resolved only some of the technical uncertainties surrounding the operation of the new tax on bonus issues, and on points of detail most City interests seem to have abandoned speculative discussion until the debate

in the House. The mechanism of the revised profits tax, however, the effects of which in several important classes of case was at first very obscure, is now more clearly understood. One point which even now seems to have escaped attention is the manner in which the tax will apply to post-budget dividends which have the effect of raising the total dividends declared for an accounting period falling wholly or partly before January 1st last over those of the preceding period.

As explained in these columns last week, such post-budget dividends will be treated, to the extent to which they contribute to the increase, as distributions in the accounting period in which they are actually paid. Ordinarily, therefore (ignoring any complication which may arise from the inclusion in profits of investment income which has already borne profits tax), the amount of the resultant excess will suffer tax at $7\frac{1}{2}$ per cent—because the company, having become liable to tax at $12\frac{1}{2}$ per cent on the whole of its profits for 1947 (assuming it accounts for a calendar year), will be debarred from claiming non-distribution relief to the extent of the dividend which has, in effect, to be brought in from the earlier period. For example, a company which paid 6 per cent for 1945, and for 1946 paid 8 per cent before this year's budget with a further 2 per cent declared after the budget, would for tax purposes have to treat half the increase in the year's distribution—that is, the 2 per cent added after the Budget—as a first payment on account of 1947, and made out of the profits for that year. If it paid 8 per cent specifically for 1947 (in further dividends made before June 30, 1948), but earned 12 per cent, its non-distribution relief would apply, not to one-third of its profits, but to only one-sixth.

That is the normal case, but there are other cases in which the post-budget distribution would not in effect attract any additional tax at all. These are cases in which the company, quite apart from the so-called post-budget distribution, pays out more than it earns. Despite the operation of this Clause 29 (3), which was designed to prevent forestalling and which at first glance seemed to have retrospective effect, the essential principle of this distribution tax is that it cannot attack profits accumulated before January 1st last. This principle will be the better understood if it is remembered that in form there is not any specific tax on distributions (other than the "distribution charge" on over-distribution): the practical effect of taxing distributions is achieved

by giving relief for non-distribution. Now Clause 24 (3), which imposes the distribution charge on amounts distributed beyond the amount of the year's profits is subject to the proviso that:—the amount on which tax is chargeable under this sub-section for any chargeable accounting period shall not, when added to the total of the amounts on which tax is charged thereunder for previous chargeable accounting periods, exceed the total of the differences [i.e., under-distributions] in respect of which reductions have been made . . . for previous chargeable accounting periods.

If, therefore, in the case considered above, the company while earning 12 per cent for 1947 specifically distributed for that year, not 8 per cent, but the whole 12 per cent, it would pay tax at $12\frac{1}{2}$ per cent on the whole of its profit. Its distribution for the year in the eyes of the Inland Revenue would, however, be 14 per cent because of the 2 per cent excess payment produced for the previous year by the post-budget distribution. But this over-distribution of 2 per cent for 1947 could not attract the distribution charge of $7\frac{1}{2}$ per cent because there would be no fund of accumulated non-distribution reliefs out of which any such charge must nationally be met.

Pre-1947 Earnings Immune

Provided that they are prepared to distribute up to the hilt for the current year, companies can with impunity even now declare dividends for 1946 which have the effect of increasing the amounts paid for 1945. At first glance, these provisions seem calculated to have the opposite effects to those which Mr Dalton presumably intended; they appear to penalise the conservative while allowing the reckless to go scot free. But in fact this is not so. Because the distribution penalty of $7\frac{1}{2}$ per cent cannot in any case fall upon profits accumulated or accrued before January 1st last (no matter when they are distributed), the only way in which companies, but for the safeguard in Clause 29 (3), could have forestalled the new burden would have been by anticipating 1947 profits by distributions forthwith, while pretending that the payments related back to an earlier year. That possibility has been ruled out. On the other hand, if they anticipated so lavishly that in the end their distributions for 1947 (including the post-budget payment) exceeded the profits, then, obviously, the excess would in fact be a payment from pre-1947 profits which fall outside the new provisions. The truth is that these changes of themselves

The original peso circulated widely throughout the Americas and was also known as the Spanish dollar or "piece of eight." It is now the monetary unit of several South American countries.

peso

For many years Barclays Bank have fostered the growth of Britain's trade with South America by providing a comprehensive foreign banking service reinforced by the establishment of a Representative's Office in Buenos Aires. Today, when the expansion of our export trade is vitally important, Barclays Bank offer a complete foreign service, together with such other banking facilities as customers may require.

make it neither less nor more attractive to companies to share out resources accumulated up to the moment when the new provisions took effect, but they do make it more costly to distribute profits accumulated subsequently.

This principle also has a much wider application. It resolves the difficulty, which has greatly worried the market, about the fate of colliery companies or others which are due for nationalisation. Companies which wind up may be liable to tax in their final period on any distributions of capital in excess of the nominal amount paid-up, because under Clause 29 (1) (c) any such excess is not allowed to rank as capital which would be beyond the reach of a distribution charge. This limitation suggested to the suspiciously-minded that Mr Dalton was planning to take a rake-off from the compensation for the taking-over of nationalised assets whenever there was a clear surplus for the equity holders. But, in fact, the proviso quoted above—that there can be no distribution charge except out of a notional fund built up by past reliefs—runs equally for the case of wind-up as for current over-distributions. The receipt by a colliery company, or by any other nationalised concern, will not, whatever the date of payment for or vesting of the assets, increase this notional fund, because these receipts, being capital, will not attract any profits tax and therefore there can be no non-distribution relief for any accounting period in which they continue to be held. In consequence, when they come to be distributed on a wind-up, the company's liability to pay a 7½ per cent distribution charge on any excess over par will in principle be no different from that of a company quite outside the range of nationalisation. In either case, the excess will be taxable only to the extent to which it represents profits accumulated but not distributed since January 1st last, and which have accordingly already secured the 7½ per cent rebate. An excess resulting either from prior accumulation of profits or subsequent accumulation of capital (e.g., share premiums or capital compensation moneys) will escape. In short, apart from objections to the new form of profits tax in principle, it has to be admitted that the Chancellor's intentions seem to have been equitably and sensibly worked out by the tax authorities and draftsmen.

Trade with Russia

The trade talks with the USSR, which began in Moscow after Easter and are now being continued in London, show rather more signs of coming to fruition than previous series of negotiations—though there is some difference of opinion about the likely outcome between those whose approach to Russia is commercial and those who have had experience of the diplomatic methods of the Russians. Both sides appear to be anxious to develop trade relations, although both equally obviously are more anxious to buy than to sell. Last year British exports to Russia totalled £9,038,000, of which more than half was machinery remaining from wartime orders. British imports from Russia amounted to £4,920,000, of which £1 million was furs, £724,000 raw cotton, £600,000 wheat and timber, and £233,000 non-ferrous metals.

While there are a number of commodities which Britain is anxious to obtain from the Soviet Union—the list of over 100 items under consideration includes cotton, flax, hemp, copper, zinc, potash, glue, gelatine and edible oils—the main emphasis was laid by the British trade delegation on timber and wheat. Small quantities of timber have been supplied under the agreement reached last autumn, and Britain is obviously anxious to increase the scale of its imports in order to remove one of the main bottlenecks in the programme for housing and industrial recovery generally. The extent to which timber supplies can be increased depends to a large extent on British capacity to send suitable timber-getting equipment to Russia, in particular rails for tracks to convey the timber from the forests to the ports.

Wheat deliveries from the USSR could hardly be on a large scale this year, but if there is a good harvest, and if the efforts to rehabilitate Ukrainian agriculture are successful, there seems no reason why considerable quantities of wheat and coarse grain, suitable for feeding stuffs, could not be shipped during the course of 1948.

From Britain, it is expected that Russia would take machinery and capital equipment of all types, but mainly electrical equipment and machine tools. There have already been talks between the leaders of the electrical industry and the Russians, and there are still war surpluses of machine tools, although the Soviet Union is apparently anxious to obtain the most up-to-date types. It is hoped that the pre-war export of herrings from the east coast and from Scotland can be revived.

The stumbling block to previous attempts at agreement has always been the question of payment. The Russians, for example, have preferred a fixed price to the British method of a price

variation clause, and certain Soviet clauses for inspection and penalties for late deliveries have been unacceptable to British manufacturers. The question of a credit was outside the scope of the Mikoyan-Wilson talks and has been referred for higher consideration in London. However, given a genuine desire on both sides to open up trade, the obstacles which have formerly held up agreement may now not prove so formidable.

Vickers in Transition

Vickers, with its large armament interests was bound to suffer considerably in the transition from war to peace. Sir Archibald Jamieson warned shareholders a year ago that they must be under no illusion that profits as large as those for 1945 could be expected in normal times. Even so, they were probably not prepared to find that, before taking credit for an estimated EPT recovery of £1,100,000, the group's trading profits and miscellaneous revenue have fallen in 1946 from £6,738,386 to £3,122,985. After meeting all charges, including reduced appropriations for income tax, depreciation and deferred repairs, profits are insufficient to cover even the preference dividends. With the assistance of the EPT recovery it is, however, possible to cover all dividends, including the increase in the ordinary distribution from 10 to 12½ per cent and to add some £478,000 to reserves and carry forward. Figures for the past two years are set out in detail on page 369 of the *Records and Statistics* supplement.

These figures perhaps present too gloomy a picture to be altogether representative. The profit figure is arrived at after providing £950,000 for possible losses on contracts, while it appears that a provision, apparently of the order of £850,000, has been made for anticipated losses on the re-establishment of civil aircraft and other commercial products, including the building of merchant ships. Apart from current earnings and the EPT recovery, the resources of the group have been increased by a modest profit on sale of securities and the liquidation of a subsidiary, while credit is taken for an EPT refund of £1,672,713, of which the bulk had been received at the date of the report. Following the acquisition in 1945 of interests in Associated Electrical Industries and Powers Accounting Machines, the group bought a majority interest in Cockatoo Docks and Engineering of Sydney in December last, while it spent during the year £2,595,509 on land, buildings, plant and machinery. At the end of the year it had substantial commitments for capital outlays in progress, but their total is not disclosed. Evidently an effort is being made to cast an even wider net than in the past, but, as with other concerns, progress is being restricted by the prevailing shortages. The consolidated balance sheet shows a net expansion of some £1,670,000 in fixed assets and holdings and a rather smaller rise in net current assets, to almost £28,470,000, of which £21,376,000 is in liquid form. Reserves and surplus have risen by £2,780,000 to £26,260,000. There is no reference to the long-discussed project for the restoration of the ordinary shares of 10s. to their original value of £1 by the distribution of a part of these reserves. But the omission is scarcely surprising in view of the new tax.

Canada's Sterling Surplus

In 1946 the traditional shape of Canada's balance of payments—a surplus with the sterling area balanced by a deficit with the US dollar area—was more exaggerated than ever before. Details of the surplus with the sterling area and of the manner in which it was financed are provided in a report issued by the International Payments Branch of the Canadian Government. The net balance on current account in favour of Canada in its trade with the sterling area amounted last year to \$662 million, of which \$495 million was attributable to the United Kingdom and \$167 million to the trade with the rest of the sterling area. Of this total deficit of \$662 million, the bulk, namely \$540 million, was financed by drawings on the Canadian loan to Britain. A further \$112 million came from interim advances made to Britain and other Empire countries before the new loan was granted. The small residue of \$10 million is the net balance of a number of items, some of them fairly large, which included the sale of \$150 million of gold to Canada, \$135 million for sales of British-owned Canadian securities, and, on the other side of the account, certain inter-governmental transactions involving payments to the United Kingdom. The report stresses that the value of Canadian exports to Britain, Europe and other overseas countries in 1946 was greater than in any previous peace-time year.

These figures provide an eloquent commentary on the difficulties which Canada has recently experienced in meeting the Dominion's deficit with the US dollar area. The issues to be faced in this respect are merely part of a wider problem of which Britain is perhaps more keenly aware than Canada. These questions will have been the subject of helpful discussions which Sir Wilfrid Eady will have had with the Canadian authorities on his short visit to Ottawa.

Steel Output Recovery

The decline in iron and steel production which followed the fuel crisis was arrested in April. Figures issued by the British Iron and Steel Federation show that average weekly production of steel ingots and castings was 236,400 tons last month compared with 196,000 tons in March. The corresponding annual rates were 12,294,000 and 10,190,000 tons. The annual rate of output in April was thus only 1.4 per cent below the January level. But it was still nearly 4 per cent below the 1946 level of production of 12½ million tons, which is the figure set for the industry in 1947 by the *Economic Survey*.

Pig-iron production has also recovered. Average weekly production in April was 139,200 tons, compared with 123,100 tons in March and 150,100 tons in January. The annual rate last month was thus 7,238,000 compared with 7,806,000 tons in January.

These improved results were achieved, says the Federation, only by drawing upon depleted stocks of steel-making materials, especially pig-iron, and can be maintained only if supplies of coking coal improve. It is clear that iron and steel have joined the growing list of industries which will be almost entirely dependent for the rest of this year on supplies of materials from current production. There is only the slenderest margin of safety against even a temporary interruption in output. The hopes which Sir Stafford Cripps held out on Wednesday of obtaining some steel from abroad in the autumn are therefore particularly welcome.

Nationalisation of French Shipping

History, perhaps, may give the French Government a better excuse for using the guillotine in its transport nationalisation debates than could be pleaded by Mr Barnes. At all events, the comparable technique was employed for the Bill presented by M. Jules Moch, which contains drastic provisions for the nationalisation of shipping. The two major companies, *Cie Générale Transatlantique* and *Messageries Maritimes*, and one or two special services, are to be state-owned and administered by a board of 15 representatives, five of the Government, five of personnel and five of users (of which two will represent Chambers of Commerce and one each the railways and the colonial territories). All other shipowners whose fleets exceeded 100,000 tons gross in 1939 are to come under the control of the Minister of Transport, who will appoint a commissioner to be present at all board meetings with the power of veto, subject to Ministerial arbitration. The remaining shipowners are to be "free," provided that they find employment in activities regarded as essential to the Monnet plan. Finally, a Maritime Commission will be created to preside over all shipping affairs and to advise the Minister. Its 20 members will consist of five representatives each of the Government, of users and personnel, and of shipowners. An assured majority of 15 non-experts will thus direct shipbuilding programmes, create or maintain shipping services and "prevent uneconomical competition between individual companies."

French shipowners apparently regard the proposed regime as a stultification of their hopes of reviving French participation in international trading. Shipowners under free flags refrain from comment. The dangers of a revival of economic nationalism are being sufficiently obvious, particularly when strenuous efforts are being made to expand international trade, but it remains to be seen how long the French Treasury will be able to pour out millions of francs in the operation of a state fleet in an attempt to save imports of shipping services. Not only are these services now likely to cost more, but the state fleet is unlikely to earn as much foreign exchange as before the war in exporting its services. The nationalisation of the two leading companies merely regularises their present status, for their losses have been covered by the

Treasury for 25 years. That record alone should be sufficient reason for hesitating to apply nationalisation to further branches of an essentially international industry.

Retail Margins Negotiations

The Board of Trade has agreed, after consultation with the organisations representing the retail trade, to consider with the Central Price Regulation Committee the effects of the reductions in retail margins made in January. Margins fixed during the war had to take account of the reduced turnover in the shops. But since the war sales have been expanding and towards the end of last year the Board of Trade was satisfied that wartime margins could no longer be justified. Cuts introduced at the turn of the year in a number of clothing lines resulted in small but, from the consumers' point of view, very welcome reductions in price. Reductions in other margins were under consideration when the fuel crisis broke.

The resultant dislocation destroyed such basis as had existed beforehand for computing turnover in the shops in 1947. It was clear from the outset of the crisis that production of textiles, to take only one example, would be severely reduced, and that this reduction would affect the retail turnover of clothing later this year, but that any exact estimates of the prospective reduction in sales would be clearly impossible.

Before the margins were cut, the Retail Organisations' Committee and the Board of Trade were agreed that there would be an increase in wage costs and overheads to be set against the increase in gross receipts. The separate estimates, made by both sides, of the percentage probable increase in turnover and costs in 1947 did not differ substantially, but the discrepancy was sufficient to make an important difference in the prospective cash receipts of retailers. The Board of Trade was satisfied, however, that a case had been established for reducing margins, and they were revised accordingly. Now that the trend of turnover is downwards, the retailers' case for a reversal of the decisions taken in January has obviously been strengthened. But there is also a case for reviewing afresh the whole basis of controls. Restriction or specific fixing of margins was an inevitable ingredient in the formula of wartime price control, and regulation of margins by reference to turnover—so that, in principle, the unit margins widened as the volume of trade declined—was regarded as necessary to ensure that the existing retail organisation was not constricted by purely financial pressure. Scarcity of supplies at present perhaps justifies similar arguments now, but the system

In addition to the short "Statistical Summary" which appears weekly in *The Economist*, a full service of statistical and factual information appears weekly in

Records and Statistics

Supplement to *The Economist*

Records and Statistics is a separate, self-contained weekly publication of from 16 to 24 pages. It includes not only many statistical tables but also factual records of public affairs, including Parliamentary activities and digests of state papers, and industrial and commercial reports from home and overseas. It is believed to be the most comprehensive statistical and factual report appearing weekly anywhere in the world.

The *Records and Statistics* Supplement to *The Economist* is available by postal subscription only. The subscription, which may be sent direct to this office or through a newsagent, is 30s. per annum. For those who are already direct postal subscribers to *The Economist*, the economy of posting both publications together makes it possible to quote a combined subscription of £4. Subscribers to *The Economist* who wish to receive *Records and Statistics* should notify this office as soon as possible, but are asked not to send any money until an account is rendered. It is regretted that it is no longer possible to supply back numbers of *Records and Statistics* or to date subscriptions back.

Paper shortage also makes it impossible to supply sample copies. For a limited time, however, subscribers to *Records and Statistics* will be allowed, if they wish, to cancel any unexpired portion of a subscription.

THE ECONOMIST, BRETTENHAM HOUSE, LANCASTER PLACE, LONDON, W.C.2

can operate inequitably for retailers and is not calculated to increase the efficiency of the distribution system. If the consumers' interest is to be adequately served, a thorough overhaul of all price structures from manufacturer to retailer is necessary to discover not only if margins are too high or too low, but also if some allowances are necessary at all. Unfortunately, the fact that the Census of Distribution has been postponed for a year suggests that there is little prospect of a thorough overhaul of the retail price structure in the near future.

Diamonds and De Beers

The change of trend in the diamond market in recent months lent an added importance to Sir Ernest Oppenheimer's review at the annual meeting of De Beers Consolidated Mines. It was even more informative than usual. Total sales of diamonds in 1946 reached a new high level at nearly £30 million—£26.1 million by the Diamond Trading Company (whose dividend was raised from 12½ to 27½ per cent) and almost £3.5 million by the newly formed Industrial Distributors (1946), Ltd., whose object is to develop the particular sales technique which is best suited to industrial diamonds; this company paid a maiden dividend of 10 per cent. Unfortunately, the sales of gem stones were concentrated almost wholly in the first nine months of the year, before the setback on Wall Street. The outlook now is clouded by overstocking of the smaller gem stones by jewellers (partly from stones downgraded by the group during the war and released at low prices as industrial diamonds in order to ease the supply for such purposes), by restrictions on purchases in European countries, and, above all, by the uncertainties which spring from fears of an American trade recession. "Much reduced but quite reasonable" sales of rough diamonds are therefore envisaged for the current year, but Sir Ernest claimed that the conservative price policy—which had not followed the market to its peak—and the financial strength of the group will enable it to cope "easily and successfully" with temporary recession. Meanwhile, the Diamond Corporation—jointly owned by De Beers (80 per cent) and by Consolidated Diamond Mines of South Africa (20 per cent, most of which is in effect indirectly held by De Beers)—made "substantial" profits during the year; the question of a dividend was postponed until the current year and will be considered "at a later date."

The diamond interests of De Beers nowadays are, in any case, only the most spectacular of its ramifications. The De Beers Industrial Corporation holds a half-interest both in African Explosives and Chemical Industries (the other half is held by Imperial Chemicals) and in Boart Products, makers of diamond drills and tools. The Chemical company is providing for expansion of its output of superphosphates to 500,000 tons per annum and to increase the South African production of various chemicals, which must be supplied as cheaply as possible because they are the raw materials of other industries, including gold mining. The scheme also embraces a leather-cloth plant and the whole programme will cost £3,000,000. De Beers is reducing its holding of the Industrial Corporation shares by £1,000,000 nominal as a result of options granted to other Rand groups in 1944 at a price of 30s. per share, and is also providing half the block of 400,000 shares to be released to the Johannesburg market (at 32s. 6d.) in connection with an application for a quotation on the Johannesburg Stock Exchange; a similar application will also be made in London. Altogether, the outlook for the group as a whole is obviously less rosy than in the boom years of war, but, after stressing the strength of the De Beers company's cash resources—these, including the proceeds of the realisation of the Industrial Corporation shares, total nearly £5.7 million—Sir Ernest remarked that "dividend declarations can in future approximate more closely to actual earnings." For 1946 De Beers deferred shareholders received £2 per share (equivalent to 4s. on the existing 5s. units) compared with earnings of £2 14s. 3d. per share.

Jet Aero-Engine Exports

The week-end announcement that Pratt and Whitneys are to build Rolls-Royce Nene jet engines under licence marks an important stage in the expansion of British aeronautical exports. The Americans have for some time acknowledged the supremacy of British jets and last June the Taylor Turbine Company was formed with a capital of \$10 million to build Rolls-Royce jets. It thus seems certain that jet engines will become an increasingly important dollar-earning export. They are, however, already

earning considerable sums of hard currencies. Sweden makes De Havilland Goblins under licence and is soon to make Ghosts, apart from the purchase of several dozen complete Vampire fighters. The Swiss Air Force is abandoning all other fighters in favour of Vampires, and Argentina has just bought several Gloster Meteors. Other markets are France and China, where Hispano-Suiza are licensed to build Rolls-Royce jets.

The emphasis so far has been on the use of jet-engines in fighters. But it should be remembered that the first jet air-liner, a modified Lancastrian, was also a British machine, and since it flew last summer, considerable experience has been gained from it and other prototypes of the performance of large jet aircraft. Considerable experience is also being gained of propeller-turbine engines which attempt to overcome the present disadvantages of jets by the use of a propeller. The Bristol Theseus has just passed its tests and gone into production, and several other British manufacturers have similar engines almost as far advanced.

Meanwhile, aircraft exports in March totalled £1,373,201, more than twice the figure for March, 1946, compared with £792,226 in February when the fuel crisis hindered production. Of the latest total, 145 aircraft accounted for £636,635 and 84 engines for £573,716. A satisfactory feature of this rising trend is that it has yet to reflect the export of new types. The figures for the past year or so admittedly included a number of obsolescent military types, but few large civil machines and none of new design. When new machines, designed for propeller-turbines and, later, jets incorporating war-time lessons and often very much larger (and there more expensive) appear, the export prospects should be bright—unless dimmed by another fuel crisis.

Whisky for Dollars

There have been reports recently that the Government is contemplating a centralisation of exports of whisky, particularly for the American market, and possibly by means of Government purchase by a central selling agency. Certainly, whisky is one of the surest British exports to the United States. Its demand is based on the acquired thirst of those Americans who knew "Scotch" before the war, together with the relative new-comers who were first introduced to its taste through British hospitality in recent years. Americans used to yearn for real "Scotch" and ask why they could not get more of it "back home." But, in spite of this, whisky does not bring in any very large quantity of dollars for Britain. Its export price is 5s. a bottle f.o.b. or 60s. for a case of 12 which compares with the British wholesale price of 4s. 3½d. a bottle and a retail price of 25s. 9d. On the face of it, there would seem to be scope for increasing the dollar yield, either by a straight increase in the export price or by the imposition of an export duty payable by the purchasing countries.

But how elastic is the demand for whisky in the United States? There are many substitutes and although no connoisseur would ever drink rye-whisky in preference to Scotch, the average consumer has to consider relative prices in relation to his income. The retail selling price in America is 22s. to 25s. a bottle. The difference of 17s.-20s. compared with the British export price is made up by taxes, freight and distributive margins. Nevertheless, this price is relatively much lower than the British retail price, when considered in relation to the higher American income structure, and it would appear possible to effect a moderate rise in price without affecting consumption unduly. The British whisky trade, however, considers that such action would be "the height of folly," on the ground that consumer resistance is already beginning to harden in the United States, particularly in luxury trades. According to the Scotch Whisky Association, its sales have never covered more than a relatively small share of the American market, and now are believed to represent barely 5 per cent. If this is so, it would suggest that the majority of consumers were of the "connoisseur" type, in which case price elasticity is likely to be less than unity and an increase in price would cause a less than proportional decline in consumption.

From a domestic consumer's point of view, it seems only fair that the maximum number of dollars should be obtained from the whisky which is denied to the home market. Of the British retail price of 25s. 9d. a bottle, the Chancellor of the Exchequer receives 18s. 4½d., but from the export price he receives nothing. Indeed, the United States Federal Government gets about 10s. a bottle from taxes, and State governments also impose levies. Although it is difficult to state categorically that the demand for a product is elastic or inelastic without careful investigation, these facts do suggest that the demand for Scotch whisky in the United

States, although conditioned to some extent by the price of possible substitutes, tends to be relatively inelastic. Naturally, if an export duty were considered, it would have to apply to exports of whisky to all destinations. But in 1946 exports to dollar countries amounted to 3.9 million gallons out of a total of 5.9 million gallons. With the increased allocation, exports should show quite an appreciable rise this year.

Floating Security

A number of London banking houses have recently been deprived of security they held in respect of a debt of £400,000 owing to them by the Hungarian River and Sea Navigation Co. and outstanding from the pre-standstill days of the early 1930's. The security was eleven ships belonging to the debtor. They were part of the Hungarian Danube fleet that had been detained by the American authorities after the liberation of Austria. When those ships were released last November they were handed over by the American military authorities to the Hungarian Government, which now, directly or indirectly, has a hundred per cent interest in the Hungarian River and Sea Navigation Co. As the ships made their way down the Danube they were arrested in Linz on behalf of the British creditors acting on the authority of the Austrian courts. After remaining in Linz for several weeks the ships escaped on May 4th unhindered by the Austrian police and in disregard of the court orders. Their escape appears to have been prompted by emissaries who had been sent from Budapest. On their journey down the Danube the ships were re-arrested in Vienna by the Austrian authorities, but were released in less than 24 hours on orders from the Russian military authorities. The latest news is that the ships are now in Budapest and well out of reach of the creditors. This is a clear instance of illegal seizure by the Hungarian Government of property belonging to British banking creditors. This event should strike a very odd note in the discussions which are now proceeding for granting substantial London credits to the Hungarian Government to finance the import of wool into Hungary. These credits are being arranged by London bankers and will be secured by the Export Credit Department guarantees. This seems to be a case where the left hand of the City of London, to say nothing of the Foreign

Office, knows little of what is being done by, or rather to, their right hand. Better co-ordination might avoid losses which Britain can ill-afford to make at this moment.

International Timber Plans

The international timber conference held in Czechoslovakia concluded last Saturday. It was convened in order to estimate and co-ordinate the world supply and demand for timber and to attempt to overcome the problem of scarcity. The members comprised most of the European countries, including delegates from the western zones of Germany, together with the United Kingdom, Canada, the United States, Brazil, Chile and Egypt. The USSR was not represented and did not send an observer. As expected, the conference did not achieve any major results, but it was far from being a failure. It is interesting to find that the United Kingdom, being the main consumer, took a leading part in the discussions and in the formulation of the decisions.

The world available supply of softwood for the 1947 season has been estimated at 2,509,000 standards, of which 550,000 standards are to come from Canada; 410,000 standards from Finland (this figure includes shipments for reparations); 400,000 standards from Sweden; 328,000 standards from Germany; 250,000 standards from the United States; and 45,000 standards from the Soviet Union. British requirements comprised nearly half of the total. The prospective deficits between supply and requirements for 1947 and 1948 were estimated to be about 10 per cent. Whereupon France proposed, and the conference agreed, to request all producing countries to expand output in the next two seasons by this percentage.

The second resolution was that consumers should take all practical economy measures. The influence of British wartime experience was obviously very strong in this field. The conference recommended a limitation of timber in buildings, economy in packagings, use of fibre-boards and other non-wood materials wherever practicable, and finally the recovery of old timber. All these economy measures are already in operation in this country.

It was further agreed that it would be unwise, from a long-term point of view, to cut too much timber now. The Economic Commission for Europe is therefore to be asked to take responsibility for the effort to increase available timber supplies and to effect a satisfactory distribution, taking into consideration countries' current needs for reconstruction purposes and also longer term requirements.

Finally, the conference recommended that, as German aggression caused the damage which now has to be repaired, and as the amount of German timber felled during the war was double that of the pre-war period, Germany should make a major contribution to current supplies. It was agreed that she could export some 328,000 standards in 1947 and 200,000 standards in 1948.

If these recommendations can be carried out, timber prospects for the next twelve months will look brighter. Of the estimated available world supplies for 1947, some 1,200,000 standards should be available to cover British requirements. The use of German timber will not interfere with the British plans for developing supplies from the British zone; it will rather form an expansion of it. It is not known whether the Soviet Union will agree to ship timber from its zone for reconstruction purposes in Western Europe.

Accountants and Nationalisation

All too little attention has so far been paid to the question of the form of accounts to be adopted by the various governmental boards of nationalised industries, despite the obvious importance of coherent and objective systems of costing. The Accountants' Joint Parliamentary Committee, the work of which was described by Mr Gilbert D. Shepherd in his presidential address to the annual meeting of the Institute of Chartered Accountants last week, was set up last year to consider the effect of coal nationalisation upon the accountancy profession. The terms of reference of the Committee, which includes representatives of each of the leading accountancy bodies, have now been widened to cover all nationalisation proposals which may have an effect upon the accountancy profession. It seems that the Committee has so far been concerned mainly with the impact of nationalisation upon accountants as such, but it is very clear that many of the issues involved have a much wider public significance.

Although the National Coal Board, the practice of which may well be followed by other nationalisation Boards, has appointed a leading firm of accountants to audit its own accounts, it is also planning to establish a comprehensive internal audit department responsible for the detailed audit work of the various collieries, etc. Naturally, it would have been impossible to establish such a system rapidly, and in the meantime the Board is employing a number of professional firms in the various regions. But when the plan is fully working it seems clear that the field for professional accountants in the colliery industry will be greatly narrowed, and the benefit of much highly specialised knowledge

will inevitably be lost—more particularly as few accountants of standing would be attracted by the prospects of working as employees wholly within a given industry. It would certainly be regrettable if the accounting systems of the nationalised industries were to be assimilated to the methods of the traditional service of Government accountants, for their techniques are essentially adapted to the needs of public administration rather than to those of the running of trading and industrial concerns. In pursuing such issues as these mainly from the standpoint of their effect upon the accountancy profession, the Accountants' Parliamentary Committee may none the less perform a valuable public service in drawing attention to the need for the highest standards of objective accounting in nationalised industry. Without adequate and realistic accounting data, it will be virtually impossible even for the expert outside observer to judge how far such industries are being efficiently and economically conducted.

Shorter Notices

Following the increase in crude oil Gulf prices recently, the prices of certain petroleum products in the United Kingdom have been raised this week. Motor spirit is increased by 1½d. to 2s. 0½d. per gallon, including duty. Paraffin and vaporising oil are increased by 1d. and Diesel oil for road vehicles by ¾d. a gallon. White spirit is increased by 1½d. a gallon and bitumen by 9s. per ton.

United States imports of manganese ores reached a record level of 1,747,000 tons in 1946, against 1,461,945 tons in 1945. India and the Gold Coast were the main sources of supply. Industrial stocks of ore at the end of 1946 totalled 872,347 tons, against 513,063 tons in December, 1945, and were equivalent to over six months' supply at the consumption rate established in the second half of 1946. Domestic production represented about one-tenth of consumption.

Following the reports of several committees of enquiry, the Minister of Labour has decided to set up seven different wages councils for the retail distributive trade, and a separate one for hairdressing. Objections to this proposal can be lodged before June 19th, but, even if there is some opposition from the trade, there is unlikely to be any from the general public. While some sections are already covered by joint industrial councils, there are still some largely unorganised and unregulated sections in this highly complex and heterogeneous group of trades. The effect of wages councils should be to raise the standards of those sections and units which are below average and to give statutory protection to workers whose conditions and hours are still unregulated.

SECURITY PRICES AND YIELDS

A fuller list containing 370 securities appears weekly in the *Records and Statistics Supplement*. Notes on the following company reports also appear in the Supplement: Vickers; Ever Ready; Home and Colonial; Pinchin Johnson.

COMPANY MEETINGS

SCOTTISH UNION AND NATIONAL INSURANCE COMPANY

SUBSTANTIAL INCREASE IN PREMIUMS

SOUND POSITION

MR. GEORGE F. HENDERSON'S SPEECH

The 122nd annual general meeting of the shareholders of the Scottish Union and National Insurance Company was held at Edinburgh, on the 14th instant.

Mr George F. Henderson, M.C., W.S., the chairman, who presided, said:

My Lords and Gentlemen, The accounts for the year which have been in your hands for some days largely follow the customary form. Having regard to the many difficult problems of trade and commerce throughout the world, over which area we operate, I hope that the figures presented to you may not be considered unsatisfactory.

The outstanding features of our accounts are the substantial increase in premiums in all departments and the present heavy cost of running our business. The former of these two items will be dealt with under the reviews of departments. Of the latter, the considerable increase in expenses will have been noticed. This is mainly due to three factors. Firstly, a substantial rise in premium income which must naturally carry with it increased cost, then the increase in commodity prices which means that we have had to pay more for our office supplies and equipment, and lastly the increased salary bill, following the return of the majority of those of our staff who have been serving with the Forces during the war. These men and women whom we welcome back have been reinstated in our employment on a basis which is intended to prevent them from being prejudiced by their years of absence and this, together with a general rise in salary rates, naturally increases our expenses.

LIFE DEPARTMENT

The return of the majority of our outdoor staff in 1946 was reflected in the increased new business written in the life department. The total new sums assured, after deducting reassurances, amounted to £1,792,408, an increase of 80 per cent. over the figures for the previous year. While this total is lower than the new business written in the years preceding the war, it should be remembered that the whole of it arises from business written within this country. We do not now, as was the case before the war, transact new life business in India or Eire. In the circumstances the business written is very satisfactory, more particularly as the figures are in no way inflated by any blocks of business or special schemes at low rates of premium.

Our claims by death are higher than for the last four years. Our experience in recent years has been most favourable and despite the increase in 1946 the total payments are less than were expected by the mortality tables which we employ. Expenses and commission have both advanced with the increased business written. On the other side of the account, despite the single premiums in 1946 being £10,000 less than in the previous year, our total premium income shows a satisfactory increase of over £20,000 at £858,393. The life and annuity funds have increased during the course of the year by over £200,000 to £12,851,977.

FIRE DEPARTMENT

The total premium income of £1,915,610 constitutes another new record in the history of the company. This increase is, in some measure due to the rise in insurable values,

but it also reflects the work done by the members of our organisation in developing new avenues of business. Adequate provision for premium reserve has been made to meet this development of our fire account. The claims paid and outstanding are higher than in 1945, mainly on account of the continued unfavourable experience in our North American business. The remainder of our business, both at home and overseas, has been extremely favourable and indeed is an improvement on the previous year. Our position in the USA and Canada, however, follows the general experience of companies in these countries. While there is no consolation in making a loss in any class of business, it is interesting to note that our loss experience on the American Continent is below the average of the majority of companies.

Overall the trading surplus in the fire department for the year was £211,591 but out of this the sum of £185,193 has been added to reserve for unexpired risks in consequence of the increase in premium income.

ACCIDENT DEPARTMENT

In this department the aggregate premiums increased by some £87,500. Each section of the accident department contributed to this advance. The smaller transfer to profit and loss is entirely due to a heavy loss experience in the motor section. The other sections of the account each showed a satisfactory profit.

Looking ahead we must anticipate some reduction of our premium income as a result of the impending legislation regarding Workmen's Compensation. The National Insurance (Industrial Injuries) Act, under which the administration of workmen's compensation will operate, provides for the Ministry of National Insurance taking over the insurance of employers' liabilities to their workpeople other than those which arise at Common Law.

MARINE

After the anticipated reductions in marine premiums which occurred in recent years, it is very satisfactory to report an increase of over £194,000 in the premiums for 1946. This has, of course, made it necessary to increase the marine underwriting fund but, on the other hand, it has been possible to release £50,000 from the reserve we had set up to meet possible excess profits tax no longer required, and the sum of £110,000 is available for transfer to the profit and loss account.

INVESTMENTS

1946 saw the continuance and, I hope, the culmination of the Treasury's present cheap-money policy. As a result, the market value of the Stock Exchange investments showed further appreciation at the end of the year. We are, of course, more concerned with the difficulty of investing money at a reasonable yield. Although it seems likely that we shall not see lower interest rates, conversions to lower rates of maturing debentures, etc., are likely to continue to affect earnings for some time. The loss of various securities through nationalisation of industries will have a similar effect. The new dividend tax may still further limit the earnings from investments. It is to be hoped that it will not be a vehicle for stifling enterprise and denying the normal protection to capital while inflationary conditions continue.

Balance Sheet.—I do not think I need make much comment about the balance sheet, which reflects the sound and healthy condition of the company.

The past year has largely been one of reconstruction after the disorganisation caused by the war. The rehabilitation into our business of the men and women who served in the Forces has been a welcome responsibility. Many of the readjustments in our organisation rendered necessary by this factor are yet to be put into full operation. Every encouragement is being given to the younger members of the staff to equip themselves by training and practice to play their part in the development of our business and the provision of that service which the company always seeks to provide for its policyholders.

During the war years it was not possible to make visits to our overseas branches and agents, but last year our general manager, Mr Stevens, paid visits to the United States, Canada and Australia, while a number of our representatives from abroad paid visits to this country. These direct contacts with our representatives in other countries are of great importance and most helpful to our business.

The year 1946 has not been an easy one for insurance companies and has called for much hard work by the executive and every member of our staff. I wish to take this opportunity of thanking them one and all for the good work they have done and to assure them of our appreciation of their loyal services and co-operation. These remarks also apply to our agents and representatives abroad whose efforts and services have been of such benefit to the company.

The report and accounts were approved.

ROYAL INSURANCE COMPANY LIMITED

101st ANNUAL REPORT

In a statement circulated with the 101st annual report of the Royal Insurance Company, Limited, the chairman, Mr. P. R. England, said that fire, accident, and marine premiums at £21,840,373—a record figure—were higher by £4,255,642 over 1945. Underwriting profit was £1,056,010 compared with £1,563,237 in the previous year.

DEPARTMENTAL RESULTS

Fire premiums at £10,428,006—the highest recorded—rose by over £2½ million against the 1945 figure of £7,841,426.

Accident and general premiums totalled £9,462,674 (a record), rising by over £1,700,000, against £7,752,880 of 1945.

The Marine account closed with a profit of £440,999 to which the four principal marine underwriting centres—Liverpool, London, America and Australia—all contributed.

Life new business, at £7,598,000, showed a substantial advance of over three and a half million pounds against the 1945 figure of £4,005,000.

Apart from agency commission and overseas taxation, expenses were 15.47 per cent. of the premiums.

PROFIT AND LOSS ACCOUNT

In addition to interest (amounting to £1,056,529 net) and the usual departmental transfers, the account had been credited with £103,949 profit on foreign exchange in respect of interest and dividends remitted. £756,461 had been brought in on account of profit realised on investments, mainly in respect of U.S.A. securities. On the other side of the account, a transfer of £534,500 had been made to the staff pension funds, this figure including a provision against the

pension liabilities arising from the post-war adjustment of salary levels. £950,000 had been charged as provision for British taxation in respect of 1946 profits. This was additional to the taxes of £884,200 on interest (which was shown net in the account). There were also Dominion and foreign taxes of £632,705 which appeared as separate charges in the revenue accounts.

A balance of £1,771,859 had been carried forward.

A YEAR OF TRANSITION

The chairman characterised 1946 as primarily a year of transition. The world had been acclimatising itself to the atmosphere of war's aftermath, an atmosphere no less exacting than that of war, but perhaps, in a sense, more dangerous because less stimulating. The solution of Britain's problems would tax the resourcefulness and political sagacity of her people to the utmost, and would depend on the persistence of those qualities which had made for her greatness—leadership, hard work, tenacity and willingness to co-operate.

MANPOWER AND EFFICIENCY

Much had been said and written about steps to improve the economic position of the country. The inescapable emphasis was upon increased production. This rightly applied not only to manual work, but equally to black-coated occupations. There were perhaps three million black-coated workers in this country. It took little imagination to visualise the additional manpower which would become available if the output of each individual could be raised by 10 or 15 per cent. The responsibility did not lie merely with the employee. He undoubtedly had his obligation to raise his output to the maximum, but it was equally important for the employer to plan for maximum efficiency to eliminate antiquated methods and unnecessary routine.

INTERNATIONAL TRADE AND INSURANCE

It was regrettable that there was still a tendency in many countries to adopt a legislative policy inimicable to the interests of foreign insurers. It was hoped that those responsible might yet realise the international character of insurance so convincingly stressed by Sir Stafford Cripps in the House of Commons in November, 1945. No one in Great Britain would lack sympathy with countries which were confronted with difficult problems in their balance of payments, but it was permissible to stress the inescapable truism that, if those other countries looked to Britain for a market for their primary products, they must be ready to accept some part of the payment therefor in the services Great Britain had to offer, of which insurance is not the least important.

DIVIDEND

In November last an interim dividend of 3s. 9d. (less tax) was declared. The directors recommend a similar rate for final dividend, making 7s. 6d. per £1 stock for the year compared with 6s. 6d. for 1945.

THE LICENSES AND GENERAL INSURANCE COMPANY, LIMITED

FURTHER EXPANSION

The fifty-seventh ordinary general meeting of The Licenses and General Insurance Company, Limited, was held, in London, on the 14th instant.

Mr Stanley Christopherson (the chairman), who presided, said:—

We go from strength to strength, the total funds at £2,323,175 showing an increase of £295,655 during the year which has passed. The Assurance Companies Act, 1946, requires that a company shall possess in "free

reserves" a sum equal to 10 per cent. of the premium income. Your company is in a position to declare a percentage largely in excess of the required figure.

The Life department funds now total almost £400,000. This department is assuming quietly a measure of some importance. The fire department continues to show a reasonable profit in a transfer of £19,261 to the credit of profit and loss. With regard to our motor account, an accession of business has called for substantial reserve additions, costing no less than £54,821—and equal approximately to twenty-five per cent. of the income figure. There remains the sum of £6,665 to add to profit and loss.

The general account provides a profit similar to the preceding year, but with the increased income, the financing charge is slightly more onerous than in 1945—£27,269 in all being required for unexpired risk and added claims reserve before a profit balance is reached. The upward trend of interest earnings continues and your directors feel that the dividend payment might again follow a like course by an additional 2½ per cent. in the final payment.

The report was adopted and a final dividend of 22½ per cent., making 32½ per cent. for the year, was approved.

METHUEN AND COMPANY, LIMITED

PUBLISHERS

INADEQUATE PAPER SUPPLIES

The annual general meeting of Methuen and Company, Limited, was held, on the 22nd instant, at 36, Essex Street, W.C.2.

The following are extracts from the statement by Mr H. N. Hume, C.B.E., M.C., the chairman, circulated with the report and accounts:—

There has been only a relatively small contraction in gross and net trading profits which, having in mind the difficulties which persisted throughout the year, is gratifying. The reduction of excess profits tax to 60 per cent. has made available an appreciably larger sum for reserves and dividends, with the result that we have been able to recommend a dividend of 10 per cent. which will cost (after income tax) £4,400 more than the 6 per cent. dividend last year, while at the same time we have added £12,035 out of the year's profits to reserves and carry-forward, whereas we added only £5,026 a year ago.

SATISFACTORY LIQUID POSITION

We received £31,396 by way of post-war refund of Excess Profits Tax during the year, and we have since received a further £10,226. In the same periods, Chapman and Hall, Ltd., have received £7,184. The aggregate of reserves in the balance sheet of Methuen and Co., Ltd., now amounts to £102,862, and there are further reserves in Chapman and Hall, Ltd., to which this company, as the parent, is beneficially entitled. The liquid position of both companies is satisfactory, but shareholders must realise that our cash resources are needed to recreate our stock in trade as soon as supplies of raw materials allow and the necessary production facilities are available.

I wish it could be said that the increase in the available profit for 1946 was symptomatic of a general improvement in the condition of book production, but that would be very far away from the truth. Our late chairman, Mr C. W. Chamberlain, described at our last annual general meeting the serious slowing up of printing and binding which had then become apparent and which he regarded as constituting the company's biggest problem. Paper supplies were not adequate in

relation to the demand for books, but they were sufficient to keep printing and binding works—manned to the extent they then were—fully occupied. More labour was the great requirement.

Since 31st December last the position has deteriorated. The winter fuel crisis caused an immediate loss of output in all branches of production (and incidentally also of distribution) and a cut of 10 per cent. in the 24th paper quota. Unfortunately, that was not all, for it quickly became apparent that the 10 per cent. reduction in the paper ration imposed by the Paper Control was one thing but the real reduction, possibly amounting to 50 per cent., imposed as a consequence of the Ministry of Fuel's allocation of coal to the mills, quite another. The official "quota" for publishers is at present no more than a pious hope of the Ministry of Supply, but we cherish hopes that this position will be improved in the near future.

My colleague Sir Stanley Unwin, in a recent characteristically forceful statement, has pointed out a number of other large inconsistencies in the Governmental attitude to books.

While the shortage of raw materials lasts, and while books continue to be regarded officially as plain merchandise, and not as vital to the nation's life and therefore to be accorded some degree of priority, the universities, schools, libraries and general readers will continue to find themselves short of books.

ENCOURAGING DEMAND FOR BOOKS

Happily the outlook is not without brighter vistas also. The demand for books of all kinds continues to be most encouraging to publishers. There are signs that the reading habit which was so noticeable during the war is not apparently being overcome by rival attractions.

With the complete lifting, at last, of the Excess Profits Tax, we can look forward to the enjoyment and utilisation in more reasonable measure of the profits we earn. We have suffered most unjustly from the incidence of this tax. Over the 20 years immediately preceding its imposition in 1939—years which included several that were bad ones for the whole publishing trade—our profits averaged nearly £30,000; yet our standard for excess profits tax purposes was under £20,000. Since 1939 our profits have averaged £77,000. Admittedly six of these eight years have been exceptional ones for publishers; but, with the pre-war profit record I have mentioned, I consider optimism is justified.

E. POLLARD AND COMPANY, LIMITED

STRONG FINANCIAL POSITION

The thirty-fifth annual general meeting of E. Pollard and Company, Limited, was held, on the 14th instant, at 159, St. John Street, Clerkenwell, London, E.C.1, Mr H. Edward Pollard, chairman and managing director, presiding.

The chairman, in the course of his speech, said: I have pleasure in submitting to you the accounts of the company for the year ending December 31, 1946. The actual net profit after providing for taxation and crediting an estimated amount of E.P.T. deficiency relief for 1946 is £57,420, as against £42,893 for 1945.

You will see that the balance of the profit and loss account amounts to £132,385 after deduction of depreciation and amortisation, interest and a provision for deferred repairs and rehabilitation expenses of £15,248 and after adding an estimated E.P.T. deficiency relief claim of £164,346 and an amount of £8,286 for interest and rents receivable, etc.

PROFIT AND DIVIDEND

To this profit of £132,385 is added the carry-forward from 1945 of £39,243, giving us £171,628, which we propose to deal with by payment of the preference share dividend of 7 per cent., amounting to £10,351 net, and a dividend of 7½ per cent. on the ordinary share capital amounting to £12,636 net. We are reserving for income-tax £72,911, which we consider adequate, and also £2,054 for the debenture reserve account. This leaves a balance of £73,676, of which £25,000 is to be transferred to the general reserve, leaving £48,676 to be carried forward to the 1947 accounts. Altogether our total assets amount to the considerable total of £1,377,373, and I think you will agree the balance-sheet shows a strong financial position.

A YEAR OF DISAPPOINTMENTS

Nineteen hundred and forty-six was a year of disappointments. You will appreciate the inevitable delays that must occur in changing from war to peace-time production. We have met and overcome these difficulties and, in fact, made good progress towards establishing a peace time market. There are in addition other obstacles to any rapid return to full production. I refer to the extreme difficulty of obtaining raw materials and to the frustrations and delays that are caused by the restrictions and controls placed upon all our important materials by the authorities. Timber, plywood, plate glass, iron and steel are all being controlled out of existence as far as we are concerned, although we are constantly endeavouring to improve matters. Decorative veneers are controlled, we are told, because they are required for housing. Plate glass is manufactured in large quantities in this country, but nearly all exported, while foreign plate glass is being regularly imported. These are but two peculiar happenings that we find so difficult to understand.

As regards 1947 and the future, I can only predict that we shall begin to trade properly as soon as licences and controls get easier. There is an enormous amount of work waiting to be done, and this is increasing as time goes on. In the meantime we are concentrating on our research and development of alternative materials. We have brought our designing and manufacturing staff up to date with the world developments that went on during the war outside this country. Delegations of our staff have visited the United States and South Africa and the lift engineers of Hammond and Champness, Limited, made the official investigation into German methods and design on behalf of the authorities. They visited that country and, incidentally, found much of interest in Hitler's own private lift in his Berchtesgaden hide-out.

INCREASING EXPORTS

We are slowly increasing our export of Haskins' steel shutters and extending our market to all likely countries. Shop-fitting is not very suitable for export, but we have been able to do a small amount with English firms for their foreign branches. Our other activities in shop display, building supplies, and bronze metal founding are all well organised and we are ready to grasp every opportunity as it arrives and one day shall reap the benefit of our preparedness.

In conclusion, I should like to thank the management, staff, and all employees, for their constant support, their encouragement and their loyalty.

The report was adopted.

UNITED GLASS BOTTLE MANUFACTURERS LIMITED

YEAR OF SATISFACTORY PROGRESS

SIR WALROND SINCLAIR ON THE OUTLOOK

The thirty-fourth ordinary general meeting of the United Glass Bottle Manufacturers, Limited, was held, on the 8th instant, at the registered office, 8, Leicester Street, London, W.C.

Sir Walrond Sinclair, KBE (chairman of the company), in the course of his speech, said:—

Comparative figures indicate clearly the satisfactory progress made during the past year, both in our earnings and financial resources.

RESULT OF YEAR'S OPERATIONS

Turning first to the profit and loss account of the parent company, manufacturing and trading profit after providing fully for excess profits tax, is shown at £488,972, an increase of £33,555 over the previous year. Dividends from subsidiary companies together with sundry revenue from other sources as detailed, after deduction of income tax, brought in a further £68,331 and disclose a total credit amounting to £557,303. Your directors propose to increase the distribution on the ordinary capital from 13½ per cent. to 15 per cent., less income tax, by the payment of a final 7½ per cent. and a cash bonus of 2½ per cent. I have no doubt this recommendation will meet with your approval. The credit balance to be carried forward to the current year will thus be increased by £10,503 to £86,745.

REASONS FOR IMPROVED RESULTS

So much for the figures given in your company's profit and loss account. These improved results are due largely to two factors: economy in administration and increased turnover. Economies under existing conditions are not easy to achieve, but with the willing co-operation of our very efficient staff this has been accomplished, notwithstanding the increased turnover over the record established in the previous year. The latter is due to circumstances with which you are doubtless as familiar as I am, for the shortage of glass containers has been for some time, and still is, an acute national problem.

Upon referring to the balance sheet you will observe that the fixed assets appear at a valuation of over two and a-half million sterling, the net increase over the previous year's figure being £94,941, and of this increase £89,577 represents the increase in land, buildings, plant and machinery, even after the provision of £108,282 for depreciation. In this connection it is important to note that the fixed assets of the subsidiaries, whose shares appear in your company's balance sheet at cost and were acquired on a profit basis in 1937, and upon which considerable expenditure has since been made, have been valued as at 30th June last by a well-known firm of surveyors and valuers and are included in these accounts at a figure very substantially less than the valuation.

I wish to emphasise the important fact that they were appraised as going concerns upon a conservative basis and your directors subsequently reduced the valuation to the extent of approximately 67 per cent. on the plant and machinery and 33 per cent. on the land and buildings concerned.

The reserves and undistributed profits have risen by over £200,000, the general reserve being actually £350,000 higher at £850,000 consequent upon our having transferred the debenture redemption reserve not now required and amounting to £292,991 plus £57,009 from our earnings during the past year. The other items which go to make

up the total already mentioned explain themselves, and I think you will agree that our financial structure is on a very sound basis.

The consolidated accounts give you a clear picture of the whole undertaking. Trading profits, after providing for taxation, reach the very satisfactory total of £737,838, the two principal charges against these are income tax £233,415 and depreciation £147,712. You will gather from these figures that our contribution to the National Exchequer is on a considerable scale. The net profit is shown at £322,011 and together with the balance of £183,371 brought forward from the previous year makes a total of £505,382. Reference to the appropriation account will indicate how this has been dealt with. The consolidated balance sheet shows assets aggregating £6,028,044, to which current assets contribute £3,894,618. Current liabilities amount to £1,454,542, while there are reserves and undistributed profits totalling £1,897,960.

DEMAND EXCEEDS SUPPLY

You will no doubt be interested to learn whether any change has taken place in trading conditions since I last addressed you. As a matter of fact, the position regarding supplies of glass containers is still as acute as ever. The demand still greatly exceeds the supply. The difficulties regarding raw materials, adequate skilled labour, the high cost of fuel coupled with the poor quality of such coal supplies as we are fortunate enough to secure, make the work of our managerial and administrative staff much more laborious than we would desire. In normal circumstances the change-over from war to peace-time conditions should not, in our trade, be a serious matter, but for reasons which must be obvious to you there seems general agreement that the difficulties to which I have referred are, if anything, even more apparent to-day than they were a year ago.

While our turnover exceeded that of the previous year both in volume and in value, production costs continue to increase, and, as I have already mentioned, our improved results are largely due to the economies we have been able to effect in administration. Of course, there is a limit to these, and our policy will still be to ensure that the traditional service to all UGB customers is maintained to the utmost of our power. As you may know, in common with the industry, we maintain close relationship with Government Departments, and this has been mutually helpful and satisfactory.

THE FUTURE: CO-OPERATION ESSENTIAL

As I see the future, while it is not at present possible to assess the effect of stoppages caused by the fuel crisis on this year's trading, much depends upon what happens during the remainder of this year by way of our securing adequate supplies of fuel and raw materials. It becomes increasingly evident that co-operation throughout the ranks is essential to the prosperity of industry and the well-being of the individual, and you can rest assured that so far as this company is concerned your directors will use every effort to ensure that such a policy governs our activities. This company enjoys a very high reputation in the industry with which we are associated, and has a very fine body of workers who take a real pride in their work. At the same time, the company is built on a strong trading and financial basis so there is every reason why we should continue to enjoy the prosperity that has been our good fortune for many years past.

The report was adopted.

LANCASHIRE STEEL CORPORATION, LIMITED

INCREASED EARNINGS

The seventeenth ordinary general meeting of the Lancashire Steel Corporation, Limited, was held, on the 12th instant, at Warrington.

Mr John E. James (chairman and managing director) said that the earnings from operations for the 14 months' period to December 31, 1946, which included the earnings of the corporation's subsidiary companies, Rylands Brothers, Limited, Whitecross Company, Limited, and the Pearson and Knowles Engineering Company, Limited, amounted to £960,486.

The directors recommended a dividend for the 14 months at the rate of 8 per cent. per annum on the "A" and "B" ordinary stock. This represented an increase of 1 per cent. per annum in the rate of dividend which had been paid annually since 1936.

The general reserve was now £1,000,000, while a reserve of £500,000 for possible losses due to reduction of output and possible fall in present prices of trading stocks, which had been accumulated in previous years, appeared for the first time. The reserve for depreciation amounted to £2,690,000. The excess of current assets over current liabilities and provisions amounted to £3,391,089.

At their Irlam works they had completed the 32-inch and 34-inch mill scheme commenced in 1938 and delayed during the war and all the mills were now electrically driven. As the blast furnaces became due for rebuilding, they had constructed them of larger capacity and were installing more powerful modern blowing plant which would enable them to make further increases in their size if desired.

INCREASE OF PRODUCTION CAPACITY

Plans were already well forward for rebuilding the older part of the open hearth steel furnaces with the object of increasing the output of steel ingots. They had already converted some of their steel furnaces to oil firing. In addition they had made good progress with an ingot mould preparation building with a view to improving further the quality of production.

They had just completed the Rixton tipping ground for refuse which would cover their needs for many years ahead. They had put forward a plan for a new rod and bar mill of the most modern type for installation at their Warrington works. The wire side of their business had had attention and last year they had commenced to build a new nail factory at Rylands Brothers, Limited. They hoped to have this new factory in full operation by the next annual meeting.

During the period under review, their works had been fully employed. The pressure for delivery of all iron and steel materials was heavy, but notwithstanding difficulties in supplies of raw materials, they had been able to obtain average outputs.

The lack of certainty about coal supplies was giving rise to grave apprehension, and continuous working of the Main Departments would become impossible unless adequate guaranteed coal supplies were granted and, in addition, further supplies to enable reasonable stocks to be accumulated to cover holiday periods and transport dislocations.

The iron and steel industry had undertaken to increase its production capacity to 15,000,000 ingot tons per annum and to bring the industry's plant and machinery up to date in all respects. Little could be done in the latter direction during the years of war. In his opinion, however, unless the industry could count on supplies of coal of the right quality and labour for the necessary reconstruction work, the programme on which it had embarked would be delayed, and the industry would fall short of its objectives both at home and abroad.

The report was adopted.

RIO TINTO COMPANY, LIMITED

DETERIORATION OF POSITION IN SPAIN

The seventy-fourth ordinary general meeting of the Rio Tinto Company Limited, was held, on the 13th instant, in London.

Mr J. N. Buchanan, D.S.O., M.C., presided in the absence, owing to the sudden illness, of the chairman, the Rt. Hon. The Earl of Bessborough, G.C.M.G., whose speech he read, of which the following is an extract.

I refer with profound regret, first—to the death on February 14, 1947, at Gibraltar, of Captain Ulick de Burgh Charles, and second—to the resignation on the 11th March, from the board of directors, of its distinguished chairman, Lord Geddes.

RESULT OF YEAR'S OPERATIONS

The revenue account shows that the net return on sales of produce was down by some £60,000 as compared with last year, after deducting the writing back of the amount of £84,000, a reserve no longer required; on the other hand, the figure of "gross dividends and interest" was more than doubled; on the opposite side of the account the increase in the first item from £187,000 to £323,000 is mainly due to British taxation resulting from this increase of dividend receipts. The balance carried to appropriation account is higher by £66,000. It amounts to this: after meeting the debenture service and the payment as usual of the preference dividend, there is a balance for the year of about £160,000—or, if the item of £84,000 before mentioned is eliminated, the surplus for the year available for the ordinary shares would not have exceeded £76,000.

In view of the serious deterioration of the company's position in Spain since the turn of the year, to which I will refer later, the board have decided that it would not be prudent to pay a dividend on the ordinary shares, and have therefore added the surplus for the present to the carry-forward. This is undoubtedly the wiser course to pursue, in view of the board's decision to redeem the debentures. They propose to give notice on the 30th June next, as by the terms of the trust deed they are entitled to do, to redeem the outstanding debentures on the next following interest payment date, October 1, 1947. As a substantial proportion is already held by the company in its portfolio this operation will not strain the company's financial resources.

Once the company is freed from the gross annual charge of £160,000 for the service of the debentures the date for the resumption of the payment of a dividend on the ordinary shares is appreciably nearer. But the position in Spain does not permit me to-day to promise a dividend for this current year. It is largely a question of coal.

INCREASED ACTIVITIES IN 1946

I now turn to Spain. At the end of May last year, when the last annual general meeting was held, the prospects for the trading year 1946 appeared to hold out considerable promise; the prolonged drought which had seriously hampered our operations throughout 1945 had been broken by beneficial rains; the export trade in pyrites was unmistakably improving; it was believed that our production of copper and brimstone would be greater than in the preceding year, and it was confidently expected that our investments in the copper producing mines in Northern Rhodesia would yield a greater return.

All these favourable expectations were fulfilled during the course of 1946. Our pyrites deliveries were more than 100,000 tons higher

than in 1945; copper and sulphur production figures were up and our gross income from dividends and interest rose from £158,863 to £332,458.

Despite those substantial gains in our production and delivery figures in Spain and overseas the net yield to the company has been most disappointing. The year 1946, which began so full of promise, ended in the most adverse and disappointing circumstances, which have continued far into 1947. Throughout the first four months of this year fuel shortages have precluded all metallurgical operations for the production of blister copper and brimstone, with concomitant effect upon our overall costs and our income in Spain.

Within a fortnight immediately following my election to the chair I set out, in March this year, to visit your company's properties and organisations in Spain. I was accompanied by Sir Francis Joseph and Mr. Thomas Robbins, our managing director, thus forming a fully empowered deputation of the board. We were joined in Madrid by Mr. A. T. Gough, our general manager at Rio Tinto, and with him we were received by His Excellency Don Juan Antonio Suanzes y Fernandez, the Minister of Industry and Commerce.

DOMESTIC PRICES

You will share my satisfaction over the outcome of those interviews. Knowing my anxiety to be able at this meeting to acquaint you with his decisions, the Minister has promptly caused me to be informed of the new official prices for copper, sulphur and pyrites produced and consumed in Spain. Although it appears to have been impracticable for the Minister fully to meet all our claims for consideration, the relief afforded by these new price levels is important. It will alleviate our position when we receive the increased quota of fuel to the extent promised, which will enable us once more to produce copper and sulphur. I am grateful to him for his courtesy as also for the recognition by the Government of the Spanish State of the justice of our claims after they had been submitted to prolonged and searching examination.

ENCOURAGING SYMPTOMS

Further encouraging symptoms of development favourable to your company's commercial activities in Europe are now evident. Last year, from this chair, and elsewhere in the course of official representations to the responsible Ministers of State, Lord Geddes directed attention to the wisdom of resuming fertiliser production in Central and Western Europe for the rehabilitation of Europe's soils. The Lord President of the Council promptly initiated action, which, after prolonged examination, resulted in the acceptance of our proposals for the supply—with the Tharsis Sulphur and Copper Company Limited—of substantial shipments of pyrites for consumption in the British and American zones of Germany.

The competent authorities in those zones have now agreed to our proposals for the treatment on toll of residues from Rio Tinto and Tharsis pyrites which have accumulated at roasters' works in Belgium and Holland. This development will be most beneficial to the economy of the British and American zones in German and to our pyrites customers in adjacent countries and should, in turn, facilitate our selling operations in those countries, but has otherwise no special significance to the company as the residues are the property of the pyrites roasters.

The report and accounts were unanimously adopted.

GOVERNMENT RETURNS

For the week ended May 10, 1947, total ordinary revenue was £170,601,440, against ordinary expenditure of £34,728,040 and issues to sinking funds, £480,000. Thus, including sinking fund allocations of £1,009,015, the surplus accrued since April 1st is £160,836,049 against a deficit of £115,442,000 for the corresponding period a year ago.

Full particulars may be had on application.

INSTITUTE OF INDUSTRIAL ADMINISTRATION

The London Centre has arranged a course of lectures HIGHER MANAGEMENT IN PRACTICE, a study of the practice of effective general management as a contribution to the solution of contemporary economic problems. Wednesday, 21st May to 18th June, at the Fyvie Hall, The Polytechnic, Regent Street, W.1. Fee £1 is 1s. Full details from Hon. Sec., 78, Amberwood Rise, New Malden, Surrey.

The Universities Bureau of the British Empire, 8, Park Street, London, W.1, has been requested to announce the following vacancy:-

THE UNIVERSITY OF SYDNEY

CHAIR OF GOVERNMENT AND PUBLIC ADMINISTRATION.

The Senate will shortly proceed to the appointment to the Chair of Government and Public Administration which will become vacant upon the retirement of Professor F. A. Bland. It will be glad to hear before July 31, 1947, from anyone who would like to be considered for the appointment. The salary is £1,350 per annum, but negotiations for a general increase in University salaries are in progress. There is retirement provision on the lines of F.S.S.U. and, in addition, the University pays £400 by way of annuity. One year's leave is granted on full pay every seven years or thereabouts. Travelling expenses will be paid as arranged at time of appointment.

Applications are to be sent direct to G. DALE, Acting Registrar, The University of Sydney, N.S.W.

EXCEPTIONAL career opportunity in Advertising and Marketing. Top executive position available for man of high calibre with outstanding ability and ambition. Age 30 to 45. Applicant must have extensive business experience, marketing experience and knowledge of advertising. Write in confidence to Managing Director, N. W. Ayer & Son Ltd., 39, St. James's Street, London, S.W.1.

ECONOMIC RESEARCH ASSISTANT required for inquiry into problems of nationalisation. Post will be temporary in first instance, but may become permanent. Salary according to age and qualifications. Knowledge of statistics desirable.—Apply Box 465.

COMPANY SECRETARY, 47, married, no children, offers his service as private secretary in return for living accommodation and reasonable salary. This advertisement is addressed to landowners, business magnates, politicians, etc., to whom the advertiser could become an invaluable aid.—Reply Box PS932, Deacon's Advertising, 36, Leadenhall Street, E.C.3.

CAMBRIDGE Economist, Barrister (Patents and Trademarks), 38, with metallurgical and engineering experience, desires to enter field of industrial finance at home or abroad.—Box 492.

SENATOR GALAL ABAZA BEY, Chairman and Managing Director of various Egyptian Companies, is visiting London in connection with the B.I.F. He would be pleased to meet Exporters of any type of goods interested in the Egyptian market, particularly with regard to textiles, cotton goods and silks.—Ring Suite 749, Grosvenor House Hotel, Park Lane.

Imperialism or Indifference?

IN any comparison of the potential resources of the Great Powers, the United States, even before Hitler's War, far outstripped every other nation in the world in material strength, in scale of industrialisation, in weight of resources, in standards of living, by every index of output and consumption. And the war, which all but doubled the American national income while it either ruined or severely weakened every other Great Power, has enormously increased the scale upon which the United States now towers above its fellows. Like mice in the cage of an elephant, they follow with apprehension the movements of the mammoth. What chance would they stand if it were to begin to throw its weight about, they who are in some danger even if it only decides to sit down?

There is, indeed, one question that the analyst of power need not spend time in asking about the strength of the United States. If raw material resources, industrial capacity, scientific knowledge, productive "know-how," skilled labour—if these alone were the ingredients of power, then the United States could take on the rest of the world single-handed. But though these things are essential ingredients, they are not all that it takes to make a Great Power. There must also be the willingness, and the ability, to use economic resources in support of national policy. The rulers of Soviet Russia, as was suggested last week, are not likely, at least for a generation to come, to have nearly as good cards in their hand as the Americans. But the nature of their system of concentrated power and iron censorship enables them to play a forcing game. The Americans' hand is all trumps; but will any of them ever be played? And for what purpose?

There is no lack of prophets, either in America or in Europe, anxious to tell the world that the United States either will or should turn to an aggressive imperialist role in world affairs. Critics on the Left argue that capitalism is inevitably aggressive and that sooner or later the largest capitalist community is therefore likely to prove the most aggressive. Supporters on the Right argue that America, as the last stronghold of the free-enterprise system, must use its strength to preserve this "free way of life" against Communist inroads. Nor is it only in books and speeches of private citizens that the evidence of imperialist tendencies can be found by those who are in search of it. There are actions of the United States Government that fit neatly into such a thesis. For example, in the name of defence, most of the islands in the Pacific Ocean have been brought under exclusive American control. And the appropriations for Greece and Turkey were presented to Congress as the first step in a world-wide policy of opposing Communism everywhere. Is this then a new phase in American policy, a phase of expansion and imperialism?

Only those whose view of America is distorted by ignorance or malice, or obscured by dogmatism, could possibly believe any such thesis. It is true that there are individual men and women and groups, some of them with a measure of influence, who are impressed with their country's overwhelming strength and attracted by the short cuts of aggressive diplomacy. But their views should not be mistaken for the policy of the

United States. The nation-wide debate that followed President Truman's request for the Greek and Turkish appropriations was the most impressive testimony to the emotional and institutional obstacles that lie in the way of canalising America's overwhelming economic strength into a sustained and effective foreign policy of any sort, be it imperialist and aggressive or constructive and co-operative. Faced with the daily exasperations of high prices and the dislocations mainly attributed to much publicised strikes, the average American is not certain that his community is much wealthier and more powerful than in 1939. Moreover, even an America that was fully conscious of its strength would be held back from using it by some of its most deeply rooted patterns of thought. The brake would be applied impartially to any active policy, whether of aggression or of co-operation. The old combination of liberalism at home and isolationism abroad, of a forward policy in domestic matters and of no policy at all in foreign affairs, still holds good. The La Follette family may, for the first time in decades, hold no office either at Washington or in Wisconsin, but the pattern of their thought is very much alive. Some of the keenest opposition to the "Truman Doctrine" comes from those who believe that direct American intervention violates the rights of the United Nations and the criticism was strong enough to impel Senator Vandenberg to propose reservations designed to save face for the United Nations. This specific support for the United Nations is one strand in a wider fabric of anti-imperialist, anti-militarist thought which should certainly not be dismissed as ineffective idealism. The anti-militarist has been sufficient in the course of the last two years to do away with conscription, drastically to reduce the army, to throw doubts on the full effectiveness of any volunteer system and, with the German peace treaty undrafted and the Truman Doctrine looming ahead, to permit Congress to slash 10 per cent out of the appropriations proposed for the various armed forces.

All this opposition to direct American intervention abroad on moral grounds fuses at the political level with the amoral but even more effective force of mere selfish isolationism. When Mr Joseph Kennedy remarked that the best way to defeat Communism was to make the American system work at home, he did not speak only for himself. And when the House of Representatives, in a single day, gave Mr J. Edgar Hoover all the funds he wanted for tracking down Communists in America and threw out the entire appropriation for the "Voice of America," the broadcasts by which the State Department hopes to explain the American way of life to the world, they demonstrated their relative concern for the internal and external aspects of America's anti-Communist crusade.

The more difficult and distasteful the problems of the outside world become, the greater is the temptation to Americans to concentrate on the world they really control and understand—which is their own United States. It is easier and possibly more rewarding to build a TVA for the Missouri than for the Danube.

This is the emotional context in which the American political and economic system works. The structure of the system adds further impediments of its own to the development of a consistent, sustained and aggressive foreign policy. It is difficult to believe that the next few years will abolish the old economic instability of the United States, the cyclical recurrence in its economy of recessions and depressions. The importance of these dislocations is not, as is sometimes supposed, the possibility that they will allow other nations, in particular the Soviet Union, to outstrip America in industrial strength. The loss of wealth represented by even the most severe depression is not more, in real terms, than, say twenty per cent, and with a national income running at some \$160 billions a year, the United States' margin of superiority over its competitor is far

larger than that. The importance of a depression to America's external relations is that it would enormously reinforce the instinct to concentrate on American problems to the exclusion of the outside world. Foreign lending would cease as abruptly as it did in 1929. And the spectacle of the richest community in the world closing its factories and struggling with mass unemployment would probably knock the longest nail yet driven into the coffin of the "free way of life."

But perhaps the greatest single obstacle to the emergence in America of a sustained and positive foreign policy is the nature of its political system. The division of power between President and Congress, the possibility of different parties controlling the one and the other, the lack of a Cabinet responsible to the legislature, the working of the party system, are all weighted against the present pursuit of long-term national or international objectives. So long as the essence of the political struggle in the country is the conciliation of minorities and the avoidance of controversial topics, the great issues of foreign policy cannot be fairly placed before the electorate and later confidently worked out. The spectacle to-day of the wool bloc in Congress, representing a minute fraction of American political life, pressing an increase in tariffs in the middle of the Administration's attempt to lead the world to freer trade and lower tariffs is a typical example of the pluralism of objectives and scattering of efforts which characterise American politics.

The only way in which an Administration in these circumstances can make its voice heard above the clamorous shouts of minorities, lobbyists, special interest groups, silver Senators, cattle Senators and cotton Senators is by dramatising the issue at stake to ten times life size and compelling Congress by a species of shock treatment to pass the necessary appropriation. The fact that President Truman had almost to declare war on Russia to get Congress to agree to a minor appropriation for small-scale police work in the Eastern Mediterranean bodes ill for the future of a fully developed long-term foreign policy whose implementation will demand billions of money, and much more than money, from the American people.

These arguments are really decisive. So long as the American Republic is constituted as it is to-day, a consistent policy of deliberate imperialism is out of the question. No doubt from time to time there will be imperialist overtones—some of them deliberate, far more of them unconscious—in American policy. It would be difficult to have a mood of willingness to pursue any active policy, in a country where speech is so unbridled, without a lot of foolish things being said, and some done. But these imperialist overtones are unlikely to go very far or last very long. The prospect is that American policy will continue to fluctuate between a mood of activism, mainly liberal and well-intentioned but with a verbal top-dressing of aggressiveness, and a mood of wholly idealistic indifference to the rest of the world—and if this is a true forecast, the rest of the democratic world may even come to welcome the periodic reappearance of imperialist talk in Washington. The real choice is not between General MacArthur and Mr Henry Wallace, but between President Truman and President Coolidge. Already since 1945 such a fluctuation has taken place. The mood which followed the end of the war, and which encouraged the United States both to end Lend-Lease from one day to the next and yet to support international action through the United Nations and Unrra, represented the triumph of the liberal isolationist mood liberal in its support of international action but isolationist in its tendency to see in international institutions a complete substitute for American policy. Now a new mood is apparent, for which Mr Molotov is uniquely responsible. Russian diplomacy has succeeded in goading the United States into an unwilling realisation that perhaps it must itself, in terms of its own

strength and manpower, do something about the outside world. But it would be rash to say how long it will last. The only certainty is that the fluctuations will continue.

Yet it is possible to discern under this flowing and ebbing tide a steady rise in the line of the tide mark. After each phase of active diplomacy, the Americans do not fall back to quite so deep a trough of isolation, and each new period of activity carries them further up the rocky and unwelcoming shore of world politics. Statesmen and administrators and liberal men of affairs all over the country are at work to try to establish between the upper and lower mark of these shifting tides a foreign policy which combines the idealist and the active wings of American thought, to produce a policy in which America's great strength is used in an honestly internationalist and not an imperialist fashion. It is on the success that these

Keep Left

THE Annual Conference of the Labour Party that opens at Margate on Monday is only the second that has been held since the party's unexpected triumph at the General Election. The Bournemouth Conference last year was, in the main, a victory celebration and a very good time was had by all. This year's conference will be a soberer affair. The fuel crisis has thrown the Labour Government at least partially on the defensive in the country. And in the last twelve months some rifts have appeared to disturb the perfect harmony of the Parliamentary Party. But, unless the preliminary indications are very misleading, it would be a mistake to expect any fireworks at Margate. The note of jubilation has gone; but the Labour Party is still fairly well pleased with itself, and believes that this pleasant emotion is still shared by a majority of the electorate.

How long this complacency will continue, however, is another question. The Margate Conference roughly represents the watershed of this Parliament, and it is altogether probable that the two or three years immediately ahead will be far more difficult for the party than the past two years have been. Both internal and external troubles are clearly coming. Internally, the Party faces a let-down of excitement. The programme of legislation is well on the way to completion. By the end of the present session, only one more major party measure, the Steel Nationalisation Bill, will still be in prospect. For two or three more sessions, with this one exception, Parliament will have to concern itself with minor matters which will not excite the passion of party loyalty, or with administrative performance, at which it is already clear that Labour Ministers do not shine as brightly as they do at the legislative marathon. There is nothing that holds a party together so well as the rapid-fire enactment of measures long dreamed of and unanimously approved within the party. There is no morale-builder to equal the regular recurrence of opportunities for singing "The Red Flag" in the division lobby. But this stimulus is about to be removed, and the internal quarrelsomeness of the Parliamentary Party will inevitably increase as a result.

Moreover, it is at least possible that the party will feel itself increasingly on the defensive towards the electorate. The Socialists are probably allowing themselves to be misled by their remarkable record of losing not a single seat at a by-election in nearly two years. The fact is that very few of the Labour seats that have been defended at by-elections have been seats that the Conservatives could possibly win, even in one of their good years. The marginal Labour seats are mainly held by healthy young men who neither die nor get appointed to fat jobs. The electoral tide almost invariably flows between elections against the incumbent Government, the actual performance of politicians in office so rarely coming up to what, on the hustings day, they have led the electors to expect; and the available indications,

men have that the strength of America depends. Their task can be aided or greatly impeded by the amount of intelligent and constructive support and counsel they receive from their colleagues in the other democratic communities. Those democrats in England who scream at the Americans that they are imperialists, capitalist reactionaries, and would-be aggressors no doubt imagine that they are helping to bring about a "democratic," "progressive" American policy, presided over by Mr Henry Wallace. What they are actually doing is helping to persuade America to retreat within its own borders, to bolt the doors, turn its back, and set itself to organise a purely self-sufficient American economy. They might well be asked to pause and consider whether this is what they really want—to be left alone in a world given over to power politics and in which Soviet Russia will be the greatest Power.

though they are neither very numerous nor very conclusive, suggest that, in spite of the by-election record, this Government is no exception. In any event, whatever may have happened up to date, there is clearly likely to be quite enough economic trouble in the next twenty-four months to give the Opposition a chance. The Labour Party will feel itself less and less reassured by the loyalty of the organised workers and more and more impelled to care rather more than a tinker's curse for the views of the rest of the community.

For internal and external reasons, alike, therefore, the Labour Party faces some awkward decisions—not at the Margate Conference, but soon after it is over. And it so happens that both sets of questions—both those of party strategy and of public policy—are likely to present themselves as a conflict between the right and left wings of the party. There will, for example, certainly be a fight over the programme for the next election. It is all a question of the interpretation that is put on the electors' intentions at the General Election two years ago. If you believe that they—enough of them to give the party a Parliamentary majority—deliberately and consciously gave a "mandate" for the party programme, then presumably you think they will be pleased by the prompt decisiveness with which their instructions have been carried out, and you will offer them a second instalment of the same story. But if you take the more sceptical view that the decisive two million—the margin between victory and defeat—were not so much voting positively for Socialism as negatively against the Tories, then you conclude that they have had about as large a slice of a programme they never really wanted as they can swallow without being scared off. That, presumably, is one of the reasons why the party managers (who are always on the side of caution) have rushed the programme through in two years, so that the rest of this Parliament can be spent in soothing the nerves of the volatile, but decisive, middle vote.

Infinitely more important than these moves in the game of politics, however, is the similar dilemma that is rapidly approaching in the public policy of His Majesty's Government. The shadow of the impending dollar crisis is getting blacker week by week. Inexorably, three fateful propositions are hardening into facts. First, the American and Canadian credits will be exhausted long before the end of 1948. Second, there is no possibility of British exports being by then large enough to make the country self-supporting. And third, any reduction of imports from hard currency countries to the level that Britain will be able to pay for in 1948 will produce very great popular hardship and widespread industrial dislocation. Shall the Government try to borrow more dollars, without any assurance whatever of getting what they ask for, but with the certainty of getting it only in return for a solemn re-affirmation

—at the very least—of all the pledges, political and economic, expressed and implied, that were given last time? Or shall they face the rigours—which might be intense—of doing without dollars, other than those few that they can earn? Shall the Government seek to maintain the present level of consumption and industrial activity at the cost of a public declaration of dependence on America? Or shall they seek independence at the cost of lower rations and higher unemployment? Shall it be capitalist Lend-Lease (if they can get it) or hairshirt Socialism?

It is a cruel dilemma for a Labour Party to face. It is reasonable to guess that the majority of the Cabinet would vote, however reluctantly, for at least trying the Lend-Lease solution. But many of the backbenchers may be tempted to insist that there is a third course, one that will avoid both economic crisis on the one hand and the necessity of soliciting a political and economic alliance with capitalist America on the other. This is the doctrine that is put forward in the pamphlet with the significant title of "Keep Left" which was published by fifteen backbenchers a few weeks ago*. The pamphlet is well worth examination as the first extended exposition of the views of the "rebels" within the party.

It is a curious document, partly no doubt because of the composite nature of its authorship. It starts with a statement of the dilemma facing the country which is both forceful and correct. It would be difficult to improve upon the clear posing of the alternatives with which this part ends—either to cut imports or to borrow more dollars or to balance the accounts in 1948.

How are we to do it? All the great issues of modern British politics are involved in the answer to that question.

But, the reader's expectations having been aroused by this introduction, he is immediately plunged into the old barren recital of what a mess the Labour Government inherited. This part is clearly the work of Mr Michael Foot, whose pen is rarely dipped into any non-corrosive liquid. It is full of rancour and contains the most astonishing distortions of fact; though it is couched in the language of offence, its purpose would appear to be the defensive one of explaining away failures.

To this there succeeds the economic section—presumably, to judge from its obsession with the virtues of Scientific Manage-

* "Keep Left." *New Statesman and Nation*. 1s. It is stated that the pamphlet is the work of Mr R. H. S. Crossman, Mr Michael Foot and Mr Ian Mikardo and is endorsed by the other 12 signatories.

† Since the pamphlet will clearly be much quoted in the months to come, it is worth while—though it is a digression from the main argument of this article—to demonstrate the quality of some of the "facts" presented in this part. For example, in support of the thesis that the collapse of capitalism is at hand, it is stated that

"the slump of 1929 was different. After previous slumps, the system recovered and touched new peaks of productive power. This never happened after the slump of 1929. Right up till her (sic) entry into World War II, American production in mining and manufacturing never reached the pre-1913 level. . . . In most countries, including Britain, recovery from the worst slump years was dependent on rearmament. . . . Our leaders of industry and the successive Governments which reflected their outlook vainly hoped and prayed for a return to the unclouded days of 1913. They did little or nothing to put our house in order. They wasted twenty years."

The truth is that the output of American manufacturing industry ("value added by manufacture"), which was \$9.2 billion in 1914, was \$24.7 billion in 1939, the rise in prices in the intervening period having been only about 10 per cent. The index of industrial production, which was 110 in 1929, was 113 in 1937. (These figures are taken from a book bearing the signature of Mr Henry Wallace.) For Great Britain the estimates of national income by Mr Colin Clark (himself once a Labour candidate) can be taken. They show that real net national income in 1935, long before there was any rearmament, was 19 per cent higher than in the worst slump year and actually 9 per cent higher than in 1929. Over the whole decade 1929-39, including the slump years, the rate of increase in real national income per head was at least as fast as the average of the nineteenth century. There was plenty that was wrong in the 1930s, but critics of the Tories only weaken their case by resorting to malicious prevarication.

ment, the work of Mr Mikardo. For raising production to the level necessary to balance the international accounts by 1948, Mr Mikardo has four prescriptions. The first is "an extended and tighter system of materials controls designed to divert materials, and hence employment, from inessential to essential purposes." The second is "preventing inessential industries from increasing their existing staffs without licence." The third is a policy of enabling workers in different industries to get different supplies of consumer goods, and subjecting them to differential taxation. The fourth is a policy of applying differing rates of profits tax to different industries, according to their essentiality, in order to "ensure that as workers moved to the essential trades, the capital for their machines and equipment would move with them." There are many things that could be said about these four proposals; but two must suffice. First, even if the administrative nightmares they would cause could be overcome in a few weeks and the policies could be fully applied by, say, the autumn of this year, can any man in his senses imagine that the quantitative effect they would be likely to have would be enough to dispense with the need for more dollars in 1948? Even if they would do some good, would they do several hundred million pounds' worth of goods to export in their first year? Yet, apart from more nationalisation and "a wide and whole-hearted extension of industrial democracy," no other remedy is suggested. Secondly, it will be noticed that each of these recommendations involves a new, tighter and more arbitrary form of economic control. If Mr Mikardo's intention had been to prove the Tory thesis that Labour economics, being based on a refusal to face the facts of life, but a desire to prevent them from emerging, can only resolve its contradictions by erecting an ever more elaborate and frustrating apparatus of detailed control—if this had been his intention, he could hardly have done better.

Finally, (after a lucid interval on demobilisation) there is Mr Crossman on foreign policy. It is the familiar formula. There are the usual wild statements ("nothing could long delay the advance of the Red Army to the Atlantic Coast" . . . "The French are bound to the USSR as closely as we are bound to the USA"). There is the usual irresponsible mixture of insults hurled at American policy with demands that America shall provide large sums of money, without conditions. There is the usual patronising belief that the great deluded mass of American citizens are anxious to respond to a lead from Socialist Britain, which is to be given by "boldly standing up to the US Administration and putting forward its own Socialist proposals at every conference." Above all, there is the old conviction, from which the steady disproof of events has never been able to make Mr Crossman waver, that Britain has only got to make ringing declarations of faith in "democratic Socialism" for "100 million allies" to spring out of the ground to its support, in peace or war. The only change since 1940 is that the figure is now getting on into the billions.

If there really were a policy of the Left which would rescue the British people from the very painful economic dilemma with which they are faced, and would simultaneously absolve them from the necessity of taking sides in the new balance of international power—if there really were such a policy, it would be folly to oppose it merely because it was painted red, or involved doing daring, extreme things. But there is no such policy. Both in its domestic economic aspects and in its foreign political aspects, it dissolves on examination into hot air. The Right Wing of the Labour Party may be fuddled and bumbling, but at least its feet are still on the rocky ground of unpleasant facts. If there were any prospect of the Margate Conference deciding to "Keep Left," one could only despair of the commonwealth. Except, of course, for one comforting reflection—that there could be no surer way by which the Labour Party could commit electoral suicide.

University Progress

VERY little that was new was added from the Government benches in the debate on the universities in the House of Lords last week, but Lord Lindsay of Birker, who initiated the debate, asked some very pertinent questions, which need urgent consideration now that the expansion of the universities is getting under way, and before the new shapes they are working out become set and unchangeable. He asked whether some of the expansion should not take place in new universities, instead of only in existing ones; if some new types of university should not be encouraged rather than the existing models reproduced; if there was not a place for more institutions of university status but of a more specialised kind, like the German *Handels-hochschulen*; if the schools were producing enough boys and girls of the right type to permit a doubling of numbers in the universities without a lowering of standards, and whether there was an adequate demand for them once they had passed through the universities. To answer these questions he proposed that an independent Government Committee should be set up, to review university policy as a whole, and to draw together the piecemeal recommendations which have been made in a whole string of specialised reports on scientific, medical, teaching, dental, oriental and other matters.

During February, 1946, three articles in *The Economist* discussed the future number of graduates which the nation required to meet its need for scientists, executives, and professional men and women and the methods by which the necessary expansion of the universities, which was estimated to involve a doubling of the number of students in the next ten years, could be achieved. These articles appeared before the publication of the Barlow report (Cmd 6824) on the nation's needs for scientific manpower, but the report largely confirmed the estimates made in these pages. Before the publication of the Barlow report it was known that many universities regarded a large expansion of numbers with many misgivings, and that their development plans were much more modest than would be required to secure a doubling of numbers. But during the summer of 1946 a transformation of outlook took place which to the outsider might appear almost revolutionary. Few could now reproach the university authorities with timidity. The Government too has accepted the financial implications, which are on their side of the bargain, in a spirit of courageous generosity and have increased the grant to the universities to six times its pre-war amount. The stage is, therefore, set for a really bold and far-reaching development of university life to meet the needs of a nation whose future depends upon the quality of its citizens.

During the past year the University Grants Committee has been busy considering the development plans of all the uni-

versities. Unfortunately its statistical report will not be published until the autumn, and detailed comprehensive figures are therefore still lacking. But it is nevertheless possible to obtain fairly full details from the various universities individually, and to obtain a general picture from the Chancellor of the Exchequer's statement on March 10th and the Lord Chancellor's statement last week about the size of the revenue and capital grants over the next five years. From both these sources the evidence is extremely encouraging.

Before the war there were some 50,000 students at British universities: for the year 1946-47 there are 66,000, but this increase of 30 per cent masks a very much more impressive increase in certain universities, particularly in the "civic" universities. It is generally agreed that neither Oxford nor Cambridge should carry out an expansion of anything like the same proportions as the other universities, and that London University has special difficulties at the moment owing to more serious war damage than any other university. But the numbers at Cambridge are almost exactly what they were before the war—round about 6,000—the numbers at Oxford have increased by 20 per cent—from 5,000 to 6,000—and those at London University by 12 per cent—from 13,100 to 14,700. By the end of the decade Cambridge University hopes to reach 7,000, Oxford to remain at its present level and London to reach some 18,000. Since these three universities, which before the war accounted for half of the total number of students, are thus planning an expansion of less than 30 per cent, the main burden of the post-war expansion has fallen on the rest. Their response has been good: numbers at Bristol have risen from 1,000 to 1,750, at Manchester from 2,500 to 3,400, at Birmingham from 1,500 to 2,500 and at Edinburgh from 3,200 to 4,200—to quote only a few examples. The development plans at the first three universities envisage an expansion to 2,500, 5,000 and 4,000 respectively before the end of the post-war decade, and the proposed increase in numbers at some of the university colleges is even greater proportionately. Yet in spite of this very satisfactory response, Mr Dalton's statement in March showed that when all the plans are added together the universities have felt unable to attain a total figure of more than 88,000 by 1956-57, a figure which is well below that proposed by the Barlow Committee, and very much lower than the 108,000 proposed by the Parliamentary and Scientific Committee last December.

The reasons for this relatively unambitious target are not far to seek. No one knows what is the optimum size for a university which possesses a large non-residential element, but it is probably round about 5,000, and this figure cannot be achieved

Bonus Distribution

TRIENNIAL VALUATION
1944-46

Reversionary bonuses on With-Profit policies have now been allotted at rates per annum ranging from £1. 10s. to over £2. 10s. per £100 of sum assured, and 10/- % on all existing bonus additions

comfortably even in a decade by the smaller universities and university colleges. Indeed in certain cases, such as Reading, which must be largely residential, a building programme which could provide hostels or colleges for such a huge increase, is beyond the bounds of present possibility. And even if it were possible, it is doubtful if it would be desirable. Reading University already plans to quadruple its student population in ten years and almost entirely to re-create itself in a near-by park of 250 acres. No one could accuse such a plan of timidity or lack of vision. It is difficult to resist the conclusion that if Oxford and Cambridge increase by only some twenty per cent, an increase to a total of 100,000 students cannot be achieved without the creation of at least one new university and a large expansion of London University, perhaps by splitting it into several separate parts. There is no fundamental reason why an area of 10 million inhabitants should not have four or five different universities of fairly reasonable size. The existing nuclei are already largely independent in academic affairs, but are still bound by administrative links.

It is easy to see why the University Grants Committee has been content to accept the universities' own estimates. The peculiar relationship between the Government and the universities is such that the Committee is largely dominated by what the universities and that loose but important unofficial body—the Committee of Vice-Chancellors and Principals—suggest. It could never compel London University to break itself up against its will; neither is it prepared to go against the advice of the Vice-chancellor's Committee that it is better to concentrate resources in the existing institutions than to dissipate limited reserves of personnel and materials on entirely new ones. Yet it is not so certain that the rejection of the idea of an entirely new university, or university college, is altogether wise at this stage. There is at present an outburst of interest in the creation of new universities. Carlisle, Inverness, Lancaster, Lincoln, Bradford, Huddersfield, Norwich, Stoke and York are all showing interest, with varying degrees of soundness, in the idea of starting on the road that leads to a local university. Clearly all these requests cannot be granted, but it would equally be lacking in vision to reject all if additional foundations are going to be required before long. The enthusiasm is there now: it may be difficult to revive five or ten years hence, and it would be better to permit a modest beginning in say two of the centres now, than to flog a discouraged movement later.

The passive acceptance by the University Grants Committee of the universities' own recommendations throws into relief two major issues which will have to be faced before either the question of total numbers, or the best ways of achieving them, can be satisfactorily settled. The first issue is that of ascertaining as reliably as possible the real requirements of the nation for different kinds of scientific, technical, professional and managerial skill. The second is the evolution of a more satisfactory method of planning and guiding university development, without introducing unnecessary rigidity or interfering with the essential independence of the universities themselves. On the first issue the nation is known to be undermanned in all these fields, but no one really knows how many physicists, or metallurgists or electrical engineers the country ought to have; much less what are the requirements for statisticians, economists, social science workers, historians or linguists. Certain professional bodies have made their own estimates, almost certainly on the conservative side: the Ministry of Education has made its estimates for teachers, and the Good-enough Committee attempted an estimate for doctors. But neither the Hankey Committee nor the Barlow Committee tried to break up the global requirements into detailed specialities, nor were even the global figures of the Barlow Committee

firmly based on reliable statistics. They were at best intelligent guesses—inevitably so, since only a detailed and comprehensive inquiry could yield anything more reliable.

*

In the absence of such statistics the University Grants Committee is unable to say to the universities that the nation requires so many chemists or university-trained business managers, and that their proposals do not attain this target. Nor can the universities themselves say whether they are over-expanding or under-expanding particular departments in relation to the demand for the graduates they will be sending out from them. There is, for instance, considerable apprehension in some quarters that the current popularity of the social sciences is going to result in far too many young social scientists appearing on the labour market. This may or may not be true, but the crux is that no one knows.

It would be Utopian to imagine that it would ever be possible to produce any exact estimates—the field is far too vast and the pattern far too fluid. But some very useful guidance could be derived from an inquiry, or more probably several inquiries, into the demand for different kinds of knowledge and skills, which would at least provide the rough proportions between the different types of graduate needed. In the scientific and professional fields it ought to be possible to get near enough to the mark to prevent the universities from producing twice as many radio-engineers and half as many mining engineers as the nation needs. The Coal Board have indeed made their estimates and were prepared to negotiate with the University Grants Committee to obtain an increase, but were asked to deal with each university directly and separately—an excellent example of the limited views of its responsibilities the UGC takes. On the Arts side, estimates are more difficult, for the ultimate utilitarian purposes of the various degrees are much less defined. But apart from the demand for teachers it is fairly clear that the largest field for the future employment of non-technical graduates is in business. A start in assessing the demand has been made by the Manchester Joint Research Council, which carried out an inquiry among local firms into their future demand for technical and non-technical university staff. This inquiry, which yielded illuminating results, should now be repeated all over the country, and it would appear that the Ministry of Labour is the body to conduct it, accompanied by a proselytising campaign by the Ministry or the University Appointments Departments or the new Institute of Management to persuade business firms that they need the men of imagination and breadth of vision, which the universities are supposed to breed. Until these requirements and estimates are drawn up, all plans must necessarily be made in the dark.

The second major issue is that of the method by which university development can best be planned and guided. This very important subject will be reserved for a subsequent article.

NOTES OF THE WEEK

Six Months to Think

The tone of Mr Bevin's speech on foreign affairs last week should have silenced prophecies of his departure from the Foreign Office. Repeating that the Moscow Conference had left him "neither pessimistic nor optimistic," he declared that he would go on working for agreement with the Russians in the hope of an eleventh hour and fifty-ninth minute settlement. If finally he had to say "Well, it cannot be done," then the Government would "have to review the whole of their policy." That is a very weighty and significant promise. In the face of it, it was somewhat unfair of Opposition speakers to complain—as doubtless others will complain at Margate this week-end—that British foreign policy is unconstructive.

In the immediate future the ability to make a constructive contribution to Europe's future lies almost entirely with the Americans; the power to make the Foreign Ministers' conference work lies largely with the Russians. Until Mr Bevin is certain about the long-term intentions and powers of Mr Marshall—who is now immersed in his papers—and about the short-term intentions of Mr Molotov, there is little that he can do on the wider issues. The next six months before the November meeting in London is rather a time for studying the implications of a change in British policy: the effects of a decision that the four Powers cannot work together, that Germany must remain divided, Austria occupied, the peace treaties unratified. Those are the worst things that are likely to happen in present circumstances.

Clearly Mr Bevin must have alternative policies in his pocket when November comes. But it is irresponsible and inaccurate to state—as do his critics in the Labour Party—that those alternatives are clear and easily achieved. Proposals for European union—whether political or economic or both—bristle with unexamined difficulties, as the Belgian and the Dutch can prove from their negotiations for the Benelux Customs Union. French own negotiations for the single western German federal state adherence to any plan for a single western German federal state cannot be taken for granted; nor for that matter can a French decision to follow Britain and the United States in a split with the Russians. Assumptions have to be made about the world economic developments of the next two years on which even the experts disagree. It is a time to combine intensive research with a careful watch for any opportunities to improve the atmosphere in which the November conference will meet.

Much that has been in the Foreign Secretary's mind is made clear in the twopenny pamphlet called "Cards on the Table" which has just been published by Transport House. It gives an admirably clear and crisply argued analysis of the difficulties which have faced British policy since Labour came to power. The party trumpet is blown only quite faintly against the main theme of Russian intransigence and American unawareness. It is most refreshing to find such cool, factual treatment. "Cards on the Table" makes "Keep Left" look very amateur and ill-informed.

*

Diplomacy in Public

Disappointment with the results of public diplomacy is now general. Mr Bevin expressed it strongly in the House of Commons last week, was supported by Mr Eden and would probably be applauded by most British journalists who have covered the last three meetings of the general public in the detailed record of very little value for the general public in the detailed record of the Ministers' set speeches, and what should be negotiation becomes more like a wrestling match, reported round by round. Statesmen are tempted to talk over the heads of their colleagues to their supporters and critics at home, or even to those interested masses of Germans and Japanese who will applaud any champion who may appear. As Mr Bevin put it, it is impossible to "think aloud" without having the thoughts pinned down in the next day's headlines. Some better way should be found of running the London meeting in November.

The Council of Foreign Ministers was originally intended to be a kind of international cabinet, a special diplomatic instrument, not to be confused with the Security Council. As such it has as much right to keep its proceedings private as has the British Cabinet. One can imagine the embarrassment, confusion and bitterness which would result from detailed reports of what goes on in No. 10 Downing Street. This analogy is sometimes challenged on the ground that members of the British Cabinet are all of one mind and party on fundamental things, that as

they have to function as one body everything should be known about their agreements and nothing about their disagreements. But the conception underlying the Council of Foreign Ministers was—and should remain—the same, until it is proved invalid; it is that the four Foreign Ministers represent war-time allies, united in their determination to settle the problems created by their common enemies in the war. The Council was not intended to become a forum for debating all policy issues arising between them.

Mr Bevin thinks that the November conference will be "probably the most vital in the world's history." If so, the damage that premature publicity might cause to delicate negotiations should be guarded against. The Americans are hardly likely to take the initiative in doing so; their news agencies will bitterly oppose a return to the original plan of issuing agreed communiqués and nothing else. The Russians, who were from the first opposed to daily and detailed press conferences, will quite rightly say "we told you so." It surely lies with the British, as hosts to the next conference, to work out and propose some new method of keeping the public informed and of binding the world's press to greater discretion and less inquisitiveness. If the British and American news agencies could come to a gentlemen's agreement on leaks and contacts, the rest of the press would probably gladly accept communiqués and occasional press conferences in place of the exhausting daily hunt for four sets of clues to the news.

*

The TUC and the "Economic Survey"

The Trade Union Congress's Report on the "Economic Survey for 1947" has to its credit a clear-headed assessment of necessities and a willingness to recognise their immediate cost in increased or prolonged austerity. Coal is the first necessity—not the 200,000,000 tons of the White Paper target but 250,000,000 as a reasonable medium-term objective and 220,000,000 as a minimum. To attain that minimum, better conditions, increased recruiting, foreign labour, and the other steps outlined in the White Paper are commended, but these, the report claims, must be supplemented by a really concentrated drive for more equipment; the engineering industry must be "mobilised, toolled and operated" to that end, home production must be supplemented by imports, and exports of equipment must be stopped entirely. To make the coal, once mined, effectively useful, electricity output must increase, and for this the same urgencies apply; an increase in the production of generating plant, imports if possible, and a suspension of all exports. As a third priority, transport must be improved both as an aid to industry in general and because of its key importance in fuel distribution. This programme of priorities will bear hard on the balance of payments; the curtailment of exports and the increased imports must, therefore, be matched by greater exports and lesser imports of less immediate necessities. All this sounds very logical and coherent. But is the TUC quite sure that it is not merely theoretical? Just how, this year and next, are 250 million tons of coal to be mined? And is it really sensible to talk of expanding exports and yet to ban two categories of goods in which British exporters still have an advantage? And what exactly are the unessential imports that can be cut?

It is, however, difficult to quarrel with the Report's observations on manpower in general and on the distribution of workers between industries, as far as they go. But they are strangely vague on those special "restraints" and "encouragements" by which movement from less to more necessary occupations should be expedited. This question is the central crux of planning in a free society, the dilemma of any social-democratic government; in all the world there is no body better qualified than the TUC to solve it; one can only, on the strength of this Report, hopefully, but doubtfully give them credit for having perhaps some ideas in store. No credit, however, can be given on the Report's treatment of production per head. The incontrovertible Government statement that "the nation cannot afford shorter hours of work unless these can be shown to increase output per man year" is objected to on the extraordinary ground that it will "prejudice the pursuit of claims for a shorter working week" by putting the onus of proof on the claimants. Where else, one wonders, should it be? This is not the voice of industrial statesmanship but the whinnying of Low's noble but bone-headed steed.

Planning Bill Third Reading

The Town and Country Planning Bill received its third reading in the Commons on Tuesday, with a not unexpected vote of 297 in favour and 126 against. There was very little said in the debate that was fresh. The majority of Opposition speakers were content to go over old ground and repeat their complaints on the lack of opportunity given for discussion. However, the Minister himself was conciliatory enough. The major points he dealt with were, first, his acceptance of the criticism made in Committee of the Government's original plan to "weight" the grants to be made towards the redevelopment of war damaged areas. Local authorities of these areas will now be given grants on an equal basis. Next, he confessed to alarm at the anticipated shortage of planning staffs with experience and promised to do what he could to remedy that. This was coupled with the interesting statement that the universities are to be brought into the training of men and women for positions in the planning departments of local authorities. They can so clearly supply both the instruction and the background needed to convert the technically trained architect or surveyor into a man broad enough to balance all the aspects of planning.

The other Government concession was that announced by the Parliamentary Secretary at the end of that debate, the production of a device, clumsy but it is to be hoped effective, to relieve those who contemplate improvements in existing agricultural cottages of the damping effects that the immediate imposition of a development charge would have. The Minister was at his weakest in his attempt to explain away the ability of other Government departments to ride roughshod over development plans, and Mr H. G. Strauss very properly reminded the Minister of the case of the Post Office and White Horse Hill. It is not to be expected that every Cabinet Minister will be energetic enough to tour the country to inspect the acts of vandalism committed by his department. But Mr Silkin declined to step into the breach.

* * *

London Phoenix

Details have now been published of the final report of the joint planning consultants for the reconstruction of the City of London. The consultants are Dr Charles Holden and Professor W. G. Holford, and their report was considered by the Court of Common Council on Thursday. As might be expected, coming from such a quarter, the report is detailed, sensible and a very fine adjustment between all the conflicting claims that, in the case of the City of London, inevitably cry for precedence. Is there to be any paramount consideration? Should traffic, or the need for office accommodation, or the claims of antiquity, or even the reverence due to St Paul's, dominate the plan? Fortunately none of them does.

In the compass of the space available it is impossible to do justice to the many facets of the plan, but some points do stand out. It is good to see that at last it is proposed to give St Paul's Cathedral its proper setting. The main stream of traffic in Ludgate Hill and Cannon Street will be diverted to slightly nearer the river, so that the approach to the Cathedral from the West will not be enmeshed in traffic problems. A new approach from the river on the South is to be made (culminating in a grand vista of the Bankside power station, St. Silkin's, from the south front of St. Paul's?), this to be expressly reserved for ceremonies that should restore the river to its old place in London life. Even the North-East aspect is to be made more open. Sir Christopher Wren should turn in his grave with pleasure.

On the side of practical considerations, the report is equally clear-sighted. A standard of office density is advocated, based for the first time on the floor space in each building used by the office population. The standard suggested is that the working floor space in any building should not exceed four times the ground area the building covers. A new day-lighting code is recommended, and the report, with considerable courage, criticises the bad design, in this respect, of many of the new buildings put up in the City between the wars. Finally, the report even suggests, tentatively, a date on which reconstruction should start. Civil engineering operations could begin in June, 1948, and building operations in April, 1949. With a building force of 500 men at the outset, growing to 5,000 by 1965, the report envisages substantial progress in ten years and completion of the whole gigantic task within 30 years. Inevitably any plan for the City of London must be a compromise. It is difficult to see that the compromises embodied in this report could be bettered if work is really to be started within the lifetime of the present generation.

Operation Breadbasket in 1948?

In his report to the House of Commons, Mr Bevin was able to announce better news of the administrative structure in Germany. General Robertson and General Clay have agreed that the authority of the German bi-zonal agencies shall be strengthened and the details of the new arrangements are in process of clarification.

Since both the move of the agencies to Frankfurt and their acquisition of new powers make a reconsideration of the two zones' administration inevitable in any case, might it not be wise to go a step further and ask at this point whether in fact the new arrangements will meet the administrative crisis which next winter will almost certainly bring? In particular, will it cope with a food crisis which, on the present estimate of world harvests, is likely to be as acute as the present shortages and may even be worse? If this question is squarely faced now, there is time in the next months to find the answer. Many problems in Germany have been mishandled owing to insufficient longterm planning, particularly in the purchase, allocation and distribution of food. Nine months before the crisis line is not too soon to lay down the principles of the proposed supply operation.

One point is surely clear. To ensure a sufficient ration to the big towns in the British zone—the food problem is basically this—more draconian measures, not less, will be needed to ensure local deliveries and to safeguard local distribution. It is equally clear that no German agency, however its powers are strengthened, is going to accept responsibility for greater ruthlessness. Since this is the case, the answer to next winter's food crisis is probably not to blame or threaten the German authorities (as Military Government has done very vigorously this week) but simply to make the collection and distribution of food a military operation, under direct Allied control in which the German officials act as agents, not independent authorities. There is probably no other way to avoid a grim repetition next year of this year's breakdown.

* * *

The French and Their Food

Everybody in Paris is talking about food. There is no immediate threat of famine, and undernourishment in the working class is nothing new; but the difficulty of bridging the gap until the next harvest, without reducing the scanty bread ration, threatens trouble in Paris. In many other parts of France, prefects have decreed that allocations shall fall to 200 grammes (eight ounces) a day, scarcely half of the consumption before the war, when there were many alternative foods to be had.

The public were not expecting another bread shortage this year; the unpreparedness is due, say the Communists in the Chamber, to "the Socialist and American illusions" of the Food Minister. The Government have admitted that they deliberately misled the public, in order to prevent hoarding; now they have reversed, on a spectacular scale, the policy of official optimism and are building up the impression of crisis. An emergency collecting committee, under patronage of the President of the Republic and of leaders of the Catholic, Protestant and Jewish communities, is imploring and exhorting recalcitrant farmers to bring in their grain. A nation-wide press and radio campaign is driving home the unpalatable fact that, while equally pressing claims for food are crossing the Atlantic from other countries of Europe, the French will have to depend during the lean months on tapping their own reserves, known to be stocked in large quantities in the scattered barns of wary peasant proprietors.

The Prime Minister has assumed personal direction of food supplies, a task of which he has already had unhappy experience during his term as Food Minister in the de Gaulle administration. He has made a favourable impression by intervening in the Assembly and assuming full responsibility for the food situation, the blame for which critics have put on individual ministers. Paris flour mills, which threatened to make things worse by a sit-down strike, were requisitioned under the law until July, and the strikers were threatened with penal action. Ingeniously combining firmness and kindness, he brought the men back to work after a pause of three days, refusing them pay for time not worked, but paying them double rates for the three subsequent days.

M. Ramadier's enemies on the right have chosen this moment to launch a strenuous campaign against state controls. It is being received enthusiastically, not only by exasperated traders, but also by all income groups which can afford "parallel" prices

and resent being forbidden to pay them. The Communists, doubtless with an eye on the coming municipal elections, have joined the chorus of protest against *dirigisme* and have issued a quaint directive to members, urging them to recruit for the party from all ranks, "even if they do not share our philosophic conceptions." On Monday, tens of thousands of Paris shopkeepers gathered at the Vélodrome d'Hiver to denounce state interference, and a number of picturesque riots against food officials are reported from the countryside.

Food controls have certainly failed to check scandalous inequalities; never has Paris offered such succulent pastries at 40 francs a piece as in this week of bread crisis. But a return to complete freedom would not improve matters. The freeing of meat and eggs brought them back into the shops, but prices rose sharply. Even if this rise is temporary and might, in the long run, increase production and reverse the trend, the immediate result over the whole range of foodstuffs would be the collapse of M. Blum's policy of restoring the franc by forcing down prices and freezing wages. Such a collapse would mean the end of the four-year plan, which some antagonists of the present régime would probably view with equanimity.

Entente in Africa

Very wisely the Foreign Office and the Quai d'Orsay are allowing their African experts to work together in the field and at a high administrative level. On Tuesday a conference on problems common to the African territories of Britain, France and Belgium was opened in Paris with an assistant under-secretary representing the Colonial Office. Their discussions on matters ranging from sanitation and irrigation to soil conservation and diseases of cattle are intended to lead to more permanent arrangements. Joint organisations will be set up in Africa by which decisions can be taken at short notice. At the same time British and French experts have been meeting at Dakar to discuss common use of communications and other services in West Africa. There the natural outlets to the sea from French territories are in the British coastal enclaves and there is a clear case—now that the alliance with France is firm—for recognising the natural unity of these West African possessions. Presumably Portugal and Liberia will come into the picture later.

The general objective is the technical one of creating the conditions in which African living standards can be raised. More particular objectives may be the co-ordination of economic policies to assure a steady market for African products, some general agreement on educational—if not political—policies, and the exchange of views on administrative problems. Immediately important is the fact that French governors and high commissioners have been assured by their Minister in Paris that liaison with the British and Belgians has full official backing; presumably Mr Creech-Jones has given similar assurances to British officials. There seems to be no reason to read deeper strategic and political trends into this new effort at co-operation; it is obvious that, if British and French policies tend towards closer economic and defence arrangements in Western Europe, their African possessions will have an important role to play. The importance of West Africa to Commonwealth communications was vividly shown during the war.

Equalising the Rates

Mr Dalton's reference, in his speech at Bishop Auckland last Sunday, to his plans for the future of local government finance can only be regarded as a shadow of events to come, obscure in its details as shadows commonly are. The present burden of rates on local communities has grown since the end of the war and in some areas is now oppressively high. Existing legislation will bring some reduction next year, by removing the cost of out-door relief and of health services from the local budget—a reduction financially satisfactory to local authorities but still leaving many of them regretful that local control of an essential local service has gone. Authorities, too, will benefit from Mr Dalton's other plan to relieve them of the burden of high-interest loans. Accordingly, rates should tend to fall next year and Mr Dalton apparently proposes to take the opportunity provided by the reduction in outgoings of all local authorities to augment the income of some. At the moment, all local authorities receive a block grant from the Treasury. The basis on which the block grant is calculated is the rateable value of the whole area of the authority but that calculation in each case is weighted by two additional factors, the incidence of unemployment in the area and the number of children of school-attendance age, so that

authorities which have heavy unemployment and a large child population are specially favoured.

Mr Dalton apparently proposes to make yet another adjustment in the block grant. In future it seems the block grant will not be paid to those authorities whose rate poundage is below the average for the country and what is saved there will be paid, in the form of an addition to the present grant, to those authorities whose poundage is above the national average. But whether this division into sheep and goats will be as clear-cut as this has not yet been revealed. Will the grant be shaded in the case of authorities whose rate poundage is just above or below the average? Few will object if a borough with a rate poundage of 8s. receives no block grant in the future if its savings, in expenditure offset its loss of income, but the authorities—and there are many—whose poundages run at about the mean are still in the dark.

It is to be hoped that the new Dalton plan, trumpeted as it was, is no more than a stop-gap. Some day some government will have the courage to tackle the whole problem of rating and valuation, particularly as this new plan, once again, encourages deliberate under-assessment of property by the local authority. Chaos is not really removed by spreading its effects more evenly. Mr Dalton has produced, just before the party conference, another red patch to sew on to the old blanket but no one should be short-sighted enough to think that the blanket is thereby rendered any the less threadbare.

* * *

The Manchester Scheme

The proposals for a complete reorganisation of local government in the Manchester area, under which county boroughs would be eliminated and a new populous county, with smaller authorities under it, would be brought into existence, are making headway. The idea has been voluntarily inaugurated by 27 local authorities of all types (except that Lancashire County Council was not represented) who have appointed a committee to prepare a scheme for submission to the Local Government Boundary Commission. The Boundary Commission is extremely interested. Its own investigations are covering only a comparatively small and unsatisfactory area around Manchester. But the scheme of the local authorities' committee envisages a "Manchester County" of much better size. It would include 76 existing authorities, including 7 existing county boroughs, and its population of 2½ million would be rather larger than Middlesex, while its area would be a good deal larger. This is the right sort of new authority for a conurbation and its environment. The county boroughs within it, including Manchester, would, of course, lose their status and there have been suggestions that all the lower tier authorities in the area—demoted county boroughs, non-county boroughs, urban districts and rural districts—might all profitably exercise the same or very similar functions. Moreover, many of them would be amalgamated into larger units, while perhaps Manchester itself might be split up into several authorities.

The new county would be a closely-knit and well integrated unit, mainly urban but with a rural fringe. It would be quite unlike other counties, except perhaps for Middlesex and the County of London; and it might be the starting point for a radical reform of local government, at least in the main urban areas. So the Boundary Commission believes, for it has now suggested the possibility of creating a similar new urban county in the Black Country, which would absorb among other authorities the five county boroughs of Dudley, Smethwick, Walsall, West Bromwich and Wolverhampton, and have a population of one million. Better still it might centre on Birmingham and have a population of over two million. The main alternative to this policy—in the Black Country, as in Lancashire—is the creation of a solid block of county boroughs which would absorb all the urban and rural districts between them. This view is naturally taken by the county boroughs themselves, who variously suggest that the whole Black Country should be divided among seven, six, four or even one county borough.

For the Manchester area, at any rate, the "New County" solution is more promising than the county borough solution. But it is only so, generally, if the idea is translated into practice with sufficient boldness. The new counties need to be—although the word is disliked in local government circles—minor regional authorities; and nothing would be worse than a sort of parochial regionalism. The whole idea is to create major units of local government which are effective and democratic. This requires that the new kind of county should cover a reasonable area; should possess considerable financial authority and independence; should reabsorb as many as possible of the functions—such as hospitals—that are now being filched from local government; and

above all that it should—unlike the proposals now mooted in Manchester—be directly and not indirectly elected.

Films Abroad and at Home

The Rank organisation, headed by Mr J. Arthur Rank, is continuing its battle to establish the place of British films in the world, and to ensure that it is a fair one. An interest in a circuit in the West Indies has been acquired. An agreement was made recently with Czechoslovakia under which a satisfactory minimum of British films will be shown in that country each year. And now comes the news that Mr Rank is to establish a circuit of 50 cinemas in the major towns in the United States, to be devoted to the proper display of this country's products.

At the moment, such an announcement may be regarded more as a shot fired in the battle of nerves than as a step likely to have immediate practical results, but clearly such a step would not even have been contemplated if Mr Rank, and presumably some American supporters, were not convinced that there is in fact a commercial future for British films in North America. Perhaps of all the independent monopolies operating in this country the Rank organisation has most to be grateful for to a Socialist President of the Board of Trade; on the other hand, the Board of Trade (and the Treasury) have equal cause to be thankful to Mr Rank for his energy and persistence and, above all, for his ability to operate a monopoly which gives such remarkable artistic freedom to those working within it. But perhaps the most sensible thing said was the statement attributed to an American impresario, that if British films were not allowed to earn dollars in the United States, how could Britain pay dollars to see American films.

This month has also seen the publication of the report of the Cinematograph Films Council on proposed reforms in the quota system under which British films are by statute assured of some place in circuits in their own country. The proposals are mainly technical and suggest that the actual level of the quota should in future be fixed from year to year after joint consultation between the authorities and the industry. But as an appendix to the efforts of British films to establish themselves abroad, the figures of foreign films shown here are of interest. In the year ending September 30, 1946, the aggregate length of film shown in performances in Britain was 46,903 million feet, as compared with 46,095 million feet in the previous year. Only 20.96 per cent of this total was of British films, as compared with 19.75 per cent in the previous year. British films have still a long way to go to recapture their home market.

In the Wake of Truman

The Brazilian Supreme Court has disallowed the appeal of the Communist Party against a recent majority decision of the High Electoral Tribunal declaring the Party illegal. Thus after only a year and a half's legal existence the Communists are again being driven underground. In their short life above ground they have, nevertheless, made remarkable progress. In the congressional elections in January last year they polled some 500,000 votes on a total electorate of about 7,500,000—and this within a few months of regaining legal existence. In the field of organised labour their success was so rapid and comprehensive that when, in alliance with the Labour Party, they founded the Workers' Confederation of Brazil (CTB) it was declared illegal, being considered too strong a threat to the official labour policy.

The new constitution of last September, however, which provided the opportunity for such a spectacular advance in labour matters had other and more damaging clauses. These were soon used to call into question the whole legal position of the Communist Party. In particular, full freedom to engage in party politics was not given to parties "opposed to democratic government." To democratic ardour against the Communists nationalist feeling added the charge of subservience to foreign interests. And in January, just before the State elections, the attacks became so sharp and were made by such high authorities—including both the President and Minister of Justice—that many people thought the elections would be postponed and the Communists declared illegal then. But the elections were held and the Communists again registered considerable gains. The campaign against them was intensified. In April the Communist Youth Party was banned for six months. Then the Communist headquarters in the State of Alagoas were closed down. And now the Party is outlawed.

Brazil, however, is not the only Latin American State where

anti-Communism has been growing in recent months. In January a state of siege was declared in Paraguay, due to disturbances caused by "anarchists collaborating with the Communist Party," and almost immediately the Communists were outlawed. In the middle of March a civil war broke out, which still continues. This was said to be due to "Communists and *Febreristas*" (militant right-wing Nationalists). And in Argentina only this week influential demands for an investigation into the country's Communist Party have been made. But more important was the response of the *Apristas*, the main Peruvian Party, to the Truman Doctrine at the end of March. Its executive attacked the Communist fifth column and declared its full support of the American campaign. Recent strikes in nitrate mines have been blamed on Communists, and (partly perhaps with an eye on the trade negotiations with Argentina) strong action is not unlikely. In Chile strong action (again rumoured to be in response to Argentine pressure) has already been taken, the Communists being removed from the Cabinet in the middle of April. But in Chile, as in Brazil, recent elections had shown a disconcerting increase in Communist strength, and it is most unlikely that these repressive actions will reverse the trend even though they prevent its expression.

Jugoslav Five Year Plan

The draft Five Year Plan which was brought before the Yugoslav Federal Parliament at the end of April is an ambitious document. By 1951 production of coal, coke and iron ore is to be double that of 1939 and electricity output is to be increased four times. Special attention is paid to agriculture. One of the main arguments used by the Plan's spokesmen in favour of developing heavy industry was that Yugoslavia would then be able to produce at home the equipment required to mechanise agriculture. It is hoped to produce in 1951 nine times more ploughs than in 1939. By the same date production of artificial fertilisers is to be five times the pre-war level, and industrial crops and fodder are to be more than doubled. Some 400,000 hectares of marshes are to be drained and 400,000 hectares of waterless land irrigated. The plan also refers to the need to increase labour discipline and to establish "norms of production" in the factories.

The consumer is not forgotten in the plan. Consumption of textiles and shoes is to be double that of 1939. The volume of goods in retail trade in 1951 is to be double that of 1946. Large numbers of new schools, hospitals, libraries and museums are promised. Press and radio comment stresses the intention to abolish ration cards and coupons at some time in the future.

Jugoslavia certainly needs a programme of reconstruction of this kind. During 1946 UNRRA saved millions from starvation, and provided transport and equipment which made good at least a part of the ravages of German occupation. In particular, the number of lorries and tractors supplied exceeded that which the country possessed before the war. But Yugoslavia has not only to repair its losses but also to build for the future. Already in the '30s its most pressing problem was rural over-population, which caused permanent under-employment and poverty among the majority of the peasantry. The standard of living of the Yugoslav people can only be raised by radical improvements in the methods of agriculture, development of specialised crops, public works (roads, irrigation and drainage), and new industrialisation. And even in ideal conditions such a policy could not quickly produce results.

What is less clear is how the Yugoslavs hope to obtain the equipment required for this plan—especially electrical and agricultural machinery. Agreements have been made with Czechoslovakia and Switzerland, but it remains to be seen how much they will provide. Since the shooting down of American aircraft last summer Yugoslavia's relations with the United States have been bad, and the hate campaign against Britain has not abated. Marshal Tito's speech to Parliament on the Plan celebrated Yugoslavia's "liberation" from foreign capital, which he alleged in the past made profits "several times" larger than the capital invested. Rhetoric has always been popular in Yugoslavia, under every sort of political regime, but it has never yet sufficed to build power stations or fill bellies.

Prisoners of OZNA

Among the many digressions of the Foreign Affairs Debate was the exposure of a somewhat acrimonious dispute which has arisen among Members of Parliament about the Parliamentary Delegation, numbering eleven persons, which visited Yugoslavia in November, 1945. It seems that Mr Stokes recently circulated

to Members a statement alleged to have been made by a former Yugoslav political prisoner to the effect that when the British Parliamentary Delegation visited the prison in which he was confined, all the prisoners were put in the cellar and told to keep quiet on pain of death, while their places in the cells were taken by men of the OZNA, the Yugoslav secret police, who then answered the questions of the visitors. This story called forth an indignant protest from certain of the Delegates, who at the time of the tour gave Tito's government a public testimonial on the good treatment of its political prisoners—a testimonial of which it made the fullest propaganda use.

This is a pretty little controversy and it is easy to see why it has aroused some violence of feeling, for if Mr Stokes's account is accepted the delegates are made to look utterly ridiculous. However, they have made themselves ridiculous enough by their own line of defence, even if the Stokes version is rejected as the invention of an unscrupulous *émigré*. Mrs Manning states in her contribution to the dispute that "we had complete freedom to discuss, sometimes in French, sometimes in English, sometimes through an interpreter in Serbo-Croat, with any prisoner we liked, any point we liked. Prisoners were completely frank with us, sometimes critical—especially of their detention while evidence was being collected—but not one prisoner had any complaints to make about treatment or food or conditions; *au contraire*, they seemed annoyed at some of the statements which had appeared in the foreign press and which seemed to them to reflect upon the civilisation of their country."

Even on the assumption that the prison inmates who talked thus were real prisoners, and not OZNA substitutes, what possible value can such interviews have if there is no guarantee of protection against reprisals for those who complain against their gaolers? Investigation of prison conditions is a notoriously difficult matter even in normal times in countries where civil liberties are most firmly established and there are strong legal safeguards against the torture or murder of prisoners. In Yugoslavia, as even the admirers of the Tito regime must admit, there was a pre-war tradition of police brutality and subsequently a ferocious civil war from which a revolutionary government emerged; it is hardly likely that in these circumstances prisoners would have had no fear of their captors. The Zillies may believe that the OZNA would not hurt a fly unjustly, but that is what they have to prove by refuting massive testimony to the contrary, including that given in the recent State Department Note about the imprisonment in Yugoslavia of certain individuals claimed as American citizens. To rely on talk with prisoners without recognising the possibility that they may be speaking under intimidation, is simply to assume what it is intended to prove.

Wool Tangle at Geneva

The news from Geneva remains depressing. The date has passed when the back of the tariff negotiations should have been broken, allowing the delegates to pass to their second task, that of debating the latest version of the charter of the International Trade Organisation and of negotiating an interim agreement incorporating some of the crucial sections of that charter. The delegates are now, in fact, devoting much of their attention to this debate, but this is largely because talks on the tariff side have reached something of a deadlock. The main reason for this is to be found in one single commodity, wool. This one item now appears to dominate tariff talks. The importance which has been given to it is not misplaced. On the American side, discussion of the excessively high protection given to wool will show more clearly than anything else the relative strength on the one hand of the specific vested interest, especially where it has powerful pressure groups behind it, and on the other, of the glib and no doubt sincere generalities concerning American economic foreign policy that emanate from the State Department. On the Dominion side, wool is equally crucial. It represents the principal commodity for which additional markets could be found in the United States as consideration for some dismantling of imperial preferences. The position is sufficiently serious to have caused Mr William Clayton, head of the US delegation, and Dr H. C. Coombs, head of the Australian delegation, to fly back to their respective capitals for further instructions.

The news on the US wool tariff situation remains somewhat confused. The American offer to the Australians, New Zealanders and South Africans in Geneva was to bind the present tariff on wool imports into the United States at its present figure, which is equivalent to a duty of 65 to 75 per cent *ad valorem*. The shattering effect of this offer was then aggravated by news of the Robertson Bill before the Senate which would increase wool duties by 50

per cent, raising them to a range of 110 to 125 per cent. The story of this Bill goes back to a measure introduced by Senator O'Mahoney last year to provide a price-support plan for wool. When this measure was before the Senate Agricultural Committee it was diverted to the corresponding House Committee with a suggestion that provisions about import control and the imposition of an import fee might be added to it. As it emerged from the House Agricultural Committee the Bill provides for an import fee of not more than 50 per cent *ad valorem* over and above the existing tariff to be imposed by the Secretary of Agriculture if he finds that imports of wool are interfering with the price-support programme. The substitution of the word "fee" for "tariff" is held to exonerate the bill from all protectionist taint. The State Department is now fighting hard to have the measure dropped, but the wool growers' lobby is an extremely influential one and appears determined to have this legislation debated in Congress. Until this episode is safely out of the way, and indeed until the United States find themselves able to do something better than insist on the maintenance of the present excessive tariff on wool imports it would be wise to view the proceedings at Geneva as a performance of somewhat academic interest.

Education for Management

The long-awaited report of the Urwick Committee, now published*, raises all the interesting questions it contains about management in parentheses and answers none of them. The dull questions about the teaching of management in technical and commercial institutions, it answers sensibly enough, but the range is limited and of interest mainly to the nineteen professional bodies who are concerned wholly or partly with training managers in their various fields. The value of the report to the general reader lies in its revelation of the inadequacy of any knowledge about management generally—the numbers of those carrying out managerial functions, the ladders they have climbed to reach positions of responsibility, the future demand for managers, the facilities available for training them, and the experience of training gained elsewhere, notably the United States, which has devoted a great deal of attention and resources to the study of this question.

The trouble has been that the committee who framed the report under the chairmanship of Colonel Urwick were representative of professional and educational interests and they found themselves confronted with problems which were mainly commercial and industrial, with which they were not competent to deal. There is certainly scope for co-ordinating the curricula of the bodies carrying out training, and as the result of the committee's work, these organisations have agreed to co-operate. But the really big question is what can be done to improve the quality, and perhaps the numbers, of those managing the business affairs of the country. It is debatable how much about management can be taught by theory, and any movement which attempts to make managers into a closed professional clique is to be strongly opposed. But if the committee's estimate that there are some 400,000 to 450,000 people engaged in managerial functions in this country is anywhere near correct, this is a sufficiently large number to justify more attention than has hitherto been given to them. The committee suggest that the proposed new Central Institute of Management, which would operate under the auspices of the Board of Trade, should turn its attentions to acquiring the missing information. This is a most sensible suggestion.

De-requisitioning

So many people have personal grievances about the requisitioning of land and buildings by Government departments—whether it be house, office or treasured beauty-spot—that an inquiry by an impartial committee into the processes of de-requisitioning is of general interest. The report published by the Select Committee on Estimates deals with the problem under three main headings—the release of (1) factory and covered storage premises, (2) residential and non-industrial premises, (3) land. On the first they conclude that the rate of release has been satisfactory: on the second they have some hard words to say about the heavy and increasing demands for office buildings

* Education for Management, H.M.S.O., 6d.

† Release of requisitioned property. H.M.S.O. 3s. 6d.

from the civil departments, and express the rather innocent view that to cut these demands might have a favourable effect on reducing the size of the civil service; on the third they are very critical of the service department's failure to decide on their plans for training, since this delay is seriously holding up the release of land.

The following figures show the very great decrease there has been in property held by the Government since the end of the war.

	1946	Dec., 1946
Non-industrial property—holdings.....	96,566	16,784
Industrial and storage premises—sq ft.	220,000,000	30,000,000
Land—acres.....	12,000,000	2,500,000

The big user of industrial space is the Ministry of Supply, but the target for releases was nearly reached by the end of 1946, and was thereafter mainly delayed by the effects of the weather on the transport of stores from buildings due for release. The demand for office accommodation is a much more serious problem, particularly when it freezes flats and houses needed for normal housing purposes. The Committee recommend that housing should be given priority over all other purposes and that such accommodation should be released from its use as offices. But it is easier to say this than to put it into practice, for whatever doubts one may have about the value of many of the functions performed by civil servants, there is no guarantee that the dislocation caused by officeless civil servants would be the lesser evil. Slum conditions in Government departments are already causing their own delays and difficulties. In this connection the Service departments' record is good, since they have reduced their holdings by more than 94 per cent, whereas the civil departments had reduced their holdings by only 52 per cent by the end of 1946. There is no real solution until the total of accommodation is increased by new building.

Letters to the Editor

The Capital Budget

SIR,—The capital account tentatively presented in your issue of April 26th gives ground for alarm, by reason of the high total of Government sponsored items, leaving little margin for other industrial outlay.

I may assume that your readers are of one mind in holding that to balance our external account before the American Loan runs out should now be our supreme objective. In the hurry and scurry of the last months before this crisis comes upon us, it may be well to let our minds dwell upon a point of theory. It seems that we are drifting without a plan; this absence of plan may be in part at least due to lack of intellectual clarification.

The external deficit in any period is necessarily exactly equal to the excess of domestic capital outlay over domestic saving. Consequently if we plan to have capital outlay considerably in excess of anything likely to be yielded by domestic saving, we are in effect planning to have an external deficit. That, I suggest, is what we are now doing. We are deliberately planning not to avoid an external deficit, but to incur one. Is this generally recognised?

There are only two ways out that are logically possible: one to increase saving (decrease consumption) by the required amount, the other to curtail capital outlay. The former is not practicable at this stage. You may cut off further commodities from the consumer by administrative act; but his purchasing power will flow in elsewhere, and thus maintain the present volume of national effort tied to his service.

It is said that only an increase of output per man can save us. This is no doubt supremely important for various reasons, but on the most optimistic assumptions is not likely to solve this particular problem. If increased output is accompanied by increased earnings, it will contribute little to the external balance (only to the extent that the extra earnings are not spent).

What can and should be done is to cut the capital outlay drastically. It is particularly important to cut planned capital outlay. This should be cut so as not only to eliminate the external deficit, but to allow an ample margin wherewith to re-fill the industrial pipelines and make up arrears of maintenance, since these last are likely to have a quick effect on output.

This means that the building programme should be drastically curtailed, big constructional work be suspended, and modernisation plans be looked at most critically and only encouraged where

Shorter Notes

The National Service Bill petered out into the tamest of last thoughts in the Report stage on Wednesday. Perhaps the all-night sitting last week had drained the critics of all their vigour, for they had kept up a very sustained fire during the committee stage. The only aftermath of any significance in the political field is the renewed rumblings of the trade union side of the Parliamentary Labour Party, who protested at a meeting the same day against the indiscipline of those who voted against the second reading of the Bill. Fortunately they were overruled.

If the House of Lords are intending to stage a big fight on the Transport Bill they are certainly reserving their thunder. The second reading passed with little incident and few clues of where the main attack, if it is to come, will be launched. Perhaps their Lordships have been so overcome by the danger of having to sit after dinner that all the fight has been drained from them. Could any arrangement be more calculated to even out the relative strengths of Government and Opposition?

The Lord Chancellor's speech in the House of Lords opposing the Liberals' Preservation of the Rights of the Subject Bill can only be described as a piece of staggering impudence. He condemned the Bill as a mere manifesto, "ill-considered, ill-digested, and ill-drafted"; to which Lord Reading replied, charitably leaving out the epithets, that the translation of manifestos into Bills had been the House's sole job for months. Speaking for a Government which has produced the Transport Bill, the Electricity Bill and the Town and Country Planning Bill, in each of which the guiding principle has manifestly been "get the Bill through first and draft it later," he would have done better to choose almost any other line of attack.

the new machinery will amortise itself in two or three years. To secure the necessary total reduction, defence expenditure will probably have to be severely reduced also, the saving to the Exchequer being retained as a budget surplus.

The external problem is not insoluble, not even stupendous, given vigorous action on the right lines. Thus, if all those due for release from the Forces this year (or an equivalent number) were harnessed to work for exports, our problem would be solved. The only way to get them so harnessed is to eliminate rival demands for their services. If this were done, many material shortages would also automatically disappear.—I am, etc.,

Christchurch, Oxford

R. F. HARROD

Sweet Rationing

SIR,—May I make the following comments on Mr Sinclair's letter last week?

I did not suggest "that an increase of one ounce per week on the present ration would be sufficient to meet demand at the present price levels." I stated that in my view rationing might be dispensed with at the new price levels with possibly only a small increase, say one ounce, on the ration. When I made my speech, I mentioned that new price levels corresponding with the new prices of raw cocoa were under discussion. Those discussions have now ended, and increased chocolate prices have been announced. It was with these new prices in mind that I made my statement.

Whether 5 ounces will suffice to end rationing is dependent on a number of conditions, and, to put the matter in its proper perspective, it is useful to go back to the position in 1924. In that year the average price of chocolate and confectionery was 5½d. per quarter pound. The average consumption was 4½ ounces per head per week, which was costing the public just over 6d. a week.

By 1938, the average price of chocolate and confectionery had dropped to 3d. a quarter pound. Consumption had risen to 7½ ounces, and thus the public was spending just under 6d. a week, say 1s. 9d. a month. When the new selling prices came into effect on May 26th, the average price per quarter pound will have risen from the pre-war 3d. to 8d. At these prices, a 5-ounce ration will mean 10d. a week, or 3s. 4d. a month; almost twice the pre-war 1s. 9d.

The question, therefore, is whether two-thirds the pre-war quantity of confectionery at almost twice the cost will be all the public is prepared to buy. In considering this question, it must be remembered that since 1939 the public has learnt to spend more, in some cases much more, on tobacco, cigarettes, drink and films. These habits will be difficult to change, and will compete with chocolate and confectionery more than they did before the war for the consumer's 3s. 4d.

It will make a considerable difference whether the extra ounce is given while other commodities such as clothing and household equipment are still in very short supply, or is given when they are becoming available to the public in more adequate quantities. The more closely a 5-ounce ration is timed to coincide with such increases, the more likely is it to satisfy public demand.—Yours faithfully,

Frenchmen and their Social Services

SIR,—In connection with your correspondent's article of May 10th which I have just received, readers may be interested to hear of a strike in protest against the new legislation which took place in Grenoble about four weeks ago.

The commercial classes, shopkeepers and business people in general staged a one-day strike against their rate of contributions fixed at 250 francs a quarter, which they consider far too high, especially in comparison with what the workers pay. All shops and restaurants were closed, people being warned the day previous to lay in provisions over two days. The only shops I saw open were those distributing milk to the children.

The university students who are also having to pay this contribution, admittedly far too high for the average student, also went on strike, the professors being faced with empty lecture-rooms, since pickets were placed round the entrances to the university buildings to stop any students wishing to attend. The students' union did not carry all its members with it when deciding the strike.

I think I am right in saying that in the United Kingdom anything of that type of unfairness as far as students are concerned would be the subject of a question in the House and a peaceful settlement rather than agitation of the kind staged here. Links between Deputies and their constituencies seem to be of an entirely different nature from in the United Kingdom.—Yours faithfully,

D. C. CARNER

Agreement to Separate?

SIR,—Your article on May 17th calls for more than one comment. The truncation of Bengal will deprive the eastern half of Pakistan not only of the Calcutta industrial area, but also of the coalfields in western Bengal, the loss of which may have even more damaging consequences.

A second point, often overlooked, is the extent to which long established allocations of industrial functions between Hindus and Muslims may affect the economic problem. If, as a result of partition, Hindus tend to migrate to Hindustan and Muslims to Pakistan, the resulting economic dislocation will be more serious than is, perhaps, generally realised.—Yours faithfully,

Larchfield, Churt, Surrey

GEOFFREY BRACKEN

Bonus Issues

SIR,—Have you not withdrawn too far in face of Mr David Eccles's challenge? The argument that a bonus issue of, say, one share for every share held is merely a paper transaction which leaves each shareholder with two certificates where previously he held only one, but with the same interest in the same assets as before, is valid if the bonus issue is an issue of shares of the same class as those carrying the right to the bonus. But when there is a bonus issue of preference shares to the holders of ordinary shares, there is the material difference that the shareholder can sell his bonus shares without sacrificing any part of his interest in the equity. True the equity will have diminished in value, but (unless the rate of the preference dividend is unnaturally high) not by more than it would have diminished if the nominal amount of the bonus issue had been distributed in dividend. When the subject of the bonus issue is not shares at all but debentures, the position is completely transformed, as a debenture-holder is a creditor of the company. By selling his bonus debentures the holder does not part with any of his interest as a shareholder, and the company may even redeem them within a few days, the redemption money being capital.

There are probably more ingenious methods of evading sur-

tax by means of bonus issues, but the above does not, I think, call for much ingenuity.—Yours faithfully,
13 Old Square, Lincoln's Inn, W.C. 2

Drive for Generating Plant

SIR,—With reference to your Note, page 727, of your May 10th issue, the *Monthly Digest* states that the output of hydraulic turbines and steam turbo-alternators (above 10,000 kW) was under 1,000,000 kW in 1946. This presumably includes export. The load shed by the Central Electricity Board on January 30th last was approximately 2,000,000 kilowatts, which means that we were that amount short which must be made good before we can have an adequate supply. If it is to be made good in four years, it will require 500,000 kW a year plant to be produced. The normal increase in demand is about 10 per cent a year, and the obsolescence 5 per cent. Based on a present available capacity of 10 million kilowatts, these two items require 1,500,000 kilowatts a year. The export business should be about 750,000 kilowatts annually. These figures add up to 2,750,000 kilowatts a year. In view of this, it is difficult to see the justification of your statement that a (assumed) production capacity of 1,500,000 kilowatts a year is "ample." If my figure of 2,750,000 is correct, it would mean that the monthly deliveries would have to be at the rate of 3½ per cent a month, of orders outstanding, against 1 per cent a month attained last year.—Yours faithfully,

C. C. GARRARD

"Tintagel," 135 Rectory Road, Sutton Coldfield
[Our estimates were based on the need to fulfil the Central Electricity Board's programme of about 1,000,000 kW of generating capacity a year between now and 1950, not on the capacity which it would be necessary to install in order that all electricity consumers could take their full supply of electricity in 1947 and 1948 without either load shedding or adjustments in working hours.—Ed.]

Census of Production

SIR,—I have been greatly interested in the correspondence on the subject of the recently postponed Census of Production. While I agree wholeheartedly with the necessity of obtaining the requisite information for the purposes of Governmental planning, I do not think that the Department concerned used sufficient forethought in the way it set about collecting that information. In fact much can be done to make the task bear less heavily on the business executive whose lot it is to fill in the forms.

Modern businesses do, as Mr Barna affirms, keep records which could readily be used to supply the figures required and there is no insuperable difficulty in arranging the accounting of a firm to provide for this. The trouble which your previous correspon-

From The Economist of 1847

May 22, 1847.

Some weeks ago, actuated, no doubt, by an earnest desire to alleviate the sufferings of the country under the present great scarcity of food, Her Majesty, among other private regulations relating to the consumption of the household, ordered that no bread should be used in the Palace, but that known by the name of "seconds." Her Majesty's example was quickly followed by various members of the nobility; for we learn, that in one morning, a baker in the neighbourhood of Grosvenor Square, received orders from five noblemen to supply only "seconds" in future to their establishments. The example then set has rapidly descended to the middle classes.

The practical effect has been, that so great a demand has existed among the millers for "seconds" of late, that the true relative price of the two qualities has been disturbed; the poor man's loaf has been raised higher, in proportion to the best loaf, by the unintentional competition of Her Majesty—and the nobility of Grosvenor Square—with the weaver of Bethnal Green. On last Monday we find that while "best household flour" . . . was not raised in price, a rise of two shillings a sack took place on "seconds" . . .

The difference, therefore, between the price of the flour generally used by the rich and that used by the poor is now only about four per cent, while in ordinary times it is fully ten per cent. So that in place of the poor being benefited by the intended sacrifice made by the rich, they are actually injured.

If Her Majesty were to set the example of ordering beer to be used in the household made chiefly from sugar, which is now extremely cheap and abundant, it would have the twofold advantage of economising the use of grain for the poor, and of adding largely to the public revenue.

dent, Mr Stuart, had in mind was, no doubt, the fact that the idea of the Government Department about what information is vital is not exactly the same as the idea of the business man, with the result that records are kept by methods differing considerably from the methods which would readily give the statistical data required by the Census of Production.

On this point I write with feeling since I have, as recently as February last, spent two weeks of valuable time reconstructing material from my firm's records in order to satisfy the questions of the Chief Statistical Officer. Also add to this my chagrin when, after posting the appropriate form complete, the postponement was announced.

Surely, and this is the point I wish to make, the Government statisticians could take the "practical man" into confidence and announce well beforehand what type of data was wanted—then the business executive could make preparations accordingly, keeping currently details of the information required, instead of having to "job backwards" as was the case in which I was involved.—Yours faithfully,

HAROLD E. COLE

Books for Austria

SIR.—There must be many, not only professional scholars, who feel an anxiety to give what present help they can in the task of restoring the stricken centres of learning on the Continent so that each can again make its special contribution to our culture. This is to draw attention to the urgent need of scholars and students in Austria, particularly in Vienna. Those of us who have recently visited Austria have been deeply impressed by the range and quality of what Austrian scholars are already doing under very adverse conditions, and by the eagerness of their desire—after eight years of politically imposed isolation—to regain contact with the work of scholars in the Western world. Their intel-

lectual isolation is such that they lack the means even to discover what work has been done and what books have been published outside Austria since 1938, still less to procure any learned publications of which they may happen to hear word. The need is especially pressing in the humanities and social sciences, where valiant attempts to renew a great tradition and to shake off the effects of long Nazi censorship are frustrated by want of the barest minimum of literature required for renewed integration with Western scholarship.

The signatories of this letter are trying to organise a collection of the more important books and periodicals bearing on the humanities and social sciences published in this country since 1938, and to arrange their transport to the Austrian National Library in Vienna. Some, we hope, may be obtained from authors and others with copies to spare; but funds will also be needed to purchase expensive standard works and, more particularly, certain bibliographical reference books if Austrian libraries are to be enabled to learn what they have missed for eight years. We beg, therefore, through the hospitality of your columns to appeal to your readers for books and money for this purpose. Books for transmission to Vienna may be sent to Professor F. Saxl, Warburg Institute, University of London, Imperial Institute Buildings, S.W.7, marked "Austrian Book Committee"; cheques or money orders to the Treasurer of the Committee, Dr. Georg Tugendhat, Adelaide House, London Bridge, E.C.4, crossed "Coutts and Co., Austrian Book Committee," or direct to the bankers, Messrs. Coutts and Co., 440 Strand, W.C.2.—Yours, faithfully,

H. I. BELL, BEVERIDGE, G. N. CLARK, WALTER DE LA MARE, CAMPBELL DODGSON, T. S. ELIOT, GEORGE FRANKENSTEIN, F. A. HAYEK, H. F. JOLOWICZ, LINDSAY OF BIRKER, O. E. NIEMEYER, EDNA PURDIE, F. SAXL, CHARLES K. WEBSTER, DOUGLAS WOODRUFF

New Zealand Labour Relations

"Report on Industrial Relations in New Zealand." By A. E. C. Hare. Published on behalf of Victoria University College, Wellington, New Zealand, by J. M. Dent and Sons, Limited, and Whitcombe and Tombs, Limited, Wellington, 1946. 370 pages and index. 10s. 6d.

DR. A. E. C. HARE, Research Fellow in Social Relations in Industry, Victoria University College, has examined the legend that New Zealand leads the world in enlightened industrial legislation and relations, and finds, not only that a new and improved Factories Act is urgently needed, but that "most of the industrial life in New Zealand is yet hardly touched by the greatly improved methods of management which are being worked out overseas." This is of particular importance, since "there has been a mushroom growth of manufacturing industry (in the Dominion) in the last six years, which has brought about an industrial revolution, and has had the most far-reaching economic and social consequences on the life of the country."

In its claim for enlightened labour legislation, New Zealand has largely relied on the Industrial Conciliation and Arbitration Act as a method of settling industrial disputes. In this connection Dr Hare reports that "the Act has shown itself to be an instrument for the regulation of wages well adapted to the social environment of New Zealand. . . . It appears, however, that the Act does not promote voluntary negotiation, and that it has in various ways retarded the growth of discussion of common interest. Though providing an adequate means of wage regulation, the system of compulsory arbitration has not brought about the development of good industrial relations. . . ." The *ad hoc* judicial machinery for conciliation and arbitration has largely deprived the Department of Labour of responsible functions in respect of conciliation work. This, and other factors (for example, the Department itself has no function with regard to employment through labour exchanges) results in an inadequate factory inspectorate and conciliation service.

Other matters discussed in the report include the management of labour, trade unions, organisation of employers, strikes, and methods of consultation. The examination of New Zealand conditions is prefaced by a 60-page section on "The General Problem of Industrial Unrest," and concludes with 36 pages of detailed Recommendations. There is, in addition, a technical appendix on the distribution of personal income in New Zealand. The whole forms a valuable document on contemporary industrial

labour conditions in the Dominion, providing a useful reference for those interested in similar problems elsewhere.

One minor criticism deserves attention: it appears that Messrs Dent have imported supplies of the book direct from New Zealand and have added a label on the cover which refers to the author's studies in a "colonial environment." Such an epithet is likely to cause deep offence.

History and Politics Mixed

"British Trade Unions." By N. Barou. Gollancz. 271 pages. 7s. 6d.

MANY years have passed, as Dr Barou modestly reminds the reader, since the Webbs published their classic works (and, like most classics, unobtainable) on British trade unionism. A good deal of information and discussion has appeared since then, in bits and pieces, and it is a real service to have packed it all together in a handbook of this size. Generations of students will doubtless bless Dr Barou around their midnight oil. Not, however, for saving them the trouble of thinking; for, whatever his competence as a compiler, his ideas of trade unionism run in a regrettably narrow groove. Trade union policy has always tended, he seems to suggest, towards the goal of socialism on the Russian model—a goal sometimes seen darkly, but always present at the end of the road. Could he not, perhaps, have provided a little more analysis of the actual historical variation in union ideas on the control of industry, which scarcely supports his case, and of the recent reaction to experience of the problems of planning and nationalisation? And is it quite so certain that the best way to encourage voluntary organisation and local initiative throughout the country (p. 219) is to shift, through nationalisation, more and more responsibility to the national level? Trade union ideas, again, are today in a state of flux; it would have done no harm to admit that there is at least equal progress, for much the same reasons, on the side of management. Progress on the management side has indeed gone further and faster; the very limited interest of the vast majority of trade unionists in the bulk of what Dr Barou has to say was shown most startlingly in the almost complete lack of resistance to the slump in joint production machinery at the end of the war, at a time when the trade unions could have held the country to ransom, and some, like the miners, did.

He rightly argues that a planned economy, in any sense of the word, requires a great deal of co-operation ("Only in this way can discipline become enjoyable") from the planned.

in his lyrical enthusiasm for the Labour victory in 1945, he might have borne in mind that co-operation may be discouraged by treating 52 per cent of the electorate as if it did not exist. It is too much to expect left-wing writers to treat the basic issues of trade unions as beyond politics; but need they always prejudice their case by misrepresentation and political abuse?

Railway Achievement

"L'Année Ferroviaire—1947." By a Group of Directors of the French Railways and Airlines and Officials of the Ministry of Transport. Plon. Paris. 225 francs.

"L'Année ferroviaire (the Railway Year)—1947," published under the auspices of the French nationalised railway company, the SNCF, is a collection of highly authoritative articles and of comprehensive statistical material on the present state of the French railways, packed into a single small and readable volume. The Director-General of the SNCF, Monsieur Lemaire, who introduces it, explains that it is designed to be the first of an annual series whose object will be:

The publication of all information on the railways which may be of general interest to the public and of use to financiers, economists, engineers and sociologists.

The result is a curious medley. The first half of the book contains a series of articles, varying from a technical report with photographic illustrations of different types of French and foreign engines, contributed by Monsieur Yves Legrand, chief engineer of the SNCF, to a vivid and dramatic descriptive piece on night-work at a main railway junction, by Monsieur Roger Vercel, under the appropriate romantic title, "Nocturne."

The most impressive story which the book has to tell, covered principally in the chapter by Monsieur Roger Besnard, a high official in the French Ministry of Transport, but referred to in most other sections, is of the recovery of the French railways since 1944, which certainly deserves to rank among the greatest achievements of post-war reconstruction in the world. Monsieur Besnard traces the story of the railways from their almost total paralysis at the liberation, when more than half the lines and almost one thousand stations were out of action and over two thousand bridges and aqueducts destroyed—to say nothing of the immense losses in rolling stock—to their present state of prompt and punctual efficiency. Commenting on this recovery he declares:

THE WORLD OVERSEAS

Eastern Europe in 1947—I

Communists and Nationalism

(By a Special Correspondent)

SINCE the middle of last century Eastern Europe has been the world's storm-centre of competing nationalisms. This is partly explained by ethnical and historical facts. At least fifteen distinct national groups are squeezed together in a comparatively small region bounded by the two giants, Germany and Russia. In many districts two or more nationalities are inextricably mingled together. Such natural boundaries as exist (Carpathians, Danube, Vistula) seldom coincide with ethnical limits. It is thus inevitable that there should be frontier disputes. It is also inevitable that small nations which for centuries were ruled by alien conquerors (Austrians, Turks, Russians) should be extremely sensitive about their national independence.

But nationalism in Eastern Europe, especially in the last twenty years, has been more than this. It has been preached with the fanaticism of a religious dogma. East European school-children have been brought up to believe, not only that their nation has the right to its own independence, but that it is entitled to rule over its neighbours. The "freedom to oppress" is the most cherished possession of the nationalist. Almost every East European nation at some time in its history had an empire extending far beyond its ethnical limits (which in any case were not considered relevant in the feudal and dynastic ages). Some (Serbia and Bulgaria) were ephemeral; others (Poland and Hungary) lasted for centuries. But, in the 20th century, nationalist schoolmasters and text-books represented each of these empires as the natural territory that their respective nation should occupy.

The people of France, confronted with so fine an achievement from the first public service to be nationalised (the SNCF was created in 1937), cannot fail to draw hopeful conclusions.

The book also contains interesting material on the progress and plans for modernisation, and notably for extending the electrification in French railways, by which it is expected annually to save three million tons of coal. It will be recalled that internal transport, of which the railways are the most important branch, ranks among the six basic industries which should command priorities in the allocation of capital and investments according to Monsieur Jean Monnet's Five-Year Plan. Beyond the immediate programme, however, the writers refrain from speculating on the future of the industry. As one of them points out:

The example of Monsieur Thiers, who did not believe that railways had any future, invites us to prudent reserve.

The Director of Air-France, Monsieur René Briand, contributes a useful study of the co-ordination of rail and air transport, and it is regrettable that there is no parallel chapter for rail and road, which economically, for the present at least, is so much more important.

The second part of the book contains conveniently presented factual and statistical information on all aspects of the French railway industry, along with tables comparing it with foreign railways, which might have been more useful had it been possible to obtain the figures for later than 1938.

Shorter Notices

"Coal." By D. R. Grenfell, M.P. Gollancz. 8s. 6d.

This book falls between two stools. As a political tract on coal mining it is made out of date by the nationalisation of the coal mines. (The text of the Coal Industry Nationalisation Act takes up the second half of it.) As a post-nationalisation analysis of the coal industry's problems it can hardly be said to scratch the surface. There are references to the high quality of British coal, but none to its current poor quality for some uses. The problem of coal for export is dismissed with the phrase that "while we must not assume that the British coal industry is to be permanently relieved of the obligations to send coal abroad" there is no hope of returning to the position of 1913. Key issues such as increased mechanisation and the concentration of manpower on efficient mines are given equally inadequate treatment.

Correction.—It is regretted that in the review of *Economics of Migration* last week the author's name was spelt Isaacs instead of Isaac.

Soviet policy recognises the existence of different languages and cultures, and regards attempts of majorities to force their nationality on minorities as wrong, stupid and bound to fail. The Soviet Union has perhaps the most centralised government that has ever existed but, provided that its citizens obey the State and Party authorities, they will suffer no discrimination on national grounds. Press and literature are subject to the same censorship in all parts of the Union, but what the censor passes may appear in any language. Most observers seem agreed that nationalist persecution, the curse of Eastern Europe, has really been ended in the USSR.

Old Feuds Buried

East European Communists have always been proud of Soviet nationality policy, and urged its adoption in their own countries. During the war they had the chance to try in the Balkan countries. While the Axis Powers incited Croatian "Ustashi" to massacre Serbs, and Serbian Chetniks to take revenge on Croatian peasants, Tito and his Communists preached unity of the Serbian and Croatian peoples against a common enemy. The courage of the Partisans, the obvious bad faith of the invaders, and simple commonsense combined to popularise Tito's programme; and already two years before the final victory, even in areas where massacres had been particularly bad (for instance, western Bosnia), Serbs and Croats were fighting side by side in the Partisan ranks against the combined enemy forces of Germans, Italians and Croatian and Serbian quisling nationalists. Hardly less striking was the collaboration between the Yugoslav Partisans and those of neighbouring countries. The Yugoslavs helped the small but growing Bulgarian Partisan movement throughout the spring and summer of 1944. Allied arms supplies were (with the approval of Allied HQ) shared with Bulgarian guerrillas, who found refuge and a training base in Yugoslav territory. There was also close co-operation with the more powerful Albanian (LNC) and Greek (ELAS) guerrilla movements. As far as possible military operations were co-ordinated, and bands retreating from enemy attack in one country were given assistance in the next. It was found that the Balkan nations, whom their ultra-nationalist former rulers had always claimed were hereditary mortal enemies of each other, could be loyal friends in a common struggle. High hopes were born.

The collapse of Germany led to the establishment in most of Eastern Europe of governments more or less dominated by Communists. In the first months after liberation there was one striking common feature of the policy of most of these governments—an attempt at reconciliation with neighbour nations.

There were, of course, some exceptions from the beginning. Far the most important were the Germans. The mass expulsions from Poland and Czechoslovakia have created a major European problem. Yugoslavia, Rumania and Hungary, each of which had German communities numbering 500,000 to 800,000, also decided in principle to expel them. The decisions have, in fact, not been

fully carried out, and may never be, but there has been a fairly thorough expropriation of German property.

The other officially unsolved national disputes affect fewer people, but are of some importance.

First is the Polish-Czechoslovak quarrel over Teschen. The area is of great economic importance to the Czechs, who also remember that Poland acquired it with the help of Hitler in 1938. The Polish Government is keen to have it because, being very sensitive to the charge of lack of patriotism for its surrender of the eastern provinces to the USSR, it feels bound to back every possible "national claim." According to the additional protocol to the recently signed Polish-Czechoslovak treaty, territorial disputes will be settled within the next two years. Meanwhile, relations have undoubtedly improved.

The second is the Czechoslovak-Hungarian dispute. The Slovaks wish to expel most of their Hungarian minority and to denationalise those who remain. They argue that for centuries the Hungarians made Slovaks into Magyars, and that now the small Slovak nation must increase its numbers by absorbing some tens or hundreds of thousands of Magyars. Slovak nationalism grew very strong during the six years of "Independence," and the Czechs are unwilling to attempt any moderating influence on the Slovaks, whose intolerance they are glad to see diverted away from themselves.

The Threat to Greece

The third case is the relations between the South Slav states and Greece. The war-time hopes of all-Balkan co-operation were shattered in the fighting between the British troops and ELAS in December, 1944. The Yugoslav and Bulgarian Communists see in the nationalists who have dominated Greece under the various governments of the last two years their mortal enemies. They consider Greece an outpost of aggressive western imperialism directed against them. They claim that the considerable Slav minority in north-west Greece is being persecuted. The Greek nationalists for their part fear Slav and Albanian pressure on their long northern frontier between Corfu and the Maritsa, which cuts off, and in places by a very narrow strip, the people of the northern Balkans from the Mediterranean. They fear an old-fashioned imperialism directed at Salonica. Whatever the rights and wrongs, this is less a nationalist dispute than an ideological and strategic problem, the importance of which has been enhanced by the proclamation two months ago of the Truman Doctrine.

In the rest of Eastern Europe, however, much progress has been made towards national reconciliation. Relations between Yugoslavia and Albania, Yugoslavia and Bulgaria, Bulgaria and Rumania, and even Yugoslavia and Hungary, seem better than ever before. Within Yugoslavia itself a federal system based on the Soviet model has made possible great progress towards the removal of national discrimination. Even the Macedonians, the most oppressed of the South Slavs, now have substantial home rule. Within Czechoslovakia the right of the Slovaks to equal status with the Czechs as a nation, promised at the time of the Slovak rising of Banska Bystrica against the Germans in the autumn of 1944, has been established, and seems to be genuinely accepted by most Czechs.

Perhaps the most interesting attempt has been Rumanian-Hungarian reconciliation in Transylvania. This is the work partly of the Rumanian Communist leaders and partly of the non-Communist Premier Groza, who has always held the view that Transylvania is the home of both nations, which must live together in friendship. The present regime has not stopped at fine words, but has given the Hungarian population many more schools than it had under the old regime, its own university, and almost complete control of the bureaucracy in regions where Hungarians form a majority. Unfortunately, reconciliation has not gone as far as seems at first sight. The present government is for general reasons unpopular with the Rumanian population, and their discontent often takes the form of accusing Groza of unduly favouring the Hungarians. On the other hand, the Hungarian population objects to the fact that Hungarian

interests are officially represented by Hungarian Communists who represent a minority. The Hungarians also fear that if the present Rumanian Government should be replaced by one truly representing Rumanian opinion there would be a revival of nationalist persecution. Thus, though practical improvements have been achieved, it cannot be said that either nation yet likes or trusts the other.

Transylvania and the Yugoslav Federation, the most conspicuous successes of the new regime, both illustrate the weaknesses as well as the merits of the Soviet type of policy. One cause of discontent nationalist discrimination, is removed, but its place is taken by another centralised Communist Party dictatorship, to

The Russians and Palestine

ON May 14th the United Nations Assembly heard Mr Gromyko expound the Soviet view on the Palestine issue. His speech had sensational ingredients. It gave a pleasant surprise to Zionists and a shock to Arab politicians. Mr Gromyko began his statement by asserting that the mandatory system of administering Palestine had not stood the test of events. He quoted at length Mr Bevin and the findings of the Anglo-American Commission and made the most of figures of the expenditure of the Palestine Administration, in the light of which the mandatory system appeared to have degenerated into an ineffectual police régime. He referred to one fiscal year, that of 1944-45, in which nearly \$18½ million were spent on maintaining "law and order," while the total expenditure on social services and education was \$5,000,000. But the really startling part of his speech was that in which he dealt with the aspirations of Zionism:

It is well known, he said, that the aspirations of a considerable part of the Jewish people are associated with the problem of Palestine and its future organisation. This hardly requires any proof. . . . During the last war the Jewish people experienced exceptional calamities and sufferings which defy description. . . . In the territories where the Hitlerites ruled, the Jews were almost completely exterminated. . . . The total of the Jewish population so annihilated is approximately six million. . . . Past experience, especially that of the Second World War, has shown that no single state in Western Europe proved capable of rendering the Jewish people the necessary assistance in defending its rights and its very existence. . . . against the Nazis. . . . This is a grave fact, but it should be admitted as all facts should. This. . . provides an explanation of the Jewish desire to create their own state. It would be unfair to refuse to reckon with it or to deny the right of Jewish people to the satisfaction of that aspiration.

Of the four possible solutions to the Palestine problem: an Arab-Jewish State with equal right to both nationalities, partition, an Arab State in disregard of Jewish rights, or a Jewish State in disregard of Arab rights, the formation of an Arab-Jewish State—said Mr Gromyko—would commend itself most strongly to the Soviet Government. But the intensity of feeling between Palestine Jews and Arabs might be such that the Soviet Government might support partition, if the creation of a bi-national state were to prove impossible.

The reason why Mr Gromyko's statement created such a stir is clear: it really meant a radical departure from the attitude towards the Arab-Jewish feud officially maintained in Russia ever since the Revolution. For nearly thirty years the Soviets showed hostility towards Zionism. Very early in the 'twenties all Zionist groups and organisations were banned in Russia. For a time, the Left Poale-Zion, a grouping that tried to combine Communism and Zionism, was still tolerated; but it, too, was soon forced to give up all activity. Quite a few Zionist leaders were exiled to Siberia or imprisoned. Even the non-political, "cultural" blend of Zionism, based on the teachings of the Hebrew philosopher Akhad-Haam, who saw in Palestine the spiritual rather than the political centre of Jewry, was treated rather harshly. Jewish attempts at reviving the Hebrew language were suppressed, even when they took a purely literary form. Zionism and "Hebrew-ism" were treated as a brand of counter-revolution. The excesses of the anti-Zionist policy were to a large extent due to the zeal of the so-called Jewish Section of the Communist Party, which was in this respect certainly *plus léniniste* than the Party. A few of the Russian Bolshevik leaders had indeed, viewed with some sympathy the Jewish attempts at the revival of the Hebrew language; and Lunacharsky, the "godfather" of the great Commissar of Education, was the godfather of the famous Hebrew theatre "Habimah" which later left Russia for Palestine. But, in the end, the "Jewish Section" prevailed against the pro-Hebrew sentiments of a Lunacharsky, because anti-Zionism was undoubtedly more congenial to the Bolshevik outlook.

which must of course be added economic misery resulting from the war. Both the moderate and the extremist opposition seize every opportunity of directing discontent into nationalist channels by ascribing all hardships to deliberate oppression by Russians. The USSR, they argue, is using small cliques of paid quislings to attack, not the privileges of a ruling class, but the national existence of the East European peoples.

The success or failure of the nationality policy of the Soviet regimes will in fact depend on the policy pursued by the Soviet Union towards the East European states.

[In our next issue we will publish a continuation entitled "Russia, Pan Slavism and Nationalisation."]

The Bolshevik Party had two motives for its anti-Zionist policy. The Second Congress of the Comintern (1920) proclaimed the support of the Communist Parties to the anti-imperialist movements among the colonial and semi-colonial peoples. The national or nationalist aspirations of the Arabs were treated sympathetically as an important aspect of the anti-imperialist revolution. In the context of that policy Zionism automatically appeared as the enemy of Arab emancipation or, what was even worse, as "the agency of British imperialism" in Palestine. Even the fact that the Arab movements were more often than not led by highly reactionary Effendis did not shake Communism in its belief that it was bound in duty to take the side of Arabs against Zionism. So much so, that in 1929 the Arab war against the Jews was hailed as a great revolutionary event by the Comintern, including the Communist Party of Palestine, in which Jewish Communists played a predominant role.

The other motive which accounted for Soviet hostility was that Zionism tended to divert the masses of Jewish workers in Eastern Europe from the class struggle on the spot. As recently as last year, Mr Stalin himself repeated that charge in an appendix to the second volume of his "Collected Works," saying that "Zionism is a reactionary-nationalist tendency that has its followers among the Jewish bourgeoisie, intelligentsia and the most backward sections of the Jewish workers. The Zionists strove to isolate the Jewish working masses from the common proletarian struggle." The vision of a Jewish home in Palestine was seen as an escapist mirage competing among Jews with the much more real ideal of Socialism. Zionism was said to reflect Jewish distrust in Socialist Revolution which was committed in advance to overcome anti-Semitism and to grant the Jews complete equality in their native lands.

The survivors of European Jewry must now feel that the Jewish distrust in the ability of the European Left to deal effectively with anti-Semitism, the distrust of which Zionism has been the exponent, has been all too tragically justified. "Common proletarian struggle" was unable to save the six million Jews that perished in Hitler's gas-chambers and death camps. Mr Gromyko's words about the inability of "a single state in Western Europe" to defend its Jews sounds like a frank endorsement of the Zionist pessimism about "humanitarian and freedom loving" Europe. Mr Gromyko spoke about Western Europe. It may be assumed that what he had in mind was Europe to the west of the Curzon line.

As to the Soviet Government itself, it can rightly claim to have been the only Government in Europe that has done its utmost effectively to save the lives of its Jews—in 1941 it gave them priority facilities for evacuation from the provinces threatened by the advance of the Nazis. But the fate of European Jewry has given a shock even to Russian Jews, who have enjoyed complete equality with other Soviet citizens; and it is probable that under its impact Zionist dreams and longings have revived even among Russian Jews. All the same, it is doubtful whether, in spite of its changed attitude, the Soviet Government would allow any revival of Zionism in Russia itself, let alone any emigration of Russian Jews to Palestine. This would amount to a confession on the part of the Russian Government of a failure to deal with the problem of nationalities, a confession for which there seems to be no justification in the facts. However, the new Governments in the countries of the Russian zone have not pursued the anti-Zionist policies to which the Communist parties of those countries had been committed. While they have called on their Jews not to rush away in a panic and have invited them to stay put, they have not, however, placed any obstacles in the way of Jewish emigration. Nor have they banned Zionist parties or groups and Zionist political activities.

The other motive behind Soviet anti-Zionist policies—

sympathy with "Arab emancipation"—has now apparently also lost some of its validity. True, Mr Gromyko was very careful to avoid giving offence to Arab susceptibilities. He tried hard to strike a balance between Jewish and Arab claims. But whoever has been responsible for formulating the new Soviet approach to the Palestine problem—it could hardly have been any authority lower than the *Politbureau*—must have been aware that the policy expounded by Mr Gromyko would arouse little enthusiasm among Arab politicians; that it would tend to weaken rather than enhance the Soviet influence in the Middle East, especially because the Arab leaders had expected Soviet Russia to remain true to its old and uninhibited anti-Zionism. It is impossible to say just how clearly the implications of this new policy have been grasped or worked out in Moscow. But at Lake Success, Mr Gromyko certainly gave the impression that in their present mood the Soviets did not care much about the repercussions of their policy among the Arabs—that they were not at all anxious to play the Arab card in the present diplomatic game. Russian policy is, of course, unstable; and the directives upon which Mr Gromyko spoke to the United Nations Assembly may well be reversed for one reason or another. But for the time being it looks as if Russia was effecting an ideological retreat from the Arab Middle East, a retreat which logically supplements its virtual political withdrawal from Northern Persia.

Trade Unions in the British Zone

[BY OUR CORRESPONDENT RECENTLY IN BIELEFELD]

THE persistent food crisis in the British zone has brought the German trade unions to their most testing time and, in the rapidly moving situation, it is clear that they are playing a decisive role. Hitherto, the union officials have exerted a restraining influence over the workers, and have both preached and practised a policy of co-operation with the British authorities. The present mood of the populace is such, however, that checks and restraints can be of very little avail. Only an improvement in food supplies and the clearing-up of the administrative confusion can bring any change.

At Essen last week-end the Ruhr trade unions put forward a seven-point programme for far-reaching measures of economic and administrative reform, and for dealing with the food situation. They have shown signs of a constructive attitude which is very welcome in a Germany rapidly—to use the unions' own phrase—"drifting towards disintegration." But the programme can also be regarded as in the nature of an ultimatum that, unless steps are taken along the lines they propose, trade union co-operation in reconstruction would be withheld. Non-co-operation would have serious consequences, and would no doubt be regarded by the British as "the most unkindest cut." The unions have been allowed every possible freedom to develop their organisation, and there is a lot to be said for the view that protests should properly be directed against German, rather than British, authorities. The unions, conscious of their key position, may be seeking a trial of strength.

Of their present influence there can be no doubt. The trade union movement in the British zone, having passed through the teething stage, has been emerging as one of the few healthy organisations in the anæmic body politic of Germany.

The recent conference at Bielefeld, establishing the central *Bund* or Federation, showed that the unions are anxious to profit by past experience and to sink internal differences in order to achieve a united movement.

A United Movement

The Federation comprises twelve industrial groups (metal, building, mining, timber, food, textile, chemical, printing, public service, transport, music and agriculture), and covers a total membership of about two million. There is thus obviously a large field of trade union recruitment among the zone's eight million industrial workers. Industrial unionism has been accepted as the basis of organisation, and this has inevitably given rise to difficulties. Both the clerical workers and the railwaymen have sought to maintain their individual identity. A compromise solution is being worked out for both groups, but there are bound to be disputes over demarcation and "poaching," so familiar to the British trade union movement. Another possible source of difference is the extent of authority which the *Bund* is to wield over its constituent bodies. The general idea is that the individual unions will be

autonomous on industrial matters, but that the *Bund* will have authority over general policy.

The structure of the trade union movement is designed to secure the democratic rights of the individual trade unionists at every level. Each union will be organised on the basis of a local group, with a regional association and an association executive elected at the annual congress. Every trade union in a district will be represented on a local or *Kreis* committee—somewhat on the lines of British Trades Councils. Above these *Kreis* committees there will be regional or district councils, whose areas will be laid down by the Federation executive.

Each trade union will appoint one member to a Federation Council (unions with 200,000 or more members being allowed an additional representative). The Council, which must meet at least every three months, will be generally responsible for policy, and will act in most respects as the equivalent of the TUC General Council. The actual day-to-day work will be done by the Federation's executive, elected biennially by the Federation Congress.

The objectives both of the individual trade unions and of the Federation have been set out in a draft constitution, which was accepted by the Bielefeld Conference. In both cases the industrial and non-political aims of the unions are stressed, and it is stipulated that no distinctions of race, religion, party or sex shall be allowed. While the main emphasis is on what are regarded as trade union functions proper—the protection of labour standards and the negotiation of agreements on wages and working conditions—some more positive aims are included. Thus the trade unions are to co-operate in social and economic improvements, in the furtherance of Works Councils and in the "democratisation" of the national economy and the "rooting out of National Socialist and reactionary elements."

Similarly the constitution of the *Bund*, as well as covering purely organisational points, includes the aim of "ensuring for the workers an equal voice in the control of economic and social policy . . . and their participation on a basis of parity in all existing and future economic corporations."

Partnership in Industry

The extent of workers' participation in industry is one of the burning issues in Germany to-day. The idea of workers' control still has many advocates, particularly among the older type of trade unionists, but the more modern idea of partnership is taking root. The controversy centres on the functions of works councils. A quadripartite Law (No. 22 of April, 1946) allows the establishment of works councils in individual enterprises, and suggests in broad terms their composition and functions. They can, it is stated, negotiate collective agreements, participate in social and welfare matters, investigate grievances and—these are the controversial issues—submit proposals for the improvement of production and "co-operate in the prevention of all war production" and in denazification.

Different interpretations have been given to this law in the different zones. In the Soviet zone, Works Councils have been compulsorily set up; in the British zone, they have been "encouraged." The trade unions in the British zone have drawn up a model constitution, and have in many undertakings secured the employers' agreement on their terms which are certainly far-reaching. They include, as well as matters affecting wages, welfare and working conditions, provision for regular reports from the management on production progress and programmes; they stipulate that the council shall have access to the firm's books, and should be consulted on all questions of staffing and promotion.

It is not surprising that some employers should have only agreed reluctantly to what some must have regarded as the signing away of their managerial rights. In some cases, their refusal to agree with the trade union terms has led to strikes.

Support for Socialism

The union claims are not confined to Works Councils, but apply to the policy-making bodies in the zone generally. The resolutions passed at the Bielefeld conference cover a wide range of economic and political issues. They call, for example, for the immediate socialisation of the basic industries, beginning with coal and steel; for a halt to the dismantling of factories which could be put to peaceful purposes; for land reform, with a complete purge of the food administration and stricter measures to ensure deliveries from the farms; a speeding up of the return of prisoners of war; and, in general, for a sharper definition of German administrative responsibilities and a centralisation of authority. The programme of the Ruhr trade unionists is on the same pattern as that adopted at Bielefeld. The trade union

leaders have exercised considerable restraint on wages, and this has helped to keep the price-wage structure stable. But the workers' pressure for higher wages is beginning to make itself felt. Low wages have not hitherto been a burning issue, because of the extent of barter rather than money exchange. However, as soon as reform of the currency is tackled and as soon as more production can find its way into the normal market, instead of the black or "grey" market (i.e., barter between factories and farms) the low purchasing power of the German worker will be sharply felt. Equally, while the coal shortage is keeping most industries running at short time, the length of the working week is an academic point. The miners have agreed to work a six-day week, to meet urgent production needs, but sooner or later they are bound to follow the example of the British miners in seeking a five-day week.

Siamese Prospects

[BY A CORRESPONDENT]

IN the flux of Far Eastern affairs, Siam holds a unique position of which much could be made both by the Siamese and the British. The country faces political, economic and population problems not unlike those of its neighbours, but by good fortune attenuated to a degree which spares it that condition of chronic crisis familiar to China, India, Indo-China and, to a lesser degree, Burma and the Dutch East Indies. There is no population problem; in a territory roughly the size of France and containing little unexploitable land lives a population of between 16 and 19 million. It is growing rapidly; in 1929 it was 11½ million, in 1937 (the last census year) 14 million, in 1940 an estimated 14½ million. But it cannot yet be described as pressing on the means of subsistence.

Siam has been spared the experiences either of prolonged and embittering foreign tutelage or of chronic internal strife. Its independence, like China's, was saved during the period of European imperialist expansion by the mutually frustrating rivalries of the adjoining Powers, Britain in Burma and France in Indo-China; its smaller size and less elaborate governmental structure was less vulnerable to the effects of a breakdown in tradition, and there are no acute communal differences as in India. The remote jungle tribes of the north do not clash with their more advanced fellow-citizens of the plains and seaboard, and religion (Hanayana Buddhism) is the same for all. A concession system, benefiting European nations, similar to that in China, was abolished in 1936; and Siam's nearest approach to revolution was the practically bloodless *coup d'état* of 1932, which substituted constitutional for absolute monarchy.

Even the second world war touched Siam comparatively lightly. With Japanese backing, the Government of Songgram successfully claimed from France the cession of substantial frontier territories in Indo-China, and subsequently, after a few gestures of resistance, found itself providing the Japanese with a strategic base and supply area, and forced to declare war on Great Britain and the United States. Although Great Britain retaliated in kind, the United States was realistic enough to ignore the declaration altogether, merely breaking off diplomatic relations. The Siamese part in the war was kept as small as possible. Although Bangkok and the Siamese railway system in general suffered from allied bombing, and the economy endured the usual distortions and requisitions, the tight-rope willingness of Siam's statesmen averted the more acute effects of co-prosperity.

The experience of Japanese occupation on the one hand and the traditional concentration of Siam's internal trade in the hands of its one substantial foreign minority, the Chinese, has had the effect of directing whatever xenophobia exists against fellow-Orientals rather than against the West. The ambition of Siam's leaders—of the democratic Juang Nowasarat as well as of the somewhat totalitarian-minded Songgram—has been to westernise. Some manifestations of the westernising policy have had a fantastic, almost Erehwonian, character. But at present the more rational intention prevails of absorbing whatever western ideas and techniques can be harmonised with Eastern tradition, while holding firmly to native culture and religion. Almost symbolic of Siam's attitude to these two factors in her national life is the equipping of her magnificent and flamboyant *Wats*, or temples, with wireless sets.

The immense post-war economic difficulties have not passed Siam by, but the country has suffered to a comparatively mild degree. The staple production—rice, rubber, teak—suffered from Japanese requisitioning of draft animals, from the breakdown of transport and from the cutting off of normal markets; and her

finances suffered acutely from being tied up to the eventually insolvent Japanese war machine. But there has been no post-war famine, and the depreciation of the *baht*, or tical, though severe, has reached nowhere near the astronomical figures of the Siamese dollar. The official sterling rate for the tical (originally a gold standard currency valued at 11 to the pound) is now 40, and there is a probability of a further devaluation to 60; while side by side with the official rate, whose use is virtually limited to government import transactions, there flourishes a grey market, unofficial but officially recognised, in which the sterling rate is about 84. Siam's currency problem being due more to lack of goods than to an adverse balance of payments, the government are pursuing a vigorous import policy to meet its need in textiles, machinery and means of transport of all kinds.

Chances for British Trade

Many of these needs must be met from low cost Oriental sources; Indian textiles, for instance, can replace Japanese as the Lancashire product is unlikely to do. Out of the total Siamese population not more than a million or so are in the market for modern Western consumer goods. But for the capital goods needed to set in train Siam's overdue industrial progress, to rehabilitate and extend her road and railway system, to modernise her cities, she looks to Britain and America. British goods enjoy the reputation of reliability; British deliveries have been more punctual, and British prices, partly by reason of transport costs, are generally lower. But American advertising is overwhelmingly more aggressive, and it is only from America that novelties, as distinct from familiar lines, can be obtained. The Siamese are reported to prefer British to American cars; the petrol shortage is acute, the roads are narrow, particularly in the cities where the most car-owners are to be found, and the small engine and short wheel base of the light British car make it popular. There is also an apparently inexhaustible demand for British bicycles. But the major demand is for capital goods; rice mill and wood mill machinery, tractors, mining tools, refrigerating plant, road-making machinery, rolling stock and marine engines—90 per cent of Siam's present transport being by water. There is into the bargain a demand for expert advice and a readiness—due to the comparatively happy political experiences mentioned above—to grant concessions to foreign capital, particularly for mining licences.

Siam's own resources for foreign trade fall into two fairly well-defined groups. The staple exports—rice, teak, tin and rubber—are all, by the treaty of 1946, under control by licence. The last three may be freed before long, but rice, in view of the severe food shortage throughout the rice-eating countries, is likely to stay controlled. By the same treaty, Siam agreed to turn over its entire rice surplus to the organisation allocating rice between the various consuming areas, at first free, as reparations, later at an agreed price. In the second group are the minor, as yet little developed, but rapidly increasing export products—wolfram, antimony, jewels and semi-precious stones, spices, gums and lacquers, and copra, with a possibility of cotton and tobacco as the paramount need for rice cultivation diminishes. This field particularly commends itself to the merchant-adventurer type of private enterprise, especially as part of a two-way, export-import traffic. The development of Anglo-Siamese commerce, both in the expansion of old lines and the development of the new, should be favoured by the conclusion in the near future of a new commercial treaty to replace that of 1937. The greater importance attached to Anglo-Siamese relations was marked last year by the promotion of the British Minister in Bangkok to the rank of Ambassador. Altogether, with uncertainty, disorder and hatred of white men rampant through so much of the East, Siam offers a pleasingly clear prospect of mutually advantageous development and progress, always providing that present opportunities are not neglected.

up an abnormally large mass of persons 65 and over, and at a time when society has not yet relearned methods of making these years at least partially productive for more of them.

Care for needy and kinless old people in institutions was common in the 19th century, on the model of English workhouses and private almshouses. There remains a widespread system of local public workhouses (known by a variety of names) and about 1,500 private almshouses (known mostly as "old people's homes"), many of them run by religious sects, and taking selected old people at cost, for what little they can pay, or without charge. Most have long waiting lists. However, few new ones are being built now. Only a couple of hundred thousand people live in almshouses and workhouses together.

The current growing point in institutions for the aged is what is called in America the "nursing home"—a private boarding house run for profit, specialising in the care of convalescent and elderly persons. Old age pensions have enormously increased the numbers of such nursing homes, and the end is not yet. Some are well run (and expensive), some are abominable exploitations of poverty and helplessness. States and municipalities are beginning to regulate and inspect them, which is some help. State and Federal governments are under constant pressure to liberalise the pensions, which is more help.

But economics is only part of the problem. The basic grievance of the aged is loss of the honoured status they enjoyed in agricultural civilisations when they were rarities. What they need most is useful work within their capacities, and loving grandchildren (or their moral equivalent), near enough to be some good to them, yet from whom they can escape when weary.

Recovery of patriarchal status is less likely than the evolution of a new status of respect and affection, with less proximity than of yore, but more than there often is now. The block of flats specialising in the elderly, the light-housekeeping quarters within a flat or house, the "mother-in-law house" at the end of the garden—these are some of the experiments that are finding increasing favour among specialists, though as yet but little used.

And problems of old age are becoming a fashionable specialty in both medicine and sociology. Books and articles in quantity aspire to a place beside Cicero's *De Senectute*. Within the past year the learned journals *Geriatrics* (Minneapolis) and *Journal of Gerontology* (Springfield, Illinois, and St. Louis) have made their debut. Columbia University's College of Physicians and Surgeons has started a medical research project on aging, and the University of Chicago a sociological one. Popular as well as professional interest is rising. Perhaps, after all, the best is yet to be.

American Notes

The Portal Decision

The business community is surprised and gratified by Mr Truman's decision to sign the Bill outlawing all past and most future claims for portal-to-portal pay (that is, pay for time spent on the employer's property, walking to and from the machines and preparing for work). In the future, suits will be allowed only when sanctioned by contracts or industrial custom, and may not be filed more than two years after the "work" is completed. In approving the Bill, the President insisted that the need to relieve business of a potential burden running at one time as high as \$6 billion was greater than the risk, urged by the unions and the Secretary of Labour, that the loose wording of the Bill might endanger the wages and hours provisions of the Fair Labour Standards Act. But he sweetened the pill for Labour by suggesting that with the portal uncertainty cleared away, it was time to consider extending minimum wage standards to groups not now covered, and raising the minimum wage from 40 to 65 cents an hour. He also took the unusual step of appending his own interpretation of ambiguous passages in the Act, a statement which can hardly be ignored by the courts which will soon be construing it and testing its constitutionality.

Mr Truman's decision in this case is no guarantee that he will be equally co-operative when the Labour Bill arrives on his desk, but it does suggest that he is far from being the political captive of Labour. It is now virtually certain that the Labour Bill which will emerge from conferences between the two branches of

Congress will be much more like the Senate version than the Draconian measure passed by the House. Among the Senate conferees is the very able freshman from New York, Senator Ives, who played such a prominent part in obstructing the most controversial of Senator Taft's "stiffening" amendments. Mr Hartley, the author of the House Bill, has already indicated that he will sacrifice the ban on industry-wide bargaining and the provision allowing private employers to secure injunctions against strikers.

This display of sweet reasonableness is not primarily designed to deprive Mr Truman of the grounds for a veto, but to assure the two-thirds majority in the Senate needed to override a veto. With the Republicans enjoying only a six-vote advantage in the Senate, the influence of such progressive Republicans as Senators Ives, Morse, Aiken, Tobey, Lodge and Thye can, on occasion, be very much greater than their numbers suggest. On the Labour Bill, they are, in effect, imposing a veto on the excesses of their own party. Indeed, their successful revolt against Mr Taft's ban on industry-wide bargaining is taken as the first solid evidence of a split on broad policy inside the Republican ranks.

Retail Trade

A modest setback in retail trade during March is now being accepted as further evidence of a turn in the business trend. The fall reported was confined to non-durable goods, with sales in durable types showing little variation, so that over the first quarter of 1947 total volume showed little change from the level reported for October-December, 1946. Dollar sales for March at \$8.6 billion were still 15 to 16 per cent above those of a year ago.

This news confirms trade reports of a considerable contraction in wholesale demand from retailers during recent weeks, a trend which has been confined, of course, in the main to non-durable goods, although certain jewellery and hardware items have been included. So uneven, indeed, has been turnover in retail trade during the war years and the immediate post-war period, that retailers must, in any event, expect some unsettlement at this stage, coupled with a decidedly more selective attitude on the part of consumers.

The dollar volume of retail trade in recent years is shown in the table below:—

	ANNUAL SALES (in billion dollars)			
	1939	1941	1945	1946
All retail stores	42.0	55.5	76.6	96.7
Durable goods	10.4	15.6	11.5	19.0
Non-durable	31.7	39.9	65.1	77.7

Through the war years, in fact, consumer expenditures for goods and services of all types rose steadily to a peak of \$127 billion for 1946, the latter level representing an advance estimated at 20 per cent over 1941, even when allowance is made for the changing price structure. Through the war years, however, the dollar volume of retail trade was considerably below the pre-war relationship with disposable incomes, and not until 1946 was the pre-war pattern re-established.

For that year, however, sales of non-durable goods were far above the level suggested as "normal" by pre-war experience, while the scarcity of durable goods still found reflection in sales below pre-war rates in relation to national income trends. With business activity sustained at a high level, therefore, it seems fairly certain that retail trade should be maintained at a relatively high volume, since such goods as automobiles, household equipment, hardware, building accessories and furnishings will take up the slack created by the satisfaction of accrued demand for foodstuffs, apparel and general merchandise. Any general uncertainty concerning trade, however, will almost certainly find an early reflection in sales for this type of goods, and while there is no present evidence of any slackening in demand for automobiles, there may well be considerable hesitation in the trades that depend on the building industry.

Mr. Benton's Mirror

Wherever the Congressional economy axe has fallen, there have been anguished wails of "Woodman, spare that tree!" But despite slashes at prized and essential public works for the Western states, the near-elimination of the government's statistical and research services, and cuts in "safer airways" funds, no economy has aroused so much controversy as the decision of the House to uphold its Appropriation Committee in refusing \$31 millions for the State Department's International Information programme. This refusal was based on the fact that the House

failed last year specifically to approve Mr Benton's "mirror-like" projection of the United States to foreign countries.

To prevent any interruption in the broadcasts known as the "Voice of America"—which have just been extended to carry Mr Marshall's and Senator Vandenberg's voices to the Greek people—Representative Mundt has introduced a Bill conveying the required Congressional approval. It has been vigorously supported by Mr Marshall, who urged that it was hard for Americans to realise how misunderstood they were abroad, and by Mr Acheson, who pointedly observed:

What a colossal folly it would be to spend vast sums abroad without telling people what we are doing. There is not much point in trying to do good by stealth.

The opposition is made up both of those who are opposed, root and branch, to any government information policy which trespasses, however remotely, on the preserves of private enterprise (the United Press and the Associated Press still nourish their old hostility under the guise of devotion to a free press) and those who, while they reluctantly approve the end, feel that the present Office of International Information is ineffective, extravagant, and "riddled with Reds." The total of \$31 millions is microscopic compared with past and projected American investments abroad. Mr Marshall's prestige, and the evident need not only for piercing the iron curtain, but for supplementing the rather bizarre versions of the "American way" exported by Hollywood and parts of the American press and radio, make it almost certain that some way will be found of getting at least part of the programme through the Congressional needle's eye. Another project, originated by Mr Benton, and now supported by Mr Marshall, is the creation of a foreign broadcast "radio foundation" to be sponsored jointly by the government and the seven major radio companies.

Mr Walter Lippmann suggests this week that the Voice of America will be effective abroad and supported at home only when it is given a clear and convincing script by Mr Marshall. This is an over-simplification, for under the American system Mr Marshall's powers to create and carry through a foreign policy are very much slighter than, say, Mr Bevin's. But unquestionably the confusion over information policy reflects the much greater confusion over foreign policy. The mist on Mr Benton's mirror is not all of his own making.

The Third House of Congress

(From our US Editorial Staff).—The Congressional Directory of the 80th Congress, first session, lists a Senate membership of 96 and a House membership of 435. The directory of persons registered under the Federal Regulation of Lobbying Act numbers 745. There is a similar contrast between the economic status of this third house of Congress and that of the two older bodies. Senators and Congressmen get \$12,500 each, plus the extra \$2,500 expense money they allowed themselves last year, making a total of \$15,000 a year. Top lobbyists do far better: Mr Purcell L. Smith gets \$65,000 a year and M. Stephen M. Walter \$25,000 (with an additional \$26,000 from 13 individual firms) to represent the National Association of Electric Companies; others in the top dozen, with salaries ranging from \$18,000 to \$45,000, to say nothing of expense accounts, represent the Cane Sugar Refiners, the Hawaiian Sugar Planters, the US Beet Sugar Association, the United Fresh Fruit and Vegetable Association, the Independent Petroleum Association, the Motion Picture Association, the Air Transport Association, the American Plant Food Council, the Association of American Railroads, the National Association of Manufacturers. Two of the twelve were members of the 79th Congress—one served on the House Appropriations Committee and the other as Majority Whip; a third used to be Director of the Office of Marketing Services, while a fourth was Solicitor of the Department of Agriculture.

The organisations which these and other lobbyists represent claim loudly that only a fraction of their activities consist of trying to influence legislation, but even a fraction of a declared quarterly expenditure that approaches a million dollars, with ten organisations spending more than half of that amount, seems likely to have some effect—at least when equal and opposite pressures do not kill each other off. For every lobbyist does not represent big business. Among the ten heaviest spenders were the National Rural Electric Co-operative Association, devoted to advancing the development of public power projects, the Civil Rights Congress, fighting the cause of minorities, and the Conference of American Small Business, working for anti-trust enforcement as well as for restrictive labour laws.

While Washington supports the greatest concentration of lobbying talent, this is only half the story. The pressure boys' real technique, behind their well-staged appearances at public hearings

in the Capitol, their large cocktail parties at the Statler Hotel and their small dinners in Georgetown, is summed up in a letter by the present president of the Association of American Railroads to the general counsel of one of its member firms, exhibited by the Justice Department in a current anti-trust case: "All of us have long recognised that the only effective way to influence Congressional action is to convince the influential men in each Congressional district that the public interest and the interest of the railroads coincide." The inference is clear that amounts spent under the auspices of the Association in Washington are heavily supplemented, locally, by constituent firms.

Steel for Automobiles

The recent news that the Chrysler Corporation had been forced to suspend production of leading models for a period of ten days, mainly because of shortage of sheet steel, is yet another example of the way in which industry is still hampered by the present famine in basic metals.

Material and metal shortages, including a serious shortfall in supplies of both tin and copper, now form the automobile industry's most critical problem, since any large-scale labour dispute for some way ahead is now remote following the general wage settlement for an increase of 15 cents an hour. Labour disputes had a crippling effect on production in 1946, when output of all types of vehicles was no better than 3,100,000 by comparison with the 1941 level of 4,800,000 and the 1929 record of 5,300,000.

Current shortages of materials are especially unfortunate because the winter months of even production enabled the industry to step up output to a recent level of more than 100,000 units weekly, a rate that would enable it to attain a 1947 output of not less than five million passenger cars and trucks. The attainment of this output, however, will demand continuous operation at, or near, recent levels, and while some metal shortages may be corrected, it seems reasonable to presume that a general easing of the position must now await a general setback in industrial activity, which will in turn affect the demand for automobiles.

A great deal has been heard in recent months about "consumer resistance" to higher car prices. Obviously, the rise in costs and prices must have forced some prospective purchasers from the market, but trade reports continue to assert that demand continues at a very high level, and that the industry has order books which should ensure full operations for quite a long time ahead. Here, again, demand may be affected by the present situation, since manufacturers generally have been proceeding on the assumption that rising productivity would cushion the quite substantial wage concessions recently granted, and that no fresh advance in prices would be needed to sustain profit margins.

The industry will not, of course, escape without damage from any more general trade recession. From 1937 to 1938, for example, output fell from 4,800,000 to 2,500,000. It is estimated, however, that the lapse from normal output in recent years has brought the average age of registered automobiles to nearly nine years, against a pre-war figure of not much more than five. Since there is little evidence to suggest that the passenger car is losing ground in terms of competitive outlets for consumer incomes, there is confidence in the longer-term future, whatever may be in store for the remainder of 1947.

Shorter Notes

The British Ambassador has delivered a protest to the State Department against the inflammatory advertisements on Palestine financed by the extreme Zionists appearing in the American Press. The latest of these is a letter from Mr Ben Hecht, the Hollywood scenarist, in which he states: "Every time you blow up a British arsenal or let go with your guns and bombs against the British betrayers, American Jews make a little holiday in their hearts." It adds insult to injury that contributions toward the funds that these advertisements are designed to support are apparently regarded as charitable donations and exempted from taxation.

The war control agencies will vanish on June 1st. Rent controls will be in the hands of the Federal Housing Expediter, the remnants of price control go to the Department of Agriculture, and subsidy payments will be made by the Reconstruction Finance Corporation. Material allocations will be made by the Department of Commerce. These moves will liquidate the Office of Price Administration, the Civilian Production Administration, and the Office of War Mobilisation and Reconversion.

THE BUSINESS WORLD

The OFS Goldfield—I

A FEW days ago, Sir Ernest Oppenheimer cut the first sod of the Welkom Gold Mining Company in the Orange Free State, and, with appropriate ceremony, predicted that the output of the projected Free State mines would eventually reach £50 million annually. To appreciate the present position in the OFS, it is helpful to glance first at the historical background. Just about ten years ago, serious gold prospecting in the region looked like petering out. Over several decades, recurrent bursts of prospecting activity, based on the various theories of great gold-bearing deposits of the Witwatersrand series in the general direction of the Vaal River, had all ended in disillusionment. In the middle thirties good borehole results obtained by Western Reefs in the Klerksdorp neighbourhood, to the North of the Vaal, led to a good deal of work in areas further south, down to a point about 16 miles north of Odendaalsrust. Nearly all this work, however, was fruitless and the results were even discouraging to further effort. Except for a narrow strip on the Vaal River controlled by Western Reefs Limited, no payable reefs had been located by the end of 1937 and the main result of the boreholes put down was to emphasise the thickness (5,000 to 8,000 ft.) of the layer of Ventersdorp lava underlying the whole area. The existence of the Witwatersrand series beneath this great cap had been confirmed; but—as has been true of thousands of square miles of Witwatersrand territory, where vast fortunes have been lost in fruitless prospecting—the accumulated evidence showed that, although gold-bearing strata existed, they were very deep, unpayable as to grade and much broken by faulting. Moreover, the characteristic “pay horizons”—e.g. the Main Reef series—of the rich 70-mile outcrop of the Rand proper were either absent or present only in degenerate form.

How nearly right were the negative conclusions of the later thirties is shown by the fact that almost all the areas considered interesting in 1937 have since been abandoned. Western Holdings Limited was formed in that year mainly to acquire a group of participations in various OFS areas under exploration by leading houses, but all of them proved abortive. The company's spectacular rise to fame and fortune owes its origin to some directly owned long-shot options in the Odendaalsrust region, in the vicinity of a once unknown farm called St. Helena, situated a good way to the south of the Vaal River region. Minor positive results had been shown in this area but it is open to doubt whether it would ever have been considered worth while to sink money in boreholes so far south had not the Union Corporation found that a geophysical prospecting apparatus—the Eotvos torsion balance—gave recordings from which could be deduced the points where the lava cap was relatively shallow. To the expert, the principle seems simple enough, being based on the fact that the Ventersdorp lava exercises a lighter gravitational pull than the surrounding deposits. Some remarkable readings given by this apparatus led to the acquisition of further option rights in the St Helena area and indicated the siting of the historic St Helena No 1 borehole.

When this borehole revealed the existence of gold-bearing conglomerates at moderate depth, it led to a systematic drilling

campaign, aided by further geophysical prospecting.* All the leading South African mining houses extended their activities, and, when results in the St Helena region discovered two economic ore horizons—which came to be called the Leader Reef and the Basal Reef—a rash of boreholes rapidly extended over most of the Northern Orange Free State. The spate of borehole results which has showered on the mining and investment worlds in recent years is apt to leave the uninitiated with the impression that something resembling a vast dinner plate of gold-bearing strata, much of it showing payable values, underlies the whole area. In fact, in the words of the authors of the paper referred to in the footnote,

... thousands of square miles [have] been tested by judiciously located boreholes, but as yet no new promising mining areas have been found further than 17 miles from Western Holdings' first strike, and none of the later discoveries has so far succeeded in locating the Witwatersrand beds at such shallow depths.

It may be noted at this point that it is in the vicinity of the original St Helena strikes that the daughter company, St Helena Gold Mines Limited, is now sinking the first OFS shaft which is down to a depth of over 200 feet and should meet the gold-bearing horizons at about 500 feet before long.

Prospecting during the war years did not make much headway, but in the year following the end of hostilities a number of really significant discoveries put beyond all reasonable doubt the existence of a large, commercially exploitable field. It may be significant, however, that work in the past twelve months has achieved little—apart from the phenomenally rich strikes in the Western Holdings-Blinkpoort area—beyond a more precise delimitation of the future mining areas, while negative results have virtually ruled out some of the much canvassed “prospects,” such as the African and European Block 8 and portions of the areas covered by the Free State Development Company. On the work done so far, it is fairly generally agreed that the basis has been established of nine to ten important mines, so far as boreholes can provide evidence. They are all located roughly on a north-south axis running through the town of Odendaalsrust, and the mining layout is roughly indicated by the accompanying chart. The areas will be discussed individually in a subsequent article.

Broadly, the underground formation dips from west to east from the sub-ore crop (i.e. the westerly limit near which all the projected mines are situated); as the formation deepens towards the east, the Leader and Basal Reefs, which are expected to provide the greater part of the exploitable ore, seem to disappear or become unpayable. Limited quantities of payable ore to contribute to the output of mines working the two chief reefs may also be taken from two other strata—the “A” and “B” reefs, two minor horizons not yet clearly identified. Even in the established areas, however, the ground is often much faulted, and this, together with the existence of the overlying granite cap, may well pose some considerable technical problems in the

* The story is given with great wealth of technical detail in a paper by Messrs. Frost, McIntyre, Papenfus and Weiss published in the September, 1946, issue of the *Journal of the Chemical, Metallurgical and Mining Society of South Africa*.

course of development on the reef. The problem of ventilation will be considerable, because, owing to the lower conductivity of the rock compared with the Rand, temperature will rise steeply at depth.

The projected mines consist of the following:—

- (a) St Helena—first in the field with shaft sinking.
- (b) The three Welkom areas 1, 2 and 3, making up part of the area formerly known as African and European Block 7 (in the portion of Block 7 lying further east, the reef seems to dip steeply). Shaft sinking on No. 1 lease area will begin this year.
- (c) Western Holdings Second Lease Area.
- (d) Blinkpoort.
- (e) Two (and possibly three) mines to be located in the Free State Development territory round Odendaalsrust.
- (f) One or two mines to be sited in the Wit Extension area.

The Union Corporation took the lead in the sequence of events which led to the discovery of the area, and this group retains control of St Helena and also has a substantial interest in Western Holdings, as well as a number of other participations. But the Anglo-American Corporation, by a series of moves, of which acquisition of control of African and European was perhaps the most important, has attained the position of major finance house in this field—all the leading houses are, of course, represented. The Welkom group, Western Holdings, Blinkpoort and presumably Wit Extension mines will be under the technical and administrative control of Anglo-American, which is represented directly or indirectly in almost all OFS ventures of consequence. Free State Development is under the control of Johannesburg Consolidated.

It is too soon yet to reach any conclusion about future milling capacity or effective crushing grades. But, on present indications, the expert view is that most of these mines should support a plant of 150,000 tons per month, indicating a total capacity of the field, so far as can be supposed at present, of say 20 million tons per annum. Blinkpoort is a rather smaller property, though much above average richness, while the two big Free State Development mines in the immediate vicinity of Odendaalsrust may be planned on the basis of 200,000 tons per month—following the policy of Johannesburg Consolidated on the Rand (e.g., Randfontein) of using big units.

As regards grade, there are no indications as yet except the notoriously misleading results of boreholes. It is, however, always diverting to guess—and, of course, tentative assumptions about grade have to be made before shaft-sinking is justified. As a working hypothesis, liable to be upset at any time by some new strike, informed opinion reads the signs on roughly the following lines: St Helena and the two Free State Development mines referred to above, 5 to 6 dwts.; the Welkom group, and Wit. Extensions 6 to 7 dwts.; Western Holdings Second Lease area and Blinkpoort, above 10 dwts. Interest in these two last-named properties is intense in view of the unprecedented strikes on the farm Geduld 697, on the boundary between the two properties, seen against the background of boreholes on the neighbouring Freddie's ground to the north and Welkom No 1 to the east. Geduld No 1 borehole, showing 1,252 dwts. over 18.4 in. on the Basal Reef, was naturally written down as a rather amazing fluke, but the result assumes a different complexion in the light of the two important strikes announced in recent months. Geduld No 2, 4,000 ft. distant to the SE of Geduld No. 1, gave 1,904 dwts. over 6.58 ins.; and Rietpan No. 2, 6,000 ft. to the NW, gave 124.8 dwts. over 8.7 ins. All mathematical probability now points to an exceptionally rich deposit in this area, and the eyes of the mining world are on the progress of the hole now being drilled about a mile to the south—Friedscheim No. 511, which, though now stopped for a brief period owing to a mechanical defect, should before long reach a depth at which the Basal Reef intersection might be made. A negative result here would have but limited local significance; and,

while the man in the street is toying with the chance of another fabulous value, the technical observers are more concerned to gain further confirmation of the regularity of the structure.

It is clear that, whatever natural problems may be met in the course of exploitation, the new field has had, or has in prospect, great advantages over any mining region developed in the past. Geophysical prospecting not only guided the location of boreholes but will also help in siting shafts; close relationships between the controlling houses have permitted a give-and-take policy in dividing up claim areas so as to ensure the most logical divisions: a-1 siting of the mines; and modern underground layouts are being devised to maximise operating efficiency. Many costly errors in the development of the older portions of the

Rand are thus being avoided. But a similar advance is being shown in the policy of the authorities in the general development of the area. They, too, have behind them the experience of the early days of the Rand. The Union Government is to introduce legislation providing for control of use and sub-division of land in the area, and an interim controlling authority has been appointed in conjunction with the provincial administration. The mining areas are situated in a hyper-endemic plague region and the Department of Health is taking steps to prevent rodent infestation and the growth of conditions likely to foster trouble. More positively, an Act has been passed providing for the con-

struction of a railway line from Whites to Odendaalsrust which will be the urban centre for the mines. This line is expected to come into operation by the end of this year. Water is being provided for by the construction of a pipe-line by the Government from the Vaal River to a reservoir from which the mining companies will draw their supplies. This supply is planned to be available in 1949, and in the meantime the moderate needs of the companies during the earlier stages of development will be provided by pumping surface water by diesel engine. To meet the situation in later years, when large-scale operations should be in full swing, the Government is considering raising the level of the Vaal Dam and laying a second pipe-line.

The recruitment and housing of natives for mining—and, not less important, for urban and ancillary activities generally—have received wide attention. Sir Ernest Oppenheimer at the 1946 meeting of the Anglo American Corporation emphasised the great saving of unskilled labour in the mines which can be effected

by mechanisation, pointing out that it is the older mines of the Rand, which are gradually dropping out, that require comparatively the greatest number of natives. He foresaw that, if mechanisation is applied to the fullest extent, the industry will become less dependent than it is to-day on a plentiful supply of unskilled native labour. However, because of the supply problem alone (i.e., housing, feeding, etc.) it will apparently be necessary to continue to rely on the compound system for a large part of the native labour required, although the creation of native villages is envisaged as a long term aim. The recruitment of European labour will also take time and care, but will be eased by immigration. By and large, inasmuch as the labour requirements will increase largely only when the main shafts have been sunk, there is sufficient time to lay plans well ahead. This gives a reasonable assurance that commercial exploitation of the gold-bearing deposits will at least not be seriously impeded by labour shortage.

Development Area Policy

THE report of the Select Committee on Estimates on the administration of the Development Areas is a timely, if somewhat limited, document. The committee was not concerned with the broad principles of industrial location, and such issues as the effectiveness of the Government's policy of "steering" rather than compelling new industry into the Areas, the use of building licences to encourage new development, the improvement of amenities and communications and the type of areas to be scheduled, are not considered. Its main purpose was to examine the detailed day-to-day administration of the Distribution of Industry Act. This Act has now been in force for nearly two years, and a review of the progress made in bringing new industries to the old depressed areas is therefore opportune.

The present position is, frankly, disappointing. As the committee points out, "the progress made in factory construction gives some cause for concern." It recognises that exceptional difficulties and shortages have been encountered, which could not have been foreseen when the Act was passed. But, if progress is measured in terms of actual "jobs found" in new industrial enterprise, compared with total potential employment to be provided in the Areas, there would certainly seem to be very real cause for concern.

By March 31, 1947, 3,257 people—1,368 men and 1,775 women and 108 juveniles—had been found employment in factories provided under the Distribution of Industry Act. This compares with a total potential employment of 242,100 intended to be provided in schemes under the Act. Over half this total potential employment is scheduled to be provided in new factories built or planned since the end of the war; the remainder in factories built by the Commissioners for the Special Areas before the war, in converted Royal Ordnance factories and other Government factories and war-time "standard" factories.

The actual and the potential employment in the four main Development Areas, is shown in the following table:—

	No. of Factories	Actual Employment				Potential Employment
		Men	Women	Juveniles	Total	
North East	11	511	536	11	1,058	72,200
West Cumberland	5	109	94	52	255	8,900
Wales	18	555	777	...	1,332	81,300
Scotland	8	193	368	45	606	72,700
Wrexham	42	1,368	1,775	108	3,251	235,100
South Lancashire	...	...	...	...	...	5,200
	...	...	...	...	...	1,800
	...	...	...	...	...	242,100

Another indication of progress can be seen in the trend of the unemployment figures. These relate to the Ministry of Labour Region, which are wider than the scheduled areas, but in every case the bulk of the industrial population is contained in the Development Area. The national level of unemployment in mid-April was 423,759 or 3 per cent of the total insured population; in the London, South Western and Midlands regions the proportion was only 1½ per cent. In the Development Areas, however, it was much higher. For Scotland, the unemployment total was 76,948 and the proportion 4½ per cent; for Wales it was 55,095 (7½ per cent); and for the Northern Region, 49,730 (5 per cent). By comparison with pre-war totals, these are encouraging figures. But the contrast they present with the rest of the country is disheartening. The full employment which rules elsewhere has obviously not invaded the former depressed areas.

Contrary to earlier expectations, the slow progress towards the employment targets does not seem to be attributable to reluctance on the part of new industry to settle in the Development Areas. The inducements offered by the Government in terms of factory space and financial aid are proving effective in attracting firms, and in many districts, there are more applicants for entry than can be accommodated. There is a danger, however, that the slow building progress, by compelling firms to wait in any case before they can start production, may lead them to defer their plans altogether, until building supplies become more generally available and they can build on a site of their own choice, rather than on one selected by the Board of Trade.

The delays in factory construction are, of course, wholly due to the universal shortage of building materials, particularly steel and timber. But the evidence given before the Select Committee suggests that, even within these physical limitations, progress has been hampered by inadequate co-ordination, lack of clear directives, and insufficient planning of the most economic and effective use of the limited supplies of materials. There also appears to be unnecessary duplication of effort between the Board of Trade and the trading estate companies. It is difficult to see, however, how some overlapping could be avoided, in view of the Government's decision to concentrate new employment in the trading estates, making the Board's trading estate companies responsible for local administration as the Board's agents. The committee's own suggested solution is that the companies should receive block grants, and should be given wide discretion, subject only to control on general matters of policy.

Another criticism which may be pertinent, but is somewhat

academic in the light of Government policy and the accomplished facts, concerns the conversion of Royal Ordnance Factories into trading estates. In some cases, the buildings may be highly suitable and conveniently situated. In others, they have been built for specific warlike purposes and are not readily adaptable for individual factory units for peace-time production, while they were located for defence reasons and are remote from centres of population. There is obvious justification for the committee's suggestion that the use of Royal Ordnance factories deserves fuller investigation. In the meantime, however, they are providing a nucleus for industrial development which otherwise would be long-impaired by the acute shortage of factory space.

★

The problems of the Development Areas will perhaps be seen in better perspective if related to the specific issues which have been arising in one of the areas—the Northeast coast. Fundamentally, the Development Areas face the same problems. They all depend, basically, on the prosperity of their heavy industry, whatever measures may be taken to provide a "cushion" of light industry. For an indefinite time, unemployment in the mines will present no problem, but measures to rationalise and raise the efficiency of the mines, shipbuilding, iron and steel and heavy engineering must in time create an unemployment problem. Already, on the Northeast coast, the elimination of surplus shipbuilding capacity on the Tyne and Wear is creating a pool of unemployment. In all areas, the chief problem is to provide work for the male unemployed, and to encourage the industries which will employ men rather than women. The tendency so far has been to attract light engineering and consumer goods industries mainly employing women. There is, admittedly, a large potential field of women's employment: before the war, women in the northern region were only 12 per cent of the insured population compared with 22 per cent for the country as a whole. Even so, it has been necessary to tell firms wanting to settle on the Team Valley estate that they can do so only if they will employ men.

Of the Development Areas of Scotland, South Wales and the Northeast coast, prospects for the Northeast area are the most encouraging. That does not mean that the area faces no real

difficulties, but its present level of unemployment is not regarded as unduly serious. In March, at the end of the fuel crisis, the figure for the whole Northern area, including Cumberland and the North Riding, was 69,614. Owing to the proximity to the coalfields, the Area did not suffer from fuel shortage or from the same need to shed electricity load as in other industrial areas; but production was inevitably dislocated as a result of the interrupted flow of supplies from the affected areas, and building was virtually at a standstill.

Two aspects of the Northeast Development Area can be regarded as reassuring. First, although most of the employment which is being provided on trading estates is in the production of light consumer goods, there are developments which are definitely related to the needs and character of the basic industries. A factory producing mining machinery on the Team Valley estate is working round the clock to supply the needs of the Northern coalfields. There are hopeful developments in the electrical industry and in the chemical industry. Teesside, now included in the Area—though formerly excluded from the old special area—will benefit not only from the plans for expansion of Imperial Chemical Industries, but from the attraction of firms whose activities are related to the production of chemicals.

The second factor is that industrialists, trade unionists and local interests generally have shown a remarkable degree of enterprise and cooperation in furthering schemes for industrial development. The activities of the North Eastern Development Association have undoubtedly been useful, not only in making factual surveys on which to base development plans, but in carrying out these plans.

Altogether, in the Northeast coast region, there is some reason to hope that the development plans can be brought into effect within the next twelve months and unemployment kept within manageable proportions—given a reasonable supply of building materials. That, of course, is a fairly large assumption, but it may be that, as a result of the Select Committee's report, higher priority will be given to schemes for factory construction in the areas. At this stage, unfortunately, it is difficult to be at all optimistic about the Development Areas of Scotland and Wales.

Business Notes

Drafts on the Dollars

The dollar problem continues to dominate the international scene. Comments on it have come this week both from Mr Dalton and Sir Stafford Cripps. The Chancellor disclosed that of the \$500 million drawn by Britain on the US loan in the first quarter of this year, \$70 million was required for purchases for the British zone in Germany; and Sir Stafford Cripps, in a speech to the National Federation of Women's Institutes, gave a stern warning—"when the dollar loans are exhausted, as they will be before very long, unless we increase our exports we shall have to cut imports to two-thirds of what we are now importing, and the effect of this on our food supplies would be disastrous." and the effect of this on our food supplies would be disastrous." The figures show a record level of imports for that month, while the geographical analysis discloses a larger trade deficit with hard currency countries in the first quarter of this year—£116,400,000, compared with £109,000,000 in the previous three months.

The accelerating rate of British drawing on the US line of credit can be seen from the table in next column.

The weekly rate of drawings has been steadily increasing to £16 million, this latest figure being calculated on the assumption that the next instalment of £50 million will be drawn on or about June 10th. Mr Snyder has announced from Washington that by June 30th, £487½ million of the line of credit will have been withdrawn, and, on this no doubt well-informed assumption, the timing of the remaining £50 million instalment may be tentatively placed in the first or second week of June. At the latest rate of

withdrawals, the remaining £500 million would last for about 31 weeks from the date of the next drawing, so that the whole credit would therefore be exhausted by the first few weeks of 1948. That may be too alarming a view to take—though it seems to be borne out by the latest indica-

	Amount Drawn	Weekly Average
	£ million	£ million
1946		
July 15th to Dec. 31st	150	6.3
1947

May 14	50	16.0
April & May	162½	
Total	437½	
Unutilized portion of credit	500	

tion of the hard currency deficit. Within the next few weeks, however, the Government must surely take drastic measures to save hard currency expenditure on current payments. There is also a chance that the terms of trade may begin to move in,

Britain's favour, though recent hopes of a crumbling of farm produce prices in the United States have been disappointed again in the last few days. Against these favourable factors it must be assumed that the extension of "expendability" of current sterling after July 15th will cost something more than "expendability" is costing to-day. On present indications, therefore, the Government should base its plans on the assumption that the dollars will, for all practical purposes, have given out in the first quarter of next year—just as British industry may be emerging from its second fuel crisis.

There have been many rumours that plans are already afoot for raising a second loan from the United States. The rumours are probably as true as those that the British General Staff has plans for waging war against a number of countries with which this country is now at peace. That kind of planning is, or should be, part of the normal routine of "preparedness" and the experts at the Treasury, the Bank of England and the Foreign Office would be very remiss if they saw no further ahead than the first quarter of 1948 in planning the foreign exchange ways and means situation. But to proceed from this to an assertion that there is an intention to embark on early negotiations for another dollar loan is to step well beyond the range of probability. There appears to be no such intention. It seems probable that in high quarters the dollar problem is now conceived not in national but in international terms. That seems to have been the gist of Sir Wilfrid Eady's message to the Canadians on his recent visit to Ottawa and the understanding echo which it awoke in that capital can be gauged from the rapidity with which Mr Graham Towers, Governor of the Bank of Canada, decided to visit Britain to continue discussions of this common problem. If the dollar crisis is destined to overwhelm the greater part of the world in the latter part of the year, the answer to the emergency must be something more comprehensive than another dollar loan to Britain. Such a loan, in the prevailing circumstances, with sterling a convertible currency, would be merely funnelling an inadequate supply of US dollars into the large terrestrial dollar deficit, with Britain standing guarantor for the debt. That is not an attractive proposition—but neither is the alternative of a vicious tightening of British and other belts later in the year.

America and the Market

Until the end of last week the stock markets, at least in terms of price movements, had seemed oblivious to the dollar crisis, the evident troubles of industry, and the discrimination against equities contained in the budget. The rise in equities, which had been resumed towards the end of March, had by then carried the old index of *The Financial News* to within 2½ per cent of the post-war peak, a rise of over 5 per cent from the pre-budget level. This rise owed nothing to a change in the rate of interest, for the gilt-edged index was virtually unaltered on the period. The explanation is to be found neither in this nor in any narrowing of margins between the return on fixed interest and equity shares. The yield on the shares composing the index was 3.83 per cent at the bottom of the slump in mid-February, 3.80 per cent on the eve of the budget and 3.85 per cent a week ago. The operating factor has been the rise in dividends. It is more difficult, however, to justify the implied optimism, in assuming that these increases would be a permanent feature and basing a rise in values upon them.

It is a curious irony, too, that the turnaround in markets has come just at the time when there is a fair accumulation of evidence that the effects of the power cuts and the fuel shortage may be somewhat less marked than was commonly feared. The popular belief in market circles—and it may be well-founded—is that the long-expected setback is due in the main to developments outside British industry. The view is, of course, supported to some extent by the fact that the whole of the market, with the partial exception of the Funds, has weakened. There is at least a growing realisation that British industry, and the income of equity holders, can no longer be divorced from developments in the world at large. The rapid exhaustion of the dollar credits, the daily emphasis upon the many problems loosely associated with July 15th, the statement of the Chancellor on the sterling balances (produced with his usual flair for the theatrical), the talk of the end of the sellers' market, particularly in South Africa, and, most of all, the fall on Wall Street and the stories of an incipient American slump—all these have combined to awaken the market to realities. The selling so far is little more than profit-taking, although there is some evidence, in a diminished volume of enquiry, that it may induce a healthier attitude. The extent of the fall at its worst was some 2.2 per cent. At the moment it appears to be halted, but it will be surprising if, once

started, it is not carried to a point at which yields are more attractive than the present level of 3.92 per cent.

"Consolidating" Cheap Money

In all his references to cheap money now, Mr Dalton is careful to avoid forecasts of the "up-and-up" variety which were common form during last year's offensive. Indeed, in the debate on the Second Reading of the Finance Bill on Monday, he gave the clearest indication yet that the authorities have at present no intention to resume the pressure. Justifying his indifference, in the 1946 Budget speech, to the rising level of floating debt, the Chancellor declared that he was not dismayed by it—

because we were then carrying through the cheap money drive with the object of arriving at a basis of 2½ per cent long-term. We have got that. Later, we may advance towards other objectives, but at the moment we are consolidating the 2½ per cent long-term.

If we are in position to consolidate 2½ per cent long-term and also gradually to reduce the floating debt through a Budget surplus, then, indeed, we are getting the best of both worlds, and we are very well content. Therefore, we have now reached a point where a reduction in the floating debt is a very desirable subsidiary process to what we have been carrying on in the reduction of long-term interest rates. I hope that by the end of this financial year we shall have seen both a firming-up of the 2½ per cent long-term rate and also a reduction of the floating debt.

This very frank statement of policy does in fact align very closely with the interpretation which has lately been current in informed City circles. Nobody expected the authorities to take any extreme measures to try to restore the position which obtained before the fuel crisis, but equally nobody would be surprised if Mr Dalton tries to thrust out further minor salients whenever the opportunity arises.

Relief for Local Borrowers

In the meantime Mr Dalton is contenting himself with seeking out every opportunity to extol the benefits of his policy. The decision, recorded in a note on page 793, to relieve borrowers from the Local Loans Fund from interest charges in excess of 4½ per cent, is no doubt right and sensible, but the Chancellor really goes too far when he presents it as "a further practical example of the benefit to the nation of cheap money," and implies that this is a first-fruit of the ill-starred Local Loans conversion. The relief, affecting roughly £105 million of local authority loans, will cost about £15 million. With curious disregard of arithmetic, almost every Press report this week has implied that this distribution of largesse derives from the saving produced by the replacement of £429 million of 3 per cent Local Loans by 2½ per cent Treasury stock. In reality—as the official statement did admittedly reveal—the money comes from a surplus of £20 million accumulated in the Local Loans Fund, and merely including actuarial credit for the prospective saving. The power to disburse all but £5 million of this sum derives from the Finance Act of 1935, but the release was contingent upon the conversion of Local Loans stock. It is only in this remote and technical sense, therefore, that the concession can be said to flow from a cheap money policy.

The Chancellor was, of course, on somewhat firmer ground in claiming that, in the absence of cheap money, the level of Government expenditure, about which the Opposition complained, would have been even higher. In one sense that is a truism, but it is too often overlooked that the real savings from conversion operations derive only from reductions in rates of interest on securities effectively held by the public, as distinct from banks and Government agencies. The true saving from the operations of the past 18 months is certainly much less than will be shown in the Exchequer accounts, and even that has been achieved only by a strategy which compelled the Treasury to enable the banks to substitute high-yielding long term securities for floating debt. Mr Dalton, reversing the theory enunciated in last year's Budget speech, now regards reduction of the floating debt as "very desirable." It will be hard indeed to combine funding operations with adherence to the cheap money theories by which he has so far been guided—and harder still to reduce the overall cost of the national debt simultaneously.

Budget Accounting—A Plea for Realism

The Finance Bill debate itself was a real disappointment. The importance of the Bill inevitably resides in its detail, and examination of that awaits the Committee stage, to be taken after the recess. But this year there seemed a chance that the Second Reading would be made the occasion for worthwhile debate on a really vital issue—the role of financial policy in this post-war

economic crisis. The attempt to make it so misfired badly. With the return to peacetime techniques in Government finance—and to the tricks of subterfuge so beloved of Chancellors between the wars—discussion of the Budget is fast degenerating into nauseating wrangles about mere book-keeping. This week both Ministers and leading Opposition spokesmen became embroiled anew in fussy arguments about the unreality of Mr Dalton's surplus. It is so obvious, as *The Economist* showed a few weeks ago, that there is no surplus in any sense which can have economic significance, that the book-keeping definition is not worth further attention.

Yet realistic accounting is indeed a necessary pre-requisite of clear-headed policy. This week Mr Glenvil Hall, with a spurious air of pursuing lofty principles, echoed the attempt in the Budget speech to rely for a defence of its accounting upon the distinction between expenditure which does and does not create capital assets. The Treasury in fact never succeeds in drawing that line neatly, and no doubt it would be valuable to have it so drawn, just as it would be valuable (especially in this transition phase) to have a parallel set of accounts distinguishing plainly between recurrent and non-recurrent items—the two groupings would not, of course, be co-extensive. But the essential principle, which never seems to have been coherently stated in the House, is to divide the whole range of Government receipts and payments (whether above or below any of the possible "lines") between those which may be presumed to have "real" economic significance and those which are nominal or passive. The distinction in principle is very simple: the test is whether Government disbursements will or will not create (or be likely to create) a demand for goods and services on the part of the recipients, and whether Government receipts will or will not represent a curtailment of such demand. Admittedly, in a minority of cases the distinction will be conjectural, and also a classification which is right on a six months' view may not be right for a twelve. The lack of precision makes such a form an unsatisfactory substitute for the formal Exchequer accounts. But until the national accounts are presented on some such "economic" basis as this—in addition to whatever purely book-keeping statement the Treasury chooses to adopt—it will never be possible to relate the Budget to the national economy as a whole on the modern principles to which the Chancellor pays ostentatious but quite barren lip-service.

That "Scintillating Diamond"

Lacking such an approach as this, the Opposition this week inevitably became bemused in the book-keeping labyrinth. And the few good points made on the plane of high policy—such as Captain Crookshank's comment that, though borrowing might indeed be confined to creating capital assets, the Government might try to create more than could properly be financed by the savings available—were never driven home.

On the plane of detail, rather more progress was made; but only the Committee stage will clear up those "mysteries" which, Mr Glenvil Hall's confident statement notwithstanding, still remain in the Finance Bill. This "scintillating diamond" certainly has many more dull facets than the Member for Blackley perceives. But it is refreshing to find two prominent supporters of Mr Dalton assailing his pet policies. Mr Jay was "shocked to discover"—it is a belated discovery—that bank deposits have risen by £800 million in twelve months, and thinks the cheaper money policy ought to stop: his "advice to the Treasury would be that they should think a little more in future about the volume of bank deposits and a little less about the rate of interest." And Mr Diamond, though obviously embarrassed by Opposition approval, gave one of the best exposures yet of the stupidity and fallacies inherent in the bonus issues tax, even disputing the logic of the purely political motive which is the only conceivable reason for it. When a Government supporter can refer to the Chancellor as "Black Max of the Bonus Tax," city spokesmen for the Opposition must look to their laurels.

Brazil Sterling Talks

The discussions between representatives of the British and Brazilian governments on the problem of Brazil's sterling balances are drawing to a close. A fortnight ago the first objective was reached when Brazil undertook to resume quotations for sterling and to buy that currency. Since then the Bank of England has published a selling rate on Brazil and trade between the two countries has ceased to be hampered by the unwillingness of the Bank of Brazil to acquire additional sterling. When this agreement was made, it was confidently regarded as indicating considerable progress towards the second stage of the negotiation,

... but a cheque is better!

No great harm is done if a properly drawn cheque goes astray, but when cash is lost, the results may be serious. In these days, an account at the Westminster Bank is not simply a pleasant conceit—it is a very real necessity. To the man of moderate means it makes a special appeal, for not the least of its advantages is the peace of mind which comes from the certain knowledge that one's money is completely safe. The Manager of any local branch will gladly explain the many ways in which the Westminster Bank can be of service.

WESTMINSTER BANK LIMITED

The prosperity of the Gold Coast has largely been built up on its exports of cocoa and gold. These two industries still head the export table, but recent trade figures show that production and exports of manganese, bauxite and timber have greatly expanded under the impetus of war-time requirements.

The gradual change-over to a peace-time economy with its varied demands may well bring about further changes in the commercial activities of the Gold Coast. Modern commercial development calls for careful and continuous study of local market conditions. Full and up-to-date information, backed by an intimate knowledge of the Colony, is available to merchants and manufacturers interested in trade with the Gold Coast.

BARCLAYS BANK
(DOMINION, COLONIAL AND OVERSEAS)

HEAD OFFICE: 54 LOMBARD STREET, LONDON, E.C.3

namely the status to be given to Brazil's accumulated balances, amounting to about £65 millions, and the rate at which these should be liberated. Agreement on this point is about to be reached. It is still not certain whether Brazil will respond to the invitation of Mr Dalton to cancel part of her claim outright, but it is widely understood that a short-term agreement, probably covering the next five years, will envisage the liberation of about one-tenth of Brazil's accumulated balances over that period. Moreover, current accruals of sterling to Brazil will be freely expendable. Agreement on these points being reached, it is probable that Mr Machado, representative of the Bank of Brazil, will return home. That leaves unsettled the question of the sale to Brazil of British-owned public utilities and railways in that country. It is very doubtful whether discussions on this aspect of the problem ever reached any very concrete or precise stage.

The subject was bound to be mentioned in discussions of the future of Brazil's accumulated balances, but it is questionable whether Mr Machado had any power or authority to engage in detailed negotiations for the acquisition of these assets. The impression has emerged from the discussions that Brazil is at the moment a most unwilling buyer and would much prefer to have her accumulated balances available to purchase the new equipment and machinery which she needs. Rash and unfounded rumours about the detailed progress of alleged negotiations for the sale of these utilities had led to considerable speculative buying of the securities in question on the Stock Exchange. The corrective slump duly occurred this week when it became evident that there was no immediate likelihood of a sale and that the chief Brazilian delegate was returning without going into the details of such a deal.

Progress in Steel

A valuable and detailed account of the progress made to date with the iron and steel development plan was given this week by Mr R. M. Shone, of the British Iron and Steel Federation, in an address to the Royal Statistical Society. His figures bring together, for the first time and in a convenient form, the actual schemes submitted by the industry for the approval of the Iron and Steel Board. Some of the salient figures are reproduced below.

The British Iron and Steel Federation's plan, submitted last year to the Government, estimated a total expenditure of £168 million at 1945 prices for the industry's post-war development and modernisation programme. The whole work was to be started over a 5-year period and completed in 7½ years. So far, schemes to cost £140 million have been submitted in detail to the Iron and Steel Board. Approval in detail has been given to projects costing £90 million and these are now under construction, while a further £35 million has been approved to be spent on schemes which are temporarily held up by lack of materials. But, although the value of schemes submitted represents about 83 per cent of the original £168 million, a tonnage basis discloses—as the table below indicates—that only some 65 per cent of the actual schemes envisaged in the plan have reached this stage. Adjustments to the original plan and increased prices of equipment account for the difference between value and volume. Mr Shone, estimates that the whole plan will cost about £200 million at current prices.

	Total Schemes submitted by the Industry	Total in the Original Plan
Steel ingot capacity (tons).....	4,148,000	5,835,000
Blast furnace capacity (basic & hematite) (tons).....	2,775,000	4,750,000
Rolling mill capacity (tons)	3,700,000	5,450,000
Total.....	10,623,000	17,035,000

Examination of the schemes submitted shows that steel ingot capacity plans have reached 71 per cent of the original total, rolling mill schemes 68 per cent and blast furnace capacity 58 per cent. Priority has been given to those schemes which will yield quick benefits. And since expansion of steel capacity is an obvious pre-requisite of expansion in the later stages of production this probably accounts for the relatively greater progress in formulating detailed schemes for expanding steel ingot and rolling mill capacity. The 4,148,000 tons of steel capacity includes, for example, the new steel works at Margam in South Wales, the output of which will be necessary to feed the proposed new continuous hot-strip mill.

Dollar requirements for the whole scheme have also had to be revised upwards. Instead of the original estimate of £9 million of American equipment, as much as £15 million worth

is now required. This equipment must clearly secure a high rating among the claims on this country's limited dollar resources in order to increase the iron and steel industry's export potential. Failure to obtain American equipment on an adequate scale would put key sections of the programme back as much as four years.

April's Export Recovery

Exports from the United Kingdom during April, though obviously strongly influenced by the winter's crisis, showed a welcome recovery. The total value of £82.7 million was slightly higher than the March figure of £82.6 million, despite the effects of the Easter holiday. There were, however, slightly higher exports by Unrra and for the Naafi compared with last month. On the basis of 26 days as a normal working month, the trend of exports during the last nine months has been as follows:—

U.K. EXPORTS (£ Mn.)					
Aug., 1946 .. 78	Nov., 1946 .. 92	Feb., 1947 .. 82½			
Sept., 1946 .. 74	Dec., 1946 .. 90	Mar., 1947 .. 82½			
Oct., 1946 .. 87½	Jan., 1947 .. 88	April, 1947 .. 89½			

The volume of exports for April has been provisionally estimated as 98 per cent of 1938 volume. This is the same as March, but it shows an improvement over February, when the volume was only 92 per cent. Exports of machinery reached a record figure of £14.3 million and accounted for one-fifth of all exports of manufactures. The tonnage was 48 per cent higher than the monthly average for 1938. The chief destinations were the Soviet Union (which took 22 per cent of the total), British India, the Union of South Africa and Argentina. The second largest item was vehicles, which amounted to £11.5 million—a substantial recovery from the low level of February and March. Textiles showed a marked reduction, which was no doubt due, in part at any rate, to diversions of cotton yarn and wool tops to the home market in order to relieve the shortage caused by the fuel crisis. Re-exports for April amounted to £6.7 million, of which £2.5 million was accounted for by rubber (the largest single recipient being Italy) and £1.6 million by wool.

Imports during April reached the very high level of £147.1 million, exceeding the March figure by £17 million and the monthly average of the first quarter by £26 million. The value of retained imports (£140.4 million) was the highest recorded since July, 1920. Retained imports of food, drink and tobacco were the highest on record, and represented more than half of the total, whilst raw materials were the highest for 22 years. The main items in the food group were meat (£13.6 million), dairy produce (£9.9 million) and grain and flour (£9.7 million). Of the raw materials, seeds and nuts for oils totalled £12.2 million and raw cotton, including cotton waste, £9.5 million.

The April trade figures certainly explain the official anxiety about the balance of payments position. Large shipments of food came from the western hemisphere while exports still appear to be going mainly to soft currency areas. During the first quarter of the year the value of imports from hard currency areas reached £173.3 million or £3.6 million more than in the preceding quarter, while supplies from other areas fell by £9.6 million to £190.5 million. The United Kingdom continues to import nearly one-half of her supplies from hard currency areas compared with one-third before the war. Total exports to hard currency countries amounted to £56.9 millions—a rise of £1 million compared with the previous three months, while those to other countries fell by £13.2 million to £211 million. The British trade deficit with the hard currency areas has risen steadily over the past nine months, being £109 million in the third quarter of 1946, £114 million in the fourth quarter and £116 million in the first quarter of 1947.

The Voice of Wall Street

Mr W. Randolph Burgess, vice-chairman of the Board of the National City Bank of New York, spoke to the American Chamber of Commerce in London this week on some of the economic problems that face the United States, and in particular on the question of US foreign lending. Since the influence over US economic foreign policy is increasingly leaving Washington and returning to New York, the views of Mr Randolph Burgess, who is now the main spokesman for the commercial banks of the United States, deserve the closest attention. He recalled the beating which America took in her foreign loans after World War I, quoting, significantly,

"Neither a borrower nor a lender be
For loan oft loses both itself and friend
And borrowing dulls the edge of husbandry."

Finally, he turned to the experience of Britain in its hey-day as a foreign lender to provide a guide to the United States. In British experience he purported to find five secrets of sound foreign investment: Britain exported her men with her money and allowed no absentee landlordism about her investments; British banking and insurance followed and serviced British business; the Government stood behind the British trader and investor; the world was relatively free of restrictions on the movements of men, money and goods; in general, the investments were well chosen and profitable. At least one of these discovered secrets will come as a surprise to this country, namely the assertion that the British investor has in the past had the support of his Government. Save for a comparatively brief Palmerstonian episode it will be difficult to substantiate this claim. But surely Mr Burgess, in his search, missed the most important secret of all, and that which has most relevance to the United States to-day, namely that Britain was prepared to accept in goods and services from the rest of the world the annual service on her overseas loans. It has yet to be seen that the United States is ready to do the same, and some of the recent proceedings at Geneva are not of hopeful augury in this respect.

Mr Randolph Burgess was therefore decidedly cautious in his estimates of what the United States might lend to other countries. He saw considerable scope for direct investment by American business, but very little for open market bond issues to foreign Governments. The small and only moderately successful beginning which has been made with loans to Australia and Norway bear out this estimate. As regards the new official institutions, Mr Burgess emphasised that the International Bank would be "satisfactory management" and that its loans would be "prudently" made—a note of ominous restraint.

It was to America's domestic problems that Mr Burgess brought back the attention of his hearers, namely the \$260 billion to which the national debt had been "blown up," the budget of \$37½ billion which was "out of control" and at which Congress was now chipping away. He reminded the rest of the world that they ought to be as much interested in American stability, which he implied was being achieved by this chipping away, as in American loans. Mr Burgess anticipated an early decline in business in the United States. If his comments on foreign loans truly reflect American policy on this subject, his prophecy is certain to come true and on a somewhat more spectacular scale than that which he envisaged in his speech.

Second Five-Day Week

Coal output figures for the week ended May 17th show an increase over the previous one, the first five-day working week for the industry. Provisional figures, issued by the Ministry of Fuel and Power, show that 4,056,800 tons were raised, compared with 3,756,100 tons in the previous week and 4,108,300 tons in the week ended May 3rd, the last six-day week. The table below compares the tonnage of deep-mined coal raised, by regions, in the first two five-day weeks. It is quite clear that the improvement over the first week has been due to the end of the strikes in the Durham and Lancashire areas and to the recovery in Scottish output after the spring holiday.

	Week Ended 10th May	Week Ended 17th May	Change on the Week
	Tons	Tons	Tons
Northern	644,400	745,600	+ 101,200
N. Eastern	808,600	810,300	+ 1,700
N. Midland	719,700	715,900	- 3,800
N. Western	255,100	276,000	+ 20,900
Midland	362,200	360,400	- 1,800
Wales	463,000	462,600	- 400
Scotland	275,100	448,000	+ 172,900
Kent	28,600	28,500	- 100
Total of deep mined	3,556,700	3,847,300	+ 290,600

Absenteeism figures are now available for the first five-day week. Total absenteeism was 8.1 per cent, and of this only 3.2 was voluntary. In the week before, total absenteeism was 13.7 per cent. Over the same two weeks, output per manshift rose from 1.05 tons to 1.07 tons.

These results are encouraging, but if the success of the five-day week is to be judged, as it should be, on the industry's ability to increase coal output and not merely to stop it from falling, there is still a need for substantial improvement. The official target reduced to a weekly average lies about halfway between the figures achieved in the first and second five-day week. Next week will bring the Whitsuntide holiday week-end, and the summer holiday season is approaching. The five-day week figures

of production already show what inroads public holidays can make on the slender safety margin which exists if even only 200 million tons are to be mined this year. A greater effort is still required if a summer seasonal fall in output is to be satisfactorily cushioned. Mr Shinwell has asked for a further 250,000 tons a week. To achieve this extra tonnage, the industry will have to rely on increased manpower. Recruitment figures for March and April were encouraging, but men take time to train and time is short. The present indications are that this extra output might be built up—but only slowly as the year proceeds. It is to be hoped that substantial progress will be achieved by October-November, when industry's summer stock building period comes to an end.

Building Societies and Tax

A good deal of discussion has taken place recently about the possibility of a revision of the arrangement which the building societies have with the Inland Revenue for the payment of a special "composite" rate of tax on their profits—an arrangement which relieves shareholders and depositors of the societies from further liability to pay income-tax on the interest they receive. It can now be said that the whole position is indeed being reviewed by the Inland Revenue authorities in consultation with the societies, but some of the recent press reports are certainly premature and, even as forecasts of what might happen, are likely to prove wide of the mark. Although the first approaches to the problem were apparently made some months ago, it seems that no decision has yet been reached, and there is certainly no reason yet to suppose that the likely outcome may be an abandonment of the principle underlying the existing arrangement.

Under the terms of the agreement, the tax authorities are quite entitled to seek a revision, and it is easy to see why they should wish to do so. The arrangement naturally suits the building societies, but it is also a very great convenience to the Inland Revenue authorities, since it absolves them from the need to scrutinise for income-tax purposes the interest receipts of numerous building society members, many of which have total incomes falling below the exemption limit or taxable only at the reduced rates. The arrangement which substitutes a compounded rate of tax payable by the societies for the variety of rates which otherwise would be payable by individual recipients of interest should therefore be regarded less as an act of grace than as a commonsense business deal. As such, it was obviously intended to provide a composite rate—it is expressed as a percentage of the normal standard rate—which represented a reasonable approximation to the average of the rates to which the recipients would have been liable individually. If the underlying assumption was valid when the existing terms were agreed, it is most unlikely to be valid now, for the attractions which, as a result of this tax arrangement, building society investment presents to persons of above-average means have been accentuated by cheaper money. Surtax payers, in particular (though they are assessed to surtax on their "net" interest), secure an income-tax advantage which in principle is analogous to their benefits from holding savings certificates, but with the important difference that although building societies limit the amount of individual holdings, there are only practical limitations to the amount which an individual can place in the movement as a whole.

The authorities can quite properly proceed against this form of tax avoidance. It would be a pity, however, if the solution adopted were such as to penalise the genuine small savers which are the traditional basis of the building society movement. Any substantial increase in the composite rate—that is, in the proportion of standard rate payable—would have this effect, and yet could not wholly extinguish the differential gain by the surtax payer. If the authorities are pursuing only this fiscal objective, a more equitable approach would be to look to the income in the hands of the recipients and to put individuals with taxable incomes beyond a given level outside the benefit of the scheme. Though the extra administrative work involved in such a plan would be unwelcome, the authorities cannot have it both ways.

There is, however, some ground for suspicion that the fiscal motive is not the only element in the official approach. The Treasury, even before Mr Dalton's advent, has held curious views about the nature of savings, and shows more concern with specific targets and the precise form in which savings are held than with the real total of genuine savings. Now that interest rates have been cut on savings certificates, it may be that the authorities fear the building societies' competition with the National Savings Movement even more than they dislike their ostensible (but quite unreal) competition, via the large depositor, with gilt-edged. If

such ulterior, and quite illogical, motives were to play any significant part, it would scarcely be possible to devise an equitable solution, and the effects on the building societies might be regrettable.

Bank and Fund News

Interesting changes in the management of the Bank and Fund are in the news. From the Bank comes announcement that the British executive director, Sir James Grigg, is retiring and that his place is being taken by Mr Gordon Munro, the UK Treasury representative in Washington. Sir James was appointed for a period of a year, which has now expired. He may well have found the atmosphere of Washington somewhat too enervating for his boundless energy. He will find ample scope for his qualities when he returns to this country. The change in British representation of the Bank is of some general interest in that it represents another departure from the principle of full-time executive directors on both Bretton Woods institutions, since Mr Gordon Munro will continue to represent the UK Treasury in Washington and will no doubt find that task very nearly a full-time job in the difficult months to come. The time he would be able to spare for the Bank will not, therefore, represent more than a small part of his work. He will be assisted, as was Sir James Grigg, by Mr Maurice Hutton, who, besides being alternate executive director of the Bank, is head of the British Food Mission in Washington.

The large void left on the Board of the Monetary Fund by the departure of Dr Harry White is about to be filled, and reports from Washington suggest that the new US Executive Director will be Mr Overby, assistant to Mr Snyder, Secretary to the US Treasury. It is probable that Mr Overby also will give only part-time duties to the Fund and will retain his position at the US Treasury. If this new appointment is made, it will contradict rumours which have been assiduously circulated in Wall Street that Mr Eugene Black, US executive director on the Bank, would also fill the same role on the Fund. For some time past there has been a campaign waged by commercial bank interests in the United States to have the Bank and Fund merged into one institution, largely on grounds of economy. The case against such a merger, at least from the point of view of all countries other than the United States, is very strong, and it is reassuring in this respect to find that the thin end of the wedge will not have been introduced by appointing a common US executive director to both institutions.

The Cement Bottleneck

The report of the Committee appointed by the Ministry of Works to enquire into cement costs became available just as this issue of *The Economist* went to press. It is now five months since the Committee reported to the Ministry, and the contents of its Report, at first reading, suggests that there was little cause to delay publication. After reviewing the operation of the price- and quota-fixing arrangements in the industry, the Committee considers that profits earned have not, on the basis of capital employed, been excessive and that the price system is not unsound.

Some of the difficulties which will arise when an overhaul of the price-system is considered are dealt with in the chairman's statement circulated with the report of Associated Portland Cement Manufacturers, Limited, details of which are given in the *Records and Statistics* Supplement this week. Owing to losses of output in the early months of this year—in the first quarter of 1947 total UK production was 1,108,000 tons, in contrast with 1,854,000 tons in the previous quarter and 1,226,000 tons in the corresponding quarter of 1946—the Associated group is quite unable to forecast how nearly this year's output will match demand. The extent of the cement industry's dependence upon fuel—principally coal—is well illustrated by the fact that 53 per cent of the company's works costs is accounted for by fuel and power. Fuel conservation efforts have reduced calorific consumption by 6.85 per cent by comparison with pre-war but these savings have been offset by a decline in the quality of coal supplies. As available stocks of cement are now equivalent to less than a month's consumption, shortages of fuel, labour or bags are quickly translated into shortages of cement for the building and construction trades and road-making. The Associated Portland Cement group hopes gradually to reduce its dependence on coal by means of fuel oil installations, but in the meantime the lower level of cement production may contribute to such an increase in unit costs that cement prices may well be forced up. The Cement Costs Committee considers that the time for a review of prices "may well

have arrived", but it is difficult to read a definite meaning into its statement that the subject should be studied "with reference to the future price level."

Morris Motors Recovery

Foreign sales of British cars are so important a mainstay of the export drive that Sir Miles Thomas's informative statement—on behalf of Lord Nuffield—at the meeting of Morris Motors, Limited, is of particular significance. The motor industry is, of course, severely hampered by shortage of raw materials, especially steel and iron castings, and the Morris programme for manufacturing agricultural tractors has had to be suspended. Labour troubles, however, have for the most part been quickly resolved, and there has been a most encouraging recovery of vehicle production since the fuel crisis. Production of cars is, however, still below the pre-war level. Sir Miles gave no figures of recent exports, but the April trade returns showed a further welcome recovery. In value, Morris exports for the second half of 1946 were 570 per cent above pre-war, but there are already signs of more acute competition, and it is clear that only a combination of high quality and low prices can ensure continued large sales of British cars overseas.

Arrangements have been completed for assembly of some Morris products in India, and good progress is being made with similar arrangements for Australia, New Zealand and South Africa. On the vexed question of motor taxation, Sir Miles favours a petrol tax combined with a small registration fee, which would, of course, favour a larger car; but he believes that the major difficulty arises from the general level of taxation, by impeding production and sale at home of the type of medium-sized car which most overseas buyers want. In present circumstances, however, increases in exports which could be achieved only at the cost of parallel or even greater increases in production for the home market would not be economic from the national point of view, so that this all too familiar argument offers no solution. On the contentious problem of reducing the range of cars offered, Sir Miles was silent—he pins his faith to economies from bulk production of basic components for all the cars of the Morris group. New models will incorporate much technical progress, but for the present the group does not intend to sacrifice substance by prematurely changing designs. That is obviously wise.

"Shedding" Next Winter's Load

The report of the Joint Consultative Committee's sub-committee on electricity is principally an appeal to industry to prepare plans for reducing the electricity load next winter. The target to be aimed at, according to the report, is that the peak load should not exceed two-thirds of last winter's peak industrial load. The Committee gives warning that, unless a saving of this order can be achieved, industry will be threatened with a power crisis in 1948 far worse than that of 1947. Despite the measures taken to increase generating capacity, there will still be a wide gap between capacity and estimated peak consumption. Including new capacity, which represents some 600,000 kilowatts, generating capacity will not exceed 9.6 million kilowatts, in contrast with an estimated peak demand of some 12 million kilowatts.

Various means of achieving the required economies are suggested. These include the staggering of day-shifts, working a proportion of night-shifts, transferring to night-shifts processes which involve a heavy electrical load but comparatively few workers, the operation of rota schemes on a local or area basis, and the geographical grouping of industries to facilitate equitable sharing of the "shedding." The appointment by firms of "electricity savers", on the principle of the wartime fuel watchers, is also recommended.

Many of the changes in working arrangements, if adopted, will inevitably cut across trade union agreements. It is important that firms should lose no time in negotiating with the unions any new rates and conditions which may be necessary. Much of the trouble that developed when the Government originally suggested reducing the load by working night-shifts arose from lack of previous consultation with the unions. Arrangements which lead to the employment of women and young persons on night work may also involve departures from the Factory Acts. The Minister of Labour is inviting firms to submit suggestions for any modifications of the Acts required to fit in with their plans. It is a measure of the need for emergency measures to maintain the flow of industrial production this year that there may have to be, however temporarily, a retrograde step in factory working conditions.

There may be some disappointment that the committee has not given any clearer directives to industry about the shedding of next winter's load. On the whole, however, experience suggests that the best results are obtained when the general principle has been established and the working out of schemes is left to individual industries, with only broad guidance from the Government.

Higher Chocolate Prices

On Tuesday the Ministry of Food announced an increase in the price of cocoa butter from 1s. 7d. to 2s. 11d. a lb., an increase of 6d. in the price of cocoa powder, of 3d. in drinking chocolate and corresponding changes in the retail prices of chocolate and chocolate confectionery. The retail increases take effect on May 26th. There may also be price increases in sugar confectionery not containing cocoa, but these are likely to be only minor adjustments. These price increases will be partly cushioned by a reduction in wholesalers' and retailers' margins introduced since the sweet ration went up from 3 oz. to 4 oz. a week.

The increased pressure on chocolate prices has come mainly from the rapid increase in raw cocoa prices over the last two seasons. Before the war, chocolate manufacturers were used to contending with violent short-term fluctuations in raw cocoa prices, and were able to absorb them in their cost structure with- prices, and were able to absorb them in their cost structure with- out correspondingly wide price fluctuations in chocolate. But sustained pressure over more than one season, as in this case, necessitates a revision in manufacturers' prices.

During the war, raw cocoa prices were depressed. Cocoa was not an essential war commodity and production was not encouraged. Cocoa farmers in West Africa, which produces most of the world's second-grade cocoa, received about £13 a ton. First-grade cocoa comes from the West Indies, but is only a small fraction of the total world crop. Towards the end of the war, however, world demand for cocoa increased. In the season 1945-46, Gold Coast farmers received over £27 a ton at up-country buying stations from the West African Produce Control Board, which fixes the price paid to farmers from season to season. There were corresponding advances in the price of Nigerian cocoa. Except for an ephemeral burst of prosperity in 1936, this price was the best received by the farmers since 1929.

Last year, the OPA price ceilings were removed in the United States and cocoa prices in New York, which is the leading world cocoa market, rose steeply. The West African Produce Control Board, which sells cocoa at the world price, decided to offer as much as £51½ a ton for cocoa at up-country stations in the Gold Coast, and corresponding prices in Nigeria. This is the best price the farmers have had since the 1927-28 season.

There can be no hope of lower chocolate prices until the world cocoa price comes down, and that is dependent on lower commodity price levels in America. The consumer might draw some consolation from these higher prices if there were any likelihood of a significant increase in the value of his sweet coupons. But

SECURITY PRICES AND YIELDS

A fuller list containing 370 securities appears weekly in the *Records and Statistics* Supplement. Notes on the following company reports also appear in the Supplement: Morris Motors; Associated Portland Cement; Hawker Siddeley; Babcock & Wilcox; John Summers.

* To earliest redemption, except \$ flat yield and assumed average life 17 years 6 months. Net yields after allowing for tax at 9s in £.

this is unlikely. Better supplies of West African cocoa will be dependent for some time to come upon whether the farmers have an incentive, in the tangible form of increased supplies of consumer goods, and especially textiles, to harvest more cocoa beans. They will depend, too, on the success achieved in the present drive against "swollen shoot" disease, which is decimating the cocoa trees in some areas. At present, the possibility of a quick improvement in supplies from either cause seems remote.

* * *

World Sugar Supplies

There was a marked increase in world production of sugar in the 1946-47 season, the total for beet and cane being estimated at 25.3 million tons. This compares with 21 million tons in 1945-46 and 27.6 million tons in 1938-39. The output of beet sugar amounted to 8.1 million tons compared with 10.5 million tons in the pre-war year; the reduction is mainly due to the smaller output in Germany. Supplies of cane are equal to their pre-war level, in spite of a much lower production in continental Asia and the Netherlands East Indies. Cuba has shown a considerable expansion, with this season's output estimated at 5.3 million tons compared with 4 million tons in 1945-46 and 2.8 million tons in 1938-39. Full details are given in this week's issue of the *Records and Statistics* Supplement.

As was shown in last week's issue of *The Economist*, British stocks of sugar are at the moment reasonably ample, being estimated at 17½ weeks' supply as at the end of March, 1947. Were it not for currency difficulties, there would be every reason to believe that it would be fairly soon de-rationed. But British supplies come mainly from Cuba and St. Domingo and have to be paid for in US dollars. It is possible that alternative supplies may be obtained from India and Java, when production in this latter country has recovered to its pre-war level. In the case of India there may be political difficulties to overcome first. The South American states have also increased production, but it is unlikely that larger quantities of sugar will be purchased from these countries, unless Britain enjoys a favourable trade balance with them and the more urgently required commodities are not available.

Shorter Notes

Due to a typographical error, Table II in last week's leading article "Housing and Industry" was headed "Stocks of Building Materials." The heading should have read "Production of Building Materials."

Shipments of tung oil from China amounted to nearly 40,000 tons in 1946. Pre-war exports totalled more than 80,000 tons and represented one-half to two-thirds of the total production. Some 26,000 tons were shipped to the United States and the remainder went to the United Kingdom and the Soviet Union.

(a) Interim. (b) Final. (c) Whole year. (d) Int. paid half-yearly. (e) Also a capital bonus of 2½ per cent. free of income tax; yield worked on 15 per cent. basis. †Free of Tax.

COMPANY MEETINGS

HAMBROS BANK LIMITED

PROPOSED NEW ISSUE MR. R. OLAF HAMBRO'S STATEMENT

The thirty-fifth general meeting of Hambros Bank, Limited, will be held, on the 6th proximo, at the offices of the bank, 41, Bishopsgate, London, E.C.

The following is an extract from the statement by the chairman, Mr. R. Olaf Hambro, circulated with the report and accounts:—

The past year has been one of increased activity for our bank, which is clearly shown in all the items in the balance sheet. In spite of the continuance of restrictive controls and bulk purchases of commodities between Governments, we have been able to increase our acceptances on foreign account and the total has risen from £2,457,371 to £6,954,437 in the course of the year under review. The liquidity position is again high, our total holdings of cash, Treasury bills and Government stocks being 82 per cent. of the deposits, which have risen to £34,226,765.

During the year we have acquired an investment trust company, the whole of the ordinary stock being held by us. This has enabled us to segregate our investment business from the banking side and the item of "other investments" shown previously has now been eliminated. Our holding of the shares in the trust, which has been renamed Hambros Investment Trust, appears under subsidiary companies.

EXPANDING ACTIVITIES

You will notice that you are asked to attend an extraordinary general meeting immediately after the annual general meeting, the purpose of which is to request your authorisation for the raising of fresh capital by the issue of £600,000 new "A" shares. These will be offered to the holders of the £10 shares and the "A" shares in the proportion of one for each £10 share and one for two "A" shares.

In connection with this proposal we have decided to transfer a sufficient sum from the contingency reserve account to published reserves, which, together with the premium reserves, will reconstitute the published reserve fund with an amount of £1,000,000. Thereafter the paid-up capital and published reserves will be:—

400,000 shares of £10 each,	
£2 10s. paid	£1,000,000
1,000,000 "A" shares of £1 each,	
fully paid	£1,000,000
Reserves	£1,000,000
	£3,000,000

The expanding activities of the bank are the reason for our decision to increase the capital and make the transfer to reserve. At the same time you may be confident that the decision regarding this transfer has only been arrived at on your directors being satisfied that the inner reserves are sufficient to cover all foreseeable contingencies.

The profit and loss account indicates the very satisfactory results of the year's working, and we are again strengthening the inner reserves by a transfer of £250,000 to the contingency fund. The recommendations regarding the dividend are set out in the directors' report.

I have recently returned from a business trip to the United States, in the course of which I have taken the opportunity of personally visiting the main centres in which the activities of our export company are at present concentrated. It is of lively satisfaction to me to be able to confirm that the hoped-for expansion in our trading subsidiary's activities in that direction has been achieved and the demand for several of their export lines has considerably exceeded the available supplies. A very satisfactory expansion has also been achieved in other parts of the world.

COMMERCIAL UNION ASSURANCE COMPANY, LIMITED

FURTHER EXPANSION

MR J. F. G. GILLIAT'S REVIEW

The annual general meeting of the Commercial Union Assurance Company, Limited, will be held, on the 2nd proximo, at 24, Cornhill, London, E.C.

The following is an extract from the statement by the chairman, Mr. John F. G. Gilliat, circulated with the report and accounts:—

I will deal with the departmental accounts in the customary order:

FIRE DEPARTMENT

The premium income amounted to £9,466,024, showing an increase of £1,866,161 over that of 1945. The ratio of claims paid and outstanding was 43.10 per cent., commission absorbed 19.35 per cent., and expenses of management accounted for 21.78 per cent. After adjustment of the reserve for unexpired risks, £700,000 is transferred to profit and loss account. The fire fund now amounts to £8,890,328, or 93.92 per cent. of the premium income.

The expansion of premium income at home has continued with satisfactory results; nevertheless, fire wastage at any time is a loss to the community, and in times of shortage, such as we are now experiencing, preventable fire wastage, particularly of food and raw materials, is something which the country can ill afford and is an unnecessary handicap in our struggle towards recovery. The Fire Offices' Committee, of which we are members, has established the Fire Offices' Committee Fire Protection Association. The purpose of the association is to contribute in every possible way towards the prevention of outbreaks of fire and the reduction of the consequent damage. Membership is open to all who have an interest in these objects.

In the United States our premium income was substantially increased. In the Dominions, the Colonies and elsewhere overseas we have had a satisfactory year.

LIFE DEPARTMENT

During 1946, 10,266 life assurance policies were issued for total sums assured of £10,311,892 of which, after allowing for re-assurances, £9,883,010 was retained at the company's own risk, and these figures are to be compared with 6,357 policies for £5,892,021 gross in 1945. In addition 2,055 policies were issued to secure immediate or deferred annuities totalling £90,998 per annum. The average sum assured was £1,004, compared with £927 and £862 for the two preceding years. The total new life business was greatly in excess of the amount secured during any previous year in the history of the company.

The life assurance premium income of £2,545,213 was £281,418 in excess of the corresponding income for 1945, and during the year the life fund increased by £1,298,203 to £34,606,463.

Death claims and matured endowment assurances accounted for £639,710 and £1,447,989 respectively (£605,961 and £1,223,733 in 1945), while the payment of £149,755 in respect of the surrender of life assurance policies, though £80,099 in excess of the corresponding amount paid in 1945, was still not much more than one-half of the amounts paid out in surrenders during the immediate pre-war years.

1947 is the last year of our present quinquennium and a valuation and distribution of profits to the participating policyholders is due as at the end of the year, though we do not expect an announcement of the results before April or May, 1948. Some strengthening of our valuation basis will be necessary in view of the current financial outlook, and

towards this end a substantial special reserve has already been accumulated out of undistributed profits from the past. Though the possibility of distributing bonuses on the scale enjoyed in pre-war days remains remote, I do not think that our policyholders should have any cause for dissatisfaction; and in the meantime in respect of policies which become claims by death or by maturity before the end of 1947, we are continuing to allow interim bonuses on the full scale declared at our last distribution of profits.

MARINE DEPARTMENT

The net premiums in this department amounted to £1,161,324, an increase of £350,577 over the previous year's total. The claims paid and outstanding, after deduction of reinsurances and salvages, amounted to £548,540, and out of the profit of underwriting years now closed the sum of £500,000 has been transferred to profit and loss account. The marine fund now stands at £2,056,706, or 177.10 per cent. of the premium income. The increase in the premium income is due to the release of tonnage from requisition both here and in the United States, the delivery of new vessels and the increasing activity of our branches and agencies in many fields. Perils from mines are still very real in many waters, and serious losses sustained in the Adriatic, the North Sea and the Baltic have caused underwriters to increase their rates for war and mine risks.

ACCIDENT DEPARTMENT

The premium income amounted to £11,133,762, showing an increase of £2,129,872. The ratio of claims paid and outstanding is 58.38 per cent. Commission accounted for 16.64 per cent., and expenses of management amounted to 18.98 per cent. The underwriting surplus amounted to £711,014, but the large increase in income necessitated an exceptionally large additional provision for unexpired risks amounting to no less than £851,949. With this adjustment there is an underwriting loss of £140,935, or 1.27 per cent. of the premium income. The total fund in the accident revenue account now amounts to £7,746,262, or 69.57 per cent. of the premium income.

The premium income in all classes of business transacted by this department has substantially increased, both at home and abroad. The motor section shows the greatest expansion and this, of course, is the result of the general return of motor-cars to the road following the removal or lessening of restrictions, but the cost of claims for damage to the insured vehicle or to other property and claims for personal injury has reached new heights, and it will take time to make the necessary adjustment in premium rates. This experience is world-wide.

In the burglary section the premium income has increased and is accompanied by a great increase in the number and cost of claims. In the personal accident section it is pleasing to record a marked increase in premium income.

The balance available for transfer to the profit and loss appropriation account is £1,151,968 compared with the corresponding figure last year of £955,223. This balance will permit of the usual amount of £25,000 being written off freehold premises, allow a transfer of £250,000 to contingencies and taxation reserve and leave sufficient to provide the interim dividend of 3s. per £1 stock paid in November last and the final dividend of 4s. 6d. per £1 stock recommended by the directors and a carry-forward of £577,804, an increase of £146,843.

LEGAL AND GENERAL ASSURANCE SOCIETY, LIMITED

QUINQUENNIAL VALUATION
THE HON. W. B. L. BARRINGTON'S REVIEW

An extraordinary general meeting of the Legal & General Assurance Society, Limited, was held, on the 21st instant, at 188, Fleet Street, London, E.C.

The chairman, the Hon. W. B. L. Barrington, in the course of his speech, said: It is my duty to submit to you the valuation report of the actuarial investigation as at December 31, 1946, covering the period of the preceding five years. During the past quinquennium the total net sums assured and bonuses in force at the end of 1946 amounted to £176,528,000, and the annual premium income of the society increased during the quinquennium by no less than £3,789,000, bringing the total life premium income for 1946 up to £9,276,000.

The average net rate of interest earned on our life funds during the quinquennium amounted to £3 10s. 4d. per cent. It compares, however, with £3 19s. 10d. per cent. for the period 1937-41, and £4 5s. 7d. per cent. for 1932-36.

THE SURPLUS

The last section of the report gives particulars of the valuation surplus. Under the society's constitution participating policyholders are entitled to 90 per cent. of the profits of all classes of business, including those of our fire and accident accounts, to the extent necessary to provide a compound bonus of 38s. per cent. The life assurance funds are able to provide this maximum bonus without recourse to the other funds of the society and, after providing for the cost of the bonus, the surplus in the life funds amounts to £589,194. The rate of bonus of 38s. per cent. compound has been maintained for the last 55 years.

Adding the surplus of £49,104 in the sinking fund and capital redemption account, and the surplus of £42,278 in the permanent sickness account, there is an available surplus of £680,576. It is proposed to transfer £325,000 of this to the profit and loss account from the life assurance and annuity fund and £20,000 from the permanent sickness account, making a total credit to the profit and loss account of £345,000 and leaving total balances of £335,576 to be carried forward.

The report and resolutions were adopted.

ANNUAL GENERAL MEETING

The ordinary annual general meeting of the Society was then held.

The chairman said: It is my pleasure to submit the report and accounts for the year 1946. The new business of the society showed a large increase over the previous year. In the ordinary section, comprising mainly whole life and endowment assurances, the increase was £4,645,853. The total business in this section was £8,930,152. The group life and decreasing term business was £12,875,729, an increase of £6,508,324, compared with 1945. The total net life new sums assured was thus £21,805,881, compared with £10,651,704 in 1945, an increase of £11,154,177.

The consideration money for immediate annuities was again substantial, being £1,911,793, an increase over the previous year of £776,399. The Society also granted deferred annuities amounting to £1,479,598 per annum, an increase over 1945 of £441,817. After making the usual provision for unexpired liabilities and all outstanding claims there was an underwriting surplus of £97,781.

In the accident account, which also includes the business of the "Gresham Fire," the total net premiums amounted to £563,231, an increase of £120,111. The main increase was, as expected, in the motor account, where the premiums rose from £168,917 to £248,704.

During the past quinquennium the growth of the fire and accident departments has been substantial. In 1941 the combined fire and accident premiums of the Legal and General and Gresham Fire, together amounted to £990,868. At the close of the quinquennium they amounted to £1,613,688, an increase of £622,820. The total fire and accident underwriting profit of the Legal and General during the quinquennium and that of the Gresham Fire since consolidation amounted to £604,325.

The total funds of the society increased by £9,512,994, and amounted at December 31, 1946, to £88,134,447. The total premiums received from all classes of business amounted to £11,082,999, an increase of £1,289,396.

PROFIT AND LOSS ACCOUNT

The profit and loss account has been changed very materially since the previous year, owing to the transfer of profits resulting from the quinquennium. The balance brought forward from 1945 was £202,640. Interest and dividends brought in amounts to £80,162 gross, and a total of £501,333 has been transferred from the underwriting accounts.

The directors feel justified in recommending the payment of 3s. 6d. per share on July 1, 1947, which, with the interim dividend of 1s. per share paid on January 1 last, will make the total dividend 4s. 6d. per share, subject to income tax for the year 1946. After allowing for the payment of the above dividend the balance in the account will be £530,023.

In regard to our subsidiary companies, the directors are satisfied that the amounts at which these assets stand in our books are conservative. We have now almost completed our reorganisation whereby we have combined our branch offices with those of the Gresham Fire & Accident Society, and I am happy to say that there is every indication that this will prove of considerable benefit to both societies.

The report and accounts were adopted.

EAGLE STAR INSURANCE COMPANY, LIMITED

FURTHER EXPANSION

The annual general meeting of this Company will be held, in London, on June 12th.

The following is an extract from the statement of the chairman, Sir Edward M. Mountain, Bart., circulated with the report and accounts for 1946:—

In the life department the net new sums assured exceeded £20,700,000, an increase of nearly £4½ million over 1945, which includes a big expansion in ordinary life business. The rates of bonus for the years 1945 and 1946 in the current life fund are satisfactory, the reserves having been strengthened to the equivalent of a 2 per cent. net premium basis.

The fire results in the home account are satisfactory and although the experience in Canada has been unfavourable, our overseas fire account has been profitable.

In the motor insurance account there has been a further expansion in premium income and a further sharp rise in the cost of claims, and we have to show a loss in this account.

The personal accident, employers' liability and general insurance accounts show good results.

Our marine fund at £839,995 is 169 per cent. of the premium income.

The net interest earnings at £386,987 show an increase of £78,315: £160,781 is transferred to profit and loss as a result of the valuation of the current life fund, while profits of the other trading departments, after allowing for a loss of £18,000 in the motor department, total £233,000.

The assets of the company, valued on a very conservative basis, total £41,598,450, of which £26,096,037 are assets of the life department. The reserves in the trading departments at £3,068,795 are substantially in excess of estimated requirements.

THE EMPLOYERS' LIABILITY ASSURANCE CORPORATION, LIMITED

FURTHER PROGRESS

The sixty-sixth ordinary general meeting of The Employers' Liability Assurance Corporation, Limited, was held, in London, on the 21st instant, The Rt. Hon. Lord Courtauld-Thomson, K.B.E., C.B., the chairman, presiding.

The following is an extract from his circulated statement: Our total premiums, at £8,837,874, were the largest in the history of the corporation, all our main classes of business and all parts of the world having contributed to the increase of £1,054,135 over 1945.

Our fire account, with premiums of £668,926 and a profit of £78,933, again shows satisfactory results, the percentage of profit being 11.8. This is particularly gratifying in view of the increased losses by fire reported from many countries during the twelve months under review.

The transition from war to peace conditions, particularly in the United States, has presented many problems, the solution of which is proving to be neither easy nor rapid, and I have to report a loss on the accident and general account amounting to £409,962.

POSITION IN U.S.A.

Although the claims experience in the United States has deteriorated generally in the past twelve months, it is the results of the motor business there, which have caused us the greatest concern. Every effort is being made to secure the higher rates which are necessary, and, in several States, increases have been authorised, although it is not yet possible to say that these new rates are adequate. We have, therefore, no sure grounds for anticipating an immediate return even to the moderate margin of profit in pre-war years, but I hope the present position is transitory and that an improvement will be shown in the future. Our other main class in the United States is workmen's compensation assurance. The claims ratio of this branch of our business in 1946 was also larger than the average of recent years.

Our business generally in all other parts of the world, including the United Kingdom, continues to make healthy growth and to show satisfactory results.

Our total investments, at £12,928,078, show a slight increase on the year and stand in our books at less than their market value on December 31st last.

The Clerical Medical and General Life Assurance Society again reports excellent results. The "Merchants' Marine" has been placed on a firm footing.

THE DIVIDEND

Our gross interest, dividends and rents amount to £383,660, an increase of £38,703 on the year. To this we add the profit on our fire account of £78,933 and the sum of £137,443 transferred from the provision in respect of the Merchants' Marine Insurance Company, Limited, so that, with the amount brought forward from last year, £687,332, we have an available total of £1,287,368. The interim dividend of 1s. 6d. per share was paid last October and the directors recommend a final dividend of 2s. per share.

With our highly developed organisation, our able and enthusiastic staff and our undoubted reputation for efficient service, the name of the corporation stands high in the United States and in all those other parts of the world to which our operations extend. In spite of the admittedly still difficult times ahead I look forward to the future, therefore, with confidence in an eventual return to our previous standard of profit.

The report was adopted.

ALLIANCE ASSURANCE COMPANY LIMITED

FURTHER EXPANSION

The annual general meeting of this Company will be held, on the 28th instant, at the head office, Bartholomew Lane, London, E.C.

The following are extracts from the review of the report, accounts and balance sheet for the year 1946 by the chairman, Mr Richard Durant Trotter:—

In the life department, the net new business completed during the year amounted to £3,965,000, in comparison with £1,761,499 in 1945. The claims by death, excluding those on the closed funds, were £585,332, compared with £587,254 during 1945, the mortality experience continuing to be very favourable. The net purchase money for immediate annuities was £60,350, an increase of £18,657 over the corresponding figure for 1945. At the close of the year, the "Alliance" life and annuity funds amounted to £24,182,830, in comparison with £23,689,711 at the end of the previous year.

In the fire department there was another satisfactory increase in business, the net premiums amounting to £2,795,644, being £110,429 more than the figures for 1945. Claims, including contributions to fire brigades, at £961,745 were slightly more than in the previous year, when they absorbed £959,251. The surplus, after increasing the reserve for unexpired risks, amounts to £467,461, which has been carried to profit and loss.

ACCIDENT AND MARINE FIGURES

In the accident department, the net premiums amounted to £1,725,783, which is £306,342 more than the corresponding figure for 1945. While I am sorry to say that the burglary and motor sections resulted in a loss, the surplus over the department as a whole amounted to £88,283, after adjusting the reserves for unexpired risks, and this amount has been carried to profit and loss.

In the marine department, the net premiums were £1,020,573. Here I should explain that the premiums shown are net of commission, a change which has been made in accordance with the provisions of the Assurance Companies Act, 1946. The above figure is £163,634 more than the comparable figure in 1945. The underwriting account for 1944 has now been closed, with a balance of £359,160 which compares with £326,611 of the 1943 account. After setting aside £97,693 to meet further claims, which maintains the reserve for previous years at £425,000, a balance of £261,467 is carried to profit and loss.

In the trustee department, the fees received during 1946 amounted to £9,974, an increase of £1,884 over those for 1945. The average gross rate of interest over the whole of the funds of the company, which was £4 2s. 10d. per cent., while a little lower than that for 1945, was higher than for any previous year since 1941.

The following appropriations have been made from the profit and loss account:—£75,000 to writing down of premises; £50,000 to the staff pension fund and £30,000 to the additional reserve in the accident and miscellaneous insurance account, and we have again made an additional contribution of £25,000 to the widows' and orphans' fund.

Your board feel that the time has come when they may safely increase the dividend, which for so long has been at the rate of 18s. per share to 20s. As an interim dividend of 8s. was paid last January, the final dividend payable in July will be 12s. per share, and it is proposed that should the circumstances at the end of the present year justify it, the interim dividend next January will be increased to 10s., in which case the final dividend would revert to its previous figure. I have no doubt that this will meet with your approval.

GENERAL ACCIDENT FIRE AND LIFE ASSURANCE CORPORATION, LIMITED

TOTAL ASSETS EXCEED £31,250,000

The sixty-first annual general meeting of this Company will be held, in Perth, on the 28th instant.

The following is an extract from the circulated address of the chairman, Mr Frederick Richardson:—

There has been a substantial enlargement of the life fund. This has been due to the remarkable increase in new life business transacted by the General Life Assurance Company amounting to £2,135,849, an increase of £1,395,272 over the previous year. This increase is due very largely to a strong revival in the demand for all forms of life assurance.

Accident and general account:—The premium income in this division shows an increase of £2,860,375, and establishes a record. The total writings in this, our major department, amounted to £11,534,973. We show a loss in this department as a whole, and to meet this we have transferred £80,381 from profit and loss.

Fire account:—We had another excellent year in this department, and have been able to transfer £164,620 to profit and loss account.

Marine account:—We have a small but growing marine account, and in recent years have been able to make transfers of profit. On this occasion we are again transferring £50,000 to profit and loss account.

Over a long period of years the rise in interest earnings had been slow, but I am pleased to direct your attention to a substantial increase in this item of £37,012 during 1946.

The total assets have risen to £31,271,266, an increase of £2,507,108, and the net income rose to £15,081,150, an increase of £3,477,219.

MERCHANTS' MARINE INSURANCE COMPANY, LIMITED

SOUND FINANCIAL BASIS

The seventy-sixth ordinary general meeting of this Company, was held, on the 21st instant, in London, The Rt. Hon. Lord Courtauld-Thomson, K.B.E., C.B., the chairman, presiding.

The following is an extract from his circulated statement: In last year's report your directors stated that it was their intention, during the year, to reconstruct the capital of the company with the object of eliminating the debit balance in the profit and loss account. This has now been achieved by calling up the unpaid capital of £262,500, and then writing down the total capital of £5,000. The paid-up capital was then increased to £100,000 by the issue of 47,500 shares of £10 each, £2 paid. The mortgage of £50,000 on the Company's freehold and leasehold property in Cornhill has been redeemed, and the value of the property has been written down to £195,725.

You will observe from the marine account that our premiums amount to £377,734, and after transferring £30,000 to the profit and loss account, the marine fund stands at £643,336, which represents 170.3 per cent. of the premium income. The premiums in the fire and general account amount to £60,480, an increase of £25,716 over 1945, and the profit shown of £8,378 has been transferred to the profit and loss account. The balance at the credit of the profit and loss account amounts to £56,118. There is a balance of £7,062 which we carry forward. I believe that the company now faces the future on a sound financial basis, but before any resumption of dividends can be recommended your directors consider that a further period of consolidating and strengthening the company's reserve is desirable.

The report was adopted.

ENGLISH AND CALEDONIAN INVESTMENT COMPANY, LIMITED

DIVIDEND OF 6½ PER CENT.

The twentieth annual general meeting of this Company was held, on the 19th instant, at 23, Blomfield Street, London, E.C., Mr Henry S. Loeb (chairman of the company) presiding.

The following is the statement by the chairman, which had been circulated with the report and accounts and was taken as read:—

At March 31, 1947, the company's investments stood in the balance sheet at £923,064, compared with £960,936 for the previous year. The value, however, of the investments at March 31, 1947, was £1,351,126, showing an appreciation over the book figure of £428,062, or an appreciation of 46.37 per cent., compared with an appreciation of 24.68 per cent. at March 31, 1946. This improvement of 21.69 per cent. compares favourably with the rise of 17.9 per cent. during the same period shown by the *Investors' Chronicle* monthly securities index.

There is a further slight increase in the proportion of the company's funds invested within the Empire. There is a slight fall in the proportion of funds invested in equity stocks, and this decrease reflects the present policy of the board in relation to equity stocks.

THE YEAR'S REVENUE

Turning to the revenue account it will be noted that our income of £62,221, which excludes transfer fees, shows an increase of over £7,000 on the income for the previous year, and I think I should mention that only approximately £1,200 of this increase is due to receipt of arrears of dividend on certain of the investments.

Administrative and sundry expenses amounted to £2,972, against £2,687 last year, while bank and loan interest amounted to only £97, against £536 for the previous year. After deducting these charges and also interest on the debenture stocks, the net revenue for the year was £39,861, an increase of £6,000 over the net revenue for the previous year.

After charging the sum of £17,728 for taxation and deducting dividend on the preference stock for the year to March 31, 1947, the amount earned on the ordinary stock was £13,883, equivalent to 12.62 per cent., as against 9.33 per cent. for the previous year.

An interim dividend of 1½ per cent. has been paid on the ordinary stock and the payment of a final dividend of 5 per cent. is now recommended, making 6½ per cent. for the year. Your directors have transferred the sum of £6,000 to general reserve, leaving a sum of £5,322 to be carried forward.

CONSOLIDATION OF CAPITAL POSITION

In my statement last year I informed you that we had been selling a part of our investments in equities and investing the proceeds in Government securities. The object of these operations was, of course, to consolidate to some extent our capital position, and during the year under review we have continued to pursue the same policy, although we realised that the effect on our income may be adverse for a time.

The trade and commerce of this country continue to be hampered by shortages of fuel and raw materials. The full energies of all sections of the community will only be released when there is a substantial alleviation of the present almost intolerable burden of taxation and a further reduction of Government expenditure.

The report and accounts were unanimously adopted.

ASSOCIATED GAS AND WATER UNDERTAKINGS, LIMITED

ILL-CONCEIVED NATIONALISATION

MR. W. H. BENNETT'S STATEMENT

The ordinary general meeting of Associated Gas and Water Undertakings, Limited, will be held, in London, on the 29th instant.

The following is an extract from the circulated statement of Mr W. H. Bennett, the chairman: Since I last addressed you the Government's expressed intention to nationalise the coal, transport, electricity and gas industries has become an accomplished fact in the case of coal-mining companies and their subsidiaries.

The National Coal Board has been functioning now for only a few months, but in that short time its activities have aroused open criticism from many quarters, notably from the Government's own supporters in the House and from trade union leaders outside. What the position may be when and if the Government's full programme of nationalisation is brought to fruition cannot be visualised at present, but so far the coal experiment is not encouraging.

The gas industry, looking to its own future, views with grave disquiet the general structure of the Electricity Bill, which places autocratic power in the hands of one Minister who is licensed to seize the total assets of the electricity industry, compensating its present owners on a basis which to any fair-minded man is almost confiscation.

Stock Exchange quotations are a day-to-day index of prices in the stock and share market, and are affected by many influences which have no relationship to the basic value of the assets concerned. Yet this is the basis adopted in the Electricity Bill for all companies whose capital is quoted on the Stock Exchange. The Electricity Stock to be issued to the dispossessed owners will doubtless yield some 2½ per cent., entailing grave hardship to thousands of small investors.

Stockholders of this company have a particular interest in the Electricity Bill, as four of our larger subsidiary companies owning electricity as well as gas undertakings will, under the provisions of the Bill as it stands at present, be acquired in total by the Electricity Authority. This is a matter of some concern to this company, as our total investment in these four subsidiaries represents 47 per cent. of our total assets.

THE FUEL CRISIS

Since the beginning of the year this country has been overtaken by the greatest economic crisis in its history—a crisis brought about by the lack of coal and the consequential curtailment of gas, electricity and solid fuel supplies. I would make it quite clear that the Government was informed by industry that this state of affairs was bound to mature during the year, and that the severe weather, while it aggravated the position, merely hastened the inevitable. The primary cause of the crisis was bad planning by the Government and their refusal to listen to the advice of those best qualified to judge the situation.

Notwithstanding the threat of nationalisation within our group, plans have been put into effect for the provision of bulk supplies between various undertakings and the erection of further manufacturing and storage plant, in order to meet the ever-increasing load, is going ahead, as it is our intention to assure the consumer of an adequate supply, even should the control of these undertakings be out of our hands in the future.

In comparison with the previous year, total revenue from all sources shows a slight decrease of £1,194. If the proprietors approve the directors' recommendation regarding the declaration of final dividends, the sum of £35,858 will remain to be carried forward, representing an increase of £3,358 over the amount brought in.

INCORPORATED ACCOUNTANTS

NEED FOR RELAXATION OF CONTROLS

The sixty-second annual general meeting of the Society of Incorporated Accountants and Auditors, was held, on the 21st instant, in London.

Mr. F. Woolley, F.S.A.A., J.P., the president, in the course of his speech, said: The provisions of the National Service Bill now before Parliament present problems to every profession. His Majesty's Government has announced that articled clerks born after January 1, 1929, may, generally speaking, be granted deferment to cover the whole period of professional training. Special by-law candidates may apply for deferment for a maximum period of five years from the date of entry to the profession, subject to their being allowed time for private study to the extent of not less than eight hours a week on average during their training.

The proposals for the co-ordination of the profession were approved by overwhelming majorities of members of the six qualifying bodies—that is, the Institute, Society, the Association, and the three bodies of Chartered Accountants of Scotland—at extraordinary meetings held in June, 1946, and the future conduct of the Public Accountants' Bill was entrusted to the Co-ordinating Committee. To remove misunderstandings that have arisen in some quarters, it may be well to reiterate that the main purpose of the Bill is to set up two public Accountants' Councils in England and Wales and in Scotland respectively whose duty it will be to ensure that all practising accountants shall have acquired a sufficient degree of competence, and to maintain and improve the standards and qualifications of public accountants. Furthermore, the qualifying bodies, of whom the Society is one, will each retain their own constitution and functions as hitherto.

NATIONALISATION

During the past year the Accountants' Joint Parliamentary Committee has considered a large number of measures before Parliament which have included provisions relating to the qualifications and status of auditors. In particular, I want to mention the work of this committee in regard to nationalisation. Generally speaking, the committee has endeavoured, as its main object, to secure statutory recognition of the principle that the accounts of the various boards and commissions set up by Parliament to administer nationalised industries and services shall be subject to audit by independent qualified accountants. His Majesty's Government, however, has reserved the right to set up an internal audit system should developments make such a course desirable. It is, of course, in the national interest that full information in regard to nationalised industries should be made available to the public and this can be best achieved by a completely independent audit and report, and not merely by a check carried out by another department of the same organisation.

The members of our profession are in intimate touch with the industrial and commercial undertakings of the country as well as public utilities. We have heard much about the 20 per cent. of industry which is in process of nationalisation. But at least equal importance attaches to the 80 per cent. to be left to private enterprise.

The Companies' Bill has now left the House of Lords and will shortly be considered by the House of Commons. The accountancy provisions seem to me to go as far as is desirable at present, and I hope that no attempt will be made in the House of Commons to extend these provisions, as practical experience of their working should first be obtained.

The report was adopted.

BRITISH MATCH CORPORATION, LIMITED

INCREASING SUPPLIES

The twentieth ordinary general meeting of British Match Corporation, Limited, was held, on the 21st instant, at Haddon House, 66a, Fenchurch Street, London, E.C., Mr Arthur Hacking, O.B.E. (chairman) presiding.

The following is an extract from the chairman's statement, circulated with the report for the year ended April 30, 1947:—

The yield from investments in subsidiary and associated companies during the year ended April 30, 1947, was 10.189 per cent., as compared with the return of 10.148 per cent. for the year ended the same date in 1946; this we consider again most satisfactory.

Since the end of the war, the distribution of matches to the home market has been increased, and there have been fairly considerable imports. We are hoping for a still further increase in the comparatively near future. I should warn stockholders that difficulties in regard to supplies of raw materials are getting worse and worse, particularly in regard to timber. This is a matter which is causing the most serious concern to the boards of your operating companies.

It is your board's intention at the expiration of the next financial year, or other period, to issue a consolidated balance sheet. I think it advisable to envisage the possibility of the Corporation's financial year ending on December 31st in each year instead of April 30th. It will be appreciated that the preparation of consolidated accounts will take some considerable time, and it is not anticipated that we would be able to hold the annual meeting of the Corporation at an earlier date than at present, viz., about the middle of May.

The report was adopted and the dividends recommended were approved.

ROTHMAN'S, LIMITED

LARGE DEMAND

The eighteenth ordinary general meeting of Rothmans, Limited, cigarette manufacturers, was held on the 20th instant in London.

The following is an extract from the circulated statement by Mr Sydney Rothman, the chairman:—

Home sales of cigarettes and tobacco continued to be limited by Government controls, but export sales were limited only by the capacity of the factory. The turnover of your company and the quantity of cigarettes produced during the year were greater than in any previous year, thanks to the strenuous efforts of the management and employees.

The net trading profit for the year was £77,907. It is proposed to pay a dividend of 3½ per cent. (less tax) upon the Ordinary shares. Of the taxed profits available for distribution to Ordinary shareholders 74½ per cent. is being retained in the business and 25½ per cent. paid out in dividends.

The capital employed in your company's business now exceeds £750,000, and the net sum to be distributed in dividends in respect of the past year amounts to less than 3 per cent. of that capital. I feel, therefore, that the Chancellor should consider reasonable our proposed appropriation of profit.

Operating costs have risen, partly on account of higher wages and partly because it costs more and more to keep old plant running, and its productivity declines even with the most careful maintenance.

In the export markets the demand for your company's brands of cigarettes has been greater than our capacity to produce, and the immediate prospect is that we can sell profitably abroad all the cigarettes we can produce after the home trade demand has been met.

The chairman then thanked the management and staff for their services during the year, and the report was adopted.

RAND MINES, LIMITED

(Incorporated in the Union of South Africa)

GOLD-MINING INDUSTRY'S PROBLEMS

MR W. H. A. LAWRENCE'S SURVEY

The annual meeting of Rand Mines, Ltd., was held in Johannesburg on the 16th instant, Mr W. H. A. Lawrence presiding.

In moving the adoption of the report and accounts, the chairman said that profit earned during 1946 amounted to £583,167, being £16,407 less than that for the previous year. Two dividends of 50 per cent. each declared during the year had absorbed £537,749 which, together with other appropriations shown in the accounts, left a balance of £1,011,900 to be carried forward to the current year's accounts. Ample cash resources were available to meet all contingency and option liabilities, including commitments to finance and to subscribe for shares in certain undertakings.

VALUATION OF INVESTMENTS

Investments in shares had been brought into the account at a book value of £4,714,504, being an increase of £331,587 over the figure for the previous year. Investments for which share market quotations were available appeared in the books at or under cost but in no case above the market price at December 31, 1946. Unquoted securities had been entered in accordance with the conservative valuation placed upon them by the board and in no instance at a valuation exceeding cost. Where it had appeared prudent to do so the book value of holdings had been written down below the cost and below the market value.

It was evident from the schedule of investments published in the annual account that market value had largely exceeded the book value stated in the balance sheet. The market value of the gold mining investments of the company at the end of the year represented 76 per cent. of the market value of all investments in shares, and of those gold interests 94 per cent. had been revenue-producing.

GOLD MINING STATISTICS

Operations of the Witwatersrand gold mining industry during 1946 had been generally restricted by a continued shortage of labour; by restricted supplies of essential mining materials such as steel and cement and by delays in obtaining machinery and equipment from overseas producers. In addition, operations had been adversely affected by strikes of European and native employees. The necessity for increased development work to rectify the generally depleted ore reserve positions remained, and as much labour as possible had been used on such work.

On the whole, therefore, tonnages had tended to decrease and development footages had increased. Figures for Central Mining-Rand Mines group of mines showed that tonnage milled had decreased by 4 per cent., while development had increased by 8 per cent.

In spite, however, of the decrease in milling and increase in development, the total ore reserves of the mines of the group had shown a further decrease of 7 per cent. That was largely due to a rise in working costs, which had not only caused large tonnages to be lost to payable reserves through the consequent rise in pay limits, but had also resulted in increased development footage being necessary to open up any given tonnage of payable ore owing to the adverse effect of the increased pay limits on the percentage of payability. Normally, there was a balance between stoping and development work which must be retained in the interests of sound long-term mining policy. During the war that balance had been of necessity upset. Since the war every endeavour had been made to restore it. The shortage of labour and the continued rise in the costs

were, however, making it difficult to maintain the position existing at the end of the war, unbalanced though it was, let alone to restore the industry to its proper equilibrium.

TAXATION STILL HIGH

Since the close of the year the Minister of Finance had proposed in his Budget statement that certain relief should be granted in respect of gold-mining taxation. Under the new formula, taxation would be levied at the rate of 90 per cent. of that applying under the 1946 formula. Although they welcomed that downward adjustment, the rate of taxation remained, in the case of many gold-mining companies, inordinately high compared with the general level throughout industry.

Even with that reduction the average rate of mining taxation was twice that of other industries. Further immediate relief would, however, be given by the proposal to increase the redemption allowance for old mines to 22½ per cent. of all unredeemed capital expenditure at the end of each year. The Minister had said that the redemption allowance introduced last year in the case of existing mines had been "an important step in the right direction," and had introduced the new allowance as "a further step."

They welcomed the inference that the allowance might be increased in the future because, as the Minister had said, "this matter is of particular importance in view of the desirability of encouraging ultra-deep level mining."

INCREASED AVERAGE YIELD

Ore milled by the 12 Witwatersrand mines of the group during 1946 had totalled 17,099,100 tons, which was 695,100 tons less than during the previous year. The average yield of gold per ton milled had increased by 0.212 dwt. to 3.754 dwts. Working revenue had increased by £635,159 to £27,854,806, while working costs had increased by £1,346,865 to £22,217,273. Consequently there had been a reduction of £711,706 in the working profit, which had amounted to £5,637,533. The amount distributed in dividends had been £3,218,559, an increase of £457,585 over that for 1945. Taxation had decreased by £1,299,288 to £1,825,333. Development accomplished had totalled 469,103 ft., an increase of 34,991 ft. The available ore reserves of those mines at the close of their respective financial years had amounted to 50,675,100 tons, which was a decrease of 3,557,300 tons, compared with estimates made the year previously.

Particulars of individual results and ore reserves of Witwatersrand companies of the group were given in the usual schedule attached to the annual report, and the report of the directors made reference to matters of special interest and importance concerning the position and operations of certain individual companies. Results of operations at the producing mines of the group in the Pilgrims Rest district of the Transvaal did not call for any lengthy comment. Glynn's Lydenburg had declared dividends amounting to £35,000, which was the same as for some years past. Mining operations at Transvaal Gold Mining Estates had still been restricted, consequently the profit from mining during the calendar year 1946 had been reduced to £7,134. On the other hand, the profit from plantations had increased by a further £36,508 to £109,459. Dividends declared by that company at £60,423 had again shown an increase over the amount distributed during the previous year.

EUROPEAN AND NATIVE LABOUR

The average number of Europeans employed by the Witwatersrand mines of the group had been 12,937, including a few who

were still on full-time military service. The average number of non-European employees had been 96,537, a decrease of 147 compared with the previous year.

The health record of native employees had shown that there had been an increase in the morbidity rate from disease and accident, while the mortality rate had shown a small decrease. Shifts lost per native per annum due to disease and accidents had shown a further decrease from 6.01 to 5.73.

SILICOSIS COMPENSATION

The present value of outstanding silicosis liabilities of the mines of the group was £6,139,716, a decrease of £58,120 compared with 1945. The twelve mines affected had provided, with accrued interest up to the end of 1946, a total of £4,838,594 towards meeting that liability. The Silicosis Act No. 47 of 1946, which consolidated previous enactments and provided for substantially increased awards to phthisis beneficiaries and their dependants, had come into operation on August 1, 1946.

The present value of additional outstanding liabilities resulting from that legislation amounted to £8 millions, and the industry would also be called upon to pay increased amounts in respect of current silicosis benefits. The net result was that the scheduled mines would have to provide a further £900,000 per annum towards phthisis compensation.

SERIOUS RESULT OF STRIKE

The results of the producing Witwatersrand Gold Mines of the group during the first four months of the current year had been very seriously affected by another strike of European miners, which had lasted from the end of January to the middle of March—a period of seven weeks—and had involved most of the mines on the Rand. Like the strike which had occurred the year previously, the dispute had been a purely domestic one within the ranks of the Mineworkers' Union, and had in no way concerned mine managements. The reduction in the total working profit for the group as a result of that strike might be gauged by comparing the results for the first four months of the current year with those for the previous four months.

During the period September to December, 1946, working profit had been £1,338,144. That for the period January to April, 1947, had been £798,509, the decrease being £539,635. As the results for Blyvooruitzicht had also been affected by the strike towards the end of last year, the figures for that company had been excluded. The effects on the economy of the industry and country as a whole had been considerable.

OTHER INTERESTS

Particulars of interests the company held in a number of Witwatersrand gold mining companies outside the Central Mining-Rand Mines group were contained in the schedule of investments published in the balance-sheet. The results of those companies were detailed in their annual reports and in the proceedings at the respective meetings.

INDUSTRIAL INTERESTS

The various South African industrial concerns in which the company was interested, such as coal-mining and lime, pipe and cement manufacturing companies, had all been maintained in a sound position and had distributed satisfactory dividends. The Transvaal Consolidated Land and Exploration Company, Limited, had continued work on the opening up and establishment of a colliery on its farm Van Dyk's Drift in the Witbank district of the Transvaal. An incline haulage had been sunk and connected with the vertical ventilation shaft. Exposures in the main coal seam had confirmed the promising results shown by boreholes.

The Pretoria Portland Cement Company, Limited, had increased its capital during the year for the purpose of extending and improving the existing factory facilities at Pretoria, Johannesburg and Slurry, and for the

erection of a new factory at Orkney, in the Klerksdorp district. The Pretoria Company's subsidiary and associated companies at Cape Town, Port Elizabeth and in Rhodesia were also extending and modernising their plants. The Hume Pipe Company (South Africa), Limited, and its subsidiary, the Hume Steel South Africa (Proprietary), Limited, had also had successful years and had been able to increase their dividend distributions. Prospects were good and the Hume Steel Company was planning to expand its plant.

O.F.S. DEVELOPMENT

During the past year there had been important developments in the Orange Free State goldfields. Shaft sinking had started on the first mine—that owned by St. Helena Gold Mines, Limited—and mining leases had been granted in respect of three mines to be established on Block 7 by African and European Investment Company, Limited. The first of those three mines would be operated by Welkom Gold Mining Company, Limited, and the other two would be operated by new companies which would be floated off in due course.

Applications for mining leases in respect of another four mines to be established on ground near Odendaalsrust held by Western Holdings, Limited, Blinkpoort Gold Syndicate and Free State Development and Investment Corporation, Limited, had been made.

DRILLING RESULTS

The company's holdings in Free State companies were shown in the balance-sheet. Since the close of the financial year, participation rights in the Welkom flotation in respect of those holdings had been exercised. Drilling had continued on and around the Weltevreden-Leeuwbosch option area in which the company had an interest with the Central Mining and Investment Corporation, Limited. Boreholes W.T. 3, 4 and 5 and H.T. 1 and 2 had been completed and boreholes W.T. 6, H.B. 3 and L.B. 2 were nearing the reef horizon. Due to faulting, the Basal reef had not been located in some of those holes; where it had been intersected it had been poorly developed. Drilling had, however, shown that the area was underlain by the Basal reef at from 2,000 to 8,000 feet below the surface and that the "A," "B" and Leader reefs were also present.

On Farm New Kameelkloorns Number 1,398, boreholes N.K. 7, 8 and 9 had been sunk during the year and the results of those and previous boreholes had shown that about one-third of the farm lies to the east of the main north-south fault, and was therefore outside the proved reef-bearing zone. At the southern extremity of the farm the Basal reef occurred at a comparatively shallow depth in a small area wedged between two major faults, but on the rest of the farm, west of the fault, it lay at depths varying from 8,000 to 10,000 feet.

On Schaapplaats Melkkrak block of options drilling was in progress in borehole S.C.P. 1. During the year, Central Mining and Investment Corporation, Limited, had acquired options over 10,541 morgen in the Bothaville area and 3,533 morgen in the Theunissen area, and recently over 25,706 morgen in the Ventersburg area of the Orange Free State. The company had accepted interests in those options.

TRIBUTE TO OFFICIALS AND STAFF

In conclusion, he wished to pay tribute to the valuable work done and loyalty shown by the head office staff of the company and by the managers and staffs of the mines of the group. He would also like to express their appreciation of the services rendered during the past year by their London secretaries, Messrs A. Moir and Company.

The report of the proceedings at the meeting would appear in the press, and copies could be obtained on application to the head office in Johannesburg or to the London secretaries.

The report and accounts were adopted.

CROWN MINES, LIMITED

(Incorporated in the Union of South Africa)

PROGRESS OF DEVELOPMENT

MR W. H. A. LAWRENCE'S ADDRESS

The annual meeting of Crown Mines, Limited, was held, on the 14th instant, in Johannesburg, Mr W. H. A. Lawrence presiding.

After reviewing operations, the chairman said that total profit for the year had been £1,234,207. Provisions in respect of silicosis outstanding liabilities had totalled £60,427 and provision for taxation had amounted to £471,213. There had been a transfer to contingency reserve of £73,400 and dividends had absorbed £754,450.

Net expenditure on equipment during the year had totalled £28,652, and against that sum there had been a credit of £215,476 in respect of monies received on account of property sales, principally those mentioned by the chairman last year. There had therefore been a net credit of £186,824 on account of capital expenditure during the year. In addition, there had been at the end of the year an amount of £218,075 outstanding in respect of freehold property sold on terms.

SILICOSIS COMPENSATION

Legislation had been introduced in regard to compensation to silicotics and their dependants in gold-mining and other dust-producing industries. That legislation, the Silicosis Act No. 47 of 1946, which had come into operation on August 1, 1946, consolidated previous Miners' Phthisis Acts and provided for substantially increased awards to phthisis beneficiaries and their dependants. The present value of additional outstanding liabilities resulting therefrom had been actuarially determined to be £8,000,000 and was recoverable from profits of scheduled mines over a period of approximately 20 years, by means of annual levies.

As shown in the accounts, the company's proportion of assessment for the eight months ended March 31, 1947, had been £24,859. Due to increased compensation payable to European and native miners, sums collected from various scheduled mines in respect of current payments to beneficiaries—which amounts were a direct charge to working costs—had also been increased. The total additional cost to the industry of those increases was about £900,000 per annum, equivalent to about 4d. per ton milled.

RISE OF COSTS

Development accomplished during the year had totalled 86,676 feet, an increase of 7,397 feet over that for 1945. Payable ore developed had totalled 2,117,000, averaging 5.3 dwt. per ton, which, however, had been 198,000 tons less than that for the previous year, the value being 0.3 dwt. higher. Thus, in spite of an increase of 13 per cent. in the amount of reef development carried out, the tonnage of ore opened up had shown a decrease of 8½ per cent. The reason for that was not to be found in any falling off in sampling values, but rather in the effect of rising costs on the pay limit.

Costs had risen by 3s. 3d. per ton during the year, which was equivalent to a rise in the pay limit of 0.38 dwt. That in turn had adversely affected percentage of payability, and consequently had increased the amount of reef development required to open up any given quantity of payable ore, thus aggravating the already acute position in regard to development. It would be remembered that during the war period the industry had been

called on to maintain production at the highest possible level and had therefore been compelled by shortage of essential stores to curtail development at the expense of sound long-term mining requirements. The average annual footage at the company's mine during the four years 1937-1940 had been 140,858 feet, compared with only 50,517 feet per annum during the four years 1942-1945.

LABOUR PROBLEMS

Shortages of labour and of available points of attack had made it impossible to restore the amount of development to anything approaching pre-war level, let alone to reduce the leeway resulting from wartime sacrifices. Consequently, the number of stope faces now available for production was inadequate for the most economical working of the mine, and regulation of breaking and control of grade was becoming increasingly difficult.

To assist in maintaining production on the present scale until such time as there was an appreciable increase in the supply of labour which could be directed towards improving the depleted ore reserve position, the old workings at No. 2 Shaft, which were known to contain considerable tonnages of low-grade payable Main Reef, had been opened up and were now producing ore for mill.

The available ore reserve as estimated at December 31, 1946, had been 10,892,000 tons of an average value of 4.9 dwt per ton over a stoping width of 47.8 inches. That showed a decrease of 1,179,000 tons on the previous year's figure, the value being unchanged and the width being 2.4 inches greater. Thus, in spite of an increase in the amount of reef development carried out and a decrease of 10 per cent. in the quantity of ore mined from reserves, ore reserves had been depleted by 10 per cent. compared with the previous year. It was estimated that the quantity of ore lost to reserve, due to increase in the pay limit, had been no less than 1,600,000 tons.

EFFECTS OF STRIKE

A strike of European miners which had lasted from the end of January to the middle of March of the current year, which had affected most of the Witwatersrand mines, had arisen like that which had occurred a year previously from an internal dispute within the Mineworkers' Union and in no way had involved mine managements. Losses to the industry, to the country as a whole and to shareholders, had been very heavy. In the case of Crown Mines, working losses of £16,350 and £6,047 had been recorded during February and March. Compared with the preceding four months the profit for the period January to April, 1947, had decreased by £290,945, a substantial reduction which was almost entirely attributable to the effects of the strike.

In his recent budget speech the Minister of Finance had announced certain changes in gold-mining taxation. Firstly, the rate of taxation had been reduced by 10 per cent. by a downward adjustment of the formula. Secondly, the rate allowed for amortising capital expenditure had been increased to 22½ per cent. per annum on the balance of all capital expenditure unredeemed at the end of each year. Whilst welcoming those concessions as steps in the right direction it should, however, be emphasised that the rate of gold-mining taxation remained excessively high in comparison with the general level. Last year the company had paid taxation at the rate of 45½ per cent. Under the new formula that would be reduced to 41

per cent., which was still twice the rate applicable to industry in general.

APPLICATION FOR LEASES

At the east side of the mine, workings had already reached the southern boundary. Application had been submitted to the Mining Leases Board for 992 claims which, if granted, would extend the southern boundary to a position where the reef was estimated to lie at an approximate vertical depth of 10,000 feet. A cooling plant was in successful operation at No. 17 shaft and one was on order for No. 16 shaft. To enable the ground south of the existing boundary to be explored it would be necessary to sink additional shafts and to install additional cooling plants. That work would entail heavy capital expenditure before any production would be possible from the area whence only a small margin of profit could be expected.

Crown Mines had been honoured by a visit by the Royal Family in the course of their recent tour of South Africa. They had inspected part of the underground workings in No. 17 shaft section and subsequently had lunched informally at the general manager's house.

The report of the proceedings at the meeting would appear in the press and copies could be obtained by shareholders on application to the head office in Johannesburg or to the London secretaries.

The report and accounts were adopted.

CITY DEEP, LIMITED

(Incorporated in the Union of South Africa)

OPERATIONS RESTRICTED BY LABOUR SHORTAGE

MR. G. V. RICHDALE ON THE POSITION

Mr. G. V. Richdale, chairman, presided at the annual meeting of City Deep, Limited, in Johannesburg, on the 14th instant.

After reviewing operations for 1946, the chairman said that total profit was £395,258. Dividends had absorbed £245,250, provision for taxation had amounted to £135,371, net expenditure on capital account had been £2,989, further provision made in respect of silicosis outstanding liabilities had been £14,248, and there had been a transfer to contingency reserve of £6,300. Capital expenditure incurred during the year had amounted to £7,763, mainly in connection with winding equipment for No. 5 shaft and an extension to the native hospital. Against that were offset sales of property which had realised £4,774.

A FURTHER SALE

Since the close of the year a further area of approximately 19.5 morgen of the company's freehold property on farms Doornfontein No. 24 and Turfontein No. 21, which were not required for surface operations, had been provisionally sold for the sum of £150,000. In the terms of the company's articles of association, that transaction must be sanctioned by shareholders in a general meeting and it would therefore be brought before shareholders for approval by means of a formal proposal which would be submitted to shareholders that day. The township of Moffatview, in extent of about 11 morgen, had been established during the year on four portions of farm Klipriviersberg No. 25. It had been proclaimed an approved township and all lots had been sold.

The new Silicosis Act, which provided for increased awards to beneficiaries and their dependants and for special benefits for native silicotics, had come into operation on August 1, 1946. The present value of additional outstanding liabilities incurred in the terms of that act, which would be collected over a period of 20 years and 8 months, ending March 31, 1967, from the present and future scheduled mines in proportion to their taxable income, had been determined at £8

millions. An amount of £6,662 had been provided during the year in respect of the company's proportion of that additional liability.

LABOUR TROUBLES

Operations had been restricted throughout the year by the acute shortage of European labour and to some extent also by a shortage of native labour. In March, 1946, and again in January, February and March of the current year, a section of European miners had come out on strike although there had been no matters in dispute between the strikers and the mine management, the difficulties being of a purely domestic nature concerning the affairs of the Mineworkers' Union. Nevertheless, operations at the mine had been affected on both occasions with a consequential loss of tonnage and revenue. Furthermore, in August last year there had been a short strike among native labourers employed on the mine, and that also had affected operations adversely.

It was largely as a result of those labour disturbances and shortages that working costs per ton milled had risen to the abnormally high figure of 36s. 4d. and that profit per ton milled had fallen by 2s. 7d.—from 10s. 6d. to 7s. 11d. Footage developed during the year at 31,617 feet had been 3,506 feet lower than during the previous year. Total payable ore developed during the year had been 709,900 tons valued at 6.5 dwt per ton. The available ore reserve had been re-estimated at December 31, 1946, to be 3,318,000 tons of an average value of 6.0 dwt over a stoping width of 41.1 ins.

Available reserve showed a decrease of 219,000 tons compared with the previous year's figure, the value being 0.2 dwt higher and the width 1.6 ins. less. The rise in working costs to which he had already referred had made it unprofitable to mine larger tonnages of marginal ore which in former years would have been payable. It was estimated that the quantity of ore which it had thus been necessary to exclude from the reserve was approximately 140,000 tons, or 64 per cent. of the total decrease compared with the previous year's figure.

DEEP-LEVEL PROBLEMS

Two years ago he had commented on the report of the committee appointed by the Government to consider technical and financial problems associated with deep-level mining. As shareholders knew, that was a matter which was of particular interest to the company, and shareholders would be interested to learn that the board had recently applied for undermining rights of an additional area equal to about 472 mining claims adjacent to the southern boundary of the present mining area. It was expected that the main reef leader would lie at a vertical depth of over 8,500 feet in the majority of those proposed new claims, and it was not anticipated that any of the other gold-bearing reefs would be payable.

The price of gold had increased from 172s. 3d. to 172s. 6d. per ounce fine as from January 1, 1946. With effect from January 1, 1947, there had been a further alteration in the formula tax which was based on the ratio of profit to recovery. That alteration would benefit the company, and the company also welcomed the Government's decision regarding the redemption of capital expenditure at the increased rate of 22½ per cent. per annum which was now applicable to the outstanding balance of all capital expenditure, irrespective of when it had been incurred.

The report of the proceedings at the meeting would be published in the press and copies could also be obtained on application to the head office in Johannesburg or to the London secretaries.

The report and accounts were adopted.

JAMES W. COOK AND COMPANY, LIMITED

GOOD RESULTS

The annual general meeting of this Company was held, on the 9th instant, in London, Mr. W. J. Clarke, the chairman, presiding. The following is an extract from his circulated statement:—

The accounts we are now considering are those of the company's Jubilee year. Once again results are good and indeed show an improvement on the previous year's figures. During the year there was a new issue in the form of 250,000 4½ per cent. £1 cumulative preference shares, and the whole transaction has been successful.

During the year we purchased a lighterage business, which is continuing to earn a good return on the capital invested. Our original lighterage department has been fully engaged but we are still short of craft. Our wharves have continued to be busy, and we are using to the utmost the accommodation that we have. Our tanker fleet of three vessels has been returned from Ministry of Transport service.

In road haulage, four of our companies passed under control in 1943, and were only released in August last. From the moment of de-control we found that our friends, old and new, have given us increasing support, which is a tribute to the efficiency of our service. With regard to the Transport Bill, we are as bitterly opposed to it as ever, not entirely because of the injustice of the terms of purchase, but because we know that the operation of a fleet or fleets of lorries with even the slightest amount of red tape—which prevents the quickest turn-round of the vehicles—is bound to result in breakdown. It has been our policy to spread our interests. This we are continuing to do boldly, yet carefully.

The report was adopted.

AGRICULTURAL MORTGAGE CORPORATION, LIMITED

Speaking at the 18th annual general meeting in London, Mr. E. J. Bunbury, M.C., chairman, said: The financial year ended on March 31, 1947, witnessed further expansion in our business, and £1,746,024 new loans granted, an increase of £636,296 over total completed in previous year. Loans for £514,309 approved by directors are in course of completion. All borrowers in good standing at former 5 per cent and 4½ per cent. rates of interest have been offered advantageous terms for conversion of loans to present 3½ per cent. rates, and £3,048,048 loans converted to date.

During the financial year legislation was introduced of utmost importance to all engaged in cultivation of the land. The Agriculture Bill in particular is designed to give greater stability to farming industry.

1946 harvest will long be remembered for appalling weather. In 1947 unprecedented snow, frost and flooding will telescope farming year into fewer weeks and again bring into sharp relief difficulties of our major industry.

Despite all difficulties, dairy industry continues to set up new records of production. Good work continues in establishment of new pastures and farmers now regard this as profitable farming expenditure, recognising that good grass is cheap food for all farm livestock. Need for production of poultry and eggs is now recognised and the corporation's credit facilities are available in case of poultry farms constituting proper economic units as for farms devoted to crop and livestock production.

The Government's recent economic survey brought us face to face with the gravity of the situation and we must concentrate in ever increasing degree on efficient production of food and reduce strain on our very limited dollar resources.

ASHANTI GOLDFIELDS CORPORATION, LIMITED

FRESH ORE BODIES

MAJOR-GENERAL SIR EDWARD L. SPEARS'S REVIEW

The 50th ordinary general meeting of Ashanti Goldfields Corporation Limited, was held, in London, on the 8th instant. The following are points from the speech of the chairman: Major-General Sir Edward L. Spears, K.B.E., C.B., M.C.

Accounts: Reserves amounted to £630,137, and creditors to £54,623. On the assets side expenditure on plant, machinery and buildings and main shaft had been less than depreciation. Sundry debtors were less by £68,000. The value of stores and plant increased by £77,366.

Investments: Investments in gilt-edged securities were at £902,211. Shares in other companies were less by £92,279 owing to sales. The total market value of their investments was £1,850,076.

Tax reserve certificates and cash were less by £50,000 and £274,350 respectively, due to increase in investments.

Bullion Reserve: The bullion reserve was now shown on the accounts to comply with the Cohen Committee's recommendation. The reserve was no new departure, as it enabled them to maintain regular monthly declarations.

Costs: Working costs were higher, partly because of an increase in the price of stores and spare parts, and partly because the output of the African employees had not risen with their wages.

Mechanisation, to save labour, was being considered to counter this.

Closed-down Mines: The final payment on closed-down mines amounted to £85,174.

Balance: The interim and final dividend, and the jubilee cash bonus, together with income tax, required £727,409. Deferred repairs needed £93,832, and £5,000 was transferred to the pension fund, leaving a balance of £212,941.

WORKING

New shafts: Owing to the war, sinking in the main shaft had been postponed. They were, however, going to sink an internal shaft to explore the main reef below No. 32 level.

Plans for the new north shaft were well forward. It would go down to No. 32 level, and connect with a crosscut from the internal shaft.

Fresh Ore-bodies: They had found high-grade ore in two shoots on No. 32 level, instead of the single ore-body on higher levels. Dr N. R. Junner, late director of the Gold Coast Geological Survey, had reported on the mine for them, and said that geological conditions at the bottom of the mine were the same as on higher levels, and that the ore-bodies would probably live to great depths.

New Plant: Good progress had been made with the erection of the new wet treatment plant. It should be working before the end of the year. They could then gradually increase their through-put, and they hoped the new plant would be more economical than the old dry crushing and roasting plant, which used great quantities of firewood. The old plant would, however, be kept in being till the new plant was running satisfactorily.

Ayeinm Mine: The first ore had been mined from Ayeinm.

Prospecting: The campaign, to prospect for new mines on their concession had had to be suspended in 1941, but by then they knew there might be large low-grade deposits

in the Sansu and Blackies areas. Now they had to find out their size, and whether their gold content justified working.

Ore Reserves: Ore Reserves were 1,684,292 tons of an average value of 21.1 dwt.

Stores: There had been difficulties in deliveries, and shipping time-tables were often erratic. This had been partly overcome by establishing an Engineers' Department in their London Office, to hasten and synchronise deliveries.

Staff: Morale on the mine was very fine. They had a splendid staff and everyone was cheerful, though the priority granted to officials' wives for passages was a real grievance. The African Staff was contented, and appreciated the Corporation's efforts to improve their conditions.

Quarterly Reports: Quarterly progress reports would be resumed at the end of June.

UNFAIR DIVIDEND TAX

New Dividend Tax: This was an unfair tax, particularly to gold mining. The Chancellor preferred profits to be ploughed back rather than distributed, and industry would be willing to plough back more if times were less uncertain. But industry was pardonably shy of a measure which might be intended to fatten it for the altar of nationalisation. They were not like a manufacturing concern, which widened its scope by enlarging its plant. They produced an essential commodity, gold, from a wasting asset, a mine, and there was no sense in investing in more machinery than was needed. They would hope that the Chancellor would re-read his own work, "The Principles of Public Finance," in which he had said such taxes were bad, and repeal this unsound and unjust measure.

The report and accounts were unanimously adopted.

BIBIANI (1927) LIMITED

OUTPUT INCREASE EXPECTED

MAJOR-GENERAL SIR EDWARD SPEARS'S ADDRESS

The twentieth ordinary general meeting of Bibiani (1927) Limited, was held in London on 8th instant.

The following are points from the speech of the chairman, Major-General Sir Edward L. Spears, K.B.E., C.B., M.C.

Accounts: Creditors were at £59,340, £10,391, less than last year. In the case of main shafts and of plant, machinery and buildings, the accounts now showed expenditure since the inception of the company, less depreciation over the same period. Mines development at £141,825 showed an increase of £10,194, while stores and plant on hand was at £250,185, an increase of £30,173. Sundry debtors were more by £18,000.

Investments: Investments in British Government Securities were up by £100,000. This accounted for the decrease of £134,000 in tax reserve certificates and cash, at £194,544.

Bullion Reserve: The chairman had dealt with this in his speech at the Ashanti Goldfields Corporation.

Costs: Working costs at 26s. 9d. per ton showed an increase of 1s. per ton, partly owing to the rise in the cost of spares and stores, and partly to the increased wages of the African staff. This rise in costs was being given great attention by the management.

Closed-down Mines: The final payment for closed-down mines amounted to £25,750.

Dividends: The interim and final dividend and provision for income tax amounted to £187,416. £13,409 worth of obsolete stores had been written off, and provision for deferred repairs and the staff assurance scheme made, amounting to £48,120 and £10,500 respectively. This left a balance of £136,863 to be carried forward.

WORKING

Tonnage treated: The amount of gold produced had increased in spite of a small reduction in the grade of ore. It was hoped during the current year to increase the tonnage to the mills to counter the rise in costs.

Development: Development footage had increased from 12,737 ft. to 15,050 ft. No. 1 Shaft South had been sunk to No. 14 level and the central shaft to No. 12 level, and driving to connect the two shafts was well forward.

DR. JUNNER'S REPORT

Dr. Junner, late director of the Gold Coast Geological Survey, had inspected the mine and reported that as they went deeper they would pass out of the present less productive zones and that the ore-body should persist in depth. He had also found a "crush-zone" carrying pay-values, above the old workings on Nos. 1 and 2 levels. This was being investigated.

Diamond drilling from No. 10 level had located payable ore to the east. Cross-cutting had confirmed this, and so far 150 ft. of ore had been proved, of average mine-grade with neither wall exposed and both ends payable.

Extraction: At 91.1 per cent. extraction had again improved.

Water Supply: Work was in hand on a 65,000,000 gallon reservoir. They were awaiting excavating machinery from the US to enable the work to be completed.

Welfare: They were now providing the Africans with the best possible food at the lowest price, which was much appreciated. The departmental committee of African employees were working well, enabling the management to keep in touch with the workers. On his visit to the mine during the year, he had received a number of deputations of African employees, who had demonstrated the happy relationship between management and workers. Enlargements and improvements had been made to the African Club, where he had been present at some very successful functions.

Staff Assurance: The scheme to provide additional security for the European staff was now complete, and they had a bulk policy of assurance on the lives of the staff. Every man's family would be protected if any misfortune befell him, and he would receive a lump sum on retiring, after the date the policy matured.

Passages for Wives: The only thing that marred the happiness of the European community was the difficulty of obtaining passages for wives. Although we were no longer at war, the Government still controlled 55 per cent. of all passages. Furthermore, although missionaries, etc., played a valuable part in the Government's educational scheme, their passages were provided out of the non-official quota. He could see no justification for giving officials a quota so large that even their children's nurses could travel, while there was seldom accommodation for the wives of the business community.

Staff: Difficulties due to the war were gradually being overcome, thanks to their fine staff.

Quarterly reports: Publication of quarterly progress reports was to be resumed at the end of June.

The report and accounts were unanimously adopted.

SPILLERS LIMITED

MILLING INDUSTRY STILL CONTROLLED

NEED FOR RETURN TO FREE MARKETS

FLOUR OUTPUT EXCEEDS PRE-WAR LEVELS

SIR MALCOLM ROBERTSON'S SURVEY

The sixtieth annual ordinary general meeting of Spillers, Limited, will be held, on the 30th instant, at the Abercorn Rooms, Great Eastern Hotel, London, E.C.

The following is the statement by the chairman, the Rt. Hon. Sir Malcolm A. Robertson, P.C., G.C.M.G., K.B.E., circulated with the report and accounts:—

This is the last occasion on which I shall preside over the annual general meeting of the company, as I shall retire next September under the age limit prescribed in the articles of association. It has been a great privilege and pleasure to act as chairman of your company, and I am most grateful to the stockholders, to my colleagues on the board, and to the managers, staff and workpeople for the continued and wholehearted support which they have given to me throughout the 17 years that I have occupied that office. I shall carry with me into retirement the pleasantest memories of a very happy association and the knowledge that the affairs of your company will be ably looked after by the present board.

CHANGES ON THE BOARD

Some formal reorganisation has been made within the board as intimated last year. Sir Norman Vernon and Mr Wilfred Vernon have been appointed managing directors; Sir Archibald Forbes has been appointed finance director; and Mr Hosegood and Mr Whittaker have been appointed executive directors.

I am glad to inform you that the board has unanimously invited Mr Arthur Whittaker to become chairman when I retire and he has accepted this invitation. Mr Whittaker has had a unique and distinguished career, and, having joined the company as a boy 47 years ago, he is familiar with every aspect of its business. I am sure you will agree that there could be no happier choice, and will associate yourselves with his colleagues and myself in congratulating both him and the company and wishing him the success in office which I am certain he will achieve.

An invitation is being extended to Mr Humphrey B. Vernon, M.C., at present our general manager for the North-West Area, to join the board in the autumn of this year. Mr Vernon has spent 26 years in the company's service, and he is well fitted by his experience and ability to undertake the wider responsibilities which he will assume on becoming a director.

As you know, we agreed, at the special request of the Government, to release Sir Archibald Forbes from his executive duties to become first chairman of the Iron and Steel Board, an organisation set up by agreement between the Government and that industry. We feel pleased and proud that one of our colleagues should have been chosen for this important task.

Mr Wilfred Vernon has been elected vice-president of the National Association of British and Irish Millers and will become

president next month. We are delighted that this signal honour should have been conferred upon one of our number by the milling industry and wish Mr Vernon a highly successful period of office.

THE ACCOUNTS

I now pass to the accounts for the year ended January 31, 1946. On this occasion you have before you, in addition to the usual accounts of the company, consolidated accounts of the parent company and its subsidiaries. Both sets of accounts are still approximate in the sense that the results of the flour milling operations carried on under Government control are still subject to final agreement with the Ministry of Food, and this in turn delays a final determination of the taxation position. Satisfactory progress continues to be made with the ascertainment of these figures, but you will appreciate that the matter is affected by circumstances outside the company's control. Although the directors would have preferred to submit the first consolidated accounts upon a less provisional basis, they felt that there was now sufficient information available to present a reasonably accurate picture of the position of the Group as a whole to the stockholders. This has accordingly been done with the foregoing reservation.

The fixed operating assets of the parent company stand at £2,432,000 and those of the Group as a whole at £3,503,000, in both cases after providing for depreciation and obsolescence, but before making any adjustment for war damage. Their replacement value would be considerably higher to-day, and the mounting cost of capital construction is of material significance, since the replacement of these assets is, in the ultimate, essential to the continuity of operations. The directors have concluded that further account must be taken of the increased level of capital cost in providing for depreciation and obsolescence, and have accordingly increased the annual provision in the accounts of the parent company from £200,000 to £275,000, as shown in the profit and loss account.

Moreover, the directors would like to emphasise that not only this factor, but the whole question of trading margins, must be reviewed in relationship to the general rise in price levels and the additional capital which will have to be employed to maintain the same scale of operations. The increase in the item for investments in subsidiary companies in the parent company's balance-sheet represents the cost of acquiring new interests after taking credit for certain sales and surpluses on realisation of other interests and assets.

STRONG POSITION

The net surplus of current assets over current liabilities and provisions is £3,607,000 in the case of the parent company and £4,786,000 for the Group as a whole—a position of considerable strength.

It has been decided that the bad debt and investment reserves of the parent company can now be amalgamated with the general reserve, which, with the addition of an appropriation of £50,000 from the profit and loss account for the year ended January 31, 1946, now stands at £1,250,000. The insurance reserve remains as before at £500,000. A new reserve against investments in subsidiary companies has been created by transferring

thereto special dividends from subsidiary companies in respect of periods down to January 31, 1945, and amounting to £500,000. The total surplus in the way of reserves and undistributed profits is £3,717,000 for the parent company and £4,362,000 for the Group. It is of interest to observe that the total capital and surplus employed in the business on the basis of book values is just over £8½ million applicable to members of the parent company and with just under a further £1,000,000 applicable to minority shareholders—i.e., nearly £9½ million in all.

RESULT OF YEAR'S OPERATIONS

Dealing now with the earnings for the year ended January 31, 1946, it will be seen that the trading surplus of the parent company (before providing for depreciation and obsolescence) and the income from outside investments are approximately the same as for the previous year. After bringing in dividends from subsidiary companies in respect of their years ending on or within the year to January 31, 1946, and making the necessary provisions for depreciation and obsolescence and income-tax, the net profit carried to the appropriation account is £373,000, as against £314,000. Of this £279,000 is absorbed by the dividends already approved and paid for the year, leaving £94,000, of which it is proposed that £50,000 should be transferred to the general reserve and the balance of £44,000 added to the carry forward, making this £267,000.

The consolidated net earnings of the Group for the same period, after providing for depreciation and taxation, amounted to £417,000. Appropriations for dividends and reserves account for £341,000 and the consolidated balance carried forward in the accounts of the parent and subsidiary companies is £389,000.

I have explained to you in previous years that, since the outbreak of war, the parent company has drawn nothing material from the subsidiary companies by way of dividend. The directors considered this the appropriate policy, not only because of the difficulty of ascertaining the results of the subsidiary companies under the control arrangements, but also because of the desirability of conserving resources to meet the heavy constructional and re-equipment programme which lay ahead, and to provide against the uncertainties of trading in these times. The conservation of the profits earned by the subsidiary companies down to January 31, 1945, is not affected by the special dividends declared thereout, and amounting to £502,000 net, since these merely represent a transfer from reserves in the subsidiary companies' accounts to the new reserve of £500,000 in the parent company's accounts, to which I have already referred. The balance of some £2,000 has been credited to the provision for contingencies in the parent company.

DIVIDEND AND BONUS

Having reviewed the consolidated results down to January 31, 1946, and having regard to the extent of the ploughing back of resources which it has been the company's policy to follow for many years, the directors consider that a stage has now been reached when the available profits of the parent company should be supplemented by drawing upon those of the subsidiaries, and further that the stockholders should now derive some direct return from the continued and substantial investment in the acquisition and development of these interests over the last ten years. Accordingly, the directors submit for the stockholders' approval the payment of dividends for the year ended January 31, 1947, at the same rate as for the previous year with the addition of a cash bonus of 2½ per cent. I cannot, of course, predict whether it will be possible to maintain the distribution at this level.

I hope that the state of the company's affairs as portrayed in these accounts will

commend itself to the stockholders, and I think we can all be justly proud of the company's record of service, both in peace and in war. Today, we labour under the anxieties deriving from the economic consequences of the war, not least of which is the inevitable frustration of enterprise resulting from existing shortages of manpower, materials and foreign exchange, and the resulting need for their rationing by Government.

GOVERNMENT PURCHASES

The milling industry itself continues to operate under control, and this will remain in being at least until 1948. This is inescapable under current conditions, but your directors will continue to press for its relaxation at the earliest practicable moment as we remain convinced that this industry can only be operated economically and efficiently in the long term by the restoration of free markets, and a return to trading under full competitive conditions. I would, in particular, record our grave concern regarding the disposition to purchase wheat and grain under long-term contracts between Governments.

I have to report that a little progress has been made with the obtaining of the necessary licences to carry out reconstruction of capacity destroyed during the war, but only to the extent of preparatory work in certain instances. The delay in the ability to proceed with the work continues to be a main source of anxiety. Our output of flour continues to exceed the pre-war level, but restrictions principally concerning the supply of raw materials still affect the output of other commodities.

On your behalf and that of the board I should like to commend most highly the manner in which all our managers, staff and workpeople have carried out their duties during the past year, and our best thanks are due to them all.

SIMMS MOTOR UNITS, LIMITED

OVERFLOWING ORDER BOOK

The twenty-seventh ordinary general meeting of Simms Motor Units, Limited, was held, on the 20th instant, in London, Mr Tom Thornycroft (the chairman) presiding.

The following is an extract from his circulated speech:—

During the past year we have been faced with many difficulties, even more than I thought possible. We have had a general shortage of raw material throughout the country. This has made it impossible to obtain supplies within reasonable time or with any certainty of delivery.

We have purchased the buildings erected for the company by the Ministry of Aircraft Production and the Admiralty. One of these buildings, which was erected for the manufacture of Simms' aero magneto, which proved to be the finest aero magneto during the war, has now been converted for the production of fuel injection equipment, there being a great future in this work.

The selling price of our products is on the average only about 40 per cent. above pre-war; the cost of our purchased supplies has increased to a far greater extent than this and the cost of labour is nearly double; therefore you will see that we have made definite progress in the efficiency of our organisation.

We have at present orders for a long time ahead, and the only limitation to our production during the past year, and for the year ahead, is material. Given adequate supplies of materials, we could usefully employ a great deal more labour. We have a large and overflowing order book. Our export manager is at present in the South American Continent, and we have every hope of doing considerable business there.

The report was adopted.

PINCHIN, JOHNSON AND COMPANY, LIMITED

RECORD SALES AND PROFITS

FURTHER EXPANSION

MR C. G. HEYWOOD'S STATEMENT

The annual general meeting of Pinchin, Johnson and Company, Limited, was held, on the 20th instant, at Tigbourne Court, Witley, Surrey. Mr C. G. Heywood (the chairman) presided.

The directors' report stated that all subsidiary companies in Great Britain had been liquidated during the year and the accounts now presented showed a consolidated position. The 1946 net profit figure and the total value of sales both represented a record in the history of the company, whilst the volume of production was successfully maintained in spite of various continued difficulties and scarcity of certain raw materials.

Exports showed a very considerable increase and all overseas units continued to operate successfully and expand their businesses.

The chairman's statement was as follows:—Last year I emphasised very particularly the fact that the demands for our products were enormous, but that the limiting factor to our productivity was in the raw material availability. I ventured to make certain suggestions in that statement to the effect that during the shortage of raw material there should be certain directives to our industry that would at least ensure the full operation of the manufacturing industries that are dependent upon the paint industry for surface coatings because, not only was great employment given to the operatives engaged in manufacturing industries, but on the export of the manufactured products this country's importation policy depended.

IMPORTANCE OF THE INDUSTRY

I would state that the surface coating at the end of industrial effort is just as important in the national economy, as power is, as a motivating force, at the beginning.

Of equal importance, possibly, to the manufacturing industries are the transport facilities of the country, whether they be road, rail, sea, or air, all of which are large consumers of paint and varnish products. Some of these paint and varnish products are essential even to the functioning of transport; for example, electrical energy is incapable of being produced or harnessed unless insulation is forthcoming, and your company is one of the largest specialist suppliers of insulating products in the United Kingdom.

Obviously, too, the condition of rolling stock, through the enforced neglect of repainting during the past seven years, requires now almost a complete removal of the existing paintwork and a repainting schedule from the bottom upwards. All this is quite apart and distinct from the new construction that is needed in order to bring our transport facilities up to date and in line with modern requirements.

URGENT DEMANDS

As a company we have been to the fore in battling for the highest priority for both industrial and transport paint needs, believing these to be of higher national importance and urgency than the provision of products that are designed for housing, whether for new or existing structure.

It is as well to emphasise that the paint industry is, in reality, three great industries. The first is the painter industry, in which many ancient and well tried methods and materials are still used. Progress of the paint type product, from a technical aspect, has

not been as fast as in the industrial and transport fields.

The second great industry is, of course, the specialist industry that deals with manufacturing and industrial surface coats. Here the demands of mass productions have been for functional properties of rapid drying, great adhesion, high durability, and other factors, all of which have been met by the progressive technical development which has taken place in paint technology.

The third division is that specialist division that deals with the needs of the transportation industries. Here, obviously, there have been rapid strides in technical progress to make more durable and quicker drying products, in line with the greater stress to which transportation equipment is now subjected.

COMMODITY BOTTLE-NECKS

Concerning the raw material situation, we have found it highly desirable, with our unique organisation covering so much of the world, to check up the economic trends, by which means we are able to forecast that point at which the present bottlenecks are likely to dissolve away. It is desirable that the clearance of bottlenecks be gradual and balanced, and not merely on one or other of the available commodities, leaving an ill-balanced position with other commodities still in short supply. One important non-commodity in short supply is containers. Paint and varnish are not products that can be packaged in cartons and paper bags. This point should be recognised when shortages of tinplate affect many industries, because there are many industries that need not pack their product, for home distribution, in tinplate at all. If this fact were considered, and sensible executive action taken, one of the present bottlenecks of the paint industry would be at least brought into reasonable proportions.

The principal commodity bottlenecks to higher productivity in the paint industry are unquestionably those caused by drying oils and white pigments. Drying oils are indirectly the product of agricultural activity in the main, and it has been quite a shock for us in this industry to realise how little of the Empire has been surveyed for the cultivation of oil seeds or oil beans or oil nuts, the extract or crush of which would have added to the drying oil position, and rendered us partly, if not entirely, independent of non-Empire sources of supply.

COMPANY'S TECHNICAL ACHIEVEMENT

Our own technical people have done miracles, if I may say so, in splitting non-drying, or semidrying oils, formerly of little value to paint technology, into two or more fractions; one of which, and generally the largest fraction, produces drying oils fully equal to the normal performance obtained with linseed and, in some cases, with new and highly desirable qualities, in which linseed oil itself is singularly lacking.

I will not burden you with technical detail, but we are working now on processes which eliminate undesirable elements from these non-drying and semi-drying oils, giving us, on the one hand, a useful paint-making oil, and on the other an oil which can readily find a market with other industries, thus rendering the process entirely economic.

TESTING OF PRODUCTS

Reference has been made on previous occasions to the high value we place upon

our research, and it is in these recent developments that we see the reward for our continued expenditure. Fortunately, too, that factual policy that motivates our research workers, wherein nothing is permitted to be passed unless the time and durability factors are worked out from actual facts, leads us to other most useful experiments. We have built test stations which are probably without superior in the world today. We have marine test stations as well as land stations and also have the use of a small public railway with miniature gauge whose rolling stock is exclusively placed at our disposal for experimental testing of developments and improvements on our standard practices.

All this keeps our applied research—as distinct from fundamental—on very practical lines and gives our selling force immense confidence in the merits of the goods we produce.

In addition to this activity in the U.K., we have parallel activity taking place in the laboratories of our associate and subsidiary enterprises on the Continent, India, Australia, America and South America. From this you will see how we are able, accurately, I think, to forecast the shape of things to come, and the economic trends, in so far as our raw material supplies are concerned.

FURTHER EXPANSION

I am pleased to state that in the year 1946 we completed very successful arrangements in South Africa, since when we have acquired the unissued ordinary share capital at an economic figure of the firm of Herbert Evans and Company, Limited, of Johannesburg, and, with that company as partners, we have formed a new company known as Pinchin, Johnson and Associates (South Africa) Pty., Limited, to make certain specialities in Africa and to make available, through our operations, the technique which is ours, to Herbert Evans and Co.

We believe this will prove a most successful overseas set-up, and when other extensions which we intend to develop are complete, we can say that we have covered every territory in the present worth-while paint world.

We feel that our policy of major investment outside Great Britain should be directed largely to the Empire, and we are planning our developments on those lines. We also recognise and realise the tremendous technical resources which are available to us from our associates in America, and shall, if possible, increase our commitments in that country, knowing full well that such investment will bring us not only financial return but highly technical co-operation at all times.

As with other partnerships, we consider ourselves extremely fortunate in the choice of our partners there.

In the year 1945 we also completed development arrangements with our Swiss partnership. This little country, with its sane economic outlook, contributes not a little in our technical resources, quite apart from the financial return on our investment.

RECORD NET PROFITS

A great deal still remains to perfect our United Kingdom organisation. Regrettable and, in my judgment, inexcusable delays still hamper us with the rehabilitation of our lost capacity and extensions. This company, as you know, did a tremendous share of the total war paint effort and yet, at the same time, suffered grievous harm in plant and buildings.

Dealing specifically with the accounts for the year, it should be noted that the net profits and sales, both for home and export, are, monetarily, the highest ever recorded by our company.

It is, of course, perfectly true that, in addition to labour costs, selling prices are directly and indirectly geared to commodity prices, and what we have to pay to the Government who are, in effect, the supplying agent, has to be passed on to the consumer. We regret this enforced raising of prices, but we are powerless because against our wishes we are not the masters of our supply situation.

During the war, as a very conservative policy, we reduced the dividend on the Ordinary shares to approximately one-half, which gave a poor net return to shareholders, particularly when taxation increase and the reduced purchasing power of the pound are taken into account. It now affords us considerable satisfaction to recommend a dividend which will compensate somewhat for the sacrifices of the past. At this point I feel it appropriate to tell you that all the company's workers and staff received a prosperity bonus on their wages and salaries for 1946, which your company was very pleased to pay in December last. It was well received by all.

OVERSEAS SURVEY

With regard to the future, I am disturbed at the loss of markets to many British industries, simply because many of the countries formerly importers of British goods are now themselves taking steps to employ their own labour in the secondary industries.

This is an economic trend which it is impossible to ignore, but it does mean the loss of certain types of consumer exports from this country. On the other hand I fully believe that if Britain will produce highly skilled products of design and craftsmanship they will always be exported and be readily received into consumer markets in spite of the trend towards national self-sufficiency in those markets.

STEEL BROTHERS AND COMPANY, LIMITED

CONTINUED PROGRESS

CONDITIONS IN FAR EAST

MR J. K. MICHIE ON REPARATIONS

The fifty-sixth annual ordinary general meeting of Steel Brothers and Company, Limited, will be held, on the 29th instant, at Winchester House, Old Broad Street, London, E.C.

The following is the statement by the chairman and managing director, Mr J. K. Michie, which has been circulated with the report and accounts:—

A year of painful post-war adjustment has gone by since I last addressed you, and I am happy to be able to report that in our case it was also one of continued progress towards the re-establishment of the company's financial position and trading activities.

On December 31, 1946, dividends on the £800,000 six per cent. cumulative first preference stock were brought up to date by payments for the three years in arrear. We also paid dividends on the £1,000,000 seven and a half per cent. cumulative second preference stock for the years 1942 and 1943, leaving three years in arrear. The accounts now before you show how this was made possible. It was largely accomplished by our own exertions, but we also had the benefit of recoveries of trading assets in Burma and further payments against our claims under the Burma War Risks (Goods) Insurance Scheme, totalling in all nearly £75,000. Our losses in trading assets, as you will see, are now reduced to £776,876 from the original figure of £919,818. In all the circumstances, the results are satisfactory for, as you know, until well into the year we were only in process of getting back to Burma and, as was inevitable, this major operation also carried with it very considerable expenditure.

In this field I am sure your company is progressing on the right lines by establishing manufacturing and trading companies overseas, whilst at the same time using every endeavour to export more and more goods of as high a grade as possible.

ENCOURAGING OUTLOOK

In closing my review for the past year I take the opportunity of thanking all the company's employees, management staff, and workers, for the grand way in which they have pulled together for the welfare of all concerned.

Regarding 1947, you will notice from the accounts that your directors have appropriated £100,000, after tax, to provide for loss which may have accrued during the stoppage occasioned by the unfortunate fuel crisis. This is an amount which I feel confident will amply meet the situation, especially as I am glad to be able to inform you that within two weeks of our factories resuming work after the stoppage production had recovered to pre-stoppage proportions. This is very encouraging for the future.

The report and accounts for the year 1946 were adopted, and a final dividend of 15 per cent. and 5 per cent. bonus (both, less tax) was declared on the Ordinary shares, making a total of 25 per cent., less tax, for the year, against 15 per cent. for 1945.

The retiring directors were re-elected and the auditors reappointed.

TRADING ACTIVITIES

In Burma we have carried out the parts and functions allotted to us under the agricultural, timber, and importing projects inaugurated by the Government of Burma, mainly as agents of the Government, and we have engaged in trading wherever that was permitted and possible. In this country, in India and Ceylon, in Palestine, Syria and Lebanon directly and through our subsidiaries our established agency and trading activities were vigorously pursued. In Siam our subsidiary company reopened its office in Bangkok and we continued to share in the Siam rice buying agency appointed by the Ministry of Food. Each contributed its quota to the total result.

A fresh departure was the opening of an office in Hongkong, partly to re-establish and to develop our China business previously carried on from Kunming via Burma, but also with the object of widening the scope of our business. An office has also been opened in Milan primarily in connection with our Near Eastern business. Nowhere have conditions been easy, and it says much for your staff at home and overseas that these figures can be presented.

Both in Burma and India the transition from the old status as part of the Empire to a new national political stature as yet not clearly defined—except that full freedom has been offered—is in process. We believe that sound business capable of finding and securing the best markets for their produce and of obtaining the most suitable goods for their needs will continue to be essential to both countries and these services we shall continue to offer.

In practically every country in the world national aspirations are increasingly evident and with these we have much sympathy.

The danger of too enthusiastic a pursuit of this aim lies in the possibility of measures being taken in the name of nationalism which would be to the long term disadvantage of the country or countries concerned.

QUESTION OF WAR DAMAGE

The question of war damage compensation for losses in Burma is I regret still unresolved but at long last an assessing commission was set up in Burma in January of this year and its report on the extent of the damage should now not be long delayed. Most recent news is that the commission hope to make an interim report in July. We must hope that consideration of the basis of settlement will be arrived at before the end of this year. It is now over five years since our losses were suffered and nearly two since Burma was liberated from the Japanese, so we can hardly be accused of unreasonable impatience. The promise in principle made by His Majesty's Government in 1943 still stands and there is no doubt that in the interests of Burma and this country a settlement is a matter of urgency. To many of the sufferers it is more than that: it is vital and to all a matter of common justice. The figure of trading losses I have given is only a small part of our claim in respect of the parent company and its subsidiaries and a settlement is therefore essential to our prosperity and to the interests of the preferred ordinary and deferred ordinary shareholders who are still carrying the burden of complete loss of income.

GOVERNMENT'S ATTITUDE

We must rely on the good faith of our Government and particularly on the principle governing war damage losses in this country as laid down by Lord Simon, the then Chancellor of the Exchequer, when *inter alia* he said in the House of Commons on January 31, 1939: "The general principle which the Government think should be applied is that such loss or injury ought not to be treated as merely the concern of those who directly suffer it, but must be regarded as falling upon the community as a whole and consequently as constituting a proper subject for compensation from public funds. In other words, the loss ought not to be left to lie where it happens to fall." It is, I think, opportune and appropriate to remind ourselves and the Government of the spirit of the promise made to the Hay Committee by the Secretary of State for the Colonies in a letter dated January 12, 1943. This letter was in reply to one in which Sir John Hay asked for a more clearly defined statement

NOTICES

APPLICATIONS are invited for the post of **CHIEF EXECUTIVE OFFICER, LAGOS DEVELOPMENT BOARD, NIGERIA.** The Board has been set up to undertake the re-planning of Lagos and its work will involve slum clearance, land reclamation and development on a large scale. The officer selected will be directly employed by the Board and will be responsible for executing its policy in both technical and administrative matters. Candidates should not be below the age of 40 and must be fully qualified Civil Engineers. They must have had wide experience of Civil Engineering construction, including dredging and land reclamation in swampy areas, and should possess a sound knowledge of port development work. They should be familiar with the preparation and execution of town-planning schemes and capable of dealing, as manager, with the business, legal and financial aspects of the Board's work.

The appointment will be on agreement for two tours of 18 months each in the first instance, and will carry a salary varying from £2,500 to £3,000 per annum, according to age, qualifications and experience. Free furnished quarters will be provided, together with free passages for the officer and, if married, for his wife on first appointment and on leave which is usually granted after not more than 18 months' resident service at the rate of seven days for each completed month of resident service. Income Tax at Nigerian rates only.

Candidates should write at once to the Director of Recruitment (Colonial Service), Colonial Office, 15, Victoria Street, London, S.W.1, stating age, qualifications and experience.

TRANSPORT MANAGER requires change. Sound knowledge of all branches economics, Oxford P.O.W. certificate for general economics, money and finance, international trade and industrial organization. Knowledge of book-keeping and salesmanship. Extensive study of road transport. Preliminary study of statistics.—Box 475.

COMMERCIAL EXECUTIVE desires change. 20 years with one of the largest electrical manufacturers in country, specialising in thermionic products. Full control over business, including financial responsibility for research.—Box 480.

MOBILE CRANE, diesel-driven, new condition, lifts 2 tons on double rope.—Box 478.

than that of qualified intention previously given on October 27, 1942.

The appropriate extract from His Majesty's Government's reply reads as follows: "As regards the request that His Majesty's Government should in conjunction with the local governments assume responsibility for all loss and damage not recoverable under any insurance schemes, the assurance quoted in the letter of October 27th is an undertaking of the most far-reaching character to which your committee appear to fail entirely to attribute the weight which it deserves." We must believe that this paragraph means what it says. As readers of *Hansard* will have seen, the two extracts I have made were quoted by Mr Walter Fletcher, MP, in his contribution to the debate on Burma on May 2nd. In that debate others, particularly Mr R. A. Butler, also put forward the case for war damage compensation, so that we at least know it is being kept well before His Majesty's Government.

THE OUTLOOK

In these uncertain times it is dangerous to try to forecast future prospects. All I can say is that if no unforeseeable disabilities or restraints are put upon us we hope during 1947 to make further steady progress. But Burma's agriculture is still very far from being on its feet and as our rice business and the trade and industry of our subsidiary, the Consolidated Cotton and Oil Mills, Ltd., depend on agricultural produce for their raw materials and their turnover, the full revival of these parts of our business is, I fear, still some years away. On the other hand, we have certain extensions of our business in train. Recently we acquired the Strand Hotel, Rangoon, as an investment and we are also taking a majority interest in a company now being formed to run it as a business. As hotel accommodation in Rangoon is small in comparison with needs, prospects are reasonably good.

There is one point arising out of the Budget proposals just announced to which I wish to draw attention. N.D.C. has been abolished and a "profits tax" of 1s. in the £ on undistributed profits and 2s. 6d. in the £ on all distributed profits has been imposed. As this tax is not recoverable from Preference and Preferred Ordinary dividends it will all fall on the Deferred Ordinary shareholders. This does not affect them immediately as—unfortunately—we cannot pay them dividends, but when we can, their yield will be reduced by 5 per cent. per annum, not because of the incidence of the profits tax on their own dividends but because of the amount payable at 2s. 6d. in the £ on the £183,000 per annum

of prior charges. I admit that the Chancellor of the Exchequer has nothing to do with the capital structure of our or any other company, but as he claims that he should be able to borrow at 2½ per cent. per annum, perhaps the fact that in our case he will take away twice that rate from those who bear the greatest risk may help to bring home to him that the tax is very highly discriminatory and inequitable. Our staff has continued to work with their usual whole-hearted enthusiasm and will undoubtedly make the utmost use of any opportunities of furthering our business that may come their way.

JOHNSON AND PHILLIPS, LIMITED

GOOD RESULTS AND PROSPECTS

The forty-second annual general meeting of Johnson & Phillips, Limited, was held in London, on the 22nd instant.

Mr. G. Leslie Wates, J.P., chairman and joint managing director, said that the results presented were satisfactory and the net profit was among the best they had reported. The immediate prospects were good; nevertheless, the long-term position of their industry as a whole gave the board some anxiety. The conduct of a manufacturing business such as theirs had become increasingly difficult throughout 1946. Even those difficulties had since been overshadowed, and it was impossible to say whether they had yet reached their peak. Their order book was the largest in the history of the company, but shortages of material and labour had been such that there had been no possibility of accelerating output to keep pace with the increasing volume of business being offered to them.

The demand for electrical products certainly seemed almost limitless at the moment, but they must envisage the time when Central Europe would again be producing and when the great industries of the U.S.A. would have overtaken their home demand. By that time it would be a matter of life and death for British industries to have brought their manufacturing technique to the highest level of efficiency so that their costs would compare satisfactorily with those ruling in other parts of the world.

The trading profit at £373,296 was up by £60,000, which he thought demonstrated that they had successfully got over the transition period from war to peace. They recommended that the dividend should be at the same rate as during recent years, namely, 15 per cent. for the year.

The report was adopted.

EXECUTIVE POSITION. Solicitor with wide experience in the law wishes to consider an executive appointment offering scope for ability and sound prospects. Age 38.—Box 446.

B. COMM. (LONDON), woman, 7 years' experience international and viewing, committee work, research, reporting, with politician, social administrator or industrialist.—Box 483.

LARGE company manufacturing and distributing textiles, plastics, etc., requires the full-time services of a senior qualified Economist-Statistician at its Head Office in London. Applicants should be about 35 years of age, hold University or equivalent degree, and have first-class experience in the compilation and interpretation of statistics for management purposes. Salary according to age and experience.—Write full particulars to Box 484.

MARKET and Advertising Research Assistant and deputy to head of department required, preferably with experience in an advertising agency research department.—Apply, with full details, to Box 485.

ENGLISHMAN (32), holding honours degree in Economics and Law, possessing a knowledge of industry and at present holding substantial industrial relations executive position abroad, wishes to seek employment in the United Kingdom, preferably as Assistant to Company Secretary with a view to promotion. Present salary £1,600 per annum.—Box 486.

SALES MANAGER for the United Kingdom wanted by Genatosan, Ltd., Manufacturers of Medicinal, Pharmaceutical and Fine Chemicals. The position can only be filled by a man with first-class qualifications and wide experience. Applications should give particulars of experience over the past 10 years, and be sent to Secretary, Genatosan, Ltd., Loughborough. All letters will be treated in confidence.

YOUNG FRENCHMAN is desirous securing residence with good class English family with view to perfecting English, for period July-October. Own family resident France. Willing to offer similar service in exchange.—Reply Box 469.

GOVERNMENT RETURNS

For the week ended May 17, 1947, total ordinary revenue was £49,751,560, against ordinary expenditure of £42,834,954 and issues to sinking funds, £150,000. Thus, including sinking fund allocations of £1,159,015, the surplus accrued since April 1st is £167,602,655 against a deficit of £140,624,000 for the corresponding period a year ago.

ORDINARY AND SELF-BALANCING REVENUE AND EXPENDITURE

(1946 Accounts)

UNIVERSITY OF MELBOURNE

RITCHIE CHAIR OF RESEARCH IN ECONOMICS.

Applications are invited for the Ritchie Chair of Research in Economics. Salary will be £1,500 (Australian) per annum, plus £66 per annum cost-of-living adjustment. The position is for a fixed period of three years, but may then be extended. Reasonable travelling expenses payable by the University. Further information may be obtained from the Secretary, Universities Bureau of the British Empire, 21, Gordon Square, London, W.C.1. Closing date for the receipt of applications (in Melbourne) is June 30th, 1947.

The Universities Bureau of the British Empire, 8, Park Street, London, W.1, has been requested to announce the following vacancy:—

THE UNIVERSITY OF SYDNEY

CHAIR OF GOVERNMENT AND PUBLIC ADMINISTRATION.

The Senate will shortly proceed to the appointment to the Chair of Government and Public Administration which will become vacant upon the retirement of Professor F. A. Bland. It will be glad to hear before July 31, 1947, from anyone who would like to be considered for the appointment. The salary is £1,250 per annum, but negotiations for a general increase in University salaries are in progress. There is retirement provision on the lines of F.S.S.U. and, in addition, the University pays £400 by way of annuity. One year's leave is granted on full pay every seven years or thereabouts. Travelling expenses will be paid as arranged at time of appointment. Applications are to be sent direct to G. DALE, Acting Registrar, The University of Sydney, N.S.W.

UNIVERSITY COLLEGE OF SWANSEA

DIPLOMA IN SOCIAL SCIENCE.

The College offers, in October, 1947, a full-time course extending over two Sessions leading to the Diploma in Social Science. For graduates the length of the course may be reduced to one Session. Full details and forms of application may be obtained from the Registrar, University College, Singleton Park, Swansea.

UNIVERSITY COLLEGE OF WALES, ABERYSTWYTH

The following appointments will shortly be made in the Department of Economics and Political Science:—

(a) Lecturer on the scale of salary £500 to £750 per annum.
(b) Assistant Lecturer at a salary of £150 per annum.
Applications should be sent to the Registrar, from whom further particulars may be obtained, not later than the 30th June, 1947.

GIRTON COLLEGE, CAMBRIDGE.—Applications are invited for the post of College Accountant. It is desirable, but not essential, that candidates should hold a University Degree, but they must be women suitably qualified by professional training and/or experience. Salary, privileges of residence and other emoluments within lecturers' scale according to qualifications.—Applications, together with copies of recent testimonials should be addressed to the Bursar.

Dollars for Europe?

THE Chancellor of the Exchequer was certainly not exaggerating when he described the problem of bridging the gap between imports and exports as "by far the greatest and gravest of the immediate economic problems to be faced," on which depended "the whole future of our country and the standard of life we shall enjoy in the years to come." Mr Dalton was speaking of the British problem. But his canvas might well have been much larger. The same spectre stands at M. Ramadier's elbow as he struggles with the spiral of wages and prices in France. It haunts Signor de Gasperi's efforts to form a new Italian cabinet. It mocks all the efforts that are being made to keep the people of Western Germany from starvation and utter despair. More and more, as week succeeds week, the whole of European life is being overshadowed by the Great Dollar Shortage.

The margin between recovery and collapse throughout Western Europe is dependent at this moment upon massive imports from the United States. The economic dislocation left behind by the second German war is proving to be far greater and far less tractable than the legacy of the first. There is no quick return to "normalcy" this time; indeed, in many respects, conditions are getting worse, not better. The International Emergency Food Council, at its fourth meeting, has declared that food stocks are at "their lowest ebb" and that next winter's shortages may be the worst yet experienced. The prospect that faces the British people is both more and less promising than those with which the Continental nations are wrestling. Britain is fortunate in having access to a line of dollar credits which, even on the worst supposition, will last through next winter. But, on the other hand, Britain is so much more dependent on imports for supplies both of food and of raw materials that a complete lack of means of payment would be much more painful here than elsewhere. The seriousness of the position is still not realised; there are still voices that can say, as Miss Jennie Lee said at Margate on Wednesday, "let us decide not to go to America begging again." But the decision is not Miss Lee's to take; it is not the Labour Party's; it will not even, in the end, be the Government's. The decision will be taken by the unpleasant facts. It is wholly right that nobody in Britain should, in Mr Dalton's words, "count on raising any further overseas credits" and that, at this stage, the problem should be envisaged as one of increasing exports and cutting imports until they balance. But those who think this is a policy that is easy or agreeable, or that it is possible at all without bringing on a first-class economic crisis, should be invited to study the facts that are set out in another article in this issue and to say exactly which imports they would cut out—and how they would manage to increase the activity of the export trades while reducing their supplies of raw materials and the rations of their workers. It is very unpleasant to have to admit such a large dependence on borrowed dollars so long after the end of the war. But unpleasant facts are no less facts for being unpleasant.

If the reality of the Dollar Crisis is so little appreciated by those who would most suffer from it, there is little cause for wonder that it is still

less appreciated in America. It is not, indeed, wholly ignored. There have been several signs in recent weeks that the Administration is becoming increasingly worried about it. Mr Dean Acheson's last act before leaving office was to remind the American people of their economic responsibilities. The Secretary of State has set up within the State Department a special planning staff charged with the responsibility of estimating the world's needs and relating them to American resources, and there is talk of a special session of Congress to be summoned in the autumn to consider a comprehensive programme. Moreover, private citizens of influence and vision are busy issuing their warnings. Mr Walter Lippman, for instance, has argued that only the resumption of something on the scale of Lend-Lease can meet the crisis. And Mr Harold Stassen, returning from his European tour, has boldly urged the United States to devote one-tenth of its annual production to a ten-year plan for rebuilding the world, specifically renouncing any right to repayment in "dollars or manufactured goods."

*

But these voices are not representative of the majority of American public opinion. Mr Randolph Burgess, in his recent speech to the American Chamber of Commerce in London, was accurately reflecting the mood of his colleagues of the financial community when he poured cold water on the notion that commercial lending could be relied upon to close the enormous gap in the American balance of payments. American investors, he pointed out, "took an awful shellacking" over foreign loans after the first world war. Nor are the existing Governmental finance institutions likely to be much more helpful. The Export-Import Bank has now returned to its proper field—"a useful but limited area to supplement and encourage bank financing of trade . . . its charter excludes reconstruction loans." The International Bank's lending powers depend very largely on its borrowing powers, and

the buyer of debentures wants to know what happens when the loans go to about \$4 billion. The scepticism about foreign loans is great enough, so that it is a real and not imaginary problem. It will, in fact, be one reason why you will find the Bank operating with care and conservatism, more so than some Europeans will like.

Mr Burgess would have been more helpful if, in addition to accurate reflection of Wall Street opinion, he had followed his logic to the obvious conclusion—that if the dollar gap cannot be filled privately and commercially, it will have to be filled governmentally and non-commercially. But any such conclusion, however logical it may be, runs entirely counter to the dominant philosophy of the moment in America. There is certainly no sign that any member of Congress is following logic to any such conclusion. On the contrary, the mood of Congress seems to be more Coolidgean than Rooseveltian. The Senate has been persuaded only with the greatest difficulty—and the House of Representatives has not yet been persuaded at all—to refrain from enacting a sharp increase in the tariff on raw wool, and thus bringing the Geneva Conference to an abrupt end. Moreover, Congress is economy-minded, and the provision of further millions—let alone billions—for foreign countries could hardly be further from its intentions.

American opinion, and the policy of the United States, can swing round very rapidly. They have done so before. Indeed, there is something in the present situation that is very reminiscent of 1940, when also it was very clear that Europe could only be saved by America, but nobody could see how America could be persuaded, in time, to undertake the rescue operation. In 1940 the persuasion was done by a clear proof of the dire necessity, and by a no less clear demonstration that American efforts would not be in vain nor American assistance wasted. In the crisis of 1947, perhaps it is the second demonstration

that is the more necessary. It is probably true at the present moment that American opinion needs more reassurance on the ultimate strength and vitality of Britain and Europe than reminders of their present plight. If the dollars that are so desperately needed could somehow be represented not merely as assistance to the improvident but as the foundation of some good constructive purpose, then there might be a greater chance of eliciting a favourable response.

Many people, on both sides of the Atlantic, have, in recent weeks, seen the possibility of such a constructive approach in the idea of a closer association of the nations of Western Europe. During the war, and for some time after it, the idea of a "Western bloc" was looked upon in Washington with almost as much disfavour as in Moscow. It offended against the then dominant canon of "One World," and there can be little doubt that it was this chill disapproval that, more than anything else, prevented any progress from being made with the idea at the time when it could most easily have been promoted. But since American policy has swung round to the doctrine of "Two Worlds" and has been increasingly immersed in the problem of rehabilitating Germany, the idea of "the United States of Western Europe," to be extended some day to "the United States of Europe" has had an almost spectacular rise in favour in America. It is conceivable that a gigantic programme of economic aid—almost, if not entirely, reaching Mr Stassen's dimensions—would find favour if it were a Lending Loan for such a large conception—new, promising and progressive—while considerably smaller sums, if presented as requests for further credit to individual nations already in debt and believed to be senescent, might have a much more difficult passage. This might conceivably be the grandiose programme that would fire the American imagination and touch the twin chords of generosity and idealism that inspire so many American actions.

*

The Economist was one of the earliest, and has been one of the most persistent, advocates of a closer association of the Western European nations and its desirability can perhaps be taken for granted in these columns. But it would be idle not to face some of the difficulties that lie in the way of floating off a Western Association on Lend-Lease dollars. In the first place, any poofing of political or economic sovereignty in Western Europe—let alone anything properly deserving the name of "United States"—would be technically a most difficult thing to negotiate, and almost impossible to negotiate quickly. The difficulties being met with by the governments of Belgium, the Netherlands and Luxemburg in negotiating their "Benelux" customs union—on which a message from our Brussels Correspondent appears on another page—are sufficient evidence. Yet if a far-reaching association of the Western European nations is to accompany American economic assistance, it would have to be contrived very quickly indeed.

Secondly, the Russians have always made it clear that they are rootedly opposed to any "Western bloc," and their opposition is not likely to be lessened by their success in creating an "Eastern bloc." However innocent an initiative for closer union in Western Europe might in fact be of any intention to hurt Russia, it would meet with clamorous opposition not only from Moscow but from the Communist parties and their fellow-travellers in the Western countries themselves. Indeed, in the present mood of American opinion, it would have to be made to look like a deliberate bulwark against Russia for it to be accepted. This would hardly make it any easier for the Governments concerned to play their part.

Thirdly, the conditions exacted in return for American insistence might well stray over from matters of foreign policy to domestic concerns. Even Mr Stassen, who has shown a vivid awareness of Europe's actual needs, would make it a condition

of his proposal that countries accepting American aid should make no further Socialist experiments or depart further than they have already from that system of free private enterprise which nine out of ten Americans would regard as the only guarantee that their money would not be wasted. It is important that Europeans should not write off the stating of conditions such as this as pure offensive meddlesomeness, but should realise that it springs from a profound and wholly sincere conviction. But it is also important that Mr Stassen and other Americans should realise that insistence on such conditions would ruin the project. If not merely the Communists but also the Socialists and the nationalists were driven into opposition to it, in which countries of Western Europe would it have a friend?

Lastly, a closer association of the countries of Western Europe would require the abandonment by the United States of the commercial policy for which Mr Clayton is still battling against heavy odds at Geneva and at Washington. No integration of Western Europe is conceivable without preferential trade agreements among its constituent members—unless, indeed, it is believed that a full-blown and complete Customs

University Progress—II.

Towards a University Policy

THE preceding article discussed the present development schemes of the universities, the size of the expansion planned in the next ten years, and the necessity for finding out by special inquiries how the global estimates of numbers should be broken up, so that the output of graduates in the various branches of arts and science should not be too widely at variance with the demand for their services. It is the purpose of the present article to consider how, the approximate requirements for the different faculties having once been ascertained, the financial and material resources available for the universities should be distributed to the best advantage. This involves some sort of machinery for national policy-making, which has never so far existed.

Before the war the total Exchequer grant to the universities was just under £2,500,000 a year. This grew steadily during the war, and at the beginning of March of this year the Chancellor of the Exchequer announced the resumption of the system of quinquennial grants rising from £9,000,000 this year to almost £12 million in 1952 for recurrent expenditure, plus a sum ranging between £30 and £50 million for the five years as a whole for capital expenditure—the difference being due to the gap between estimates of the building resources which will be available and the building plans drawn up by the universities of what they require. Even with a rise of 50 to 60 per cent in the cost of living, a sixfold increase in public expenditure in the universities hardly indicates a lack of appreciation of their importance. Indeed, it is possible that delays in the building programme will mean that the universities will have a larger income than they can usefully spend, since the estimates of annual expenditure were related to the larger plans for physical development.

Strangely enough for a Socialist Government, this financial liberality has not been accompanied by any demands for tighter control. The University Grants Committee was indeed given wider terms of reference last year, but the independence of the universities appears to be wholeheartedly accepted. There are, however, serious disadvantages in the present system: the University Grants Committee consists of a minute full-time secretariat drawn from the Civil Service, controlled by a committee of eminent persons mostly engaged in university work—an arrangement which keeps them admirably in touch with the

Union could be constructed between now and next year.

These are formidable difficulties. But the need is so great that if this is the most promising way by which the wealth of the New World can be brought in to redress the balance of payments of the Old, it should be explored with all diligence and despatch. And if the difficulties in the way are simply the unreasonable recalcitrance of the Europeans, let the United States use its great power to knock their heads together and impose agreement; there are plenty of Europeans who would welcome American "dictation" if it were for a good cause. But it does not behove the Western Europeans simply to wait in attitudes of passive despair for their salvation to be thrust upon them. Those who remember the strenuous crises of the war will recall that President Roosevelt succeeded in launching Lend-Lease only after the Battle of Britain had been fought and won. The countries of Western Europe must similarly show, this time, that they have done all they can for themselves and that, if they are given the tools, there is a job they know how to finish. They could not possibly do harm to themselves, and they might conceivably do much good, if they were to tackle the job together.

universities, but permits of only a rather leisurely conduct of business. For purposes of deliberate policy-making the universities are even more casually organised than their governmental opposites: on a strict definition, the UGC can only negotiate with the individual universities, but as a matter of convenience matters concerning the universities as a whole are usually discussed with the Committee of Vice-Chancellors and Principals. But this Committee has very limited authority and (very properly) no power to commit any university in advance of agreement by its own Council and Senate, and until recently it has been served only by the yet more minute secretariat of the Universities Bureau of the British Empire. So modest are the services at the disposal of the two sides that it has been said that the appointment of only four young Principals to the UGC would transform the work of that Committee, and that the appointment of a new secretary and of an additional under-secretary to the Universities Bureau is already working wonders on the side of the Vice-Chancellors.

Yet with such an equipment it is small wonder that there is very little sign of a conscious policy, and that the scale of government grants is determined by adding together the estimates of all the individual universities. But such a procedure must end by being highly unsatisfactory, for the aggregate of what every university wants individually is not necessarily the same as what the nation needs in total. And short of cutting the total grant to any particular university, there is at present no way of avoiding duplication of services, or of seeing that resources are concentrated on particular needs at particular universities. Naturally enough no university ever willingly abandons a chair or department once it has gained it: yet to hand out funds to every university in perpetuity for every activity it has ever taken on must result in a serious waste of resources. From the national point of view it is absurdly uneconomical to run ten underdeveloped departments of mineralogy at ten different universities, or to have small scattered departments of slavonic studies, when a far better service could be provided by two or three. Yet under the present system concentration is almost impossible to achieve.

What is the solution? Undoubtedly the secretariat of the University Grants Committee ought to be strengthened, and it appears that this has been recognised very recently, and the

steps which are also being taken to relieve the pressure on the members of the UGC by increasing the number of sub-committees dealing with special subjects will also assist matters. But there are obvious dangers in doing more than this on the official side, if university independence is to be maintained. If, however, the universities are right in rejecting anything which looks like an imposed policy, they will be just as wrong if they do not find some means, as an alternative, for taking the initiative themselves for formulating a policy and presenting it to the Government. The price of official restraint coupled with liberality on the Government side must be less separatism and closer cooperation on the side of the universities.

It is worth looking in this connection at the most recent developments in France. The system there, is as a whole, far too over-centralised to be tolerable to British stomachs, but there is one new and very interesting feature. In working out his policy the French Minister of Education is advised by a large and powerful consultative committee, consisting of university professors elected by the universities themselves, to whom the Minister refers all important questions on university affairs—the creation of new departments, the concentration of others, the need for changing the system of examinations, a raising of the level of entrance, or a general expansion of the tutorial system. The Committee is large enough to provide sub-committees for all the various faculties, so that the Minister can seek expert advice when he requires it, instead of appointing *ad hoc* committees, as has been done in this country. Having obtained the advice of the Consultative Committee the French Minister of Education then negotiates direct with the particular university concerned. The system is not perfect, but at least it provides food for thought.

Yet, in spite of deficiencies and inefficiencies of the kind described, it would be grossly unfair to pay anything but whole-hearted tribute to the way in which the universities have tackled their post-war problems. Boldness, imagination and ambition are the hall-marks of almost all their plans. The heady wine of ample funds and public support has at times proved almost too intoxicating. Fired, for instance, by the example of Oxford and Cambridge, and abetted by the University Grants Committee, plans for halls of residence are in full swing and nearly every university aspires to double or treble the proportion of students who will be housed in colleges or halls. But when a university is already doubling or trebling its numbers of students it is extremely doubtful if it is possible to give this ambitious build-

ing programme so high a priority. The value of college life is indeed very great, and with the present acute shortage of houses it is easy to sympathise with the universities' desire to provide proper living accommodation for their students. But can the nation, at the present time, afford to provide its students with a standard of living well above what most of them are accustomed to? Including the interest charges on £30 million of capital development the nation will already be spending £145 a year per student by 1952, excluding the sums paid in scholarships, or by the student himself. It well may be that Mr Dalton's estimate that labour and materials will be available for only £20 million out of the £40 million programme will result in most of the schemes for residential accommodation being shelved for another five years, for, if the worst comes to the worst, laboratories and lecture halls, libraries and refectories are even more essential. And if students cannot be well housed it becomes even more important to provide them with good facilities for feeding and for social activities; an extension of the students' union buildings nearly always, therefore, comes high on the list of priorities. Similarly the student who cannot retire to his college precincts or nearby lodgings needs somewhere to work by day. The increase in numbers means that most libraries are crowded out and that plans of extension are urgent.

Yet, with all these things in short supply, it is astonishing how much the universities have already been able to accomplish. Empty houses and hotels have been snapped up to provide hostels; Ministry of Works temporary huts have been put on bombed sites to serve as new laboratories; disused rooms are being brought back into commission to take the overflow of lectures. And everywhere there is talk of new departments, of new ways of linking up degrees, of making the scientists less uncivilised and the arts students less impractical. Perhaps one of the things which has helped most in the transitional period has been the atmosphere created by the ex-service student, his seriousness, his maturity, his desire to concentrate and his willingness to accept the necessary improvisations. University staffs are enthusiastic about him, and his successful adjustment from the camp to the campus has done much to convert the universities to the idea of conscription before rather than after the university period.

It may have been necessary for the Chancellor to dangle a large financial carrot before the universities were prepared to start moving, but they are now proceeding at a very vigorous gallop.

Punishment and Reformation

(By a Correspondent)

A CENTURY ago, in March, 1847, the Government of the day announced the final abandonment of the policy of transporting convicted criminals out of Britain. By then the major stations to which convicts had been transported, mainly in Australia and the Norfolk Island, had been closed. A "new model" prison at Pentonville, in London, had been built and was ready for business. Accordingly, the Home Secretary, Sir George Grey, gave the House of Commons details of the Government's new plans. They were, in outline, that the convicted man should be given a limited period of separate imprisonment, twelve to eighteen months, in Pentonville, or elsewhere as facilities became available. That was to be followed by employment on public works, either in this country, or at Gibraltar or Bermuda, and ultimately by exile or banishment for the remaining term of the original sentence. Additional points made by the Home Secretary were that steps would be taken to prevent "the indiscriminate association of convicts," that each would be given moral and religious instruction and industrial training, and that work would be organised by tasks accompanied by the offer of

"advantages, both immediate and prospective, to the industrious and well conducted." The final despatch from the country was to be on an individual basis, with Governmental assistance and a portion of the earnings during imprisonment and on public works were to be applied in defraying the expenses of emigration. For juveniles, the prison sentence was intended to be reformatory, not penal. Females were not included in the emigration scheme. All these proposals have a curiously modern ring—in their principles, if not in their details—which adds to the depression that inevitably accompanies such a backward survey. Identical problems of crime and punishment, it seems, still face the authorities, and the public. If the objectives of today are very much the same, has performance made really great strides forward?

Such problems have a continuing urgency; which is unfortunate. Were they of intermittent urgency more attention and thought might be paid to them on the occasions when they intrude themselves on general notice. As it is, it is possible for a Government to consider a Bill to reform Company Law of

greater social urgency than a Bill to reform Criminal Law, as though to a government that thinks of itself as progressive stocks and shares were more important than maldeveloped human lives. And when an innocent bystander is shot in a London street, attention is focused, both by the police and the public, on the process of apprehension of the criminal, not on the causes of the crime. It is too easy to forget that the first step in that murder was taken some time ago, when the man who is the murderer first crossed the invisible line that separates the normal man from the socially irresponsible.

Imprisonment as a social implement suffers from a deep-seated contradiction. Public opinion still expects two contrary things from it. It expects that a criminal will be both punished and reformed; and the process that punishes a man may not reform him. Prisons as they are at present do punish. There must be few—although there are no doubt a few—who prefer prison to freedom outside. But do prisons reform their occupants? Not always. In 1943, the last year for which figures are available, of 17,216 men convicted of an indictable offence 11,547 were known to have previous proved offences. The proportions among women similarly convicted were not very different.

The main discussion about punishment, as distinct from reformation, revolves around the death sentence. Every man has a strong instinct for retribution. Ninety-nine of any hundred men or women who saw a man killed in cold blood would say of the murderer, "let him be killed, too—now." But common sense asserts that few murderers at the moment of their crime are influenced by the nature of the penalty they will suffer if caught and, equally, that most of them are never likely to commit a similar crime again, even if they are not hanged to make certain that they will not repeat it.

But reformation is a more tangled subject. It is easy to think loosely, particularly over some crimes, such as sexual crimes. Some say that those are not crimes at all, that the man or woman who commits them is mentally diseased and should be treated, not punished. Others, notably legislators and judges, refuse to make any distinction in the punishments they inflict for such crimes and those inflicted for crimes against property. Sexual offences are crimes, for the state has the right to lay down a code of personal behaviour for all its subjects—though the boundary of its jurisdiction may be disputed. But clearly what may reform an embezzler, such as imprisonment plus work in a male prison library, is not likely to reform a male homosexual. And it is probably true that some criminals can never be reformed at all, by any method.

Lord Templewood, in the first annual lecture he gave at Cambridge last January to the University's Department of Criminal Science and which has since been published,* used one quotation from William Blake to illustrate the problem that faces those responsible for prisoners. Their task was, he said, "the

study of the minute particulars." Nothing could be more true.

At the moment, the country is waiting for the new Criminal Justice Bill, and the discussion that will accompany its appearance. But there are many questions that can be debated, and some things that can be done, that need no new statute. One major question is whether the authorities are making the best use of all that was learnt in the classification of men's minds and characteristics by Service authorities during the war. Sir Ronald Adam, Adjutant-General to the Army during that period, in a recent broadcast doubted if that were the case.

All three Service authorities in the war were faced with two problems, fitting men to tasks they could successfully perform and building them up again when the strain inherent in the task had broken them down. About ten per cent of the population are dull, backward and mentally defective people. About 0.5 per cent of the industrial population (or the Services, for the rates are about the same), will, in any one year, leave their employment because some psychiatric defect prevents them from adjusting themselves satisfactorily to a normal job (and, of course, this psychiatric defect may exist whatever the level of the intelligence). It is from these groups, largely but by no means exclusively, that criminals come. If it is possible to identify in each convicted man or woman the major failing in mind and character that led to crime, it is equally possible then to determine what particular line of treatment is most likely to reform them. In a few cases minds can be readjusted to face circumstances. In the majority it will involve adjusting circumstances to minds. In either case, the result should be a reduction in the number of people in what are called the criminal classes. Few would claim that the country's present penal system now is, systematically, doing anything of the kind.

War-time experience shows that it is possible to devise tests, both general and individual, that will determine the mental level and major characteristics of an individual and that such tests can be simple and speedy in application. Army psychiatrists worked out tests to determine in advance whether a man was likely to make a good paratrooper or not. They graded prospective trainees into four grades in accordance with their predictions of who would fail and who would not. Of those they placed in the first grade, those least likely to fail, only 3 per cent failed. Of those they placed in the lowest grade, 46 per cent failed. All these men, of course, were volunteers, anxious to succeed, men who had convinced their officers that they were at least worth trying, and who submitted themselves willingly to being tested, so that the results are not directly applicable to the problem of classifying prisoners. But equally they are not wholly irrelevant. A second lesson is that it is comparatively easy to train men and women to carry out these screening tests; in the Navy, for instance, they were all carried out by members of the WRNS. Thirdly, the cause of mental collapse in many cases was that the individual was unable to cope with the circumstances in which he found himself. Transfer a backward

The report on the Greek frontier situation presented to the Security Council by the Uno Commission after three months' work was, as expected, accompanied by "reservations" by the Soviet and Polish delegates so far-reaching as to deprive it of any real value. The refusal of the Albanian, Yugoslav and Bulgarian governments to co-operate with the subsidiary commission, appointed to watch conditions on the frontier until the Council takes a decision on the report, does not promise well for future attempts of Uno to deal with disputes between countries in the "Anglo-Saxon" and "eastern" spheres. Nine out of the eleven investigators are in no doubt that Yugoslavia was primarily to blame for supporting guerrilla warfare in Greece, with Albania and Bulgaria guilty in a less degree. But they also recognise as contributory factors disturbed political and economic conditions under the

Britain does not seek exclusive rights in Middle Eastern oil, but no way has yet been found of making a regional source of wealth open simultaneously to the Soviet system and to the rest of the world. Experience shows that areas or installations which come under Soviet control are thereafter closed to the rest of the world. From the Soviet side it is argued that the free capitalist or semi-capitalist system likewise denies access to the closed socialist economy. It is the resulting lack of reciprocity in world dealings which makes Mr Bevin's problem. Britain cannot afford to be shut out of the Middle East as she has been shut out of

sacrifice, it would do more to gain the moral leadership of the world than by issuing stern warnings or kindly advice.

The Proof of the Pudding

The statistical shindy which has raged in both Houses of Parliament, but particularly in the Lords, since Dr. Franklin Bicknell published his arresting assertion that England was "dying of starvation," leaves the impression that both defenders and attackers of the Government's position, but particularly the latter, were more concerned with the manipulation of figures than with the realities for which these figures stand. What emerges from the blast and counterblast of calorie estimates is the existence, concealed under the apparent equality of the rationing scheme, of a new "submerged tenth" in matters of diet. Their plight is not now wholly or even mainly due to poverty, but depends on family circumstance and the accidents of restaurant and canteen convenience. In a family unit, there may be small children needing nowhere near the adult's needs of calories, but entitled to that amount (or very nearly) and to supplementary milk and other things, as well; older children getting school milk and school meals; and a breadwinner lunching at a canteen several days a week. The housewife in these households may technically get only 2,100 calories a day, but in fact the family pool gives her an ample margin. But at the other extreme, down among the submerged tenth, is the family unit consisting of man and wife alone, having no access to canteens or restaurants; or, worse still, of a couple similarly cut off from extra facilities and with three or four ravenous adolescents, beyond school age and its attendant privileges. In this last case the housewife puts into the pool, instead of taking from it; and probably does come genuinely near to serious malnutrition.

Which is representative? There is no means of knowing. One can only judge of the extent to which the national health is being impaired by lack of calories (or, on the contrary, improved by the strategic concentration both of calories and of "protector" elements where they are most needed) by examining the evidence of the national health—the proof, so to speak, of the pudding. In countries where the word "starvation" can be seriously used—say, Holland in 1945 or Germany to-day—the results appear in rocketing tuberculosis figures, in doubled and trebled infant mortality, in a frequently fatal outcome to ordinary infectious diseases. To-day in England infantile and maternal mortality stand at their lowest recorded figures; the tuberculosis death rate is low and falling; no epidemics, fatal or otherwise, mar the statistical picture of a nation healthier than ever before. A certain listlessness, a certain lack-lustre appearance, may be the legacy of nearly eight years' strain, or the symptoms, too subtle for statistical evaluation, of a dietary lack; but evidently England is starving to death, if at all, only in a strictly Pickwickian sense.

* * *

How Are You?

Statistics of infant and maternal mortality and of the incidence of tuberculosis may be convenient indications of whether a country is starving or not. But they are inadequate in determining the general state of its population's health. Nor, indeed, is there any single source of information on this question. Health insurance returns do not cover even the whole working population, and they exclude illnesses lasting three days or less and those not causing incapacity for work. Notifiable diseases, of which statistics are available, cover only 1 in 500 of all adult illnesses. In these days, when mothers and children, and persons suffering from well-defined diseases such as tuberculosis, are given priority in food, it is perfectly possible for an improvement in certain vital statistics to be accompanied by a decline in the health of non-priority classes.

This lack of information about the general incidence of all illness, severe and mild, is gradually being made good. In the Ministry of Health's report for the year ended March 31, 1946 (Cmd 7119), which was published last week, the Chief Medical Officer described some of the means by which this was being done. It is first of all essential that all notifications of diseases and deaths should be based on a standard classification, and the Medical Research Council has prepared a coded classification of diseases and injuries designed for statistical compilations. Secondly, the wartime statistical analysis of the records of patients admitted to hospitals in the Emergency Medical Service is being extended to in-patients in all hospitals. Thirdly, the Industrial Health Research Board has initiated a system of recording, by number of employers, the amount of sickness absence among their employees

and the indicated causes of it. Fourthly, there is the monthly survey of the departures from normal health, experienced by random samples of the whole civilian population over 16 years of age, which is undertaken by the Social Survey.

To the man-in-the-street it is this last method which will make the greatest appeal. The hospitals' records are not likely to cover him at all, for their cases are selected. But in the Health Index of the Social Survey he will see represented, not only the serious illnesses he may have suffered, but all his minor complaints, including the common cold, whether they incapacitated him from work or not. Even "It's my nerves, doctor," will be faithfully tabulated. An account of the surveys undertaken up to December, 1945, has now been made public, and it is clear that they will be a valuable means of ascertaining the amount of sickness at large. The period covered so far is too short for any comparisons to be made about the general state of the public health, but some useful facts have emerged: for instance, the difference in sickness rates between town and country, between different regions and between different occupations. A national health service, whose statutory obligation is the promotion of health, will not only be able, with the help of this survey, to adjust itself to where needs are greatest; it should also have its success tested by this record of all departures from normal health. But will someone now define what is a normal healthy man?

Japan's New Premier

The election of Mr. Tetsu Katayama as first Prime Minister of Japan under the new Constitution is an event of some significance, even though doubts may still be held about the depth of root so far achieved in Japan by the imported plant of Western democracy. Mr. Katayama is the leader of the Social Democrats, who were returned in the general election last month as the strongest single party in the House of Representatives. The elections showed a definite trend to the Left in Japanese politics and clearly reflected popular discontent at the failure of the Yoshida Cabinet to cope with Japan's post-war economic maladies. On the other hand the Social Democrat leadership is far from radical (though there is an extreme wing of the party which wants a united front with the Communists) and the parties of the Right—the so-called Liberals and Democrats and some smaller groups—have between them still a majority in both Houses of the Diet which will enable them to block any legislation of which they strongly disapprove.

Katayama thus takes office either in coalition with elements of the Right or with a minority Government—his Cabinet-making is still in progress; in either case he will have no free hand for his party's policies and, coming to power at a time when the economic situation appears to be growing daily more serious, he risks drawing on himself the unpopularity bound to be visited on any Premier who cannot produce a rapid improvement. Yet the risk may be worth taking from the Social Democrats' point of view; they will avoid the reproach of shirking office after the electorate programme, they will gain administrative experience—which they have never had previously—and they will get control of some of the patronage now at the disposal of Government parties. It is quite likely that in some respects they will be able to effect an improvement in the condition of the masses, notably by strengthening controls, restricting the black market and organising a fairer distribution of food and necessities. They can bring into office young men with a belief in controls set up in the public interest, whereas the elderly politicians of the Right, brought up with an ideal of economic liberalism, have not had either the will or the aptitude for operating a controlled economy. Before and during the war the economic controlling was done—in the interest, of course, of war potential—by the Army, which has now ceased to exist; to-day the controls which are required unless the Japanese people are to be exposed to the unchecked ravages of famine and inflation can only be operated by men of the Left. This is perhaps not exactly what General MacArthur would like to see in Japan, but at any rate he can be assured that there is nothing anti-American about the Social Democrats, for Soviet propaganda since the elections has made it clear that Russia has no use for them.

Troubles in Slovakia

The execution of ex-President Tiso has not led to open disorder in Slovakia, which indeed was hardly to be expected in present circumstances. But that widespread discontent was caused is not only the opinion of most foreign observers but is admitted by the Czechoslovak Press. A Czech liberal paper notes

an increase in religious demonstrations with a political character, and the Czech Communists accuse the Secretary-General of the Slovak Democrat Party of collaboration with exiled Slovak Fascists. The attitude of the Democrat Party is indeed curious. The party's leaders are men who always opposed Tiso's régime, but it depends for its votes on people who supported Tiso. The party continues to form part of the Prague Government, which is ultimately responsible for the execution, but has made repeated efforts to excuse itself, particularly by withdrawing its members from the bench of judges of the People's Court which tried Tiso, and by recommending mercy after sentence was pronounced, though it must have known that there was little chance of this. Whether this double dealing will benefit the party remains to be seen. There is little doubt that the execution has embittered relations between Czechs and Slovaks and has dealt a blow at the new Czechoslovak Republic from which it will take time to recover.

Meanwhile an unidentified "Slovak Freedom Station" is broadcasting violent attacks on Czechoslovakia. It denounces President Benes as a Bolshevik criminal, states that Slovaks do not wish to live with Czechs, prophesies for the Czech nation reconquest by the Germans, and declares that the people of the United States and Spain (sic) sympathise with the fight of the Slovaks for a new independent State. It speaks in the name of a self-constituted "Slovak Action Committee" and seems to regard as its leader the quisling ex-Foreign Minister of Slovakia, Durecansky, the man who in March, 1939, went to Vienna to arrange with Hitler Slovakia's share in the final dismemberment of the Republic. Durecansky's whereabouts are not at present known, nor is the location of the "Freedom Station." Broadcasts of this kind require considerable equipment and can hardly be easy to hide. It is to be hoped that the British and American authorities in Germany, Austria and Italy have taken steps to ensure that their zones of occupation are not being used for this neo-Nazi propaganda directed against a friendly State.

Light on the Birth Rate

The information contained in the Registrar-General's *Statistical Review** for the years 1938 and 1939 is, at this late date, largely of historical interest. It gives a detailed picture of the demographic situation at the end of the inter-war period, and is thus an essential ingredient of the whole social history of that period; it also casts some rather startling light on popular customs and standards in this country—such as the information that 30 per cent of first babies, and over 70 per cent of babies born to mothers less than twenty years old, are conceived outside wedlock. But as a source of evidence on present trends it is, necessarily, more remarkable in promise than in performance. It offers the first fruits of the Population (Statistics) Act of 1938, in the shape of a number of tables relating births to the age of the mother, the duration of the marriage, and the number of children born previously. The aim is (to quote the *Review*) "to show how families are growing by ascertaining the frequencies at which first, second, third, etc., children are being born to mothers of different ages and how those frequencies have changed or are changing." This is, of course, just what students of the population problem have been wanting for years; for it is only by the use of such evidence that the difference can be perceived between changes in the birth rate—or, for that matter, in reproduction rates—resulting from earlier or later marriages or from earlier or later first maternities, and those due to the much more fundamental and permanent factor of changes in the size of the normal family. The steep rise in the birth rate during the war and post-war years must be quite differently interpreted according to whether it consists predominantly of first children born to couples marrying younger, or of second, third or fourth children added to families whose pre-war counterparts would have stopped at one, two or three. In 1939, 45.4 per cent of all legitimate maternities were "firsts"—at all events, no earlier-born children were living; 26.1 per cent were "seconds," 12.3 per cent were "thirds," leaving only 16.4 per cent for all larger families.

In time, no doubt, the record will be brought up to date and amplified in the light of the coming report of the Royal Commission on Population. It is to be hoped that it will be a very short time. Meanwhile, it is hard to imagine any reason for not making public the statistics of family size—less elaborate, less specific, and not strictly comparable, but definite and highly significant—which must, since the inauguration of family allowances, be in the hands of the Ministry of National Insurance.

* HMSO. 4s. 6d

Councillors' Expenses

The Government has accepted in general the conclusions of the committee* which, under the chairmanship of Lord Lindsay of Birker, has been considering the desirability of making contributions out of the rates towards the necessary expenses of members of local authorities. The majority report of the committee—one member, Major Turton, dissenting—is notable for laying down all the right principles, without however giving them altogether satisfactory effect in terms of details. It was almost a foregone conclusion that the committee would recommend that councillors should be paid, on request, their travelling expenses, together with subsistence allowances and some compensation for loss of earnings. The financial hardships that local government service (except in Scotland) at present entails, more especially in rural areas, unquestionably deters many suitable candidates from standing for election. It is high time this situation was righted and the system made properly democratic.

However, there are also dangers in the opposite direction. The committee rightly emphasises that "local government must not even look like a salaried service." The essence of service to the community is that it must involve sacrifice, and indeed such voluntary work "would lose its savour if it did not." It follows that council service should never result in financial gain, and it is pointed out that "it would be quite impossible to do away with all financial loss to every member without involving financial gain to some." The committee here seems to be feeling its way towards the view that a flat and somewhat Spartan scale of allowances should be payable to all members, irrespective of their means, which would prevent the poorer ones from suffering actual hardship while the richer ones—should they claim it—would get a good deal less than their normal earnings.

Unfortunately, the actual maximum payments suggested look too high as well as being unwisely vague. Thus, first-class travel on the railways would be sanctioned for some journeys, and a day and a night's subsistence allowance is reckoned as high as 32s. 6d. The maximum payment of £1 a day for loss of earnings is not perhaps unreasonable; but it would be more democratic to make a uniform flat payment of a rather smaller amount than to let members claim a sum up to the maximum according to their conscience. Major Turton, in his minority report, says that some councillors in Scotland—where expenses are already paid—are drawing £217 a year for subsistence and loss of earnings, and that under the proposed scale they would draw £297. The committee offers no good answer to this disquieting observation.

* Report of the Inter-Departmental Committee on Expenses of Members of Local Authorities. Cmd. 7126. H.M.S.O., 1s.

Shorter Note

The opposition to the Bankside power station project, which has included a strong protest to Mr. Silkin by the LCC and representations to the Premier by a number of Labour MPs has now led Mr. Attlee to give a promise that he will re-examine the whole question. It has become increasingly clear during the controversy on the one hand that London will need all the power stations it can get, but on the other that Bankside's contribution would be very modest and that its erection interferes with the proper planning of the South Bank.

Letters to the Editor

The Russians and Palestine

SIR.—As a possible explanation of Russian policy in relation to the Palestine question, I should like to offer the following observations, arising from your article in the issue of May 24th:—

1. Britain, in order to maintain her interests in the Middle East, would appear to have no alternative, in the long run, but to uphold Arab desires.

2. America, although understandably reluctant to take sides, must also tend to favour Arab desires, owing to her growing interest in the oil of the Middle East, following the possible exhaustion of her own resources.

3. Strong Russian opposition to possible British and American action will help to stiffen Jewish resistance to Arab demands and so keep the position in the Middle East fluid. This is in line with the Communist belief in keeping a fire burning until they, themselves, are in position to put it out.

4. At a time when the American public are turning more and more against Russia and Communism, any Russian move to help Zionism will tend to influence American Jewish thought in favour of Russia.

5. In the event of the establishment of a Jewish State in Palestine, Russia could expect, at least, favourable treatment from such a State in the matter of treaties.

The new Russian attitude towards Zionism would thus appear to give her the best of both sides. Given a result in favour of the Jews, she will be the one Great Power to have spoken outright in favour of Zionism and will thus reap any benefits which might accrue. Given a result in favour of the Arabs she will be in a position to foment strife in the Middle East as and when she pleases.—Yours faithfully,

Prisoners of OZNA

SIR.—I was greatly interested to read the Note on the above subject which appeared in the issue of May 24th.

During the visit to Yugoslavia of the British Parliamentary Delegation in November, 1945, I was living in Belgrade and had been there for several months. It was my privilege to attend several of the functions in that city to which members of the delegation had been invited, and so had an opportunity to meet many of them.

Not once, but several times, did foreigners living there endeavour to express their views on the country, based on personal experiences and observations, but rightly or wrongly the delegation chose to ignore such expressions and views. It must be quite obvious to anyone possessing common sense that it is impossible to obtain the full facts about a country when on a tour of short duration: to achieve this takes months or even years! Anyone who has ever served in the Forces and experienced an inspection or visit by some person of importance is aware of the preparations made beforehand to ensure that everything is on the top line so that the visitors will leave with a good impression. This is an everyday fact in or out of the services, in this or any other country.

The British Parliamentary Delegation visited Yugoslavia, at that country's invitation, forewarned that all was not well, but prepared to find out for themselves. It should have been obvious to them that if the Yugoslavs were in fact ill-treating their political prisoners, they would not desire such a fact to become common knowledge, especially to the representatives of an important foreign power; accordingly they would make arrangements to ensure that such knowledge was withheld from the visitors. This is what did actually happen and was why our Parliamentary Delegation came away with such a glowing report of prison conditions.

In various parts of the country they stopped to speak to peasants to gather first-hand facts from these people and were quite impressed with what they heard! I suggest that in a country ruled by secret police, where one's best friend may even be an Ozna agent, it is hardly likely that anyone would have the courage to express his true sentiments if these were opposed to the government of the day, with the prospect of being overheard

and reported to Ozna HQ to suffer reprisals at a later date.—Yours faithfully,
L. E. LEAH

Hunger for Books

SIR.—The comment on "Hunger for Books" in your issue of May 17th may leave an impression that the general famine in educational books is merely a question of lack of materials, and that the distribution of special shortages is not significant or remediable. Comparison of books needed in certain branches of university studies with books on sale, does not altogether bear this out. But the limitation of production—the actual facts as to what books can at present be bought, and what books cannot be bought, surely depends on the policy of publishers. At the moment, people will buy anything between new covers, and it is merely a question of getting type on to paper and binding it up. Is it not, therefore, in the interest of publishers to concentrate on withholding from the market editions, for which the demand is inelastic and permanent, so that they can maximise their sales as soon as conditions allow an expansion of production? Meanwhile, they can print just enough of what is really wanted to retain goodwill, but the bulk of production can be of ephemeral books which will not prematurely take the edge off a future valuable demand for works of a more enduring value, or of books which contracts with authors on their lists oblige them to produce.

I will not ask for space here to classify the new book market as it appears to a university teacher or student; it leads to the suspicion of monopoly exploitation. The fact is, however, that the "hungry sheep look up and are not fed," while the gorged goats may well be unaware of any shortage. If exchange control has cut the goats off from the larger American romances, they can always visit the bookstalls, where the restoration of basic quotas for new periodicals or the black market trade in printers' paper has fertilised a fine crop of dwarf pornographic magazines.—Yours faithfully,

MICHAEL VYVYAN

Trinity College, Cambridge

From The Economist of 1847

May 29, 1847.

SINCE the death of Napoleon, no man has so much engaged the attention of Europe as Mr O'Connell. He was arraigned in Parliament, before the Courts of Law and in the Press. The ablest of our periodical writers, and the most impressive of our orators, made him the object of some of their bitterest philippics. By a small numerical minority of his own countrymen, but a minority politically and pecuniarily powerful, he was incessantly vituperated. By the great numerical majority he was admired and applauded. For them he was THE LIBERATOR. For others he was THE BIG BEGGARMAN. Vouchsafed a far longer life than either Cromwell or Bonaparte, he was for nearly half a century the idol of Catholic Ireland and a bugaboo to the rest of the empire.

For nearly forty years, whatever party was in power, Mr O'Connell was the chosen monarch of the Irish. His word roused them to action or lulled them to peace. . . . Millions gathered at his bidding or disappeared at his nod, or crowded on his path as he passed in triumphal procession through the south of Ireland. He had no armies at his beck. He had gained no victories. What, then, was the source of his power? He spoke out, for the greater part of his life, the griefs of an oppressed people. He promised them redress in return for obedience to his devices. . . . He fought only with moral weapons—he organised only a moral resistance. In all history there is no other demagogue, very few conquerors and only a few monarchs who reigned so long over the affections of a numerous people.

It was not strange, indeed, that Mr O'Connell, contemplating the helpless beings around him . . . should become the opponent of *laissez faire*, and, like most of his countrymen, a strenuous advocate of government help. He felt its power to do mischief, and he concluded that it was equally powerful to do good. He only found out his error with the close of his life.

Oklahoma

SIR.—You do not often in your columns deal with the theatre, but I venture, nonetheless, to write to you of a theatrical affair which has a moral for our everyday economic and political life. I went recently to see "Oklahoma!" What an experience, and how good it would be for every leader, in every walk of life, in our country to go to see it.

Of the dramatic quality of this sparkling all-American show, I do not pretend to know anything. But two qualities pervade it, as they pervade everything the Americans do, which are sadly lacking in nearly everything we do. Those qualities are Vigour and Precision.

They sang, danced, moved, acted, spoke, tumbled, loved, fought and died, not only hard, but with zest to do it as well as they could, and as if it were just part of their everyday life and natural to them.

Where are the vigour and precision in our life to-day? In our planning? In our congested and sloppy legislative programme? In the tempo of our industrial work? The miners, I believe, are now working wonderfully hard—but everyone thinks that so extraordinary that Ministers have to make congratulatory speeches about it.

Perhaps we do not have enough vitamins to produce such gusto and *joie de vivre* and faultless work. Nor must we forget that there are other qualities besides Vigour and Precision—I saw no hint of compromise in the scintillating teeth and smiles of those lovely singing and dancing bodies.—Yours faithfully,

PETER NORTON GRIFFITHS

Whisky for Dollars

SIR.—With reference to your note in the issue of May 17th, if we consider that the best thing to do with Scotch whisky is to sell it for US dollars, it is surely worth trying to get the largest possible number of dollars for it. Instead of sending it across the Atlantic at five shillings a bottle, would it not be better to retail it here to thirsty visitors from the US at anything from five to ten times the price? No doubt some must go over for advertising expenses, but the bulk of our production should be kept here, and might even be a small extra inducement to the tourist to come here!

Books and Publications

Palestine Mission

"Palestine Mission." By Richard Crossman, M.P. Hamish Hamilton. 256 pages. 10s. 6d.

SOME of those who unbosomed themselves to Mr Crossman the commissioner will wish they had remembered they were also talking to Mr Crossman the journalist, for the book is a very personal, even intimate, account of the author's experiences as a member of the Anglo-Palestine Committee. Yet despite its often gossipy flavour, the book contains valuable material for anyone who wants to fill in an episode of contemporary history with human detail. Above all, it tells us a great deal about Mr Crossman.

For a layman, the difficulty about the Crossman approach to foreign affairs in general has always been its esoteric character. After making allowance for some plain disgruntlement, there remains a mass of hard reasoning, but what does it add up to? It is difficult to see how the rebel approach would work out differently in practice when applied to current problems. If Mr Bevin had been briefed for the Moscow conference by Mr Crossman, what would have happened? The sort of arguments put up by the rebels certainly have an influence on British foreign policy, but the facts of any given situation would impinge as forcibly on them as they do on the Foreign Minister.

"Palestine Mission" offers a clue to the Crossman approach. It is basically emotional. His reasoning and observation are both highly trained and ably directed, but it is his heart, not his head, which calls the tune. Hence the missing factor of stability in his outlook. As a Palestine committeeman he is seen swaying from one emotional complex to another. It is an emotional experience which determines his early plunge, fully clothed and with all his wits about him, into the Zionist side of the pool. In New York the violent abuse of Britain by the American

But are you so right in stating that "no connoisseur would ever drink rye whisky in preference to Scotch"?

I should have said that in the US there were many more connoisseurs of rye than of Scotch, and very many others who rate Scotch as far below Bourbon as a good citizen of Dublin rates it below Irish. It is a matter of taste. Again then, if it is dollars we're after, would it not be sensible to recognise the existence, and at least the dollar appeal of Bourbon and rye, and to ensure that these are in plentiful supply for tourists when and if they come? It might even be good business to import the basic materials for making Bourbon and rye, and to use some of the surplus capacity of the Scottish distilleries for producing them. It seems they can be quickly "aged" and it should not be beyond the skill of Scottish distillers to produce passable, if not superior, imitations. Certainly Scotch Bourbon should be well above the standard of American "Scotch," which sells all too well in the US.—Yours faithfully,

H. M. O'CONNOR

52, Cornhill, E.C.3

Then and Now

SIR.—In your issue of May 17, 1947, you state (p. 750) that coal-mining was one of the "war-swollen industries" of 1914-18 and in support you quote the Census Figures of persons employed in mining in 1911 and 1921. If, however, you take figures of coal-miners on the colliery books in the years 1914-18 (see Ministry of Fuel and Power Statistical Digest, 1945, Cmd. 6920, Table 1) it will be seen that, whereas the number was 1,107,000 in 1913 it fell to 935,000 in 1915, gradually rose to 990,000 in 1918 and only in 1919 did it increase to 1,170,000. There was little variation in the average number of days per week on which coal was wound during those years (see 18th Abstract of Labour Statistics, p. 101) and therefore the annual variations in the "equivalent number of miners working a full week" can be taken to be similar to the above. This implies, therefore, that the contrast between the experiences of the two wars is to be sought in the rate of demobilisation and the way in which demobilised manpower went back to the mines after the Armistice, rather than in the events of the war years themselves.—Yours faithfully,

A. R. PREST

16, Rustat Road, Cambridge

an eternity of Jewish immigration thereafter and with no prospect of any escape from colonial rule. The men of the Committee have more than themselves to blame for this. The current passion for unanimity has been responsible for more colourless and futile documents than their report, and the apparent light-heartedness with which Mr. Crossman in the end jettisoned his own conviction that nothing short of partition would do is not unique. There are other recent and better-known instances of principle being sacrificed to agreement.

Russia from Two Fischers' Eyes

"The Scared Men in the Kremlin." By John Fischer. Hamish Hamilton. 200 pages. 10s. 6d.

"The Great Challenge." By Louis Fischer. New York. Duell, Sloan and Pearce. 346 pages, \$4.00.

IN spite of its sensational title and its somewhat slipshod style, Mr John Fischer's book stands out among scores of worthless journalistic reports on Russia as a fairly informative and vivid account of life in the Ukraine, as the author saw it in the spring of 1946. As a member of the Unrra mission in the Ukraine he travelled freely throughout the devastated land, had access to official information and a good glimpse into the life of ordinary Ukrainians. His direct contact with life in Russia made him immune from fashionable scares, but inspired him with no admiration for the Russian way of life. The picture of devastation in the Ukraine, and of the poverty resulting from it, is perhaps the most instructive part of the book. Most of the devastation, as Mr Fischer found out, was not caused in the ordinary course of hostilities, but was wilful, sadistic destruction inflicted upon the country by an already defeated and retreating *Wehrmacht*. Of course, the public knows this and is tired of reading about atrocities. But Mr Fischer does not relate a single atrocity—he merely describes in a completely unsentimental way the incredible legacy of misery with which the Ukraine has to contend.

Of almost equal interest are his descriptions of the new privileged bureaucracy, the workings of the police state and so on. "For centuries Russia's rulers were harsh, arbitrary and incompetent. Now they are harsh, a little less arbitrary, and far more competent. Nearly everybody is grateful for the obvious improvement." This is a fair statement, though the harshness of the rulers, as reflected in the tragicomic picture of ubiquitous spying, is greater than before. The picture of growing prosperity and civilisation in the countryside, even in the devastated Ukraine, is also revealing, and it is the more the pity that the author's tale is somewhat spoilt by an inadequate sense of proportion and perspective and by a number of inaccuracies.

Few writers on Russia can withstand the temptation to pass from eye-witness accounts to solving the big issues of high policy. Mr Fischer believes that Russian policy is shaped mainly by fear and defensive considerations, but that it may become aggressive. He therefore supports a policy of moderate "firmness" vis-à-vis Russia, urging his country to encourage the creation of a Western Bloc, but not to engage in a race for strategic bases and armaments.

★

Mr Louis Fischer's "The Great Challenge" has none of the relative merits of Mr John Fischer's book. It belongs to those writings that have become the plague of current political literature—the pretentious and voluble outpourings of the self-important journalist, the dilettante political philosopher, who offers the bits and pieces of his information and his interviews with politicians as the last revelations of wisdom. "I predict"—is the title of one of his chapters. The title of another is "Stalin and Hitler—a re-interpretation." What the author really re-interprets is not Stalin and Hitler but his own views on them, since Mr Louis Fischer, who has for many years been a zealous advocate of the Kremlin's policies, has now succumbed to the "infantile malady" of anti-Stalinism.

The range of his book is very wide: it covers Britain and India, China and Russia, the United States and Palestine; but Russia is its main topic. Some of the things that the author says about the evolution of the Soviet regime and the great purges are a useful counterblast to his earlier pro-Stalinist writings; but even these are marred by the excessive zeal of the fresh convert. His argument is extremely confused, for he criticises his former idol from contradictory viewpoints. He attacks Stalin for having betrayed the revolution as well as for fostering it, for having become conservative and for not being conservative enough. The burden of Mr Louis Fischer's philippics is that the Stalinist regime is inherently aggressive and bent on world domination. But when

it comes to drawing the practical conclusions from this, the courage of his convictions fails him. "There are—he states—three ways of dealing with the Russian problem. (1) Fight Russia now—I reject that vehemently. (2) Appease Russia . . . I reject that. . . . (3) Block Russia's . . . expansion . . . I defend that." The moderate conclusion does not quite tally with the tenor of his book. And what can one make of such maxims on foreign policy as that "the foreign policies of America and Britain should be as broad and deep and inclusive as human life" or that "a better America, a better England, a better France, a better Germany, a better Russia, a better India would work together for a better world"? A better book would make better reading.

BBC House Magazine

"BBC Year Book, 1947." Published by the Corporation. 150 pages. 2s. 6d.

THE British Broadcasting Corporation has now published its *Year Book* for 1947. It is by no means easy to tell from the book what the purpose of its publication was (except, perhaps, the understandable feeling that 1947 ought to have its book of the year, too). The book contains six articles on various aspects of the Corporation's work and responsibilities, a generalised account of each section's task and record in 1946, and one or two short appendices, names, addresses, accounts and the like, in all totalling 143 pages. In addition there are some photographs of the kind that appear in this kind of publication, mainly portraits.

The most interesting of the six articles are the first and last—"The Next Five Years in Broadcasting," by the Director-General, Sir William Haley, and "The Past and Future of Staff Training," by Mr. E. A. F. Harding, Director of Training. Any article by a director-general of a corporation of the size and importance of the BBC is bound to be interesting, both by reason of what it says and what it does not say. This article scores most under the latter heading. Sir William is not complacent. He is very much alive to what can be done to expand and improve the service that the BBC offers to its customers. But he accepts the Charter as an immutable document—as, of course, within the Corporation it must be so taken—and he accepts the present organisation set up under the Charter as equally permanent in its form. In short Sir William sees the BBC as a body staying roughly where it is, but getting better and better as it does so. Mr Harding writes well about his job, but he, too, seems to share the same set of blinkers. Among the other articles, Miss Rose Macaulay writes well and sensibly on the Third Programme, and Mr Louis MacNeice is irritatingly defensive on the subject of writing for the radio. But a great deal of the rest of the book is depressing reading. Far too many of the writers who describe the various BBC services in detail have caught that blend of condescension and complacency that is the hallmark of the average housemaster writing about an average house in the magazine of an average public school.

This brings back the original question, what is the purpose of this year book? It is not sufficiently detailed to serve as a staff directory. The accounts of the Corporation, as printed, would leave the Cohen Committee aghast at their obscurity. The book is too long to be read by the bulk of the customers, the licence-holders, nor is there sufficient range or depth in the articles in it to provoke any effective public discussion of their contents. The book is not an apology, for the BBC has no need to apologise for the job it is doing within what it considers its own terms of reference to be, nor is it a stimulant, for everyone writing in it seems to think that everything he is doing is for the best. Next year the BBC should get off the fence. Either it should produce a popular guide to broadcasting, complete with a biography of Mr Handley, or it should summon up its reserves of courage and permit controversy to extend inwards as well as outwards. The Corporation needs an internal Third Programme.

Shorter Notices

"The Theory of Social and Economic Organisation." By Max Weber. William Hodge and Company. 395 pages. 30s.

THIS is the first English translation of Part I of Max Weber's *Wirtschaft und Gesellschaft*, which was conceived by its author as study of the sociological and institutional bases of modern society. The editor and part translator, Dr. Talcott Parsons, contributes a long introductory essay.

AMERICAN SURVEY

Mr Truman's Dilemma

NOW that so many eager and influential voices are recording the first signals of storms ahead, it may be worth while to sit back for a moment, and to examine the pace of the post-war boom. At no period in the peace-time history of the United States—most certainly not in 1929—has industrial activity put such an obvious strain on available manpower and material resources. Critical shortages embrace iron and steel, all the non-ferrous metals, fats and oils, timber, and many of the basic chemicals. These in turn have hampered railroad efficiency, and at some points have delayed key constructional work. Plant and material shortages, indeed, have been even more troublesome than labour supply problems, and it is scarcely true, as Mr Bernard Baruch recently suggested, that a major remedy might be found in a general extension of working hours.

For nine months or so, in fact, the United States has been as near to a condition of "true" inflation as it has ever been, and nearer than it may be again for a very long time once industry has met the longer-term accumulation of demand arising from wartime shortages and, perhaps, some of the more notable deficiencies entailed by the neglect of the long years of depression before 1939.

The inflation period proper, to go by the familiar evidence of rising prices and wage costs, covers scarcely a year—just back to that time when Congress was demonstrating its entire refusal to sustain an effective Price Controls Act. But the safeguards against a dynamic rise in prices were shattered, not by Congress in 1946, but by the Truman Cabinet immediately following V-J Day, when the direct controls on manpower and consumer expenditures were removed so hastily that even Mr Truman was forced, later on, to make a partial return journey, and to re-establish some hold on key materials, housing, etc. From that time onwards, Mr Chester Bowles and the Office of Price Administration waged a battle that was lost before it was begun.

What corrective forces, then, were left in the hands of Mr Truman? Budgetary policy was one, and the President has held firmly to the theory of a balanced budget and debt reduction, though since November he has been in the hands of an opposition Congress and a majority pledged to substantial tax reliefs. In passing, it may be noted that the budgetary surplus now emerging reflects the rake-off from inflationary profits and incomes rather than Draconian tax rates. Some qualitative controls on credit may also be cited. The Federal Reserve Board has held a severe grip on security market speculation (as noted in *The Economist* of May 17th) although its other control in this category—regulation of consumer credits—has been

relaxed sufficiently for the attainment of a peak figure of \$10 billion—30 per cent up in dollar volume on 1929, and 80 per cent higher than the V-J Day level.

Elsewhere, the Truman Cabinet has been left with the possibilities attaching to purely monetary devices. But fully a year ago, Mr Marriner Eccles, the chairman of the Federal Reserve Board, was deploring the lack of control inherent in the banking structure, and demanding the imposition of sweeping new controls over the investment policy of the commercial banks, and more flexible reserve provisions. But he rejected the curative possibilities of higher monetary rates because:—

A major consequence would be a fall in the outstanding market value of Government securities. These price declines would create difficult market problems for the Treasury in re-funding its maturing and called securities. Price declines could have highly unfavourable repercussions on financial institutions, and might even weaken public confidence in such institutions.

The Treasury thus began its process of curbing inflationary pressure, not by the redemption of debt from a genuine budgetary surplus, but by the repayment of maturing obligations from a swollen Treasury war-chest. The general Treasury fund of \$26 billion in February, 1946, was less than \$4 billion in December, and the gross public debt was down by a full \$20 billion to \$259 billion.

In a negative way, the Treasury has in this manner preserved a grip on the so-called "debt monetisation" process (i.e., the inflation of private deposits through commercial bank purchases of existing Government securities) by holding down the balance of "excess" reserves in the commercial banking system to well below the figure of \$1 billion regarded, at least until recent months, as a practical working minimum.

But even that hold has been precarious enough. At the close of 1946, the commercial banks held \$11.2 billion of one-year Treasury Certificates, all guaranteed by the Reserve Board's assurance, given after Pearl Harbour, that short-term rates would be wholly stabilised at $\frac{3}{8}$ per cent for Treasury Bills and $\frac{7}{8}$ per cent for Treasury Certificates. Every billion of these Certificates could, with existing reserve requirements, in theory at least, sustain new security holdings of \$6 billion. Moreover, despite the reduction of the Treasury's deposits in the banks in the course of 1946, the supply of private liquid funds within the economy increased from \$153 billion to \$165.7 billion.

In attempting to control the pace of the post-war boom, therefore, the Truman Administration has had problems enough on hand. It may not have put up a very heroic defence, but it can plead with a great deal of justification that direct controls

WAR ACTIVITY AND POST-WAR BOOM

became politically impossible after V-J Day; that price control was destroyed by Congress, and that after November last, controls were altogether doomed. None the less, the policy of the Truman Cabinet had been decidedly erratic. It has attempted to preserve price controls, it has endeavoured mildly to take up the slack in the credit structure, it has put an effective ban on security speculation, and it has recently tried moral suasion in terms of industrial—though not of farm—prices.

But even within the powers it holds it has not tried very hard. Even though it be granted that a drastic readjustment of money rates would have done more harm than good, it has not used those limited powers which might well have had quite important psychological effects in recent months when commodity speculation has been especially rampant. It could easily have abandoned the "peg" on short-term money rates, justifiable enough in wartime, but wholly unrealistic in terms of present boom conditions. But the government has aggravated the price spiral by something more definite than conditional neutrality in the money market. Its foot was put sharply on the accelerator pedal in the autumn of 1945 when the fullest possible support was given to the demand of the unions (coming mainly from the Congress of Industrial Organisations) that workers must retain the "weekly war wage packet." The foot has never been applied forcibly to the brakes and not more than a month has elapsed since the accelerator was again tried when Mr Truman reasserted that wage rates must rise again—in the absence of price reductions. It now looks as though that latest declaration by Mr Truman may not suffice to give a new twist to the price spiral; but if that does, in fact, happen to be the case, the Administration's policy has certainly not contributed to any decline in consumer demand.

Selling Ideas

(From Our US Editorial Staff)

IF the British government saw fit to protest against a Jewish committee's advertised plea for money with which to bomb British installations in Palestine, so did a good many Americans. The protest was, however, against taste and not against right. To buy full-page space in a metropolitan daily is a recognised privilege of responsible persons who can afford it, and the dream of every minority group no matter what its political complexion or its social aim. Communist cash and conservative cash weigh the same in the business office. This attitude makes of paid space not quite the poor man's forum (a full page in a single issue of a major New York daily may cost \$3,000), but it is the one way in which an unpopular cause can be sure of reaching a large number of readers in the words its proponents choose. Also, it gives the unpopular cause a certain cachet. If the full-page advertisement is expensive, so much the better. In a commercial civilisation it is commonly believed that only men and causes of substance have money.

This may be naïve. It is certainly influential. The wide acceptance of this myth in the United States gives power to the new spate of idea advertising which is appearing in the newspapers, in magazines and on hoardings. (It makes its way into radio more slowly because the top national networks have a rule that time cannot be bought for propaganda purposes. That rule is now under attack.) Food dealers are trying to sell not only their products but also their price policies. A chain store advertises, "Our net profit during the past five years has

Mr Truman has been very conscious of inflationary evils. But behind every official warning of such dangers has been a deeper and far more potent fear—the shadow of the Hoover Depression. Mr Eccles may cry for stringent bank controls, and the Federal Reserve Board may predict, as it clearly did in a private capacity last year, the need for consumer controls. Mr Eccles may now advocate the plan which he rejected last year for harder short-term money rates. But Mr Truman has never been quite sure. Presidential elections are never very far away, and the arrival of a business recession might be very unfortunate in its timing. If it has to come, it had better not appear to be deliberately initiated by the Administration.

Since V-J Day, Mr Truman has never been alone in his dilemma, which to-day is clearly reflected in the uncertain mood of the Republican Party, and outside Washington, in the obstinate refusal of Wall Street to join the merry dance of rising price levels. For Wall Street, and for all politicians, the long years of depression banished all the gods but none of the devils.

Possibly no very certain answer can be given to the question of how far it would have been possible to restrain inflationary developments, without using measures so drastic that they would have killed all kinds of reasonable activity. The post-war period has presented very special problems, and no very flexible mechanism. But Mr Truman's dilemma has not been solved. As he now reflects on the measures which have been used to bolster consumer demand, and thus to accelerate the pace of investment, he must be very conscious of the instability thus generated. It will be very surprising, not to say unnatural, if the present feverish pace of business can be replaced by a rather more sober stride without an intervening adjustment of some severity.

averaged only about 1 cent on each dollar of sales." An importer pleads, "We are selling our bananas at 5½ cents per lb. seaboard at southern ports . . . It is to be hoped that dealers who handle our bananas will reduce the retail price of such bananas to more reasonable levels."

The principles in labour-management disputes are argued before the public in paid space, during a strike or in anticipation of it. A group of railroads warns, "Non-operating railroad unions are demanding still another raise of \$568 million a year. You (Mr and Mrs Consumer, Mr Shipper and Mr Farmer, Mr and Mrs Passenger) would foot the bill." The National Association of Manufacturers argues, "Industry-Wide Bargaining is No Bargain for You." The American Federation of Labour retorts in equally expensive space, "Don't be a NAM Fool."

Another type of idea advertising proceeds on the theory that the best public relations advertising is that which serves the public. McGraw Hill, publishers, buy a full newspaper page in five leading cities every month to reprint one of their own editorials with an economic slant. The latest is headed "World Trade is Our Duty and Our Opportunity." The International Latex Corporation just delivered a triple-column warning against racial intolerance which was headed, "Lynch Mobs Don't Always Wear Hoods."

The new thing in all this is the product which the advertisers are seeking to sell. Since 19th century days when "Carter's Little Liver Pills" was painted on boulders and barn ends, Americans have been recognised as peculiarly responsive to being told what they should buy. At least as early as World War I they were told in advertisements what to do. Now they are being told what to think. The shift is an important one, and it raises questions of which that evoked by the Palestine committee's invective—the propriety of buying space in order to enlist violence against a friendly nation—touches only one aspect.

The new plans come from the advertising industry itself, and the story of their inception is an interesting commentary on the present moment in American democratic capitalism. Advertising men traditionally pride themselves on being bellwethers of opinion. Victims, before the war, of a corroding cynicism heightened by the long uncertainty of the thirties, they offered their services to the government at the outbreak of hostilities, and did a brilliant job of persuading their fellow Americans to buy war bonds, save fats, salvage metals and paper, plant victory gardens, and otherwise co-operate in the problems of the home front with patience and pride. Working on an organised volunteer basis, charging only what it cost to buy the tools with which they worked, they secured for government purposes at a fractional price some three hundred million dollars worth of advertising for each war year—a grand total estimated at a billion. Also they acquired for themselves a taste for usefulness which had had little satisfaction for a long time.

The end of the war and the withdrawal of government advertising campaigns for war purposes left the Advertising Council (which had co-ordinated the work of advertisers, and experts all over the country) facing a future that looked bleak. As business men, they saw ahead a heavy slash in the appropriations that had lined their pockets during the war. As craftsmen, they saw themselves deprived of the psychic satisfaction that had come from supplementing campaigns to sell deodorants with campaigns to save the country. Also, they may have a premonition that left-wing attacks on the economic soundness of the three-billion-dollar advertising industry (*Printer's Ink* says it grossed \$3,116,600,000 in 1946), might again rise up to plague them, and that it might be wise to seek ways of justifying their existence.

Whatever the final motive, the industry's trade organisations decided not to disband the Advertising Council but to re-align its work in accordance with what seemed to them to be the country's peacetime needs. They persuaded President Truman to create a small unit in the Office of Government Reports which should co-ordinate the government's requests for public service advertising. In 1946 they carried on a series of campaigns in the public interest—for soil conservation, for cancer research, for nurse recruiting, for the prevention of forest fires, and so on—done as in war time for the mere cost of the tools, and representing an estimated hundred million dollars worth of advertising time and space—about a third of what went into the war effort. Some of these campaigns were initiated by the government, some by private agencies interested in public affairs. In order to steer a clear way amid a flood of non-governmental ideas, the Council appointed a Public Advisory Committee composed of distinguished citizens in the fields of labour, management, the universities, social work, whom they charged with the responsibility for surveying campaigns and approving copy.

The bellwether instinct and the missionary impulse were, in a day when Americans are increasingly conscious of new problems and responsibilities, not satisfied by this service to known goods. The more socially-minded among the widened group began to explore what else might be done with idea advertising. In company with their fellow citizens, they shared the prevailing unease over Communist competition, the atom bomb, domestic division and international chaos, and they were sensitive to the common frustration as to what was the wise and effective thing to do about it. They wanted to insure the American future by selling confidence and co-operation in the American way to their fellow Americans. Acting on suggestions which came from various sources, they outlined, this spring, four new idea campaigns—one explaining the American heritage, one promoting racial and religious tolerance, one on world trade, one applauding the American economic system. These would not be government campaigns, but put out by private advertisers to whom they appealed as a public service.

There is some evidence that the industry's first impulse was defensive and that the first copy submitted in certain of the new campaigns showed a tendency to rest on old boasts, but the Public Advisory Committee moved to correct that. Copy writers found themselves delving into production statistics, histories of industry and of labour organisations, wage and

profit tables, resource surveys, world trade maps. This might be in essence a reaffirmation of faith, but the story of America was no longer to be told in terms of the little red school house and of the wartime plea, put out by a manufacturer of consumer durables, to "keep everything just as it always was—even to the smell in the corner drugstore."

Even among a people with as high a degree of consumer resistance as Americans have necessarily developed, the potentialities of idea advertising are enormous. Its dangers are recognised by the more thoughtful. Its proponents argue that if this be propaganda, it is being put out by private enterprise, free from the monolithic menace of government propaganda as known in Hitler's Germany and in Stalin's Russia. They prefer to dwell on the educational character of the new campaigns, and to stress the fact that never before were the commercial tools of communication turned by private enterprise to educational purposes in the public interest on so vast a scale.

The new advertising may be serious, but it has its lyric moments. A half page put out by an agency proclaiming its own skill reads, "An advertisement, whether about jobs or jewelry, fish or finance, is more than a commercial appeal; it is an invitation to a way of life. And as truly as when Roland blew his horn, it is a trumpet call of human dignity and individual freedom." The space is headed, "You Wouldn't See an Ad in *Pravda*."

American Notes

The Sensible Samaritan

The State Department is in no hurry to apply Mr Acheson's prescription of large-scale loans for the recovery of Europe. Both Mr Marshall and Senator Vandenberg have insisted that with the \$350 million relief bill, and the \$400 million gift to Greece and Turkey, the foreign calls on this session of Congress are complete, except for such aid to Korea as can be smuggled through in the appropriation for the War Department. There is talk now of summoning a special session in the autumn (Congress would normally adjourn at the end of July and reconvene in January, 1948). By that time the State Department's assessment of foreign needs and the policy to meet those needs will be complete, while Congress will not yet be wholly absorbed in preparations for the party conventions in June, 1948. Meanwhile, the President has proposed an extension of the Truman Doctrine in the direction most popular with Senator Vandenberg and the Republicans, in the form of arms and aid for hemispheric defence.

It has been left to Mr Harold Stassen to keep alive the central issue of aid for Europe raised by Mr Acheson. In his first major speech since his return, Mr Stassen boldly suggested that the United States devote one-tenth of its production for the next ten years to the resuscitation of the world. Mr Acheson has pointed out that one month's work of every American this year is destined for export. Mr Stassen would freeze this pattern in a programme of "production for peace," directed against no country, but designed to create world-wide peace and prosperity. Mr Stassen describes his policy as lying between two extremes: that advocated by Mr Wallace who would "make of America a nation of fellow-travellers down the wrong road" and that of Colonel McCormick, who would "make of America a nation of cold-hearted misers passing by on the other side." Mr Stassen would be a Sensible Samaritan. He insists that such an integrated programme would be cheaper in the long run than the current patchwork of partially misdirected loans and would provide the greatest single guarantee against depression in America and chaos abroad.

Tied Tithe

In some circles Mr Stassen is now bracketed with Mr Wallace as a visionary "do-gooder." It is true that Mr Stassen faces the fact that repayment could hardly be expected in dollars or manufactured goods, but only in raw materials, and certain "intangibles" comparable to the benefits derived by the United States from Lend-Lease. One of these is "access to raw materials" and the availability, in quantity, of those materials needed to prevent the depletion of American resources. But Mr Stassen's tithe is tied in a way that Mr Wallace would deplore.

"AMERICAN SURVEY" is drawn from three sources. Articles described as "From Our US Editorial Staff" are the work of a small group of regular correspondents, resident in the United States. Articles with some such attribution as "From An Industrial Correspondent" or "From A Correspondent in Ohio" are from outside contributors. Everything printed without attribution is prepared in London.

Among the conditions he would lay down is that the governments aided

would not move farther away from individual economic freedom and go further down the sad trail of increasing nationalisation, socialisation, or government ownership, which would result in lower production for them and would negative the constructive efforts we are making, and would make more difficult our own economic future.

Should Congress approve a large-scale programme of "Lend-Lease in Peace" stricter supervision of the spending of the money is inevitable. On May 14th Senator Lodge, a member of the Foreign Relations Committee, expressed the new insistence:

While we must be prepared to spend some money, we must not pour money down a rat-hole. We must make our expenditures solely in pursuance of an intelligent plan whereby, in exchange for our outlays, these foreign peoples become self-supporting.

Senator Lodge was urging that Europe should integrate itself into an economic union "which has the possibility of life and growth." This project of fostering European economic union is attracting influential support. Senator Lodge was very careful to say that European unity must be entirely voluntary. But it is a warning signal that so liberal a Republican as Mr Stassen should be a supporter of what might be called "economic Trumanism." Mr Stassen objects very rightly to devoting American resources to the purely negative end of stopping the spread of Communism; but he would welcome their use to halt the spread of state ownership. The battle for a world loan much vaster than the loan to Britain is only in its early stages and it may well never materialise on the scale needed, but already there are the hints of conditions even more far-reaching than those which accompanied the British line-of-credit.

Civil Rights in Carolina

Of the 31 defendants in South Carolina's mass lynching trial at Greenville, 26 had signed statements admitting their participation in the murder of Willie Earle. The Governor of the State had demanded their conviction; the Federal Bureau of Investigation had been called in. The judge, who warned the jury to disregard any "so-called race issue," had maintained exceptionally high standards of court procedure. Again and again he halted the defending attorneys in their denunciations of "northern meddling" and in their appeals to race passions. Yet an all-white jury acquitted the defendants on each of 96 counts. The South was conscious that it, as well as the lynch mob, was on trial. The verdict has gone against Carolina justice, despite the best efforts of the State.

The result of the trial can hardly fail to stimulate the search for new teeth for the Federal Civil Rights statutes, proving, as it does, how inadequate are the powers of the States to punish lynchers even when their officials are willing. There are only two laws under which the Federal Government can intervene in cases of violence. These are all that time and the Supreme Court has left of a whole series of Civil Rights statutes passed during the Reconstruction period. Both of these—sections 51 and 52 of the Criminal Code—are designed primarily to protect individuals against infringement of their rights by the Federal Government, the State governments, or officials of any of these. The Bill of Rights in the Federal Constitution was drawn up in a day when governments were the tyrants to be feared, and it was fashionable to believe that man was good, a philosophy which robs Washington of the power to protect men against their fellows.

In December President Truman, alarmed by a quadruple Georgia lynching, and the wave of post-war violence against the negro in the South, appointed a Civil Rights Commission to investigate what could be done to sharpen the Federal Civil Rights laws. This Commission no doubt will also recommend the passing of Federal anti-lynching, anti-poll tax and Fair Employment statutes. These are measures the Republican majority in Congress might well support with enthusiasm as election day approaches; but Southern Senators refused last year to relinquish the filibuster, the reef on which every anti-lynching law has been wrecked. A new approach may be to withhold Federal funds from States

practising and countenancing discrimination. This has the disadvantage that it would punish the innocent with the guilty; it would also exacerbate the very legacy of poverty and ignorance which nourishes racial violence.

Grounded

Air transport companies generally are facing the near-term future with considerably more confidence than seemed probable a few months ago when traffic was showing a spectacular decline from the post-war peaks.

For the aircraft manufacturing concerns the position is far more serious. In 1941 the industry had an output of 26,300 military planes and 6,844 civilian craft; by 1944 military output had jumped to 96,300 (no civilian output allowed), and the airframe weight of craft produced was nearly 270,000 tons, against only 40,000 in 1941. In 1946 only 1,300 military planes were sold. The airlines, moreover, have concentrated orders for fast transport types into a short space; whatever may be the near-term prospect for air transport, orders will fall away for some time. No one yet knows what sort of appropriations will emerge from Congress for 1947-48, but the presidential estimates themselves allow for no more than 1,500 military and naval aircraft, and the Republican majority has been scrutinising every expenditure list.

The industry thus stands to run at a substantial operating loss. For 1946 net incomes were falling rapidly:

Company	1945 (net income \$ '000's)	1946
Boeing	6,489	— 327
Consolidated Vultee	6,749	— 2,776
Douglas	8,956	2,180
Glenn Martin	8,379	3,363
Grumman	5,713	338
Lockheed	5,470	3,059
U. Aircraft	12,855	6,061

These figures by no means reflect the slump in gross sales, since the industry was a large EPT payer. But 1947 will be much worse. The Douglas company lost \$807,000 in the first quarter, and cash resources of many smaller units are dwindling.

A full-dress Congressional investigation of aircraft manufacturing is now in progress. Before that, however, service chiefs held a special conference with representatives of the industry, and were told that Britain was years ahead in technical achievement (especially jet planes), that the Soviet Union was turning out far more military aircraft than the United States, and that the industry wanted firm orders for 3,000 to 5,000 aircraft yearly "to assure survival."

The present Congress has come a long way from early post-war days when service enthusiasts were eagerly discussing the erection (near Boulder Dam or the Grand Coulee) of billion dollar supersonic wind tunnels for experimental missiles and aircraft, with correspondingly heavy maintenance charges for research and experiment. But service officials are obviously worried, and a barrage of press publicity suggests that Republican policy in this respect at least is meeting with heavy opposition from industrial interests.

Shorter Notes

The scope of the dollar problem is again stressed by the trade figures for the March quarter. Exports for this period amounted to \$4.9 billion—equivalent to an annual rate of very nearly \$20 billion. This rate has been exceeded in only one year, 1944, when most of the goods and service transactions came within the scope of Lend-Lease. Imports of goods and services were at an annual rate of less than \$2 billion, and, apart from US Government transactions and private gifts and transfers, foreign dollar assets declined by \$1 billion.

The Senate has refused to accept the House (Robertson) Bill which would impose a further 50 per cent "fee" on imports of foreign wool. If the House clause is restored in conference, a Presidential veto is expected. Meanwhile, Mr Knutson, chairman of the House Ways and Means Committee, announces that Congress will revise any tariff pacts at Geneva deemed to be "damaging to vital domestic industries."

THE WORLD OVERSEAS

Benelux Under Way

(From Our Brussels Correspondent)

BY July 1st the governments of Belgium, the Netherlands and Luxembourg hope to have ratified by their respective parliaments the new customs tariff of the Benelux Union. They hope to bring it into force by September 1st. The tariff is the result of many months of negotiation and was made public in April. All three parties are satisfied that this represents good progress in face of political and technical difficulties. Otherwise, no further decisions of importance about the future of Benelux have been taken beyond those described in *The Economist* of January 25, 1947.

Although the introductory explanations to the tariff, furnished by the Belgian and Netherlands Governments, differ in character, owing to the different public views in the two countries, both stress the immediate importance of the decisions taken. They point out, not only the long-term implications for industry and commerce, but also the possibility of extending the Union to other countries, especially to neighbours. The new common tariff is drawn up according to the scheme produced by the League of Nations in 1937, which advocated almost exclusively *ad valorem* duties. It contains 991 items, of which 350 are to be regarded as temporarily suspended so long as the parties experience abnormal conditions due to the war. For the Belgians, the agreed duties are a reduction on those of 1939. Hitherto, values were fixed by the Belgian and Dutch customs authorities in different ways; for the future they agree to consider as "customs value" the normal selling price in the country. This means big changes in the Belgian tariff; this used to contain 3,000 items, of which only 400 were *ad valorem*, the others being calculated according

to weight, volume and quantity. In the Netherlands, on the other hand, *ad valorem* duties applied to only 160 items.

It is hoped that the new tariff will have good effects on the respective price levels. So far, disparities in the two price structures have provided one of the main obstacles to a quick realisation of the Benelux Union; disparities between the respective gold and foreign exchange reserves, and between Belgian liberalism and abundance on the one hand and Dutch interventionism and austerity on the other, have also made difficulties. The general impression now is that the new tariff will tend to lower the Belgian price level and to raise the Dutch. As before, raw materials will, generally speaking, not be subject to duty: coal, rubber, raw textile fibres, and oil will all be free. Examples of the new duties are as follows:—

	per cent.
Textile products	4-18
Metal goods	6-10
Steam engines and hydraulic machines	6
Electrical machinery	8-12
Railway carriages	12
Watches of all types	12
Optical instruments	10-15
Paper	15
Fruit juice	20
Motor-cars	24
Shoes	24
Chocolate	24

It is important to realise that the new tariff covers customs

OVER A MILLION CLIPPER PASSENGERS WERE CARRIED IN 1946

8-year-old flies Atlantic alone

"I want to be an air hostess"

SHE TELLS STEWARDESS

LORNA TAGGART was only eight. All on her own, she made a 3,000-mile flight by Clipper to see her gran in Scotland. But she loved every minute of it—the comfort, the wonderful meals, the friendliness of all aboard.

As she left the giant Clipper at London Airport, Lorna waved goodbye to the stewardess. "I want to be an air hostess, too!" she cried, and her eyes sparkled as she added "on a Flying Clipper, of course!"

duties only; the future of excise duties and transit charges is not yet settled. All that has been completed so far is the first of the three stages towards union; the next is to co-ordinate excise and transit charges, and subsequently to integrate the economies. Customs legislation remains for the time being unchanged, but a study group is preparing a general customs law for all Benelux members. Foreign exchange controls remain and national reserves are to be kept separate. The scope of present agreement is therefore limited, but will enable the governments already to start co-ordinating their economic policies. Efforts are now being made to increase the exchanges between the Belgians and the Dutch, and special agreements will be negotiated to this end. The Belgians, of course, insist on the need for more freedom in commerce, largely because they are following a policy of lowering prices by increasing production.

Meanwhile, the expert commissions on a number of specific questions are making good progress, summarised below.

Transport

A final report was produced on February 26th, as a result of which competition between the Belgian and Dutch ports is being ironed out. Port duties at Rotterdam were increased as from April 1st, but Amsterdam has not yet done the same; on the Belgian side there is a feeling that the interests of Antwerp and Ghent have not yet been properly recognised. But it is hoped that fresh negotiations will bring agreement before the end of the year. These and other problems connected with the ports have their roots in history and are delicate to handle in any case; but things are made worse by the drastic reduction of traffic from the German hinterland. Two joint appeals have already been made to the occupation authorities in Germany, asking for their present transport policy to be revised. The first, sent in February, asked the British and American authorities to modify the policy of diverting traffic to Bremen and Hamburg from its natural outlet via the Rhine and canals to the Belgian and Dutch ports; and in March a memorandum was sent to London and Washington asking for a settlement of questions of Rhine navigation, in which Belgium and the Netherlands have a direct and traditional interest.

Postal Services

Agreement has been reached on common charges. A letter sent from Brussels to The Hague, for example, will no longer be subject to the international tariff, but will be stamped as for a Belgian destination.

Monetary Problems

These have been examined in detail, but, as foreign exchange reserves are to be kept separate, no decisions can be made beyond the existing credit agreements. Here the Belgians have been very liberal; their credits to the Dutch amount already to more than four billion Belgian francs. A joint effort is to be made against the black markets in guilders and francs.

Industrial Development

No great progress has been made at the official level, but there have been numerous private meetings between industrialists from both countries, in which problems have been discussed and plans and agreements made for the future. Civil servants and industrialists do not always see eye to eye on methods of negotiation, the latter preferring to dispense with the intervention of the former. As more or less official reconstruction plans exist in both countries, this lack of collaboration between officials and private employers is regretted by the governments.

Agriculture

Numerous problems remain unsettled, owing to stubborn differences between national policies. In Belgium, maximum commercial freedom is the aim of official policy; the Dutch go on sticking to their complicated monopoly system.

Besides the regular discussion under the heads just given, groups of economists and statisticians are examining ways of co-ordinating statistics and of producing uniform documents. So far as foreign trade statistics are concerned, the task is virtually finished, and in the near future accurate comparison of trade movements in the two countries will be possible. Similar work is now being done on price, wage and cost of living indices.

The Council of the Benelux Union, consisting of high civil servants, meets every five or six weeks, alternating between the three capitals. They discuss the progress made by the special commissions and give new directives. In future—as a result of a successful meeting in Brussels at the beginning of this month—

Ministers will also meet every three months. At this meeting it was decided that the plans for unification of excise and transit charges should be prepared and ratified before September 1, 1948, so that the second phase of progress towards union may begin exactly a year after the first.

Those who have followed the negotiations closely are impressed by the fact that the state of mind of the negotiators is exactly what it was two years ago: firm resolution to overcome all difficulties, to establish a solid union, and avoid taking any risks that might endanger the results already achieved. But the fact remains that very little progress is being made in such vital matters as co-ordination of agricultural and industrial development. If work continues at its present speed, it will be five years before the third phase of union is reached; meanwhile, industrial conditions are crystallising in western Europe and opportunities to create new industries—arising from the weakness of Germany—may be lost.

Yet industrial and financial circles in both countries are almost unanimously in favour of union; as are most of the general public

who do not understand all its implications. In October, 1946, a Gallup poll held in Holland showed 80 per cent of people in all social groups in favour of the union, three per cent against it and 17 per cent with no views. At the beginning of this year a similar poll in Belgium showed 69.3 per cent in favour, 23.5 per cent indifferent and 7.2 per cent against union.

This result in Belgium was remarkable, because some political circles there had expressed fears that union might slacken the traditional ties with France, and so weaken the position of a small minority in a Dutch-speaking group. In fact, close economic collaboration with France already exists through the monthly sessions of the Tripartite Council (delegates of France, Holland, Belgium and Luxembourg), but its results are not very constructive. There is, in particular, a conflict of views over Germany. The French wish to see German heavy industry destroyed or reduced for security reasons. The Belgians and the Dutch fear that the development by the Germans of manufacturing industries to take its place would directly interfere with their projects for developing finishing industries. Moreover, if German

production remains at its present low level, the ports of Antwerp and Rotterdam will be restricted to the role of receiving imports from overseas.

The present situation is that both governments recognise the need for joint action and policies to defend interests which are increasingly common to both. If political fears should interfere too much with the efforts to work together, then a political arrangement complementary to the economic one may have to

Eastern Europe in 1947—II

Russia, Panslavism and Nationalism

(By a Special Correspondent)

IN the first months after victory the efforts of the new regimes for national reconciliation were fully backed by the Soviet Union. The principle of reconciliation agreed with Soviet ideas about the solution of national problems. The new governments were largely controlled by Communists, and proclaimed the devoted friendship of their countries for the USSR. Sweeping social reforms were decreed, and conscientious if not always successful attempts were made to put them into practice. The Soviet leaders expected that these reforms would win the peasants and workers, and at least a section of the professional class ("intelligentsia") to the new governments, and that the "broad popular masses" would thank the Soviet Union, not only for delivering them from the German yoke, but also for making possible a social transformation which would raise their standard of living. As it was expected that the new regimes would be friendly to the USSR, and that the peoples would love both the regimes and the USSR, it was obviously desirable that the peoples should be friendly to each other. Reconciliation between East European neighbours was therefore encouraged by Moscow.

But expectations were not fulfilled. It is true that the pre-war regimes were (with the sole exception of Czechoslovakia) oppressive and unpopular, and that the new social reforms and economic plans offer a greater prospect of ultimate prosperity than any pre-war policy. But the war devastated Eastern Europe, houses and factories were destroyed, cattle, machinery and means of transport were removed by the Germans and have not been recovered, and reparations and the expenses of Soviet occupation have been and are a severe burden. The Rumanian and Bulgarian droughts and the expulsion of German skilled workers from Bohemia have created problems even in areas which escaped relatively lightly from the war itself. The result is that, though conditions vary in different regions, the material standard of living is in most places much lower than it was under the dictatorial Right wing regimes of 1939. People are discontented, and they blame the new governments, and the Soviet Union as the pro-jector of the governments. In countries occupied by Soviet troops anti-Soviet feeling is still stronger.

The Soviet leaders were soon forced to admit that they had miscalculated. In the new situation policy had to be reconsidered. With the peoples anti-Soviet and the new regimes weak, it was no longer certain that reconciliation between East European neighbours was to Russia's advantage. It would be wrong to suggest that Soviet policy was completely reversed, but it is certain that it was modified. The most striking example was Soviet treatment of Hungary during the first six months of 1946. Hungarian leaders were allowed to hope that the Transylvanian frontier would be modified in their favour, and that Moscow would press Czechoslovakia to treat the Hungarians in Slovakia more leniently. At the same time, the Prague and Bucharest Governments were convinced that they would be fully supported by the USSR. The policy of "divide and rule," traditional game of the Great Powers of the past, was played right up to the Paris Conference, when Mr Vyshinski definitely came down on the Czechoslovak and Rumanian side against Hungary.

During the war an important feature of Soviet propaganda was Panslavism. Unlike some other concessions to Russian traditionalist feeling which were stopped after victory, Panslavism has remained. The representatives of the small Slav nations at the wartime Panslav congresses in Moscow included such well-known Comintern figures as the Bulgarian Kolarov and the Macedonian Vlahov. The most recent congress was held in Belgrade in December, 1946. The speeches of delegates were a curious mixture of revolutionary and racial slogans. Some passages recalled the "Slavophile" doctrines of the nineteenth century, which attributed to the Slav nations a moral superiority over those of the West, and stressed the mission of the Slavs, and particularly of

Russia, to save and regenerate the world. The Slavophiles believed that the spiritual and social traditions of "Holy Russia" contained the means of solving problems in the face of which the West was powerless. The Panslavs of 1947 do not use their predecessors' terminology, but the underlying note is surprisingly similar. It is overlaid with phrases about continuance of the world struggle against Fascism. The audience are not openly told, but are allowed to infer, that "Fascism" and "the West" are identical. An interesting feature of the Belgrade congress is that it was attended by delegates of the Slavs of the United States, Canada and New Zealand.

It is hardly likely that the members of the Politburo have been converted to the doctrines of Aksakov and Dostoevski. It should be remembered that the attitude of Russian governments to Panslavism was always opportunist. The Slavs oppressed by the Habsburgs or the Sultan naturally looked for help to a great nation linked to them by affinities of language and (in some cases) of religion. The Russian Slavophile intellectuals had dreams of redeeming the human race. But the government of the Tsars was interested in Panslavism as an excuse to justify an imperialist foreign policy and as a means of diverting attention from internal problems. To-day the Soviet Government aims at enlisting the support of different groups by the use of different slogans. Classical Marxism will appeal to the working classes of industrial Europe, nationalism and "Panasiatism" to the colonial and "coloured" peoples, and Panslavism to the nations of the disinherited East of Europe, to whom the Westerners, whether they be Germans, British, French or Americans, can be represented as a selfish race of exploiting plutocrats, who regard the rest of Europe as colonial booty.

In 1871 the Panslav writer Danilevski published his "Russia and Europe," which outlined a future Slav confederation under Russian leadership. Most of his prophecies, which then seemed fantastic, have been realised during the twentieth century. Among those which have not were the incorporation of Trieste and part of Carinthia in a South Slav state and of the Thracian coast in Bulgaria. These still figure among the aims of the Panslavs of 1947. The Soviet press has shown sympathy for them, but the Moscow Government has compromised, at least temporarily, on both points. Its ultimate decision on the second will depend on whether it believes that the departure of British troops from Greece will allow a government to be formed in Athens in which Communist influence will prevail. If this could be achieved, Greece as a whole could be detached from Britain and brought into line with the other Balkan States. If the price were to allow Greece to keep south Macedonia and Thrace it would be worth paying. But if, even without British troops, the Greek Right remains in power and maintains its reserve towards the USSR, then the arguments of the Panslavs on the Slav character of "Aegean Macedonia" and Thrace, and on the suppression of their inhabitants by Greek Fascists, will receive support in Moscow. A friendly Greece can keep its frontiers, but a hostile Greece should be partitioned and the "Slav block" brought to the Aegean. The support given by the Truman Doctrine to Greece has postponed but not radically changed the issue.

The national problems of Eastern Europe, which the Austrian, Russian, German and French statesmen of the past could not solve, will cause many anxieties to Soviet diplomats. Hitherto Moscow has done fairly well. First priority is given to the Slav nations, and of these the two most unreliable, the Poles (who have historic reasons to hate Russia) and the Czechs (who, though Slavophiles, have genuine sympathy and understanding for the West), have been encouraged to take action which must make reconciliation with Germany inconceivable, and must thus increase their dependence on Russia for protection. Of the non-

Slavs the Rumanians have been preferred to the Hungarians, partly because the Rumanians are the more docile nation, partly because the other Slav nations hate Hungary but are indifferent to Rumania, and, above all, because Rumania is nearer Russia and strategically easier to control. By restoring Transylvania whole to Rumania, the Soviet leaders extended their own frontiers west. Rumania is an essential part of the Soviet defence system, Hungary is not.

It would seem then that Soviet policy has made the best decisions possible in the circumstances. But to play with East European nationalism is a dangerous game, in which the enemies of Russia within each country have much experience. It is difficult for the new regimes to outbid the Right opposition in nationalism, for they can so easily be denounced as agents of Russian imperialism. The counter-charge that the opposition are tools of the Anglo-Saxons is much less effective, for the Anglo-Saxons are far away, and the average East European has never had such experiences with their troops as he has had with the Red Army.

Symptoms of Fascist Revival

Before the war nationalism and Fascism went easily together, and it seems likely enough that this will happen again. Available evidence suggests that nationalist feeling is in fact being much more successfully exploited by the oppositions than by the regimes. Explicitly Fascist mass organisations cannot easily be built in Eastern Europe to-day. But the symptoms of a Fascist revival are undoubtedly visible. In Yugoslavia and Bulgaria Fascism was artificially imposed from above and never had mass support. In both these countries nationalism, though violent, is at present to a large extent controlled and directed by the governments, and anti-Russian feeling, though perhaps growing, is probably not very strong. But in Poland, Rumania and Hungary Fascism was a genuine native product. The National Radicals, Iron Guard and Arrow Cross were once powerful minorities, deriving real support from sections of every social class. In all three nationalism is to-day out of control. In all three hatred of Russia is passionate and widespread, and is fiercer among the masses than among the official opposition leaders, who, realising the need for good relations with the USSR, try (with little success) to hold their followers back. In the same three countries anti-Semitism is as strong as ever in the past.

Finally, in Poland, Hungary, Slovakia and Croatia the Catholic Church has great influence. Only in Croatia it suffered real persecution. But it is obvious that the new regimes intend to allow it less power in political life, and especially in education, than it enjoyed under the old. The Church distrusts fair words from MM. Bierut and Rakosi and makes little attempt to hide its hostility. It is a rallying-point for anti-Marxism and for every shade of nationalism. The same is true, on a much smaller scale, of the Orthodox Church in Rumania, Bulgaria and Serbia.

The social bases of a Fascist revival are the dispossessed bureaucracy and commercial class and the discontented peasantry. The ideological basis is a mixture of ultra-nationalism, clericalism, anti-Semitism and indiscriminate hatred of all that is Left. No new movement would openly call itself Fascist, but would probably approximate to one of two types, examples of which are the Russian "Black Hundreds" of the beginning of this century or the Austrian "Christian Socials" of Dollfuss. The impending departure of the Soviet troops makes the problem a real one.

Whether the Soviet political and military leaders could have shown more tact and tolerance, and whether had they done so they would have met with genuine co-operation from the East European peoples cannot be proved one way or the other. But it is certain that to-day nationalism is as fierce as ever before. To anyone who has seen something of the harm it caused in the past, and who remembers the hopes of 1944, the change must seem immensely tragic.

(To be continued)

Stalin's Dose of Optimism

[BY A SPECIAL CORRESPONDENT]

LAST Monday the Supreme Soviet of the USSR issued a decree abolishing the death penalty. This is the second time that the death penalty has been abolished in Soviet Russia. The first occasion was immediately after the October Revolution, but the reform was then very short-lived. Capital punishment was re-introduced at the beginning of the civil war and since then the legal standards prevailing in Soviet Russia have been those of a country torn by virtual civil war. There were only two intervals in this long period of terror: the first phase of the New Economic Policy, in the middle 'twenties, and the period of "constitutional

illusions" in the middle 'thirties. Yet even during those intervals the death penalty was not abolished, in fact it became "daily bread" under the grim Yagoda-Yezhov regime, when the guillotine of the great purges was in feverish motion. Then, after the purgers themselves had been purged and Stalin put his countryman and biographer L. Beria at the head of NKVD, the wave of terror subsided, though capital punishment was still an important element in maintaining Russia's civil and military discipline during the war.

Since the end of the fighting there have been many indirect indications of a pressure to soften the rigours of the regime. It is only natural that a people that has borne as heavy sacrifices as the Russians have and has, on the whole, shown astonishing loyalty to the regime—in spite of innumerable grudges and grievances—should expect their rulers to relax the grip of the secret police. The demand for some liberal reform has not been voiced or formulated by any organised political group, because no such group has been allowed to survive. But the expectation is present in the Russian mind. The rulers know this, and are aware that they must somehow meet it. In the inner councils of the Kremlin, the opponents and the advocates of some liberalisation of the regime are almost certainly arrayed against one another, though the outsider cannot say which members of the Politbureau stand on which side. In 1933-34 the "liberal" trend in the Politbureau was represented by S. Kirov, the Governor of Leningrad, whose policy was defeated when its prompter himself was assassinated by a young terrorist from the opposition. Mr Stalin was then biding his time and refusing to commit himself. Something similar may be happening now.

Trade Unions and Morale

It is perhaps significant that the abolition of the death penalty has been decreed on the responsibility of Mr Shvernik, now President of the Soviet Union and former leader of the trade unions. From the despatches from Moscow it appears that the decree has not been countersigned by the Prime Minister Mr Stalin. The explanation of the decree places responsibility for it primarily upon the trade unions (the Party has, surprisingly enough, not been mentioned among those "authoritative organisations" that have pressed for the reform). Evidently the expectation of quasi-liberal reforms is an important factor in the morale of the working population on the state of which fulfilment of the Five-Year Plan to a large extent depends. The trade unions may be more concerned with the matter than some other organisations, for they are more directly in touch with the prevalent moods in factory and workshop. The Government, on the other hand, have recently shown an anxiety to enhance the moral position of the trade unions by reviving the previously discarded practice of collective agreements in industry. The latest decree is calculated to increase the popularity of the trade unions.

The abolition of the death penalty has come after a series of such other measures as the promise of *habeas corpus*, to be embodied in the new legal codes, the reduction of the formal status of the NKVD, the transfer of labour camps from the authority of the NKVD to that of the Central-Commission for Labour and so on. All these measures, if seriously carried out and supplemented by a few others, would add up to a real modification of the regime. The "if" is a very big one.

Propaganda Boomerang

Another motive given for the decree is that "the international situation . . . shows that the cause of peace may be considered secure for a long time, in spite of the attempts of aggressive elements to provoke a new war." This reassuring view is often contradicted by day-to-day propaganda and by the tenor of the Russian press, which must have sounded alarmist to the Russian public. A similar contradiction can be found in Mr Stalin's own speeches, which have contained hints about the capitalist encirclement of the Soviet Union as well as reassuring statements about the stability of peace. As usual, the style of Russian propaganda is veering between extremes of pessimism and optimism. The gloomy suggestions about an imminent danger of war have been needed to strengthen the appeal for more and harder work for the fulfilment of the Five-Year Plan; but they have apparently tended to defeat their own purpose and create apathy and panic instead of enthusiasm for work. The effects of an unduly pessimistic line of propaganda must therefore be dispersed by an injection of a big dose of optimism. There can be no doubt that the Soviet Government are also anxious to demonstrate to the outside world that Russia is preparing for a long peace. All that is needed to secure it is that "the attempts of aggressive elements to provoke a new war" be discontinued.

THE BUSINESS WORLD

Scope for Import Cuts

TO the well-informed, the gravity of the problem of Britain's balance of overseas-payments needs no emphasis. But the general public at home, and many even of the knowledgeable public across the Atlantic, are still only dimly aware of it. If they looked for proof they would readily find it in the rapidly accumulating evidence of the intensity with which, in the past few weeks, the responsible Ministers and departments, under the lead of the Treasury, have been seeking remedies. The unpalatable fruits of these labours are likely to be seen before long, and the public must prepare itself to stomach them. But, Ministers having this week been otherwise engaged though Mr Dalton gave an ominous warning, even so this is an appropriate moment to consider, against the statistical background, what may be in store.

The original import programme for 1947, set forth in the belated *Economic Survey*, provided for a total of £1,450 million (f.o.b.)—an increase of no less than £350 million on 1946 which was intended to make good the inroads into stocks of materials and food, to provide for the growing needs of re-equipment, to maintain some variety in Britain's diet—and to meet the rise in dollar prices. But this programme was founded on the assumption that Britain's overall payments' deficit for the year would be no more than £350 million, and even by the date of the budget the figure had been officially revised to upwards of £400 million. Now, although industry's recovery from the fuel crisis is, on the whole, proving more rapid than had at first been feared, Sir Stafford Cripps has admitted that the resultant loss of exports may be about £200 million. The greatly accelerated drawings on the dollar credits leave no doubt that the import target must join the growing list of abandoned goals. Sir Stafford has given warning that, if the credits run out before

the export targets are realised, imports would have to be cut by some £400-450 million per annum. There is, in fact, some reason to think that the current review was directed at first to a saving of almost this extreme order, but appreciation of the burden it would impose seems to have substituted the more modest, but still elusive, objective of off-setting the prospective shortfall of exports below the original target for the year—a cut of perhaps £200 million. How could such a saving be achieved, and what effects might it have?

Much depends, of course, upon the supplying areas upon which it is concentrated—if, indeed, the principles of non-discrimination (which may be presumed to be receiving close scrutiny) permit the Government as large a flexibility as the situation so patently demands. Obviously it is not sufficient—especially in this phase of acute stringency, when Britain must gain time at all costs—to look simply to the overall balance. It is true that the advent of July 15th, after which all proceeds of exports to Britain become convertible, will in principle extend the problem beyond the "hard currency" imports which have been the central difficulty so far. The overall balance will admittedly become progressively more significant, but on a relatively short view, as a study of Britain's deficits by countries reveals, the problem will not be basically altered by the new status of sterling. Though the problem becomes, in principle, one of foreign exchange as a whole, it still remains, in fact, overwhelmingly one of dollars.

Countries with which the United Kingdom had an adverse trade balance of over £10 million in 1946 are listed in Table I. The chief country with which the account is adverse is the United States, with a balance of £187 million, to which should be added £19 million for Cuba. Canada assumes second place

with £162 million, New Zealand third, with £48 million, followed closely by Argentina (£46 million). Apart from New Zealand, which can probably be relied upon to hold its accumulating sterling, the three major countries with which there are deficits are also the three major hard currency countries. Whether, therefore, convertibility imposes additional dollar strain, the essential pattern of the problem will be unaltered.

TABLE I
UNITED KINGDOM'S DEFICITS ON VISIBLE TRADE
Balances exceeding £10 mn. in 1946

Country	1946	First Quarter, 1947
Total	£ Mn. 335.6	£ Mn. 95.9
United States	187.1	53.9
Canada	161.7	35.7
New Zealand	47.7	24.4
Argentina	46.0	22.1
Ceylon	28.1	4.4
Netherlands West Indies	22.1	5.3
Cuba	19.4	3.9
Nigeria	14.0	3.8
Sweden	10.5	0.2

Unfortunately, many of the most commonly discussed measures for economising dollars would be intractable or illusory. Some £18 million might be "saved" by prohibiting foreign films, but only at the risk of counter-measures against the expanding British film industry, with its promise of valuable "invisible" income. Up to £35 million might, theoretically, be saved in imports of consumer goods—at the cost of more intense austerity. The hypothetical 25 per cent decline in tobacco consumption would save £13 million, including freight, etc. Even if to these items there could be added a further, say, £20 million saved on imported petroleum by drastic domestic rationing, less than half the presumed target of £200 million would have been achieved. And the figure of £200 million, it should be remembered, is not what is required to balance the accounts, but simply to reduce the deficit to the total of £350 million originally contemplated. If such items are "frills," it is obvious that to cut them thus drastically would not protect the basic import programme. To achieve worth-while savings, there must be cuts in one or more of the groups of essentials—food, raw materials and equipment.

Anything more than a modest pruning of raw materials would evidently have almost immediate repercussions upon exports. It is possible that there is a little scope for selective cutting of imports for industrial re-equipment. This could not be done without heavy eventual loss, out of all proportion to the immediate gain, but this highly improvident criterion may have to govern policy. Clearly, there is little room for reduction in imports of either materials or capital goods. But this is equivalent to saying that the axe must fall on food imports, and that might lead just as quickly, through impaired productive efficiency, to lower exports. Maintenance of the basic food supplies plainly has the highest priority except over limited supplies of crucial equipment—such as bottleneck items of mining machinery.

What economies could be made in food imports without affecting the basic rations? In 1946, food and drink accounted for £572 million, or just under 50 per cent of total imports, and most of these purchases were for basic rations. It is possible, however, to effect certain economies by giving the public a less palatable and more monotonous diet. For example, some £10-13 million could be saved on the meat bill by excluding such items as game, poultry, tongue, etc. By halving the imports of dried eggs, £15 million could be saved; £10 million could be found by cutting out condensed and dried milk; and £20 million from such "luxury" fruits as apricots, grapes, pears, peaches, etc.—while retaining bananas, oranges, grapefruit and lemons, costing £18 million in 1946, as "necessary" fruits. A ban on imports of spirits or wine would save £11 million; of fish, £25 million; preserved and tinned fruit, £15

million; and cakes, £4 million. Such a pruning of the food import programme might produce £110 million, which, with the £60 million or so from tobacco, consumer goods and film remittances, would, in a purely arithmetical sense, come within striking distance of the presumed target.

But it is important to realise that such savings would be illusory or impracticable—or merely theoretical. The coal-oil conversions now taking place in Britain will probably require even larger imports of petroleum. Moreover, the basic British rations are inadequate to maintain healthy living. Total rationed and pointed foodstuffs give only 1,600 calories a day; the remaining 1,300 calories are obtained from other foods. Many items, too, which would have to be cut in order to give this theoretical economy are used in the manufacture of "semi-essential" foodstuffs, such as jam, savouries, etc. It is probable that the real luxuries, such as spirits, wine, poultry, etc., would not amount to as much as £50 million. More important still, on a short view, a large proportion of the so-called "luxury" food imports come from countries with which Britain enjoys a favourable trade balance, and since the currencies concerned are not yet convertible into dollars, these imports are simply an alternative

to additional British lending abroad. In some cases, too, there are political reasons for such purchases. Cuts in such supplies would do nothing—or virtually nothing—to solve the basic problem.

The problem of the "deficit" countries can best be seen from an examination of the imports from the United States, Canada and Argentina, which are given in value terms for 1946 in Table II. Food from the United States accounted for £85 million or 38 per cent of the total, the largest items being dairy produce, meat, wheat and flour. Tobacco imports cost £55 million, while raw materials totalled £24 million. Of the £63 million of manufactured goods purchased in the United States, many were intermediate and not end-products. For example, manufactured oil and fats accounted for 45 per cent (£28 million); metal manufactures totalled £6 million; chemicals, £4½ million; and wood manufactures, £3 million. Imports of machinery were under £10 million. The extent to which any economy can be made is obviously limited. Perhaps £10 million might be saved from the total food category and possibly £11 million from "other manufactures." If £13 million on tobacco is included, a theoretical total of £35 million is achieved.

The position of Canada is similar, although the commodities concerned are different. Food accounted for £118 million, or 60 per cent of total imports in 1946. The main commodities

were wheat and flour, meat (mainly bacon and hams) and dairy produce. Raw materials amounted to £41 million, with wood and timber accounting for £25 million. Total manufactures were valued at £35 million, over £17 million being spent on "non-ferrous manufactures"; these in fact were non-ferrous metals imported in a semi-refined or refined state. It seems doubtful if imports from Canada could be reduced by so much as £20 million without affecting staple commodities.

Of the Argentine imports, some 72 per cent comprised food, with meat as the main item. Oilseeds, hides and skins were the chief raw materials obtained from this source, whilst purchases of manufactured goods consisted of miscellaneous articles. The total possible economy on Argentine purchases is probably below £3 million. Thus from the three main hard currency sources of supply, a maximum theoretical saving of well under £60 million could be achieved on these premises. The realistic figure is likely to be considerably less.

It would seem, therefore, that neither the total amount of imports nor those from the major deficit countries can be effectively reduced by cutting off both the fairly obvious frills and other items which, though very desirable, cannot be regarded as vitally necessary in a condition of emergency. It remains to be seen what would be the effects of a cut in the supply of staple commodities. The chart on previous page shows for the main foodstuffs the proportion of total requirements produced at home and the main sources of imported supplies. No allowance has been made for changes in stock-levels; in most commodities these have been incorporated into the proportion given for imports. The small proportion of domestic supplies to total requirements is more or less consistent with pre-war experience. The only commodities of which home output supplied more than half the total needs are highly perishable goods, such as shell eggs, fresh fruit and vegetables, or manufactured foods, such as margarine and compound cooking fat—and for this latter group the raw materials have to be imported. The chart clearly demonstrates Britain's dependence on overseas supplies for most of the staple commodities. Canada alone supplies 65 per cent of total British requirements of wheat and flour, with the remaining 10 per cent of imported supplies coming from the United States and Argentina. Argentina also supplies nearly one-fifth of British meat consumption, while other western hemisphere countries accounted for 13 per cent. New Zealand sent 17 per cent of the total and Australia 7 per cent. Canada also provided 43 per cent of bacon and ham requirements, and Denmark 14 per cent, but supplies from this latter source are expected to increase. Butter came from New Zealand, Australia and Denmark—relatively "soft" currency countries—but cheese mainly from New Zealand, Canada

and the United States. Most of the imports of pure lard, condensed milk, milk powder and dried egg came from the United States, whilst over half the sugar requirements of the United Kingdom was supplied by Cuba and St. Domingo. Tea was purchased mainly from India and Ceylon, with small quantities from Nyasaland, and fresh fruit and vegetables from Europe.

The significance of the western hemisphere and of New Zealand and Australia for the British food economy is striking. Europe is unlikely to have sufficiently recovered from the war to become for some years an important supplier of Britain, although increasing quantities of mainly dairy produce are expected to become available in Denmark and Holland. But Britain's food economy appears to be fairly firmly founded upon the western hemisphere and if hard currency cannot be found to meet the purchases, then, willy-nilly, the quantities will have to be reduced. The problem is, however, further aggravated by the low level of stocks in the United Kingdom of precisely those foodstuffs which come from the United States, Canada and Argentina. Stocks of wheat and flour, meat, bacon, cheese and fats now stand at such levels that even temporary cuts in imports would have to be reflected in reduced rations. The only commodity the imports of which could possibly be reduced without any direct impact on consumers is sugar.

It is clear that there is no solution of the problem which would not impose serious hardship upon the public. There is one faint hope—that the terms of trade may move in Britain's favour in the immediate future. But this is too uncertain a chance to serve as the basis for policy now, and decisions can no longer be deferred in the hope that it might materialise in time. The import programme should be reviewed as an integral part of the Government's overall economic policy, and the priorities should be decided accordingly. Once the modest frills have been cut away, the Government, as during the war, will be faced with the unenviable task of cutting supplies for a number of uses all of which may look equally vital. Obviously, no long-term solution can be achieved by such means; but Britain now has to try to hold out in the hope that the whole climate of world trade will alter—until hard currency prices fall, until soft currencies become convertible and until Britain's export capacity expands considerably. The hope may be vain, but in any case only an increased supply of dollars could save Britain from import cuts, and proposals for additional aid surely could not be broached until a further serious effort had been made to bridge what the Americans may still regard as a short-term gap. In such a situation, the only expedient will be to do what is necessary to stay alive, even if that means leaving the future to take care of itself.

The OFS Goldfield—II

AN article in *The Economist* last week described in general terms the scene which is unfolding in the new goldfield in the Orange Free State. This week an attempt is made to relate the mining developments to the financial organisation. There are, it is believed, some 160 companies interested in prospecting in the OFS, but of these only a modest proportion deserve any attention from the investor. Most of the present minor promotions, with many predecessors from the early days of the Rand, will doubtless exist eventually only in the reference records of moribund companies. These articles make no attempt to survey the whole range conceived in such terms: they are concerned, mainly, with the interests of the leading mining finance houses which dominate the prospective mining area. The prospecting in the north of the OFS has not greatly changed the outline of the new field in recent months. The extraordinary strikes in the Blinkpoort-Western Holdings area have not unnaturally

fostered hopes that these two potential mines may prove exceptionally rich, with complementary indications from and for the property lying immediately to the east—that is the Welkom No. 1 lease area, the most northerly of the three projected Welkom mines and the one on which shaft-sinking will begin this year. The first OFS shaft, that on the St. Helena, may soon reach the reef horizon, but its siting was based primarily on the shallowness of the overlying beds in this part—only about 500 feet, compared with an average Basal Reef depth of some 2,000 feet in other parts of the St. Helena property and of 4,000-5,000 feet on the Welkom properties. Information about the structure and mining conditions generally from this shaft will be regarded in technical circles as more instructive than the actual values immediately encountered; these, indeed, are not expected to be particularly high.

In short, more information has been, and is being, gathered

about the nine or ten probable mines, but little positive has yet emerged to encourage expectations of an extension of the field. The various exploiting groups and companies have done a certain amount of swapping of small areas, with the general object of rounding off the mining boundaries to permit of more logical exploitation in the light of information about the lie of the land underground. The financial grouping has also been simplified by various financial operations, some of which are referred to below. This unscrambling—perhaps rescrambling would be a more descriptive word—of the technical and financial position makes it easier for the general investor to know what is represented by the various shares on the market. The stage has been reached at which it is perhaps legitimate to draw some distinction between speculation and gambling chances.

Among the ventures which give promise of being serious mining propositions, St. Helena has generally been rated as less promising than Welkom, because the grade of borehole cores has not been particularly exciting; but such comparisons involve assumptions which may not be confirmed when the ore bodies are examined. Meanwhile, the St. Helena property has the solid advantage, in terms of working capital, operating costs, and time required for preparatory development, of the shallowness of the reef. The present incline shaft with steam haulage will be followed by two vertical shafts when electric power is available; but much work remains to be done before a decision can be taken to erect an ore crushing plant. In the mines under Union Corporation management on the Rand itself, ore is not reckoned for calculation of proved reserves until it is blocked on three sides. But even when such knowledge has been gained, and there has also been experience of actual working conditions, estimates of future profitability and longevity made in the early years of working are likely to be falsified by the widest margins. At the present initial development stage, therefore, while attempts to make such forecasts for the OFS mines are obviously necessary as a basis for such decisions as the sinking of an incline shaft, similar exercises in arithmetic for the purpose of reaching any conclusions about share values would involve very long shots indeed. They certainly will not be attempted here. It may be noted simply that the St. Helena company is capitalised on the basis of share market values at about £13 million, with the 10s. shares at 51s. 3d.; it has about £1.7 million of resources in hand for shaft sinking, but another £2 million or so will probably be required for installation of reduction plant.

The second of the actual mining companies to be formed, Welkom Gold Mining Co., Ltd., is exploiting part of the former African and European Block 7, in lease areas Nos. 1, 2 and 3 respectively. All three are owned by the Welkom Gold Mining Co., but only the first (and incidentally the richest of the three so far as can be seen) will actually be worked by the company; the two others will be worked by daughter companies to be formed one year and two years hence. The initial

capital of the Welkom company is 8,000,000 5s. shares, quoted at 55s., and £4,000,000 Debentures, so that the present market capitalisation totals £26 million. When the second and third companies are formed, the senior company will be allotted 1,000,000 shares in each as consideration for the right to work the areas; and the balance of the present authorised capitals—4,000,000 shares of 5s. for each company—will be offered *pro rata* to Welkom shareholders. The debentures will be redeemed at par not later than 1963 and rank for earlier amortisation out of profits. The present Welkom shares thus have the full equitable right in all three of the projected mines. Borehole results, especially on the Welkom side of the border between the No. 1 lease area and Western Holdings (whose property, as the chart published last week showed, lies to the north-west), have been interesting, with values averaging around 500 inch-dwts. The reef dips generally to the east over the whole of the Welkom area, but the difficulties presented by the high temperatures to be expected at depth will doubtless be met to some extent by special ventilating systems and below-surface cooling-off rooms for workers.

It had been expected that the third mining—as distinct from prospecting—company would be formed by Western Holdings, to exploit the Second Lease area. But the directors recently announced that, as this area is virtually the sole remaining mining property owned by the company, it would develop it on its own account—news which provoked a sharp relapse in the price of the shares to around £5. At 92s. 6d. the indicated market capitalisation is about £13 million; to this there will have to be added the further £2 million or so which will be required to finance shaft sinking. The company owns also 968,750 shares and £500,000 Debentures in the Welkom company, and 215,000 shares in the St. Helena. A 20 per cent interest in the Second Lease Area is attributable to Union Corporation.

From the technical angle the neighbouring Blinkpoort property is interesting, but the Blinkpoort Gold Syndicate, Ltd., has only a 40 per cent interest in the vendor and subscription rights. Blinkpoort shares are dealt in in London under Rule 34 E, at around 73s. 9d., indicating a market capitalisation of some £7.4 million for Blinkpoort's share of the property, assuming its other assets are of little value.

The outline becomes less clear-cut in the Johannesburg Consolidated—New Union—Free State Development ("Freddies") group. "Freddies" itself has a mixed bag of interests, including territory round Odendaalsrust which is considered sufficiently proved to justify two large mines, and leases have been applied for over areas sufficient to support reduction plants with a crushing capacity of 200,000 tons per month; but the possibility of a third mine further north, adjoining the Wit. Extensions area, has yet to be demonstrated. Wit. Extensions itself,

though in the New Union (Erleigh) group, has handed over the prospecting of its main area to the Orange Free State Investment Trust ("Ofsits"), ceding as consideration to the Trust a 60 per cent interest in the vendor and subscription rights of any company formed to exploit the property. Results to date justify the expectation of one mine, but the steep dip of the reef throws some doubt on the chances of a second mine in the eastern portion. The position of these two companies, Free State Development and Wit Extensions, has not crystallised to the same degree as in the instances referred to earlier.

Obviously, there must at this stage be a large element of chance in all OFS propositions, but it is perhaps least in the shares of the Orange Free State Investment Trust, through which holding company the Anglo American Corporation group has interests in most of the significant prospects and prospective mines in the OFS. The Trust's principal holdings are:

	Present Market Price	Approx. Market Value
364,930 African and European shares	90/-	£1,640
1,355,475 Welkom shares	55/-	3,730
£485,000 Welkom Debentures	Par	485
723,150 Western Holdings shares	92/6	3,345
61,588 Blinkpoort shares	73/9	230
1,019,075 St. Helena shares	51/3	2,640
		12,070

The Trust also has a direct 60 per cent interest in vendors' and subscription rights of Blinkpoort and Wit. Extensions. While a comparison of the current market value of the underlying shareholdings of a Financial Trust with that of its own shares may be misleading if pushed too far, it deserves to be noted that the present market capitalisation of "Ofsits" 7,000,000 10s. shares is around £25 million, at the present price of 70s. On December 31st last, as the report issued last week showed,

Business Notes

Cheap Money Now

The Stock markets this week, after their rather sharp relapse before the holiday, have been so inert that even the rumblings from Margate have had no noticeable reverberations in the City. There is no doubt that thoughtful investors are at last becoming more aware of the realities of Britain's economic difficulties, and their awakening seems to derive from the intensive focusing of attention upon the dollar problem. But in market circles there is no unanimity on the vexed question of how a further narrowing of the critical bottlenecks—in dollars and coal—would affect industry's earning power. The present uneasy market equilibrium seems to be supported by a facile assumption that what might be lost on the roundabouts through industrial dislocation might be made good on the swings of inflation. The short comment on that argument is that in such conditions inflationary pressures would be highly selective in their effects, even if price-control left them room to exert a due influence upon profits. One new factor is the impending share-out of the Argentine Rail purchase monies. The wider effects of that have hardly yet been appraised, but it looks as though it may provide some cushioning for the equity markets—at a time when a cushion may perhaps be particularly needed—though for gilt-edged it may tend to have the opposite effects. Details of the Argentine Rail companies' proposed allocations of the purchase monies and other available resources to the various categories of stockholders became available just as this issue of *The Economist* went to press. To assess the implications for the fifty or more stocks affected requires precise and detailed investment analysis—which is perforce deferred until next week's issue.

Meanwhile, one of the other major props for buoyant equities over the past eighteen months or so—the cheap money policy—now looks much less dependable than it did, and certainly has lost its power to exert further leverage. Gilt-edged securities in the past week or so have suffered a further attrition. It is tempting to ascribe this to a belated response to Mr Dalton's neglected restatement of policy in the Finance Bill debate—a

"Ofsits" shareholdings had a book value of £3,155,568, but at market prices (or cost for any quoted shares) the total was £10.9 million.

The main gold mining interest of African and European is based on Block 7 property, of which the proved parts have been included in Welkom in which a large interest is held. The company has substantial shareholdings in Western Holdings, St. Helena and Lydenburg Estates, as well as in Amalgamated Collieries, Union Steel, Grootlei and New Central Wits., and interests in land. Lydenburg Estates, in its turn, has as its main interest 109,172 Welkom shares and £510,000 debentures.

At least two years must elapse before anything much can be known about the underground structure of the OFS field. Several more years experience of actual working conditions and of profit-earning capacity will be needed to bring the possibility of dividends into view. At this early stage, inevitably, even the most general and cautious forecasts of dividend potentialities might turn out eventually to have been dangerously misleading. All that can be said with any assurance is that the more extravagant expectations that have been mooted ought to be heavily discounted. But, subject to these caveats, it seems that, if the more reasonable hopes for the richer areas are realised, there should be substantial profits eventually—promising reward to shareholders for the long-sustained patience and risk-bearing which, however attractive the prospects may seem in the early days, are inevitably required of them. Meanwhile, they should be prepared for alternations of excitement and disappointment such as were experienced, for example, in the long development period of the Rhodesian Copper Mines. The wise operator will try to buy on the ebb tide and sell on the flood—but for members of the public that is, perhaps more clearly in the mining share market than in most other sections, a counsel of perfection. Certainly, it is not their usual fate in this sphere.

statement quoted in *The Economist* last week but previously almost wholly overlooked because of the accident of its timing at the very end of the debate (involving a "continuation" report in *Hansard*). But in fact the knowledgeable institutional investors, whose operations normally dominate the market except in phases of major change of mood, hardly needed an admission from the Chancellor to confirm to them that the fire had gone out of the cheaper money policy, and perforce out of the gilt-edged market, too. And it is very clear that the general public, though dimly aware of the underlying drift of recent months, is not yet seized of the significance of Mr Dalton's admission. Even so, against the background of the boom and slump of the five months to last March, the calmness of the response is rather striking. The Chancellor's candid assertion that the objective of the whole spectacular effort has now been achieved certainly sits rather oddly beside his truculent riposte in the crisis economic policy debate, with its promise—never fulfilled—of a comprehensive defence in the Budget speech. Had the admission been made a few weeks ago, when the gilt-edged position stood out in the full glare of the spotlight, the effects would assuredly have been electric.

Holding the Line

Policy now is directed towards consolidating the objective of "2½ per cent at long-term." There is still the same ambiguity as before about the definition of "long-term," but if the authorities had thought they could confidently substitute "irredeemable," Mr Dalton would surely have said so. And Treasury 2½ per cent stock is still fully 3½ points below par. But an attempt to consolidate even the present basis is simply common prudence even from the limited standpoint of the technical problem which the authorities face in the market, apart altogether from the wider inflationary dangers which any alternative tactics would involve. The shadow of the large issues of compensation stock grows steadily nearer, and next year the market will have to face

heavy sales by many of those who have chosen the rail route into gilt-edged as well as sales by original holders of transport stocks. Obviously, it is not too soon for the authorities to begin active preparations for that situation. To meet it, they need to have their powder dry, but it certainly is not dry now, and the Argentine rail operation, by necessitating repayment of Argentina's present lendings to the Treasury, will exhaust more of the available ammunition. The role of the new savings which flow towards the gilt-edged market in the next six months or so should be to relieve the "departments" of their accumulated load.

That is what Mr Dalton ought to mean when he talks about the need now, in this new "consolidation" phase, to reduce the floating debt. The money which the public draws off its banking accounts in order to buy stock from the "departments" would in effect be cancelled because the Treasury would use it to redeem Treasury bills or Treasury deposits held by the banks, and the banking position would be correspondingly deflated. Any other form of floating debt reduction—except, of course, a similar repayment out of a true budget surplus—is a purely nominal operation only, devoid of real significance. But it is not yet certain that Mr Dalton, in calling for a reduction of floating debt, is in fact thinking in these realistic terms. He made great play with the book-keeping fact that, a week or so ago, the floating debt was reduced by the "record" amount of £139 million—but did not explain that most of this repayment derived simply from the credit to the Exchequer of the first instalment of the "clawing-back" of surplus balances of unspent votes which makes up this year's nominal prospective budget "surplus." Even so the extent that these funds may have been held in banking accounts outside the immediate reach of the central Exchequer, so that their return reduces bank deposits, the operation is of no real account—it neither reduces the inflation potential nor increases the real capacity of the departments to absorb gilt-edged. It merely window-dresses the level of bank deposits and floating debt, much in the manner in which they were window-dressed during the war when deposits were reduced and floating debt repaid by the device of borrowing (more expensively) on Tax Reserve Certificates. But some of these receipts are certainly even less tangible than this: they represent moneys of which the Treasury already has effective command, and all that happens is that they are credited to a different internal account.

The gilt-edged market need take no heed of such debt "reduction" as this. But if Mr Dalton really means to get his powder dry the market will inevitably feel him at work. Unless the public shows much less appetite for liquidity than in the past few months, the process of unwinding last year's departmental operations will hardly leave any scope for Mr Dalton to "advance later to other objectives." He has a sufficient task already.

Monetary Fund's First Operations

At last the International Monetary Fund has carried through its first exchange operation. For about two months after the IMF opened for business on March 1st the customers kept away, not because they did not want the goods on sale, but because rumours had got about that purchasers would have to pass a stringent qualification test and no member appeared anxious to risk a rebuff. Last week, however, two countries decided to break the ice. France applied for 25 million in US dollars and the Netherlands for 6 million of dollars and £1½ million of sterling. The requests were granted. These currencies were purchased against payment in the currencies of the buyers. The French purchase was justified by France's balance of payments difficulties resulting, in part, from the need to make large purchases of grain owing to the severity of the last winter. The Netherlands' case was similar, with the added reason that dollars and sterling were needed for short-term reconstruction purposes. France's IMF quota amounts to \$525 million, which would give her the right to purchase from the Fund \$53¼ million or its equivalent in a year—provided that the currencies were bought for purposes consistent with the Fund agreement. The first purchase therefore represents rather less than one-fifth of France's permissible yearly withdrawal. The Dutch purchases represent approximately the same proportion of the permissible maximum of £68½ million. Now that the ice has been broken, it may be assumed that other operations will follow—especially if the board of executive directors of the IMF lives up to the principle of living dangerously which found such admirable expression in its first annual report, with its suggestion that "in the early period of its operations the Fund may take risks that would not be justified under normal circumstances." Plenty of "risks" will be coming its way in the next few months.

A significant feature of the initial operations announced by the

Fund is that sterling should have been one of the two currencies purchased. When accumulated sterling balances have been immobilised by the agreements about to be negotiated, then, so long as current earnings of sterling remain freely expendable in any currency area in the world, current sterling and dollars should be virtually interchangeable currencies and sterling will be just as scarce a currency as the dollar. It is appropriate that a foretaste of this important fact of economic reality should be provided by the very first batch of operations announced by the IMF. These initial transactions illustrate how the agency of the IMF will help the United Kingdom to ease its own dollar difficulties. The purchase of sterling by the Netherlands will have reduced the IMF's holding of sterling by that amount and to that extent will make room for purchases of dollars or any other currencies by the United Kingdom against payment in sterling (which, in turn, will replenish the IMF's holdings of sterling). The limit of British drawings in any one year will still be set by the proportion of one-quarter of the UK quota of \$1,300 million. But the total amount that can be drawn by the UK will increase as sterling is purchased from the Fund by other members. This is because the ultimate limit to purchases by any member is reached only when the Fund holds an amount of that member's currency equal to twice its quota.

Cement Monopoly: Acquittal—

After a year of deliberation and a further six months' delay in publication, the report by the Committee appointed by the Minister of Works in December, 1945, to inquire into cement costs* was released just as last week's issue of *The Economist* went to press, and its content was then only briefly noted. It is clear that the most valuable evidence on costs and prices has not even now been presented in the report—a suppression which the Committee justifies by the well-worn plea that such facts ought not to be put at the disposal of a firm's competitors. But there are many devices—as evidence presented before the wartime Public Accounts Committee plainly illustrated—by which cost information of great general value can be presented in a global or disguised form. Without definite data it is impossible to discern what correlation exists between costs and size of the unit of production, method of manufacture and efficiency. Hence the report scarcely provides the means of achieving an independent judgment on the efficiency of the industry.

A summary of the report is included in this week's issue of the *Records and Statistics Supplement*. The Committee is satisfied that profits earned by the industry in the past have not been excessive by reference to capital employed. It finds no evidence that the Federation has abused its position, and considers that control has not been exercised for the sake of restriction of output. The Committee is satisfied, too, that the minimum price system is not, as a system, unsound, "nor in its intention does it work injustice on the consumer." It feels, however, that when the existing price controls are withdrawn, the Federation should be prepared to submit its price schedules to an independent body. Consultations with such a body should be held at appropriate, but not too frequent, intervals. Sufficient bargaining power, it is claimed, already exists between the manufacturers and those interested in the rebates on prices to merchants and large users of cement for it to be reasonable for adjustments to be left to the interested parties. Lastly, comes the only real note of criticism: the Committee is of opinion that the Federation's constitution "presents considerable difficulties to any outside interest establishing new works in this country independently of membership of the Federation." Except at this point the report appears to be a somewhat mild exhortation to the Cement Makers' Federation itself rather than an analytical appreciation of the industry's finances addressed to the Minister of Works. Indeed, if the Committee can be said to criticise, the criticism never obstructs, but emerges only obliquely or by implication—as, for example, in the advice to the Federation to seek in future expert and independent opinion before fixing its minimum prices.

—Or Not Proven?

Admittedly, on the charges of monopoly or unfair price discrimination, the circumstantial evidence is in favour of the Federation. As the report points out, its first task, on its formation in 1925, was to remove the chaos and unprofitability of cut-

* Cement Costs: Report by the Committee appointed by the Minister of Works: H.M.S.O. 9d.

throat price competition in a highly capitalised industry. From 1925 onwards the Federation can point to regular expansion of annual output (with the sole pre-war exception of the year 1932), to a steady price-structure, an intelligent distribution system and reasonable profits. The expansion in demand for cement, which began in the Federation's youth with the prosperity of the late 'twenties, was continued by the building boom in the 'thirties and then by the rearmament programme. So far as the industry was concerned, this steady expansion of demand was fortuitous. But the fact that these conditions obtained means that those who bring charges of restrictive monopoly against the Federation have in the home market, no rough and ready index in restricted output or rising prices, no standard of comparison, with which to confront the cement manufacturers.

On the other hand, there is *prima facie* evidence that the Federation's constitution does restrict entry into manufacture and that the number of merchants handling cement is strictly controlled, if not the terms of their rebates. The report gives no guidance on two important points. First, there is no indication of the cost build-up and no suggestion of the directions in which economies might be secured, whether in production or distribution. Secondly, it is not possible to form any firm idea of how far the Federation's price policy has maintained inefficient and normally redundant cement works in operation. There is, however, a hint in the report that price policy may have had some conscious influence in this direction—an impression which will continue outside the industry until the facts are known.

The cement industry has its post-war problems—a shortage of coal and bags, and difficulty in obtaining equipment to expand capacity. But the arrears of house and factory building to be made good ensure long-sustained activity once these difficulties are overcome. It would be to the advantage both of the industry and of cement users to clear up finally at the beginning of the post-war period the doubts about cement price policy. It is greatly to be regretted that the Committee—although apparently furnished with the relevant data—has not been able to carry this issue further towards a conclusion. As it is, its recommendations for a price review obviously deserve immediate action. In any case, there is still need for more published information about the industry. Until further evidence is forthcoming, the popular charge of monopolistic practices stands "not proven."

Spotlight on Cotton Machinery

The Committee of Investigation into the Cotton Textile Machinery Industry, set up by the Minister of Supply last

In addition to the short "Statistical Summary" which appears weekly in *The Economist*, a full service of statistical and factual information appears weekly in

Records and Statistics

Supplement to *The Economist*

Records and Statistics is a separate, self-contained weekly publication of from 16 to 24 pages. It includes not only many statistical tables but also factual records of public affairs, including Parliamentary activities and digests of state papers, and industrial and commercial reports from home and overseas. It is believed to be the most comprehensive statistical and factual report appearing weekly anywhere in the world.

The *Records and Statistics* Supplement to *The Economist* is available by postal subscription only. The subscription, which may be sent direct to this office or through a newsagent, is 30s. per annum. For those who are already direct postal subscribers to *The Economist*, the economy of posting both publications together makes it possible to quote a combined subscription of £4. Subscribers to *The Economist* who wish to receive *Records and Statistics* should notify this office as soon as possible, but are asked not to send any money until an account is rendered. It is regretted that it is no longer possible to supply back numbers of *Records and Statistics* or to date subscriptions back.

Paper shortage also makes it impossible to supply sample copies. For a limited time, however, subscribers to *Records and Statistics* will be allowed, if they wish, to cancel any unexpired portion of a subscription.

THE ECONOMIST, BRETTENHAM HOUSE, LANCASTER PLACE, LONDON, W.C.2

summer under the chairmanship of Mr Justice Evershed, has issued an interim report.* The decision to issue such a statement has been based on the strong criticisms voiced in the Cotton Industry Working Party report and elsewhere on the spinning section of the textile machinery industry which is virtually a monopoly of Textile Machinery Makers Ltd.

The committee does not mince words. It considers that, since the spinning machinery makers returned to peace-time production in 1945, the TMM has been deficient in personnel both in its directorate and management; that the structure of the holding company and its subsidiaries has been over-complex; that the company has been deficient in research and technical development; and, finally, that it has failed to comply with modern standards of costing. In suggesting remedies for this state of affairs, the committee has rightly taken into consideration the fact that the Government is prepared to subsidise re-equipment of the spinning industry, a fact which underlines the need for efficiency in the textile machinery industry if public money is to be well spent. The committee recommends four remedies, all of which have been adopted or will be adopted voluntarily by the company's management, which has been re-inforced since the enquiry began. The committee is of the opinion that a new director with special experience of management should be appointed to the Board. Sir Percy H. Mills, managing director of W. & T. Avery, has already been appointed. At the suggestion of the committee, the financial structure of the group is being simplified by the liquidation of the intermediate holding company, the Werneth Investment Trust. To meet the recommendation for improved research, the company has appointed, in consultation with the Shirley Institute, a chief research officer. A new cost system has also been introduced, and the company has agreed in principle to introduce a scheme by which prices of machinery will be fixed on the basis of cost estimates and rates of profit agreed with the Ministry of Supply. This arrangement is endorsed by the committee.

The sense of urgency which the committee has shown in pressing for reorganisation of the TMM group is welcome. Reorganisation of the cotton industry must begin with spinning, and any expansion or re-equipment of spinning capacity must be founded, for some time at any rate, on a re-organisation and expansion of the TMM group. It is too soon to say how large an expansion of capacity will be needed. The company is planning for a peak annual demand over the next few years, from both home and export markets, of £17½ million, but the committee puts the target for capacity at £20 million. Other investigations have suggested a figure as high as £30 million or even more. From these widely divergent estimates it is clear that the company will have to be prepared to adapt itself to quick changes of circumstance, and to develop a flexible production policy. The need for this will be accentuated by the fact that there may be a demand from the Lancashire industry for larger quantities of some types of machines, such as ring spindles, than for others. This might require a sudden expansion in one line of production only. To deal with such a situation, the best management and costing methods would be indispensable.

The forthright style of the Evershed Committee report sets a high standard of constructive criticism for the final report and the Cotton Board's report on redundant capacity which are to follow. Only when these other two are available will it be possible to gain a balanced view of the scope of Lancashire's re-equipment problem.

Canada's Exchange Control

The regulations operated by the Canadian Foreign Exchange Control Board have this week been tightened so as to reduce from \$100 to \$10 the amount of US dollars which a Canadian resident is allowed to hold without selling it to the Bank of Canada. It was as recently as September, 1946, that the regulations were amended to remove the obligation to sell holdings up to US \$100 and to free the export of funds by resident travellers up to a figure of \$150, compared with the previous limit of \$50. The rapidity with which the reversal of these relaxations has come about is a measure of the speed with which the Canadian exchange position has deteriorated vis-à-vis the United States. The latest change in the regulations is aimed primarily at ensuring that the whole of the receipts from US tourists in Canada are effectively collected by the authorities. Ever since the easing of the regulations last September it has been found that an un-

Trial by Fire

Give him a bag of coke, a bucket of water, and the necessary apparatus, and the chemist can build up thousands of different substances—from alcohol and 'meta fuel' to aspirin, motor spirit and food fats. Add a bottle of ammonia and he can turn out thousands more. To perform this modern magic he needs to know not merely what elements make up the substance he wants to prepare, but how much of each it contains. The majority of known chemicals contain carbon and hydrogen, usually oxygen, and frequently nitrogen. The chemist uses the combustion tube, illustrated above, to find out the proportions of these. A few milligrams of the substance are enough (and there are over twenty-eight thousand milligrams in a single ounce). These are strongly heated in a current of air or oxygen. As the substance burns, the carbon in it is converted into carbon dioxide gas, and the hydrogen into steam. These products are collected in weighed parts of the apparatus, and from the amounts formed the chemist can calculate the composition of the original substance. A simple experiment—yet it demands refined, reliable apparatus. Data provided by it lie at the root of modern progress in biochemistry, chemotherapy, dyeing, waterproofing, nutritional and agricultural chemistry, photography, and many other aspects of civilised life. Every working day throughout the year hundreds of combustion tubes are giving the result of this trial by fire which enables the British chemical industry to serve the nation.

AND NOW — AIRPORT BANKING

Ever ready to extend its service to travellers,

the Midland Bank now adds a branch at London

Airport to those which it has already established on

board the great ocean liners. The Airport branch will

be found in the Passengers' Arrival Hall at Heathrow;

it will be open daily, including Sundays, from 9 a.m.

to 6 p.m. It will provide facilities for foreign exchange

transactions and all normal banking operations.

MIDLAND BANK LIMITED

But what about Imports?

There is an urgent necessity to re-establish our export trade, and the private Banking House of Glyn, Mills & Co. offer their financial services to undertakings extending their export business. But as the economic situation improves, so should the natural balance be restored, and the national import trade grow once more. Business houses anxious to develop their import trade will find invaluable this private bank's international contacts and intimate knowledge of foreign conditions.

FRESH Horizons

To those private citizens who feel that in Australia and New Zealand lies the way to a fuller life. . . . To those industrialists who may contemplate establishing a factory in these Dominions. . . . The Bank of Australasia offers the benefit of a long experience and practical knowledge of local markets and conditions. The Bank has been in existence for over one hundred years and has numerous branches throughout Australia and New Zealand. Enquiries are welcomed by the Overseas Department at the address given below.

THE BANK OF AUSTRALASIA
(Incorporated by Royal Charter 1835)

Head Office: 4 Threadneedle Street, London, E.C.2. (Manager: G. C. Cowan)

justifiably large proportion of the US dollars brought in by tourists was seeping away and failing to reach the reserve held in the Exchange Fund Account. As this year's tourist income will play a decisive rôle in the Canadian balance of payments with the United States, it has been decided to take such steps as are possible to close this loophole.

The full text of the report of the Canadian Foreign Exchange Control Board for 1946, a cabled summary of which was cited in *The Economist* of May 3rd, has now reached this country. The report brings out with particular clarity the interrelationship between Canada's current deficit with the United States and its current surplus with the rest of the world. The heavy current deficit of \$603 million with the United States in 1946 no doubt arose to some extent from abnormal demands which had been accumulating for years, but the Foreign Exchange Control Board also associates it with the record peacetime levels of national income and expenditure in Canada. It proceeds to argue that this high level of economic activity is in part the result of the heavy flow of exports to the United Kingdom and Europe, itself stimulated by the granting of comparatively large overseas loans and credits by Canada. As American industry has progressed very rapidly through reconversion to peacetime production, whereas the restoration of the civilian industries of European countries has been much slower, the high demand for consumer goods in Canada has had to be satisfied by unusually heavy imports from the United States. Thus the very forces set in motion by Canada's record export surplus to non-dollar countries have contributed to the magnitude of the Dominion's deficit with the US dollar area. Inevitably, the Control Board's report closes with a reiteration of the importance to Canada of obtaining its income from overseas in the form of convertible currencies—but there is no suggestion of how the solution of the problem may be found.

Swiss Loan for Belgium

Switzerland, which has the distinction that its Central Bank is now turning away gold and US dollars, is obviously the country that should launch on a relatively adventurous scale into the business of foreign lending. There are some belated signs of grace in this respect. One of them is the announcement this week of a loan of 50 million Swiss francs to the Belgian Telegraph and Telephone system. The loan is guaranteed by the Belgian Government, bears interest at 4 per cent, is issued 99 and is repayable in whole at par on June 1, 1959. For a Government guaranteed loan of this medium-short character, this is fairly expensive borrowing. Allowing for the fact that the loan is repayable in twelve years, its terms will be found to accord fairly closely with the 4½ per cent which France is paying for its 30-year loan from the International Bank for Reconstruction and Development. These operations are setting the pattern for future international loan operations. It is a far better design than that which emerged after 1919 and, allowing for the risks of external lending, bears some relationship to the comparable prevailing level of interest rates for domestic issues in the markets concerned.

Coals to Newcastle

Efforts to import coal into Britain have long been advocated, but the bitter irony of Britain's plight is brought home afresh by the details—the paltry details, as they look beside any pre-war background—of Britain's application for aid to the European Coal Organisation. An allocation of 600,000 tons from American exports during the July-September quarter (at about \$22 a ton) has been made by the Organisation. But this takes effect only after normal European importers have had the opportunity to take up the first 9 million tons of American coal. This country's total bid was for 1.2 million tons over the quarter. The American authorities are apparently satisfied that, if the rate of loadings achieved at US ports in early May can be maintained in the third quarter, there is a reasonable prospect that this quantity may be available for Britain, but if there should be protracted strikes in the mines, only about 600,000 tons is likely to be forthcoming.

Even the larger figure is equivalent to less than two days' output from Britain's own mines—and would be provided at a cost of about \$26 million. This is black gold indeed, but in conditions of such acute scarcity as to curtail vital industrial production even this summer, not to mention the situation which might recur next winter, the demand price of marginal supplies for Britain is obviously far above the market price. The February crisis showed the importance of a few marginal hundred thousand tons in stock, and no means of purchasing assurance now can be

neglected—even when the price has to be paid in scarce dollars. As Mr Dalton reiterated at Margate this week, coal is the foundation of the whole national effort, in its external no less than in its domestic aspects.

Meanwhile, provisional coal output figures for the third five-day week are encouraging. Total output last week at 4,074,500 tons compared with 4,073,500 tons in the previous week. There are signs that the miners are beginning to set themselves a pace. Much depends on their maintaining it.

Wool in Transition

From a survey of the wool industry prepared by the Board of Trade, assisted by the Wool Control, and published in last week's issue of the *Board of Trade Journal*, it is possible to bridge some of the gaps in published information on the wool industry between the end of the Wool Working Party's proceedings and the onset of the fuel crisis. Between September last year and the end of February, total personnel employed (including administrative and maintenance workers) increased from 166,400 to 178,600. Of this increase, 4,500 occurred in the badly under-staffed worsted spinning section, but a quarter of it was represented by night-shift workers on a short week or emergency evening shifts. The labour shortage in spinning—only by contrast is it less acute in other sections of the industry—has been masked in 1947 by the fuel shortage, but if and when coal becomes more plentiful, labour will again become the limiting factor, unless recruitment can be improved to achieve the Working Party's tentative target of 200,000 workers in the industry as a whole.

The table below shows the variations in the different types of wool used in top making and woollen spinning in the first year of war and the first quarter of this year. It is unfortunate that the figures do not go back to a pre-war period, since war-time production included large Government contracts, which in the case of the worsted industry in particular called for an increased use of crossbred wools. As was to be expected, once Services contracts became less important, proportionately rather more merinos than crossbreds have been processed by the topmakers. By December last, topmakers were using a weekly average of 5.15 million lb of wool (excluding hair) compared with 6.8 million lb. in 1939-40, but only a third of this was crossbred, compared with about 45 per cent in the earlier period. There were signs, therefore, that by the end of 1946 the pre-war pattern of wool consumption was beginning to reassert itself—however slowly.

In the woollen spinning section the same slow process of return to pre-war mixing proportions was beginning to develop last year. During the war, inevitably, the proportion of noils, hair, waste and shoddy was increased. By 1939-40 it was as high as 50 per cent. But by December, 1946, it was down again—to 35 per cent. Over the same period crossbred wool increased from 31 per cent of the total spun, to 42 per cent.

* Merinos and Crossbreds : British, Dominion and S. American wools.

The production of tops has been held up by a shortage of labour during the transition period, but not so seriously as in other branches of the industry. The topmaking labour force is predominantly male and it has benefited from demobilisation rather more than have the spinners, who are more dependent on female labour. At 4.38 million lb. the weekly average output of tops in December had recovered to about 85 per cent of the 1937 level, but to only about 70 per cent of the level reached in the first year of the war, when the industry was working at pressure on Government, civil and export account.

Wool Textile Supplies

Changes in the composition of total wool consumption have been accompanied, and to some extent caused, by a changeover in

PROGRESS OF SUBSIDIARIES

FUTURE OF STEEL INDUSTRY

SIR JOHN CRAIG'S STATEMENT

The sixteenth ordinary general meeting of Colvilles, Limited, was held, on the 29th instant, at the registered office of the company, 195 West George Street, Glasgow, Sir John Craig, C.B.E., D.L., chairman and joint managing director, presiding.

The following is his statement circulated with the report and accounts for the year 1946:—

Administration—Sir James Lithgow found it necessary to curtail some of his many activities and submitted his resignation from our board. We valued his stimulating help and his resignation was accepted with much regret.

Following upon the special resolution adopted at the last meeting, an executive board has been elected for the Colville Works as from January 1, 1947. By this policy we have brought into the control of these works members of our own staff who have served the company for many years and who have special knowledge and experience of the varied branches of our activities.

THE ACCOUNTS

The increase in the net profit is largely explained by the reduction in the rate of E.P.T. The trading results are so far satisfactory in that they have been achieved notwithstanding increases in costs in many direc-

tions without compensating advances in the price of steel. We are now reaping the benefit of improvements in plant and economy in the use of fuel, which have been steadily carried out in former years.

In 1937, we launched the first of our big extension schemes when we commenced the erection of coke ovens, by-product plant and two blast furnaces. The cost was over £2,000,000. At that time, we stated we had arranged to find half of the cost from our own resources and the balance through a loan for £1,000,000 from an insurance group. The plant came into operation in 1939-40. It proved invaluable to the country during the war. It also fulfilled all the expectations of the directors and, indeed, set up new standards of efficiency and economy for the country. Further, the method of financing worked out as planned and now to-day, as stated in the directors' report, the final repayment of £200,000 has been made. It will be gratifying to you to realise that there are now no debentures, debts or mortgages on any of the properties of the company or its subsidiaries.

DIVIDEND DECISION

In view of the increased earnings, the directors gave careful consideration to the question of the ordinary dividend. They recog-

nised the claims of the ordinary stockholders to share in the prosperity of the company, and it appeared that this year was an occasion when the ordinary dividend might be increased. The directors, in reviewing the conditions that have unhappily affected industry, and particularly the steel industry, in recent months, and the uncertainty of the present times, came to the conclusion that in the best interest of the company they should leave the dividend at the same rate as in recent years. The additional earnings they propose to carry forward. The amount thus to be carried forward into 1947 is:—For the company £618,419, and for the subsidiary companies £558,216, a total of £1,176,635, which is an increase over the amount brought in of £323,769.

Our published balance-sheet has shown a trading profit for the company and its subsidiaries amounting to a total of £2,902,407 for the last three years and during the same period the total net amount paid to the stockholders is £700,368. The directors trust that their policy will meet with your approval. It is in keeping with the advice that a large share of the earnings should be ploughed back into the business to maintain or improve the efficiency of production and the dividend-paying capacity of the company.

We recognise that this policy affects all our stockholders, the number of which is almost the same as I stated a year ago. At the end of the year there were 9,695 ordinary stockholders and 3,292 preference stockholders, a total number of 12,987, and of this number 11,164 stockholders hold less than £500 and 12,500 hold less than £1,000 stock. You will see how widespread is the interest in the company.

You will notice in the balance-sheet that we have carried to reserve the E.P.T. post-war refunds, as this money has to be spent on development.

The industry has established with the authorities a claim for deferred repairs, which

tions suggest that the undertone of the market remains weak. There was some excitement, however, in New York last week when rumours began to circulate that tentative bids were being made from Indian quarters for anything up to 10 million ounces of silver. These rumours did not stand up to verification, though there is no lack of attempts made by Indian quarters to circumvent both the existing embargo on import licences for silver and gold and the equally difficult obstacle of obtaining dollars with which to acquire silver in the United States.

Rubber Uncertainties

The price of rubber at Singapore, which has been declining since the beginning of the month, staged a modest recovery earlier in the week, when buyers from Europe and other parts of the world began to operate. But the market has since suffered another shock from the announcement of the US Reconstruction Finance Corporation that it is about to reduce its selling price for natural rubber from its 216,000 ton stockpile from 25½ cents to 23 cents per lb.

US domestic synthetic rubber is selling at 18½ cents a lb. (or about 11d. a lb.) and according to officials of the US Department of Commerce the war-time order stipulating the amount of natural rubber that must be combined with synthetic in making rubber goods will be retained, despite recent rumours to the contrary. The reasons given for this policy are, first, that the United States must maintain a strong domestic rubber producing industry for strategic purposes and, secondly, that there are not sufficiently large supplies of natural rubber in the country.

Indications are therefore that the rubber price will decline, and as the RFC has ceased purchasing operations since the beginning of April, a lower price might well stimulate American demand. Output in Malaya during the first four months of 1947 has totalled 212,000 tons of which about a half came from the estates and the remainder from smallholders. Production in the Netherlands East Indies also appears to be on the upgrade, with imports into Malaya in the period January-April, 1947, totalling 76,000 tons.

it was found impossible to carry out during the war and for which no provision was made when selling prices were fixed. Your company has a considerable share in the amount granted to the industry, which will be utilised in carrying out such repairs as quickly as circumstances permit.

PRODUCTION AND PLANT

You will perhaps recall that in the statement which I made to you a year ago I indicated that, for the first four months of 1946, our output showed an increase of about 15 per cent. over 1945 and that this could be maintained and even exceeded provided fuel supplies were available. Unfortunately, fuel supplies became steadily worse, both in quantity and quality, so much so that we had in some cases to close furnaces or reduce the working week, with the consequence that our total output for the year only exceeded the output of 1945 by about 4 per cent. There have been references from time to time to the shortage of steel supplies in Scotland, with the implication that this arose from lack of organisation or proper plant. It is not generally realised how serious are the effects of the fuel cut: today we would be producing 2,000 tons a week more pig-iron and 5,000 to 6,000 tons a week more steel if we had adequate supplies of fuel.

When it became apparent that coal supplies were to be limited, we took steps to introduce the use of oil in our melting furnaces. I am glad to say that this has proved so far successful and the results have justified us in extending its use. We are, therefore, remodelling some of our melting shops to make them entirely dependent upon oil. We hope in this way to be able to attain an output which would not otherwise be possible with the existing restrictions.

Our new blast furnace at Clyde Iron Works is practically complete, but I am glad to say the two existing furnaces are still in active operation and, as I previously explained, the third furnace was originally constructed to ensure a maintenance of output during the time when the existing furnaces would require to be re-lined. At the same time, when the situation regarding coking coal is clarified and supplies are assured, our plan is to build additional coke ovens so that the three furnaces can be in active production if required and thereby increase our output of pig-iron by 4,500-5,000 tons per week.

RESEARCH

Our research activities have continued throughout the year with sustained enthusiasm. There is no section of our production that does not come under the close scrutiny of our technical staff. There is no lack of problems, but there is a real scarcity of young men trained for scientific work and prepared to devote themselves to an industrial career. This is rather surprising because the opportunities for a successful career in the iron and steel industry are immense and I do not know of any other industry where the chances for rapid promotion are so favourable.

SALES

We have reviewed our steel deliveries for the year from the Colville Works and the following figures show the variety of trades which use our products:—

Shipbuilding and marine engineering	28.04
Railways, locomotive and wagon	
Building	10.29
Structural, mining and general engineering	10.05
Tube, rivet, bolt and nut trades, etc.	11.01
Semi-finished for re-rolling	18.58
Direct export	13.6
Stockholders	2.53
Unclassified	5.9
	100.00

A particularly disappointing feature of the year was the Government decision to reduce exports. Many of our friends throughout the world were looking to us for supplies when export was curtailed severely and it

was with great regret that we had to disappoint them. It would be difficult to give a pre-war comparison, but, generally speaking, we exported about 30 per cent. of our output and, although the figure for last year is 13.6 per cent., it is considerably less to-day because of these restrictions.

The question of transport has been one of constant anxiety, and time and again we have been on the verge of restricting our production because of the shortage of wagons. I am not thinking of the period of severe weather when abnormal difficulties were encountered. Throughout the year, the supply has been so irregular and insufficient that it has involved considerable expense in laying down and rehandling material.

SUBSIDIARIES

It is some time since I reviewed in any detail the position of our subsidiaries. No doubt, therefore, you will be interested if I briefly refer to them.

On the works of the Steel Company of Scotland, Ltd., we have spent a considerable sum of money. You may recall I stated that at Blochairn over £1,000,000 had been spent and I am glad to say that we are getting some benefit from this expenditure, although not to the extent we had anticipated, because of the fuel position. Improvements at the Hall-side works have also been made and conversion of the melting furnaces to oil has been approved by the board. The foundry at these works was fully employed throughout the year. It is well equipped to deal with castings of all types, including heavy castings required by the shipbuilding and engineering trades. The works of the Govan Shafting and Engineering Company have recently been re-equipped with modern plant for the bright drawing and turning of steel bars. They have a wide connection both at home and abroad, and, unfortunately, are quite unable to meet all the demands for their products.

LANARKSHIRE STEEL COMPANY

The Lanarkshire Steel Company had a good year. We have recently completed at these works the largest fixed melting furnace in Britain, which has proved a great success, so much so that we are in the process of rebuilding other furnaces on the same lines.

Smith and McLean had a successful year. There was an increasing demand for all their products and they have served many customers, as can be judged from the fact that they are regularly rolling about 3,000 tons a week of steel, principally into sheets.

The Clyde Alloy Steel Company has also found an increasing market for their products, both from the foundry and the rolling mills. They specialise in high-quality steel for the motor-car, aircraft and engineering industries, and the demand has so greatly increased that an expansion in their production is a subject which is at present receiving serious consideration by their directors.

COLVILLE CONSTRUCTIONAL COMPANY

The Colville Constructional Company is engaged in the production of structural steel and welded fabrication work for the engineering and shipbuilding industries. The demand for welded products has grown to such an extent that it has been found desirable to transfer the structural steel department to Mossend Works, and to leave their Gleggarnock department devoted wholly to the welding side of the business. The section of the Mossend Works which they are occupying is being thoroughly equipped with all the plant necessary to produce structural steelwork of all classes.

The Fullwood Foundry Company has a modern mechanised foundry for the production of ingot moulds for the group and also a smaller foundry for general castings. Both departments have been very fully employed during the year.

From the Carnlough Lime Company some of our limestone supplies are obtained, and here also modern plant is being introduced to facilitate the handling of their products.

As you are aware, our collieries have now been transferred to the National Coal Board,

and as from January 1st of this year we have ceased to have any interest in their administration. The price to be obtained is not yet determined, and it may be a considerable time before this is settled.

We have retained the brickwork, producing ordinary building bricks, formerly owned by Archibald Russell, Ltd., and have also acquired Rosehall Brickwork. Both these works are situated in Lanarkshire. The raw material comes from old colliery bings and by their removal we are serving the double purpose of improving the amenities of the district and producing bricks which are so much needed to-day.

During the year, we entered into an arrangement with Messrs. Clugston Cawood, Ltd., and formed a company, Colvilles-Clugston, Ltd. Messrs. Clugston have wide experience of dealing with slags, and we thought it would be useful to join with them in developing the production and distribution of slag products.

Colvilles-Clugston are laying down new plant at Clyde Iron Works, and as soon as it can be brought into operation we hope it will lead to the disposal of a large quantity of our blast furnace slag.

LABOUR AND PERSONNEL

Although it has only just taken place, I think I should make reference to an interesting development regarding working conditions in the steel industry. In consultation with the appropriate union, it was mutually agreed that in the interests of production we should introduce a continuous working week—in other words, there should be no stoppage at the week-end at the melting furnaces. We feel that in this innovation the national appeal for greater production is being met in an enlightened way, and, by agreeing to it, the employees in the steel industry have shown a real sense of the needs of the times.

The War Memorial Home, which was opened in June last year, has proved beneficial to a large number of the employees who, under the doctor's recommendation, have spent there a period of convalescence. The committee of management have been gratified by the appreciation which has been so frequently expressed by those who have recuperated at the home.

GENERAL POLITICAL AND ECONOMIC CONSIDERATIONS

The outstanding national feature of the industry during the year was the appointment in September of an Iron and Steel Board, and the Government have placed upon them the responsibility of dealing with all matters relative to the industry, both as regards production and development. The Board, under the chairmanship of Sir Archibald Forbes, is engaged in investigating the whole subject.

The British Iron and Steel Federation has recommended that the output of the steel industry in this country should be increased to 15,000,000 ingot tons per annum, and we have given an assurance that in this expansion the Scottish output will be increased proportionately.

As mentioned in the directors' report, we have prepared plans with this object in view, which show how this result can be achieved with due regard to economy in capital expenditure and without any sacrifice in efficiency or in the attainment of the lowest costs of production.

IMMEDIATE NECESSITIES OVERLOOKED

In former days, having reached such a decision, we would have proceeded with the construction of our schemes forthwith. To-day that is no longer possible, and it is now necessary that the consent of many interests be first obtained. We wonder sometimes whether in this process the consumers of steel in this country, who are suffering so severely from a lack of steel supplies, are not being asked to sacrifice too much in the interests of a planning policy which concentrates on the long-term aspect and forgets immediate necessities.

There are references from time to time to the Government's policy concerning the steel trade and to their schemes for bringing the industry under Government ownership. In consequence, there is great uncertainty throughout the industry. In our view, any decision to nationalise a complex industry like the steel industry could not be otherwise than damaging to the national economy.

We have little faith in the benefits which, it is stated, arise from centralised control, and we think that many of the ideas current on this subject at the present time exaggerate the assumed benefits which have not been proved and do not emphasise sufficiently the dangers which are latent in such policies.

SERVICES OF THE STAFF

I am sure you desire to be associated with the directors in expressing to the staff our appreciation for the loyal service they have rendered during the year. I would specially mention the works managers and foremen, who have had a particularly trying time.

The report and accounts were adopted; the proposed dividend was approved; the retiring directors, Mr Peter Baxter and Mr. Henry Lithgow, were re-elected, and the auditors, Messrs Moores, Carson and Watson, were reappointed.

SUN INSURANCE OFFICE, LIMITED

FURTHER EXPANSION MR W. M. PRYOR'S REVIEW

In continuance of the custom which has been adopted in recent years the chairman has issued with the annual report and accounts a brief statement, summarised below, on the affairs of the office during 1946. The annual general meeting will be held on June 3rd.

In September, 1946, Commander Sir Robert Micklem, C.B.E., R.N., was appointed a director.

ACCOUNTS

Premium income in both fire and accident sections once again advanced substantially. In the aggregate the increase in premium volume in 1946 compared with 1945 amounted to £1,269,480.

It is perhaps worthy of note that in a year when throughout the world there has been so marked an increase in salary levels as well as in costs of materials and supplies the office has been able to conduct this substantial business at no greater cost by way of general expenses than 17.2 per cent. of the premium income. This figure compares with 16.4 per cent. in 1945.

FIRE BUSINESS

The advance in premiums amounted to £590,408. The claims experience at home and, generally speaking, overseas was again favourable. In Canada and in the United States of America, however, an underwriting loss was sustained. The underwriting profit resulting from last year's operations amounted to £289,318, which is equivalent to 7.83 per cent. of the premium income.

ACCIDENT ACCOUNT

There was an advance in premium income in 1946 of no less than £816,546.

As regards motor business, the toll of the roads both here and abroad has been heavy, outpacing the increases in rates of premium, although these have in some parts of the world contributed not a little to the higher premium volume. Rates are in course of adjustment upwards in many fields and a change has already been announced here which should go some way towards meeting the rising cost of repairs and the still advancing cost of settlements in the case of personal injuries as a result of accidents. Severe losses due to these causes have been sustained by the office and particularly in the United States of America.

The claims experience of burglary business abroad is tending to deteriorate and at home the results have again proved unfavourable.

Workmen's compensation business at home is still producing an unfavourable result.

Generally speaking, the rest of the business in the accident account has proved satisfactory but, by reason of the three features to which special reference is made, an underwriting loss amounting to £155,259 has been experienced.

MARINE ACCOUNTS

The figures contained in the 1946 account disclose a very satisfactory position. The office have been able to transfer £350,000 to the profit and loss account leaving the fund at £1,273,198, which is equivalent to 205.93 per cent. of the year's premium income.

PROFIT AND LOSS ACCOUNT

In the aggregate the three revenue accounts resulted in the profit and loss account benefiting by £484,059. Net interest earnings totalled £232,293, which amount is greater by £16,882 than the interest earnings of 1945.

Provision of £70,000 has been made for British taxation. The pension fund has again received a contribution of £100,000 and £10,000 has also been contributed to the staff widows and orphans fund.

An interim dividend of 1s. 6d. per share, less tax, was paid last January and a final dividend of 1s. 8d. per share, less tax, has now been declared. The book value of the investments stands at £12,024,183. The market value of the securities is substantially in excess of the book value.

In conclusion the chairman paid tribute to the zeal, efficiency and loyalty of the general manager, his deputy, the other members of the executive and the entire staff at home and overseas.

INDUSTRIAL AND GENERAL TRUST, LIMITED

EXPANDING REVENUE

The 59th ordinary general meeting of the Industrial and General Trust, Limited, was held in London, on the 22nd instant.

Mr L. A. Stride, the chairman, said that during the year ending March 31, 1947, their revenue had continued to expand, gross receipts at £604,453 showing an increase of £84,359, giving an overall yield of slightly more than 7½ per cent. on the balance sheet total of the investments. For the third successive year they were able to declare a bonus on the ordinary stock in excess of the dividend of 12 per cent. paid in each of the last ten years. For the year ended March 31, 1945, the bonus had been 2 per cent. and last year 3 per cent.; now they recommended 4 per cent., making the total distribution 16 per cent. for the year as against 15 per cent. last year.

Their investments stood, at or under cost, at £8,284,570. Last year there was an appreciation of well over 50 per cent. and at March 31st last the surplus over book values was more than 75 per cent. It was comforting to realise that their capital, debenture stocks, reserves and revenue carry-forward had, at the moment, substantial cover, but he must repeat the warning given at previous meetings that wide fluctuations in security prices had occurred in the past over quite a short period of years. The present unprecedented inflation resulted from the Chancellor of the Exchequer's cheap money policy and the depreciation of the £ and was aggravated by the terms of compensation—he might almost say confiscation—envisioned under the various nationalisation proposals. The search for adequate revenue-yielding investments was an investor's nightmare.

The report was adopted.

NORWICH UNION INSURANCE SOCIETIES ANNUAL MEETINGS

EXPANSION OF BUSINESS

The annual meetings of the Norwich Union Insurance Societies were held at Norwich on the 27th and 28th instant.

Speaking at the Fire Society's meeting, the chairman, Sir Robert Bignold, said: "I feel sure I shall have your indulgence in making brief reference to the year 1947. This Society was founded by my great-grandfather, Thomas Bignold, in 1797; thus this year marks the 150th year of its existence. During all that time there has been a member of my family actively associated with the Society."

During the past year the premium income was the highest in this long history of the Society.

FIRE, ACCIDENT AND MARINE ACCOUNTS

During 1946 the fire premium income has increased by £514,535 to £3,267,320. This expansion is well distributed between our home and overseas business. The amount of profit at £118,405 is an improvement on last year's figures, due largely to better underwriting results in the home field.

In contrast with the very noteworthy contribution we have received in past years from the accident account, the resulting transfer this year amounts to £44,607. The reduction shown is due almost entirely to adverse claims experience in the motor department. In all other accident departments the results were most satisfactory. It is gratifying to note an expansion in premiums of £487,754, making the total income in the accident account the highest ever recorded at £2,368,130. The net marine premiums amounted to £469,864, an increase of £22,370. The directors have decided to transfer a sum of £150,000 to profit and loss account.

The balance brought forward of £370,588 has been increased by the trading profit of £313,012, together with the sum of £138,650 for net interest. A total of £840,069 is available for disposal. Dividend, less income tax, requires £145,200 and home taxation £89,286; £100,000 has been transferred to general reserve, and it was considered advisable to strengthen the pension fund by the transfer of £150,000. The total assets of the Society, as shown in the combined balance-sheet, amount to £9,558,677, an increase of £406,076.

LIFE SOCIETY

Sir Robert Bignold also presided at the Life Society's annual meeting, at which he said: "At the end of 1938 our total funds were £48,124,000; at the end of last year they had increased to £63,723,000."

In 1938 we were able to show a gross return on our funds of £4 15s. 6d. per cent., and this has fallen in 1946 to £4 6s. 8d. per cent., while the position was made considerably worse by income tax, the net rate being respectively £4 2s. 7d. per cent. and £3 12s. 5d. per cent. In 1938 our total new business was £11,755,700, and last year the record figure of £23,597,000. Our premium income has increased from £4,550,000 to £6,090,000, and during the eight years we have paid out £9,700,000 in claims by death and £20,000,000 by maturity of policies. Expense ratio is 18 per cent. of our premium income against 15 per cent. for 1945. Our mortality has again been favourable and well below expectation.

We have added £757,000 to our British Government securities during the year, and these now stand in our balance-sheet at £15,310,000. During 1946 we contributed a further £452,000 of overseas currencies to the British Government, making the total under this heading since 1938 £3,262,000.

The reports were adopted.

GOVERNMENT RETURNS

For the week ended May 24, 1947, total ordinary revenue was £77,999,120, against ordinary expenditure of £56,829,109 and issues to sinking funds, £100,000. Thus, including sinking fund allocations of £1,250,945, the surplus accrued since April 1st is £209,872,665 against a deficit of £143,806,000 for the corresponding period a year ago.

ORDINARY AND SELF-BALANCING REVENUE AND EXPENDITURE

OXFORD UNIVERSITY

TRINITY COLLEGE AND JESUS COLLEGE—LECTURERSHIP IN ECONOMICS

Trinity College and Jesus College, acting together, propose shortly to appoint to a Lectureship in Economics, tenable at both Colleges.

The appointment in the first instance will be for a period of two years from October, 1947. The stipend will be £500 per annum, with dining rights. Rooms will be provided by Jesus College. The Colleges will contribute appropriate sums to a pension scheme under the F.S.S.U.

The duties of the Lecturer will be to teach Economics, primarily for the Honour School of Philosophy, Politics and Economics. It would be an advantage if the Lecturer could teach Statistics for the Honour School. He will be expected to teach up to a maximum of eight hours a week for Trinity College and eight hours a week for Jesus College.

Applications should be made to the President, Trinity College, Oxford, and must reach him not later than July 1, 1947, with a statement of qualifications and two testimonials.

The choice of the Governing Bodies will not necessarily be confined to those who apply.

UNIVERSITY OF OXFORD

Applications are invited for the Secretaryship of the Delegacy for Social Training, vacant October 1st next. Secretary will be responsible for educational and administrative work of the Department. Stipend £900 a year, pension under F.S.S.U. and children's allowance of £50 each child.

Also Supervisor of practical work. Stipend, £500-£600, according to age and experience. F.S.S.U. and children's allowance of £50.

Applications with names of three referees, but no testimonials, should be sent, before June 9th, to the Registrar, University Registry, Oxford, from whom further particulars may be obtained.

UNIVERSITY OF EDINBURGH

The University Court invite applications for the post of Lecturer in the Department of Political Economy. The salary will be in the range £500 to £650 per annum, according to qualifications and experience, and the appointment, which is subject to the conditions of the Federated Superannuation System for Universities, will date from October 1, 1947. Applications, with a copy of two testimonials, should be lodged with the undersigned by July 31, 1947.

R. JARDINE BROWN, Secretary to the University.

UNIVERSITY OF ABERDEEN

LECTURERSHIP IN ECONOMICS.

Applications are invited for a Lecturer in the Department of Economics. Salary £500-£600, according to qualifications and experience. In addition, a Children's Allowance of £50 per annum for the first child and £40 per annum for each subsequent child, or while the child is undergoing full-time education, is payable. Applications should reach the Secretary to the University (from whom Forms of Application and Conditions of Appointment may be obtained) not later than June 26, 1947.

The University, Aberdeen. H. J. BUTCHART, Secretary.

UNIVERSITY OF READING

DEPARTMENT OF AGRICULTURAL ECONOMICS.

Applications are invited from graduates for the post of RESEARCH ASSISTANT in Agricultural Economics. Preference will be given to candidates possessing qualifications in Statistics. Salary according to the Ministry of Agriculture's scale for the Provincial Agricultural Economics Service.

Applications to be made not later than July 15, 1947, to The Professor of Agricultural Economics, University of Reading, 7, Redlands Road, Reading, from whom further particulars may be obtained.

UNIVERSITY COLLEGE, LONDON, will shortly appoint Two Assistant Lecturers (Grade III) in the Department of Political Economy, duties to commence October 1, 1947. Salary, £400-£500, according to qualifications and experience. Applications, to be received by June 14, should be addressed to the Secretary, University College, London, Gower Street, W.C.1 (from whom further particulars may be obtained).

UNIVERSITY COLLEGE OF SWANSEA

DIPLOMA IN SOCIAL SCIENCE.

The College offers, in October, 1947, a full-time course extending over two Sessions leading to the Diploma in Social Science. For graduates the length of the course may be reduced to one Session. Full details and forms of application may be obtained from the Registrar, University College, Singleton Park, Swansea.

THE BANK OF NOVA SCOTIA

(Incorporated in Canada with Limited Liability.)

Established 1832.

General Office: Toronto, Canada.

Paid-up Capital ...	£12,000,000
Reserve Fund ...	£24,000,000
Total Assets over ...	£650,000,000

Special facilities are available to the public through the Branches of this Bank for the transaction of business with Canada, Newfoundland, Cuba, Puerto Rico, Dominican Republic, Jamaica and the United States at New York.

Address enquiries to London Branch:
108, OLD BROAD STREET, E.C.2.
E. C. MACLEOD, Manager.

The Universities Bureau of the British Empire, 8, Park Street, London, W.1, has been requested to announce the following vacancy:—

THE UNIVERSITY OF SYDNEY

CHAIR OF GOVERNMENT AND PUBLIC ADMINISTRATION.

The Senate will shortly proceed to the appointment to the Chair of Government and Public Administration which will become vacant upon the retirement of Professor F. A. Bland. It will be glad to hear before July 31, 1947, from anyone who would like to be considered for the appointment. The salary is £1,250 per annum, but negotiations for a general increase in University salaries are in progress. There is retirement provision on the lines of F.S.S.U. and, in addition, the University pays £400 by way of annuity. One year's leave is granted on full pay every seven years or thereabouts. Travelling expenses will be paid as arranged at time of appointment.

Applications are to be sent direct to G. DALE, Acting Registrar, The University of Sydney, N.S.W.

UNIVERSITY COLLEGE OF SOUTH WALES AND MONMOUTHSHIRE

The Council of the College invites applications for the post of Assistant Lecturer in Economics (specialist in Pure Theory). Initial salary, £450 per annum. Two copies of application and testimonials (which need not be printed) must be received by the undersigned, from whom further particulars may be obtained, not later than June 30, 1947.

LOUIS S. THOMAS, Registrar.

University College, Cathays Park, Cardiff.

SECRETARY TO THE HOME COUNTIES LIBERAL FEDERATION

Applications are invited for this position, which will shortly become vacant. Commencing salary dependent upon experience and qualifications, but not less than £500.—Applications, stating age and giving details of experience and naming references, to be sent to the Chairman, Home Counties Liberal Federation, 34, Victoria Street, London, S.W. 1, within two weeks of the appearance of this advertisement.

INDIA—FUTURE OF BRITISH BUSINESS

Mr. P. J. Griffiths, C.I.E., I.C.S. (Retd.), Leader of the European Group in Indian Legislative Assembly, writes an important article in May 30th issue of CITY PRESS. Copies (price 3d., including postage) can be obtained from CITY PRESS Publishing Office, 44, Hopton Street, London, S.E.1.

OLD-ESTABLISHED British financial and commercial weekly published in India require an Assistant Editor. Some practical newspaper experience and university education preferable. Good terms and prospects for selected candidate.—Box 488.

AN advertisement for Engineer as set out below was published early this year in certain daily papers. It produced many interesting applications from people seeking a position as "Maintenance Engineer." We are seeking a man for a position of wider and more management or executive responsibilities than normally associated with "Maintenance Engineer." We therefore re-insert the advertisement. No previous applicant should re-apply. Fresh applicants should have a First or Second Class Honours Degree in engineering as one of his qualifications.

Engineer wanted by industrial undertaking making consumer goods and employing now 2,000 men and women in Somerset. Applicant should have professional qualifications, practical experience, and be capable of and new construction of both machines and buildings. Should be between 30 and 40 years of age. Commencing salary about £1,200, rising to £1,500 according to age and experience.—Reply, giving following details: age, education, particulars of all posts held, present salary and salary required, to Box 487. The firm's name will be sent to any possible applicant who wants to know before applying for the post.

THE CHARTERED INSTITUTE OF SECRETARIES.—Directors requiring the services of CHARTERED SECRETARIES to fill secretarial and similar executive posts are invited to communicate with the Secretary of the Institute, 16, George Street, Mansion House, E.C.4.

COMMERCIAL EXECUTIVE desires change. 20 years with one of largest electrical manufacturers in country specialising in thermionic products. Full control over business, including financial responsibility for research.—Box 480.

C. & J. CLARK, LTD., Shoe Manufacturers, Street, Somerset, require Woman Secretary for the Chairman of the Company. Previous experience of similar work is essential. This post will appeal to those who like living in the country. Further information will be given on application.—Full particulars of age, education and experience should be given on application, which should be marked "personal" and addressed to the Personnel Officer.

NATIONAL TRADE ASSOCIATION requires Secretary (male preferred) for retail section working under its Director. Experience S.R. & O's and relations with Government Departments an advantage.—Apply Box 491.

Agreed Division

THERE have been many plans for India in recent years. But this week's White Paper differs from all the rest in two decisive respects. It is not a proposal for ultimate change but a plan for immediate action. And it has been accepted, on the day of its announcement, by the leaders of the three major Indian communities, Hindu, Moslem and Sikh. This is a very considerable achievement for the British Cabinet and for the Viceroy. Their decision in February to announce a date for the withdrawal of British rule from India was widely criticised (though not in *The Economist*), as reckless and panicky. But it has proved to be sound tactics and has brought the quarrelling Indian politicians much closer to an agreement than they have ever been before. To offer prizes for reasonable and responsible behaviour—which is the approach that has been made to India in the past two years—involves very obvious risks. But it works; and the risks are probably no greater than those of the former tactic of insisting on agreement before action, and therefore offering the prizes to the unreasonable.

The new plan is a partition plan. The fact is not admitted in so many words in the White Paper, the procedure of which might in theory produce a United India. But in fact it has been decided to divide India into Hindu and Moslem states and to do so by partitioning the crucial provinces of Bengal and the Punjab, in each of which there is a Moslem majority, but only a small one. In these two provinces, the Legislative Assemblies will first be asked to decide which state, Hindustan or Pakistan, the province would belong to if it were to remain undivided. Thereafter, the representatives of the districts with Moslem majorities (which are listed in the White Paper) and the representatives of the other districts will sit separately, and if either of these two halves of the Legislative Assembly votes for a partition of the province between Hindustan and Pakistan, then it will be partitioned. The first vote, that of the whole Legislative Assembly, will presumably, both in Bengal and in the Punjab, go for Pakistan by a small majority and thereafter the non-Moslem representatives, sitting separately, will vote for partition. But if by any chance the first vote should go for Hindustan (as it just conceivably might in the Punjab), the Moslem district representatives would certainly thereafter vote for partition. In either event, therefore, partition of the two provinces is certain.

The advantage of this scheme is that partition will reduce the risk of civil war in these two large provinces with small Moslem majorities and that it provisionally makes the partition by an objective test which does not require negotiations or fresh elections—namely, the last population census. However, it is hardly possible that a grouping of districts of which the boundaries were drawn only for purposes of local administration could automatically provide a good international frontier and it is therefore proposed that there shall be Boundary Commissions in each case to carry out "a detailed investigation of boundary questions" and to draw frontiers, partly "on the basis of ascertaining the contiguous majority areas of Moslems and non-Moslems" and partly "taking into account other factors"—presumably

such as communications, resources and the Punjab irrigation system. The Boundary Commissions are to be set up by the Viceroy with membership and terms of reference to be settled "in consultation with those concerned." There is no reason why these Commissions should not ultimately reach agreed solutions, but their tasks are not by any means simple or easy and with the best will in the world "detailed investigations" must take time. Until the frontiers have been fixed, if only approximately, neither Hindustan nor Pakistan can know what is the extent of its territory or its assets or liabilities and the danger of jumping claims by force will be continually present.

It is the great merit of the schemes proposed for the Punjab and Bengal that neither of them involves any new appeals to the electorate; in neither province is the communal tension to be further inflamed by election campaigns and polling with no prospect of being able to control the disorders which would certainly arise. In Sind, where the Moslem League has a large majority, the decision to join Pakistan will be an almost automatic one. In two other areas, however, the White Paper proposes decision by referendum. The first of these is the

North-west Frontier Province. By a curious paradox this province, the most thoroughly Moslem in India, has much less enthusiasm for Pakistan than have the Moslems who live nearer to numerically strong masses of Hindus, while the extreme poverty of the Province and its dependence up to now on subsidies from the central government have given it a vested interest in Indian unity. The province has in consequence continued up to now by a (mainly Moslem) majority to support the Congress cause, and two of its three delegates have taken their seats in the Constituent Assembly. But if Pakistan is created including Sind and West Punjab, the Frontier Province would be isolated from Hindustan and would be merely a narrow strip of territory between Pakistan and Afghanistan with virtually no economic resources and no outlet to the sea. The White Paper considers that, if partition is to be adopted in India, the Frontier Province "in view of its geographical situation and other considerations" should be given "an opportunity to reconsider its position" by means of a referendum, which is to be held "under the aegis of the Governor-General and in consultation with the

Provincial Government." A similar referendum is to be held in the Moslem-majority district of Sylhet in Assam to decide whether or not it should join East Bengal as part of the second new Moslem state.

There does not seem to be any good reason for either of these referenda. In particular, the one in the Frontier Province could be a most murderous affair. On general grounds it seems clear that, if Pakistan is established, the Frontier Province must be included in it. But nobody can tell what the result of voting is likely to be in this backward and turbulent area, even if the elections were free, for the conflict of Moslem League and "Red Shirts" has been so much tangled up locally with tribal, family and personal feuds that parish politics would tend to prevail even on an issue of such international importance. What is to happen, then, if the vote is against Pakistan? And how in fact is the freedom of the elections to be assured on such a crucial issue after there has already been so much violence? "Under the aegis of the Governor-General" means that a heavy responsibility is placed on the Viceroy for keeping order in what may be the most bitter election campaign ever yet held in India. The Provincial Government—Moslem but Congress—can hardly be relied on, in the circumstances, to refrain from using the methods of "Eastern democracy" to obtain the result it desires and these might be countered by armed bands brought in from outside the Province. It would surely have been less dangerous for the British Government to have laid it down that if Pakistan is formed the Frontier Province must be included in it.

In all probability, therefore, the plan will result in the creation of three new independent states, one Moslem in the North-West, a second Moslem state of Eastern Bengal and Sylhet, and an Indian state covering the rest of British India. The position of the native states is left undetermined. They are not to be coerced, but they are to be given every encouragement to seek association with one or other of the new states. Most of them will no doubt do so, though there will be difficult cases, such as Hyderabad and Kashmir. These problems will take some regulation, but the probability is that India will emerge as three states, each making a fairly compact appearance on the map.

None of the Indian parties is very pleased with the partition plan. Congress dislikes the division of India; the Moslem League dislikes being deprived of any part of Bengal or the Punjab, both of which it claims for Pakistan in their entirety; and the Sikhs fear that the partition of the Punjab will mean the vivisection of their community. But all three apparently realise that this is their last chance of avoiding a murderous civil war. The principle of partition, and some of the details, are therefore agreed. The British Government are evidently determined to take full advantage of this agreement while it lasts and not to provide any opportunity for it to be frittered away by delay. Accordingly, legislation is to be put through Parliament in the immediate future, and power is to be handed over, within two months or so, to provisional governments in the three new states. These states, until they decide otherwise (as they are to be free to do), will be regarded as *Dominions* of the British Commonwealth.

This decision is in reality the most controversial of the whole plan, though it has not been treated as such either in Great Britain or in India. Here, the Conservatives, under Mr Churchill's leadership, have accepted with relief the fact that the new India is not to be immediately divorced from the Commonwealth, while in India the politicians seem to think the continuance of a formal tie to the British Crown to be a reasonable price to pay for actual independence and self-government within a matter of weeks. But in fact the risks involved in so rapid a transfer of power are considerable. The problems of partition

are enormous. Modern India has grown up so completely as a unit that to cut it in pieces without doing irreparable harm will be a task which cannot even be begun in a few weeks. The administration machine will have to be, in many respects, taken to pieces and put together again. The seamless garment of the Indian economy will have to be divided and though the new states may eventually (as was argued in *The Economist* of May 17, 1947) be economically viable, there are problems of immense difficulty to solve meanwhile. The Indian Army is at present a unity which can hardly be divided without being destroyed. So is the irrigation system of the Punjab. There are questions of currency, communications and foreign trade to decide. But after the transfer of power there will be nothing but the common sense and moderation of the new Governments to guarantee success in these many and difficult operations. The White Paper speaks of settling some of them "under the aegis of the Governor-General." But the Governor-General in a Dominion has no powers of his own, and the Governor-General of three Dominions at once, which is the position Lord Mountbatten will occupy after August, may be in a very difficult posture indeed.

It is easy to see why this decision has been reached. The Indian politicians are clamouring for an immediate transfer of power; the structure of British Government is crumbling day by day. The chief British preoccupation, now that a transfer of power is inevitable, must be to get out while the going is good; and though the present agreement makes the going good for a few weeks to come, it would be very rash to assume that agreement will not soon stumble on one of the many hundred sharp stones that litter the way ahead. The policy of placing responsibility on the Indians and leaving them entirely free

After Margate

THERE was more than one duel in the sun last week at Margate. But, apart from Mr Bevin's resounding personal victory over his rebel opponents, none of the contests produced any conclusive results. Indeed, the Labour Party conference of 1947 will perhaps be remembered as much for the issues it left unresolved, and the questions it left unanswered, as for any definite trends or positive decisions that it produced. The one indisputable fact that emerged from last week's proceedings is that there will be no General Election before the present Parliament runs out.

On this assumption, the Government is evidently preparing to use the next two or three years as a breathing-space to consolidate its position, rather than to push forward with any new schemes. The danger signals of administrative overstrain have been observed. The Cabinet are still apparently determined to undertake the nationalisation of the steel industry, but this is to be the last big dose that Parliament, the Civil Service and the public will be asked to swallow until after the General Election. At the same time, the Labour Party will speed up its preparations for the next election and the formulation of its second five-year programme. It has decided to launch a propaganda fund, and to increase the membership fee, which together should bring in another £200,000 to party funds, while special efforts will be made to gain support in the rural areas and to retain it in the marginal.

It is in this sense that Mr Morrison's speech to the Conference, with its re-discovery of the "so-called middle class," was so pertinent. It is not perhaps so very remarkable that Mr Morrison should have spoken in this sense, since he has always had the sense to see that the Labour Party, if it is to survive the test of public opinion at the next election, must ally itself with, and not alienate, the middle-class. What was particularly interesting was that his appeal to employers,

both to decide what they do with it and to face the consequences of their decisions, has worked hitherto. But with the fact of partition the circumstances change, and the compulsion on Mr Nehru and Mr Jinnah to be reasonable will be perceptibly less once they have formally parted company.

It would be very foolish not to recognise these risks in the course that is being pursued. Yet the Government's courage has hitherto been rewarded with success. Mr Attlee and his colleagues, with Lord Mountbatten, have pulled off a political miracle—even if it is still only an incomplete one. It will have cheered many hearts to see this proof that the British people still have their secret of political suppleness; the boast is justified that there is not another breed of statesmen in the world who could have brought matters so far. It is true that the solution of the Indian problem that is now emerging has its drawbacks. It is a tragedy that one of the great political units of the world should be broken up—but some Indian unity may yet be saved, or later restored, and at least there is now a prospect that the parting will be in peace. It is sad that the long connection between Britain and India—which, in spite of its traducers, has brought benefit to both parties, the Indians not least—is now to end in a formal sense and that the glories of the Indian Empire are to pass away. But something may remain even of the formal ties if Dominion status is not renounced; and in any case the essential strategic and economic ties between Britain and India will remain, even if it is under different political forms. And to them will be added a new respect. This is the possibility that is now dawning. But it is still only a possibility. With praise for the Viceroy's courage and skill which have already achieved so much, will go hopes that his skill and courage will win the ultimate prize.

managements and "workers by brain" to co-operate with the Government, his barely-disguised rebuke to the Shinwell school of thought, was so well received by the Conference.

What Mr Morrison did not say specifically, although he implied it and Mr Dalton was rather more specific, was that it is no use appealing to entrepreneurs to cooperate in the production drive, while at the same time conducting a campaign against the profit motive. A great deal was heard at Margate about incentives, and it is surely time that the Labour Party and the trade unions should recognise that the business community, as well as the workers, need incentives to production. A little less sympathy for the "so-called middle class" and a little more willingness to allow them the means of existence, would have been more convincing. More especially if the tempo of nationalisation is to be reduced, the overwhelming part of the national income in the coming years is going to be earned by private enterprise, and in their own interests Ministers ought to pay some attention to providing the conditions in which private enterprise can be both efficient and fruitful. They may, if they wish, cherish the belief that the private manager in every industry is in the waiting room for the gas chamber. But they ought to admit to themselves that he is going to be there for a long time to come.

The issue which was not resolved at Margate, but which ran like a persistent thread throughout the debates, is the constitutional one—what is to be the future relation between Party and Government? The party conference has long regarded itself as the supreme policy-making body, and so long as Labour was in opposition, no difficulties arose. But the situation is very different with Labour in power. Are Cabinet Ministers to come to the conference, as Mr Attlee implied, to make their annual pilgrimage to the Socialist Lourdes, to

"brush up" their Socialism and renew their contacts with the rank and file? Or do they come to be told what to do and when to do it? Six out of the seven members of the National Executive elected to represent constituency parties are also Ministers of the Crown. They have been told by the conference to give themselves instructions, against their own judgment, on the question of the tied cottage and on equal pay for equal work. The immediate importance of this cleavage has been exaggerated. Mr Bevan's formula, that the Conference can decide on matters of principle but must leave the timing to the Government, will be followed and the Cabinet will simply ignore instructions that they find inconvenient. The whole issue, indeed, might be dismissed as academic, were it not for the strong feeling it has undoubtedly engendered in the party. If the coming years bring as much economic trouble as seems likely, the loyalty and cohesion of the Labour Party will be put to a very heavy strain and grievances that are now well below the surface may become important.

Of far more urgent importance than this mainly domestic issue, however, is the conflict over wages policy, which is fundamentally the conflict between the industrial and political wings of the movement. The miners' resolution, calling for improvements in wages in the undermanned industries, was accepted by the Executive, and, *ex hypothesi*, by the Government. This was hardly more than a formal obeisance to the notion of including wages policy in the Government's economic planning. Those unions which are in a strong bargaining position, especially the miners, are to have their rapacity dressed up as "wages policy," and that is about all. But even this limited and more than faintly hypocritical interpretation of a conscious policy for wages was too much for Mr Deakin of the Transport and General Workers' Union, who saw in it a threat to the collective bargaining system and feared the effects upon his own members if discrimination were granted in favour of other unions. The issue is whether the trade unions are to admit any restraints upon their separate bargaining powers in the interests of a

coherent economic policy. The realistic answer is that they are not. "Wages policy" will be used to justify some increases in wages; it will not be allowed to stop others. The clash between the Minister of Health and Mr Luke Fawcett, the building union leader, was another facet of the same problem. The case made out by Mr Bevan for providing incentives, in the form of output bonuses and payment by results seems, to the outsider, logically unanswerable. Yet it drew a storm of protest from the union side, which sounded much more sincere than the protestations that productivity must be raised.

The difficulty that the outside observer must feel in interpreting the results of the Margate Conference is to know how many of the fine words there uttered are likely to be matched by actions. Mr Morrison knows—and some of the others are beginning to have a glimmering—that the Labour Party faces an uphill task. The present indications are that it will be beaten at the General Election—that statement is based on the evidence that the two major parties are now approximately equal in the public esteem, and on the probability that the next two years will be a period of great economic difficulty. The Labour Party's chances of reversing the present probabilities depend, more than anything else, on the success they have in confronting the economic problems of the country and in convincing the middle vote that they are not an exclusive class party. But their attempts to have a coherent economic policy are obstructed at every turn by the jealous particularism of the unions. And there are very few members of the Party who can bear to admit that there has never been, and is not now, a positive majority in the country for socialism. Only those of them who cannot control their tongues will make the mistake that Mr Shinwell and Mr Dalton and Mr Aneurin Bevan make, of deliberately infuriating the middle class. But very few of them will be able to bring themselves actually to do anything helpful for the middle class or for the private-enterprise profit-earning system by which it earns its daily bread.

The New German Government

THE new agreement between the British and American military authorities for the effective fusion of their two zones is undoubtedly a marked improvement on the cumbersome, confused and self-frustrating machinery that has existed hitherto. The essence of the new plan is to place above the six States, or *Länder*, a responsible German Council which can exercise some of the more important functions of a zonal Government. In this way, the process of extreme splintering in German economic and political life which was the immediate result of the joining together of the two zones has been arrested and a first step taken in the direction of effective central organs of government. The members of the new "Economic Council" will be elected by the various *Landtage*, or State legislatures, in proportion to the populations of the States and to the party strengths at the most recent elections for the *Landtage*. The functions of the new Council appear to be virtually as wide as the normal economic powers of any central government, and their exercise is to be directed towards "permissible economic reconstruction," a somewhat indeterminate phrase which was substituted at the last moment for an earlier version, which would have empowered the Economic Council to "direct the economic reconstruction of the two zones on the basis of a new plan for the agreed level of industry."

The Council will have an executive agent, the Executive Committee, which will bear to it something of the relation of a cabinet to a parliament. The Committee, however, will not be chosen from the Council, but each *Landtag* will nominate one representative to serve as a permanent member. At the

lowest level in the new hierarchy are the bizonal departments—for food and agriculture, finance, transport and so forth. In the past these departments were the only instruments of fusion and consisted of the appropriate Ministers from the various State Governments, together with an independent chairman. Now they will cease to have the character of inter-ministerial conferences and become permanent departments on Civil Service lines and each will be headed by a permanent Executive Director, nominated by the Committee and approved by the Council. The new structure is completed at each level by agencies for Anglo-American control. The Council will be subordinate to a Bipartite Board consisting of the Military Governors, the Committee will be supervised by a Bipartite Control Office and the Departments by bipartite panels.

The advantages to be derived from the new structure are obvious. A very real clarification and concentration of authority have taken place. Responsibility has now been more or less unequivocally transferred to the Germans and from the Economic Council down to the departments the chain of decision and execution is clear. At the same time machinery has been introduced which makes it possible for the Germans to exercise a complete oversight over all the interrelated sections of their domestic economy and to evolve a consistent economic policy. It will no longer be possible, as it has been with the complete separation of the various German Committees that has prevailed hitherto, for the Germans dealing with economic policy to promote a completely different policy from that proposed by the Finance Committee. At the departmental level,

more efficient administration should follow from the abolition of the conferences of Ministers drawn from the different *Länder* and from the substitution of genuine executive departments. Since Germany has been suffering for two years from the lack of genuine government—quadrupartite deadlock is no substitute for it—it is encouraging to see the emergence, in all but name, of a genuine government for Western Germany.

Yet it must be remembered that so far the new plans exist only on paper. Even if the machinery is better, it is still incredibly cumbersome. Each State repeats at its lower level the structure of parliament, cabinet and civil service, and this demands for the routines of administration far more Germans than can possibly be called efficient administrators. Germany presents the paradox of a country that has at once too much and too little government—too many offices and controls and co-ordinating committees, too little drive and decision and oversight. Since the new machinery adds to the number of governmental agencies, serious consideration should be given to the possibility of simplifying its operation by removing Allied control from all but the highest German authority. Another danger lurks in the interpretation to be put on "decentralisation." The Economic Council has it is true, the right to impose its decisions on the States whereas the old committees had not, but the agreement lays it down that "maximum use" is to be made of the State Governments in administering the decisions of the Economic Council and only those who have followed the relations between the old committees and the States can realise quite what powers of obstruction a State as isolationist as Bavaria can exercise.

Moreover, it is not certain that the new Economic Council will itself be determined to put strong pressure on the States. In the latest elections, the bourgeois parties—the Christian Democrats and the "liberals"—had everywhere, save in Schleswig-Holstein, a majority over the Social Democrats. The CDU, particularly in the South, is the spearhead of the movement for States' rights and *laissez faire* economics. If the Economic Council faithfully reflects the voting, there may be an anti-centralist, anti-planning majority in the Council itself. To hold that this could limit the potentialities of the new structure is not to assert any theoretical superiority of Socialism but simply to recognise the fact that the economic margins are exceptionally narrow and that priorities and allocations—in other words planning—are essential for the survival of Germany.

Another obstacle to the effective working of the new system lies in the nature of the powers conferred on the Economic Council. The aim of the merger of the two zones last year was, as is well known, "self-supporting." The two zones are to pay their way and the import-export programme is clearly the central point in any scheme for the reconstruction of the zones. But it is not clear whether the Economic Council is to have any more control than had the earlier committees

over this vital sector. It is true that the Council's list of powers includes "internal and external trade," but it is apparently not suggested that the Anglo-American Import-Export Agency should be divested of its present authority. Yet if the Economic Council cannot control the flow of imports or plan its own export programme, can it be said to have received adequate authority for the economic reconstruction of the zones? It should be possible to give the Germans a general budget to work to over, say, three or four years and leave it to them to develop the practical details. Such a scheme would, incidentally, put an end to the present arrangement whereby if the Germans manage to provide more foodstuffs from the zones, their allocation from overseas is promptly cut—an obvious and direct incitement to non-production and non-delivery in Germany.

This difficulty over the import-export programme is only one part of a much more complex problem, one which the adoption of new governmental machinery hardly touches. The question which must determine all the new agencies' hopes of success is one that they themselves cannot solve. Can the Anglo-American Zone, under any type of administration, good or bad, really be made to pay its way? Can it produce the exports? Having produced them, can it market them? If in fact self-sufficiency is an economic impossibility, no improvements to the machinery of government will have the desired result.

It must be frankly admitted that the prospects are not good. Nominally the production of exports still suffers from the disabilities imposed by the first Level of Industry plan. Under this plan, it will be recalled, a large number of German industries were restricted to a certain output. The decisive figures were the limitation of steel production to 39 per cent of pre-war capacity (7.5 million tons), light metals to 54 per cent, basic chemicals to 40, heavy engineering and heavy electrical engineering both to 31, light mechanical and electrical engineering to 50, machine tool production to 11 per cent. Yet before the war no less than 65 per cent of Germany's exports were provided by these restricted industries. It has now been estimated that to secure self-sufficiency for the two zones, exports would need to be about 65 per cent higher than the pre-war figure, owing to the loss of Eastern German supplies, the greater cost today of imports of food and raw materials and the disappearance of Germany's external assets. Can it be supposed that this great increase can possibly be secured if the industries which produced the bulk of exports before the war not only do not expand, but are positively restricted?

In a sense, the theoretical position under the Level of Industry plan is academic to-day. Neither zone has anywhere near reached the permitted levels laid down in the Plan. The present flow of exports is still little more than a trickle. For instance, exports for the first quarter of 1947, which were

A Capital Annuity!

... Part capital, part interest £80 per annum guaranteed for seven years of which, on average, £76 is capital repayment and £4 is taxable interest and, after the seven years, an annuity of £120 (subject to tax) continuing for life this can all be secured by a male life aged sixty-nine for each £1,000 invested now.

EQUITY & LAW
Established 1844
LIFE ASSURANCE SOCIETY
20, LINCOLN'S INN FIELDS, LONDON, W.C.2.

expected to be \$87 million, have proved to be only \$31 million. The first aim must therefore be to expand industry to the permitted levels and not to be unduly concerned about observing the restrictions.

In another sense, however, the question of the Level of Industry is the opposite of academic. The absurdity of the old plan is now obvious to everyone. The British and the Americans are agreed in principle on an upward revision (even Mr Molotov agrees to this), and the figure of 10 or 11 million tons of steel has been widely quoted. Such a revision is obviously an overdue and highly sensible step and some bewilderment may be caused by the fact that while the first draft of the new zonal agreement suggested that such a plan was under consideration, in the second draft the suggestion was deleted. However, it must be remembered that one of the purposes behind the old Level of Industry Plan was to assess the amount of surplus German industrial capacity available for reparations. Recently there have been suggestions from Germany, demands from the Inter-Allied Reparations Agency in Brussels, and hints from the Board of Trade, suggesting that one of the purposes of a new Level of Industry Plan would be not only to increase the permitted scale of German production, but also to make a new assessment of available reparations so that, in the near future, the surplus capacity could be removed and the question of reparations from the western zones settled once and for all.

If this is the case, it is certainly fortunate that the suggestion of a new Level of Industry Plan has been withdrawn. Without prejudice to the possibility of delivering reparations in the future, it must be said that wholesale dismantlings of factories in the British and American zones in the immediate future would have so disastrous an effect on what is left of German morale that it would break down completely, carrying with it the whole present attempt to build up an administrative structure in Western Germany for which Germans are to be fully responsible. There can be only one policy in the coming months, that of encouraging by every means an increase of production in the two zones. The destruction of productive capacity, in obedience to some theoretical calculation of permitted levels, is simply not

compatible with any economic recovery, and if this is what an "increase" in the permitted level were actually to mean, then it would be a mockery.

Unhappily a solution of the problem of producing sufficient exports in the two zones—still remote enough, in all conscience—by no means exhausts the problem of making Western Germany self-sufficient. Even if the exports were produced in sufficient quantities, could they be sold abroad? Above all, could they in the next five or six years of world shortage and crisis earn the hard currency necessary to buy the food and raw materials the zones need to feed their workers and manufacture their goods? *The Economist* has on many occasions expressed its scepticism of the viability of a West German state unless certain pre-conditions were fulfilled, of which the chief is the existence in Western Europe of a large unified economic area producing enough and consuming enough to provide both Germany and the Western industrial nations with a market capable of absorbing all their manufactures. As things stand to-day, there are already signs that even a slightly revived German industrial activity is causing anxiety to other producers in the West. The frictions will grow worse as the flow of German exports increases. To this difficulty must be added the problem of the dollar, which the Germans share with the rest of Europe.

The new constitution that the Americans and the British have given their joint zone is, beyond any doubt, a great improvement on the old. But whatever the administrative structure in Germany, it cannot iron out the basic contradiction—the fact that the zones cannot and will not pay their way. To solve this dilemma the problem of Western Germany must be merged into the wider problem of Western Europe. Closer economic integration in the West could provide the necessary markets, while the provision of dollars on the scale required to reconstruct Western Europe in general could include an allotment for specifically German purposes. These projects may sound visionary, but unfortunately the solution of the zonal problem on the present basis is no less so. When ruin has reached such vast proportions, plans equally vast can alone begin the task of repair.

Deadline for the Refugees

THE Conference on Refugees at Lausanne closed on May 21st in an atmosphere of encouragement and relief. The adherence of Australia and China brought the number of signatories of the International Refugee Convention to sixteen, and with their signatures came the assurance of 75.8 per cent of the fund. Since 75 per cent of the necessary money and 15 signatures were sufficient to bring the International Refugee Organisation formally to life, the uncertainty of recent months—whether or not any refugee organisation would come into being at all—was settled before the ending of the Conference.

The delegates could also find some encouragement in the resolutions to which they had agreed. The Preparatory Commission of the International Refugee Organisation (the IRO) is to accept direct executive authority on July 1st, when both Unrra and the Inter-Governmental Committee on Refugees (the IGCR) officially go out of business. There will thus be no awkward gap during which the displaced persons might have been left with no body or organisation specifically responsible for them, or transferred to the care of local military authorities or governments—some having, some lacking the resources necessary to deal with them. The delegates probably recognised that the future budget of IRO (\$112 million) is very small and that very few days remained in which to carry out the transfer of authority from the old agencies to the new. But, in comparison with the deadlock which had existed before the Conference, the results seemed encouraging and many of the

delegates dispersed feeling confident about the next stage.

In fact, this next stage has already run into considerable difficulties. Mr Altmeyer, Secretary-General of the Preparatory Commission, faces the herculean task of creating, in precisely three weeks, a staff capable of dealing with the problems, administering the care, overseeing the living conditions and safeguarding the future of over a million men and women, representing a dozen different nationalities, living mainly in refugee camps and scattered widely through Europe and the Middle East. The last stages of repatriation have to be worked through. Meanwhile, the first phase of a vast operation of resettlement has opened. The oversight of camps and repatriation the IRO must take over from Unrra. The openings for resettlement are to be transferred to it from the IGCR. For instance, at Lausanne, IRO had to undertake responsibility for the ships already chartered by the IGCR for transporting refugees to the New World (opportunities for settlement there are discussed in an article on page 894). Under these conditions it can be readily imagined on what a scale and with what skill and experience an international organisation must work to deal with problems so complex, so vexed politically and so vast.

There is clearly only one source from which an effective organisation can be recruited in so short a time. The staffs of Unrra and IGCR alone have the experience and it is there that, in the first resort, the obvious field of selection lies. Unrra has done its utmost to make a transfer smooth and effective by

giving unstinting help to the Preparatory Commission's work. Moreover, it has concentrated all its headquarters staff for refugees in Paris where, as a result, there now exists a potential headquarters for IRO. The course of wisdom would obviously be for the Preparatory Commission to take over the Paris offices and part of the staff, and use this interim machine in the next months while the final shape of IRO is being determined, and the men and women chosen to become its permanent staff. But the truth is that delays and obstacles have been placed in the way of this obvious task of common sense and Mr Altmeyer is having a difficult task in building his new machine.

The blame must not be laid at his door, however. He is the victim, not the cause of the present confusion. The reasons are to be found at the higher levels of political responsibility, in Congress, in British Military Government, in the Foreign Office. The chief reason for the IRO's hesitancy in taking over a working staff from Unrra and the IGCR lies in the fact that Unrra has become involved in the anti-Russian, Communist-baiting politics of the American Congress. Unrra is one of the few international organisations in which the Russians are still working. That, in itself, appears to be enough to damn it. Moreover, in the refugee question, Unrra has been handling dynamite. The bulk of the displaced persons came from countries which have either become part of Russia (such as the Baltic States and the Polish Ukraine) or have acquired governments friendly to Russia. Whatever policy had been pursued by whatever authority, the cry would have been raised in Eastern Europe that undue pressure was being placed upon the Displaced Persons to stay away from their homelands, in the West that they were being forced to return. Both criticisms have been made continuously, but since, on the whole, the majority are returning home (many are peasants and labourers, little concerned with politics) and in particular since in the last six months by special inducements, such as the guarantee of rations, a large number have been persuaded to go back to Poland, the cry of unfair interference has recently been raised more loudly in the West than in the East and has come at a time when, in any case, American opinion of Russia was passing through a phase of hysteria. The result is that a powerful anti-Unrra lobby has developed in Washington, inside and outside Congress, and its activities have caused the Preparatory Commission to hesitate and hold back.

The situation is all the more unfortunate, in that Congress's attitude is, on the whole, completely wrong-headed. That individual camp officials may have shown undue "zeal" for repatriation is possible. That some of Mr La Guardia's political directives were open to question may also be true. Yet all unbiased evidence points to a high level of objectivity and responsibility among local Unrra officials and, on the whole, a very close watch was kept on Mr La Guardia—by Unrra itself. But perhaps the best vindication of Unrra's record is the second political difficulty in which it has fallen—the dispute between the Preparatory Commission and British Military Government.

British Military Government's record, with regard to refugees in the last year, more honestly merits than does Unrra's the charge of undue pressure on the displaced persons. It is by Military Government order that the rations of the refugees have been lowered and that they have been compelled to go out to work, often under German overseers. Bad conditions, low rations and forced labour are the methods which Unrra is accused of using in order to force the refugees to return home. But, in fact, Unrra has fought a strong battle in the last few months to defend the refugees against precisely this type of pressure on the part of Military Government.

The reasons for this must be understood. To Military Government, refugees are difficult and unruly elements in a zone in which discipline must be maintained. The area would undoubtedly be easier to run if the DPs were not distributed throughout its length and breadth. From this fact spring the

desire and the pressure to accelerate their repatriation. The need for order and discipline has also led the military authorities to demand full and direct responsibility for refugees, now that Unrra is coming to an end. For several months, a sort of running fight has been carried on between Military Government and the Preparatory Commission, the former demanding direct responsibility, the latter pleading for international control. The British Government, although it pays lip service to the international approach, has inclined to the side of the military and, in their endeavour to strengthen their case, the military authorities have not scrupled to join in the campaign of black-guarding Unrra as a means of fighting the idea of international control in general. And by a curious irony, they now accuse Unrra of practising those very methods of pressure—for "Communist" purposes—which Unrra has tried to circumvent. Yet, in spite of all these difficulties, the outline of an agreement between the British military authorities and the Preparatory Commission was reached at Lausanne, according to which Military Government would act as the executive agent for refugee work under IRO supervision. But later reports suggest that the detailed working out of this agreement is proving much less satisfactory.

Military opposition is not the only factor in inducing hesitation and suspicion in the British Government's approach to Unrra and the IRO. The Foreign Office has accused Unrra of helping the Jews to find their way to Palestine. In so far as Unrra camps in Italy have opened their gates to Jews moving from Central Europe to the Mediterranean, they have, in a passive sense, assisted the Jews. Since, however, their constitution forbids them to refuse entry to *bona fide* refugees coming within the Resolutions passed by the Council of Unrra—which the would-be immigrant Jews undoubtedly do—they could not, in fact, turn them away. But this is a very different thing from the accusation made against them—that of actively fostering and forwarding the movement of Jews. It would be as reasonable to accuse the British and American military authorities of conniving at Jewish immigration, simply because they have often failed to stop Jews at the frontiers as they move on to Italy.

The impact of these three political factors on the problem of setting up a functioning refugee organisation has inevitably been very serious. Unrra remains the only source of trained officials. Its headquarters in Paris is the only functioning unit which can be ready in time. The Congressmen who witch-hunt for Communists, the British military officers who try to get control of the awkward problem of refugees in order to "liquidate" it in their own way, the Foreign Office officials who write long notes about the presence of Jews in Unrra camps in Italy, all forget one thing—that time is running short, that IRO does not yet exist, and that if in the next four weeks no energetic and positive steps are taken, Unrra and its existing organisation will come to an end and no authority will exist capable of carrying on the work. Even if every accusation against Unrra were true, it would remain the only instrument ready to hand and the only source of effective executive power in the next months. Since most of the charges are demonstrably untrue and contradictory, there can be absolutely no reason or excuse for further hesitancy.

The responsibility lies squarely on the Governments which have signed the IRO convention, and in particular upon the American and British Governments. If they act decisively in the next weeks, the Preparatory Commission can come into vigorous life. If not, it is difficult to see what are its chances of success. The needed action is twofold, on the one hand, to pick five or six key men, either inside or outside Unrra and IGCR, and place them as reinforcements in Mr Altmeyer's high command. The second is to transfer sufficient secondary staff from Unrra and take over the Paris office, so that there need be no interruption in the work for refugees on July 1st.

NOTES OF THE WEEK

'Dogged Does It'?

Long before Mr Bevin reached the rostrum at Margate, the Conference had rejected the leadership offered them by Mr Crossman, Mr Zilliacus and Mr Mikardo. Not one of the "rebels" was elected to the Party Executive. And when, later in the week, Mr Bevin gave the delegates a discourse which toured them "round the world in 80 minutes," he was given a thunderous ovation. Yet it is not many weeks since American newspapers were prophesying Mr Bevin's dislodgment by his critics, and in Moscow, watchful eyes were following the fortunes of the rebel group.

The reason for the reversal of these forecasts and for Mr Bevin's continued ascendancy probably lies more than anything else in a combination of two factors—his own vigorous personality and the apparent absence of any alternative to the policy he pursues. The truth is that the group who wrote "Keep Left" have no dramatic alternatives to offer the Labour movement. They may write good sense on demobilisation, but what can be said of their main proposals? To advocate friendship with Russia is becoming less and less convincing in face of Russia's apparent inability to respond. Mr Molotov's "noes" at Moscow still echoed at Margate. To propose less dependence upon the United States is to propose something many British people might welcome, but which they do not see how to bring about. The problem of canalising American economic assistance into politically acceptable forms is hardly touched on in the pamphlet "Keep Left." But this is the real problem. To propose, as Mr Zilliacus did, that British foreign policy should be based on the United Nations and on unity within the Security Council, is likely to extract only a disgusted snort from the weary British. Back to Uno—and the veto! It hardly makes sense, let alone policy. The delegates at Margate, like their countrymen all over Britain, would like to work peacefully with America and Russia in the Security Council, they would like to know that American wealth is to be devoted constructively to the reconstruction of the world, they would like to see the atom bomb under international control, Germany re-integrated into Europe and the boys brought home again, but they do not know how to bring these things about. And Mr Crossman, Mr Zilliacus and Mr Mikardo do not tell them.

So Mr Bevin did not have a very rough passage after all. He dealt with the prevailing confusion of thought on foreign policy in the Party—and in Britain—in three ways, each very effective. He used his very impressive personality to plead with the delegates to "trust the man on the job." He then reminded them that he had warned the Party not to expect results in less than four or five years, that he himself had almost been "born again" in becoming so patient, and that he was going to have another dogged try in November to improve matters. Lastly, and very skilfully, Mr Bevin took his listeners all round the world, touching in brief detail on a vast variety of topics and if the delegates were not confused at the beginning of his survey, they certainly were at the end, and probably went away glad that Ernie and not they had to deal with the problems.

In general terms, Mr Bevin is justified in his approach. His patient and persistent handling of foreign problems in the last two years has certainly earned him respect abroad and sympathy at home. The Foreign Minister has, moreover, a great deal of common sense and a forceful method of dealing with his colleagues and his opponents. Yet is it really true that "dogged does it"? Or, at least, is doggedness enough? One would like to be certain that the combination of Mr Bevin's empirical temper and the Foreign Office's constitutional preference for dealing with issues "as they arise" were not impeding the development of a constructive and positive British foreign policy in areas in which the British already have a certain initiative or where a little effort would give them a measure of leadership. For instance, a growing body of opinion in the United States is beginning to ask what plans the European nations could themselves evolve as a preliminary to receiving American economic support. Is the British Government to take no initiative either with its immediate neighbours in Western Europe or with the European Commission? Again, Mr Bevin threw out some tantalising hints on future policy in the Middle East.

There are great possibilities. I am not in a position this afternoon to tell of them [a typical touch] but later on you will discover that there are great schemes for irrigation and other things on the way.

But the Foreign Secretary spoke in similar terms many months ago and there is so far little sign of the preparations in terms of planning and staff for any adventurous policy.

In short, while no one thinks the problem of foreign policy as straightforward as do Mr Bevin's critics, many of his warm supporters are perturbed at the sense of drift and waiting on events which characterise certain key sectors in the nation's external affairs. In these matters, patience is not enough. Foresight and action, "lucidity and daring" are even more necessary.

* * *

The Use of Womanpower

There is no *prima facie* reason to suppose that the Government's latest appeal to women to go into industry will be any more successful than the previous, somewhat spasmodic, efforts that have been made from time to time. There is, however, a greater sense of urgency about the present recruitment campaign, and the efforts are being concentrated in those districts which are particularly short of women workers, rather than diffused over the country as a whole. The Ministry of Labour has immediate vacancies for 300,000 women and girls, and the industries which are most in need of women are clothing and textiles, especially cotton spinning, boots and shoes, hosiery, hospitals and laundries. Although there are at present 700,000 more women in industry than there were in 1939, the figure is about 1,150,000 below the peak of war-time mobilisation, and the shortage is particularly acute in the industries which can contribute most towards exports.

If flattery and persuasion could work, there is no doubt that thousands of women would respond to the Government's appeal. The women are being told that they alone can save the country, as they did during the war. But the present campaign differs from war-time mobilisation, in that it is more localised and is not backed by the powers of compulsion. The idea of direction, considered by the Cabinet at one stage, has been rejected as impracticable.

But is the campaign likely to produce more than a few thousands here and there? Is it not likely that most women who are free to work and want to work are already doing so? A woman who worked during the war, but whose husband is now demobilised, may not find it worth her while financially to return to industry, while the physical difficulties of running a home and looking after a husband and family in 1947 conditions may be a real deterrent even if she is willing. And one cannot ask for a boom in the birthrate and for women to return to employment at the same time. Local district committees, which include representatives of women's organisations, have been set up to make the arrangements to facilitate women's working, even if they have homes and families to run. This presumably will mean bringing pressure on the local authorities to open nurseries; but even at their peak during the war, nurseries, which are themselves uneconomic in woman-power, only enabled comparatively small numbers of mothers to work. The regional authorities will doubtless also be asked to make the necessary transport arrangements. One solution might be to extend part-time working. This involves a considerable amount of planning and re-arrangement which firms may not be prepared to undertake, and the success of the part-time nursing schemes in Gloucestershire and elsewhere should be brought home to them. It is by no means clear whether the appeal for women is purely a short-term one, to tide over the immediate crisis, or whether there will be longer-term opportunities for women's employment. If the latter, then Government and industry will surely have to re-adjust their attitude to the question of women's employment as a whole.

* * *

Dilemma of Equal Pay

The Government's urgent call for women workers makes their dilemma on the subject of equal pay all the more acute. The straightforward argument is that if the Government wants more women to work it must recognise their claim to equality—the rate for the job—and that it is no use procrastinating on this issue any longer. This view is so obvious that it is going to be very hard for the Chancellor of the Exchequer, who must inevitably be its chief opponent, to counter it. The claims of

equality were strongly supported at the conference at Margate last week, when the delegates flatly refused to follow the Executive Committee's lead and voted in favour of the immediate introduction of equal pay for men and women in central and local government service, in the teeth of Ministers' arguments against it.

But economic and financial questions are rarely straightforward. There is very little reason for thinking that more women would be forthcoming for either industry or government service, if the principle of equal pay were put into practice, and it might easily mean that in those trades where the margin in favour of employing women arises from their lower wage rates, the numbers employed might actually be reduced. On the financial side, the direct cost of granting equal pay has been reckoned as £10 million for the civil service and £20 million for local government service. Neither of these sums is really large, but no power could stop the example of the civil service being used as an argument for equalising rates elsewhere; indeed the Royal Commission on Equal Pay was at its least equivocal when it considered the repercussions of a government decision on equal pay for the civil service on the demand for adjustments elsewhere. Since the Labour movement, the trade unions and the Conservative party all support the principle of equal pay, and the bargaining strength of labour is more powerful than it has ever been, it must be assumed that there would be a sudden rush towards equalisation once a hole appeared in the defences. The aggregate cost to the nation would be large, with, as far as can be seen, only the compensating advantage that justice—long overdue—would be done. But will the price of justice be too high? No one has suggested that equal pay will proportionately increase output, and if it does not, then its results will be inflationary. Could not honour, justice and expediency be satisfied by the Government accepting "equal pay" in principle, and promising to implement it as soon as exports reached, say, 50 per cent above their pre-war level, or within a specified number of years? A statement by the Chancellor of the Exchequer has been promised for next week.

* * *

Incentives for Building

If the Government is on the retreat about equal pay, Mr Bevan, in his Margate speech, was certainly on the offensive about housing. There was again a collision with the trade unions, who hotly repudiated any suggestion of increasing output by a system of payment by results. But the unions appear to be speaking with two voices on this issue, for only two days before Mr Key, Minister of Works, had announced in Newcastle that a committee representative of both sides of the building industry had reached the conclusion that a system of payments by results was practicable, and should be introduced as soon as possible, and that it only remained for both sides to reach agreement on details. Which voice will prevail? There is certainly nothing which would accelerate the production of houses so much.

Mr Bevan rebutted the suggestion of a national housing corporation, but his plea that the administrative apparatus behind the housing programme was not to blame for the delay in carrying

it out is not justified. The case for a Ministry of Housing, which was excellent two years ago, is now dead; so probably is that for a national housing corporation. These administrative instruments were needed when the schemes of operation were being worked out, and to create them now would merely upset all the machinery which has at last got into place. But it is not fair to whitewash the present administrative machine and to put all the blame on to the supply of labour and materials. For it was the administrative machine which allowed far too many houses to be started in proportion to the resources available to complete them. For that Mr Bevan and his chosen instruments—the local authorities—are to blame. Last October, at the outset of winter, 20 houses were being put into contract for one completed. Even if this proportion is now reduced to five to two, and drops to one to one in December, the situation of last October should never have been allowed to arise.

The diagram shows that there are now some 208,000 new permanent houses under construction, but that only 8,750 were completed during the month of April. After the disastrous February and March, completions by local authorities have at last risen again to just above the rate for December, 1946 (5,464 in December and 5,989 in April). But private enterprise has not done more than slightly to improve on the March figures. With the clamp-down on further licences this is inevitable. These figures are given in greater detail in the *Record and Statistics Supplement* which summarises the April Housing Returns (Cmd. 7129 and 7130).

* * *

Widening Rifts in Europe

For two years the political complexion of most European Governments has accurately reflected the uneasy truce and vestigial desire for co-operation characterising relations between the Big Three. Where zones of influence actually overlapped, the resulting tension led to the exclusion of "untrustworthy" groups—for instance, the Right in Rumania or the Left in Greece. But in areas of relative calm such as Finland or Western Europe, coalition governments including Right, Left and Centre have managed with varying degrees of success to co-operate.

Now the consequences both of Russian intransigence and of the Truman Doctrine are revolutionising the political scene in Europe. For some months past, American commentators have prophesied that Russia would call the Communist parties out of the Governments in Western Europe and order them into opposition. The remodelling of Hungary on the lines of "eastern democracy" was also foreseen. Now these prophecies appear to be confirmed in the event. Both in France and in Italy, the Communists no longer participate in the government, and M. Ramadier has accused them of deliberately fomenting the present wave of strikes in France in order to paralyse the administration. In Hungary, the purge of Smallholders and reshuffle in the Cabinet have virtually transferred power to the Left.

It should not be thought, however, that these significant changes have taken place solely on Soviet initiative. In Italy, the majority party, the Christian Democrats, have taken the offensive, and it was a series of moves on the part of the Prime Minister, Signor de Gasperi, that finally led to the creation of a solely Christian Democrat Ministry. It is universally believed in Italy—with relief or anger, according to circumstance—that American support encouraged the Prime Minister, and that further American economic aid was made conditional upon the construction of a "purged" Cabinet. Mr Marshall has certainly confirmed this impression by his particularly cordial welcome to the new government.

The Russians, who have taken the offensive for so long, cannot legitimately complain if other Powers follow suit. But this fact does not make the situation in Europe any less disquieting. The rift between Right and Left is widening daily and, as Mr Bevin reminded his colleagues at Margate,

the most dangerous thing to play with in small countries is civil war. It sometimes leads Great Powers to take sides and produces big wars.

An improvement in the European political scene must inevitably wait on an improvement in Great Power relations—yet another reason for pursuing that improvement with a Bevin-like patience and tenacity. Apart from this major factor, however, is the United States Government really well advised to give such warm-hearted support to a minority government such as Signor de Gasperi's, from which not merely the Communists but all parties of the Left are excluded? If the extension of American aid can be made to fall so easily into the pattern of anti-working-class ideology, the hopes for reconstruction and a measure of social stability in Western Europe seem small indeed.

Government Without the Left in Italy

The first anniversary of the new Italian Republic was celebrated on June 2nd in rather disquieting circumstances. After another "crisis" lasting nineteen days, a Cabinet has been formed of which the large body of Italian Leftist opinion can justly complain that it flouts the electors' verdict of exactly a year ago. Leftist opinion goes further; it dislikes a change which it attributes to the growing interference in politics of the *Azione Cattolica*. For the new Government is based on a single party, the Christian-Democrats reinforced by a number of experts, including Professor Einaudi at the Ministry of Finance and by Count Sforza who retains the Ministry of Foreign Affairs. Since the opposition is now composed of the combined Socialist and Communist vote, the new Government, even with the support of every Liberal, *Quahunquista* and Monarchist in the Chamber, will scarcely be able to scrape together a majority.

There are two arguments in favour of Signor de Gasperi's decision. One is that he is following the example of M. Léon Blum in forming a one-party Cabinet to tide things over until the elections. To this one is bound to say that the parallel is not exact, since the Italian elections may be nearly a year distant. The second contention which is made to justify the new Italian Government is that it has been formed in order to create confidence in America and to secure the further financial help which is a *sine qua non* for the Italian economy. But this argument overlooks the supreme disadvantage of having the majority of the organised workers in opposition. The *Confederazione Generale di Lavoro* (the Italian TUC) opened its first Congress since the Liberation in Florence on June 2nd, and it will certainly provide the new Government with some painful reminders of the workers' dissatisfaction and of Communist influence among them (which cannot fail to be increased by the creation of an "anti-labour" government).

It is thus no enviable task that awaits Professor Einaudi in his new task. He is a man of the greatest eminence in Italian public life, and few public men enjoy the reputation of complete integrity and disinterestedness he has earned over long years first as an anti-Fascist and, since the Liberation, as Governor of the Bank of Italy. Yet it may be questioned whether the extreme liberalism of the new Finance Minister's approach to economic problems and his preference for the orthodox financial policies of severe deflation and retrenchment can meet an economic crisis in which unemployment is already widespread and in which financial stability is certainly more menaced by the non-taxpaying, black-marketing, dollar-hoarding Right than by any activities of the workers.

New Government in Hungary

While enjoying a holiday in Switzerland (apparently "arranged" between himself and the Communist leaders) Mr Nagy has been relieved of the Premiership, and succeeded by his Minister of War, General Dinnyes, a member of his party. The Foreign Minister, Gyöngyössi, and the Secretary-General of the Small Holders' Party, Father Balogh, have also given up their jobs, and are replaced by other Small Holders. Outwardly this is only a reshuffling of personnel. The Small Holders' Party keeps the same Cabinet posts, and the coalition remains in being.

In fact, the situation has substantially changed, and Hungary has been brought one stage further along the road to "eastern" or "popular" democracy. Ever since the genuine elections of October, 1945, gave the Small Holders' Party 55 per cent of the votes, the Left parties have been restive and the Russians apprehensive. Soviet discontent was manifested in the unfavourable terms granted to Hungary by the peace treaties. In February came the "conspiracy," which gave the Communists an opportunity to let loose a campaign against the Small Holders, designed to split them in two. In this campaign, deliberate confusion was made between the real conspirators, pathetic romantics from the old Hungarian army and bureaucracy who hoped to restore the semi-feudal society of Horthy's day, and the political leaders of the Right who made plans for the exclusion from the government (by constitutional means) of the Communists and the creation of a new ministry based on the Parliamentary majority of the Small Holders' Party. To the latter category belonged the Small Holders' General Secretary, Bela Kovacs, who was arrested by the Russians in March. After two months' silence, during which Kovacs's whereabouts has been a mystery, the Russians now announce that his confession "implicates" Premier Nagy.

The attack from the Left during the "conspiracy" crisis failed to split the Small Holders' Party. The peasant members of Parliament, and the peasant supporters of the party in the country, held together remarkably and showed an obstinate passive resistance. But the Left only postponed their attack, and have now returned to the charge. It seems fairly certain that, adopting the methods used in Bulgaria and Poland, they will make the official leadership of the Small Holders' Party pass into the hands of its left wing; this will then join in a "democratic bloc" with the Left parties for elections in the autumn, which will presumably be on the model of Sofia 1946 rather than Budapest 1945.

This crisis has been expected on general grounds for a long time, but the exact reasons why it should have come now are less clear. There has been disagreement within the Coalition on the future of the National Bank and the main commercial banks, which together control the greater part of Hungarian industry. The Left demanded nationalisation, while the Small Holders urged state control. The new Cabinet has already acceded to the Left's wishes. A second problem concerned German assets in Hungary, which, according to the Potsdam agreement, passed to the Soviet Union. There was disagreement between Left and Right about what were German assets, and the question was complicated by the Soviet demand that while all German property should belong to Russia, all liabilities arising from such property should be paid by the Hungarian Government. Moreover, according to some reports, the Russians are also pressing for the transfer to Russia of certain assets in the old German-Hungarian trade balance which, in spite of being generally in Hungary's favour, contained items to Germany's credit. These demands would place a further heavy burden on the intolerably strained Hungarian economy.

But behind these economic questions, overshadowing everything else, is the strategic issue. The Soviet Government, which will shortly have to withdraw its troops from Hungary, is resolved to ensure that the Hungarian apparatus of state is firmly held by "reliable" hands, and that the Truman Doctrine cannot be extended to the Danube Valley. The Americans, whose growing economic influence in Hungary was yet another reason for the timing of the Communist coup, have now, obligingly from the Communist point of view, stayed the proposed American loan to Hungary and have sent Notes demanding a full explanation of the so-called "plot" from the Soviet authorities in Budapest.

M. Ramadier Under Fire

Exasperation has prevailed in Paris this week. The heat wave combined with the food shortage—itsself aggravated by the bakers' strike—has raised tension to a new level. Idle bakers standing shoulder to shoulder with enraged railway workers striking for more bread have been demonstrating outside the Hotel Matignon, and strains of the "Internationale" have risen into the hot afternoon with police reinforcements looking on imperturbably.

The most serious aspect of the present tension is the fast-spreading strike in the repair yards and the menacing situation in the newly nationalised northern coalfields. M. Ramadier has rightly attributed the sudden intensification of the wage conflict to Communist "orchestration." The big agitations date from the departure of the Communists from the Government, and they have clearly no intention of allowing the Coalition to show it can manage without them. If the Communists were to attempt to force the issue at this point, the strength behind them would undoubtedly spring from the genuine discontent of the underfed workers and their queue-weary wives. It is, for instance, widely agreed in Paris that bread is now scarcer and worse than it was under the Germans.

Nevertheless, the situation should not be over-dramatised. The Communists are unwilling to provoke violence for fear of a Right-wing counter-coup from which their party would be the first to suffer. As the Communist trade union leader, M. Benoit-Fanchon, put it:

We do not want a major clash which would play into the hands of reaction. We prefer to resort to guerilla tactics of which we have had four years useful experience. We shall fight the wage battle factory by factory.

Yet this wage battle itself can have the most disrupting effect. The experts do not believe that the upgrading of wages is possible as long as the shortage of coal continues to hold up production. In an authoritative statement, the National Council of Credit

affirmed this week that the only way of stabilising the regime and producing an atmosphere in which large-scale investments of capital can be coaxed into the work of reconstruction lies in improving the flow of supplies and the distribution of food. For this reason the Government's hard-pressed planner-in-chief, M. Jean Monnet, has agreed to undertake yet another mission to Washington and will leave next week to negotiate with the Americans for a larger wheat allocation to France in 1948. No doubt the Government is wondering whether the "tough line" with the Communists will improve M. Monnet's chances.

National Service in the Lords

The second reading debate on the National Service Bill in the House of Lords, as an inevitable result of the Conservatives' majority tended to concentrate on the Government's ill-timed reduction in the period of whole-time service from eighteen months to twelve. And both the Government spokesmen were so occupied in putting the best possible construction on the decision that they gave little information on its effect on military training. There can be no doubt that, vacillating as the Government's attitude was, from the economic and social point of view the shorter period of service is preferable. But will the effect on the armed forces mean that the reserves of conscripts will not be efficient, fully trained soldiers, sailors or airmen, but "half-baked"—in Lord Moran's phrase? The folly of using half-trained men in battle has been exposed in two major wars. Is twelve months' conscription going to be worse than no conscription at all?

In both the Commons and the Lords, doubt was expressed by many speakers, who all spoke with authority, whether twelve months was sufficient to give the training in technical arms necessary for present-day warfare. Are, therefore, these technical branches to be manned wholly by Regulars, and if so, what will be the effective strength of the armed forces? In neither House of Parliament has the Government given a clear statement on what will be expected of a conscript in his twelve months' service. He will have some training; he will do some garrison work, including the occupation of Germany, during which he will receive more training. But what will he be fit for when he has served his time? Lord Moran made an effective case for abolishing conscription altogether, so convinced was he of its social disadvantages and so little impressed by the evidence of its military necessity. In *The Economist's* view the justification of conscription is the need to have large numbers of trained reserves that can be rapidly mobilised, not the need to fulfil commitments, the extent of which in eighteen months' time, when the Bill comes into force, is at present unknown. If, therefore, the conscripts will not be adequately trained, the question of the length of service ought to be reviewed. It is probable—it is certainly to be hoped—that the "experts" are wrong and that a sound training, in all but the most specialised branches, can be given in twelve months, even if combined with garrison duties. The Service authorities have always overstated their claims for time, money and men. But the Government should be pressed for a specific assurance before the National Service Bill receives the Royal Assent.

Irish Politics

The second reading of the Northern Ireland Bill, which does no more than permit a slight increase of the legislative powers of the Northern Ireland Parliament, is to be made the occasion of a strong protest by some 200 MPs, nearly all of them Labour, against the suppression of democratic liberties in Ulster. The indignation of the MPs is very natural, even though they are treading on thorny and dangerous ground. The problem is an old one. Ever since the Civil Authorities (Special Powers) Act was passed by the Northern Ireland Parliament in 1922, during the period of internal strife and terrorism, the Ulster Government has had the power to imprison without trial, to deny access of any sort to prisoners, to suppress newspapers and to prohibit political and other meetings. The Act, which was originally intended to be temporary, has never been repealed. This is an amazing infringement of democratic rights to be found in a part of the United Kingdom. Whether or not the Northern Ireland Government can substantiate its claim to have used these powers with moderation, there can be no doubt that they are too extensive to be justified as a precaution against terrorism.

The truth is that Ulster, for all its welcome loyalty to Britain, is deeply unsettled and divided. The large Catholic minority is permanently restive under the tutelage of Orangemen, while to complicate matters the traditional hegemony of the Unionists is

threatened by the growth of a Labour party. The great issue of the border still overshadows Irish politics. The Unionists in Ulster are prepared to resort to political jerryandering, to an unfair arrangement of Parliamentary constituencies and so forth, to make quite sure of remaining separate from Eire; at the same time, the nature of the Government of Northern Ireland is Eire's first grievance against Britain and a great obstacle to better relations between London and Dublin. It is a pity that old political feuds should even now handicap the closer economic integration of Eire and Britain, which is so strongly in the interest of both countries.

Only moderation and tact—and, it may be added, time and luck—can ease the intractable nature of the Irish problem. After Eire's neutrality in the war, the people of Great Britain can hardly be expected to take any initiative in persuading the six counties to join the twenty-six, or indeed to consent to the unification of Ireland, unless this were to be shown unmistakably to be Ulster's will and included some strategic guarantees; but equally there can be no approval here of the Unionists' tactics in Northern Ireland, which are of doubtful service to their own long-term interests.

Parliamentary Seats

The Parliamentary Boundary Commission has now issued its proposals for the redistribution of English seats in the House of Commons. It proposes that the total number of seats in England should be reduced from 510 to 488. The biggest change is the elimination of 22 seats in the County of London. The rest of the country, despite considerable rearrangements—under which, for instance, London suburbs gain and the older industrial areas lose—will retain as many seats as before. The average electorate under the new arrangements will be just under 60,000—not 50,000 as has been widely reported. However, although the bad anomalies have been cut out, the new constituencies are by no means uniform in size, and vary between electorates of 40,000 and 80,000 and higher. Somewhat surprisingly the extremes are to be found in the reorganised London boroughs, where the new Paddington seat has 87,032 and the new Bermondsey seat has 41,735. The revised directions from Parliament, under which the Commission was obliged to pay more attention to the preservation of administrative and historical units and less attention to considerations of mathematical uniformity, have been faithfully carried out. The result is a fair and reasonable compromise which, if it errs at all, does so in the better direction of respect for tradition.

The political effect of the proposed changes will probably not be considerable; but insofar as there is one, it will operate to strengthen the influence of the marginal middle-class elector. The areas which lose most seats—London (22 losses), Liverpool (3 losses), Manchester (2 losses), Birmingham, Sheffield, Bradford and Plymouth (one loss each)—returned between them at the last election 89 Labour members to 19 Conservative members—a proportion of Labour to Conservative that is almost twice as high as for the country as a whole. Seats are gained by new suburban and industrial areas, whose allegiance to Labour is less deep-grounded or more dubious. The long-term effect may not be great; but the Commission's report should cause uneasiness among Mr Shinwell and his fellow-provokers of class strife.

Conference in Canberra

The Australian proposal for a Commonwealth conference in Canberra to discuss peace terms for Japan is a very sensible one, and it is much to be hoped that at least one Cabinet Minister from London will be able to attend it. It is in the first place very desirable that there should be Commonwealth talks in preparation for the Japanese peace treaty, for it must be clearly understood in London that on Pacific affairs Australia will never consent to the procedure of Great Power steam-rollering used in the making of the peace treaties with the European satellites and that any disposition here to ignore Australian feelings in this matter would put a most dangerous strain on harmony within the Commonwealth. Secondly, it is in any case good that Commonwealth conferences should be held from time to time elsewhere than in London, and particularly that Canberra should now be the scene of such a conference, both to convince Australians and New Zealanders that their remote situation in the South Pacific does not involve indifference to their problems in other parts of the Commonwealth, and also, from the side of this country, to show appreciation of the generosity of these two Dominions in food contributions during recent months.

Talks on the Japanese treaty will undoubtedly have to deal with some delicate points, for not only have there been disagree-

ments between London and Canberra on certain aspects of post-war policy towards Japan, but there has also been some conflict between Australian and American points of view in which Anglo-American, as well as Commonwealth, relations are involved. Left to themselves, the British people, overburdened with "commitments" of all kinds nearer home, would be inclined to "quit" the Pacific and leave that whole region of the globe to Powers more closely concerned with its affairs. But two of those nations happen to be British Dominions and, as long as the Commonwealth is to be a reality, this is a mode of retreat which is not admissible. The recent debate on foreign affairs in the House of Commons showed a lively opposition to the idea of fading out from the Far East and it is indeed vitally important to prevent the growth of a belief that British interests diminish in proportion to distance from London. The British Commonwealth is essentially an oceanic association, and because it extends to the Antipodes as well as to the Western Hemisphere it is incompatible with any narrowly regional view of world affairs.

* * *

Anglo-Soviet Trade Negotiations

Progress in the Anglo-Soviet trade talks at present awaits the return from Russia of Mr Klentzov, head of Russia's permanent Trade Delegation in London, who is now in Moscow for further briefing on the vexed question of the 1941 agreement and its orderly winding-up. Here, as elsewhere, the Russian tactic seems to be the bracketing in one rubric of unrelated matters, with a view to using any lever afforded by negotiation A to win concessions in negotiation B. There is no logical reason why agreement on future exchanges of Russian wheat and timber for British machinery and equipment should depend on the liquidation of the 1941 agreement, but that is how the Russian mind works, and its workings are as much part of the economic data as the statistics of wheat acreage.

No question has arisen of any further large long-term credits to Russia, reports to the contrary notwithstanding. For such credits there could be no conceivable justification; Russia, in spite of its almost pathological reluctance to use its considerable gold stocks, is, if anything, better placed to finance the proposed transactions than is Britain. The Russians would, indeed, prefer the British Government to act as their procurement agent for obtaining their imports from this country; but it is more likely that they will, in the main, be left to do their own shopping, armed with whatever credits accrue to them from their agreed deliveries—credits which can, in individual cases, be supplemented by the Export Credits Guarantee Department.

It would be a pity if haggling over the machinery of exchange should hold up the deal. For what distinguishes these negotiations from others lately carried on with other delegations is that the Russian export goods are those which Britain basically needs—wheat, timber, base metals, dairy produce from the Baltic States—and not pleasant, but inessential, frills like champagne and pineapples. (Not all of them will be forthcoming immediately, but Russian harvest prospects are at present excellent, and timber deliveries could follow quickly on the supply from Britain of saw-mill equipment and bulldozers.) Moreover, they are goods at present derived overwhelmingly from the dollar area. No question of "discrimination" in the sense abhorred by the United States authorities is likely to arise, but certainly a successful outcome to the negotiations would chime in very happily with the drive to economise on dollar imports and to develop European contacts. Indeed, while it would be far too optimistic to expect any trade agreement to have much immediate effect in improving political relations, an imaginatively conceived and wholeheartedly implemented pact would do something to restore European economic unity and so provide the groundwork from which, in the long run, political goodwill might spring.

* * *

Order in Indonesia

When people sit opposite each other with weapons in their hands, neither fighting nor agreeing, there is no reason in the abstract why they should not continue in such a peaceful deadlock indefinitely. But in practice, if neither side will give way, the guns are likely to start going off sooner or later. In Indonesia they have never really ceased, for although a truce is supposed to be in force, skirmishing with irregulars goes on, and there is so far no sign of any progress in negotiations for a settlement which would render the uneasy confrontation of armies

unnecessary. The world has more or less forgotten about Indonesia, and as the British forces have long since been withdrawn, their presence there no longer disturbs the Ukraine. But the situation is having its effects both economic and political on the Netherlands, and indirectly the whole of world economy is suffering from the delay in organised rehabilitation of this very important primary-producing territory.

The Dutch are unwilling to concede the Indonesian Republic's demands for independent control of foreign affairs and finance and for the withdrawal of Dutch troops. On the other hand, if the Dutch are not going to coerce the Javanese more actively, it seems that they might as well yield, for they are unlikely to bring the Javanese nationalists to terms by holding on to a few fragments of territory, as they do now. Time is on the side of the Javanese as long as there is no fighting, for the economic strain of the present deadlock is more serious for the Dutch with their developed European economic system than for their opponents who base their regime on an almost self-contained rural society. There is thus a very strong temptation for the Dutch leaders to follow the example of the French in Indo-China and let the guns decide. So far no foreign nation has recognised the Indonesian Republic *de jure* or questioned the ultimate sovereignty of the Netherlands. But if matters continue to drift and real and legal authority remain as widely separated as they are now, some nations will begin to consider special arrangements with the Indonesian authorities for commercial purposes, which will go far to give the Indonesians the international recognition they seek. No doubt this is what Dr Sjahrir and his colleagues are hoping. But they also know that nobody did anything to help Viet Nam when the French used force. From both the Dutch and Indonesian points of view it would be wise to come to terms quickly while there is still time.

Development by Groundnuts

The two most frequent criticisms of the development and welfare policy in the British colonies have been that the money made available by the British taxpayer under the Colonial Development and Welfare Act is far too small for a proper development policy to be carried out and—a criticism which is most often voiced by the colonial peoples themselves—that the £2 per head of the colonial population, which the £120 million total of the Fund represents, is proffered with an irritating, patronising air of philanthropy.

The scheme, announced last February, to invest some £23 million in the mechanised cultivation of groundnuts in East Africa goes some way to meet both these criticisms. Certain areas in Tanganyika, Kenya and Northern Rhodesia are to be farmed by mechanised methods to produce groundnuts for the world market in edible oils. Progress has already been made in clearing the bush, extending the railway system and fixing the location for a new harbour. The United Africa Company (a subsidiary of Lever Bros. and Unilever) have hitherto acted as agents in getting the scheme started, but, with their own full agreement and in accordance with a plan outlined when the scheme was first announced, a public corporation is to take over; the members of it have already been appointed. Its headquarters will be in London, but control will eventually, it is hoped, be vested in the three colonial Governments whose territory is affected.

This groundnut scheme is no piece of philanthropy to keep the colonies quiet, but aims at creating an industry with a market waiting to be served, a market which is suffering from a shortage of supplies. Risks are being taken on some of the technical problems, such as the feasibility of the plan for the rotation of crops, but risk-taking is a wholesome innovation in public development in the colonies and in this case courage deserves to be commended. The sum of at least £23 million which is being invested is a very large sum by colonial standards—a sum big enough to begin a frontal attack on East Africa's chronic problem of poverty and low productivity. Thirdly, the scheme is a result of co-operation between Government and private enterprise, another refreshing feature.

These three points are themselves sufficient to justify the scheme being considered an important experiment in colonial development, and it is not surprising that possibilities for adopting it elsewhere in Africa are already being investigated. A mission has been appointed to study the introduction of mechanised groundnut cultivation in West Africa where the groundnut is already farmed by small peasant proprietors. There are obvious difficulties here in adjusting peasant conservatism to modern methods. But it should be emphasised that such schemes, in East Africa or elsewhere, must be judged first of all on their

economic merits. The welfare of the people involved in them is important and must be watched carefully, but if a long over-due agricultural revolution is to be carried out successfully, there must not be too much compromise with uneducated prejudice. The ultimate aim should not be lost sight of. This aim is the raising of the colonies' standard of living; it is not merely the mitigation of the poor conditions of life—the bad health, the ignorance—which their present poverty forces upon them.

School and Life

The first report* of the Central Advisory Council for Education (England) is something of an event, for the Council was appointed in December, 1944, and has taken a full two years before being ready to proffer its advice in January, 1947. (Printing difficulties have been the main cause of the delay since then.) At this pace it will be 20 years before England has a record of reports behind it of anything like the order of the equivalent Committee in Scotland which has produced ten excellent reports in the last five years.

As a publication the report is attractively laid out and printed, but it is a little difficult to decide to whom the subject matter is directed, for it is too general for most teachers, and probably too specialist "for the wider audience" the Council have in mind. But it will be a great pity if it is not read, for no discussion could be more germane to the problems of education at the present time than one directed to the transition from school to independent life. The Council intend to publish a series of reports on this general theme, and this first one is designed as a factual background. It is the more the pity that so many of the facts which the Council must have obtained during their inquiries are rolled up into generalisations which have lost their pungency.

The two most interesting sections of the report deal with the conditions in the schools and with the transition from school to work. On the first the Council have some very damning things to say about conditions in primary schools, where the classes are far too large, the accommodation old and unsuitable, and the pressure increasingly serious, as the high wartime birth-rate

* "School and Life." HMSO. 2s. 6d.

The Silent Avon is truly worthy of the fine cars of to-day—not only in its elegant appearance but in the high standard of comfort and safety which it provides.

brings large numbers of children into the schools. The difficulties of building at the present time are well known, but the urgency of improving conditions is not so widely recognised by the general public. On the second question, the Council have some valuable suggestions to make on how to bring the child into closer contact with the adult life into which he will soon be stepping, yet without distorting his general education with too vocational a bias. The work of the Juvenile Employment Service is highly praised, and the schools are advised to bring more information about local industry and trade into the classroom.

Shorter Notes

In a Parliamentary answer this week, Mr Ness Edwards stated that approximately 10,000 voluntary workers from displaced persons' camps in the British zone of Germany had been brought to this country. They consist almost entirely of Balts and Ukrainians, and are being placed in agriculture, the textile industry and laundries, as well as in nursing and domestic work in hospitals and farmers' households.

In an article in *The Economist* last week, page 838, the number of psychiatrists in the Services was incorrectly given as 95, and it was stated that they had some 1,000 non-technical assistants. The number of psychiatrists, at home and abroad, was actually 275, and the non-medical staff, technical and non-technical, engaged in psychological work in the Service Departments was 1,776. These figures refer to the position at the end of 1943.

Sir Stafford Cripps announced in the House of Commons this week that from November 1st all outstanding clothing coupons in the 1945-46 and earlier books will be invalidated. This step was being taken, he said, to ease the burden on shopkeepers. It may be conceded that each succeeding issue of clothing coupons increases their variety and complicates the shopkeeper's task, but the small advantage for the shopkeeper which will be won by the cancellation of old coupons will surely be more than offset by the disadvantage to consumers as a whole that will result from the rush to spend them before November 1st. People who have hoarded their coupons have been doing the nation a service. They should not be forced either to spend them now or to lose the advantage of their past economy.

Letters to the Editor

Hunger for Books

SIR,—Mr Vyvyan's letter in your issue of May 31st is unfair to the publishers on whom schools and universities depend: those who are primarily concerned to produce books for systematic education have concentrated on necessities at the expense of many desirable books. In practice established publishers cannot switch quickly from one kind of book to another, and educational publishing is a specialised trade requiring extraordinarily long-term plans.

Excess of demand is now a general feature of our economy. But special causes have produced the exceptional shortage of textbooks. For seven years, under the pressure of other needs, the Government has restricted the total supply of books. Its drive to export not only books, but the scarce means of producing them, widens the gap between supply and demand. Its plans for expanding school and university education (raising the school-leaving age, supplying free class books, etc.) have created a sudden extra demand for textbooks. Yet because it feels unable to distinguish between more and less necessary books, it does not give priority to systematic education.

Class-books are a special case. They should be available in sufficient quantity, in many subjects and at many levels, just when classes need them. Their efficient distribution depends on a large reservoir of publishers' stocks, perhaps equal to the average sales of three years or more. The using up of these stocks during the war masked the effects of short-sighted official policy. Now that they are gone, orders fall direct on jammed, under-manned and irregularly-supplied production lines. The resulting disorganisation and waste in school and university work will continue until the reservoir is restored, and as yet there is no prospect of that.

On the whole, publishers have done what they could to work under this combination of planlessness and conflicting plans. It is for the Government to choose between three alternatives, all painful and slow in producing results:

(i) To raise the means of production (insofar as it controls them) until all demands for all books are supplied. The paradox that a full market requires less supply than a hungry one might prove true for books.

(ii) To cut its educational plans until they square with the restricted supply of the books they require.

(iii) To give such priority as it can to the books needed for systematic education, with the realisation that many good and valuable books are not in this category.—Yours faithfully,
The Clarendon Press, Oxford

KENNETH SISAM

SIR,—As one not unconnected with publishing I should like to reply to some of the wilder ideas put forward by your correspondent, Mr Michael Vyvyan, in his letter in your issue of May 31st.

More educational books, including university text books, are being produced and sold than during the period on which publishers quotas are based and the shortage is due (1) to increased demand, (2) to the need to replace stocks depleted and irreplaceable when the publisher's quota was lower than now, (3) to the loss of publishers' stocks by enemy action and (4) to the loss of booksellers' and library stocks by enemy action.

There is no remedy for this state of affairs other than the provision of more materials, particularly paper and cloth. This will not provide an immediate remedy, but the effect of an increase in the paper provided to-day will be felt in a year's or eighteen months' time.

What can be bought in the bookshops is not a measure of publishers' output, but of certain publishers' failures—for the most part "non-quota" publishers. The true facts are that at least 70 per cent of the books published by quota publishers are educational, sold either at home or in the export market. Of the remaining 30 per cent, anything up to 40 per cent is exported (because it is often the book criticised by the bold as useless, that provides the easiest export) so that only 18 per cent of the total book production of quota publishers is non-educational for sale in the home market, and this includes all modern fiction, poetry, travel, etc., as well as the so-called "worthless."

Mr. Vyvyan is so clearly wrong in his basic assumptions that it seems almost unkind to point out that it is not true to-day

that "people will buy anything between new covers," and the very books Mr. Vyvyan sees in the bookshops should tell him this. The wanted books do not remain in the bookshops, nor do many booksellers, generally speaking, stock educational books.

The peculiar mental process that leads your correspondent to the conclusion that it is in the interest of publishers to concentrate on withholding educational books (if that is what he does mean) is psychologically interesting but unsound, because most educational publishers publish no intentionally ephemeral books at all, while an examination of the output of "mixed" publishers shows that nearly all are devoting to educational books more than their pre-war proportion of paper.—Yours faithfully,
ROBT. H. CODE HOLLAND

Scope for Import Cuts

SIR,—The article in your issue of May 31st entitled "Scope for Import Cuts" is a most forceful presentation of the difficulties that will be encountered in any attempt to close the gap between export and import values. May I suggest that curtailment of foreign currency available to Britons travelling abroad, except of course on essential business journeys, would materially assist in closing the gap on the overall balance. Actually many holidays are spent in Sweden and Switzerland, and the currencies of these countries can scarcely be classified as soft.

Enjoyable as holidays abroad may be, it cannot be contended that their retention is of greater importance than the supply of food to the people or raw materials to essential industries. It would be interesting to know the number of persons travelling abroad from this country during the past twelve months, for if this number should be as large as, say, 1,500 per day, it will be seen that at £75 per head the amount for the year would be of the same order as the value of our pre-war coal exports.—Yours faithfully,
JAMES C. W. DRABBLE

34 Southsea Terrace, Southsea, Hants

[In 1946, £9,000,000 of foreign exchange was spent by people going abroad on commercial visits and £13 million on non-commercial visits. It is expected that corresponding figures for 1947 will be appreciably higher. But it must be remembered that in many cases this expenditure of sterling enables foreign countries to buy British exports which otherwise they would be unable to do.—EDITOR.]

From *The Economist* of 1847

June 5, 1847.

It is understood that Parliament will be prorogued before the end of the month, and that in the ensuing month a general election will take place. It will be remarkable for the absence of party ties and party principles. The distinction between Whigs and Tories is at an end. The Protectionists, too, are scarcely heard of, and the Free Traders, as a political party, embrace all sections of politicians. There is no grievance and no cry. There are laws to be amended, numerous evils, chiefly the offspring of ignorance, to be removed; but there are no great wrongs to be redressed. In this respect, the functions of the House of Commons are at an end. It no longer stands between the people and the crown—claiming redress for them before it will grant any Aids. . . . Since the Corn Laws were extinguished, there is no flagrant injustice to remedy. . . . The kingly power is not threatened, the church is not in danger, the aristocracy is safe, public liberty is secure, the Pope is not at our heels, there is no pressing and general demand for any particular species of reform. Candidates must stand on their personal merits, and electors may choose, untroubled by political passions, the gentleman whose principles and conduct they prefer. Such a conjunction of circumstances seems favourable to the election of proper men, and, apart from those family and territorial influences which send members of the aristocracy into Parliament from their names or their connexions, without any regard to their fitness, we may expect that the new Parliament should contain many new, and more than the ordinary proportion of clever, diligent, thoughtful legislators.

Russia's Strength

SIR,—Embedded in the fine amber of your leading article on May 17th reposes a preposterous little fly. May I point it out to you—quietly, before it starts to buzz?

The Soviet Government, says your writer (page 747), need fear no organised criticism at home. "In their use of police methods they are as far ahead of the British and Americans now as they were behind them in industrial methods twenty-five years ago." Well! You know what it is meant to mean, and so, of course, after the moment's shock, would most of us. But in view of the wide influence so justly enjoyed by *The Economist*, the almost *ex cathedra* authority it has attained in some quarters, would it not have been safer to inoculate that mischievous little word "ahead" at least with a couple of quotation marks?—Yours faithfully,
RONALD LAMBTON.

Prisoners of OZNA

SIR,—Is there not some confusion about the point under discussion in your Note on this subject in the May 24th issue and your correspondent's letter in the following week's issue? Three distinct matters have been mentioned; and by their interweaving the case against OZNA has been made to seem stronger. Each point, itself unproven, is taken as evidence about the other two.

The first is whether or not OZNA ill-treats its prisoners. The second is whether or not Yugoslav citizens are terrorised by fear of imprisonment or worse into telling fairy tales to visiting foreigners. The third concerns the intelligence or good faith of the British parliamentary group which visited Yugoslavia and some OZNA prisons in November, 1945.

I was sent by my newspaper to accompany the Parliamentary group in 1945, and I associated myself with their report. At that time, of course, I was no doubt subjected to the same inevitable window-dressing on the part of the Yugoslavs as they were. But I had already spent some years in the country; I knew the language; and I knew by sight some of the people we saw in jail. Since then, I have spent most of eighteen months in Yugoslavia as correspondent for my paper. May I therefore make one or two comments on the three points I have mentioned?

Any regime which arrests people for their political activities lays itself open to the charge of "terrorism" in this country. And once the word has been used, it can be made to convey anything from simple arrest for crimes which would not be crimes under English law (such as incitement to racial hatred), to every excess of brutality in the Gestapo repertory.

That the Yugoslavs habitually arrest people who have com-

mitted no crime in English law is true. In this they are in no way peculiar. But that, having jailed them, they then ill-treat them, is a story for which I personally have been unable to find a scrap of evidence. If they do, then no doubt they put themselves to the enormous trouble of keeping teams of OZNA men—who must be pretty competent actors—to stand-in for prisoners every time a foreigner visits one of their jails. This remarkable feat of organisation should certainly command our respect if not our sympathy; though it might be simpler to refuse foreigners permission to make the visit. I have visited other jails, including the main one in Zagreb, and talked to many prisoners, since 1945; and so have many other journalists. The standard of administration varies; but in all cases they are clean; cells are not overcrowded; food is good; and the prisoners look, and say they are, healthy. They all say they have not been beaten up or otherwise tortured. The only alternative to believing them is to believe the stand-in story. Personally, having suffered a good deal of exasperation at the Yugoslavs' apparent indifference to the elementary needs of public relations, I am not inclined to credit them with the more elaborate explanation.

As to the terror which is said to keep people hiding their anti-Government views, I think a few months in Belgrade or Zagreb would disillusion the most sceptical. Whatever the faults of the Yugoslavs, whichever camp they belong to, reticence is not one of them. If you are a foreigner it is impossible to escape from the people who have a grudge against the regime. They ring you up; they waylay you in coffee houses; they write to you; they send their friends to you. Since they are concentrated in the main towns, most of their contacts are foreign diplomats and journalists. One man whom I have known for five years is a bitterly anti-Communist Agrarian who works in a Ministry. I have lunched with him regularly once a month for a year. His views are well known. But so far he has kept his job and his freedom.

Rumours flourish in Belgrade in these circles. A few weeks ago a colleague of mine whose knowledge of Yugoslavia is unimpeachable felt obliged to tell his friends that he had at last received definite information that Mr "Solly" Brajlovic, a correspondent of the Associated Press who had been arrested on a security charge, had been murdered in prison. Before I left Belgrade Mr Brajlovic was back in town, having had his sentence reduced for good conduct, and lurching with his friends.

Lastly, the MPs. I would mention only one point. Many of the people whom we saw in prison in November, 1945, were well-known public figures. One was Cincar-Markovic, the ex-Foreign Minister. Another was Dragi Jovanovic, notorious mayor of Belgrade, who has since been publicly tried and executed. Their identities are not open to doubt. They were not, I assure you, OZNA agents.—Yours faithfully,

KENNETH SYERS

Books and Publications

Crime and Retribution

"Der SS-Staat." By Eugen Kogon. Verlag der Frankfurter Hefte. RM 8.60.

DR KOGON, an Austrian Catholic writer and sociologist, might with justification have written a book of his personal sufferings during the seven years which he spent as a political prisoner in Buchenwald. Instead, he has done something of more lasting value. He has compiled a factual text-book of the concentration camp system, accompanied by an unemotional description of methods and typical incidents, which are given their right significance by being set in their proper framework. It is only a pity that he did not have access to more captured Nazi documents, which would have given his work greater scope.

Among other things, Dr Kogon gives the facts about the internal power wielded by the prisoners themselves in the camps. Unpleasant stories have been circulating about the rôle played by the German Communists in Buchenwald, and Dr Kogon does a service by showing that all political prisoners benefited from Communist supremacy, though they used it ruthlessly.

His restrained treatment makes Dr Kogon's facts all the more revolting. One follows the writer through the process of degradation to which the new prisoner was subjected, through the various departments—the parade ground, where the daily dead were laid out for the roll-call, where prisoners sometimes stood eighteen hours at a stretch, or were assembled to watch one of their com-

pany flogged naked on a heap of stones; the quarry, where shooting was the kindest of deaths, the "hospital" where the sick were despatched with injections; vivisection laboratories; the cells for special tortures; and the "riding-stables" for mass executions.

Dr Kogon rightly shows the concentration camp and its bestialities to have been an essential part of the Nazi system—or, perhaps, of any system in which the State is supreme.

Great profits accrued to the State from the camps, which came under the SS Economic Administration Headquarters. The SS hired prisoners to a number of armament and construction firms. A balance sheet which was drawn up for the SS Headquarters shows the following picture: "average wage, less food and wear and tear of clothing, RM 5.30 a day; assuming the average life of a prisoner to be nine months, this equals RM 1431 per prisoner; this profit is increased by utilisation of the corpse as follows: gold from teeth, private clothing and valuables, less cost of cremation, at least RM 200. The total profit from turnover of prisoners therefore amounts in 9 months to RM 1,631 per head, not counting special revenue from sale of ashes as fertilisers."

The total number of deaths in Buchenwald alone was 55,000. Figures found at the SS Headquarters relating to only five months in 1942 showed that, without counting the "extermination camps" there were over 200,000 deaths against 264,000 new prisoners. With the extermination camps, it is probable that the grand total during the whole period was in the neighbourhood of 7½ million. (It will be recalled that a study of Genghis Khan was obligatory for sections of the SS.)

Dr Kogon accepts that the German people were, on the whole, ignorant of what went on in the camps; and the British and Americans made a bad psychological mistake in not differentiating between them and the SS, or between direct guilt and indirect responsibility. Nevertheless, what can be said for that vast majority of Germans who now, when faced with the facts, still refuse to believe or condemn them? What can be said for the people who showed no pity for the miserable wrecks whom they saw on their long marches from camp to camp; for the women who helped to shoot them down in the last days of chaos; for the judges who allowed them to be handed over to the SS; for the High Command which approved Hitler's dictum that Russians were animals, and raised no protest against the shooting of all officers, political commissars, and party officials, and the deliberate starving to death of the Russian and Polish rank-and-file; for the Germans who knew during the war that some Russians were reduced to cannibalism, and considered it rather funny; for the business managers who used the half-starved slaves from the camps for their profitable armament firms, and for the priests and pastors who, with the exception of Niemöller, never called for prayers on behalf of the prisoners? As Dr Kogon says, the list of those who might have done something, if only a little, is long. His book is essential material for that depressing occupation, study of the German mind—one which, more than most, suffers from the belief that Authority can do no wrong.

"The Nuremberg Trial." By R. W. Cooper (with a Foreword by Sir David Maxwell Fyfe). Penguin Books. 1s.

WHILE the full official record of the Nuremberg trial is being published in an endless series of volumes which few will ever read, there is plenty of room for a brief, but comprehensive, account of it, such as is now given to the public in a Penguin by a writer who observed it as special correspondent of *The Times*. The book has evidently been put together from notes taken at the time, and in some passages transcripts of prosecution speeches have remained in the first person, creating some uncertainty as to the extent of the author's own comment; but on the whole, a clear and well-balanced picture of the trial emerges, and the Foreword contributed by Sir David Maxwell Fyfe raises at the outset the basic question of the justifiability of it all. As Sir David points out, the trial was not in principle an innovation, as far as crimes against the laws of war were concerned, for it was already "well-established international law that their perpetrators can be punished by the state whose nationals have been outraged." As regards responsibility for atrocities (Counts III and IV in the indictment), the trial of the major war criminals at Nuremberg did not differ essentially from the trials of German concentration camp guards and suchlike held locally by the various Allied nations, and it may be pointed out that all those condemned to death were convicted on Counts III or IV. What was new, of course, in the Nuremberg trial was the criminal charge of planning and waging aggressive war—a charge based on the claim that the Kellogg Pact had made aggressive war a crime. As Mr Justice Birkett put it: "To initiate a war of aggression is not only an international crime; it is the supreme international crime differing from other war crimes in that it contains within itself the accumulated evil of the whole."

There is no doubt that these words reflect the opinion of the liberal democratic world and that the Nazis' leaders were justly found guilty of this crime on the evidence presented. The only real flaw in the judgment—but it is a serious one—is that the evidence disclosing the secret clauses of the Ribbentrop-Molotov Pact of August, 1939, showed that the original aggression which started the Second World War was prearranged between Germany and the Soviet Union. It is rare in criminal procedure—at any rate at the Old Bailey—for the prisoner in the dock to be able to implicate a judge on the bench of the crime of which he stands accused, and it is not surprising that at Nuremberg the judges of the three Powers which were not implicated in the attack on Poland did not quite know what to do about it; they solved the problem by not referring to the embarrassing evidence in their judgment. In the future there is likely to be more criticism of the historical distortion thus involved than there could have been at the time. But there need be no fear that the verdict of the future will be that the convicted men did not deserve death; on the appalling evidence of "genocide" alone they earned their ropes many times over. The trial was worth while if only because it established once and for all by a vigorous legal procedure and by a mass of unchallenged documents, which were above the level of mere propaganda or personal reminiscence, the monstrous premeditated cruelty of the Nazi regime.

Self-Government in West Africa

"Path to Nigerian Freedom." By Obafemi Awolowo. Faber and Faber. 137 pages. 7s. 6d.

"The Gold Coast Legislative Council." By Martin Wight. Faber and Faber. 285 pages. 12s. 6d.

THERE is at times an element of smugness in British colonial policy. It derives from the recently-accelerated progress towards self-government in many colonial areas. The West African colonies, in particular, are apt to be singled out to prove the dictum that "whatever's best administered is best." Evidence of progress is not wanting. Nigeria and the Gold Coast now have Legislative Councils with unofficial, locally elected majorities. They both have long term plans for economic and social betterment—and enough funds available to make a start in carrying them out. But what have the Africans to say about all these schemes for their advancement? Their criticism is apt to be woefully ill-informed about the facts or too violently opposed and incoherent in its attitude to interest any but those who are already converted to the same viewpoint. But when an African critic arises who shows a maturity of judgment which is prepared to admit that there is something in his opponents' point of view, it is time to take notice.

Mr Awolowo is such a critic. His book is important for two reasons. First, it is an intelligent, and in places persuasive attack on the new Nigerian constitution, with its sanctification of the system of indirect rule, and also on the dilatoriness of British colonial policy in general. Second, it is written by an African from the southern Nigerian community (both Ibo and Yoruba) which produces in the press and elsewhere much violent, irresponsible criticism and little coherent argument to support it. If Nigeria is to attain successful self-determination in the next decade it will need to rear many more like Mr Awolowo.

The author is at his least convincing when he disparages the flexibility in the new constitution which allows the three areas of Nigeria, that is the North (Hausa), the West (Yoruba) and the East (Ibo) to progress at different speeds to suit their varying traditions and outlook. But this split-up of Nigeria is connected with the indirect rule of the chiefs, and the author, as an educated southerner, has little time for the chiefs and their ways. His most convincing passages are those which make a plea for a rate of political progress which is not entirely in the white administrator's discretion. There are many who may agree with him that "it is better to go a little too fast, than to move much too slowly."

★

Mr Wight's book on the Gold Coast is much more meticulous—as becomes a more academic work. This is the second volume of the series on studies in Colonial Legislatures published under the auspices of Nuffield College. Its interest is mainly historical, since much of the book was written before the new constitution granting an unofficial African majority was introduced. But even those who are unattracted by the development of the Gold Coast Legislative Council may gain some further insight into colonial problems by comparing the African speeches in the Gold Coast Legislative Council proceedings with Mr Awolowo's book. They may think that if the Awolowos had been a Gold Coast family, the path to Gold Coast freedom might have been a book written by Mr Awolowo's father.

AMERICAN SURVEY

Frustration in Housing

(From Our U.S. Editorial Staff)

MORE and more serious leaks are appearing in the programme to put an adequate roof over the American head. The lag in construction during the first four months of 1947 indicates that dwelling units started this year may fall short by a quarter to a third of the record of a million units that was predicted a few months ago. Since last November, the number of dwelling units completed has consistently exceeded the number started, foreshadowing a reduction in the number of new homes available for occupancy later this year. During the first quarter of this year, 137,100 units were started as compared with 139,600 in the first quarter of 1946, while completions in the first three months were 176,200 as compared with 61,600 in the first three months of last year. High current completions result from the carryover of unfinished units from last year, when for the want of a bathtub or some other key article or material the house was frequently lost to use.

To a large extent the falling off in the number of units started reflects the prevailing high level of construction costs. Even official indexes show costs 25 per cent above a year ago and 75 per cent above pre-war. When statistical inadequacies are allowed for, the true picture is more extreme. Worse yet, firm commitments from contractors are usually unobtainable, so that the finished cost can be expected to be considerably higher than the estimate made when construction is planned or started.

As a result, builders of rental housing, which is in particularly short supply, have in large numbers deferred construction. In New York City alone, large life insurance companies are reported to have shelved \$75 million in contemplated projects. The difficulty can no longer be attributed to a squeeze of profit margins by rising costs and controlled rents because permissible rentals on new building are being revised. The difficulty is that rental housing investment is undertaken for a generation, and it seems obvious that today's crest in prices and costs is unlikely to prevail for that period; the potential investor fears competition in the not distant future from less costly and probably more attractive structures.

In the case of homes for sale, where the builder realizes his return immediately instead of over a period, the lesson is learned even sooner. Whereas homes stood untenanted last year for want of some item to bring them to completion, they now stand empty because buyers are either unable or unwilling to pay the price. The number of available unsold units is small, but nevertheless significant. Public housing, which is a very small factor in this country, suffers from the same ailments.

Washington remains as confused in this situation as it has been about housing for a long time. It is still trying preponderantly financial devices which are just what are not needed to meet this specific problem of costs. The outstanding Bill before Congress, revived from the last session and supported by the Administration, is the Taft-Wagner-Ellender Bill; the Baldwin Bill is similar in nature, offering the same medicine only in larger doses. Both would enact lower interest rates, lower initial payments and longer periods of repayment—that is, easier finance. The report of the Senate Banking Committee on the first of the above-named Bills aptly summarises the approach taken: "Private enterprise has the capacity to build housing in much greater volume but it cannot be expected to build what it cannot market." This is of course pure ambiguity: while factually correct, it simply ignores the root trouble of costs as the major marketing factor.

But if any one factor explains the current housing shortage, it is not finance. The large liquid savings accumulated in public

hands during the war are coupled with loan terms of extreme ease. Veterans can borrow the entire purchase price if it is regarded as anywhere near reasonable by the Veterans Administration (whose definition of reasonableness makes it nearly synonymous with generosity). Most other people can borrow 90 per cent of the appraised value, which value in practice moves toward market price with no great lag. Both veterans' and most other loans are or can be guaranteed or insured by the Government to overcome any squeamishness which might beset a lender. The maximum rate which can be charged on a veteran loan is 4 per cent, for others 4½ per cent, and these rates are being reduced in some places. Borrowers make monthly repayments of principal over two or three decades. This very easy credit is one of the major factors which, in the sellers' market, produce very high prices for houses. At the end of 1946 home mortgage debt owed by American citizens hit an all-time peak of almost \$25 billion—and much of it was incurred to purchase homes which several years from now may well be worth less than the lien standing against them.

★

Nor is the difficulty the result of any deficiency of organisation in Washington, as might be implied by still another of a long series of reshufflings just proposed by the President under the Reorganisation Act. The capital abounds with housing agencies, mostly dealing with the currently irrelevant factor of finance, and not willing, or not able, or not permitted, to deal with the heart of the problem. This is not to arraign the personnel or endeavours of the agencies; they are conscientious and able and they are resisting the adverse developments as much as is politically and legally possible.

But the basic difficulties lie in the technological and organisational backwardness of the construction industry, the anachronistic methods in use in American home-building. Both entrepreneurs and labour in the construction industry are obsessed with the notion that there is only a limited amount of work to be done and that their function is to obtain as large a share as possible for themselves. Workers generally (there are exceptions, as to all generalisations) oppose new labour-saving methods and voluntarily restrict their own output; the unions engage in jurisdictional disputes among themselves to monopolise the lion's share of work for their own members. Material-makers produce only specific products, which have to be assembled by contractors, mostly small, so that really large-scale operations are scarce. These preventions of improved methods and lower costs are solidly reinforced by obsolete and generally highly restrictionist local building codes, in which some or all of the factors of production have a vested interest. Because of these factors, plus transition difficulties in some products (mostly ending rapidly), many materials have been costly and even then not obtainable in volume. These conditions make for high cost and relative scarcity of housing in this country in both the short and the long run.

Though it is being choked off by costs and prices, the need for housing remains great. Two years ago the National Housing Agency estimated that more than 1½ million houses would be required each year for ten years to raise all housing to standards of minimum adequacy and to provide for new families as they are created. The President in his recent message to Congress again indicated that the job of adequate housing will require a

decade. Put the speed with which these needs will be met depends almost solely on the speed with which the cost problem can be solved.

This situation has a long arm: prosperity in the economy will be difficult without a large volume of housing construction. In 1936 housing construction failed to reach a high level and recovery was dampened. A recent study by the Twentieth Century Fund on "America's Needs and Resources" calls for better than 1 million units a year as a *quid pro quo* for reasonably prosperous business conditions.

But in the shorter run, by the same token, a large volume of housing construction at to-day's inflated prices—and therefore

at to-day's inflated debt levels—holds promise only of grief for both the home investor and the entire economy.

The best hope for the nearby future is that the pattern of the years after the first war will be repeated. Rising prices and costs then also choked construction. But costs and prices were responsive to a decline in volume after only a few months and in 1921 volume began a long rise which persisted for several years. The best and only hope for adequate housing in the longer run is for a reduction in restrictionism and for improved organisation and technique of the industry. But these are severe conditions and are only aggravated by the congressional pre-occupation with financial tricks.

A Hundred Notorious Years

By a Correspondent

ON June 10th the *Chicago Tribune* is a hundred years old. Except during the first eight years, it has been controlled by one family, Joseph Medill and his descendants. Medill, himself, was dictator of its policies from 1855 until his death in 1899. Fifteen years of quiet followed, during the regency of James Keeley, an English-born editor, before Colonel Robert Rutherford McCormick, Medill's grandson, came to the throne on which he still sits.

Colonel McCormick has accumulated an international reputation for political eccentricity, while his great ability in the management of his newspaper and the extension of its empire has been ignored. His curious theories he inherited from his grandfather; his imaginative direction is his own. But, while the circulation of the *Tribune* has grown from 18,000 in 1861 to over a million today, its political influence has been steadily declining. Medill, single-handed, was able to elect Abraham Lincoln, the representative of a party new to American politics. McCormick, in four attempts, could not once defeat Franklin Roosevelt even in his own Chicago. Medill, however, passionately wanted to see Lincoln President. His grandson only wanted to stop Roosevelt. He never believed in the Republican candidates he reluctantly supported, all of whom, in his opinion, were riddled by internationalism.

When Chicago was young it suffered from a cultural inferiority complex, which the *Tribune* was able to turn to advantage. Denunciation of anything and everything outside the Middle West was always certain of popularity; and Medill was expert at denunciation. But the enemy was on the other side of the Alleghenies, not across the Atlantic. A New Yorker was trusted as little as an Englishman. When the *New York Herald* dared to support General Grant for the Presidency in 1863 the *Tribune* told "This organ of . . . the Thugs of New York, that it must keep its copperhead slime off our Illinois General. . . . Unless it keeps its unclean and treacherous hands off of him, it may expect to get tomahawked." The language today is less vigorous, but the sentiment lingers on. The Eastern seaboard is believed by McCormick to be populated by "hand-kissers," always ready to betray the United States in return for a knighthood.

A ruthless nationalism was the motive for Joseph Medill's loves and hates. He wanted the United States to extend over the whole of North America. Any country which stood in the way must be attacked. Even before the Civil War was won, he wrote to his brother, then serving in the Union Army: "It is very possible that we shall have two wars when this one is ended—one to clear the British out of Canada and the other to clear the French out of Mexico. This continent belongs to the Free American race and they are bound to have it—every inch of it, including the West Indian Islands." In 1946, Colonel McCormick adopted "*Tribune's* Platform For America," which was printed every day on the leader page. One point of this platform was "Get European Governments out of America." The truculence now hides behind a paternalist mask. Talk of war has given way to offers of statehood. While Medill could say: "We shall permit no nation to abuse Mexico

but ourselves," McCormick preaches Pan-American union.

The famous, and much misunderstood, Anglophobia is only a part of the American Imperialism which has been the most consistent policy of the *Tribune*. Britain "owns" much of the territory designed by God to be a part of the United States and is for that reason the chief object of attack. But every now and then, when the Colonel pauses for breath, it is possible to see that his attacks on the British are impatience at their senseless independence. In 1943 there appeared an editorial called "States Across the Sea," in which he suggested that the British Empire should be admitted to the Union. "Great Britain could come in . . . as four states . . . Canada could constitute another state . . . Australia, New Zealand and the contiguous islands might form still another." This offer was a serious one and the Colonel was very offended when it was treated as a joke.

Three years later he returned to the subject, feeling that "the English ruling class is now the English ruled class. It is being ruled with considerable vindictiveness by the lower-class men who have succeeded to power. The old ruling class might welcome the protection of our Bill of Rights. . . ." The offer of statehood was renewed in greater detail and the leader ended: "Perhaps it is not impossible that we can form a real world parliament with these countries which share with us a common language and have, or used to have, a good many of our liberties. If they will not have it, the only alternative is a Pan-American nation." It would be too much to expect Colonel McCormick, for whom Senator Taft is a New Dealer, to have any sympathy with a Labour government, but the admission that the British people used to have liberties would have been thought dangerous radicalism in his grandfather's day. Another example of the weakening of the family's moral fibre was noticed in Chicago a few months ago. In 1884, the *Tribune* had suggested a method of dealing with beggars: "The simplest plan . . . is to put arsenic in the supplies of food furnished the unemployed or the tramp. This produces death in a short time and is a warning to other tramps to keep out of the neighbourhood." In the spring of 1947, Colonel McCormick paid a ceremonial visit to Mexico and, commenting on the number of stray dogs to be seen everywhere, remarked in a message to his paper that he had heard that food was very short in Europe. Why not, he said, round up the homeless dogs of Mexico and send them as food—free?

Though the Colonel's policy is only an emaciated version of his grandfather's, he has proved to be an even more efficient manager. Medill built the *Chicago Tribune* from an ailing small-town newspaper to an important metropolitan daily with a circulation of 100,000. Colonel McCormick has taken it from the 250,000, at which Keeley left it, to over a million. More than that, he has added to the property the *New York Daily* and *Sunday News*, the largest radio station in Chicago, two paper companies in Canada which produce all the newsprint for the family papers, and the shipping companies which take the paper through the Great Lakes to the Tribune Tower in Chicago. Another valuable property is the Chicago Tribune-

New York News Syndicate, owned jointly by the two papers, which distributes the comic strips on which their enemies believe and hope their circulation is based. The *Washington Times-Herald* is owned by McCormick's cousin, Eleanor Patterson, but the money which bought it is Medill money.

The financial basis of this empire is deceptively simple. The Tribune Company was formed in 1858 with a capital of 2,000 shares. It is unchanged today. Of these shares, 1,050 were retained by Medill and are now held by the Medill Trust which controls the Company and all its subsidiaries. The income from these shares was left by Medill to his two daughters and their children. The other 950 shares went to early partners of Medill's or to original members of the staff. Their descendants now draw large incomes, but have no voice in the management. As the shares change hands privately, and very rarely, it is only possible to guess their value, which has been recently estimated at \$40,000 a share, giving a total capital value of \$80 million for the whole enterprise.

The control is now in the hands of Joseph Medill's surviving grandchildren. Colonel McCormick's was one of four. His only brother is dead and his children have his share. On the other side of the family, Captain Joseph Patterson died last year, leaving three daughters, and Eleanor Patterson is still alive and has one. There is much speculation on the future of the Tribune Company when the older generation have gone. None of Medill's great-grandchildren, whatever their ability, show any love for the policies which have given the *Chicago Tribune* a hundred years of notoriety. Colonel McCormick himself, who might have been expected to produce a sturdy Mid-western heir, is childless. He will be 67 this year, a lonely, dignified figure, the last surviving example of the type he hates most in the world—the feudal British aristocrat.

American Notes

The Budget and Tax Rates

After many weeks of sterile debate, the Tax Bill which is now emerging from Congress can scarcely bring a great deal of satisfaction either to President Truman, or to the Republican majority in Congress. The Administration has lost the struggle to maintain current tax rates and put a buffer against inflationary pressures, while the aggressive majority spokesmen in the House of Representatives have fallen down very badly in their effort to reduce expenditures by as much as \$6 billion. And delays have played havoc with the timetable theoretically established by the Legislative Reorganisation Act.

Over the fiscal year 1947-48, the Presidential estimates allowed for net receipts of \$37.7 billion, and expenditures of \$37.5 billion. The House submitted a subsequent expenditure total of \$31 billion only, a figure revised by the more sober Senators to \$33 billion. In conference, the Senators have won at the expense of such enthusiastic Congressmen as Representative Taber, whose praiseworthy zeal for economy is hardly matched by a commensurate knowledge of the items most appropriate for revision. The Senators have also fought down all attempts to impose a flat reduction of 20 per cent over all income ranges (a proposal which quickly turned sour even in the Republican camp) and all efforts to make tax reductions retroactive to January 1st last. Reliefs now voted would cost \$4 billion over a complete fiscal year. On net incomes below \$1,000 the tax cut is 30 per cent; from \$1,400 to \$136,700, 20 per cent, and from that level to \$302,400, 15 per cent. Above \$302,000, 10.5 per cent will be saved. Labour organisations have bitterly opposed this formula.

On Budgetary prospects, the White House and Congress are poles apart. The Senate has projected 1948 figures as: national income \$170 billion, expenditures about \$33 billion, and revenues \$41.4 billion. But Mr Snyder, the Secretary of the Treasury, rejects all such optimistic estimates. The Treasury now forecasts a somewhat lower figure for national income, and a revenue total not more than \$38.8 billion. Congressional expenditure lists, he further asserts, must be revised upwards as time goes on, and a national debt of \$258 billion must be reduced. Unfortunately for the Treasury, Congress refuses to believe that revenue will be sharply affected by a declining level of national income, and it is reinforced in opposition by the fact that Presidential estimates for a \$2.3 billion deficit for 1947, have now been revised to predict an actual surplus of \$1.2 billion.

Between these projections, quite obviously, there is room for honest differences of opinion based on the probable course of business. Over the remainder of 1947 the actual cash surplus, resulting not only from direct Budgetary operations, but from trust fund and other receipts, might be large enough to bring a decidedly deflationary influence into the business situation, if current signs of hesitation are being interpreted correctly. On the other hand, the Treasury view is presumably influenced quite largely by the longer-term prospect of further and substantial relief work overseas, a programme which would not, in all probability, be confined within Budget estimates, but which would, nevertheless, support industrial activity at relatively high levels. The only moral would seem to be that present budget procedure has nothing like the flexibility needed for such a volatile economy amid present uncertainties.

The Treasury has used suggestions of a Presidential veto to bolster the official view in Congress, and Mr Truman is known to oppose many clauses of the Bill. On balance, however, it seems unlikely that a veto will be imposed. The Democrats have succeeded in taking the edge off an indiscriminate economy axe, and the Treasury has scored its debating points. A veto—even if sustained in Congress—would probably not be worth the confusion and damage it would cause.

* * *

Mr. Hoover's Prescription

Mr Hoover, the Republican elder statesman, has enjoyed a very cordial reception for his view that further delay in signing the peace treaties would impose an intolerable burden upon the world, and specifically upon American resources. Mr Hoover had been asked by Mr Taber, chairman of the House Appropriations Committee, whether he believed the War Department's request for the appropriation of \$725 million for Germany, Japan, and Korea was really necessary, and if so, to discuss measures to lighten the demands upon American taxpayers in future years. Mr Hoover supported the appropriation, but he recommended separate peace treaties with Japan and with the merged British-American zone of Germany, as the first step toward making the occupied countries self-supporting and relieving America and Britain of a drain at present without perceptible end. Senator Vandenberg has since shown considerable sympathy for the idea that if no progress can be made in step with Russia, the United States must proceed without her. In Congress it is even more evident that American patience is about exhausted.

That impatience is shared on this side of the Atlantic. The difficulty with Mr Hoover's statement—which is certain to be popular with the economy bloc that Mr Taber heads, as promising the surest method of providing early relief for the American taxpayer—is that it is so partial a view. Few Europeans would quarrel with the demonstrable need of eradicating the great international poorhouses of Germany and Japan, and making those workshops of the world not only self-supporting, but substantial contributors, in the form of coal and other goods, to world recovery. But this is only a part of the whole problem of European economic recovery, which Mr Acheson put into its proper perspective last month. The European crisis of 1948 and 1949 will not be met, though it may be ameliorated, by any measures, however admirable, taken in Germany. The danger is that Congress may be tempted to believe that German recovery is a substitute for world recovery and for a broad and constructive American policy to secure it. And on the political side, a point to which neither Mr Acheson nor Mr Hoover has given its proper value is the alarm which will be aroused in Germany's neighbours by such statements as that there is no need for large-scale reduction of German and Japanese industry to assure their permanent demilitarisation. Mr Hoover might feel differently if he had been born in Coventry, or Alsace, instead of Iowa. Such a view would be acceptable in Europe as part of the larger scheme of European economic unity now being urged by so many influential American voices, only if accompanied by assurances of security measures far more substantial than the United States is likely to

give. Mr Morgenthau's scheme for "pastoralisation" has now given way to Mr. Hoover's scheme for industrialisation. In this doctor's dilemma, the physicians see chiefly what they want to see. Mr Hoover is like a doctor dealing with a broken leg without noticing that the patient is suffering from pneumonia and nervous prostration as a result of having his house burned down.

Decision on Labour

Early this week the Senate and the House agreed on the final terms of the Labour Bill to be sent to the President. Because of the threat not only of a Presidential veto, but of losing the support of those marginal Senators necessary to override a veto, the House has given way on virtually all of the main points where it would have meted out far more drastic treatment to the unions than the Senate. Gone are the ban on industry-wide bargaining, the permission for employers to obtain court injunctions against labour unions in certain circumstances; even the Senate strictures—as well as the harsher House bar—on union welfare funds have been softened so as not to interfere with old-established funds like those of the International Ladies Garment Workers. In its final form the Bill sets out to do five things for which there is unquestionably majority sentiment in the country: to arm the government with means of fighting paralysing strikes in basic industries; to strengthen the conciliation branch; to rectify the balance of the Wagner Act so that unions, as well as employers, will be forbidden to indulge in certain unfair labour practices; to diminish jurisdictional strikes; and to democratise the internal affairs of the unions by compelling publication of financial reports. There may be substantial doubts about the means adopted to secure these ends—for example, whether the encouragement of separate craft and professional unions will not stimulate, rather than eliminate, jurisdictional raids, and whether the anti-Communist ban will not merely drive the party underground and encourage abuses.

But the main sense of the Bill goes in the direction most Americans desire, that of bringing Big Labour under the law. By their unexpected temperance, the Republicans have refused to provide the President with substantial excuses for a veto which would be acclaimed by labour and secure the union vote for Mr Truman in 1948. Once more the decision may lie as much with Mr John L. Lewis as with the President. Negotiations between Mr Lewis and the northern and western mine owners, who represent 75 per cent of the industry, have temporarily broken down. Mr Lewis would like an increase in wages of 35 cents an hour; the owners offer 15 cents. Can Mr Truman take the chance of robbing the government of the weapon of the injunction provided in the new law for precisely such an emergency three weeks before the date of a possible coal strike? If the Senate were certain to override a veto, Mr Truman might try to have his law and eat it too. Or he may accept the law with a promise to push for amendments next session. The awkwardness of combining the functions of national leader and party leader implicit in the labour decision would be greater if the unions had been more successful in delivering the labour vote last November.

New Angle on Tariffs?

Considerable interest attaches to a recent move by a Republican Senator (Owen Brewster, of Maine) for a general reinforcement of the powers now held by the Tariff Commission. By this proposal, the Tariff Commission would become a Foreign Trade Board and hold a much wider responsibility for foreign economic policy. For example, Senator Brewster declares that it should be able to:

Study all factors affecting the balance of international payments between the United States and foreign nations and submit recommendations to Congress and the President respecting such changes as may be necessary to encourage foreign trade and travel.

Co-ordinate activities of all Government agencies dealing with foreign trade, including statistical data and all information collected and disseminated by them.

Encourage foreign travel, and promote international fairs and exhibitions.

This Bill, which is now in the hands of a Senate Committee, raises several interesting issues. It is not known, for example, how far Senator Brewster has been notified of support within his own party, and it is certainly more than doubtful whether the Senate committee concerned will agree to let the machinery

relax sufficiently for a debate on the floor—the legislative programme does not seem to leave a great deal of time for the introduction of Bills which were not on the original list and the urgency of which many Senators would be disposed to deny. There is, moreover, considerable room for doubt on the question whether such a reinforced Tariff Commission would be the appropriate body for determination of high policy. It is quite obvious that the present confusion of Federal agencies should go, but Mr Marshall is busily reorganising the State Department on precisely this issue of foreign economic policy, and it would seem to be a more suitable move for the Tariff commission, with other related agencies, to work within the boundaries set by a special branch of the State Department.

Debate on the status of any new body, however, is less important than the realisation that the facts of economic life are beginning to percolate through Congressional corridors. Senator Brewster, as a good Republican, stresses the benefits of foreign travel and is wary about specific tariff cuts. But he at least is not seeking additional barriers against foreign goods; he is "concerned over the growing imbalance of exports and imports, and is expected to declare that it is the policy of Congress to secure a better balance." It will be amusing to listen to such Republican stalwarts as Senators Wherry and Millikin and Representative Knutson, if and when Mr Brewster introduces the Foreign Trade Board Bill of 1947. But it is none the less an interesting reaction, and may possibly mean that Mr Stassen will not be quite without friends as Presidential candidate in the Philadelphia convention next year.

In the meantime, the immediate mood of the Republican majority is to resist every effort by the State Department to avert a breakdown at Geneva on the issue of the US wool tariff. So far, negotiations between the State Department and the joint Congressional committee have brought no retreat from the recommendation for a 50 per cent "fee" to bolster the 34 cents per lb. duty now prevailing. The present Robertson Bill would also give domestic wool growers a premium on the extremely generous support levels attaching to other major farm produce groups.

Shorter Notes

The Committee on Un-American Activities of the House of Representatives no longer looks for Communists under the bed, but behind the screen. Its current investigation has taken it to Hollywood, which, to the surprise of the average film-goer, turns out to be the secret weapon of the Soviets. There may well be some truth in the allegation that Communism flourishes among screen writers. Some escape is necessary from the tedium of Grade B's. But to take as evidence of a Communist conspiracy, Miss Ginger Rogers's courageous refusal to mouth the subversive line: "Share and share alike—that's democracy" reduces the whole process to the level of farce.

Most Federal agencies are confirming recent indications of a business slow-down. The Reserve Board's Index of Industrial Production (seasonally adjusted) declined to 187 in April, the March peak being 190. Preliminary reports for April also indicate moderate declines both in durable and non-durable industries and in industrial employment.

Since January, gold imports have totalled over \$1 billion, a rate exceeded only in the immediate pre-war years when the flow of capital from Europe was reinforced by war material purchases. This figure, of course, is the counterpart of the heavy export surplus noted here last week. The gold stock now totals \$20.9 billion after transfers to the Monetary Fund.

President Truman has received a report from his special Civilian Advisory Commission recommending six months' compulsory military training for 18-year-old youths. The cost is estimated at \$1.5 billion yearly, and the Commission (which also advocates an immediate programme of factory decentralisation) declares that failure to adopt the plan "will invite extermination in atomic warfare."

THE WORLD OVERSEAS

Communism in Eastern Europe—I

(By a Special Correspondent)

THE contrast between the omnipotence of Communists in Eastern Europe to-day and their almost complete absence from the surface of political life between the World Wars has led many Western observers to conclude that Communism is a mere import from the USSR, lacking any real roots in the East European countries themselves. This is a serious error.

Before 1914 Socialist movements existed throughout Eastern Europe. Those of Poland, Czechoslovakia and Hungary were based on an already numerous industrial proletariat, and were influenced by Austrian and German Social Democracy. In Rumania, Serbia and Bulgaria there were few industrial workers, and the Socialists recruited their support not only from them but also from discontented peasants and small officials. In these three countries the structure and ideology of the Socialist parties more closely resembled those of Russia than of Central Europe.

When the Third International was formed, the prestige of the Bolshevik Revolution was such that in all these countries except Poland the Socialist party majorities at first chose Communism rather than Social Democracy. During the twenties, thanks partly to the Communist failures in Hungary and Bavaria and partly to the strength of Central European traditions, the Social Democrats recovered the majority of the workers in Czechoslovakia and Hungary. In Rumania the workers' movement was repressed from 1919 onwards, and was never strong, though it is probable that among the minority of politically conscious workers Communism was more attractive than moderate Socialism. Yugoslavia and Bulgaria both had strong Communist parties at the free elections immediately after the war, but both were soon forcibly suppressed. The Yugoslav party was banned in 1921 and remained illegal right up to the Axis invasion. The Bulgarian party was dissolved in 1923, obtained a semi-legal status from 1931 to 1934, when it was finally suppressed by a military *coup d'état*.

It is important to realise that many of the East European Communist leaders of to-day suffered heavily for their cause between the wars. Rakosi, now Hungarian Vice-Premier, spent fifteen years in prison. Gheorghiu-Dej, now Rumania's economic dictator, was eleven years in gaol. Traicho Kostov, secretary of the Bulgarian party, was so tortured that, fearing he might betray his comrades, he threw himself from the fourth floor of Sofia Police Headquarters. He failed to kill himself, but went back with both legs broken to prison, where he spent several years. And, indeed, there are few prominent East European Communists who have not at some time been maltreated by the police of the old regimes.

The Russian Model

The legal situation under the pre-war regimes did not (with the exception of Czechoslovakia) reflect the real strength or weakness of Communism. The parties had to work underground, as had the Bolsheviks in Russia, and the police methods which they had to fight were probably more efficient, and certainly more cruel, than had been those of the Tsars. It was therefore not merely admiration of Soviet achievement, but the similarity of their tasks, which caused them closely to follow Russian models. The parties were based on strict conspiratorial secrecy and severe practical and ideological discipline. They regarded themselves as the vanguard of the proletariat, a training school for the leaders of the future revolution. They had two sources of strength. One was the devoted labour and heroic courage of their members, the other was the sympathy of the common man. The latter factor varied between different countries depending on the extent of social oppression and discontent and the national attitude to Russia. It was a common habit of the East European dictatorships to denounce as "Communists" all who resolutely criticised social and political abuses. The average peasant or citizen knew little

about Communism, but he knew the word, because it was used as a term of abuse by the spokesmen of the regimes, which he had good reason to dislike, against enemies whom he seemed to fear. He was therefore inclined to sympathise with the Communists, and even to identify the word "Communism" with civil liberties.

German conquest and occupation gave the Communist parties their chance. In Yugoslavia from 1941, in Greece and Albania from 1942, and in Bulgaria and Slovakia in 1944, the Communists led the most active forces of resistance. Much righteous indignation has been spent on the "unscrupulous tactics" of the Communists in "pretending" to be patriots in order to "deceive the people." One can only remark that they carried the pretence rather far, for tens of thousands allowed themselves to be killed in battle or tortured to death in prison or camp. The motives of the Communists were of course always to achieve their form of social revolution and to establish their form of government, and this they made little attempt to hide. Undoubtedly they "had political aims," and were "devoted to Moscow," but the essential fact remains that they fought the enemy, and fought him hard. Their military methods were necessarily improvised and primitive, but their achievement certainly compares favourably with that of any of the other "rival resistance movements" of the traditionalist forces.

There is of course one striking exception to this—Poland. Here resistance was controlled by the men of the old regime, who were able to unite under their command people of many political categories, stretching even far to the Left. The "Home Army" was not only brave but efficiently organised. The Communist resistance group (*Armia Ludowa*) was small, and what little merit it won was more than compensated for by the manner in which its Soviet protectors treated the Home Army, both during and after the Warsaw rising. When Poland was finally cleared of Germans, much of the traditional Russophobia of the Poles had revived and the Communists enjoyed little popularity.

In Bohemia, Hungary and Rumania there was little effective resistance. Yet at the moment of liberation the Communists were popular in these countries too, for the peoples were in a revolutionary mood and were immensely grateful to the Russians for expelling the German armies.

The strong position occupied to-day by the Communists was not obtained by the same means in each country. In Poland and Rumania the present regimes were put in power by direct Soviet intervention. In Bulgaria a broad coalition was formed after a *coup d'état* in which several political groups had taken part. The Soviet authorities did not put the Bulgarian Communists in power, but they certainly helped them to obtain the upper hand within the government during the following months. In Czechoslovakia and Hungary provisional governments were formed, which represented several parties, and which the Soviet authorities recognised. Free elections followed later (October, 1945, and May, 1946). The Communists won 40 per cent of the votes in Bohemia-Moravia, 20 per cent in Slovakia and 17 per cent in Hungary. In Yugoslavia and Albania the Communist-led resistance forces took over power in their own territory, of which some had been liberated by their own efforts and some by the Soviet and Bulgarian forces (East Serbia, East Macedonia and the Voivodina), while some had been simply evacuated by the enemy (north Albania and part of Croatia and Slovenia).

Types of Communist Regime

Three types of regime are found in Eastern Europe to-day. Yugoslavia and Albania have had from the beginning one-party regimes. Albania before 1939 had no political parties in the modern sense. The present leaders are Communists, but most of their supporters are men of no political antecedents at all. The Yugoslav People's Front was built up during the war. It has always been led by Communists. Several formerly prominent

members of old parties have joined the Front as individuals, but their parties have not. Two splinter groups, the left wings of the Croatian and Serbian Peasant Parties, have joined in a body, but have no real independent activity. The Yugoslav People's Front has never claimed to be a coalition of parties.

The second type is found in Poland, Rumania and Bulgaria. It may be described as the "bogus coalition." The Bulgarian coalition was originally very representative. But the Communists and Agrarians soon began to quarrel, and by the summer of 1945, after the two Agrarian leaders, G. M. Dimitrov and Petkov, had been expelled as a result of Communist pressure, only a small rump of the Agrarian Party was left in the government. A similar process took place within the Bulgarian Socialist Party. In Rumania six months of friction led to a final breach in March, 1945, between the Communist-led Left block and the old Peasant and Liberal parties, since when the former have ruled alone. Of the various groups belonging to the present Government the only one which shows any trace of independence in its relations with the Communists is the Social Democratic Party. In Poland, the old Peasant Party of Mikolajczyk was formally included in the Government until the recent elections, but there was no genuine co-operation on either side. The Left parties include, as in Rumania, a rump peasant and a rump bourgeois party, both of which

are powerless. The relations of Socialists and Communists are not so clear, and it seems possible that the former may have far more real power than any non-Communist party in Rumania or Bulgaria. To this category should now be added Hungary. After two years of friction but co-operation within a coalition, the conservative Small Holders' Party is in process of being split by pressure from the Left and from the Russians. A rump Left wing is taking over power on the Bulgarian model. On the Left the Socialists, as in Poland, still possess some degree of independence from the Communists.

The third type is Czechoslovakia. Last summer the Czech Communists won the highest proportion of votes that has ever been given to a Communist party in a free election. Communists and non-Communists co-operate comparatively smoothly in coalition, and government is 'free' by western standards.

It will be seen from the above that there is a wide variety of government in Communist-led Eastern Europe. Whether the Communists were solely responsible for the break-up of the coalitions which have failed, and whether they sincerely intend to co-operate in those which still survive, are questions which cannot yet be answered. All that is possible is to examine some of the main features of Communist policy as revealed in the experience of the last years. This will be done in a subsequent article.

Immigration to the New World

I—Canada

(From Our Ottawa Correspondent)

IMMIGRATION is a live topic in Canada these days. There is agitation from many sources to open the gates, which were virtually closed in 1931. At the moment Canada suffers from a shortage of manpower in certain occupations. Moreover, it is being urged both on humanitarian and selfish grounds that the present disturbed post-war situation in Europe affords an opportunity to draw a large influx of desirable peoples which will soon pass. A further argument is that Canada's emptiness, most graphically seen as a population density of only three or four persons to the square mile, must excite the cupidity or the aggressive intentions of more crowded countries of Europe and Asia. In short, Canadians are being told that if they do not fill up the empty spaces themselves, the day will come when others will do it for them.

The new interest appears in a variety of ways. There is, of course, a good deal of discussion in the editorial columns of the press. The Prime Minister of Canada made a statement to the House of Commons on May 1st, and the Cabinet Minister responsible for Immigration outlined the official policy in a broadcast on May 14th. The Standing Committee of the Senate on Immigration and Labour has held eight sittings since March 26th, hearing about twenty witnesses.

There are interests and agencies which are frankly in favour of very vigorous immigration policy, and these in general base their advocacy on the belief that Canada's capacity to absorb additional population is very great, so great indeed as to make it wise to open the gates wide to all immigrants who meet certain standards of acceptability. There are also opponents to an "Open Door" policy, many of whom take a more modest—or a more pessimistic—view of Canada's capacity to absorb additional immigrants. These latter spokesmen make much of the fact that in the past eighty years Canada has lost over ninety per cent of its gains from immigration by emigration, largely to the United States.

The discussion of Canada's capacity to absorb and retain immigrants discloses a very wide range of opinion. One witness before the Senate Committee said that he believed that Canada could maintain a population of 200 million "if it was properly constituted." Premier George Drew of Ontario was quoted as saying in Britain that Ontario could look forward to a population of 25 million and Canada to a population of 50 million. The Secretary-Treasurer of the Canadian Congress of Labour concluded that "if in the next quarter of a century we bring into Canada several million people, it will be as much as human minds and human hands can accomplish." Several witnesses sought to correct the notion that the sheer geographical vastness of Canada itself gave any very useful clue as to Canada's absorptive capacity.

Dr Forsey, the Director of Research of the Canadian Congress of Labour, stated that "the physical size of the country, the fact that it covers nearly half a continent, is almost wholly irrelevant. A large part of our country is economically worthless and incapable of settlement." He quoted Professor W. B. Hurd, a distinguished Canadian demographer and economist, as concluding that available new farm land in Canada was not likely to provide more than 80,000 new farms, for which there was already a standing claim. Mr Marshall, Dominion Statistician, also took a much more sober view of immediate possibilities. He laid down four principles in conclusion: certain criteria which are often used as a basis for statements concerning the absorptive capacity for new population are quite unreliable; the objectively ascertained economic needs of Canada is the only reliable criterion of absorptive capacity; the logical and historical sequence of events is that immigration follows expansion and prosperity, it does not precede and create those conditions; finally, a long-term immigration policy should be flexible so that it can be modified quickly to conform to changes in economic conditions.

Official Caution

The official policy of the Canadian Government at the present time was cautiously outlined by the Minister of Mines and Resources (Hon. James Glen) in the broadcast mentioned above. After reporting the machinery set up in Europe to examine applicants, and discussing the transportation "bottleneck" now existing, he summed up the present position in these words:

In the first place, we do not want immigrants of such kind or in such numbers as would effect a major change in the racial, religious or social characteristics of Canada . . .

The second major limitation of our immigration policy is our determination to keep the movement of people into Canada in close relationship to our capacity to absorb effectively such immigrants. Our capacity to do so will vary from time to time and it is expected that we will modify our regulations in accordance with the changes that take place within this country. Immigration will be stimulated at times when openings for employment are favourable. It will be slowed down when the situation within Canada makes this advisable. We will hope, however, that for at least some years to come the position will be such that we can absorb annually a very considerable movement of immigrants from other countries, especially from the British Isles and the United States.

Canada's official attitude toward the humanitarian aspect, the invitation to refugees and displaced persons, was outlined by the Prime Minister on May 1st. Canada has, he said, taken an active part in the Inter-governmental Committee for Refugees and in the discussions in the United Nations leading to the establishment of the International Refugee Organisation. He mentioned the admission of 4,000 Polish ex-soldiers and of some refugees and displaced persons as being, though not of wide scope, "practical steps within the present physical limitations imposed by transportation."

THE "THREE CASTLES" CIGARETTES

"There's no sweeter tobacco comes from Virginia and no better brand than the 'Three Castles'." W. M. Thackeray—"The Virginians"

... the largest Canton in this country is called "Little Switzerland within Switzerland." It incorporates all advantages which a holiday region can possibly offer. Renowned Curative Spas: Schuls-Tarasp-Vulpera, St. Moritz-Bad, and others.

Holiday Centres: Arosa, Davos, St. Moritz-Dorf, Flims, Klosters, Lenzerheide, Pontresina, not to mention the many other resorts.

The surprisingly varied structure of the region, the changing character of its valleys, its extensive forests, its lakes and mighty glaciers form the basis of those climatic conditions which reanimate, refresh and heal the human organism.

Mountain railways, terraces with magnificent views, Postal Coaches. Eight main passes crossing the Alps. An infinite variety of thrilling impressions awaits you.

Detailed information from all Travel Agents, the Swiss Tourist Office, 11b Lower Regent Street, London, or from the Official Enquiry Office, Coire (Switzerland).

AROSA the well-known and up-to-date Alpine Season-Resort. 4,000 beds. All Summer Sports. Holidays to your heart's desire

Davos for all summer sports. For information and prosp. please apply: All Travel Agencies and Swiss Federal Railway, 11b Regent Street, London. 5,000 ft.

Flims and the famous Lake Cauma. Excellent Summer- and Winter-Resort for families. Bathing—Rowing—Golf—Tennis—Walking—Prosp. Flims. 3,650 ft.

Klosters swimming pool electrically heated; Tennis—Lovely Hotels and pensions with every comfort. Inquiries thr. any travel office or Kurverein Klosters. 4,000 ft.

Lenzerheide "THE NICEST SPOT" Pension fr. 14 upwards. Information through any Travel Agency. 5,000 ft.

St. Moritz Alpine Spa Fifth Olympic Winter Games 1948 6,090 ft.

For some time to come, however, the limited shipping available makes a good deal of the above debate and the official undertakings rather academic and even meaningless. Mr Glen admitted that it would be at least a year before any large scale movement of immigrants from Europe could be handled on the Atlantic. It was brought out in the Senate Committee that until recently it looked as though the maximum movement to Canada in 1947 would be only 15,000. Then arrangements were made to devote the *Aquitania* to the task of bringing immigrants to Halifax until the end of September, which would mean another 10,000 for the year, or 25,000 in all. But no hopes were expressed by shipping authorities that this figure could be exceeded in 1947.

2—Brazil

(From Our Correspondent in Latin America)

THE first shipload of European displaced persons has arrived in Rio. It comprises 867 Czechs, Poles, Estonians, Lithuanians and Latvians from the British, American and French zones of Germany. Healthy-looking and apparently well fed, they are bound for the State of Sao Paulo, where it is intended to place approximately two-thirds of them on the land. The remainder, who claim technical skill, are to be absorbed into industry. These are the first of the 5,000 immigrants contracted for by Brazil through the Inter-Governmental Committee for Refugees, as a result of negotiations which began last August. If transport arrangements run according to plan, the whole 5,000 should be in Brazil by October. Negotiations for further immigrants under the same auspices will depend on the success of the initial quota. It is understood, however, that arrangements are envisaged for the dispatch of up to 60,000 displaced persons, some of whom may be directed to Brazil's agricultural south, where a demand has been expressed for farming immigrants.

Under the existing agreement between Brazil and the Inter-Governmental Committee, which will later be taken over by the IRO, the international authority pays the cost of carrying the immigrants to Brazil, and meets a quarter of the cost of any new equipment to house them at the reception centres. Except for this provision, Brazil undertakes to house and feed the immigrants until they find suitable work and maintain themselves.

Although the plan now being put into execution is modest, compared with the project for 120,000 immigrants a year originally proposed by Brazilian representatives, it seems likely to call for careful administration by both the Brazilian authorities and the IRO, if the immigrants that Brazil wants are to be forthcoming and successfully absorbed. The Brazilian Communists are likely to take up the Russian attitude on the necessity of repatriating, not resettling, Balts and Poles. Opposition to the scheme may also be expected from other Brazilian quarters. For political reasons, anti-Semitic and ultra-nationalist elements in Brazil may see eye to eye with certain Sao Paulo industrialists, who fear that any large influx of skilled foreign labour may raise wage levels.

The objections of such groups may gain weight if unemployment figures mount in the city of Sao Paulo, the industrial centre

of Brazil. Here, several thousand textile workers were recently thrown out of work when some mills closed down. There are signs that labour, though far from being a drag on the market, is rapidly becoming more plentiful than during the production boom that began with the war, and which many think is now about to collapse. If a slump comes, as many business men predict, a steady flow of immigrants is unlikely to be either welcome or productive.

There are, of course, other regions that would benefit from an influx of competent agricultural workers. The IRO is understood to be favourably disposed to a request for immigrants from Rio Grande do Sul, the most fertile farming region in the country, and has also studied the possibility of sending displaced persons to agricultural colonies in the "Middle West" States of Goiaz and Minas Geraes, where conditions are generally more primitive.

But deeper problems than the above confront planned immigration, and their solution will depend on the initiative of the Brazilian authorities rather than on the IRO. In the first place, although administrative house-cleaning has unified the four separate Government agencies responsible for Brazilian immigration and colonisation, funds are still sadly inadequate for the schemes contemplated. For example, an opportunity of bringing to Brazil 1,000 Dutch families—each with their livestock—as settlers had to be rejected since the Brazilian Government could not meet the transport costs.

Again, farming conditions in the interior are still for the most part semi-feudal, and farm wages are too low for European, or indeed Brazilian seaborne standards. This is perhaps the greatest deterrent to the planned agricultural immigration needed not only to open up Brazil but to feed its growing and undernourished population adequately. Any real solution depends upon the improvement of Brazil's deficient communications system, and may well wait upon this essentially gradual prospect (which is also hampered by lack of funds). But farming methods themselves leave much room for improvement in a country where, as an early Portuguese explorer said: "Anything you plant will grow."

But the tools for planting are lacking. The generally primitive conditions ruling in the interior are illustrated by an agricultural census taken last year. Of the 1,904,580 farms throughout Brazil, only one in 563 has a tractor, and only one in four a plough. Four-fifths of all the ploughs in use are primitive wooden ones. In Rio Grande do Sul, the best equipped agricultural State, a fifth of all the farms are without mechanical equipment of any kind, while in the North-East the number of farms using mechanical devices of any sort is negligible.

It is with such problems as these that the Brazilian Government as well as the immigrant will have to grapple. They underestimated, as the recent Four-Year Plan shows. But there is generally a crippling lack of funds. The World Food Council, like the International Refugee Organisation, may have a part to play here. During his recent visit to Brazil, Sir John Boyd Orr stressed the world hunger for machines as well as for food, and predicted that one of the first steps of the as yet unformed World Food Council would be to recommend that manufacturing countries encouraged preferential exports of agricultural machinery to food-exporting countries. Brazil's claim to such help would be a solid one.

THE BUSINESS WORLD

Argentine Rail Compromise

THE penultimate phase of the Argentine railway pay-off, details of which became available just as the last issue of *The Economist* went to Press, has some depressing implications. If the scheme of arrangement, shortly to be submitted, receives the approval of the various classes of shareholders in each of the British companies owning railways in Argentina, it will remain only to settle the claims of the more senior stockholders on the stipulated terms, and then to proceed to liquidation. When it was agreed, as part of the Anglo-Argentine pact of September, 1946, that effective control of these lines should pass to Buenos Aires, it was well understood, by the British authorities equally with the stockholders, that Argentina was likely eventually to apply part of her frozen sterling balances, carrying interest at only one-half per cent, to buying up the British holding in the proposed consortium—a holding on which the return was, broadly, to be between 4 per cent and 6 per cent. In all the circumstances the possibility of discharging the sterling debt by surrender of interest in the railways seemed, in principle, to be good business. And the later agreement of the Argentine Government, from which the present scheme of arrangement stems, to buy the systems outright, instead of entering into a partnership with the companies, disposes of the problem of the accumulated balances once and for all. The purchase price of £150 million odd is, indeed, rather larger than the net amount of the balances now available, and Argentina will need to earmark current sterling income in order to foot the bill. Against that, the rail link between the two countries, which at one time was productive not only of substantial investment income, but also of profit arising from an important export trade in railway materials and supplies, may be snapped decisively.

Justification for the Treasury's acquiescence in the sale of this overseas investment is not, however, inherent in the sterling balances problem. The crucial consideration is the changed character of the investment. Of late years the return has been derisory, partly because the companies have been hit by the functioning of an artificial and deliberately manipulated exchange control system, partly because they have had to bear their share of improvements in workers' conditions without being able to pass on to railway users anything like the full cost. Moreover, at the end of 1946 the Mitre Law, under which the companies were free from duties on imported materials and from national, provincial and municipal taxation, ran to its close. Deprived of this protection, which they had enjoyed for forty years, the lines, since the beginning of the year, must have been failing to cover even operating expenses; and with the Argentine Government moved as much by nationalist feeling as by the economics of the case, obviously bent on nationalisation in the end, there was no prospect of any betterment. British investors' experience, notably disillusioning in the past two decades, clinches the case for relinquishing the investment and discharging the debt. And it imparts a national significance to the decision the stockholders must shortly take.

It has been widely emphasised that, subject to the final word of the High Court, the whole sale agreement would be jeopardised were even one of the sixty classes of stockholders to stand out against the share-out terms. This makes it desirable

that comment on the bare outline of the scheme, which is all that has so far been published, should be restrained: some criticisms on points of detail may be answered in the full General Scheme of Arrangement, which owing to printing difficulties, will not be available for some weeks. It is, however, fair to make the point that rejection of the scheme by one or more classes would not inevitably kill the sale plan forthwith. For one thing, it might be possible to submit amended terms, though admittedly the difficulties would be great. More realistic, perhaps, is the consideration that, given the British authorities' evident interest in the plan, and with the prestige of the Peron Administration ostentatiously engaged on behalf of it, the Treasury might seek effective means to avoid failure—even going perhaps to the length of requisitioning the stocks and remunerating holders on the basis either of the present scheme or of one evolved by a new tribunal. These, however, are only possibilities; they certainly provide no excuse for merely factious opposition.

Even so, the reaction to the terms of the scheme cannot be a comfortable one. The manner in which the sums accruing to each of the companies is to be allocated has been approved by a panel composed of Sir Andrew Duncan, Sir David Maxwell Fyfe, and Mr Gilbert D. Shepherd, the President of the Institute of Chartered Accountants. This is a distinguished muster, but the panel's work was severely limited. It had no say in the division of the global sum of £150 millions (which included payment for ancillaries) between the various companies. That was decided by agreement between the various boards—agreement reached, even before the companies' negotiators went out to Buenos Aires, on the basis of the "recognised capital" of each company for purposes of Argentine law. This basis, which harks back to 1908 and makes no allowance for the relative efficiency and earning power shown in the intervening years, is open to criticism; but at this stage the point that matters is that the panel was asked to consider only the directors' proposals for dividing between the different classes of stockholders a sum which for each company was already inexorably fixed—subject only to estimated receipts from the sale of other assets and allowance for certain commitments and contingencies. As thus adjusted, the total share-out figure is £155,567,660. From this, holders of loan capital will receive definitive amounts, provided before liquidation. The return to holders of share capital will depend on the amounts yielded on liquidation, though these are not expected to vary importantly from the estimates.

This procedure—of discharging the claims of the holders of loan capital as modified by the scheme of arrangement, before proceeding to liquidation—is the clearest evidence that the task of the panel was to adjudicate not upon the existing rights but upon a modification of them. Its members had to marry equity to expediency. Clearly, holders of stocks which, on the distribution of sales proceeds in strict accordance with contractual obligations would be left out in the cold, or at least in a chilly draught, could not be expected to assent to the sale of the company's assets without being offered some compensation. Judged from the standpoint of expediency the question to be asked is whether the "nuisance values" of such stocks have been pitched at the minimum figures compatible with getting the scheme through. Alternatively, are the senior stockholders

WHY DRY FLY? This world-famed Sherry (formerly called Findlater's Fino) could not be registered under that name and thereby protected from imitators. For the safeguarding therefore of our world-wide clientele we have renamed it—Findlater's Dry Fly Sherry.

being asked to give too much away? The answer is bound to take account of the speculative Stock Exchange activity in Argentine railway share capital of recent months. Table I shows movements since mid-February, when the outright sale of the railways was announced, in prices of the "equity" issues, which include the four Central Argentine stocks ranking *pari passu* in a liquidation.

Holders of Argentine North Eastern Ordinary have not fared so well as had been hoped, but in all the other stocks the rise in prices since mid-February is largely justified by the terms of the scheme. It is only natural that these terms, which are meant to appeal to holders, should pay close regard to Stock Exchange valuations. But if these valuations are, as the Stock Exchange Council has rightly insisted, no criteria of the real worth of "nationalisation" stocks, they cannot be taken as the true measure of the worth of Argentine rails. As Table II indicates, the necessity for finding something for everybody leads to the imposition of big sacrifices on some of the senior stockholders. It should be emphasised that, if the prior charges received their full contractual rights, too little would be available for holders of the middle stocks to provide scope for any sacrifices by them in favour of junior stockholders. Exactly how

these sacrifices fall depends largely on the accident of capital structure, but it is worth noting that to give B.A.G.S. Ordinary a return of 20 per cent involves paying the huge sum of

part of the brunt when less favourable circumstances occur. Not that the Preference capital is alone, in this scheme, in being called upon for sacrifices. In general, where arrears of interest or dividend have piled up, the most that Debenture holders get is repayment at redemption premium. Arrears are cancelled for all issues except three Central Argentine stocks, which get half their arrears—perhaps because any other treatment would have pampered the junior stockholders.

The simplicity of this wholesale cancellation of arrears must have appealed to the directors and the panel as being all the sweeter because a fixed sum applied to capital repayment is worth very much more than the same sum applied to settlement of interest or dividend arrears. Thus, distribution of £402,500 gross to satisfy the 57 per cent arrears on Entre Rios 5 per cent Debentures would have meant a receipt of only £221,375 by holders after deduction of income tax at the standard rate. In other words, by ignoring the claims of the one class to a return of £221,375 net, an amount of £402,500 is left available for

distribution to more junior securities. If the temptation to treat arrears so cavalierly is understandable, the fact remains that the scheme takes the easiest way out. The popular rule-of-thumb reckoning, that if a reconstruction scheme is to gain the assent of junior holders they must be left at least 25 per cent of the equity, has no application here, for this scheme is unique in its background, its extent and its complexity. But at least it can be argued that, with the ordinary scheme of arrangement, timing is an essential factor: equity holders, if pushed too hard, can afford to reject a scheme and let events run their course in the hope that sooner or later they will take a turn for the better. If one thing is certain with Argentine rails it is that, failing adoption of the sale agreement, the position will go from bad to worse until eventually, instead of something for everybody, there may be nothing for anybody. It is only the abundant need for compromise that can reconcile holders of some of the more senior stocks to such a substantial dilution of their claims.

Short Commons for Consumers

THE long-suffering British public has lately become increasingly aware that further sacrifices must shortly be asked of it if Britain's overseas deficit in the next year or so—beyond that it is hardly possible to look—is to be brought within the limits of the rapidly declining supply of dollars. In a detailed survey of the import programme, an article in last week's issue showed that it is upon food—upon the variety of the nation's diet certainly and upon its bulk, probably—that the new blow must fall, if any really substantial dollar economies are to be achieved. This prospective and almost literal belt-tightening, and the accompanying loss of imported amenities such as tobacco, would obviously be the more bearable if the consumer could count upon substantially larger and more diversified supplies of goods—necessarily, mainly home-produced—in the non-food range. From this point of view, a better flow even of relatively inessential goods would be psychologically valuable. Experience shows that the frustration of consumers who have resigned themselves to major and well-understood shortages often reaches breaking-point when lesser goods prove to be equally unobtainable.

What prospect is there that consumers may find consolation in directions such as these? In the major groups, unfortunately, the omens at present are not propitious. For twelve months or so after the end of hostilities, public grumbles about all-round shortages were countered by an explanation and a promise. The physical switch-over in industry, the public was told, necessarily took at least some months; and after civil production began, further months were needed to fill up the empty pipe-lines of distribution from factory to consumer. Hence the promise that in 1947, when these time-lags had been largely overtaken, what had been a slow trickle of supplies in 1945-46 would become a fast-flowing stream. By the autumn of 1946 there were some signs that this year might not fall too far short of the promise. But the rising hopes of more and better supplies in the shops were rudely shattered by the fuel crisis in February and March.

The extent and severity of the effects of the crisis upon supplies of some, at least, of the major consumer goods can now be measured statistically. Table I shows the trend of production of various items during the third and fourth quarters of 1946 and the first quarter of 1947. In this table, the monthly average output by volume has been expressed as an index in terms of the similar output in the third quarter of 1946 (which is taken as 100), with comparable figures of average monthly production in the latest pre-war period for which statistics are available. This basis of comparison has the advantage that it

not only indicates the effects of the fuel crisis and the extent of the deficiencies—by contrast with pre-war—in supplies for the home market, but also affords some measure of what may be expected this year. The third quarter of 1946 covered the second half of last year's summer coal allocation period, and since industry's coal allocation this summer is to be about the same as last year's, that quarter's figures may perhaps be regarded as an immediate target for those consumer goods industries (such as textiles) which are largely dependent on coal. Moreover, for most of the items selected, the third quarter included the summer's highest monthly output.

As the table shows, in all cases but two, production for the home market was rising during the last three months of 1946, and in many cases the upward trend was continued in January. In February and early March, it slumped heavily. The biggest recessions occurred in those knitting mills and pottery works which are heavily dependent upon coal—and in furniture manufacture, where the shortage of imported timber was becoming an increasing hindrance to output. As was to be expected, the decline in the quarter's figures proved to be least marked in works mainly dependent upon electric power, where the interruption of operations was not so protracted as to endanger seriously the supply of components and materials.

Initially, a fairly rapid recovery from the low levels of February and early March was perhaps to be expected. The isolated indications so far available point to a speedy recovery in supplies from power-driven factories and a more gradual recovery from those which are coal-driven. But even in this last group, some spectacular progress has been achieved. Woven cotton goods, the average weekly production of which had dropped by one-third in February, had by March recovered to within 4 per cent of their January level of 29.6 million linear yards.

But even a rapid recovery cannot guarantee that the loss of output during the crisis will be quickly made good; and the loss has been severe. Production of footwear for the home market fell from 10.4 million pairs in January to 4.5 million in February. Production of perambulators for sale in Britain was reduced from 59,500 to 34,600 units during the same period; and that of utility furniture from 3.9 to 2.4 million units. Experience differed widely from firm to firm, but the loss of production in February alone was in many cases as high as 50 or 60 per cent. Given the scarcities which existed in the leading categories even before the crisis, necessitating retention of the various systems of dockets, units, coupons and priority lists of purchasers, the implications of such losses are evident.

that blocking is not a simple and ready-made device which could be applied uniformly or with equal effectiveness to all cases.

* * *

Bank Deposits and the Deficit

Public interest—even City interest—in the movements of bank deposits has subsided since last year's phase of unprecedented expansion came to an end. But in fact their behaviour in recent months has been no less intriguing and equally difficult to explain. Mr Dalton, lamely trying three months ago to defend his cheaper money offensive against the charge that it created a bigger volume of money, declared that bank deposits would follow "a different course" when the improvement in the budgetary position made itself felt. In this argument, of course, two quite distinct influences upon the volume of money were hopelessly confused—the effects, on the one hand, of the lower interest rates in leading the public to prefer to hold cash rather than securities and, on the other hand, of the decline in the Government's need to borrow for current purposes. Ostensibly, however, the second part of Mr Dalton's argument does seem to have been justified by subsequent banking developments. Bank deposits since the beginning of this financial year have indeed followed a different course from that of 1946. In April "net" deposits (excluding items in course of collection) rose by £27 million—a modest movement by last year's standards—and last month fell by £22 million, one of the very few non-seasonal declines since the war-time expansion began. Obviously, this decline reflects the changing shape of the Budget, but the curious feature is that the image is so very small.

In the first two months of the financial year (taking figures to May 24th, as the date most nearly corresponding to the latest banking statistics), the Exchequer's ordinary ("above-line") Budget showed a nominal surplus of no less than £210 million. Below-line expenditure in this period was roughly covered by net receipts from national savings (including Post Office deposits). At the same time, no less than £171 million was provided by drafts on the North American credits. Apparently, the Treasury had some £380 million available for redemption of internally-held debt. A large part of this sum, however, quite plainly represented the mere book entries upon which the Chancellor relies for his budgeted surplus. Of the "ordinary" revenue in this period, £127 million came from miscellaneous receipts (fruits of the "clawing-back") and £26 million from surplus stores, a credit which must be presumed to derive from sales in the previous financial year rather than from current trading. Excluding these nominal items, the ordinary surplus would be only £56 million—though even this net figure represents a much larger improvement upon 1946-47 than is generally realised: in the comparable period of last year there was a deficit of £140 million.

* * *

Accumulating Dollars ?

After these adjustments, the Exchequer still had apparently some £225 million available for redemption of domestic debt; yet "net" bank deposits fell in the two months by a mere £5,000,000. It is true that the buoyancy of bank deposits was partly due to the additional finance provided for the public: bank advances rose by £68 million (the rise of £35.7 million in May was indeed the biggest monthly movement ever recorded) and investment portfolios by nearly £15 million. If these public demands had not arisen (presuming the public to have been the seller of the investments which the banks acquired), net bank deposits would have fallen by about £80 million. Further, it is perhaps reasonable to suppose that in any case not all of the drafts on the dollar credits would have yielded effective domestic finance for the Exchequer during the period in question: the £50 million drawn in dollars at the end of the period could not have been immediately spent, and no real finance accrues to the Exchequer until importers pay to it sterling for the dollars they need. If the whole of this £50 million is excluded, the effective surplus receipts by the Government are further reduced, from £225 million to £175 million; but even this smaller figure presents a wide disparity when set beside the £80 million notional fall in bank deposits, which, if all factors had been allowed for in the calculation, would represent the true repayment by the Government of indebtedness to the banks.

The puzzle which these figures present is in principle precisely the same as that which caused so much discussion last year. Bank deposits then were rising much faster than could be justified

by the known needs of the Exchequer; now, on the same basis of analysis, they are falling much too slowly. The explanation is hardly likely to be the same. At the different level now ruling in the gilt-edged market, public demands for liquidity are surely not leading the authorities to give new cash in return for securities, even though they have been buyers of the bonds which become optionally redeemable next spring. In this phase of complex negotiations with overseas sterling creditors there may perhaps be many feasible explanations. Is it possible, however, that the reserve of dollars and gold is still rising and that the borrowings from North America are accordingly providing much less effective sterling finance than the rate of drawings upon the credits might suggest? There would certainly be wisdom in a policy of borrowing now more dollars than are immediately required, for accelerated drawings after July 15th might give rise to misunderstandings about sterling's position, and to stage a deceleration then would be good tactics. A further draft of £50 million, at the now customary interval of three weeks, was announced this week, bringing the total demands on the US credit up to £487½ million (52 per cent of the original total). Meanwhile, as some corroboration of the form of this analysis (though not necessarily of its speculative conclusion), it may be noted that the whole of the decline in floating debt, which Mr Dalton cites with such pride, has occurred in what used to be called the "internally-held" debt—"tap" Treasury bills and ways and means advances.

The Vital Forty Days

The next six weeks are crucial for British industry, or at least for the achievement of the vital targets for 1947. That was the burden of the thesis which Mr Morrison developed at the latest of the "economic survey" press conferences this week. June and the early weeks of July bridge the period between recovery from the first effects of the fuel crisis and the summer holiday period when some loss of output is inevitable. While sudden and possibly short-lived bursts of energy will not suffice to meet Britain's production problem, a special effort is evidently needed in these six weeks, particularly from the miners. Mr Morrison's survey of past progress has received a "good" press: it was certainly more encouraging than earlier surveys in the now regular fortnightly series. There is no doubt that in many directions the recovery from the fuel crisis has been more rapid than the more pessimistic observers had expected, and the statistics which measure this recovery were those which Mr Morrison had under review. Most of them appear in the *Monthly Digest of Statistics*, issued this week. For example, passenger car production had recovered to 24,230 units in April, compared with 25,005 in January and only 9,921 in February. Commercial vehicle output, at 12,320 cars in April, compared with 13,159 in January and 5,792 in February. In the same month brick production was back to 92 per cent of the January level; cement to 109 per cent.

These results are gratifying, but they are certainly not cause for complacency. The loss of about a million tons of coal in the week ended May 31st, owing to the Whitsuntide holiday, has been a real disappointment; it is bound to aggravate the steel shortage which already threatens to reverse the marked upward trend of motor-car output. Even in building materials, April production was still below the best months of 1946. Coal and steel—in that order—are the key components for this summer's industrial drive, and it is becoming increasingly apparent that the hope of reaching the year's target of 200 million tons of coal must rest upon increasing recruitment to the coal industry. Mr Morrison's allusion to the probability that the target labour force for 1947 of 730,000 miners promises to be reached ahead of schedule is encouraging, but the real issue is how soon more trained surface and face-workers can be got to the pit-heads. Recruits are only potential man-power.

Upon the size of the response to the appeal for an all-out production drive in the next few months will depend the extent of sacrifices that will have to be imposed by cuts in imports. On this question Mr Morrison was no more specific than were the Ministers recently at Margate. But the logic of events will force these issues into the open before the next six weeks are passed.

Brazilian Sterling Convertibility

The brief communiqué issued rather belatedly last week-end about the recent discussions with Brazil makes it plain that no

comprehensive agreement has yet been reached. The only positive decisions it records were, indeed, already known. It is confirmed that the earlier action of the Bank of Brazil in suspending quotations for sterling and in refusing to accept sterling in current payments arose "from a question of interpretation which has now been satisfactorily resolved." This presumably means that Brazil was uncertain whether newly acquired sterling would become convertible, and the resolution of this doubt now takes the form of an agreement by Britain to make all sterling accruing from current transactions freely expendable for such transactions in any currency area in the world. The Brazilians, for their part, have agreed to accept sterling when offered in payment from third countries as well as from within the sterling area.

It is evident that, despite Mr Dalton's démarche at the recent meeting of the Brazilian Chamber of Commerce, there has been no agreement on scaling-down. The whole question of the Brazilian accumulated balances, indeed, seems still to be in abeyance, despite the official statement that "satisfactory progress was made towards a general settlement" and the suggestion that a formal agreement will "shortly" be concluded. In this case, there is in fact no reason why the postponement of this more difficult problem should cause any embarrassment to either party. On the one hand, Brazil is not facing any shortage of currently accruing sterling, while on the other hand Britain for the present is not being required to concede a right to a percentage release from the old balances.

Meanwhile, the Exchange Control has issued the appropriate formal notice to the banks, setting up, as from June 2nd, the new category of Brazilian transferable accounts, which will be operated on the same principles as apply to the existing transferable accounts. The facilities afforded by such accounts are available only to countries the Exchange Control or monetary authorities of which are willing and able to exercise proper supervision of operations upon them. Accounts in the name of residents in Brazil which are not designated as "transferable"—including Brazilian "special" and "sterling area" accounts, and "old" sterling accounts—are now known simply as "Brazilian transferable accounts." The balances on these accounts are available for payments to residents in the sterling area, including payments for exports to Brazil, and for transfer to Brazilian transferable accounts as well as other Brazilian accounts. It is at this point that the supervision by the Brazilian authorities becomes important, for the responsibility is apparently placed upon them of ensuring that sterling transferred to the "transferable account" category does not represent accumulated balances to which the right of expendability does not apply.

A Middle East Oil Deal

The announcement that the Shell group is to purchase substantial and increasing amounts of Kuwait crude oil from the Gulf Exploration Company of Pittsburgh, which owns a half-interest in the Kuwait Oil Company, operating on the Persian Gulf, is a reminder of the complexity of oil diplomacy and economics and of the effects of shortages of sterling area tankers. Kuwait is the only one of the major producing fields in the heart of the Middle East oil belt which lies outside the area of the "red line" agreement between the participants in the Iraq Petroleum Company. The output of the Kuwait Oil Company is now at the rate of 100,000 barrels per day, and should rise by 1948 by some 60 per

cent; it produces a fairly heavy crude oil at costs well below the world price. Shell will presumably purchase the crude oil for dollars, and after processing it, possibly in the Middle East, will resell to Europe and elsewhere in the sterling area for a variety of currencies. The processing gives an appreciable added value to the products, so that the substitution of purchases of Middle East crude oil at relatively low cost for those of crude oil, petrol and refined oils from the higher cost Caribbean area, opens up a prospect of worth while economies in dollar expenditure. The actual dollar expenditure on Kuwait oil may be directly balanced by sales of a proportion of the finished products to hard currency areas. But nice calculations of dollar savings by British companies must also pay regard to the need to keep dollar expenditure on tanker hire—tankers are a major bottleneck—to a minimum; and as the voyage from the Middle East to Britain is roughly twice as long as that from the Caribbean, Middle East imports can prove costly.

The Foreign Relations Committee of the US Senate, concerned to prevent the development of an international cartel, is likely to review the whole range of Anglo-American oil company agreements in Iran, Kuwait, and Arabia, in the course of the hearings which started this week. The picture is complete enough on the economic side, but political and strategic considerations will also obtrude when decisions about refinery location are taken. The relationship of tanker hauls from wells to markets may be dominated by the distribution of the large refineries which are likely to be economic units in future.

Retirement Benefits and Tax Evasion

Amid the pre-occupation with the contentious Distributed Profits and Bonus issues taxes, the tortuous and anomalous clauses in the Finance Bill on retirement benefits for directors or employees have escaped the detailed scrutiny they deserve—partly, no doubt, because the authorities themselves seem to have been at pains to keep them away from the limelight. The relevant Budget resolution was not even mentioned in the Budget speech, and when details were sought in the Budget debate, the Financial Secretary pleaded that a "security silence" was needed to protect measures aimed at tax evasion. At the Report stage on the Budget resolutions, the Solicitor-General was a little more forthcoming, instancing two forms of lump sum payments which, he said, ought to be taxable. To those familiar with the technicalities, however, these explanations simply opened up a vista of drafting difficulties, and led Mr Callaghan, for example, to promise a critical scrutiny when the Finance Bill appeared. It is to be hoped that the technicalities of the ill-constructed Clauses 14 to 18 which have resulted will not prevent this promised scrutiny in the Debate on the Bill next week.

The anomalies, indeed, are quite extraordinary. These Clauses involve in some cases unmistakable "double" taxation; they impose anticipatory taxes in respect of pensions and other benefits which the director or employee may never live to enjoy, but on which he will be duly taxed if he does; they may involve, too, extra-territorial taxation, and in other cases retro-active taxation; only in Clause 17(5) is this last possibility plainly excluded. These five Clauses, in fact, embrace many matters which it would be grotesque to describe as "evasion." Clause 14 covers cases where a body corporate secures—ordinarily by insurance—"retirement or other benefits" for a director or employee. Unless

get the best results he proposed, in the first few cases, to publish in advance a summary of the Order in Council establishing each council.

This procedure should meet the substance of the critics' case that the councils may overlap or interfere with existing trade organisations unless their terms of reference are carefully scrutinised. But the successful operation of the whole plan for development councils for industry depends above all upon the spirit of co-operation they can foster between industry, the Government and the development council itself rather than upon formal legislation. Without such co-operation they will be at best redundant and at worst a source of friction in the drive for increased industrial efficiency.

Colliery Liquidation Proposals

The first company to make proposals for the distribution of its assets as a result of coal nationalisation is Bairds and Dal-mellington, Scottish coalmasters. Their case is relatively simple, for virtually all the fixed assets have passed to the Coal Board, while the company has only one class of capital, namely, £1,750,000 in ordinary units of £1, of which £1,631,234 are issued. The board believes that not less than four years from January last may elapse before the final compensation figure is fixed and paid over. Although advised that liquidation will finally be necessary, it considered that it will be better for it to remain in office for the time being rather than to hand over to a liquidator; but it is seeking powers forthwith to realise securities sufficient to make a return of capital of 15s. per unit of ordinary stock. At the end of last year gross liquid assets—securities and cash—amounted to £1,956,509, while net current assets totalled £1,871,000 odd, or about 22s. 9d. per ordinary stock unit. This takes no account of the fact that quoted investments were undervalued. It is, of course, quite impossible to say what the compensation payment will be, but the market price of the stock units after the announcement was 65s. 6d.

In this case, it will be seen, the process of unwinding is very straightforward, and may serve as a model for other companies similarly placed. Unfortunately for their shareholders, most concerns will not have so high a proportion of liquid assets—Baird's amount to some 35 per cent of the market price of the shares—and most shareholders will have to wait for any substantial return. The fact that they may have to wait four years for the final distribution may lead many to consider realising their

In addition to the short "Statistical Summary" which appears weekly in *The Economist*, a full service of statistical and factual information appears weekly in

Records and Statistics

Supplement to *The Economist*

Records and Statistics is a separate, self-contained weekly publication of from 16 to 24 pages. It includes not only many statistical tables but also factual records of public affairs, including Parliamentary activities and digests of state papers, and industrial and commercial reports from home and overseas. It is believed to be the most comprehensive statistical and factual report appearing weekly anywhere in the world.

The *Records and Statistics* Supplement to *The Economist* is available by postal subscription only. The subscription, which may be sent direct to this office or through a newsagent, is 30s. per annum. For those who are already direct postal subscribers to *The Economist*, the economy of posting both publications together makes it possible to quote a combined subscription of £4. Subscribers to *The Economist* who wish to receive *Records and Statistics* should notify this office as soon as possible, but are asked *not* to send any money until an account is rendered. It is regretted that it is no longer possible to supply back numbers of *Records and Statistics* or to date subscriptions back.

Paper shortage also makes it impossible to supply sample copies. For a limited time, however, subscribers to *Records and Statistics* will be allowed, if they wish, to cancel any unexpired portion of a subscription.

THE ECONOMIST, BRETTENHAM HOUSE, LANCASTER PLACE, LONDON, W.C.2

holdings when market conditions in alternative securities seem propitious. But in many cases the whole of the fixed assets will not have been transferred, and the decision whether to liquidate the companies will have to be faced. In the event of final liquidation the sale of fixed assets not transferred will be a delicate and may be a protracted business. It is to be noted that even in Baird's case the board believes that it should remain in control until the many problems which it expects to arise from the Nationalisation Act have been dealt with. One would like to hear more on this particular point.

Rhodesian Mines Colour Bar

Discussions between the Northern Rhodesian Government, the mineowners and the mineworkers have recently been taking place on the subject of promotion in the copper mines of African labour to positions and grades of work at present reserved for white labour under the agreements, renewed this spring, between the Chamber of Mines and the Mineworkers' Union. Mr Dalglish was independent chairman at the discussions and was assisted by a director of Imperial Chemical Industries and by a nominee of the TUC possessing mining knowledge. Mr Dalglish served on the Forster Commission of 1940, which recommended tripartite discussion. The latest discussions appear to have reached no satisfactory conclusion, and the British members are reported to be returning home.

This result is not unexpected. The representatives of organised white labour feel that they cannot, without real risk to their authority, surrender their strong position. The Chamber of Mines, on a long-term view, may favour progressive tendencies; developments in the neighbouring Belgian Congo mine have shown that fuller use of native labour can reduce production costs, for white labour is highly paid. On the short view, however, the owners' concern is to have no labour troubles to hamper production. It would cause no surprise if, in these circumstances, a Royal Commission was suggested to investigate the whole question—a procedure which would inevitably have the effect of delaying a decision. Since March an experienced trades union labour officer has been exploring the possibility of organising native labour in Northern Rhodesia, but unless there is a change of attitude of mind in the country, neither organisation nor long-term educational schemes will ensure employment of Africans on jobs equal to their capacities.

The position has been complicated by the purchase of Rhodesia Railways by the Southern Rhodesia Government. The colour bar operates on the railways, which serve the copper mines and are one of the other large employers of labour in Northern Rhodesia. The Premier of Southern Rhodesia has accepted a formula for labour relations on the railway which will provide for determination of conditions of service and of qualification for promotion of workers, in consultation with representatives of white and coloured labour. But until the Government can set an example to other employers on the colour question, progress is likely to be extremely slow.

North American Grain Prospects

The world's wheat position is always a source of interest, but at the present time, with a food shortage in most countries, it is watched with considerable anxiety. In Britain alone the continuance of bread rationing depends on the coming harvest, and hopes have been raised by American rumours of bumper crops. The position at the moment is a little clearer, and it is expected that production of wheat and other grains will be higher than last year, or even larger than in pre-war years.

The estimated production of winter wheat in the United States during the current year is given as 973,000 bushels compared with 874,000 bushels in 1946 and 654,000 bushels for 1936-45. Stocks of winter wheat on farms at the beginning of April totalled almost 140 million bushels, which represents 12 per cent of the 1946 crop. This is a considerable improvement on last year's position when stocks almost reached 200 million bushels. The stock position of oats, rye and barley is similar; for the latter two cereals they are in fact the lowest on record.

Reports from Canada state that this year's wheat acreage will be slightly less than in 1946, amounting to 25.1 million acres compared with 25.9 million acres. The main reduction occurs in the Prairie Provinces. The oats acreage is expected to show a

4 per cent decline on the year, but barley sowings have increased. Canada is possibly the most important country from the point of view of world wheat export, and is the main source of British supply. Hence any reduction in acreage must be viewed with apprehension while the world wheat position remains acute. Favourable weather and a good harvest, however, may do much to offset the loss of area sown. Details of the 1947 acreage intentions are given in the table below:—

CANADIAN ACREAGE INTENTIONS 1947.
(Million acres).

	1947	1946	Pre-war 1935-38 Average

Oats.....	12.6	13.2	13.4
Barley.....	7.8	6.7	4.3

Tea Prices and Supplies

Britain's power as a major consumer is at long last beginning to re-assert itself. As noted in *The Economist* of May 10th, the response of the Ceylon tea producers to the Ministry of Food's long-term contract offer was rather disappointing, only some 95 million lb. being tendered against the original figure of 150 million lb., and this came from European estates owing to the re-opening of the Colombo tea auction. Producers thought that higher prices could be obtained by offerings at auction. The Ministry of Food has, quite rightly, refused to take part in these auctions and this policy now appears to be yielding the required results. The Colombo auctions have not been going at all well and over the past months prices have fallen by some 10 per cent. The United Kingdom is, after all, the main tea consumer in the world and its absence must affect demand, although its re-export trade has not yet recovered to its pre-war level. Ceylon evidently thought that the relatively low British stocks would force the Ministry of Food to return to the market at a fairly early stage; but this has not happened.

The important question for United Kingdom supplies is still the extent to which Indian producers will subscribe to the 200 million lb. contract. Perhaps they will profit from Ceylon's experience, and tender the full quantity. It will certainly be to their advantage to do so, particularly if the Ministry in desiring to get the full quota offered, increases its price. British tea stocks are in a fairly precarious position and it may be unwise for the Ministry to force its advantage too far. Its main objective must surely be to secure the full 200 million lb., even if that has to be acquired at a slightly higher cost.

SECURITY PRICES AND YIELDS

A fuller list containing 370 securities appears weekly in the *Records and Statistics* Supplement. Notes on the following company reports also appear in the Supplement: Dunlop Rubber; United Molasses; Fine Spinners and Doublers; Royal Mail Lines.

Copper Consumption—UK and US Contrasts

The copper position in the United Kingdom seems to be less depressing than that of some of the other non-ferrous metals. Consumption of virgin metal reached 28,800 tons in April, or only slightly less than the March figure and appreciably above the monthly average for 1946, which totalled 27,200 tons. The current year's consumption will apparently be about 300,000 to 350,000 tons; for the first four months it has already reached 104,200 tons, in spite of the effects of the fuel crisis last February. The copper content of copper and alloy scrap totalled 16,100 tons last month, which also shows a reduction on the previous month's figure of 16,900 tons, but it is still well above last year's average of 14,000 tons. There was no significant change among the main users except perhaps an increase in the consumption of copper sulphate to meet the seasonal demand from agriculture.

Shipments of refined copper from brass mills, wire mills and other copper and brass producers in the United States totalled 121,400 tons in April, which was 3,400 tons above the March figure. A warning signal, however, was shown by the fairly significant drop in the new business booked by these copper mills; this amounted to only 83,300 tons in April compared with 131,600 tons last month, and is, incidentally, the smallest figure since February, 1946, when the total was as low as 63,300 tons. This prospective decline in copper consumption is stated to be due to a growing resistance by copper users to the current high prices. The domestic price is still 21 cents a lb., while imported ore has now fallen below its previous level of 24 cents.

There have been reports that the Ministry of Supply is making enquiries for a substantial amount of copper (certain quarters have mentioned the figure of 60,000 tons) from Latin America. Even if Northern Rhodesia's output, which has been fairly well maintained this year, reaches its 1942 record level of over 250,000 tons, there would still be a gap of some 75,000 tons to be covered. There are indications that the world copper price may fall from its present high level, but if these reports of British action are well-founded, it will certainly bring support to the market. A report from Chile states that copper costs are now approaching the 10 cents a lb. level (equivalent to about £55½ a ton); in one instance this figure has been exceeded. In these circumstances, if costs remain fairly rigid, a fall in the copper price will probably have a significant reaction on world output.

Shorter Note

Stocks of tin held by the Ministry of Supply at the end of April amounted to 7,000 tons, with a further 3,300 tons reported as held by consumers. The respective figures for the end of March were 9,200 tons and 3,900 tons. Deliveries to consumers during the month totalled 2,100 tons, and 300 tons were exported. Stocks of tin ore (tin content) at the end of April were 5,900 tons, compared with 6,000 tons at end-March.

(a) Interim. (b) Final. (c) Whole year. (d) Int. paid half-yearly. (e) Also a capital bonus of 2½ per cent. free of income tax; yield worked on 15 per cent. basis. † Free of tax.

PHOENIX ASSURANCE COMPANY, LIMITED

FINANCIAL STRENGTH MAINTAINED

MR R. Y. SKETCH ON THE YEAR'S PROGRESS

The Ordinary General Meeting of the Phoenix Assurance Company, Limited, was held on the 4th instant, at Phoenix House, King William Street, London, E.C.

The following is a summary of the statement by Mr R. Y. Sketch, F.C.I.I., the chairman, which was circulated with the report and accounts.

Our business throughout 1946 has been marked by exceptional increases in premium income, accompanied in most accounts by heavy outgo for claims. The premium increases have been so pronounced that by the time we have set aside reserves on our usual scale for future liabilities there is but little immediate benefit shown for the company. We can be confident, however, that as the development of our premium income regains normality, the beneficial effects of our procedure will become apparent.

FIRE ACCOUNT

In the fire account the outstanding point is an increase in premiums from £4,238,000 to £5,283,000. Claims rose in total by over £360,000, which, on the larger income, represented a loss ratio lower by 3.3 per cent. This relief, however, is more than offset by the effect of the increase in the reserve for unexpired risks over that of the previous year amounting to 4.1 per cent. The transfer to profit and loss of £86,000 represents only 1.6 per cent.

So far as our home business is concerned the underwriting results were good.

In the United States, as was the common experience, we showed a very rapid rise both in premium income and losses due to the increase in prices and labour costs. Our operations in that country in 1946 resulted in an underwriting loss, but we believe that when conditions become more normal, satisfactory profits will again be produced.

ACCIDENT DEPARTMENT

In the accident department premiums rose by no less than £1,600,000. Various reasons, such as the increased cost of motor claims and adverse experiences in burglary and other departments, account for the increase in the amount of claims paid. These have led to a rise in the loss ratio of just over 3 per cent. in spite of the enlarged income. The effect of the increase in premiums is that the reserve for unexpired risks is nearly 5½ per cent. higher than for the previous year, the result being that in this department we suffer a loss of just under 4 per cent.

For some years now we have had very pleasing results from our accident business. Our belief is that this setback is but temporary, and that we can look forward in due time to returning to a more satisfactory showing.

You will perhaps remember that last year I anticipated that our accident business would be running into difficult times, and my present opinion is that 1947 is unlikely to be a beneficial year in this department.

EXPENSES

From time to time I have come across criticisms of what are termed the excessive

expenses of conducting fire and accident business. Such criticism is neither well-founded nor well-informed. The major portion of all expenses consists of salaries, and this is true even of the item shown in the accounts as commission. Taking our fire and accident accounts together, the percentage of commission is 21.97. This relates to business obtained all over the world. Most of it is paid to representatives who shoulder the expense of their own offices, and, therefore, out of that commission have to meet the cost of salaries, rents, rates, and other overhead expenses. The rates of commission fixed by agreement between the company and the agent are governed largely by local conditions, and no company can obtain useful representation at rates of commission below those normally paid in the area in which it is competing. It would not be unreasonable to say that the greater part of the commission cost has to be utilized by the agent for the payment of salaries.

The item of Dominion and foreign taxes, which represents a percentage of 2.72, is obviously something beyond the company's control.

General expenses, which include everything except commission and taxes, constitute a percentage of 16.28, and of this, salaries account for by far the largest proportion. I have no hesitation in saying that the only way in which the cost of conducting the business could be materially lowered would be by drastic reduction of salaries, and anyone with knowledge of staff affairs and the universal increasing cost of living must realize that this is neither practicable nor desirable taking into account the need of a highly trained technical staff.

In considering the question of the relative expenditure of insurance and other businesses I would suggest that the need for insurance protection constitutes our raw material and that the supply and conduct of that protection in all its various forms is the finished product. Furthermore, I contend that the cost of supplying that finished product would bear favourable comparison with the cost of any other industrial or commercial processes.

It is often overlooked that no other business has to set out in its accounts the various items of its expenditure in detail similar to that required in insurance accounts, and it is only the fact of such detailed disclosure which leads to the incorrect assumptions to which I have referred. If in our accounts it were only necessary to show turnover together with the details usually set out in presenting accounts of other forms of business, comment would be directed more to the benefits which accrue to the public and the narrow margin of profit which is obtained by the companies from insurance premiums and losses, than to the cost of conducting our varied and intricate transactions.

PRONOUNCED DEMAND FOR LIFE ASSURANCE

The demand for life assurance has become very pronounced during the last 18 months. The increase in our home new business has carried that figure to above the pre-war level, and the premium income in 1946 increased by £110,000. This, of course, led to a higher commission outgo and an increase in general expenses mainly due to higher salary charges. The interest income has gone up by £55,000. The net rate of interest has been increased from £2 15s. 8d. per cent. to £2 18s. 10d. per cent.

The funds at the end of the year show an increase of £875,000. The mortality experience was light, which is somewhat surprising, as, following the wear and tear of the war years, the opposite might have been anticipated.

MARINE ACCOUNT

This particular account differs from our other revenue accounts inasmuch as it shows a small drop in income.

Out of the funds held on account of previous years, during which we were handling considerably larger marine premiums than are now current, we have been able to transfer to profit and loss account an amount of £575,000, which constitutes a new record for the company.

The funds held for the preceding year, i.e., 1945, show a very satisfactory margin, but do not hold out the promise of so large a transfer to profit and loss account next year.

The total marine funds at the end of the year stand at £2,660,000, being 190 per cent. of the premium revenue for the year.

There are several matters affecting the marine account that are of interest. Once again there has been a serious fire on one of our great liners whilst undergoing reconstruction. Such casualties naturally affect our business, but it is of paramount importance to the nation as a whole that we should not be deprived of these ships that are so valuable to us, not only in their capacity to carry our passengers and goods but in providing a considerable proportion of our invisible exports. In these circumstances more effective precautions should be taken against the risk of fire and, what is more important, the risk of its spreading so rapidly.

Turning to the cargo side of our business, one of the greatest sources of loss at the moment is theft and pilferage. This is something which needs taking seriously by ship-owners, merchants, and all others concerned.

PROFIT AND LOSS ACCOUNT

The interest, dividends, and rents, less income-tax at £363,000, are higher by £10,000 than the corresponding 1945 figure. On account of the adverse experience in accident business the profits transferred from the revenue accounts total £437,000, as against £752,000 the previous year.

During the war years we made special reservations for contingencies in respect of transactions in enemy occupied territories. The amount originally set up was £250,000, and a substantial part of this reserve is in hand. We are not in a position to reach finality, but we can say that much of this reserve will not be required. This year we can safely release £75,000, which is the figure shown in this account.

The directors' recommendation of a dividend at the rate of 13s. has already been made known, and from the figures in the profit and loss account you will see that our interest income and contributions from the life account fully justify this proposal. It has long been recognized as a sound principle that insurance dividends should depend more upon interest earnings than upon underwriting results, and through favourable underwriting years we have adhered to this principle. Now that the interest income, together with contributions from life account, justify an increase in the dividend, it is only reasonable that the shareholders should benefit, even though the underwriting results are somewhat meagre.

The last few years have been profitable underwriting ones, but unfortunately owing to the heavy taxation we have not benefited as we otherwise should. From 1940 to 1945 inclusive, our total profits and interest amounted in round figures, to £6,350,000. British taxation alone called for no less than 65 per cent. of this, namely, £4,160,000. Out of the balance of £2,190,000, dividends to shareholders took 30 per cent., or £1,884,000,

and reserves were strengthened by £306,000, or 5 per cent. of the total.

After we have made the necessary provisions for expenses and pension reserve, the profit and loss balance carried forward at £1,588,000 is slightly below the figure at the end of last year. This balance has been built up during a number of years from undistributed profits, and should be regarded not only as additional protection for our policyholders, who are otherwise amply provided for, but also as a dividend equalization fund.

BALANCE SHEET

Our largest class of investment is shown under the heading of British Government Securities, now totalling approximately £15,500,000, the life funds having substantially increased their holdings during last year.

Should the threatened nationalisation of transport and electricity undertakings be carried through on the bases that have so far been outlined, this would increase our total holdings in Government Securities to the extent of approximately £2,600,000 in the life funds and £423,000 in the general funds. This exchange of holdings in railroad and electricity undertakings for Government Securities would apparently be accompanied by a heavy reduction in our interest earnings. The fall in the life interest would be in the neighbourhood of £33,000, and in the general fund of £5,000; reductions which are deeply deplored, and for which we can find no justification.

For several years past I have informed you that the balance-sheet value of our Stock Exchange securities is substantially below the middle market price, and this position has been well maintained during the past year. The total appreciation in the life fund is now over £3,000,000, and in the general fund over £2,000,000. This is a natural corollary of the influence of the low interest rates, and should there be any alteration in the trend of the latter it would automatically create a drain on this appreciation, but the benefits that would accrue to our policyholders and shareholders by an improvement in the rate of interest should more than offset the consequent depreciation.

An increase of some £278,000 in the cash in hand and on current account will be noted. This and more will be required for dealing with our outstanding debentures. For some time we have had under consideration the reduction of our debenture liability. Now the requisite notice has been given and our liability for £877,517 4 per Cent. Debentures will be extinguished on June 14.

Our accounts show that the balance-sheet value of our assets is now over £50,000,000, an increase during the last 10 years of more than £14,000,000. From what I have already set out you will realize that the present day value of these assets is considerably higher than the figure now mentioned, but in any case the passing of the £50,000,000 mark is an occasion of special importance and once again emphasizes to all concerned the great financial strength of our institution.

I am hopeful that consideration of the accounts for last year will bring you to the conclusion that in difficult times we have succeeded in maintaining the financial strength both disclosed and inherent of this old company which, for 165 years, has extended protection and carried out a valuable function in the world's business affairs to the benefit of all associated with it, either as policyholders or shareholders. This, however, could only have been achieved with the aid of first-class work by the executive and staff and the loyal co-operation of our representatives throughout the world, and to all of these we wish to extend an expression of our gratitude for their valued assistance.

The report was adopted.

VICKERS, LIMITED

EXPANSION OF COMMERCIAL ACTIVITIES

The eightieth annual general meeting of Vickers Limited was held on May 30th, in London.

Sir Archibald Jamieson, the Chairman, in the course of his speech, said: Our main problem in 1946 has continued to be the replacement of our armament work by commercial productions, and if we remember that our own specialised commercial products were few in number we have achieved greater success than might have been anticipated. It is an indication of the extent of this conversion that whereas the works were wholly employed on armament work at the end of the war, analysis of productive wages reveals that for the last month of 1946 the expenditure on commercial work was about 80 per cent. of the total. I must, however, make it plain to our Stockholders once more that in addition to expanding our commercial activities it is our policy to maintain our specialised capacity for the wide range of armaments for which this Company has built up a world-wide reputation, and also to retain the highly qualified staff of specialists necessary for the design of such products. Stockholders will realise that this policy involves them in unremunerative expenditure in maintaining this capacity as a reserve for possible future national demands.

DIFFICULTIES OF TRANSITION

In our efforts to carry through the change-over to commercial work, we have had disappointments and difficulties. Firstly, there was an inadequacy in numbers of certain types of labour. Secondly, we are suffering from an acute shortage of many materials and only recently our steel allocations for shipbuilding and other purposes have been reduced seriously. Thirdly, we have had rising costs, which shake the confidence of our customers and contribute to the feeling of insecurity both at home and in the export markets of the world. Fourthly, there has been unavoidable delay in carrying out our programme of modernisation and re-equipment.

The Shipyards at Barrow and Newcastle, besides being modernised in every possible way, are being modified and re-equipped to allow of the introduction of welding and prefabrication on a large scale, with the appropriate modifications to cranes, etc., to enable large prefabricated sections to be handled in the shops and on the berths. Our Yards at both Barrow and Newcastle are very heavily booked.

In our Engineering Works we have been involved in a considerable amount of rebuilding and restoration, and the rearrangement of plant to deal effectively with the large volume of commercial orders which have been secured.

AIRCRAFT PRODUCTION

The sale and production of the "Viking" proceeded satisfactorily during the year under review. In 1946 we were honoured by an order for four special "Viking" Aircraft to form part of the King's Flight and to accompany His Majesty on his South African Tour. Our technical staff are well advanced with the design of the Civil Transport Aircraft, which should ultimately replace the "Viking," and it is hoped that the prototype will be flown in the early part of 1948. During the summer of 1946, Supermarine flew their first prototype single jet aircraft.

Last year I informed you that the Company was negotiating with the Government for the purchase of an Aircraft Works at South Marston, where it was intended ultimately to concentrate Supermarine activities. Since that date, however, factors have arisen which have compelled your Board to reconsider and revise that intention. The extent of the probable order book makes

the capital outlay which would be involved in the purchase of South Marston and the provision of essential additions, unjustifiable. Negotiations are therefore proceeding for some alternative method to that of outright purchase.

The production of A.I.R.O.H. Houses at Chester and Blackpool Works, which have been rented by us from the Government for this purpose, has continued steadily, and the rate of production is steadily rising.

INTRODUCTION OF THE 5-DAY WEEK

The end of 1946 saw the introduction of the five-day week of 44 hours into our engineering establishments in common with the other engineering firms of the country. This was followed at a later date by the introduction of similar hours into our shipyards. Time alone will show whether the assurances that have been given by the Trades Unions concerned that production will not suffer are going to be fulfilled or not. No planning or political or administrative action can be effective unless total productivity can be increased.

FINANCIAL POLICY

The Profit and Loss Account was drawn up on lines which I may describe colloquially as conservative. It was prepared at a time when the country was emerging from an acute stage of the "fuel crisis" and consequently at a time when we could make a close estimate of the actual cost to Vickers-Armstrongs of the stoppage of work: this estimate was in the neighbourhood of £350,000 and that amount has been appropriated from a reserve not now required and specifically set aside for the purpose of meeting that cost. In addition, there are bound to be consequential delays in completing contracts. This is one of the reasons which prompted us to set aside the sum of £950,000 to cover possible losses on contracts in hand, and I am satisfied that this was a wise and necessary precaution.

The general ban on capitalisation of reserves has now been removed, but applications to adopt such a procedure are to be subject to the consent of the Capital Issues Committee if such an application was approved by the Capital Issues Committee a special stamp duty of 10 per cent. would become payable. The whole subject will be examined once more by the Directors, but so long as this unjust imposition continues it appears unlikely that they would be able to recommend the carrying out of an operation which in itself appears to be equitable as this would involve the payment of a large and unjustifiable impost.

PROGRESS OF SUBSIDIARIES AND ASSOCIATED COMPANIES

During 1946, the whole output of Palmers Hebburn Co., Limited, has been devoted to civil production. The Dry Dock has been fully occupied and is booked well ahead, as also are the ship-repairing facilities. The Constructional Steel Department continues to have a full order book. The closure of certain departments of the English Steel Corporation, Limited, foreshadowed last year has been effected and during the year the Company's production was, with the exception of a few armour plates to complete old contracts and some experimental work, wholly of a commercial nature. The change in type of work has entailed expenditure of large sums on new machine tools, including some of the largest lathes and borers ever made. Firth-Vickers Stainless Steels, Ltd., has a full order book for 1947. An extension scheme, costing more than £1,000,000 has been approved.

The work of Cooke, Troughton and Simms, Limited, is now almost entirely concentrated in the main factory, and the Works are fully occupied on the manufac-

ture of surveying instruments and microscopes with sufficient orders on hand for a long period. Following conversion of its resources from 90 per cent. armament production throughout the war period, manufacture of rolling stock was resumed by the Metropolitan-Cammell Carriage and Wagon Co., Limited, on an increasing scale during the past year. Ioco, Limited has achieved a reasonable increase in turnover, although it has proved difficult to secure adequate supplies of materials such as cloth, paper, drying oils, fillers and certain chemicals. In the Rubber Section of the business, natural rubber is now in use. Robert Bobby, Limited, have experienced an extremely active demand both at home and abroad for their particular products. The activity of the Malting Industry has been very pronounced and by research in this country and detailed investigation of both Continental and American methods, Bobby's are in a position to offer the most advanced and up-to-date installations. Bobby's have extended their interests in the Film Studio supply sphere.

EXPLORATION OF OVERSEAS MARKETS

Your Executive Directors have been active in visiting the Dominions. I myself have recently returned from a two months visit to Australia and New Zealand, and during this short time, thanks to the courtesy of the Broken Hill Proprietary Company, and my friends in New Zealand, I was able to see and understand many of their activities. Sir Robert Micklem has visited Canada, and Sir Ronald Weeks and Major Kilner have been to South Africa. The object of these visits is to renew old contacts and friendships which had to be neglected during those long years of war, and to investigate new developments and conditions in these great and progressive countries; and to ascertain whether as time goes on we can make some useful contributions to their further development.

I referred last year to the fact that we had bought a substantial interest in the capital of Powers Accounting Machines, Ltd., and we have every reason to be satisfied with this investment. During 1946 we acquired a shareholding in Associated Electrical Industries and Sir Ronald Weeks has joined the Board of that Company. The investment renews an old association which we believe will be of practical value to both parties. Reference has already been made to the purchase of Keenok Co., Ltd., and to the satisfactory progress made by British Clearing Machine Company, Ltd. A majority shareholding has been acquired in Cockatoo Docks and Engineering Co., Pty., Ltd. (Australia) it gives us an outpost in one of the most important Dominions to which our technical skill can be directed if required. Vickers-Armstrongs have recently acquired the whole share capital of G. J. Worssam and Son, Ltd., manufacturers of complete bottling equipments, crown corking machines and allied productions for the brewing and other industries. As our subsidiary, Robert Bobby, Ltd., specialises in the design and supply of maltings, including those for the brewing and distilling industries, we are now in a position to meet the plant requirements of those industries to a greater extent than heretofore.

If we are given adequate raw materials and reasonable supplies of our other requirements, we have at our disposal the necessary skill and craftsmanship in our Management and Workpeople, and the necessary cash to make a very solid contribution to the export markets and the essential requirements of the home market, but at the present time there is every indication that supplies will be inadequate for our requirements. However, the conservative policy that has been followed for many years has placed your Company in a position where the Stockholders can look forward to the 1947 Report with reasonable confidence.

The Report was adopted.

STEWARTS AND LLOYDS, LIMITED

STRONG POSITION: HEAVY DEMAND

The fifty-seventh ordinary general meeting of Stewarts and Lloyds, Limited, was held on the 29th ultimo in the Merchants' Hall, 30, George Square, Glasgow, Mr A. G. Stewart (the chairman), presiding.

The Chairman, in the course of his speech, said: Your directors, in reaching their decision with regard to the dividend, could not be unmindful of events which occurred subsequent to 31st December, 1946. Taking all factors into account, it is considered that it is in the best interests of the Deferred stockholders to maintain the rate of 12½ per cent. for the tenth consecutive year.

You will have seen that the accounts disclose a strong position. I think it timely, however, to emphasise again that the strength of our position is not derived from one or two years of satisfactory trading, but is due essentially to the financial policy which your company has followed right from its inception. Profits have been ploughed back into the business consistently, in order to provide adequate cover for obsolescence, and to ensure that at no time was there any financial hindrance to technical development and modernisation of plant.

TRADING IN 1946

Nineteen hundred and forty-six was a year of continuous heavy demand for all classes of tubes, pipes and fittings, both in the home and export markets, and the total tonnage of tubes now on order amounts to over 400,000 tons—a record in the history of the company. Notwithstanding the pressure of demand, it can be said that, broadly speaking, we have been able to meet the essential requirements of this country.

The export demand was greatly in excess of our ability to supply. Deliveries to export markets exceeded the 1938 tonnage by 24 per cent. The biggest single factor was the export of tubes for the oil industries, which amounted to 128,000 tons for this class of work alone, and we have orders in hand which will absorb our production capacity for those particular products up to the end of 1948. Other classes of tubes exported amounted to approximately 100,000 tons for the year. In the latter part of 1946 exports were restricted in conformity with the Government's policy for the iron and steel industry as a whole, in order to satisfy home demand and the reconversion of the consumer industries gathered momentum.

During 1947 further substantial reductions in exports have been ordered. The permitted export of tubes during the second quarter of 1947 is reduced by 40 per cent. as compared with the last quarter of 1946. Notwithstanding the volume of export demand and the fact that foreign competition since the war has been of negligible proportions, it has been our policy to maintain export prices in general at the home level except in the case of certain special categories of tubes supplied to non-Empire markets. This policy is designed to secure a continuing goodwill against the time when overseas competition has to be met, and there is evidence that it will stand us in good stead in the future.

Last year I referred in some detail to the company's interests in South Africa and Australia, and I am pleased to tell you that both these companies have made a remarkable turnover to peace-time production, and that their production for 1946 was most satisfactory, and contributed in no small measure to the speedy rehabilitation of these countries.

COAL

The supplies of coal are, of course, causing great anxiety. In the early part of this year our production was affected to the extent of fully 25 per cent. The industry has now been allocated a quota of fuel on the basis of the tonnage consumed in the summer of 1946, but if we must also build up three weeks' stock for the winter months out of this tonnage, as appears to be the case, we shall not be able to regain our normal rate of output unless there is a considerable improvement in the coal position. We had expected to increase our rate of output during this year, but I must emphasise that coal is the determining factor.

Quite apart from the quantity of fuel, the question of quality is also involved. We consumed during the year the equivalent of approximately 3,000,000 tons in the form of coke or coal itself. The quality of the coke and the coking slacks which we are now receiving shows a continuing deterioration, with a consequent increase in actual consumption of these fuels, and increase in costs. Unless this can be rectified, or, at least, the deterioration arrested, the effect on the costs of steel production must be serious.

WORKS EXTENSION PLANS

Our policy of continuous modernisation and improvement is again getting into its stride after the hiatus of the war years, and to-day, apart from any schemes for expanding capacity, over £2,000,000 is in process of being spent on improving the efficiency of our existing capacity. In addition, good progress has been made on what may be described as our 1944 extension plan, which was reported to you at the annual general meeting in 1945. It has, however, become evident that still further extensions will be necessary if we are to meet the demand for our tubular products, particularly in the export markets. A further plan—which we call the 1946 plan—was, therefore, evolved to meet the new conditions. It was decided to include in this plan provision for the production of some 400,000 tons of billers as a contribution to the national shortage of semi-finished steel.

The major extensions are scheduled to take place at Corby and in Scotland, and the overall effect will be to double our pre-war tube capacity and more than double our pre-war steel capacity.

You will be aware that a notice was published in the press in March of this year giving a brief outline of our proposals. I had hoped to be able to give you further particulars at this meeting, but our negotiations are not yet sufficiently advanced to enable me to do so. I can say, however, that our proposals have been welcomed by the Iron and Steel Board and that the difficulties of immediate and practical development are largely due to the general shortages with which we are faced in this country to-day.

Basically, we plan to develop the Corby site to its full extent. Our examination of the post-war economics of steel manufacture has convinced us that at Corby we have one of the finest locations for iron and steel production in the country and that the full development of this valuable asset would be bound to increase the economic strength of our company.

A plan of this magnitude involving heavy capital expenditure is bound to take some years to complete, particularly under present conditions of national shortages. Consequently, although the ultimate cost will be great, the rate of expenditure will be spread over a number of years. In view of this, and having regard to our existing resources, it was our intention to finance the scheme by short-term borrowing, leaving the permanent financing to some later date, when part of the scheme would be in operation.

The report and accounts were adopted.

ATLAS ASSURANCE COMPANY, LIMITED

INCREASED BUSINESS IN ALL DEPARTMENTS

DIVIDEND RAISED

The annual general court of proprietors of the Atlas Assurance Company Limited was held, on the 30th ultimo at the Head Office, 92, Cheapside, London, E.C.

Mr G. F. Horblack (the chairman), who presided, in the course of his speech said:

FIRE ACCOUNT

In the fire department our premium income, at £2,914,102, exceeds that of the year 1945 by some £480,000, and, although most parts of the world in which we operate have made their contribution to this increase, it is the United States which is mainly responsible. Losses, by fire, were heavier than in the previous year by approximately £129,000, and this increase is to be associated entirely with our overseas business, the United States figuring somewhat prominently.

I am glad to say, however, that our losses in the United Kingdom were lower than in 1945, although it has to be remembered that, in that year, home fire losses reached an unusually high level—the highest, in fact, for about a quarter of a century.

Having regard to the upward surge in the volume of our United States business—well controlled and managed though it is—and to the heavier loss experience which, incidentally, has shown no sign of abating in the opening months of the present year, your directors have deemed it a matter of prudence to set up an additional reserve amounting to £50,000. After creating this special reserve and after providing for the addition to the customary 40 per cent. reserve necessitated by the growth in premium income, the underwriting profit emerging is £187,948, or 6.45 per cent., by comparison with £154,740, or 6.36 per cent., in 1945.

ACCIDENT ACCOUNT

Our accident department premium income amounted to £900,015, against £728,353 in 1945, an increase of roughly £172,000. As was to be expected, motor insurance business—both at home and overseas—has made the greatest single contribution to the increase in income, but it has also added, disproportionately, I am sorry to say, to our claims.

The underwriting profit, at £42,851, or 4.76 per cent., is less favourable than that of 1945, when it was £68,692, or 9.43 per cent., but, bearing in mind that here again the expansion in premium income has necessitated an addition to reserve, I do not think that we need be dissatisfied.

MARINE OPERATIONS

Our marine premium income in 1946 was £379,288 by comparison with £372,784 in 1945, and that, after charging claims and other outgoings, including United Kingdom taxation, the amount transferred to profit and loss account is £25,000.

CAPITAL REDEMPTION ACCOUNT

As regards our capital redemption business, it will be seen that, notwithstanding the payment of claims by maturity totalling £116,760, the capital redemption fund increased by nearly £430,000 during the year, due largely to the receipt of over £500,000 as consideration for annuities—certain issued under our capital protection annuity scheme.

LIFE DEPARTMENT

In the life department the year 1946 was a year of increased activity. New sums

assured, after deducting reassurances, amounted to £3,864,437, as compared with £2,291,346 in 1945. The total consideration for ordinary immediate annuities granted was £145,282, against £221,870 in 1945, but this reduction was due largely to the popularity of the company's capital protection annuity scheme which in many cases is more attractive than an ordinary immediate annuity. The premium income, excluding single premiums for deferred annuities, amounted to £1,271,034, as compared with £1,228,430 in 1945.

Claims by death amounted to £300,538 and were substantially below the amount expected. Claims by maturity, totalling £607,930 reflect the large endowment assurance business completed in past years. Payments on surrender, at £311,863, show a marked increase and this is substantially due to the effect of staff rearrangements relating to one very large staff pension scheme.

The life assurance and annuity fund increased by £394,663 during the year and amounted, at 31st December last, to £18,930,209. The net rate of interest earned on the fund during 1946 was £3 7s. 8d. per cent., against £3 6s. 7d. per cent. in 1945.

A valuation of the liabilities under life assurance and annuity contracts was made as at 31st December last on the same bases as those employed a year earlier. The total surplus, including £231,162 brought forward, was £500,387. Of this amount £292,341 was distributed to policyholders in the form of a reversionary bonus for the three years 1944 to 1946 at the rate of 21s. per cent. per annum calculated on the sum assured and existing bonuses; £23,061 was used to pay interim bonuses and to meet the cost of bonuses on reassurances received from other companies and £115,000 has been applied to the further strengthening of reserves. The sum of £37,818 was contributed by the life department to the shareholders' funds and a balance of £32,167 has been carried forward.

PROFIT AND LOSS ACCOUNT

I will now turn to the profit and loss account.

You will, I am sure, have noted that your directors have declared a dividend at the rate of 11s. 3d. per share, as against the 10s. 6d. per share which has prevailed since 1939.

To refer briefly to other items in the account, you will note that interest earnings amount to £113,125 and that on the credit and debit sides of the account, there are the items relating, respectively, to the transfers from pensions reserves and transfers to the pension funds to which I referred in some detail when I had the pleasure of addressing you last year.

After taking credit for our underwriting earnings, providing for taxation and including the carry-forward of £491,987 from 1945, the balance remaining amounts to £684,182. The dividend at 11s. 3d. per share, 4s. 6d. of which was paid in November last, absorbs the sum of £136,125, leaving us with a carry-forward of £548,057.

FURTHER DEVELOPMENT

When I had the pleasure of addressing you on an occasion similar to this in 1945 I told you, in commenting on our activities in the year which had gone before, that we had commenced working again in Belgium, France, Greece, and Holland. Since then, in re-establishing other operations interrupted by the war, we have gone further afield and have also, in certain directions abroad, broken fresh ground—ground which, in due time, should yield its harvest.

The report and accounts were adopted.

UNION INSURANCE SOCIETY OF CANTON, LIMITED

ALL ROUND EXPANSION

The annual meeting of Union Insurance Society of Canton, Limited, was held on the 20th May, in Sydney, Sir F. H. Tout, the chairman, presiding.

The following are extracts from the directors' report:—

The directors submit to shareholders the report, accounts and balance sheet of the society for the year 1946, including therein the transaction of its affiliated companies, the British Traders' Insurance Co., Limited, the China Fire Insurance Co., Limited, the North China Insurance Co., Limited, and the Yangtze Insurance Association, Limited.

DEPARTMENTAL FIGURES

Marine—The net premiums for the year amounted to £1,448,688. After providing £100,000 for taxation and transferring £200,000 to profit and loss account, the marine fund stands at £1,730,186.

Fire—The net premiums for the year amounted to £1,223,761. £69,478 has been transferred to profit and loss account. The fire fund stands at £607,504.

Accident and General—The net premiums for the year amounted to £354,885. £15,456 has been transferred to profit and loss account. The accident and general fund stands at £198,454.

Dividends—The directors recommend the distribution of dividends totalling £1 7s. 6d. per share out of the society's income for the year ended December 31, 1946.

The amount at credit of the profit and loss account at the beginning of the year was £257,850, to which have been added interest and dividends £169,642 (which includes £15,148 in respect of previous years) and transfers from underwriting accounts £284,934. After providing for the dividends, and charging taxation and other outgoings, there remains a balance of £301,939 to be carried forward.

Assets and Liabilities in Reoccupied Territories—In cases where it has been possible to establish values, assets recovered have been taken into account in the balance sheet as at December 31, 1946. Your directors are of opinion that outstanding liabilities in enemy territories, are fully covered by reserves already set up to meet them.

Reserves—Following the revaluation of the above-mentioned assets, transfers have been made from exchange and investment fluctuation account of £190,000 to general reserve and of £300,000 to reinsurance fund.

RANCHES REOPENED

The following are extracts from the Chairman's Circulated Statement—Branch offices of the society, which have been reopened at Hong Kong, Singapore, and Manila, are now in full operation and making a valuable contribution to our business. Old connections have been re-established and many new ones made. In China, where branch offices have also been reopened, operations are being conducted, but under great difficulty, owing to the generally chaotic conditions which prevail. Your directors have decided that the head and registered offices shall be re-transferred to Hong Kong as soon as possible following the ordinary yearly meeting.

The revenue accounts indicate an expansion of business in all departments, with satisfactory trading results. The consolidated balance sheet shows the result of the re-inclusion of assets recovered in reoccupied territories, for which it has been possible to establish values. Advantage has been taken of the position thus disclosed to strengthen the general reserve and reinsurance accounts. The consolidated assets now approximate £8,000,000 sterling.

The report was adopted.

CROSSES AND HEATONS, LIMITED, BOLTON

SATISFACTORY RESULTS—INCREASED PROFITS

MR JOSEPH R. HEATON'S REVIEW

The twenty-seventh annual ordinary general meeting of Crosses and Heatons, Limited, Bolton, was held at the Albert Hall, Manchester, on the 29th ultimo.

Mr. Joseph R. Heaton, the chairman and managing director, in the course of his address, said:—

YEAR'S PROFIT

It gives me much satisfaction that despite all the difficulties those of us who are engaged in industry are experiencing, I am able to report a profit for the year, before making provision for depreciation of £220,121, as against £120,106 for last year. To this sum is added £72,372 which represents the profit on taking over the assets less liabilities of our two branches, Heskeths and Widdows, making a total of £292,493. The interim dividends paid on December 1st last of 6 per cent. per annum, less income tax on the redeemable cumulative preference stock and 5 per cent (actual) less income tax on the ordinary stock together absorbed £47,241. After allocating £55,000 to depreciation, £100,000 to general reserve, £75,000 to plant and machinery renewals and conversion reserve and bringing in the carry forward from last account of £183,987, there is an available balance of £199,239. From this balance your directors recommend for your approval the payment of a half-year's dividend to March 28th last of 6 per cent. per annum less income tax on the 6 per cent. redeemable cumulative preference stock absorbing £22,290 and a final dividend at the rate of 5 per cent., making 10 per cent. for the year, plus a bonus of 5 per cent. both less income tax on the ordinary stock absorbing £50,538 and appropriating in accordance with the Articles of Association of the company, the sum of £16,732 for redemption of preference stock. The balance to be carried forward to next year's accounts will be £109,679 against £183,987 brought in.

BALANCE SHEET ITEMS

Turning to the balance sheet, the book value of our fixed assets has increased by £175,643. Apart from additions (less sales) of £64,496 this is accounted for by the complete absorption of our subsidiaries T. M. Hesketh and Sons and W. and C. Widdows as branches of the company. Depreciation has been increased to £55,000 as against £45,000 for last year. In addition thereto the fixed assets have been included in the accounts of this Company at book values, against which the liquidator set aside £6,666 for depreciation in November last. The total depreciation is in effect, therefore, £61,666 and the Hesketh and Widdows plant, buildings and machinery have been taken in by us at the very conservative valuation of 14s. 4d. per male equivalent spindle.

The book value of investments at £46,026 as against £200,826 is due to the liquidation of the aforementioned subsidiaries, and by the acquisition of the Whitworth Doubling Company, Limited, Rochdale, with whom as announced in the Press, negotiations were successfully concluded on December 28th last. The consideration was the exchange of £21,000 of our ordinary stock for the whole of the Whitworth share capital. Whilst we have experienced much difficulty in obtaining a coal allocation, I am pleased to say that a portion of the mill is now in production, and we are looking forward to its fulfilling within a short period of time, the service that was intended by its absorption.

Stock-in-trade, debtors and Cash under the heading of current assets total £1,167,720 and shows an increase of £190,798 compared with last year. The value of stocks has increased by £260,391, which is principally due to the inclusion of the stocks of the subsidiaries

that I have previously referred to, and substantial increases in the price of raw cotton.

PLANT AND MACHINERY RENEWALS AND CONVERSION RESERVE

In turning to the liabilities side of the balance sheet, there only appears to be one item—apart from the newly created general reserve of £100,000—I need bring to your attention, and that is the fact that the deferred repairs reserve of £25,000 has been transferred to a plant and machinery renewals and conversion reserve, which we have increased to £100,000. Your directors considered that as the excess of £72,372 on the liquidation of Heskeths and Widdows was not a recurring profit, it was decided to plough this back into the business by increasing this reserve by £75,000.

Until the new Finance Act is published I am not in a position to say how the profits tax involving the additions for distributed dividends which comes into effect from January 1st last affects the company, but any liability is amply covered by the amount carried forward.

All our mills and plant have been fully maintained in efficient condition by the expenditure of £79,613 upon repairs and renewals as against £56,999, in addition to which £64,496 has been expended on capital account. In this connection I am sure that it will interest stockholders to know that since the incorporation of the company, aggregate sums amounting to £1,867,061 have been expended on our present mills by way of repairs, renewals and additions to plant and machinery. A point to note is that our fixed assets appear in the balance sheet at only £1,674,349. This figure bears no relation whatever to present day costs as is exemplified by the fact that for insurance purposes our buildings, plant, machinery and equipment are valued on a replacement basis at £12,500,000.

EFFECT OF COAL SHORTAGE

The improvement in production during the year is less than we anticipated owing to the coal shortage, and the reduction of the working week from 48 hours to 45 hours which has resulted in a reduced average output of approximately 6 per cent. The shortage of coal has been partially surmounted by the use of substitute fuel, but only at exorbitant prices. I estimate the excess cost for the year under review at upwards of £10,000 and loss of production caused by the enforced electricity cuts and fuel shortage at a further £10,000. The quality of coal has seriously deteriorated and the cost and wastage of manpower in dealing with substitute fuel is enormous, and adequate supplies are fraught with much uncertainty. In addition to the high price of fuel, costs of production have steadily increased by advances in wages, raw cotton, consumable stores, insurance premiums on enhanced replacement values, and other innumerable items. If we are to compete successfully abroad these costs can only be offset by higher productivity. In this connection, we are making comparisons in the detailed productions of our mills and we have given, and are prepared to give, every assistance to Board of Trade representatives in research or surveys, with regard to production per man hour, costings or other matters that are designed to further efficiency.

EXPORTS

As regards exports, the Government continues to prohibit our activities, but we are hopeful that some relaxation of control will be made in the very near future. Meanwhile, extensive arrangements have been formulated overseas through the liaison of our subsidiary, The Heaton Sales Company, Limited, and

immediately exports are possible, we are fully equipped to recommence our pre-war Continental trade. Of course, owing to the ravages of war all our former markets are not open to us, but we are tentatively off-setting these by negotiation in other directions.

In consequence of the closing of the Liverpool spot and futures market by the Government we have opened our own cotton buying office in Liverpool, and we are now purchasing direct from the Cotton Control all our various types and qualities of cotton.

PROBLEM OF LABOUR AND FUEL

The immediate future of your company would, in my opinion, be excellent, were it not for the shortage of labour and fuel. We are still very short of female operatives, particularly in our preparatory and ring spinning departments. However, having regard to all the innumerable problems and difficulties that confront us, I feel sure that you will consider the results very satisfactory indeed, and you may rest assured that we will continue to do our best to safeguard your interests.

As you are no doubt aware your directors' fees at present are £150 each per annum less tax. I feel sure that you will readily agree that these are inadequate having regard to the responsibility attached to the position, especially in a company so large as this. It is therefore, my intention later in this meeting to propose that the directors' fees be increased to £300 each per annum less tax. I am confident that you will approve this proposed increase as being more compatible with the importance of the office.

Once again, on behalf of your directors, I desire to express their appreciation of our managers, foremen and other officials and the vast majority of workpeople.

The report of the directors and statement of accounts for the year were adopted, and the retiring directors and the auditors were re-elected.

EQUITABLE LIFE ASSURANCE SOCIETY

RECORD NEW BUSINESS

The one hundred and eighty-fifth annual general meeting of the Equitable Life Assurance Society was held in London on the 28th ultimo.

Mr. Desmond Abel Smith, the President, said that the Society's funds now stood at over £17,000,000, having increased by over £5,000,000 in the past ten years. In the same period the premium revenue had increased from £750,000 to £1,350,000. Now that the support to Government loans was not so pressing as it had been during the war, over £2,000,000 derived from the realisation of British Government securities and the increase in the funds in 1946 had been invested mainly in prior charges of industrial and commercial companies.

The new business of £3,900,000 was a record exceeding by £670,000 that of 1942 when the previous highest total was reached. The figures for both years were substantially affected by new business from a large pension and insurance scheme. It seemed reasonable to expect that for some time pre-war totals would be exceeded. There was today a real appreciation of the value of life assurance. Their whole life and endowment assurance rates of premium in the major profits class were practically identical with those charged before the war, though it might be that the time is coming when they would have to make some increases in the rates.

In 1946 the average sum paid per £1,000 assured in respect of claims under whole life major profits policies was £2,210. Each year for over 150 years more than £2,000 had been paid on the average in respect of each £1,000 of original assurance.

The report was adopted.

THE DAILY MIRROR NEWSPAPERS LIMITED

NOTABLE SALES PROGRESS

Mr. H. GUY BARTHOLOMEW'S STATEMENT

The twenty-seventh annual general meeting of The Daily Mirror Newspapers, Limited, will be held at the Memorial Hall, Farringdon-street, London, E.C., on the 11th instant.

The following is the statement by the chairman, Mr. H. Guy Bartholomew, which has been circulated with the report and accounts.

It is a pleasure to present a report and accounts showing that the affairs of your company have again prospered. We have had the benefit of the reduction in the rate of Excess Profits Tax, which for the ten months of our financial year to 31st December, 1946, was 60 per cent. I need hardly remind you that E.P.T. has, during the long period of its operation, been very burdensome to your company. In December last an interim dividend of 10 per cent. was paid, and a final payment of 20 per cent. is now recommended, making 30 per cent. for the year, against a total of 15 per cent. the previous year. Very careful consideration was given to the question of recommending payment of the increased dividend. During the war years the company became liable to pay large sums by way of Excess Profits Tax. In consequence the Ordinary stockholders suffered, as it was inevitable that dividends then should be very modest, but there is no reason now why they should not receive an appropriate distribution.

SALES FIGURES

It has been a notable year. Since September last newspapers have been allowed to print sufficient copies to fully meet the needs of their readers. In past statements I have expressed the thought that there was a large unfulfilled demand for the Daily Mirror. During the period of unrestricted sales we have added to our previous figures well over a million copies, and I have pleasure in telling you that at this time the daily average net sale of the Daily Mirror is more than 3,600,000 copies.

I do not wish you to run away with the idea that this result has just happened. Much hard work has been done, and we are indebted to a first-class band of journalists, artists and photographers engaged on the editorial side of our business and to the many capable people in the various departments needed to produce a modern newspaper, for the achievement. The job does not end with production. The papers have to be distributed. The department responsible for this is under very capable direction.

Then, in turn, the thousands of wholesale and retail agents and shopkeepers throughout the country do their part in seeing that our millions of readers are supplied with the Daily Mirror each weekday with unfailing regularity.

Recalling the exceptionally adverse weather conditions prevailing for a long period in the early part of this year, it will be appreciated that a magnificent job was accomplished by everyone concerned at that time with the transport and distribution of the Daily Mirror.

At the end of March we made a modest, and perhaps I may say an overdue, increase in our advertisement rates. We continue to enjoy remarkable support from advertisers, and have every reason to believe they are highly satisfied with the results from their

expenditure. Future space bookings for advertisements in the Daily Mirror are extremely gratifying.

In these times, in spite of their limited number of pages, national daily newspapers sold at a penny give wonderful value for the money.

BALANCE SHEET ITEMS

Our balance-sheet this year shows a considerable number of changes. I would like to recall that at the end of February we disposed of our holdings of shares in Associated Newspapers, Ltd., and The Daily Mail and General Trust, Ltd. These investments were made many years ago, and, for reasons which were thought to be politic, opportunity was taken of disposing of them. Negotiations with this end in view were carried on in friendly fashion over a considerable period. As a result we became possessed of a sum of money which has enabled us to clear the balance of the bank loan arranged when we planned to pay off the outstanding Five per cent. debenture stock, which in our last balance-sheet stood at £1,788,664.

It will be noticed that we have a considerable sum in the bank, and our holding of Tax Reserve Certificates stands at £500,000.

By the operation I have just mentioned although we may suffer some reduction of investment income, we are relieved from the burden of debenture or other interest.

The net surplus which arose from investments sold during the year has been deducted from the value of the unquoted shares in subsidiary companies, which now stand in the balance-sheet at £2,001,972. It is perhaps worth while to call your attention to the quoted investments, which at 28th February, 1947, stood in our books at £618,697 and had on that day a market value of £2,552,561.

Notwithstanding the sales to which reference has been made, we still retain very large investments, notably in Sunday Pictorial Newspapers (1920), Ltd., which is a very profitable and valuable holding. You will notice on the balance-sheet a new reserve, excess profits tax post-war refund £238,636, arising from the repayment made to us for the period from April, 1940, to February 1945.

PROPOSED NEW BUILDING

With the money we have purchased a very prominent freehold site in Holborn near our present printing offices, where we hope to erect a building in every way suitable for the future needs of our growing business. It is intended to equip this building with machinery of the latest design so that work of the highest class can be turned out. This programme of development and expansion will call for a very large expenditure over a number of years.

We are advised by our accountants that a refund of a further sum of around £45,000 will be due to us in respect of the 100 per cent. excess profits tax period March-December, 1945.

I am convinced you will approve the allocation of £20,000 made as a provision for pensions. As I make it my duty to say farewell to them when they leave I know from experience how comforting it is for our people who have many years of faithful service behind them, to be able to look forward to retirement with the knowledge that a provision towards their financial needs has been made.

You will be interested to know that at this time pensions are being paid to eighty-five of our people who have retired from service with the company.

BOARD CHANGES

Consequent upon the changes mentioned earlier in my statement Mr. W. A. McWhirter and Mr. A. S. Fuller resigned from the Board.

Both these gentlemen served on the Board of your company for many years, and in your name I thank them for their loyal service. On the other hand, Mr. James Cooke has been appointed a director. We have had association with him for a long time and with the knowledge that his business experience will be of much value to the company, very heartily commend him to you when we deal with the formal business of the meeting for confirmation of his appointment.

SUNDAY PICTORIAL NEWSPAPERS (1920) LIMITED

INCREASED DIVIDEND

Mr. H. GUY BARTHOLOMEW'S STATEMENT

The twenty-seventh annual general meeting of Sunday Pictorial Newspapers (1920), Ltd., will be held at the Memorial Hall, Farringdon-street, London, E.C., on 11th instant, 1947.

The following is the statement by the Chairman, Mr. H. GUY BARTHOLOMEW, which has been circulated with the report and accounts: Our accounts again show an improved position. The financial year which ended on the 28th February, yielded a net profit of £218,174 against £158,916 the year before.

Dividends received (which form an important item in our income) and trading profit were both better than the previous year.

Last December an interim dividend of 10 per cent. was paid, and the final dividend of 20 per cent. now proposed, making a total distribution on the ordinary capital of 30 per cent., is 7½ per cent. more than a year ago.

Your directors gave very careful consideration to the question of recommending payment of the increased dividend and came to the conclusion it would be fully justified. The carry-forward, which is undistributed profit, after allowing for the amount of the increased dividend will stand at £171,707, against £148,783 the previous year.

The amount of £49,744 received by way of excess profits tax post-war refund for the period April, 1940, to February, 1945 is shown in our accounts as a reserve with a corresponding entry on the assets side of the balance sheet showing that the whole amount has been invested in 1964-67 Savings Bonds. There will from the same source be a final sum of around £15,000 due to us in respect of the ten months to December, 1945, when the 100 per cent. excess profits tax impost ceased.

SALES ACHIEVEMENT

When I made my last statement to you the sale of the Sunday Pictorial was 2,600,000 copies each week. Since then we have been in receipt of sufficient paper to allow us to print all the copies needed to meet the orders of our customers, and it is a pleasure to record that the net sale is now over 3,800,000 copies every Sunday, an increase in a year approaching 50 per cent. This is a very fine achievement, and every praise can be given to the whole of our staff for such an excellent result.

The very large increase in our weekly sale fully justified the moderate adjustment in our advertisement rates which took effect on the last Sunday in March. The Sunday Pictorial is one of the cheapest advertising mediums and very popular with the many firms of national repute who regard it with great favour and use its columns regularly for their announcements. Our future advertisement bookings are extremely satisfactory. Each week we are unable to find

space to accommodate a great number of advertisements for which we have orders, in spite of the fact that each advertisement we insert in the paper is strictly limited as to size. The early outlook for sufficient newsprint being available to print larger newspapers is not promising.

CHANGES IN HOLDINGS

As notified in the press at the end of February, when the transaction took place, we disposed of our shares in Associated Newspapers, Limited, and the Daily Mail and General Trust, Limited. At the same time we acquired a large holding of stock in the Daily Mirror Newspapers, Limited, to add to the interest in that company which we already held. These changes, we have no doubt, will be of considerable benefit to your company.

The net surplus arising from the shares sold during the year has been deducted from the value of the unquoted investments which now stand in the balance-sheet at £489,718. Our quoted investments standing at £1,995,906 had, on 28th February, a market value of £2,694,833.

You will I am sure approve the appropriation of £10,000 shown in our profit and loss account as a provision for pensions. We are not unmindful of the duty to provide towards the financial needs of our employees of long service when they reach the age of retirement.

Another item on the profit and loss account calling for notice is the sum of £25,000 provided for future taxation. The provision for this purpose amounts now to £125,000.

We have started our new financial year quite well and, although the uncertainty of the times through which we are passing produces many problems, you may rely on your directors and staff to face up to difficulties and do their utmost to overcome them.

LONDON ELECTRIC WIRE COMPANY AND SMITHS, LIMITED

RECORD ORDER BOOK

The thirty-eighth annual general meeting of The London Electric Wire Company and Smiths, Limited, was held on the 21st ultimo in London.

Mr W. J. Terry (Chairman and Managing Director), in the course of his speech, said: The profit for the year of £158,752 is £70,692 more than in the previous year, due to a marked improvement in output and return from investments.

Home sales were increased in value and volume during 1946 over the previous year, but the output was far below the demands and could have been greatly increased by the relaxation of controls and adequate supplies of material and labour. Our Order Book is the largest on record and although there may be a certain amount of over-ordering there is still a firm undertone. There was an increase in our export sales during 1946.

The question which looms so large in current events is "Nationalisation." Now that the mines are State-owned it is entirely the responsibility of the Government to ensure the production of ample supplies of coal at reasonable prices. Notwithstanding that the many problems of the management of coal mines have yet to be solved, the Government is persisting in the nationalisation of other industries—for example, electricity supply, transport and many others to come. Surely it would have been wise first of all to prove the policy of nationalisation by making a success of the coal industry, which affects the whole population, before embarking upon further adventures. It is the opinion of your board that Private Enterprise is still the best policy for this country.

The report was unanimously adopted.

JOHN SUMMERS AND SONS, LIMITED

RECORD DELIVERIES OF STEEL

MR R. F. SUMMERS ON THE OUTLOOK

The annual general meeting of John Summers and Sons, Limited, was held on the 30th ultimo in London.

Mr Richard F. Summers, the chairman, in the course of his speech said: I think you will agree that the net profit of £580,551 shows a satisfactory increase over the previous year. It is very satisfactory to know that the increased results for 1946 are due to improved production figures, and a general increase in efficiency all round. The new cold reversing mill mentioned in the directors' report was only in operation for the last quarter of the year, but sufficiently long to indicate that it will be a valuable and remunerative addition to our plant.

The production of steel ingots at Shotton was increased by some 63,000 tons over the previous year, and was the highest figure reached since we changed over to making the special quality steels which the continuous rolling process demands. I am also glad to be able to tell you that records were broken in all the rolling mills, and that the delivery figures for sheets and light plates from the Shotton works was the highest ever recorded. That these eminently satisfactory results were achieved in spite of the number of difficulties which existed, reflects very great credit on the combined efforts of the management, staff and workpeople.

A good deal has been said in recent times about the need for increasing production and exports, both vitally important if the standard of living in this country is to be maintained, let alone improved, and from what I have just said I am sure you will agree that this company has not been backward in this direction. I am confident that if the steel trade were to receive the necessary supplies of coal and other vital raw materials it would set a fine example in increasing production and efficiency, and make a valuable contribution to the exports of the country. Unfortunately, as things are at the moment we are only allowed an insignificant tonnage for the export market. So far as this company is concerned this figure only amounts to 2 per cent. of our present production, whereas before the war we were exporting approximately 30 per cent. of our output. We have many friends abroad, and look forward to the time when once again we shall be able to supply British steel for their requirements.

RELATIONSHIP BETWEEN CAPITAL MANAGEMENT AND LABOUR

There appears to be a tendency to-day to forget that industry really consists of a combined operation of the principal forces involved—namely, capital, management and labour—each of which plays a vital part in its own specific sphere. Your directors have always been conscious of the exacting demands which necessarily fall upon management at all levels, and they are equally conscious that these responsibilities have been steadily increasing with modern developments. Under the difficulties and complications which exist to-day the successful functions of management call for the highest qualities of ingenuity and tact in dealing with human nature, in addition to the accepted principles of technical and organising ability. You will, I feel sure, be glad to know that the relationship between the management and the operatives in our various works continues as

in the past to be on a very excellent basis. Not only do we try to ensure that our managers and foremen are in possession of the greatest amount of information as to our policy and the difficulties with which we are confronted, but we do all we can to extend this principle to the operatives themselves. We believe that this policy is essential if we are to obtain the best results, and it is certainly our intention to continue this practice and to develop it from time to time in any way which we think will add to the general efficiency of our various plants.

SALES

While, as I have just said, our deliveries reached a record figure, this does not, I am afraid, mean that we were able to fulfil all the demands that were put upon us. It is well known that the demand for steel of all types is greater than the supply, but I think I can say without fear of contradiction that the methods adopted by our sales organisation ensured that what we had available was fairly distributed, and that promises made for quantities and delivery dates were in very large measure adhered to. The result of this policy was that our customers knew where they stood, and we are satisfied that our methods have been appreciated, and have contributed in no small measure to the high reputation which this company and its products enjoy.

Another very satisfactory feature of last year's operations is that the increased production has been accompanied by a further improvement in the quality of our products. This is no mean achievement considering the uncertainty of the supplies of raw materials which we received.

FUEL CRISIS

I should now like to touch upon the crisis which arose in February, due to the inadequate stocks of coal at the power stations. Both the Shotton and Shelton steelworks came within the shut down area, but owing to the fact that both works have substantial electrical generating capacity of their own, we were able to some extent to minimise the full effect of this catastrophe. So far as Shelton is concerned, they generate all their electrical energy themselves, and they therefore felt practically no effect from the cuts, although they were hampered to some extent by the severe weather conditions.

At Shotton, owing to the very large consumption of electricity by the continuous mills, the power we generate is only sufficient for about one-half of our requirements, so it was not possible during the shut down for all the mills to work simultaneously; we also had to close down some of the steel melting furnaces on account of the shortage of fuel.

POSSIBLE EFFECTS

It is extremely disappointing after the results which were achieved last year that we should have been faced with this crisis, and with restricted fuel supplies since then. The industry as a whole is in very good shape, and was confidently looking forward to a record production for 1947. Unfortunately, the restrictions which have prevailed since February will make this impossible of achievement, but it is to be hoped that the recent announcement that we are to receive the same quantity of fuel as last summer, at the same time setting aside three weeks' stock for the winter, may bring some improvement in the position. We must not, however, overlook the fact that the Government do admit that they are taking a risk as far as next winter is concerned.

You may well be wondering what effect all this will have on our results. It is not easy to forecast this accurately, but I think you will be glad to know that in spite of the restrictions brought about by the power cuts and the shortage of fuel, the results so far for this year compare favourably with those for 1946.

The report was adopted.

MORRIS MOTORS, LIMITED

BIG CONTRIBUTION TO EXPORTS

SIR MILES THOMAS'S SPEECH

The twenty-first annual general meeting of Morris Motors, Limited, was held on the 30th ultimo at the works' clubhouse, Cowley, Oxford.

Sir Miles Thomas, D.F.C., vice-chairman, in moving the adoption of the report and accounts, said:—

I am making this statement on behalf of our chairman, Viscount Nuffield, G.B.E. He is on the high seas, returning from one of his regular visits to overseas and Empire markets. Those journeys are taken to promote the business of your company.

In 1946 the activities of your company took on the pattern of normal pre-war years. It is proposed now to reintroduce our former custom of presenting annually an informative outline of the activities of Morris Motors, Limited.

Perhaps I may be allowed to take your minds back to the ending of hostilities. In that period we had high hopes of picking up swiftly the threads of our pre-war manufacturing activities. Plans had been made for taking over large war-time factories that we had erected or operated during the war. The summer of 1945, however, developed a sombre background of industrial disturbances. Your directors, therefore, deemed it prudent not to embark on any extravagant expansions.

INCREASED DIVIDEND

The recommendation of an increased final dividend—bringing the total to 22 per cent., tax free—is fully justified by the level of manufacturing activities of the various companies. The bonus distribution of 2½ per cent., also tax free, is provided in that particular form, because, by so doing, we are not necessarily setting a precedent or making any implied commitments.

It has always been the policy of Morris Motors, Limited, to plough back into the business considerable sums for development and contingency purposes. The total reserves of the group to-day stand at over eight and two-thirds millions, and you will not fail to note that this year we have allocated further sums amounting to £750,000. These comprise £300,000 for reserves against contingencies: £100,000 against dividend equalisation, and £350,000 against tax on current earnings. We have continued to operate large factories in two development areas—South Wales and on the North-East Coast.

ABSORBING EX-SERVICEMEN

But the success of our trading during 1946 was largely due to the fact that we had no sizeable movements to make in the disposition of our various manufacturing activities. Our factories in Oxford, Coventry and Birmingham welcomed the returning ex-Servicemen and, so far as material supplies permitted, the rhythm of production was resumed smoothly.

We were not concerned to achieve very high output figures right from the beginning of our activities. Our major consideration was the re-establishment of the high quality of our products and a continuation of the enviable reputation that they enjoyed for reliability and high standard of workmanship. This, our Service records and the steady inflow of orders, even for long-dated delivery, show we have been successful in achieving.

WORKERS' WELFARE

Many of the currently much-advertised factory amenities in industry were pioneered in the Nuffield organisation. Among them are holidays with pay, the sharing of surplus by the workpeople, sports club facilities,

medical centres, selection of labour-intake by aptitude, and other features.

I would particularly draw to your attention the fact that no less a sum than £960,000 has been distributed to workers in Nuffield factories since Lord Nuffield donated 1,000,000 Stock units into trust on their behalf. The whole of the dividend on these units is shared among the workers and, in the Nuffield organisation, an incentive system of piece-work payments is employed, giving a bonus for extra effort. It has been our common practice for years.

The wages of our workpeople rose in 1946 to £5,242,802, from £2,824,973 in 1938. The average rate of earning per person is now nearly double the 1938 figure.

EXPORTS

Much emphasis has recently been placed by the Government on the value of export sales. Your directors have needed no inducement in this respect. It has been our policy for the last twenty years and more to promote in every way possible the sale and service of Morris, Wolseley, M.G. and Riley cars and Morris-Commercial trucks to overseas buyers.

It may be justly remarked that the big contribution that we have been able to make to the British exports so sorely needed in this post-war era was possible only because we had already built up well-established sales and service organisations all over the world. We have in operation a well-knit organisation comprising 120 distributors in 89 separate countries—all of whom are well versed in the maintenance of our products and to whom regular visits are paid by our executives and factory representatives overseas. They are supported by several hundreds of authorised dealers. We pay particular attention to the stocks of spare parts that they carry, for we know by practical experience that sales follow service.

570 PER CENT. EXPORT INCREASE

It is noteworthy that the value of our exports for the last six months of 1946 shows an increase of 570 per cent. over the similar period for the year 1938.

Very satisfactory arrangements have been made for the assembly of some of our products in India. Good progress with assembly establishments is also being made in Australia, New Zealand and South Africa, in collaboration with the appropriate distributors in those areas. I have also to report the establishment of export showrooms in the heart of London.

None the less, it would be quite wrong for blind faith to be placed in the continual absorption of the products of the British motor industry on overseas markets, and to allow a disproportionate balance to be struck between export and domestic business.

Immediately after the war, overseas markets were avid for automobiles of almost any kind. Already competition is becoming more acute, and it would be idle to pretend that just because a product is British it has a divine prerogative to command custom overseas. It is only on the basis of value for money that we shall maintain and expand our business.

HEAVY CAR TAXATION

The British motorist has to pay roughly eight times the amount of tax on a car of given size than does his American contemporary. So long as that position continues, the British motorist will ask for a small car. He will also demand a variety of sizes from which to choose, so that his pocket can be

accommodated by the amount of tax involved.

For passenger cars a tax on petrol, plus a small registration fee, is desirable. If a motorist could license a 14 h.p. car for the sum that he is now called upon to pay for an 8 h.p. model, it would provide a great incentive for the production and sale on the British domestic market of the type of medium-sized car that overseas buyers generally desire.

This question of motor taxation is of paramount importance to the well-being of every person in this country. Motor-cars and trucks are a most active, valuable and flexible form of export business, in return for which we can obtain food and other commodities to improve the far-too-low standard of living that is being suffered in this country to-day.

TRIBUTE TO WORKPEOPLE

In this connection I would like to pay tribute to the spirit that has been shown during the rehabilitation period of British industry by the British artisan.

Our organisation has been commendably fortunate, and when the crisis of coal shortage descended on us during the recent winter I marvelled at the patient forbearance of our workpeople and their womenfolk. As soon as they could get into the factories again they set to work with a will to increase output. While operating in conditions of uncomfortably low temperatures, they performed prodigies of good-natured achievement. That is the spirit that will bring Britain through.

But, unquestionably, the output of coal that is achieved by our miners is the key-stone of our national prosperity. Unless we get 220,000,000 tons in a twelvemonth, I cannot see a full-scale return to the degree of industrial prosperity that is necessary to support an unsubsidised programme of full employment.

INSTALLATION OF OIL PLANT

In our own organisation we are naturally exploring every means of fuel saving. At the same time, I would urge that production of coal is a far more profitable Governmental quest than the propagation of more restrictions on usage by industrial and domestic consumers. Where it is practicable and economic, we are installing oil-firing equipment for heat generation. It is part of our accepted policy to maintain our plant and equipment at the highest possible pitch of efficiency in all respects. The amount sanctioned in this connection during 1946 was £1,944,473, and a further expenditure of £378,845 has already been authorised during the current year.

NEW MODELS

The effect of much technical progress and development work that we have carried out will be reflected in the introduction of new models, incorporating fresh and advanced features, when the time for their proclamation becomes appropriate. We are well satisfied, however, that the need of the public to-day is for reliable, comfortable and economical motoring, and we are not going to sacrifice substance by prematurely changing designs.

In connection with the car models produced by the organisation, it will not have escaped your notice that the programmes of the Morris, Wolseley, M.G. and Riley companies are mutually supporting but non-conflicting. We fully realise the benefits that accrue from bulk production of basic components. Equally, we are alive to the fact that the sellers' market will not last for ever, and the individual desires of discriminating purchasers have to be met. We believe in a rationalised range of products, basically designed to provide economies in production, but with extensive sales coverage. At present we have over 250,000 orders outstanding.

I believe that we still have some difficult and, indeed, hazardous times to face. So long as the material supply position is as fugitive as it is at the moment, any engineering organisation that relies upon the system of flow production in its factories is subject continuously to potential hold-ups because of the non-supply of some part or another.

We are fully conscious that our suppliers are doing their best, but there has been in post-war Britain an unfortunate atmosphere created by the turgid political situation. I believe that all parties have, as their common objective, the betterment of conditions for the majority of the people of the country. But their methods of approach to the objective vary and give rise to controversy.

So long as these controversies exist—and often they reach an almost childish degree of bitterness—the situation is most distasteful to those of us who have the responsibility of industrial organisation on our shoulders. I would be very happy to see the country enjoy a holiday from partisan oratory. Its major effect, my experience tells, is to create an inclement climate for industry in which everyone has a real or imaginary excuse for not delivering a full measure of effort. And without that full-blooded effort, this country will not recover its standard of living or its place in the markets of the world.

I am glad to be able to report that the rate of output from our factories to-day is wholly satisfactory. The recovery made since the winter crisis has been most encouraging and, although orders are still coming in faster than we are delivering cars, in terms of units the volume of production is within measurable distance of pre-war activities. The financial turnover is, of course, very greatly increased.

The manufacturing capacity of the factories in the organisation—even with their present labour force—is more than adequate to cope with the available supply of material. Particularly does the steel situation cause concern. It is a reflex of coal output. Our suppliers of steel are doing their utmost to deal with the present situation and expand to their production facilities. They deserve full encouragement from the Government and freedom from hampering interference.

FUTURE DEVELOPMENTS

Amongst other civil developments that we have in progress are Diesel-engined trucks, a light aero engine and a full range of marine engines. It was a matter of great regret to us that, owing to lack of material supplies, we were forced to suspend our agricultural tractor manufacturing programme. The prototype machines have already undergone thousands of hours of field testing and are still being put to excellent use by farmers.

In this connection, I do urge the Government to pay more practical attention to the business of the country and to subordinate their political ideologies to the urgent necessity for promoting the commercial well-being of the nation.

I would also like to take this opportunity of paying tribute to the helpful relationships that we enjoy with the Minister of Supply and his executive. Particularly, too, would I ask our suppliers of materials and our distributors and dealers to accept warm thanks for their support and co-operation. I assure them of the continuation of our successful endeavour to consolidate and expand our already substantial business.

And, finally, we cannot allow this occasion to pass without expressing grateful appreciation to our many thousands of workpeople for their individual efforts on the company's behalf. Guided by the sound judgment of our board of directors, and together with the whole-hearted support and co-operative endeavour of our executive and staff, they are responsible for the healthy state of our business that it has been my pleasure to report to you to-day.

The report was adopted.

LONDON BRICK COMPANY, LIMITED

IMPROVED POSITION

SIR MALCOLM STEWART ON THE OUTLOOK

The forty-seventh ordinary general meeting of the London Brick Company, Ltd., was held on the 30th ultimo, in London, Sir P. Malcolm Stewart, Bt., O.B.E., Hon. L.L.D., D.L., chairman and one of the managing directors, presiding.

The Chairman, in the course of his speech, said:—

The profit on trading and income from various sources is up by £171,781 at £291,108 and this year does not include any dividend from the subsidiary company. As has been stated in the report of the directors, again no provision for depreciation has been provided. The directors do not recommend the payment of any further dividend in respect of the year ended December 31st, 1946.

The outstanding and satisfactory feature of the profit and loss account for last year is the fact that adequate profits have been earned from trading to permit our paying to our stockholders a dividend of 12½ per cent. gross, which is 2½ per cent. more than that declared in the previous year, when to pay 10 per cent. we had to transfer £40,000 from contingencies account.

THE STAGE OF CONVALESCENCE

Stockholders can congratulate themselves that their business has entered the stage of convalescence, although full recovery has yet to be achieved. The story of last year's struggle is one of persistent effort in the face of dire difficulties, largely the aftermath of a prolonged world war; many of these difficulties were of a character which no industrial organisation, however powerful, could overcome. Nevertheless, we succeeded in more than attaining the forecast of production aimed at when I last addressed you.

We hoped, I stated, to produce a full day's shift output by the end of June. This was achieved and we had the gratification of at last getting out of the red and according a margin of profit as production increased.

It was further stated by me that our ultimate objective was to get full day and night shifts running before the end of the year, but I doubted if this could be attained. Thanks, however, to the determined efforts of our works managers, of our production and engineering staff and to the co-operation of our employees we commenced running night shifts by the end of September, when the output was brought up to some 66 per cent. of capacity.

NATIONAL SHORTAGE OF BRICKS

For these results the greatest credit is due to our management and employees who, despite all difficulties, have brought us along so well in the race to restore our efficiency. However, it is the last lap that offers the worst obstacles to be overcome and such is the scarcity of suitable labour, materials and stores for replacements and renewals that it is clear we shall have to be favoured with better circumstances than those prevailing to-day if we are, before the end of the year, to get our production up to close on that of our full productive capacity. This is essential to meet the national shortage of bricks.

Let there be no misunderstanding. It is nothing less than full production, based on efficiency, which can once again not only fully restore the fortunes of our company but enable us to bear, without undue burden to our cost of production, the highest standard of conditions for our em-

ployees. These are our objectives combined, with a policy of lower prices to the consumer and improved returns to our stockholders. To achieve them production must be pressed up to 100 per cent. of capacity through the regaining of the highest efficiency. Thus, as in pre-war years, can we once again demonstrate that private enterprise can be mindful of and benefit the national interest.

LABOUR PROBLEM

It is no exaggeration to state that conditions in the past year were fraught with utmost difficulties only surpassed by the record inclement weather experienced early this year. Our British labour to-day inclines slowly to decrease. Here I would emphasise that the adverse comments which have been made upon employment conditions in the brick industry generally, do not apply to this company, which has been among the pioneers in this country in such matters as welfare, holidays with pay, sports arrangements and profit sharing and pension schemes.

I need not enlarge upon the difficulties experienced—and still with us—of obtaining new machinery and the materials and skilled labour needed to re-condition our works, some of which have been idle for six years. The major repairs necessary to large numbers of our kilns have required the laying of many millions of bricks in face of a famine in bricklayers.

The possession of our own extensive engineering resources at this time has been a most valuable asset. The strain upon our engineering division has been, and continues to be, heavy. Not only is it having to grapple with the immediate short-term problem of restoring our former productive capacity, but it must also devote itself to the longer range problem of an even higher degree of mechanisation.

CURRENT YEAR'S PROSPECTS

You will expect me to make some forecast as to the trading prospects of the current year. The exceptional difficulties of 1946 were nothing compared with the early grim events of this year, so adverse in their consequence. Frost and snow isolated many works, floods stopped production at our largest claypit at Stewartsby and these phenomenal difficulties were enhanced by shortage of fuel to keep our kilns running. Our only hope of recovery is to be favoured with helpful conditions from now onwards to the end of the year if we are to make good the earlier losses sustained.

If conditions improve and our present production again increases satisfactorily, then our trading results may possibly approximate those secured last year. But it must be borne in mind we are, unfortunately, faced with a grave shortage of labour, due to the repatriation of German prisoners, this at a time when British labour is so scarce. These adverse factors militate against the obtaining of efficiency, as does the delay in procuring plant for maintenance and contemplated extensions.

Please realise I cannot to-day forecast trading profits equal to those earned last year, but I can assure you no effort will be spared to procure them and to restore the fortunes of your company which, thanks to its sound financial structure, has successfully weathered the storms of war and will once again establish its pre-eminent position in peace.

The report was adopted.

THE EVER READY COMPANY (GREAT BRITAIN) LIMITED

DIVIDEND AGAIN 40 PER CENT

The annual general meeting of the Ever Ready Company (Great Britain), Ltd., was held at Hercules-London, N.7, on the 4th instant.

Mr. Magnus Goodfellow (chairman and managing director) presided and the following were his comments on the report and accounts for the year ended March 31, 1947:—

The accounts before you show a sharp fall in profits. We are among the first, if not the first, of manufacturing companies to publish accounts which reflect the harmful results of the fuel and power breakdown in the early part of this year. The interruptions and dislocations during this period resulted in heavy losses in production, and we incurred further losses of profit in that we paid salaries and wages to our people throughout the whole period.

A further misfortune befell us on the night of the 13th February, 1947, when our dispersal factory at Thornliebank, near Glasgow, was completely destroyed by fire. We had spent a year raising production at this factory, and our efforts were completely destroyed in one night. The assets, etc., were insured, but the build up of 15 months or more were lost. Our accounting year for excess profits tax is the year ending 31st March, and therefore these losses occurring as they did in the last quarter ending March, 1947, are recoverable only in part, that is to say, we lose a quarter by apportionment, and at the reduced rate of 60 per cent.

TWO NEW FACTORIES

Matters would have been worse were it not for the fact that, as I informed you in June last year, we had purchased two large factories, and were planting and equipping them. These factories helped in the period under review, and should redress and improve our production position in the near future. I am assuming that, even if our country has to refrain from exporting or is forced to import coal, the recent interruption in production throughout the country will not again be permitted to occur.

Turning now to the accounts before you, the profit of £532,000 is after an adjustment or recovery against excess profits tax amounting to £150,000, at the reduced rate of 60 per cent. The trading profit earned during the year was therefore £382,000.

Our reserves and unappropriated profits amount to £1,525,967, as compared with £1,503,005 a year ago. Reference to pages 6 and 7 of our accounts will show the movement of these reserves. Briefly, we have transferred from the profit and loss account £79,583 and taken a draft of £30,000 from the contingencies reserve to meet the balance of taxation, which includes an estimate of the new profits tax for the quarter 1st January to 31st March, 1947. We have received a post-war refund of Excess Profits Tax amounting to £41,417, and of this sum have credited £40,000 to our general reserve. I believe some adjustment of this sum downward may eventually be necessary.

A number of troubles we suffered during the past year are now behind us, and I am hopeful that our work this year will show improvement over the year under review. Your Directors gave the question of dividend careful thought and decided to maintain the usual 40 per cent. It will be observed that our reserves and carry-forward are not depleted by this decision. This dividend represents approximately 7½ per cent. on the actual capital employed in the business.

The report was adopted

BRITISH INSULATED CABLES, LIMITED

PRODUCTION DIFFICULTIES

The second ordinary general meeting of British Insulated Callender's Cables, Limited, will be held in Liverpool on the 12th instant.

The following is an extract from the statement by the chairman, Sir Alexander Roger, K.C.I.E., circulated with the report and accounts for the eighteen months ending December 31, 1946:—

The dividend on the ordinary capital of 10 per cent. is equivalent to an annual dividend of six and two-thirds per cent. This meant that after taking into account the increase made in issued capital and in the case of the former "C" stockholders the scrip they received in Callender's Trust, Limited—now Embankment Trust, Limited—B.I. stockholders receive the same return, and Callender stockholders approximately the same return, as they received immediately before the amalgamation.

The salient features of the profit and loss account are (a) that of the net profit of £2,722,143 earned by the Group, the great figure of £1,508,556 has been absorbed by taxation; and (b) that of the balance of £1,213,587 some 90 per cent. or £1,094,141 accrues to the parent company and 10 per cent., or £119,446, to minority shareholders in the subsidiary companies. The most important points of the balance sheet are (i) that net assets total £18,193,814, of which £1,562,210, or 8.6 per cent., is attributable to minority shareholdings; and (ii) that revenue reserves and surplus amount to £1,011,921 as compared with £291,756 in the parent company. Of the difference of £720,165 in revenue reserves, £416,801 represents provisions made by the subsidiaries for future taxation, and £303,364 undistributed profits in the hands of subsidiaries attributable to the parent company's shareholdings. To sum up as regards all accounts, the parent company is strong in capital reserves and short of revenue reserves and the building up of these will be one of the prime objectives.

DETERRENTS TO PRODUCTION

The main factors preventing maximum production are an inadequate supply of operatives and an unprecedented shortage and irregular flow of raw materials and component parts. The labour difficulty has simply arisen from the demand considerably exceeding the supply and, although a very serious matter, has been less devastating in its effect than the difficulty of raw materials and component parts, which, in my view, is the main bottleneck in the situation. I would again urgently suggest that the Government pause in their doctrinaire policies and instead guide and sympathetically help all industry to maximum production in the ways which industries understand and which in the past have, beyond question, proved successful. Restore the merchants and dealers and middle men to their old and experienced functions. They are an invaluable link in the supply of materials. Revivify the metal markets, the produce markets, the cotton market, and shipping. Give fresh encouragement to directors and all other grades of management from the top down to the chargehand. They are all important with their various responsibilities and, above all and beyond all, they have that priceless and irreplaceable experience which must be used to the full.

I realise and admit that some controls are still necessary in these unbalanced times, but I plead for a substantial reduction of their number and the simplification and improvement of efficiency of those retained. Industrial progress is determined by the skill and experience, enterprise and efficiency, of operatives and managers alike. Production cannot be done in Whitehall. Business must be speeded up and not slowed down and more and more autonomy must be given to industry, not less.

FRIENDS' PROVIDENT AND CENTURY INSURANCE OFFICES

Mr. HERBERT G. TANNER'S REVIEW

The annual general meeting of this company was held on the 4th instant, in London. The Chairman, Mr. Herbert G. Tanner, J.P., said:—

Last year I referred to Hugh E. Seeböhm's retirement from the Chairman's office and to a prolonged illness from which we hoped he had made a good recovery. Unfortunately, within a few weeks of our Meeting we were saddened by the news of his death.

To fill the vacancy the Directors have appointed Thomas Bradwall Barlow, who submits himself for re-election to-day.

In the Life Department new net sums assured amounted to £3,782,571, which is the largest in the history of the office. The premium income increased from £896,386 to £954,683; the claims by death were within the amount expected under the Mortality Tables. The expenses ratio rose from 12.98 per cent. to 16.65 per cent, which compares favourably with the general increase throughout the insurance industry. The increase in new Life business is being more than maintained and is likely to continue. Our Group Life Department is now a well-established part of our organisation and there is an increasing demand from employers who depend on our advice and assistance in the preparation of schemes adapted to their individual requirements. Towards the end of 1946 we launched what is now known as the Personal Security Plan. This scheme, the first of its kind, gives complete protection to the man or woman with dependants. It is not so much one new idea as a collection of new ideas dovetailed together. It is keyed to the life of the man who is producing the income for the home. It provides an income for dependants if a man dies; it provides an income for the man himself if he is disabled by sickness or accident. It provides an income for the man and his wife if he lives to a selected pension age; and for the major portion of the term this income is tax-free. It solves the problem of investing the proceeds of Life Policies in these days of low interest rates; it assures independence in declining years; removes the fear of widows and children being left unprovided for. It met with immediate success and already there has been a wide demand for it.

The Continuous Disability Department has made very satisfactory progress.

In the Fire Department the combined net income of the Century and the other Companies in the Group for the first time exceeded £1,000,000 sterling.

The Fire account has been strengthened by a transfer of £100,000 from internal reserve to augment the additional reserve.

In the Accident Department the addition to the premium income for the year was £82,000.

Our Subsidiary Company, the Southern Industrial Trust, has made satisfactory progress and we are able to report a profit of £13,821.

The Century Consolidated Accounts show that we have been able to transfer £102,327 to the Profit and Loss Account.

Securities have shown a further satisfactory appreciation during the year. We have increased the average yield on our funds, before deduction of Income Tax, to £5 4s. 7d. per cent. as compared with £5 2s. 8d. per cent. during 1945. We are glad to state that if, as we anticipate, the rate of interest to be paid on the Government Stock is 2½ per cent., the loss of income will result in a reduction in yield on our total funds of less than 2s. 5d. per cent.

The total profits, including interest, were £198,017. A dividend, including a bonus, of £150,000, has been declared and a balance of £408,884 has been carried forward.

The Report was adopted.

HAWKER SIDDELEY AIRCRAFT COMPANY, LIMITED

WIDESPREAD ACTIVITIES

The eleventh annual general meeting of Hawker Siddeley Aircraft Company, Limited was held in London, on the 28th ultimo.

Mr Thomas O. M. Sopwith, C.B.E., F.R.Ae.S., the chairman, in the course of his speech said: This meeting marks the end of 11 of the most critical years in the history of our country. As far as your company is concerned, it has consisted of four years of very rapid pre-war expansion, six years of concentrated war effort and one year of difficult transition and conversion from war to peace. No matter how superior our aircraft and engines may be, the future demand is almost unpredictable and your directors have given considerable attention to the widening of the foundations of your business. Apart from our main products of aircraft, aircraft engines and ancillary equipment, a substantial proportion of your company's turnover is now composed of motor cars, compression ignition engines for agricultural and commercial purposes, a very wide field of light alloy products and, last but not least, pre-fabricated houses.

CIVILIAN TYPES

During the years immediately preceding the war and throughout the war years, we were fully concentrated on various types of military aircraft. Today a considerable part of our organisation is engaged upon the development and production of the most advanced types of commercial aircraft. We are still delivering our trusted friend the "York." There is also a considerable number of "Lancastrians" in operation. The "Avro XIX" is selling well. The "Tudors" are progressing and trials have already shown that they will meet and possibly exceed all the requirements of the original specification of performance. We go forward confident that these new aircraft will compare favourably with their competitors in any part of the world.

In addition, we are actively engaged in the design and development of quite new types, including the so-called "Flying Wing." The requirements for military aircraft have been scaled down, but the various branches of your company engaged in this type of work are all maintaining their high places both in the eyes of the Royal Air Force and those of other air forces abroad and production is being maintained at a gratifying level.

The aero engines and gas turbines side of your business is mainly concentrated at Armstrong Siddeley Motors Limited. The famous "Cheetah" engines are still being produced in large numbers.

MOTOR CAR SECTION

The motor car section is very satisfactory. The Armstrong Siddeley "Lancaster" 4-door saloon and the "Hurricane" drophead coupe have proved of high quality. The "Typhoon" 2-door saloon has been added to our range. There is every reason to be proud of these three motor cars. Although they only began to appear in September, 1945, they quickly and thoroughly established themselves.

Light alloys are an interesting and important division of your business, which we are developing so as to enable it to supply other industries as well as the needs of aircraft. The pre-fabricated houses division is concentrated at the Hawksley Co., who have been in full production for some considerable time and have delivered over 5,000 pre-fabricated aluminium houses.

With regard to finance, dividends of 15 per cent. and 17½ per cent., both less tax, have already been paid, making 32½ per cent. less tax for the year ended July 31, 1946. The financial position disclosed in the accounts does not give cause for pessimism.

The report was adopted.

LACRINOID PRODUCTS, LIMITED

IMPROVED RESULTS

SIR LOUIS STERLING'S SPEECH

The tenth annual general meeting of the company was held at 82, King William Street, E.C.4, on the 28th ultimo. In the absence of the chairman, Mr T. L. Horabin, M.P., the chair was taken by the deputy chairman, Sir Louis Sterling, who said:

We all regret the absence of our chairman, Mr T. L. Horabin, M.P., who is unable to be with us today due to injuries which he sustained in an air accident in January: I am glad to say that he is making satisfactory progress and I feel sure I am expressing the desire of the meeting in wishing him a speedy recovery.

PROFIT AND DIVIDEND

It will be remembered that the trading profits last year were adversely affected by war damage to the factory. During the year under review normal trading was restored and the results reflect the company's first full year's post-war operations. After making provision for taxation of £27,500 the net profit for the year amounts to £18,113 as compared with £9,350 for the preceding year, after provision for taxation of £8,125.

During the war dividends paid were limited by a low profits standard for excess profits tax and with the reduction in that tax to 60 per cent. for the past year the net profits would have permitted an increase in the dividend. Your board decided, after careful consideration, to maintain the dividend at 10 per cent. per annum and to husband the company's resources for the development of our business.

The excess profits tax post-war refund for the period ended December 31, 1945, amounting to £14,524, has been received and appears in the balance sheet under the heading reserves and surplus.

In common with many other concerns, your company has suffered from and is still affected by very severe raw material shortages, which make forward planning extremely difficult and have caused many disappointments for our customers both at home and overseas.

On the other hand, I am glad to be able to report a gradual improvement in the labour situation. Since the close of the year, as members of the Engineering and Allied Employers Federation, we have adopted the 5-day week.

RECORD TURNOVER

Despite our difficulties in obtaining adequate supplies of raw material, the company's turnover for the year under review constituted a record in the history of the company. This has been due largely to heavy demand for our housing fittings and furniture fittings, in which connection substantial contracts have been and are being carried out on behalf of the Directorate of Housing Fittings and in the utility furniture range as specified by the Board of Trade.

During the past, the productive capacity of the factory has not always been fully employed owing to the delay in obtaining the high-grade tools required by our industry. This position has been ameliorated by setting up a mould and tool division at our Eastern Avenue works. The facilities thus afforded have been fully employed throughout the year with consequent benefit to our overall production. The position to-day is that the demand for tools is still so great that further extensions are contemplated.

During the year, a market has been created in buttons manufactured from glass, to which we have given the company's trade name "Opalite." This is a separate depart-

ment of our business which employs a different medium from the plastics which we normally use, and represents a useful addition to our button range.

CANADIAN COMPANY

The difficulties in developing the export business which we foresee for some time to come should be eased by steps we have taken whereby the manufacture of our proprietary lines will be carried on by a Canadian company in which we hold a controlling interest.

Negotiations carried out last summer with the Canadian Government resulted in a disused war factory in Buckingham, Quebec, being purchased from the Canadian War Assets Corporation. A number of our key personnel were transferred to Canada and the company, which is known as Lacinoid Products of Canada Limited, commenced operations towards the end of last year. There is still much to be done, particularly in the matter of factory installations and provision of the necessary plant, equipment and tools, and it is therefore too early to report to you on the progress being made by this company.

In conclusion I should like to make a brief reference to the events of the past weeks. Both factories at Gidea Park closed down entirely on February 7th, but on the relaxation of the Government ban work recommenced on March 3rd on the basis of full production. Active steps are being taken to ensure economy of electric power on which the company is entirely dependent and plans are now being worked out in relation to shift working whereby maximum production can be maintained coincident with economy in electric power. In view of the uncertain outlook it would be unwise to attempt to forecast the results of the current year's trading, but given anything like normal conditions your board views the future with confidence.

UNITED MOLASSES COMPANY, LIMITED

LARGER PROFITS AND DIVIDEND

The twenty-first annual general meeting of the United Molasses Company, Ltd., will be held on the 24th instant, in London.

The following is an extract from the statement by the chairman, Sir F. Michael K. Kielberg, circulated with the report and accounts for the year 1946:—

In spite of many disappointments and unforeseen difficulties, mainly due to shortages and the abnormal labour conditions prevailing in practically all countries where the company and its subsidiaries trade, profits for the year show a gratifying improvement compared with recent years and make it possible, after increasing the rate of dividend by 5 per cent., at a cost of about £45,000, to transfer £150,000 to general reserve (the same) and to increase the carry-forward by £103,000 compared with an increase of £28,000 the year before.

Business during the first four months of the current year has followed the mixed pattern of 1946 and, taken as a whole, the earnings have so far not been seriously affected by the grave fuel shortage which came to a head in February-March. As far as one can tell, without having audited figures, profits would appear to be accruing at approximately the same rate as last year. Our newly acquired business interests in this country and America are working to capacity at satisfactory profit margins. Prospects for 1947 can therefore be said to be satisfactory up to date, but with 7½ months still to go it would be foolhardy to attempt to forecast what the remainder of the year may have in store.

GOVERNMENT RETURNS

For the week ended May 31, 1947, total ordinary revenue was £60,628,057, against ordinary expenditure of £35,784,671 and issues to sinking funds, £150,000. Thus, including sinking fund allocations of £1,409,015, the surplus accrued since April 1st is £233,366,052 against a deficit of £172,014,000 for the corresponding period a year ago.

Mr Marshall's Challenge

THE rehabilitation of the economic structure of Europe quite evidently will require a much longer time and greater effort than has been foreseen." With these words, the American Secretary of State, Mr Marshall, opened what may well be a new phase in the relations of the United States with Europe and indeed with all the outside world. Hitherto, the belief that Europe and Asia were struggling back to more normal conditions and would shortly need no further direct assistance has underlain the policy of both Government and Congress in the United States. Mr Marshall's speech at Harvard last week is the first official statement of a new approach, in which the likelihood of continuing need in the outside world is squarely faced. Moreover, the Secretary of State departed from previous policy in recognising the fact that the misery of the countries of Europe is interconnected and that there can be no genuine recovery for one without the recovery of all. The visible destruction in Europe is

probably less serious than the dislocation of the entire fabric of European economy . . . the modern system of the division of labour is in danger of breaking down.

This general dislocation cannot be remedied without outside assistance, and the fact must be faced in America that the need for this assistance far outstrips Europe's capacity to pay.

The truth of the matter is that Europe's requirements for the next three or four years of . . . essential products—principally from America—are so much greater than her present ability to pay that she must have substantial additional help.

In his speech, Mr Marshall, therefore, proposed on the one hand that the American people should realise and accept the "vast responsibility which history has clearly placed upon our country," and on the other, that the European nations should take the initiative in working out a plan or plans for reconstruction based not on the needs of single countries but on a co-ordinated policy for solving their problems in common.

The initiative, I think, must come from Europe. The role of this country should consist of friendly aid . . . and of later support. . . . The programme should be a joint one, agreed to by a number of, if not all European nations.

It is hardly necessary to underline the dramatic importance of this speech. Mr Marshall may not command a secure congressional majority but he speaks with very great authority and has, moreover, received presidential sanction for this policy. Mr Truman in his speech at Ottawa pledged his country to the task of "restoring the world to health." It is, however, almost equally unnecessary to underline the scale of the obstacles such a programme has to overcome before its vision can become practical politics. It is not enough that President Truman, Mr Marshall and the American Cabinet should be convinced of the rightness of the new approach. It is not enough that they should be supported by some of the leading newspapers and publicists in the United States. The real question is whether the people of the United States and their elected representatives in Congress can be persuaded to accept the need for foreign relief upon a sufficient scale. The Administration has stated that the appropriations for Greece,

Turkey and American-occupied lands, together with the \$350 million voted for relief, exhaust the requests that will be put before the present session of Congress for Government expenditure overseas. And at the end of this month, the last powers—admittedly very weak powers—under which the President can secure priorities for procuring and transporting relief goods will presumably lapse.

Perhaps these difficulties should not be pressed too far. When, during this troubled session, the President has asked Congress for appropriations in support of his foreign policy, they have not, in spite of much noise and great delay, actually been refused. It is true that the circumstances in which the policy has been pursued are changing. The approach of election year is sapping the foundations of agreement between the parties on foreign policy. But the post-war economic recession seems to be approaching no less inexorably, and its effect is less easy to predict. The hint of a slump may, in the next few months, make Congressmen—especially Republican Congressmen—less anxious than they are to-day to finance grandiose plans of public expenditure, the immediate beneficiaries of which are foreign countries. The doctrine that deficit finance and Public Works are the answer to economic depression, is by no means universally accepted in America, and overseas Public Works can be expected to be less attractive than the domestic variety. On the other hand, it will not require much subtlety of logic to perceive the real effect of foreign needs on American prosperity. At the moment many commodity prices are being held in the markets of the United States at their present peaks simply by the pressure of foreign buying. This is particularly true of farm prices. If the flow of dollars is now to dry up, it is at least possible that the reaction of the farm bloc will be to support the continuance, even if by Government financing, of a large export programme.

The Issue in Congress

It is thus on the present showing of Congress difficult to determine with absolute certainty what the reaction to Mr Marshall's suggestion might be. Some things, however, are certain. The first is that Europe's dollar holdings are becoming exhausted with such alarming speed that a plan for preventing further disintegration and collapse is not an academic desirability but an urgent need. In other words, Congress must either decide upon further aid in a special session this autumn or the "economic, social and political deterioration of a very grave character" forecast by Mr Marshall may quickly come to pass. But it is certain that no Congress, meeting on the eve of what will be virtually a year's electoral campaign for the Presidency, will consent to foreign aid on so vast a scale unless the issue has become, in the fullest sense of the word, bi-partisan. It is certainly impossible that Republican leaders of the stature of Senator Vandenberg should support Mr Marshall's approach. Mr Stassen, on the liberal wing of the Party, has already given his own version of it. But any politician, Democrat or Republican, will have his ear very near to the ground this summer, and in the last analysis it will be the reaction of public opinion to Mr Marshall's lead that will prove the test of whether his policy can be lifted out of the party arena in an election year.

This fact is, in a sense, Mr Marshall's great opportunity. He, the Administration, the State Department, the publicists who support him, have a few months in which to project into the American consciousness the need for organising a vast transfusion of dollars for the anæmic economy of the world and regain for it widespread and vigorous public support. And experience of American reactions in the past would suggest that on one condition only could that measure of approval be secured—if the policy were bold, sweeping, adventurous, and very big. In fact its chances of success would almost certainly increase in direct proportion to its size. A suggested allocation of \$10

to \$15 billion a year for world reconstruction would almost certainly prove more challenging to the imagination, and thus more likely to secure acceptance, than the meagre \$400 millions proposed for Turkey and Greece. If the new project is to be "sold" to American public opinion in time for a Congressional session in the autumn, it is on this scale that Mr Marshall and his lieutenants will have to make their plans.

Convincing the American public of the necessity of a vast new policy of foreign aid is only half the problem, perhaps the less difficult half. The American voter will not only want to know about Mr Marshall's good intentions, he will also want to know on what the money drawn from his pocket is to be spent. But Mr Marshall feels very naturally that the United States cannot begin imposing precise plans upon Europe as a condition of assistance. He has therefore challenged the nations of Europe to produce their own and to bring them together into a coordinated whole. In this way, not only will the point be met that the reconstruction of a single country depends largely on the restoration of its neighbours. There is also a chance that the scheme will be sufficiently grandiose to fire American imagination and convince the taxpayer that his money is to be well spent.

Europe's Needs

Nevertheless, the practical development of Mr Marshall's idea is far from easy. The first difficulty is that, in a sense, it by-passes Europe's most immediate needs. In the three months which must elapse before the harvests are brought in, there is hardly a country in Europe that is not faced with a food crisis. The need is particularly urgent in France and Western Germany, and grows daily graver in Italy. And their food shortages are likely to be followed before long by a coal famine. If Europe is not to go into next winter in worse shape than it emerged from the last, its immediate need is for increased deliveries now of American grain and coal. Such a policy would entail making dollars immediately available to countries whose present allocations are all but exhausted, it would entail maintaining sufficient federal powers to secure priority for food and coal for export and to see that sufficient transport was available to get the material to the ports. But Mr Marshall's approach clearly does not refer to the next quarter of this year, and of its very nature it cannot be made applicable to an immediate crisis.

The reason for this is obvious. The moment there is question of elaborating joint long-term plans for reconstruction, the process must be exceedingly slow. For instance, it must first be decided within what general framework the discussions are to take place. One possibility would be to use the European Commission and the subsidiary coal, transport and economic co-ordinating committees as the instruments of planning. The machinery would then cover all Europe and would have the asset of a year's work behind its deliberations. On the other hand, the actual experience of the European Commission's workings in the first weeks of its existence do not encourage great optimism. The great political advantage of the Economic Commission for Europe—that Russia is a member of it—is a great disadvantage for the rapid formulation of practical policies. The Russians would oppose any attempt to draw into the web of "American finance capitalism" the East European countries which are now to some extent linked with the Soviet Five-Year Plan. They would oppose even more fiercely any attempt on the part of the Western European nations to go ahead without the East, since that would be the Western bloc which has always been their major bogey. They would equally oppose any attempt to include Germany in any plans that were to be worked out—except, of course, as a source of reparations. It is probable that any economic integrator of Europe along democratic lines, however innocently proposed, would be

highly suspect to the Russians. A policy proposed by the authors of the Truman Doctrine is damned from the start and would be obstructed by the Russians without limit.

Plans for Western Europe

It follows that the attempt must necessarily be confined, in the first place, to Western Europe and the Mediterranean countries. This is regrettable, but it is inescapable. The restriction of scope removes some of the difficulties. There are, between most of these countries, similarities of economic and political systems, sympathy of outlook and long-established ties of trade and friendship. Moreover, there is in Western Europe the common link of economic interest in the industries of the Ruhr, where Anglo-American control is already established. But it does not by any means follow that it will be easy for the nations of Western Europe to work out and present to Mr Marshall that joint plan for which he has asked. The sheer technical difficulties of working out a scheme of economic integration, even in the presence of good will and the absence of political difficulties, have been amply illustrated in the last year or so by the preparations for the customs union of Belgium, the Netherlands and Luxemburg. Throughout Western Europe there are Communist parties which can be relied upon to sabotage any plan that is put forward. There is the difficulty of deciding how the United Kingdom, with its responsibilities to the Dominions, fits into a European plan. And there is still a complete divergence of view between the British and the French about the best method of dealing with the Ruhr. All these difficulties can be surmounted—but hardly in three months.

Lastly there are the difficulties raised by the actual technical content of the proposed plans. Apart altogether from the difficulty of getting it drawn up, what sort of content would a co-ordinated plan for Europe have? What exactly is meant by a Five-Year Plan for Western Europe? The obvious first stage in the approach would seem to be a joint assessment of need on the part of the European or West European nations together with a detailed statement of the resources available to them, and the contribution they could make themselves to solving their deficiencies, and the balance which they would need to receive from the New World. Such plans were the essence of the wartime work of the Combined boards in Washington. The organisation of similar Boards for Europe is certainly not an impossibility and the joint approach might incidentally prove invaluable if, after all, Europe were left without dollars to make shift with its own resources. But once again, the true factor in the American situation—the need to have a programme ready and "saleable" before a Congressional session in the autumn—forbids one to pin too great hopes to the Combined Board's approach. Not only is it very unlikely that their assessments would be made or agreed in time. It would also be very difficult to dramatise their work, however useful and practical it might be. There is no lift to the spirit in fat deficiencies and little spur to the imagination in what might come to look very much like Europe's shopping list. What the American taxpayer will very reasonably want is not only an explanation of how the bill that is presented to him is being made up but also a demonstration of what is to be done with the money and of the benefit that the world will derive from it. A financial account, however detailed, is not an economic plan. What is to come from the spending of the money? The buttressing of a number of national economies, which come together to present the request and parted company when it was granted? And if it is something more than the money is to buy, something that can be called a United States of Europe, how much reality is it proposed to put behind the name? And how do we get from here to there? These, also, are questions to which honest and authoritative answers can be given—but not in three months.

This, then, is the dilemma. If Mr Marshall's initiative is to be accepted by the American people, it will have to be embodied in an ambitious and inspiring programme within a matter of months. But if the European nations are to do anything more than simply add up their national deficits and present the total of one figure instead of a half-dozen, then they will need much more than three months for the purpose. It must be done quickly, but it cannot be done quickly. It must be big enough to take the breath away, but there is no time to construct even the simplest structure. And, for all the difficulties, it would be criminal to let such a wonderful opportunity slip.

It will be a real test of statesmanship to meet all these conditions. There is only one method of procedure that holds out much hope of success. This is that the Governments of Western Europe should, within the next few months, solemnly pledge themselves to the principle of united action, and that they should set themselves a specific time-table for embodying it in practical measures. What does "united action" mean? If it is interpreted to mean pious resolutions with no real substance, then it is unlikely that the Americans will be impressed. If united action is sought it will be as well for all Europeans to recognise that the solemn resolutions must have tangible substance. They must promise something real—even if the performance has to be deferred. When the problem is looked at in this way, it ought to be apparent that there is only one thing that will meet the case. There is only one achievement big enough to be worth scores of billions of dollars, and that would be a full Customs Union of the main countries of Western Europe.

A New United States?

Can the nations of Western Europe pledge themselves, in the next few months, to accept within ten years anything so big, so desirable and so difficult? That is the challenge that Mr Marshall has thrown out. Nor is the matter one that can be tackled solely on the economic plane. It is a fashionable fallacy, but a fallacy none the less, that economic policy between the nations can outrun its political foundations. It cannot; and if there is to be a policy of economic sovereignty in Western Europe, then there will also have to be some contributions of political sovereignty to a joint organ. It is something like a United States that must be envisaged, with political and economic organs, loose in its constitution, no doubt, but not bogus. Can the nations of Western Europe bring themselves to say, and to say sincerely, that they will achieve it within ten years?

The question must not be answered in a merely emotional way. It must be answered realistically, after some survey of the difficulties. The one thing that would be criminal would be to allow a negative answer to be given by default. To the giving of an answer the energies of the governments must now be given, and the initiative quite inevitably falls to London. The British Government have hitherto shamefully neglected their opportunities in this direction; they have never made a sufficiently determined survey of the possibilities of a Western Association. For a long time they were deterred from it by fear of offending Mr. Stalin; and more recently by fear of pleasing Mr. Churchill. They will now have to work overtime if they are not to incur the charge of missing one of history's great opportunities out of mere inability to seize it.

Agriculture and Politics

BY no stretch of the imagination can the Agriculture Bill, which on Monday received its third reading in the Commons without a division, be described as a Socialist measure. It comprises an old-fashioned state guarantee of the industry's prosperity, given in exchange for the acceptance of co-operative machinery intended to raise the industry's efficiency, that is somewhat reminiscent of the Conservative protectionist legislation of the 'thirties. True, the present Bill is on a bigger scale. The Government guarantee to agriculture is far more sweeping than any that has previously been made to any industry, and the sanctions for raising efficiency are without doubt stronger than most Conservatives would willingly sponsor. But the Bill is only an old idea writ large, which proceeds on the principle of "make some effort to put your house in order and we will do the rest for you." It does not tamper at all with the structure of ownership in agriculture and hardly at all with the methods of operation. Indeed, such mild exemplifications of Socialist thought as the Bill contains have been heavily played down by the Minister, Mr Williams, so as not to disturb the unruffled contentment with which his pledges are received.

This does not mean that it is a bad Bill. It is certainly an important and, in some respects, a necessary Bill; it contains a number of good minor reforms, such as the new policy for smallholdings; but it is rather like a legislative bank holiday, on which all nasty questions and implications have been left to the morning after. There is no argument about the desirability of guaranteeing farm prices. This is an aim that has been universally accepted and that is probably the only way to cure the grave endemic instability of prices that has been the bane of agriculture for many generations. But, as must be pointed out once again, since the obvious fact has escaped both Government and Opposition, a guarantee does not constitute a policy; rather should it be a very strong inducement indeed to form a policy. But so far it has not been.

The Government's reply to this criticism would be to point to the elaborate powers that the Bill contains to ensure that farms are well managed. The powers to coerce and, if necessary, to dispossess the inefficient farmer or landlord is there all right; but in considering what these powers will accomplish in practice it is necessary to remember that it is the agricultural community itself which will administer them. The worst that a farmer or owner has to fear is a trial by his own peers, as represented by the county agricultural executive committees, a majority of whose members are chosen from the nominees of the landlords, farmers, and farm workers' associations; if the committee's decision goes against him, the farmer can appeal to an agricultural land tribunal which, in addition to its independent legal chairman, again comprises the representatives of owners and farmers. The same procedure applies to a landlord who wants to be rid of a bad tenant or a tenant aggrieved with his landlord. At no stage will the Minister apply sanctions himself and he cannot overrule the tribunal's decision.

Clearly the farming community will not judge itself over-harshly; indeed, it would be very undesirable if the countryside became the scene of extensive mutual recriminations and accusations of inefficiency. Mr Williams has made it quite clear what this machinery will accomplish. It will bring under coercion a very small minority—perhaps, at the most, one or two per cent—of badly inefficient farmers and owners (together, no doubt, with an occasional victim of local prejudice), who will be placed under supervision and as a last resort dispossessed. But it is not the few laggards right in the rear who determine the pace of an industry, and their scourging will leave wholly unaffected the degree of efficiency achieved by the great bulk of farmers. Indeed, owing to the increased security of tenure—

not to mention, of course, the assured market—which the Bill provides, the average farmer will be more firmly rooted than ever in his holding. This is not necessarily a bad thing, and it is always possible that increased stability will be a psychological inducement to improved techniques. What is clear is that there is unlikely to be much increase in the general level of agricultural efficiency resulting from the direct application of the Bill's powers of coercion. Even its theoretical control of the ordinary owner or farmer has been watered down under Conservative pressure. For instance, the standards of good estate management or good husbandry that he is required to maintain are now to take account of "other relevant circumstances" (an omnibus phrase that might permit reference to his financial standing), and the obligations on landlords to provide fixed equipment have been modified by giving a wider right of appeal against instructions. And, in any case, it is not the legal powers that will govern what is done, but the people administering them. The Bill may possibly bring a few particularly bad farms up to the average of efficiency. It will do nothing at all to raise the average.

*

What no politician cares to admit is that the Government guarantee to agriculture will not work and will not last, unless it is implemented in a way that safeguards and stimulates the industry's efficiency. And the only route to efficiency lies in the terms and the mechanism of the price-fixing powers themselves. Direct coercion will not, in fact, be much used and it is right that it should not be. The co-operation among farmers and owners in improving their farming practice, which the Bill should induce, will certainly be useful. But the major policy for raising efficiency must be an economic one. The Government guarantee is going to be very costly in the years to come. The prices paid are to be settled annually, after consultation with the National Farmers' Union, and it is the Minister's aim to see that the price schedule receives, if possible, the farmers' blessing. This year he succeeded; but there can be little doubt who got the better of the bargaining. There must in any case, in such a system, be a strong tendency to settle prices on a fairly generous cost-plus basis. Very naturally, the Bill provides that there may be some quantitative limitation on the produce guaranteed—a point to which many Conservatives took exception, preferring apparently that the taxpayers' liability should be wholly unlimited. Mr Williams has now announced that no quantitative limitations will in fact be introduced in the foreseeable future, except in the case of sugar-beet (absorption of which is limited by the size of factory capacity) and of oats (where there is a danger that farmers will sell most or all of their own crop at the guaranteed price and buy cheaper imported oats for feeding in substitution). These minor qualifications apart, the Government will offer the British farmer a good price for all that he can produce.

This may well be a wise policy in Britain's present food predicament, but there can be no disguising its very high future cost. It is an extraordinary thing that, whilst the expenditure of a few millions annually under the Wheat Act and other price support measures before the war was only sanctioned with elaborate safeguards for Parliamentary accounting, the expenditure of an unspecified sum, running into several hundred millions annually, is now being authorised without any provision whatever for Parliamentary supervision and not a voice is raised in protest. As a first step, the data and results of the annual price review should surely be published and a statement of the annual expenditure on British farm produce be submitted to Parliament. But, behind this question of accounting, lies

the major issue of how, granted that it should be given, the Government guarantee should be operated. On this issue the Bill says nothing, beyond giving complete discretionary powers to the Government; yet it is here that a policy is needed which should have been thought out and embodied in the Bill. It should be accepted as axiomatic that the nation, having under-written the purchase of domestic production, should take positive steps to ensure that this produce is distributed and utilised in the way most profitable to taxpayer and consumer. This requires, in the first place, a marketing policy that is a great deal more public-spirited than either the Ministry of Food's attempts to appease the distributive trades or the Ministry of Agriculture's attempts to revive producers' control of marketing on the pre-war model; and it requires, in the second place, a determined effort to relate the guaranteed prices paid for particular commodities to the state of market demand and the total sum paid for British farm produce to the long-term capacity and endurance of the taxpayer. It would be incredible—if it were not true—that nobody has yet answered the question how the money is to be raised to implement the guaranteed prices. If the price guaranteed to the British farmer is higher than the price at which food can be imported, how is the gap to be filled? By making imported food artificially dear and handing over the proceeds of so doing to the home producer? Or by subsidising the British producer out of the Exchequer? Is the consumer or the taxpayer to pay the piper for the tune that Mr Williams is now calling? Nobody knows.

*

It is a sad augury that the Opposition, instead of seeking a policy for the real but difficult problems that the Government has ignored, should have turned its Parliamentary performance on the Bill into a benefit match for the agricultural interests. The Conservative policy is to whittle down the sanctions against inefficiency to a minimum whilst making the state guarantee to agriculture as extensive and unlimited as possible. It was urged, for instance, that the fixing of prices should be explicitly

The Watch on the Straits

THE Turkish Government, with a supporting vote of the National Assembly, has decided to maintain its armed forces on a footing of mobilisation and to continue the state of siege imposed on the European area of Turkey, including Istanbul, ever since 1940. The Prime Minister stated in his speech that the request from "a certain foreign Power" for bases in Turkey amounted to territorial claims, that there was "no indication that these claims will be renounced" and that the Government "after mature reflection" had decided that demobilisation was for the present impossible. He also spoke ominously of the possibility of "invasion forces in the interior of the country," that is to say, airborne landings.

To put the matter plainly, Turkey fears war, and that not as a remote prospect, but at any moment. Whether or not it is considered that there is reasonable ground for such a fear, it is a grave matter that barely two years after the end of the war against Nazi Germany, a nation should be officially preparing to meet armed attack by a Great Power, a member of the United Nations. The Turks do not, however, feel themselves to be confronted with a sudden and unexpected crisis, but rather with a situation so traditional in Turkish memory that it can almost be regarded as normal. There is nothing novel for them in the danger from the north. "At Constantinople," wrote the Hon. Robert Curzon in 1854, "they say that everything that is bad comes from the Black Sea: the plague, the Russians, the fogs and the cold—all come from thence."

In the days when it was the proudest boast of the Russian

declared to be the sole responsibility of the Minister of Agriculture so as to make it quite clear that the Minister of Food, the supposed guardian of the consumer, could not interfere. It was with unconscious irony that Captain Crookshank wound up for the Opposition with the remark that—

None of us here are partners in the industry, or their delegates. We are here, as Members of Parliament, to decide what we think is right in the interests of the nation as a whole.

The Conservatives' unrelenting concern for agricultural interests, and their strenuous attacks on the incursions of Whitehall bureaucracy, which they somehow managed to read into the Bill, worked like a charm in turning Mr Williams into a progressively lighter shade of pink. It emerged from his explanations that the proposed Land Commission, far from being a backdoor entrance to the nationalisation of the land, will hardly be given the proper scope to set a good example in farm management and progressive farming. For instance, its powers to reorganise the lay-out of farms in a few experimental areas, from which great gain could be had, are so weak and dependent on voluntary cooperation as to be probably ineffective.

Altogether, the Bill's passage through the Commons has been singularly harmonious. No guillotine was used, the discussions were more than adequate, rudeness from the Opposition was largely simulated, and self-satisfaction on the Government benches very obvious. It is an almost laughable contrast to the reception of other measures. But, unfortunately, there is always a morning after, when the Government may wake up to find that it has led both farmer and taxpayer too far up the garden path—and in opposite directions—with no hope of reconciliation. The farmers have been given a remarkably good bargain in return for very little. They may some day regret that they were not content with very much less. And when that day comes they may also regret that they have not something much more substantial and purposive, in the shape of efforts to increase efficiency, to show the urban taxpayer and consumer as his return for the very heavy financial burden that he is now, unwittingly, assuming.

Communists that they had forever renounced the imperialism of the Tsars, a number of documents were published from the archives of the old régime revealing the secret discussions which had from time to time taken place in St Petersburg about ways and means of seizing Constantinople and the shores of the Bosphorus by a *coup de main*. Among these projects was the Nelidov Plan of 1896, which was provisionally approved by the Tsar and the War and Navy Ministers and of which the American historian, Professor S. B. Fay, writes:

Nelidov's plan was to dispatch suddenly 30,000 troops on warships and transports from Odessa to the Upper Bosphorus and land them to seize control of the Straits before England or any of the other Great Powers could prevent the filibustering expedition. Europe would be faced with a *fait accompli*. . . . But when the plan was further studied by the military and naval authorities, it appeared that, even with the most secret precautions, it would be almost impossible to concentrate and dispatch a sufficiently large number of troops and transports without attracting the attention and opposition of England.

The cause for worry in those days was not, indeed, the resistance to be expected from the Turkish forces, but the prospect of counter-moves by other European Powers. Neither Britain nor France nor Austria nor Germany wished to see Russia in possession of Constantinople, and in their jealousy of Russian expansion lay Turkey's safety. The situation changed, however, in the years just before and during the First World War. In the cause of the coalition against Germany Russia was promised Constantinople and the Straits by her allies, and had

she remained in the war to the end, the "Eastern Question" would have been decided in her favour. But the Russian Revolution would have none of it; the Bolsheviks urged the Russian soldiers to go home and take the land of Russia instead of laying down their lives for Constantinople. This renunciation and the common interest of Russia and Nationalist Turkey after 1918 in opposing the ascendancy of the victorious Western Allies opened a period of Russo-Turkish friendship which lasted until 1939.

In 1939 everything changed again. Turkey had already aligned itself with Britain for security against Italian expansion in the Mediterranean, but had tried to safeguard the friendship with Russia by insisting that the Anglo-Turkish alliance should not be operative in any situation involving a clash with Russia. Russia, however, having embarked on the policy of dividing Eastern Europe into Russian and German spheres of influence by agreement with Germany, was determined to bring Turkey into the Russian sphere and exclude both German and Anglo-French influence. Mr Molotov used threatening language, which had an effect the opposite of what he desired; instead of submitting gracefully to superior power, the Turks simply reverted almost overnight to their traditional fear and distrust of Russia which had been for twenty years dormant. Russia was again the hereditary enemy coveting Istanbul and the Straits, and the determination not to allow a single Russian soldier within the gates was now stronger than ever before because of the intense patriotism generated by the Kemalist national revival. "No" was the first, and it has remained the last, word of Turkey to all Russian proposals for "joint defence" of the Bosphorus and the Dardanelles.

This attitude was the principal cause of Turkey's refusal to enter the war in 1943 or 1944—a refusal which caused the greatest annoyance to the British Government and to Mr Churchill in particular. The Turks realised that, if they provided airfields and rights of transit for British forces, they would have to grant the same facilities to the Russians as well, and with the example of Poland before their eyes, the Turks saw in neutrality the only hope of preserving their national sovereignty. Turkey did not declare war on Germany until February 23, 1945, when there were no longer any German forces in the eastern Balkans and there was, therefore, no pretext for any Allied Power to require the military use of Turkish territory.

Since the end of the German war, the Russo-Turkish war of nerves has continued and Turkey has kept its army on a war footing, with a legal state of siege in the area of the Straits. Russia has persisted in its demands for bases or "joint defence" in the Straits and has also added a territorial issue by claiming the cession to Soviet Armenia of the Kars-Ardahan district on Turkey's north-eastern frontier. For a nation as economically weak as Turkey to keep up a condition of preparedness for sudden attack over a period of years—it started with precautions against a German invasion in 1941—is obviously an almost intolerable strain and, if no other factor were involved, Turkey might in the end be forced to capitulate simply by inability to remain mobilised. But in recent months the Turks have been encouraged to hold on by the general trend of world affairs. The conflict between Russia and the Western Allies has been intensified and the prospect of a deal among the Big Three in the Yalta style at the expense of Turkey has diminished; by the middle of last year Ankara could be certain that neither Britain nor the United States was willing to see Russia in exclusive control of the Straits. Had relations among the Big Three remained otherwise harmonious after Yalta, the Western Powers might have accepted a Russian outpost on the Dardanelles. But in a situation of general political rivalry, a yielding on the question of the Straits would be too dangerous because of its further consequences. Russian supremacy in the Straits would not only mean a clear protected way for Russian warships into the Aegean; in view of Russia's relative naval weakness that is at present a minor consideration. But control of the Straits also means control of Istanbul, which, despite the transfer of the capital to Ankara, remains by far the largest city in Turkey and the principal port, and control of all communications between the Asiatic and European parts of the country. With such means of pressure, and with the discredit which would fall on the present regime and its foreign friends, if the Russian terms were accepted, Turkey, as a whole, would be quickly converted into a Russian satellite with a new anti-Western Government, and this would have profound effects both on Greece to the west and on the Arab countries to the south. Hence the Anglo-American opposition to Russian claims, which has been hardening during the past year. But in the Turkish view diplomatic support is not enough; as the Western Powers have their own interests at stake and are not merely approving morally of

Turkey's stand, they must share in the burden of Turkey's defence. Turkey, in other words, has been able to bring pressure on its supporters by the threat of its own collapse and, just before President Truman took the plunge, the warnings were becoming urgent.

The hundred million dollars lent to Turkey are to be applied with the aid and advice of an American military mission which arrived in Ankara in the fourth week of May, and, in addition to consultations with the Turkish General Staff, has been making local studies in all parts of the country, including the zone of the Soviet frontier. This is the closest approach of American power so far to the home territory of Russia and it is being made in a region which, it must be admitted, is of vital strategic importance to Russia. It is true that the rulers of Russia have only themselves to thank for the consequences of a policy of menace which has turned a friendly Turkey into an enemy; if they had only been content to let well alone, Turkey would today be a reliable buffer State covering Russia's southern approaches. For the Turks do not really want to have American officers organising their defence; their desire is simply to be independent, and it is only because they are threatened that they seek help from another Power. But now that matters have turned out as they have, can it be said that the danger has been diminished? Up to a point it can be argued that anything which strengthens Turkey's capacity for effective initial resistance to a sudden attack makes such an attack less likely. If it thought to be likely at all. It is the possibility of a lightning *fait accompli* which presents such a temptation to a powerful nation equipped with modern technical means of attack. We know from the documents containing Hitler's plans for war against Czechoslovakia in 1938 that he reckoned that, if a decisive break-through were achieved in four days, no intervention of third Powers need be expected, but that intervention was probable if the military decision were delayed. The Turks have been particularly afraid of airborne landings and, not having sufficient fighter aircraft defence, they have tried to provide against this danger by widely distributed garrisons;

NOTES OF THE WEEK

The Transport Bill in the Lords

The Parliamentary limelight this week has been turned on to the Committee stage of the Transport Bill in the House of Lords. The Bill is the major controversial measure of this Parliament, and the Conservatives can do what they like with it—in their own chamber. Considerable political interest was attached to the decisions that the Tory strategists would take, since they would shape the course of politics for some time to come. The second reading debate showed nothing, since the Tory peers all made speeches against the Bill but refused to throw it out bodily—as was obviously sensible. But in Committee the time for showing hands could be no longer averted. Would the Government be challenged to a real fight, which they might transfer to the hustings? Or would they merely be pleaded with to think again?

It is now clear that discretion is still accounted the better part of valour. It is true that three amendments have been carried against the Government, and it is further true that the points with which they dealt cannot be dismissed as minor. (Their substance is discussed in a Business Note on a later page.) But this is only a demonstration. The amendments will presumably not be agreed to by the Commons, and when they return to the Lords they will not be insisted upon. That the Opposition are not anxious to carry matters beyond a demonstration is shown by the fact that Lord Salisbury, the leader, did not support the fire-eater in his own ranks, Lord Balfour of Burleigh, and—perhaps more significantly—that he joined the Government in condemning as a wrecking amendment an attempt by Lord Beveridge, from the Liberal benches, to leave out all those parts that are concerned with road transport. The political significance of this is that Conservatives do not want to run any risk of a general election this year—but whether that is because they are afraid they would lose it or because they are afraid they would win it is another story.

an increase in Turkey's air strength would certainly make airborne invasion more hazardous and enable Turkey to relieve the economic strain by demobilising a number of troops.

Against this factor of reduced opportunity for a *Blitzkrieg* must be set the increase of tension due to the definite alignment of Turkey in the American camp and the military preparations under American direction in a region adjacent to Russian frontiers. From a Russian point of view Turkey is now an American strategic base. Turkey, however, has received no American guarantee of assistance in the event of war. Nobody knows how far the Truman Doctrine really goes, or whether Congress would regard an attack on Turkey as a *casus belli*. For that matter, nobody knows, or ever will know, whether President Roosevelt would in the end have got a declaration of war against Germany out of Congress if there had been no Pearl Harbour. The United States is committed to lending money to sustain Turkey's defence, but not to fighting for Turkey. The uncertainty may cause a number of different people to make different calculations with great risk to the peace of the world. Failing a genuine international organisation of security, mankind is safest when everyone knows clearly who will go to war for what.

The loan for Turkey would probably never have been approved by Congress if it had not been tied to the loan for Greece. Turkey was not, as Greece was, in the fight against Nazi aggression; it can hardly be claimed as a democracy—though the Republican People's Party no longer has a monopoly of political life and some development of party politics has recently been going on. Aid to Turkey is hard to justify except in terms of the "balance of power" which to all high-minded Americans is a wicked and immoral principle. These are factors which leave the Turks still uncertain about the prospect of getting actual military aid from the United States in the event of an armed clash with their mighty neighbour. They will have armaments such as they have never before possessed, but they know that their survival in war cannot be assured by their own efforts alone.

It would be wrong to take an attitude of lofty scorn towards their lordships' proceedings. The House of Lords is a most useful institution, as the proceedings on the Transport Bill are again demonstrating. The Government have accepted several imposing amendments—notably one to increase the size of the Transport Commission—which they refused in the Commons. And there is always the possibility that, being forced to think again by their defeats in the Lords, they might change their minds and accept some of the amendments that were carried against them. The Bill would be the better if they did.

No Equal Pay Yet

The reasons which Mr. Dakin gave for the Government's refusal to do more than accept the general principle of equal pay were most encouraging, for they revealed an appreciation of the dangers of further non-productive expenditure at a time when the nation is already committed to a programme of social services it is ill-equipped to bear. It appears that the Cabinet have really seen a red light ahead, for the vote of the party conference at Margate last month and the Labour Party's long-standing advocacy of equal pay were heavy weights in the scales for acceptance.

To reinforce his case the Chancellor rather over-emphasised the significance of the immediate costs to the Exchequer and to local ratepayers; £10 million for the Civil Service, £11 million for teachers, £3.5 million for other local government staffs are not crippling sums. But his analysis of the repercussions which would follow thereafter was interesting. The adoption of equal pay for women in the Forces would cost between £3 million and £6 million; the extension to industrial staffs in central and local government would increase the direct burden on the Exchequer and local rates yet further; the new public boards would follow suit, trailing in their wake the whole body of occupations and trades in private

industry, without any assurance that the consequential increase in costs would give any compensating increase in production. His most debatable argument against adoption, and one which will be hotly disputed, was that the married men with families would be left in a relatively worse position than any other section of the community, and that this would lead to applications for a system of occupational family allowances. This defence, if it is intended to do more than cover the immediate present, comes ill from an ex-member of the London School of Economics, which has been a pioneer in this field, and is barely more justifiable from the Chancellor of the Exchequer, whose direct responsibility it is that the income tax reliefs for children are still so small.

What was really surprising was the refusal to give any target date for the adoption of equal pay. The Cabinet obviously fear committing themselves in future circumstances which may be yet more difficult. They may be wise in this; but they must not expect to be popular.

The Appointed Day

Mr Attlee announced in the House of Commons this week that the appointed day, when the national insurance, national assistance and national health schemes will come into operation, will be July 5, 1948. It was originally suggested that the appointed day for the national insurance schemes would be January 1, 1948, and for the national health service April 1st. But the postponement is not unexpected. It is clearly better that the three main parts of social security—national insurance, national assistance and the health service—should be introduced on the same date. Much work has been done on setting up the machinery for the first and third. The appointment of the regional hospital boards and of the executive councils, which are to organise the general medical services, is expected in the near future. The local health authorities' plans for their health services have to be submitted by the late summer and autumn.

On the other hand, when it is considered what remains to be done, even July 5, 1948, seems optimistic. The administrative machine for the health service may be ready, but will there be the technicians—the doctors and nurses—to run it? There is already a breakdown in the hospital service in parts of the country because of a shortage of staff. Moreover, the second part of social security—national assistance—has not yet been given legislative form. Mr Attlee said that this would be given high priority in the next session, but it is to be hoped that this does not mean that the National Assistance Bill will be scamped. It should be given proper consideration even at the expense of postponing the appointed day for a few more months.

In a wider context, the choice of the appointed day is unfortunate. It will coincide with the end of the American loan—and, therefore, if imports of raw materials have to be cut, social security may begin with a million or two of unemployed. Prices will still be high—and the rates of benefit may be well below the cost of subsistence; already Mr Griffiths has foreshadowed an increase in supplementary pensions. It can indeed be argued that an economic crisis is the best possible justification for introducing a scheme of social security. In any case, the Labour Government is pledged to introduce it, and, with three years of its term of office gone by July, 1948, it would be politically difficult to postpone it any longer. What one does expect, however, is that Ministers will take every opportunity of bringing home to the people that social security has to be paid for and is not merely a means of soaking the rich; that they cannot ask for more of everything—houses, schools, hospitals, wages, pensions, leisure—and give still less in return. In short, they must be warned that they are workers first and beneficiaries second—or there will be no beneficiaries at all. Mr Dalton's statement on equal pay has given a good lead.

Ratification and Pacification?

Unless some entirely unforeseen hitch occurs at the last minute, the Peace Treaties with Italy and Germany's satellites will shortly be ratified and deposited by the signatory Powers in their "appropriate place"—the Quai d'Orsay for the Italian treaty and the Russian Foreign Office for the rest. Thus, in theory, peace is being restored to half a distracted continent and within ninety days Europe should echo to the retreating feet of the armies of occupation.

By an ironic paradox, however, it looks at present as though the ratification of the peace treaties is bringing with it not more

but less pacification. The reason is obvious enough. The bulk of the withdrawing armies will be Russian and they will be leaving countries in which they have failed to establish their influence by popular means. They therefore feel that they cannot rely upon local parliamentary majorities to give them governments reasonably accommodating, let alone friendly, to their point of view. At the same time, the twists and interpretations given to the Truman Doctrine in Europe by anti-Russian groups and, it must be admitted, sometimes by indiscreet American officials, have heightened the impression that the removal of Russian troops will be the signal for a determined effort to expel from office and influence all elements favourable to Russia. Thus in these last weeks which remain before evacuation the Russians are carrying on all over Eastern Europe a species of purge of any element which might be tempted at any time to become "an agent of American imperialism."

In Hungary the *coup* is apparently complete. A new government, led by a left-wing member of the Smallholders Party, Mr Dinnyes, but to a great extent under Communist domination, has been installed. The efforts of the British and the American Governments to secure evidence on the events which precipitated the crisis—the Russian accusation is that the then Prime Minister, Mr Nagy, was implicated in a plot against his own government—and to set up a Tripartite Commission of Enquiry have so far proved unavailing. The Russians deny that the affair comes within the province of the Control Commission since the evidence has been given solely to the Soviet military authorities. The Americans are countering this obstruction by proposals to submit the whole case to the United Nations. Meanwhile, in Budapest, the Communist leader, Mr Rakosi, has openly congratulated the workers on taking control in Hungary "before the United States could rub its eyes."

Purging the Opposition

The *coup d'état* in Hungary has brought the government more into line with those of its Eastern neighbours. Before the national elections in Rumania and Bulgaria last year, those countries were ruled by a coalition in which the Communists were dominant and the Peasants and the Socialists represented by a left-wing group—small in Bulgaria, perhaps a majority in Rumania. The elections, fought with a single Government list, virtually extinguished the Opposition, although it was conceded some vestigial freedoms. Now it seems that the elections for which Mr Dinnyes has called in Hungary will also be fought by a Government bloc and will equally mark the extinction of the opposition. But in Rumania and Bulgaria the purge of the opposition has already moved beyond this stage. Recently the Bulgarian Government suppressed both the newspapers of the opposition by means of a "spontaneous" printers' strike. Last week, this move was followed by the arrest of the leader of the opposition, the Bulgarian Agrarian, Nikola Petkov. Mr George Dimitrov, the Prime Minister, questioned by the British on the fate of the arrested man, advised them to await the verdict of the courts.

In Rumania the same tightening up of control seems to be in process. In recent weeks, the arrests of opposition leaders have been intensified and some of them, imprisoned in the Pitesti gaol, have managed to get messages of protest to the British and American missions. Unhappily there is also evidence to suggest that new tension is breaking the comparative political peace enjoyed by Poland in recent months since the success of the general amnesty. A group of right-wing members of the Polish Socialist Party—the wing which supported Mr Arciszewski in London and has held aloof from the new Government—have been arrested for "terrorist activities." This move is not necessarily a direct attack upon the position of the Socialists in the Government—a position that has been greatly strengthened by the strong personality of the Socialist Prime Minister, Mr Cyrankiewicz, but it is certainly a determined effort to root out anyone who might conceivably become an "American agent." At the same time it may be a warning to the Socialists not to presume too much on their enhanced prestige and the undoubted unpopularity of the Communists.

Finally, in the no-man's-land of Europe, the struggle between the Titans is directly engaged. The Austrian Communists hint that Russia will not sign a treaty with a "Western" government and demand representation in the Cabinet as a condition of further Russian willingness to discuss the peace treaty. The Austrians so need a treaty and so ache to be rid of the occupation that the Government is reported to have considered on what terms the Communists might be admitted. The reaction in the United

States, however, has correspondingly stiffened. If the prelude to the removal of Russian troops is the setting up of satellite governments, the United States is prepared to remain. Thus the unhappy Austrians face a situation in which the terms which will induce one Great Power to go will lead the other to decide to stay.

Preparing for Partition

After the long period of tension and uncertainty the decision to divide India on the lines of the British Government plan has brought about for the time being a sense of relief and relaxation of which the Viceroy has been seeking to take the fullest advantage by getting to work at once on the details of its practical execution. With the legislation to set up the two Indian Dominions due to be passed through Parliament before the middle of August, and power transferable to the new Governments any time after that, the Indian leaders are indeed being almost rushed off their feet by the wave of British withdrawal; almost possession is now to be theirs at once, and instead of end-less controversy over abstract ideals it is now a matter of carrying out an agreed plan in proper administrative order in the shortest possible time. This is a healthy condition of affairs, and so far there seems to have been no difficulty in setting up the "partition committee" of experts which the Viceroy has asked for as a referee on questions arising out of the partition scheme. The Bengal and Punjab Legislatures are being called together to do what is required of them under the plan, and the Governors of the North-West Frontier Province and Assam have been instructed to prepare for the referendum in their respective provinces.

The risk ahead is that, in spite of the acceptance of the plan by the major parties and the reassuring speeches made by their leaders after its announcement, fresh conflicts may arise in the course of the delicate operation of dividing India and cause communal warfare to boil up once more. The questions of the frontiers and of the control of the armed forces seem likely to be the two crucial issues, and in connection with both of them the Sikhs look like being an intractable element. The plan has on the whole met the claims of the Moslem League—though the League Council had formally to protest against the partition of the Punjab and Bengal—and it is accepted by Congress leaders as the only workable solution in view of the strength of Moslem opposition to Indian political unity. But the Sikhs come off badly from a partition of the Punjab, for any line drawn by census figures would leave a large number of them on the Pakistan side of the frontier and cut their community into two parts. The Sikhs have made their acceptance of the plan conditional on a satisfactory frontier, and they may be expected to demand one much farther to the west than the Moslems will be ready to concede. Lahore is reported to be the one place in India where tension is unrelaxed, and, if there is to be trouble during the next few months, it is the most likely storm-centre.

Labour Party Liaison

Any measures which can be taken to improve the contact between the rank and file of the Parliamentary Labour Party and the Government will be welcomed, and probably not least by

Ministers. Hitherto it has been difficult for them to gauge whether criticisms and proposals on policy came from pressure groups within the party or whether they in fact represented the views of a wider section of opinion. The proposals put forward by the Liaison Committee, which consists of three members of the Government and three of the Party, would substitute an area grouping of MPs for the narrow specialist groups which have hitherto been responsible for discussing policy. If these proposals are adopted, which seems certain, there would be nine and eventually eleven of these area groups, which would have the opportunity of discussing policy with the Liaison Committee and with the appropriate members of the Government, before the issue was thrashed out at a full meeting of the Parliamentary Party. The specialist groups would continue—and it is desirable that they should—but would be mainly concerned with working out longer-term aspects of policy rather than the day-to-day issues.

The Liaison Committee in its report quite rightly points out that differences of opinion are healthy, and that at all costs the Party must avoid setting up rigid machinery which would clamp down criticism. This is, of course, a perpetual danger in the Labour Party which, in spite of its large majority, is still somewhat addicted to heresy-hunting, and where there has been a tendency to give rewards to the "good boys" and leave the bad ones in the wilderness, irrespective of merit. The rebels and critics in the Party ranks have surely by now been sufficiently disciplined.

Postal Service

There was a short debate in the House of Commons on Friday of last week on the recent deterioration in the postal service. Both sides seemed to be agreed that there had been a deterioration, that the first-morning delivery is now later and the last evening collection now earlier; but the Assistant Postmaster-General asserted that it was necessary in order to save manpower and that it would do little harm. Ninety per cent of the correspondence, he said, was collected before 6.30 p.m., and, if so, would be delivered by the first post next morning. This may be so, though it is a generalisation to which there seems to be an increasing number of exceptions. Moreover, the suppression of all afternoon deliveries (except in Central London) increases the risk that, if a letter does miss the first delivery, it will have to wait until next day. The suppression of all collections after 6.30 p.m. (except at head post-offices), and the apparent intention never to restore a late-night collection—on the ground that people ought not to sit up at night writing letters—is even more serious. If the first delivery arrives after people have left their homes for work and the last collection is taken before they return, it becomes impossible for ordinary working people to deal with their private correspondence by return of post.

The debate was, by tacit agreement, confined to the letter post. But there is another aspect of the postal services which is of closer interest to *The Economist*. Many thousand copies of this journal are dispatched by post every week. They are taken, franked and sorted, to the GPO at Mount Pleasant before 5 pm every Friday evening. In the past, and even during the war (except for a few occasions when services were disrupted by the blitz), this provided plenty of time for the copies to be delivered all over England by the first post on Saturday, and in Scotland later in the day.

Head Office:
ROYAL EXCHANGE,
LONDON, E.C.3.

Branches and Agencies throughout
the United Kingdom and Overseas.

The successful continuity of the 'Royal Exchange' over a period of two and a quarter centuries has resulted purely from the satisfaction of its Policyholders.

ROYAL EXCHANGE
ASSURANCE: INCORPORATED IN 1720

But not now. Week by week, many copies are not delivered even in London until Monday, and in a town only 50 miles from London it is now the rare exception for copies to arrive before the week-end. We have naturally drawn the attention of the Post Office to the delays, but they are either unwilling or unable to put them right. Whether or not Mr Burke's boasts about the letter post are true (and they were very carefully qualified boasts), there is no room for doubt that the efficiency of the postal distribution of periodicals is disastrously lower at the present time than ever before.

None of those who know why this deterioration in efficiency has occurred—not during the war, but two years after the war ended—seem to be very anxious to give a candid explanation. At one time the fuel crisis was the excuse; now it is the need to reduce the Civil Service, though enthusiasm in that cause is not very noticeable elsewhere. The truth is, as Mr Burke should have been man enough to admit, that the Postmaster-General is beating a steady retreat before the demands of the Union of Post Office Workers, whose objectives are a 40-hour week and no night work if it can possibly be avoided. The union, of course, is fully entitled to make such claims—that is its reason for existence. But it would be less hypocritical of the Assistant Postmaster-General if he abandoned the pretence that the public interest is being defended against these claims. In the present combination of trade union government and full employment, the public interest is defenceless, and the Post Office is being run in the interests of its staff rather than for the service of the public. That will change later, when circumstances change; but that it is so at present hardly admits of doubt.

* * *

Manpower Trends to 1951

The Ministry of Labour is to be congratulated on its boldness in publishing an analysis of the nation's manpower trends over the next four years. Such an estimate forms an essential background to any economic planning, and if the planners are serious they will certainly pay attention to the article on manpower in the current *Ministry of Labour Gazette*, and be warned by it.

The two salient, and disturbing, features of the article are, first, the decline in the younger age groups of the working population, and, secondly, the lack of balance between the sexes (also referred to in a Letter to the Editor on page 934). Between the end of 1946 and the end of 1951 the number of men in the age groups 15-39 will decline by over 400,000, whereas the number of men between 40 and 65 will increase by 470,000. The number of women between 15 and 39 will drop by 490,000, and the numbers

from 40 to 59 will increase by just under 300,000. The number of young workers under 20 will drop by 219,000. These trends are shown in the accompanying table.

The figures given in it refer to the population of working age. The article also estimates what proportions of these will be available for employment (excluding private domestic service), and its forecasts lead to the conclusion that the total actual working population will fall by just under 100,000 by the end of 1951. The proportion of women, on the other hand, will fall

from 28.4 per cent at the end of 1946 to 26.8 per cent at the end of 1951.

(000's)			
Age Group	End-1946	End-1948	End-1951
15-39	8,986	Men 8,820	8,585
40-64	6,976	7,145	7,445
15-39	9,044	Women 8,845	8,555
40-59	6,653	6,775	6,950
15-39	18,030	Total 17,665	17,140
40-64/59	13,629	13,920	14,395

The conclusions to be drawn from these forecasts are thus plain. Industry can rely on a sufficient supply neither of juvenile workers nor of women workers in the productive age-groups. This means that many of the processes in manufacturing industry hitherto regarded as women's work will have to be performed by men. It may lead to a natural revision of the relationship between men's and women's wages, for the scarcity of female labour may have the effect of levelling up the women's rates to the men's.

The diagram in the first column shows the distribution of the working population at the end of March, 1947.

Germans in Conference

When Dr Hans Ehard, Minister-President of Bavaria, took the independent step of inviting the heads of all the German states to a conference in Munich, his initiative at least carried with it the hope that the German leaders might react against their continued vivisection. It was reasonable to think that the German people themselves, until two years ago a genuine unified historical community, could not possibly be as divided as their victors have made them, and that from a conference representative of the most responsible Germans in all zones, some voice speaking for reconciliation and for fundamental unity beneath all local differences might have been raised.

In fact, the German delegates reflected to an almost fantastic degree the attitude of their Allied Military Governments. The mimicry was most marked in the case of the "Russian" delegation, which withdrew from the conference completely when the other delegates refused to discuss a programme, drawn up by the Socialist Unity Party, demanding the centralisation of government, of economic activities, of the political parties and the trade unions. And on their withdrawal, the Germans from the East attacked their colleagues in terms taken directly from Moscow radio—as "jackals of American imperialism" and "tools of Western finance capital."

The "French" delegates, permitted to attend as observers, were as non-committal as their French masters on the question of Germany's future in the wider sense. And, although the Prime Ministers from the British and American Zones showed rather more independence and infinitely more dignity, they, too, seemed to conform to a pattern of policy laid down for them from above. Why, for instance, did they refuse to discuss the question of a centralised political regime? It is true that the Germans from the East presented it in provocative form. It is also true that the "French" Germans might have gone home, had it been discussed. But in any event the Germans from the Russian Zone departed, so little was gained. Yet the conference would have gained greatly by an inter-German discussion of the issue of centralisation versus federalism—an issue upon which Germans everywhere are known to be divided. If it is argued that such a discussion might have been contrary to the Anglo-American policy of support for federalism, it follows either that the "Western" Prime Ministers were following instructions in refusing to discuss the issue or are so conditioned to obedience that they simply accept their Governors' views on this point. In either case, even if the discussions had taken place, little would have come of them. Even the establishment of a permanent liaison committee between the Zones is probably still too ambitious. But at least the conference would have offered the world some evidence of a German community—a *pays réel*—existing beneath the divisions established and perpetuated by the victors. Compared with this failure, the resolutions actually passed by the Prime Ministers from the Western Zones are of minor importance. They are sensible in their demands, for a higher level of industry, more food, better opportunities for trade. But they could have been passed by any town council. It is the evidence of emerging states-

Outlet for Output

COMPLETE distribution to meet the total needs of the country depends on goods finding their way through all the widely-scattered retail outlets. But these goods must be directed through some channel, and that is where the wholesale textile distributor comes in.

Through the wholesaler, who buys in bulk and carries stock according to the standards laid down by the Wholesale Textile Association, the manufacturer is relieved of much costly detail and ensured a nationwide distribution.

Issued in the interests of Economic Textile Distribution by

The Wholesale Textile Association, 75 Cannon Street, London, E.C.4

Under One Roof

Here, under one roof, is an organisation covering virtually every requirement in Office Machines, Systems and Equipment.

Most particularly, we are concerned with planned control of raw materials, stock, assembly, man-power, production capacity, progress, selling, and accounting. There are few problems of industrial or commercial control on which we cannot throw the light of specialised experience.

This comprehensive service becomes more apparent during a visit to our systems display rooms.

Accounting Machines; Adding Machines; Calculating Machines; Filing Equipment; Production Control Charts; Kardex Visible Records; Certified Safe Equipment; Remington Typewriters and Supplies.

German Rations and Allied Plans

In a press conference at Bad Salzungen on June 9th Sir Sholto Douglas told the Germans that there can be no prospect of better rations in Germany until the German harvest begins to come in. At the moment, the zones rely almost entirely upon imports and while enough grain has been secured for June, the July allocation is more doubtful. The press conference, at which both Sir Sholto and the Chief of the Food and Agriculture Division in the Control Commission spoke of the poor prospects for food, appears to have been conducted on a note of marked austerity and its sombre tone contrasted rather oddly with the conversations which had taken place a few days before between Lord Pakenham and the Minister of Food for the State of North Rhine-Westphalia, Herr Luebke. In these talks, Herr Luebke outlined a plan for an import programme which in the light of the threatening world food shortage is little short of fantastic. Besides suggesting increased imports of bread grains to build up stocks, the German Food Minister also asked for an increased allocation of maize to build up the pig industry and increase the fat ration. Admittedly in a normal world such proposals would be moderate. But the food situation is highly abnormal and one wonders with some anxiety what Lord Pakenham said to make Herr Luebke feel after his talks that "the ice had broken a little." If so, then Sir Sholto Douglas very quickly froze it over again a few days later.

But the lack of co-ordination between different branches of Military Government which these events suggest is not the only disturbing feature of the present situation. The ration to-day is no better than it was a year ago. Are the right decisions being taken now to ensure that it will be better in a year's time? Has the machinery been overhauled? Have all failures not due directly to the world shortage been eliminated? One or two points suggest that there is still much to be done. In the first place, the statement that the allocation of 400,000 tons of grain for July will arrive "with luck" suggests that improvements both in procurements and in control of the pipe line must still be sought. Insufficient oversight over the flow of supplies has long been a bad feature of Military Government. Apparently it is not yet remedied. A second point—is a policy which aims at securing "the average calorific value of the ration over the whole area" the most advisable at present? The needs of country towns and great towns vary tremendously. A policy of concentrating on the Ruhr and seeing that the stocks for the eight or nine great industrial centres never ran out might give better results, especially in terms of coal output which—at 211,500 tons a day—is still running well below its peak. Again, one may ask why it is only now that a new move is being made to strengthen both the inducements and the penalties of the farming community. Finally, it is relevant to ask by what failure in public relations has Herr Luebke, a responsible Minister, acquired so little knowledge of the world food situation that he could, with perfect seriousness, produce an utterly unreal plan.

Tickets for Tokyo

On August 15th Japan is again to be open to private foreign trade. The enterprising merchant will now once more be permitted to penetrate the seclusion of this forbidden country and even, with the blessing of the Supreme Commander of the Allied Powers, to dream of indulging the profit motive. But the obstacles in his way will be as many as the dragons confronting the hopeful knight-errant in a medieval romance. To begin with, the number of aspirants will be limited; there will only be accommodation and food supplies for 400, and the Inter-Allied Trade Board in Washington will have to distribute places among Allied nations, so that the would-be merchant must presumably first of all get on to a priority list of his own Government. If he is selected and can reach Japan, he will then be faced with the problem that the yen has no foreign exchange rates. Prices in dollars are to be fixed for various commodities by Allied Headquarters, but sales may be in "any acceptable currency." Transactions in sterling will presumably be in sterling prices fixed from the official dollar-sterling rate, and similarly with francs and other currencies, but what Japanese business men will think of the relative values of different currencies will presumably be reflected in the degree of their willingness to be paid in them at the con-

trolled prices. After the deals have been made they have to be confirmed by both the Japanese Government and Allied Headquarters, so that the merchant will never be sure whether he is wasting his time or not until the last form has been dealt with by the officials concerned. However, if none of these difficulties daunts the trader, there are said to be quite a number of products which Japan now has available for export ranging from paper, clocks and surgical instruments to dried mushrooms, chestnuts and tinned vegetables. As for what Japan wants to buy, it is almost any kind of raw material, but there may also be a certain market for manufactures and for capital goods to restore industrial capacity. There does not seem to be any economic reason why there should not be a considerable trade between this country and Japan, but if the conditions of commerce are to remain as now laid down, a business trip to Japan will be almost as much of a hazard as it was in the time of Queen Elizabeth. Perhaps the title of "Merchant Adventurer" might be revived and conferred by the Board of Trade on business men who have deserved well of their country in such voyages.

Foreign Service Recruits

The analysis of the educational background of the new recruits to the foreign service, given by Mr Bevin in answer to a parliamentary question last week, gives surprisingly strong confirmation of the superiority of the upbringing still available in the much-abused public schools. However people may rail against the class privileges and unfair opportunities of those who enter these gilded portals, and who then gravitate almost without conscious choice to Oxford and Cambridge, their outstanding success in the foreign service reconstruction examinations cannot be attributed to bias on the part of the examiners. The results must, indeed, be embarrassing to Mr. Bevin, whose preferences were all the other way. But no one who has any first-hand knowledge of the post-war system of civil service examinations, nor of the "house-party" tests, considers that there is any unfair prejudice in favour of the public school candidates. There is a high degree of correlation between the candidate's marks obtained in the written part of the examination, in which there could be no bias against the secondary school entrant, and those obtained in the personality tests at the house-party, and if, at the latter, ease of manner, vigour and initiative are highly marked, these are surely qualities which representatives of this country need abroad.

Of the 154 new recruits who have been admitted to the foreign service since the war 35 have been over 30 and 119 under 30 (as at August 2, 1945). Of the 119 only ten were not drawn from the services, so that there should have been ample opportunity for experience of life to counteract the theoretical advantages of an expensive education. Nevertheless, a few of the big public schools came out far ahead of the rest: Winchester has 14 successes; Eton 9, Rugby 6, Oundle and Stowe 4 each. The disparity is even more marked with the universities: Oxford produced 55 successful candidates, Cambridge 47, London 7, all the provincial universities together 2, and the Scottish and Dominion universities one each. Six successful candidates did not go to a university at all.

These figures show two things; first, how much upgrading of the other schools and universities there is still to do; and, secondly, how important it is that, meanwhile, the training of those who are selected from the present narrow circle should be designed to broaden their experience and to give them an understanding of other walks of life.

Hope for Lebanese Democracy

The curious boycott of the Lebanese Assembly by the Beirut press is worth watching. The editors of all the leading dailies have addressed a letter to the President of the Republic in which they bluntly attribute the Government victory in the elections last month to "falsification and fraud." Condemning the new Assembly as unrepresentative, they ask for its early dissolution. Meanwhile, they propose to stay away from the Assembly, refusing to report its proceedings and ignoring all acts proceeding from it. Only one newspaper of consequence, *Le Jour*, which is semi-official, has kept out of this protest, and even *Le Jour* had previously criticised the conduct of the elections.

Rigged elections are nothing new in the Middle East. Even in the relatively advanced Jewish community of Palestine voices

are regularly raised against the conduct of internal elections. What is new is that newspaper editors of all shades, of different Moslem and Christian sects, should be able to unite in such a dramatic demonstration.

Since the Lebanon became independent more than two years ago, the people, unable any longer to blame the French for the endemic diseases of corruption, nepotism and absurdly over-staffed public services, have been growing more and more bitter against their own Government, which in its composition is as nationally representative and respectable as could be asked. Moreover high prices, low wages and maldistribution are still clear enough evidence of the Government's failure to cope with the continuing economic problem. President Bishara al-Khoury himself is accused of weakness.

Yet similar causes of discontent have existed for years in Egypt, and no such united protest is recorded. As for the press, it seems hardly conceivable that such an encouraging gesture of independence and solidarity should occur in any other Middle East country. But for all their aversion where the stranger is concerned, there is a certain sturdiness and freedom of spirit about the Lebanese. Their newspapers too are not owned by political parties, and they can look for readers in a population of which a far higher proportion is educated than elsewhere in the Arab East. Above all, it would be wrong to overlook the special local influence of the American University of Beirut—known affectionately throughout the Middle East as the AUB—with the generations of Lebanese whose social conscience it has laboured to awaken.

Obviously something must happen. Either the newspaper protest will peter out ineffectively, and the Lebanon will settle down to wait for its share of the transit royalties on the projected new American pipeline from Arabia, for the revenue from the proposed new international airport, and for such development schemes as may emerge from the economic survey of the country now being carried out for the Government by a British firm. Or the President may capitulate to a press which seems to have the people behind it. In either case the crisis must continue: but in the latter there would be hope of the Lebanon's being the first Middle Eastern country to meet social problems with thorough-going social remedies.

Dinner is Served

Last week an innkeeper of Epping was convicted and fined at Epping Quarter Sessions for the old common law offence of failing to provide, without reasonable excuse, a suitable meal at a suitable price for a traveller who presented himself at his doors for lunch. The excuse offered by the innkeeper was the fact that all his tables for lunch that day were booked and as a result his allocation of food for that meal was exhausted. The Chairman of the Sessions held, as he was bound to do under common law, that the excuse was inadequate.

The common law draws a distinction between innkeepers and restaurant keepers. The innkeeper has certain liabilities which flow from his status. The restaurant keeper has freedom to contract with whom he will. The case is a nice illustration of the inevitable conflict that arises when the law of one day is carried forward unchanged into a different age—when a country progresses from an era of unlimited local supplies of food into one of state ration books and state regulation of even the most elementary needs. The only person to-day who corresponds to the traveller of the centuries when the common law was established is the man or woman on a walking tour. The *bona fide* traveller of 1947 has the resources of post and telephone to safeguard his comfort in advance and the facilities of railway, motor or cycle to transport him further if he ends up in an area of local shortage.

To suggest that every innkeeper should be given additional food supplies to enable him to avoid the fate of his Epping colleague would conflict with current notions of social justice, which frown on the giving of privileges to those with the facilities to seek them out and the money to pay for them. Yet all the arguments are not on one side. The innkeeper who sells service with his wine list and gives a bare and surly minimum with the food is not unknown. Again, from a practical point of view, an hotel licence is usually more profitable to its holder than is a restaurant licence. People do not become common innkeepers purely from a well developed sense of social service. Perhaps the only satisfactory advice to give any traveller to-day is that based on the old copybook maxim: Punctuality for meals is not only the politeness of princes; it is also the best remedy against day or night starvation.

Cambridge Women Triumph

Time and not tear-gas has won the final victory of the women of Cambridge University; and now only the processes of Royal approval and technical adjustment lie between them and full equality with the men as members of the university. It has been a long battle, fought tumultuously in its early stages, but with severe restraint in the nineteen thirties and with a Fabian caution at the last. In fact, this much heralded event is taking place practically unnoticed, and almost unopposed. Time has worked its slow processes upon the men, and the women have been content to wait.

A charming commentary on this event has been given fortuitously in a book* by Mrs. Keynes, mother of the late Lord Keynes, which has just been published. A vivid contemporary description of the crowded Senate House, where the voting took place in 1881 to allow women to sit as of right, instead of by courtesy, for the Tripos examination, ends with the following quotation: "When women get degrees, it will be nothing to this, we all feel it is the great crisis in the history of women's Colleges." How right this was. In 1921 the battle was still on; the streets of Cambridge were packed with the ancient denizens of country parsonages who came to vote against admitting women to membership of the university and to a place in its government, and were only prepared to grant them titular degrees. In the early nineteen thirties the women's representatives decided that time was on their side and that a violent campaign would only do their cause disservice. And so in 1947 the pendulum has swung right over, and the syndicate appointed to consider the status of the women has recommended that they should be given full equality except in holding the offices of Proctor or Esquire Bedell, and in their numbers; the proportion of women to men is to be limited to one fifth.

Shorter Notes

Signor de Gasperi's first statement of policy to the Assembly underlined Italy's dependence upon American assistance. The Prime Minister suggested that for two or three years to come, dollar loans would be necessary and that this year's trade deficit alone makes a credit of 200 million dollars imperative. That the country at large shares Signor de Gasperi's conviction is suggested by an extraordinary *volte face* on the part of the Communists. A week ago they were railing at the Americans for dollar imperialism and capitalist exploitation. But on June 7th, the chief organ of the Communist Party, *L'Unita*, startled everyone by declaring that "Italy needs the solid help of the generous American nation."

* * *

The new interim cost of living index is to be based on prices on June 17th, which will be taken as 100. This announcement by Mr Isaacs in the House of Commons on Thursday was accompanied by the publication of a White Paper, setting out the basis on which the new index has been compiled. It represents an index of retail prices, weighted according to the pattern of 1937-8 expenditure, with extra allowance made for expenditure on such items as tobacco. The cost of living advisory committee will now start to work out the basis for a permanent index, but it will clearly be some time before conditions can be regarded as normal.

* * *

In anticipation of yesterday's debate in the Commons on the Northern Ireland Bill, the Government of Northern Ireland last Monday published a pamphlet setting out the Government's case for its retention of the unusual powers given to it by the Civil Authorities (Special Powers) Act. The pamphlet contains an account of IRA activities during the 26 years the Government has been established, accompanied by nine full-page photographs of collections of small arms and small arms ammunition seized by the Northern Ireland police during the course of raids on houses in Belfast (the latest date of a raid given is November, 1943).

* * *

If yet further proof was needed of the prestige of university education the most recent report of the Building Apprenticeship and Training Council (HMSO 1s.) would give it. According to it the nation requires university-trained builders, who are apparently to be a breed of super managers with a general knowledge of building techniques, a broad understanding of the social implications of their work and a B.Tech or Dip.Tech after their name. The nation certainly wants first-class managers in building concerns, but this highly vocational but unspecialist method of creating them appears to combine the limitations of technical training with the dangers of amateur status.

Letters to the Editor

Bonus Issues

SIR,—I disagree with Mr Monroe and suggest that your withdrawal to Mr David Eccles's challenge was fully justified—and, incidentally, an example of journalism at its best.

When the difference between a continued holding and a sale of the bonus "issue" is considered, Mr Monroe's examples of apparent surtax "evasion" will surely be seen to be based on misunderstanding. Many shareholders continue to hold both the original shares and the bonus shares. In that case it matters nothing whether the bonus issue is in shares of the same class (equity shares) or in another class of share, or even in debentures. The shareholder still holds his original property, and the nomenclature in paper certificates having been increased, and the ability of the company to distribute accumulated profits having been reduced by the additional capitalisation.

To understand the fundamentals of the alleged surtax evasion it must be realised that any potential evasion arises not out of the bonus issue but out of events much earlier than the bonus issue. As any company withholds from distribution substantial profits which could otherwise have been distributed, so the shareholders gain in capital what they lose in income. If there should be surtax-liable shareholders, they inevitably gain—and whether there is later a bonus issue or not. The occasion of the bonus issue is no more than a publication of the accumulative effect of a socially desirable under-distribution and the consequent adjustment in nomenclature.

I submit that for the above fundamental reasons Mr Monroe's contention is wrong in general. Let us, however, take the particular case, and suppose that the shareholder does sell the whole or part of his new pieces of paper. Mr Monroe admits that if the issue is in shares of the same class the sale is no more than a sale of a corresponding proportion of his original holding—a sale of a capital appreciation which he could turn into cash at any time and without the issue. He contends, however, that an issue in a different class of share which is paper with a printed heading "Preference Share," or "Debenture," is a simple "method of evading surtax."

Possibly the best way of exposing the underlying fallacy and to demonstrate the generality of the principle that a sale of part of a shareholder's property after a bonus issue is in essence no different from a sale before, is to liken the capitalisation of a company to a neapolitan ice, say, of white and red ice. In the bonus issue of which Mr Monroe approves, the ice lies with colours running horizontally. The ice is then cut vertically, and two helpings of half the size and each of red and white are made from the original double-sized ice. In the bonus issue of which he wishes us to disapprove, the ice is turned so that the colours run vertically, and the cut is made parallel to the lines of colour: there are again two helpings of half the size instead of one of double the size, but in this case one helping is red and the other white. The man who owned one big ice in both cases now has two smaller ones; if he sells either half he is doing no more than selling a part of what he originally owned—an action clearly as approvable in the second case as in the first.

Finally, Mr Monroe raises the further point that the debentures may be repaid within a few days. This is true, but is no more than saying that any repayment of capital to equity shareholders out of past profits may, to some shareholders, be surtax-free. After all, the Courts are not empowered to withhold sanction from a proposed partial repayment of the paid-up capital of equity shares by consideration of whether some shareholder may be a potential payer of surtax.

Let Mr Monroe tilt against accumulation of profits and against repayment of capital if he likes—these are the two fundamentals of any potential evasion—but let him admit that the bonus issue itself is never anything more than a fossilisation into the capital structure of profit balances until their distribution, and that it is the other two points—which are separate—which are the only relevant ones.—Yours faithfully,

I. J. PITMAN

House of Commons, Westminster

SIR,—Re your comments on bonus issues in connection with Mr David Eccles's letter in your May 10th issue.

I am not defending the tax on bonus issues nor suggesting that such issues are or ever have been used for the express

purpose of evading surtax, but surely the case quoted by you is the perfect example for proving that bonus issues do save surtax.

A holder of £100,000 stock receiving 5 per cent dividend and 5 per cent bonus in shares, is liable for surtax on £3,000, provided this is his only income. If, however, 10 per cent is distributed in dividends he would receive £10,000 gross, of which £8,000 become liable to surtax. This is the crux of the matter. Your references to selling bonus shares or reducing the original holding and thus keeping income steady seem to be beside the point.—Yours faithfully,

F. NEUBERGH

9 Bishopsgate, London, E.C.2

[The cases that Mr. Neubergh compares are not comparable. The cash equivalent of 5 per cent plus 5 per cent bonus would be 5½ per cent (i.e., 5 per cent plus one-twentieth thereof), not 10 per cent as he supposes. And the market valuation of a share paying 5½ per cent ought, in logic, to be almost exactly the same as that of a share paying 5 per cent plus 5 per cent share bonus. The only difference is that, with the bonus method, the shareholder has to wait a year for the extra ½ per cent. But that is not an evasion of surtax on income received, it is merely a slight postponement both of the income and of the tax liability.—EDITOR.]

The Use of Foreign Womanpower

SIR,—Your note on the use of womanpower tempts me to add my plea to those already made on behalf of the many women on the Continent who would come to this country and work well, if allowed to do so. You spoke in another paragraph of 10,000 voluntary workers who have been brought to this country from displaced persons' camps. Even if three-quarters of these are women, I cannot believe that 7,500 is more than a small proportion of those who would come from the Continent if a more active and liberal policy were followed.

The use of European women meets practically all the very real difficulties mentioned in your note and there is a point which I have not seen mentioned, namely that, probably for the first time in our history, the number of young men will shortly

From The Economist of 1847

June 12, 1847.

It is with reluctance that we commence a few observations on the proceedings of our Government in relation to Portugal before the pending debate, in which the conduct of Ministers will be fully explained and defended. But, if we would not be dumb on this interesting question, we have no alternative; and on such materials, therefore, as the published despatches and notorious facts supply us with, we must form our own judgment.

Up to a certain point, the intentions and acts of Her Majesty's Government were most honourable, considerate, just, and even kind. By what fatality they have been in the end brought to take such a decided part against the insurrectionists, the despatches do not inform us; at least we cannot believe that any apprehension of the present wretched Government of Spain interfering against the declared will of England could have led to such a result. It may have happened . . . that Lord Palmerston and his employees, full of the vast dignity and power of England, have formed a very weak opinion of the Portuguese in general, and thought it was only necessary to declare their will to the Junta, to make it immediately and thankfully adopt all their suggestions. Disappointed by the patriotic dignity of Das Antas and his friends, their pride got the better of their judgment, and they regarded the refusal to adopt the proposed conditions as an insult to themselves and Great Britain. We cannot enter into their views. Against the principle of interference with the internal affairs of other nations, our whole independent career as a nation, the jealous pride with which we have repudiated all such interference, is a strong and a durable protest. But to interfere in a quarrel between parties, and to take the side of a military revolution—the side of a faction, which sets aside the constitution, and makes the sovereign absolute for its own purposes—which suspends the freedom of the press, abrogates the jury laws, and destroys the privileges guaranteed to our own subjects, appears to us, in the Ministers of England, to be inexplicable and inexcusable.

exceed the number of young women. I do not know to what extent Dr Enid Charles's calculations should be modified to take account of the war, but the young people coming into the labour market did not fight and the sexes were affected equally. Dr Charles's "third estimate" gave, for 1950, 1,502,000 males and 1,476,000 females in the age group 20 to 24. This state of things continues throughout her tables for the more speculative years thereafter, while for 1935 the figures were 1,666,000 and 1,733,000 respectively.

The social consequences of there being more lads than lasses are bound to be great. A surplus of lasses has always been assumed. The vast majority of young men marry, and quite right too, and the absence of the surplus girls may mean not a shortage of young female labour, but its almost complete disappearance. The alternative would be the sacrifice of the first years of married life, so important to the young people themselves and to the community, to a short-sighted and illiberal immigration policy.

One of the errors of this period is the imputation of all our troubles to war causes. Many of these troubles are due to pre-war trends which were masked during the seven last years and are now making themselves felt with added momentum instead of gradually. Anyone who heeded the figures could have foreseen a grave shortage of labour in the occupations such as typing, nursing or light assembly work, for which a supply of young women is necessary.

There never was a clearer case than the present shortage of womanpower for a generous welcome to those willing and even longing to come.—Yours faithfully,

G. E. TOULMIN

Werrington House, Peterborough

University Progress

SIR,—Throughout your two recent articles on university policy there is one notable omission. It is assumed that the students for the expanded universities will be forthcoming, and there is no discussion of what, for students, is the major problem: grants. The Barlow report, quoting the Leybourne-White survey, estimates that "only about one in five of the boys and girls who have intelligence equal to that of the best half of the university students actually reach the universities." Finance is possibly not the only barrier to higher education, but it is undoubtedly the greatest. The Government has recently made generous increases in the amount and number of grants to students, but a consideration of the figures will show that these increases are not sufficient.

At present there are some 66,000 students at our universities. It is understood that over 35,000 awards have been made under the Further Education and Training scheme for ex-Servicemen, about 20,000 of them since last autumn. Compared with these figures, only 6,000 "normal" students will receive grants

Books and Publications

Eye Witness in Jugoslavia

"Partisan Picture." By Basil Davidson. Bedford Books. 18s.

MR BASIL DAVIDSON's book is the first eye-witness account by an Englishman of the Jugoslav war from the Partisan side. Read in conjunction with Rootham's account of the Chetnik movement, it gives an admirable picture of Jugoslavia. Part of the book is an account of the military and political struggle in Jugoslavia as a whole. Though not based on first-hand experience, and familiar to those who have studied Jugoslav affairs, it may be recommended to the public as a narrative of events inadequately known in Britain, and confused by the mass of ignorant or mischievous propaganda put out from various quarters. Mr Davidson's facts are as near the truth as can reasonably be expected in present conditions. Among points of detail which should be treated with reserve may be mentioned his oversimplified reference to the "coup d'état" of March 27, 1941, and some of his estimates of numbers engaged in the guerrilla war.

But the main value of the book lies in Mr Davidson's own experiences. Tito's forces were of two types. There were the regular units, "corps" and "divisions" numbering some thousands, with their staffs and headquarters, organised in a comparatively stable manner and located in "liberated territory."

annually from public funds after the new Government policy has come into operation. Clearly this is inadequate.

The National Union of Students advocates that as the ex-Servicemen students pass through the universities the money spent on FE and T grants should be allocated to "normal" grants, as a step towards the acceptance of the principle of grants for all students, with the corollary of entrance by merit on the basis of revised and co-ordinated tests. The popular conception of the poor student starving in a garret is still far too near the truth, and not until as a nation we recognise the principle of equal educational opportunity up to university level will our expanded universities be used to the best advantage.—Yours faithfully,

MARGARET RICHARDS, Secretary

National Union of Students, 3 Endsleigh Street, W.C.1

Dollars for Europe

SIR,—It would be inappropriate for an American to interpret Mr Marshall's recent address at Harvard or to suggest the proper shape and character of the European Plan which it was designed to evoke.

Two general observations may, however, be relevant:

1. The larger in scope, the more far-reaching in aim the plan is, the more likely is it to commend itself to the American people, and, in the last analysis, to the Congress;

2. Beneath the fluctuating views of Americans towards Europe is a deep and virtually universal conviction; namely, that Europe will never be stable and secure until it learns to operate, economically, at least, as a community.

These observations would suggest that Europeans might do well to match, in their planning, the largeness of Mr Marshall's offer.—Yours faithfully,

W. W. ROSTOW

The Queen's College, Oxford

Scope for Import Cuts

SIR,—Your note to Mr Drabble's letter on expenditure by British tourists abroad is nonsense. We have been persuaded to accept the necessity of exporting (refraining from consuming) things that we need so that we may import (and consume) things we need more. To justify an effective import of luxury consumption on tourism in order to be able to export (and thus deny ourselves) the things we need is the export drive turned upside down and run mad.—Yours faithfully,

S. A. ff. DAKIN

Mulberry House, Chestnut Avenue, Guildford

[If exports to a soft currency area did in fact curtail the amount of supplies to hard currency countries, this would indeed be an unwise policy. But surely when hard currency areas are taking as much as they want of a certain type of goods, it may be good policy to sell the remainder to soft currency areas even for "tourist" sterling, if by so doing a future export market is secured.—EDITOR.]

THE ECONOMIST BY AIR

Express Service to U.S.A. and Canada

Readers of *The Economist* in the United States and Canada can receive their copies within a day or two of publication for an annual subscription of \$24. They should apply to:

The Publisher, *The Economist*, 15 Lancaster Place, London, W.C.2.

It is a good story, well and simply told, and there are portraits of Yugoslav characters, which will give the general reader a better notion of that delightful and exasperating country than whole volumes of history and political polemics. Mr Davidson also happily avoids the turgid phrases of political jargon that ruin most writing on European, and especially East European affairs. He is free from the "mental ingrowing toe-nails" which poison even intelligent minds with absurd suspicions. He had served on a headquarters staff before he went on his operation, he knew that not all his superiors were reactionary or incompetent, that when much-needed aircraft did not arrive, this was usually due, not to the machinations of "pro-Fascist cliques," but to weather conditions over the Adriatic or competing claims from guerrillas in Thessaly or Aosta. And if he was not always able to make his Yugoslav friends understand this, one can only say that no man can be expected to perform miracles.

The last chapter consists of general observations on British policy in the Balkans. Mr Davidson seems at times too ready to assume that brave resistance and a determination to improve one's country's lot are a guarantee that improvements will really take place, and too inclined to identify Soviet policy with progress and British opposition to features of that policy with reactionary prejudice. But anyone who wishes seriously to study the real Europe of to-day should read this book, whatever his view of Mr Davidson's political opinions, for it vividly and accurately portrays a social background and a mental outlook which, with variations of detail, prevail over about half the continent, in the lands lying geographically and culturally between the West and Russia.

More Than Gusto?

"Inside USA." John Gunther. Harper Brothers. New York and London, 1947.

MR GUNTHER describes his book *Inside USA* as a "long circumnavigation of the greatest, craziest, most dangerous, least stable, most spectacular, least grown-up and most forceful and magnificent nation ever known," and the description is a good one. In 920 pages and 52 chapters, he conducts his readers at breakneck speed round the entire continent of America, talking, sometimes a little breathlessly, in their ear the whole way round. "That was Cleveland. Look, there's Mr Taft ('What cannot be explained in Taft are his majestic wrongheadedness, his Brob-dingnagian bad judgments'). Quick, take a look at Boulder Dam. Hello, Mr Stassen ('Just when you're really close to Harold, he trips you up'). Over there we are passing Reno—and 'for every three marriages in 1946, there was one divorce.' Now, take Kentucky—yes, 'the curse of Kentucky is backwoodism.' Well, if it isn't Mr LaGuardia (the 'not so little Flower'). So it streams on, stimulating, jumping from fact to generalisation and back again, packed with people and with entirely miscellaneous information, slangy, expressive, bursting with life, in itself a sort of epitome of the immense empire it attempts to coax and bash and bully into the strait jacket of a book.

Needless to say, it is great fun.

But is it anything more? It is after all an undertaking to read 920 packed pages (holding the book is a physical effort) and at the end of it the reader should be able to feel that out of the cloud of fact and description some clear outline, some sense of the whole had emerged. Mr Gunther is conscious of this need.

Every now and then he says, "Notice this trend. It will come up again," or "This point represents a phenomenon you will meet all over America." But it cannot be said that the book altogether succeeds in this wider and more vital purpose. The final effect is one of entertaining confusion and the reader may know more about the Americans in detail, he may indeed have a better picture of their greatness, their craziness, their magnificence and their instability, but he still will not know, in the appropriate American phrase, "what makes them tick."

Mr Gunther promises a second volume, upon Washington (DC), Congress, Government, and nationwide politics. Here, no doubt, the broader statements and judgments will be laid down. But *Inside USA*, for all its gusto, would be a better book if one put down Volume One with some inkling of the broader perspectives promised in Volume Two.

A Frenchman in Berlin

"Souvenirs d'une ambassade à Berlin, Septembre 1931—Octobre 1938." A. François-Poncet, 1946. Flammarion, Paris. 195 francs.

M. FRANÇOIS-PONCET's book covers seven years of which neither Frenchman nor Germans (and, for that matter, neither Englishmen nor Americans) have reason to be proud. The Germans did almost everything within the power of a single nation to degrade and destroy Europe; the French did little to preserve it. The English went on trying obstinately to square the circle; the Americans just refused to face the technical and military consequences of a material progress to which they had largely contributed.

M. François-Poncet is concerned mainly with the *degringolade* of the German Reich. As French Ambassador at Berlin, he was in a favourable position to observe what was happening. He described to his Government very clearly what he saw; his book gives an equally clear picture, and indeed one may read it better as a history of National Socialism than as the record of an Ambassador's diplomacy. It is possible to infer a good deal from this discreet account of the French reaction to the growing German menace, but M. François-Poncet is almost too cautious. He was responsible for the execution and not for the formulation of policy, and thus has no reason to produce, like M. Bonnet, an *apologia*. He has nothing to hide and little to reveal, or, at all events, he does not produce any revelations. There are a few interesting points, e.g., Schwenin von Krosigk exclamation, "Gott sei dank" when he and other guests at a dinner party in the French Embassy were told that the Reichstag was on fire. There is also an interesting account of M. Lipski dropping out of the small dinners at which the French Ambassador and some of his colleagues met for the exchange of ideas and information. Or, again, M. François-Poncet tells that he asked Hitler more than once to add a footnote to the most virulent anti-French passages in *Mein Kampf* in order to explain that these passages were written under the influence of the French occupation of the Ruhr; "Hüter, tout en s'y prétendant disposé, ne voulut jamais s'y résoudre." In general, however, the book will appeal most to those who want a good, straight history of events in Germany between 1931 and 1938; a history written by a highly intelligent onlooker whose civilised disgust at the German reversion to barbarism does not distort his powers of observation.

AMERICAN SURVEY

80th Congress, First Session

(From Our US Editorial Staff)

TOM PAINE is rarely cited as a patron saint of the Republican Party. But the first Republican Congress in a decade and a half is now beginning to mark tentative adjournment dates on its calendar. And the legislative emphasis of its first session certainly underlines Citizen Paine's assertion that "Government, like dress, is the badge of lost innocence."

One Republican member puts it: "We came here pledged to make four reductions: in the budget, in the debt, in taxes, and in the power of labour unions to damage the national economy." (A further reduction was implicit in the Constitutional Amendment to limit the tenure of the Presidency to two terms, which Maine, appropriately, was the first State to ratify.) The amount of debt reduction that will be effected is still doubtful. Otherwise the Congress has made good on this pledge. Aside from the foreign affairs programme, which has had support from both parties, practically nothing more has been attempted; in the weeks that remain, the merger of the services and universal military training are the only important items besides appropriation bills, for which any consideration is now planned.

Two hotter potatoes could hardly have been handed to the President than the Tax and Labour Bills. With a Presidential election coming up next year, the general welfare is likely to be estimated—by both sides—in terms of votes in a particular column. At the time the Bills went to the White House, the impression was current that the President would veto the Tax Bill and might sign the Labour Bill. It was assumed that on balance, the average taxpayer's desire for relief could be outweighed by a message that would emphasise the proportionately greater relief afforded by the Bill in the upper income brackets, the danger of more inflation through release of new purchasing power and the desirability of saving future taxes by vigorous debt reduction when times are good. More dubiously, it was assumed that the general run of citizens who believe that something should be done about labour is a larger portion of the effective electorate than the organised workers. But the alternatives pressing upon Mr Truman were also recognised. A veto of the Tax Bill would almost certainly not be reversed by the necessary two-thirds vote in Congress, but it is probably too late for an alternative measure; that would mean no tax relief at all this year, and the Republicans would make it clear who was responsible. A veto of the Labour Bill would almost certainly be over-ridden. Then the Republicans would get the credit for its passage with the many electors of opinion that are strongly in favour of the Bill, particularly as toned down by the Senate. On the other hand, labour support will be crucially important to Mr Truman next year. In States with big electoral votes, such as New York and Illinois. For union leaders, the Bill is a symbol as well as a set of specific provisions. A veto, particularly coming just after Mr Wallace's not unsuccessful swing around the country, would increase the

likelihood of third-party activity in these States. In 1912, when the Progressives, with Theodore Roosevelt as their leader, broke off from the Republican Party, the Democrats got in. Next year, the Progressive Citizens of America, under Wallace, might reverse the process.

But while Mr Truman ponders these imponderables, the budgetary economies contained in some of the Appropriations Bills are giving the Republicans a few hot potatoes of their own. Reductions in the activities of the executive departments affect others than the despised bureaucrat. From its inception, the balance in the Republican Party between the industrial North East and the agricultural Middle West and Far West has been delicate. The recent slash in the Interior Department's funds for reclamation projects gave Far Western Republicans a slap in the face. (The Wool Bill was in part an effort to offer Rocky Mountain constituents a boon, in the best Hawley-Smoot tradition, to offset Republican disapproval of these public works.) Discontent moved to the Mississippi as comparable cuts in Department of Agriculture requests brought disgruntlement to the corn-hog area. After their brave show of economy-and-let-the-chips-fall-where-they-may, some Republican Congressmen will go home to find the chips on voters' shoulders.

In a broader constitutional aspect, the session has demonstrated rather strikingly how the Senate, with its staggered elections and longer terms, serves as a mitigating body, both in respect to the transfer of power from the outs to the ins, and in respect to sudden bursts of feeling through the country—as witness the story of the Labour Bill.

Both Houses have made considerable progress under the letter and the spirit of the Reorganisation Act. Business has been conducted under the reduced number of Standing Committees that the Act provided—only two additional Select Committees have been authorised in the Senate and three in the House. The number of standing sub-committees, is the same, but their work has shown more logic and less overlapping and grants about jurisdiction. Some progress has been made in improving the quality of the staffs serving these Congressional committees.

Less progress has been made on the Congressional side of the Employment Act, under which a joint Committee of the two Houses is required to file a report by May 1st of each year on the economic proposals made by the President on the advice of his Council of Economic Advisors. Mr Taft, chairman of this Committee, has been vastly occupied, particularly with the Labour Bill. So progress to date includes only the staffing of the Committee, the appointment of a sub-committee headed by the able new Senator from Vermont, Ralph Flanders, and the preparation of a questionnaire on which the work of circulation and compilation is being handled on a non-commercial basis by Dun & Bradstreet. The Committee has shown no tendency to take up the President's recommendations in related form; the concept of a legislative budget for economic measures, which was one of the basic features of the Act, is so far unrealised.

On the other hand, the Republican Policy Committee, established in the Senate under the Reorganisation Act, to take an overall view of the course of legislation, of which Mr Taft is

OPPORTUNITIES IN JAMAICA

THE forthcoming development of the Tourist Industry in Jamaica, appealing specially to wealthy tourists from U.S. and Canada, offers new opportunities for investment in Farm Lands, Building Property, Hotels and other businesses.

Lovely scenery; delightful climate all the year round; abundant labour; low taxation; and inside sterling area.

Prominent resident of Jamaica, now in London, can supply first-hand and reliable information to those interested in such investment, or in personal Homes on the island. Write to:—

WILLIAM READ

ANNUITIES

(Single lives : Last survivor : "Capital-protected" : "Capital-redemption" : Reversionary : Certain : Deferred, etc.)

Owing to high income tax, coupled with a substantial fall in interest yields, the purchase of annuities has become attractive to an increasingly large number of people, particularly now that the capital invested in them can be safeguarded, wholly or partly, against loss due to premature death. The undersigned has specialised for many years in every kind of annuity issued by the various Insurance Companies (for all of which he acts impartially), and is in a position to advise on those giving the highest NET yield with complete safety.

Descriptive Brochure, without obligation, to bona-fide applicants.

"AMERICAN SURVEY" is drawn from three sources. Articles described as "From Our US Editorial Staff" are the work of a small group of regular correspondents, resident in the United States. Articles with some such attribution as "From An Industrial Correspondent" or "From A Correspondent in Ohio" are from outside contributors. Everything printed without attribution is prepared in London.

also chairman, has functioned actively—especially in contrast to its Democratic counterpart—and survived certain problems of discipline.

A perennial question at adjournment time is, when will Congress come back? In theory, not until next January, and the leaders of the Republican majority have no other plans. But political speculators find reasons why the President might call a special session before the beginning of the winter. The necessity of a broad-gauge American programme for Western Europe is daily more apparent. The marginal nature of the Greco-Turkish programme has been commonly understood from the first. Appropriations of money by Congress play a central part in American foreign policy as it is developing. Before January, political and economic events in Europe may make clear to the country the cost of delay, which is already being counted at the operating level. Economic events in the United States may give business an interest in outlets abroad. And the members of both parties who want to maintain a bipartisan foreign policy may agree that 1947 is a better year than 1948 for consideration of difficult issues.

American Notes

Underwriting Europe?

Mr Marshall's speech at Harvard recommending the underwriting, by America, of a European plan of joint salvation, is an assurance that the issues raised by Mr Acheson will not prove to have been still-born. Whether the solution advocated by the State Department and supported by Mr Harold Stassen, Mr Walter Lippmann, Senator Fullbright, and others, will ever reach maturity is another matter. But only two other great debates in recent American history are comparable to the debate which is just beginning: that in 1919-1920 over whether the United States should join the League, and that in 1939-41 over whether the United States should take an active part in the war. The decision over economic aid to Europe in 1948 and 1949 is the economic counterpart of the political issues raised in America by the Versailles Treaty.

The considerations which may influence the decision in Congress are discussed elsewhere. So far only the friendly voices have been heard; the great issue is as yet, for the average Congressman, no issue at all. But one test is just ahead. President Truman has requested Congress three times, with a rising sense of urgency, to extend the import and export controls which are essential to the maintenance and effective distribution of American shipments abroad. At the end of March Congress could not make up its mind and postponed the distasteful decision until June 30th. Without further extension, it will become steadily more difficult to translate Europe's dwindling hoard of dollars into the goods so desperately needed. If Congress strains at this humble and necessary gnat, can it be expected to swallow the camel of an annual investment of some \$5 billion in Europe's future?

The project which Mr Marshall outlined can be acceptable only if supported by both parties. As yet Senator Vandenberg has given no clue to his attitude. To Republicans burdened both with international and party responsibilities, the dilemma must be acute. Not only is it unlikely that the device of a special session could successfully dispose of so controversial an issue before the brickbats of the Presidential campaign begin to fly, but the acrimonious exchange between Senator Taft and President Truman has already involved the foreign relief programme in the politics of domestic prices. The high cost of living is currently one of the sharpest issues between the parties: "Republican prices" the Democrats like to call them, resentfully remembering the dissolution of price control. Prices having obstinately refused to respond to the Republican recipe of freedom from bureaucratic control, Mr Taft would like to saddle the high cost of living on to the President's foreign policy and labour policy. Given continued full employment in the United States, the element of truth in Mr Taft's passing of the buck will hardly assist projects designed to maintain and even increase foreign purchasing power.

Truman v. Taft on Prices

Mr. Truman's insistence on the necessity for voluntary adjustments in industrial prices has now brought Senator Taft to the point where he is again willing to challenge the White House in terms of the unusually bitter antagonism which marked the 1946

controversy on the Price Control Act. A few days ago, Senator Taft remarked, somewhat sourly, that the President had "abandoned talk of keeping prices down in favour of heavy spending abroad that will keep them up." In his view, the only way to bring down prices was to reduce the demand for goods.

In reply, Mr Truman declared that, quite obviously, the \$400 million loan programme for Greece and Turkey was not designed to correct the price situation, but to bolster a corner of the world economy in desperate need, and to resist "totalitarian aggression." The Administration, he continued, fully recognised the danger of inflationary trends arising from foreign loans, and was therefore the more determined to "handle domestic problems with vigour and common sense." In a passage which served as an eloquent reminder that Senator Taft led the fight against price controls, the President observed that "business intelligence must take the place of government regulation" and that Senator Taft's cry for diminishing the level of effective demand was, in effect, a plea for depression as a cure for prosperity.

On the whole, this does not seem to be a particularly profitable level of controversy, and Mr Truman's selection of the quite sharp decline in food prices by comparison with those of other commodities (between the March, 1947, peaks and end-May food prices had come back 9 per cent, and all other commodities by one-tenth of one per cent only), is surely invalidated by his own recognition that, for very obvious reasons, the flexibility of farm prices can have no general reflection throughout industry.

On the other side, Senator Taft's eloquence from V-J Day onwards was scarcely directed towards price reduction through dwindling demand—if that be his current target—and the \$400 million loan proposals look very small by comparison with the \$4 billion tax cut which the Senate has just approved. The President's own vulnerable record in terms of price movements was detailed in *The Economist* of May 31st, but it may be worth repeating that the "moral drive" against price rigidities is not likely to carry very much weight. A significant item in the recent business pattern was the brave attempt made by traders in the small town of Newburyport to buttress demand by a general downward revision of retail price-lists. For this scheme, there was nation-wide publicity, and general commendation from the President downwards. The attempt was, nevertheless, a failure because the suppliers refused to co-operate and price cutting efforts were soon abandoned. Meanwhile, longer-term forces are still working for price revision. They include the high output of non-durable, and the steady rise in output of durable, goods; the heavy accumulation of stocks, and the growing productivity of labour. By the turn of the year, they may well have succeeded in ironing out some of the more obvious anomalies in the present price-structure.

Fairer Rates for the South

A grievance nearly as old as the Civil War was sustained, and, in part, redressed, on May 12th when the Supreme Court upheld an order of the Interstate Commerce Commission to adjust freight rates as between the East and the South and West. The South, and more recently, the West have always maintained that the freight rate structure organised from the industrial north-east was designed to keep them in a state of exploitation, colonies supplying raw materials to the industrial giant of the East, prevented from industrialising themselves almost as effectively as British laws in the colonial period forbade competitive American manufactures. The cause was taken up vigorously by Mr Arnall when he was governor of Georgia; it was fought by 9 States and 33 railroads.

The passionate belief in an Eastern "conspiracy" to stunt Southern and Western industry may somewhat over-dramatise the situation. Freight rates originally were higher in the South and West because distances were greater and traffic lighter. But the differentials have persisted long after the conditions that originally excused them have disappeared, and the North-East has never protested against the competitive advantage this entailed.

The aim of the South and West is a nation-wide equalisation of freight rates. This is still a long way from realisation, for America's freight rate pattern is a maze unravelled by very few, and the present order concerns only "class rates," that is, rates on manufactured and other high value goods. On these, the ICC can now put into effect the 10 per cent reduction in the South and West (though not in the Far West), and the 10 per cent increase in the East, which it originally ordered two years ago. These rates skim the cream of the traffic; bulk commodities and agricultural products are charged at other rates, as yet unaffected. The principle, has, however, been established. The Supreme Court upheld the ICC's contention that class rates were preju-

dicial to the economic development of the South and West. As an example, the ICC cited rates on cottonseed oil, which are 7 per cent higher from Southern to Official (north-eastern) territory than within Official territory. If the cottonseed oil is manufactured into margarine in the South, the discrepancy amounts to 33 per cent. This decision will give a new stimulus to the industrialisation of the South and West, which is already well under way and providing serious competition to the older industrial centres. An era of veiled colonialism is drawing toward its close.

Locking the Back Door in South America

The decision to welcome back the prodigal Péron ends a long drawn out and unhappy episode in Pan-American relations. The attempt to oust Péron had patently failed; the displeasure of the United States was proving an aid, rather than a hindrance, to Argentine efforts to forge an economic and political block among the South American States. Against this background, the Service view has prevailed that it is urgent to lock the back door of the United States against potential aggressors. The announcement that Argentine compliance in ousting known Nazis had reached a degree sufficient to warrant the holding of the Rio Conference has followed hard on the President's renewed request to Congress for approval of the project of standardising and distributing surplus American arms throughout the Americas. Once the decision had been taken, the caste of characters changed with dazzling swiftness. The President accepted the resignation of Mr Braden, who has consistently advocated a tough policy towards the Argentine and opposed the distribution of American military largesse south of the border. He is succeeded at the State Department by Mr Norman Armour, who will enjoy a wider field of activity. With the success of the mission he pressed so ardently, Mr Messersmith, the Ambassador to the Argentine, has also resigned.

These are moves which will be pleasing to many Republicans and in particular to Senator Vandenberg, who has long made it clear that his party's support for the foreign policy of the Administration did not extend to South American affairs. They are calculated to appease the Republicans at a time when bi-partisan support is more necessary than ever to Mr Marshall and becoming progressively more difficult to secure.

Yet the realisation that the "normalisation" of relations with

the Argentine was the only practical course has not made the pill any sweeter to many Americans. That the fatted calf should be killed for the Argentine at the precise moment when the Péron family is re-introducing the Fascist salute to Europe, poses very sharply the distasteful possibilities of the Truman Doctrine. For although the proposal to standardise and provide arms for the South American countries ante-dates the official proclamation of the Truman Doctrine, it is powered by the same fear of Communism. Even Mr Braden, who has so eloquently voiced the fear that the scheme will merely strengthen the strong by modernising the armies of South America, and foster an armaments race, has testified this week that Communism is a much greater danger than Fascism in those countries. Thoughtful critics in the United States are concerned that the constructive, as well as the negative, aspects of the Truman Doctrine should be applied to Latin America, where it is so pitifully clear that the best defence against Communism is the full dinner-pail.

ITO and Farm Prices

The recent approach of Chicago wheat futures to within a very narrow margin of all-time records was in itself a salutary reminder of the imponderable forces governing farm prices. The record grain crops harvested throughout North America last year were then very widely regarded as marking the close of the post-war farm boom, and early this year the Bureau of Agricultural Economy insisted upon the probability of a very sharp decline in farm cash incomes for 1947. Altogether, reports from the corn and wheat belts still suggest bumper crops, but over the last week or so there has been a significant stress on damage brought by heavy rains to feed crops. With so much of the world still clamouring for every ton of food available, it is clearly quite premature to expect a major collapse in grain prices. Many US economists are suggesting that a domestic business downturn may be the first signal for a reversal of the farm price curve. It would, however, be very foolish to predict 1947-48 crop incomes with any precision for the next few weeks.

In the meantime, the Department of Agriculture has for long shown a growing concern with the established programme of "parity prices" for farm products. These price guarantees for

major farm products continue automatically through 1948, and with this year's Congressional agenda fully booked, and with the Presidential campaign down for 1948, it looks as though neither party will at present agree to any basic revision of farm policy. It is true, of course, that possibly thousands of farmers' dislike particular features of the price-guarantee schedules. But altogether their interest is in bumper farm prices, and they have shown little inclination to resist near-term bounties which could, conceivably, wreck the farm economy over a longer period.

The Administration has new worries on hand, however, in the shape of the present Geneva negotiations on the charter for the International Trade Organisation. A special survey made by the Tariff Commission notes that the imposition of cotton import quotas might be technically permissible under the Charter because of current "surplus-removal" plans, but that "considerable friction" might follow if these plans were made the basis for import quotas. Export subsidies, again, "must be removed after a three-year interval, unless special permission is granted, or unless there is a failure to reach a wider agreement between world growers." The wheat position is held to be "much the same as that for cotton," while "tobacco exports could not again be subsidised unless a burdensome world surplus developed."

No specific comment is made on tariff rates, nor on the amazing variety of health and sanitary regulations by which the United States has frequently raised barriers more formidable, and not infrequently, even less justifiable, than simple import dues. The Tariff Commission's brief report, however, emphasises once again that all farm policy over the last twenty years has failed to solve the problem of the marginal producer, and that war conditions alone prevented the accumulation of surpluses on such a scale that the cost of carrying them might appal even a farm-dominated Senate. It remains to be said that, under present plans, ITO commodity schemes would seem to offer more than one device for cushioning the impact of world competition.

Democratic Come-back?

The jubilation with which the Republicans celebrated their famous victory in November has given way to something like alarm. The come-back of President Truman and the Democratic Party registered by the polls has been underlined by a scattering of elections. Mr Truman's popularity (tested by the question "Do you approve of the way he is handling his job?") now stands at 57 per cent, a decline of 3 points since March, but 25 per cent above October's low-point. The party-strength polls reveal the Republicans and Democrats running neck and neck, with 51 per cent of those questioned favouring the Democrats. On April 1st, in Chicago's mayoralty election, which one of the Republican strategists had unwisely prophesied would be the first important preliminary engagement of the 1948 campaign, the Democratic candidate, Mr Kennelly, defeated the Republican by a majority so large that, if repeated in 1948, it would make the whole of Illinois Democratic. In a Wisconsin by-election the Republican majority was whittled down from 29,061 to 847. Republican administrations in Charleston, West Virginia, and Baltimore have recently given way to Democratic control.

Not everything is going the Democrats' way. The big city machines on which the votes of New Jersey, New York, and Missouri hang are recovering with difficulty from the catastrophic beating they received last November. Mayor Hague has actually retired in Jersey City. In one corner of the State of Washington, a Wallace Democrat triumphed in the primaries over a Truman Democrat who supported the President's foreign policy, and kept the majority for the victorious Republican (who also supported the Truman Doctrine) down to 1,500. Mr Wallace's growing independence as his triumphal tour of the West unfolded is, indeed, the cloud the size of a man's hand on the Democratic horizon, holding as it does the possibility that the Democrats might lose just enough labour votes in the key states of New York and California to lose the Presidency in 1948.

Senator Aiken, a liberal Republican, wrote recently that in November the country put the Democrats out, rather than the Republicans in, and that consequently the burden of proof is still on the Republicans. Prices, which they argued would fall with the removal of the dead hand of bureaucracy, are higher than ever. Voters have tended to regard the achievements of Congress as disappointing and the pace slow. Economy in government—apart from the sheer wish-fulfilment of passing Bills cutting taxes—is hard to achieve without treading on voters' interests in the West and the agricultural districts, largely because of two hard facts: that the country has become accustomed to and dependent on the growing functions of government since 1932;

and that government, like private industry, has higher costs under inflation.

It is a key to the political mood of America that of the candidates in both parties it is Mr Truman, Governor Dewey, and Senator Vandenberg who are leading Senators Bricker and Taft, on the Right, and Mr Stassen and Mr Wallace on the Left, are almost equally out of the effective running. It is a mood which favours Mr Truman, who is not even that little way left of centre to which Mr Roosevelt once confessed. Can the President maintain that coveted central position, with the hardest tests in domestic and foreign affairs still ahead? At least his come-back makes him a competitor no Republican is now disposed to under-rate.

The Oil Pact Again

The Foreign Relations Committee of the Senate has at last agreed to provide time for debate on the Anglo-American petroleum agreement, though the support necessary for ratification of the treaty seems to be as uncertain as ever. The pact was signed in London as long ago as September, 1945, the subsequent delay having been due to the belief of an influential section of the domestic industry that the agreement is only an initial step in the formation of an organisation which would regulate American output as part of a world control programme.

Denials by the State Department have made very little headway, and opponents of the treaty are once again voicing their distrust of "cartel plans." The real struggle here, of course, is between the integrated and international units which can always be persuaded to abandon swings for roundabouts, and the smaller independent units whose prosperity is based simply on the domestic rate of operations. Even within the ranks of the big units, however, there is a continuing suspicion that the government is, in fact, determined upon much stronger regulatory powers in the longer run.

In the last few weeks, the opposition of the Independent Petroleum Association has been extremely clamorous, and the State Department has been accused of promoting a "flood of oil imports that will make it impossible for many producers to continue business." It is, of course, the declared policy of the Federal government to conserve domestic supplies by an expansion of imports, but the attitude of the independent operators is almost incredible in the light of the statistical position.

Crude oil output recently reached an all-time peak of 5 million barrels daily, while domestic demand, which averaged 5.3 million barrels through 1946, is now estimated at a minimum of 5.7 million barrels. The best statistical experts within the industry have recently predicted a curtailment of exports later this year, while industry has been warned that fuel oil shortages may actually force a curtailment in factory operations over wide areas. For a nation which has such prolific resources, the position is astonishing, but in addition to shortages of crude oil, refinery capacity has long been below commitments, and labour disputes have recently reduced the supply of refined and residual products.

The situation could change quite rapidly with a general business setback, for crude stocks are not unsatisfactory, and with prices at the highest since the 1920 boom, drilling and exploration work is at a very high level. Some abatement of present demand, however, would certainly not injure the domestic industry, and there is every indication that the long-term trend of consumption is still upwards.

Shorter Notes

The Senate and House have now both passed Bills extending Federal rent controls from June 30 to February 29, 1948. Both Bills contain the escape clause that 15 per cent increases in rents will be allowed where both tenants and landlords voluntarily agree. As the tenant's only alternative in many cases is to go homeless, his agreement, whether strictly "voluntary" or not, will usually be forthcoming. In effect the Bill is one for an increase of 15 per cent in rents, a concession sought by the landlords' lobby. The President has no choice but to accept the Bill, for a veto would simply mean that all controls would lapse on June 30th.

Mr Truman has appointed Mr Dwight P. Griswold, a former Republican Governor of Nebraska, to administer the Greek aid programme, and Mr Richard F. Allen to be field administrator of the \$350 million foreign relief fund recently approved by Congress. The appointment of Mr Griswold, a Republican, is laid in some circles to a desire to underline the bi-partisan support for the Greek programme. If this was the intention, the choice of one of Mr Stassen's backers was maladroit.

THE WORLD OVERSEAS

Interim Report on Geneva

(From Our Special Correspondent)

1. Tariff Bargaining

THE preparatory committee of the United Nations conference on Trade and Employment has now been in session for just over two months and there can be no denying the fact that the time-table is getting somewhat out of joint. The bilateral tariff negotiations, which should certainly have been virtually completed by the beginning of June, are still at a very early stage. The Americans, with ample staffs, have been making reasonably good progress with a number of smaller countries, and agreements with Brazil and the Lebanon are expected from day to day. But their negotiations with the Dominions have bogged down for the time being, largely due to the deadlock with Australia on the question of wool.

The negotiations on the American wool tariff were exclusively handled by the Australians, on the principle that each country only negotiates on a particular article with the country from which it obtains its largest imports of that commodity. This is intended to simplify the negotiations. The "principal supplier" can be relied upon to make the best case and obtain the best possible bargain for the article in question, and any concession obtained from the importing country will later be extended to all other suppliers through the most-favoured-nation clause.

It is, therefore, the Australians who have been fighting the battle on wool with the Americans. That battle will only be joined once more when Mr Clayton, head of the United States delegation, returns from Washington. The American delegation here is fully conscious of the damage done to the tariff negotiations and indeed to the whole foreign economic policy of the United States by the wool episode. Some of its members profess to believe that the Administration intends to take up the challenge of the wool bloc in Congress and argue that, if the Administration were to exercise its executive powers to reduce the duty on wool and challenge the Republicans to make this one of the issues at the 1948 elections, the Republicans would not be very happy. This issue should be decided soon and must be affected by the fate of the legislation now before Congress.

Of the other tariff negotiations it can be said that, in general, they are making fair progress. The American offers, barring always the case of wool, were more generous than most countries had expected, and a number of the recipients of these offers had to hasten to revise their own, which, by and large, were on the meagre side. This is, of course, as it should be. The United States entered into these negotiations with one of the highest tariffs in the world and it is the country which, by all criteria, should have the lowest. Most of the giving should thus come from America. But allowing for this fact, an appropriate response should be forthcoming from the other countries. The British demands on the United States amounted to nothing more nor less than an overall 50 per cent cut in the duties on all items under negotiation, i.e., the limit of present American concessions. The British offers, on the other hand, were not pitched in similar key: a few small reductions in tariffs, a very few offers for reduction and elimination of preference margins and, for the rest, an undertaking to "bind" margins of preference at their existing level. This collection has not made the best of impressions. In particular, the offer to bind margins of preference has not appeared to the countries to which it was made to have any negotiating value whatsoever since the British undertaking to eliminate preferences should leave no room whatever for the possibility of an increase in these margins and, therefore, should have left the maintenance of existing margins as the worst conceivable possibility, and not as something having any value as a *quid pro quo*. The Americans are thus somewhat hurt that the generosity of their initial offers should have been ignored in the fuss caused by their highly publicised attitude on wool.

Of the other negotiations it can be said that the French

have caused the greatest difficulty, owing largely to the chaotic muddle in which the French tariff structure has evolved. The new *ad valorem* rates are intended to allow for an adjustment of specific duties to the higher level of prices and for the protective element of import quotas which have been abolished or are due to disappear. In some cases the increased duties appear to do more than justice to these two factors. Moreover, the obvious and substantial overvaluation of the French franc makes the whole French tariff position one of extreme uncertainty.

The negotiations on preferences are dogged by the paradox that the party which is giving away the preferential margin is doing so at somebody else's expense. When the Americans, for example, ask for a reduction of the preference on canned fruit imported from Empire countries into Great Britain, the request is made to Britain but, if granted, will primarily hurt Australia. Before the request can be considered, there must, therefore, be some contact on this point between the Americans and the Australians to see what concession the former can make to the latter as a counterpart for this item in the Anglo-American deal. In this specific case the argument comes back immediately to wool. This example illustrates the fact that the tariff negotiations are a net-work of discussions even more complex than the pattern of some 120 bi-lateral deals with mutual concessions in each, rendered multilateral through the most-favoured-nation clause.

Though the time-table is not being adhered to, it can already be prophesied that the tariff negotiations will yield appreciable results. Even if the American tariff on wool is not reduced—and on this point it is too early to be pessimistic—the Geneva negotiations will achieve a definite reduction in the general level of tariffs and also in the margins of preferences. The key to this part of the negotiations must be the American attitude. Although the initial American offers are reasonably generous, they are not generous enough, given the comparatively high level at which American tariffs stood at the beginning of these negotiations and given the fact that in the present world it is America which must give. There is still too much evidence of American delegates having their eyes glued too anxiously and fearfully on the Tariff Commission to which all negotiated changes must be reported, of a minuteness of calculation to see that every American concession is fully matched by a concession from the other side. Yet not only must it be said that it is far too early to despair, but the progress achieved so far makes despair a wholly inappropriate sentiment. When the concessions already offered and accepted in the 91 sets of negotiations that have been initiated so far are given multilateral scope by the operation of the most-favoured-nation clause, it will be found that no previous comparable period in history has yielded such an abundant harvest of reduced obstacles to international trade.

2. The Charter Debate

THE reduced tempo of the tariff negotiations in Geneva has given more time to delegates to further the debate on the proposed Charter of the International Trade Organisation. The task has been entrusted to two commissions. These commissions, "A" and "B," give the chapters referred to them what might be termed a first reading and then submit points on which differences are revealed to sub-committees whose task it is to produce texts reconciling them. First readings have been given to chapter 3, dealing with employment, effective demand and productivity, to chapter 4, dealing with economic development and to chapter 6 dealing with restrictive business practices. The initial consideration of the crucial chapter 5, dealing with general commercial policy, has begun. So far, therefore, the most controversial topics have been avoided. But discussions of the other sections have revealed interesting points of difference and led to some important amendments.

The discussions on the employment chapter have revealed familiar differences. A number of delegations have consistently shown their dislike of its allegedly loose terminology. Amendments have been suggested and will probably be accepted which will stress the importance of productivity and will make clearer than at present the fact that the members of the ITO are committed to maintain not merely employment, but productive employment. But the main debate has centred on the safeguards for members subjected to external deflationary pressure. Some delegations argue for more urgent and positive action being provided in the event of deflationary pressures being exerted on members by the inability of others effectively to control their economies. There have been demands, first, for more automatic and immediate initiation of consultations by the ITO in such circumstances and, secondly, for the rights of members to take unilateral defensive action, provided it was notified to the ITO.

The fourth chapter on economic development has so far caused a greater outpouring of oratory than any other. This, in effect, gives the "under-developed" countries the right to avoid most of the provisions of the Charter on the ground that their more diversified development redounds to the general interest. Whatever they may lack in other respects, those countries have highly developed dialectical skill and vocal powers. They have stressed the basic character of both chapters 3 and 4 of the Charter and have urged that the obligations deriving from them must be regarded as equally binding with the obligations deriving from chapter 5 on commercial policy. The obligation it imposes must, they argue, be conditional on the attainment of the objectives of full employment, high demand and increasingly diversified economic development in all member countries. The most interesting aspect of the debate on this chapter has been the counter-attack made by the countries—notably by the United States—that would be expected to provide much of the capital from which this development would be financed. They have suggested that certain rules be set out for the treatment of foreign capital. This amendment suggests that there be equally favourable treatment for investment by foreign countries as for enterprises financed by domestic capital; that there should be most-favoured-nation treatment for foreign investment in any member country and that provision should be made for the compensation of foreign-owned property requisitioned or confiscated.

Another subject of keen debate has been the question of applying sanctions against members which may be found guilty of measures which conflict with the terms of the Charter. The difficulty is that, if a member can be "penalised" because it is not helping another to diversify its resources or because it is not doing all that may be deemed necessary to maintain employment in its area, the application of sanctions may involve a serious derogation of national autonomy. Sanctions there must be, and, since they can only be applied with the full concurrence of the ITO, they should not be feared by members prepared to abide honestly by their obligations under the Charter. But the position is aggravated by the importance attached by certain countries to sections of the Charter which can by no means be regarded as a specific code of commercial behaviour, but are rather general aspirations as to the objectives of economic policy.

But the debate on chapter 5 is generally considered the most important. It lays down a code of commercial behaviour and deals with tariff reductions and preference margins, with quantitative restrictions on imports and their non-discriminatory administration, with subsidies and with state trading. This is the hard core of the Charter. It is this section of the document which will form the main part of the interim agreement or "Little Charter" which, it is hoped, will be negotiated by the "nuclear" nations at Geneva and by which they will undertake to abide prior to the ratification of the full Charter after the full world conference on trade and employment has finished its labours—which can hardly be before the spring of 1948.

This crucial debate has begun with one concession to the views of Great Britain and the other Commonwealth countries. The important Article 24 has already been amended so as to make it less automatic that negotiated reductions in most-favoured-nation import tariffs should operate to reduce or eliminate margins of preference. The amended form of this article leaves the way open for reductions of preferential rates as well as of non-preferential rates, provided the margin of preference is not increased. This represents a major concession on the part of the Americans. Nevertheless, even more vital issues will be involved when the articles dealing with quantitative restrictions on imports come to be discussed. It seems unfortunately all too likely that the need for quantitative restrictions on imports will face many countries of the world for some years to come. How to reconcile that fact of economic

life with the American demand for the non-discriminatory operation of such restrictions and with the need to maximise the volume of world trade will provide the Geneva meeting with one of its main problems.

Communism in Eastern Europe—II

[BY A SPECIAL CORRESPONDENT]

CZECHOSLOVAKIA was the only country east of Germany where Communists experienced political freedom between the wars. Elsewhere, though there were brief Parliamentary periods when some of the opponents of the old regimes were able to criticise, the Communists were always outside the law. They do not understand the principle that every man should have the right to express his opinions freely. They never had this right, it never existed in their country, so why should their enemies have it? Talk of it in the Western press seems mere hypocrisy. The Western politicians and journalists are only concerned, they believe, to protect Fascists and reactionaries. The Communists always ask the question "Freedom for whom?" There are some people to whom experience has shown that it is dangerous to give freedom. There are others who, although perhaps themselves democrats, hesitated in the past to prevent Fascists from destroying democracy, and at the same time were quite indifferent to persecution of Communists. Such people, they claim, do not deserve liberty. If a Hungarian Communist heard praise from the West of the relative liberty which until recently existed in his country, he was offended, for he was ashamed of this liberty, which he believed benefited only the reactionaries, and which he regarded as a symptom of political backwardness. Only the Czech Communists seem proud that their country enjoys such liberty. But then they themselves were allowed liberty under the old Republic.

The present regimes in Eastern Europe are usually described officially as "popular democracies," distinct from either "bourgeois democracy" or "Soviet democracy." The Communists have no sympathy for the old parties, and will co-operate with them only on their own terms, which usually amount to complete subordination to Communist leadership. They believe that the old parties proved in the past their inability to solve vital social and political problems and should not be given another chance. Their greatest fault, in Communist eyes, was their failure to bring the masses of the people into political life. This was especially true of the Balkans, where the majority of the peasants and workers had absolutely no influence on policy, and regarded parties with increasing indifference. To them elections were just occasional opportunities for winning a little cash and a few free drinks, but were not expected to have any concrete effect on their daily lives of toil and misery. The Communists are determined to bring the "non-party masses," the disinherited majority of the nation, into active participation in national affairs. During the Partisan War in Yugoslavia this was actually done. In the areas liberated from the enemy, administration and supplies were controlled by local men, who proved their worth by their efficiency and by the respect which the population showed for them. Many hold the same, or more important, posts to-day. Something of the same kind has been attempted, with much less success, in Bulgaria through the "Fatherland Front Committees" and in Rumania through the "Ploughmen's Front."

"Popular democracy" is not intended to be a "dictatorship of the proletariat." It has a more moderate programme, including specific guarantees of private property. It is to be based on the "non-party masses," organised in mass political professional and cultural organisations, under the leadership of the Communist Party. A share in leadership is also allowed either to individual prominent figures, or to rump groups, from any of the old political parties who will accept the new programme and are prepared to co-operate "honestly," that is to say unconditionally, with the Communists. The only country which definitely does not conform to this pattern is Czechoslovakia, where co-operation between parties has been on a basis of genuine equality.

Lenin taught that the State is an instrument of power in the hands of the ruling class, and this lesson has been learnt by his East European pupils. They have taken steps to seize for the party the "commanding heights." The key positions in the civil administration are allotted as far as possible to Communists or to such members of other parties as can be relied on to carry out their wishes. Communists everywhere control the Ministry of the Interior, and occupy a strong position in the police, especially in its political, economic and security sections. Com-

munist influence in the armies is ensured by the introduction of political commissars, and by the recruitment at high and medium levels of officers trained—whether as pre-war exiles, war-time allies or prisoners of war—in the Soviet Union. Communists are also well placed in the Education and Propaganda Ministries. Communications is another Ministry much sought by the party. Finally, Communists play a dominant part in planning organisations, both of the economy as a whole and of more limited but essential sectors—such as electrification in Bulgaria or reconstruction of the "western territories" in Poland.

Communist Cadres

The Communist parties of Eastern Europe suffer from a severe shortage of personnel. The number of experienced and reliable party members is everywhere small. In Yugoslavia considerable numbers were recruited during the war from those who, whatever their political antecedents, showed themselves able and loyal in action. But a gift for guerrilla leadership is not necessarily a qualification for peace-time administration. In Czechoslovakia some pre-war cadres were left, and in Bulgaria those who had survived the savage persecution of 1934-44 had proved their worth. In Hungary a section of the workers had, while belonging to the legal Social Democrat Party, sympathised secretly with the Communists, and the discipline of factory and trade union had trained them. But in all these countries the hard core was very small, while in Poland and Rumania it hardly existed at all. The Rumanian party had some support from national minorities, especially Jews. Its leaders were a handful of political internees and exiles. For its new recruits it has been largely obliged to accept former members of the Fascist Iron Guard. These may be of three kinds—vaguely revolutionary idealists disappointed by Fascism and seeking some other "dynamic" movement; toughs who want a respectable excuse to beat up their fellow citizens; and conscious Fascists who aim at undermining their opponents from within. The Communists may make something of the first group, but the second will merely bring them discredit, while the third will be positively dangerous. Throughout Eastern Europe the Communists are obliged to fill many key posts with former business men or officials of the old regime. This disappoints the revolutionary-minded because the old bureaucratic methods and abuses remain, and at the same time infuriates the conservatives who regard all changes of personnel as an outrage.

The exact relationship of the Communists to the Soviet Government cannot be known with certainty. It is not necessary to assume that they receive vast funds or detailed instructions from Moscow. Their leaders can be trusted to pursue a policy compatible with Soviet State interests. They regard the USSR as the only socialist State in the world, and the only effective support of socialists in other countries. They therefore wish to see the USSR strong, and simply identify Soviet policy with the words "peace" and "progress." What the USSR wants must be good, because it is the USSR that wants it. They refuse to consider the possibility that Soviet policy can be contrary to the interests of their own country, or that the USSR can have imperialistic aims. "Imperialism" is by definition an exclusive characteristic of the "Western capitalistic Powers." When Pan-American Airways obtain special facilities in a South American state, or Anglo-Iranian oil derives profit from Persia, that is imperialism. But when Hungarian civil air transport is monopolised by a

joint Soviet-Hungarian company, or "Sovrompetrol" controls one-third of Rumanian oil reserves, that is popular democracy.

The Communists of Eastern Europe often state that they wish to trade with the West, and that they would welcome Western capital in the work of reconstruction. But "economic co-operation" depends on the total acceptance by the West of their political terms. Bargaining and compromise are unintelligible to them. And they are not easily able to control their emotions. They believe the West considers them as "inferior" colonial peoples. They remember that before 1939 Western diplomatic and business representatives associated only with their ruling classes, which in many ways acted as colonial governors on behalf of Western interests. Western representatives were utterly indifferent when dictatorships repressed democrats and tortured Communists, yet now eagerly protest when Mikolajczyk or Maniu are denied full liberty. The Communists therefore hate the West, and use every means to discredit it. All the past abuses of foreign capital in their countries are exaggerated, and its contribution to the creation of their industries is ignored. British social reforms are hardly mentioned, but whenever Sir Oswald Mosley opens his mouth he gets headlines. A distinction is officially made between "broad popular masses" and "reactionary circles" of the West, but the impression is given (without being explicitly stated) in press, public meetings and radio, that only the latter count. And at the lower levels of the party the distinction is forgotten altogether. Here there is an extraordinary confusion of the doctrines of Marx and Goebbels, of proletarian classes and "proletarian nations," of the Communist idea and the Slav soul. In conversation with Western visitors, the Communist leaders will admit and deplore this confusion, but it must be said that they do little to put an end to it. On the contrary, they often encourage it, and one sometimes has the impression that they begin to believe it themselves.

The propaganda has not had much success. Thanks to economic distress and Soviet tactlessness, the Communists are unpopular in most of Eastern Europe. (Bohemia and the mountain areas of Yugoslavia are important exceptions.) But except in Czechoslovakia, opposition to them is negative. The opposition leaders—for example Petkov, Grol or Mihalache—wish for political freedom and friendship with the Great Powers of both West and East, and have no desire to abolish social reforms. But their followers like the rank and file of the Communists, oversimplify, and make up in passionate hatred what they lack in understanding. All who stand in their way are "Jewish scum" and "Moscow agents," while their own material interests are equated with a crusade of Christianity against Bolshevism. Their enthusiasm for Western values is recent, and has less to do with Shakespeare and Leonardo than with the atom bomb.

The chances of genuine democracy, combining social progress with political freedom, were never very bright in Eastern Europe, but to-day they are rapidly dwindling. Czechoslovakia alone offers hope, but between the Truman Doctrine and Moscow's new counter-offensive who can say how long she will stand? Inevitably the two Great Powers attract to themselves their jackals and whet their appetites. Whether they be Communist or neo-Fascist, the demagogue and the police tough are confident that the future belongs to them. Though their nations be doomed, they will at least enjoy a little brief authority. Their only concern is to place in advance upon their rival the blame for the catastrophe which each side equally holds inevitable.

BURGH ISLAND HOTEL HAS NOW RE-OPENED

Come and relax from the strain of City life on this delightful Private Island, under the warm red cliffs of South Devon, with easy access to the mainland.

You will find luxurious comfort, first-class cuisine, and one of the finest cellars in the West Country.

Poland's Foreign Trade

[BY A SPECIAL CORRESPONDENT]

LAST week, an Anglo-Polish agreement on trade between the two countries for the next three years was signed in London. Great Britain is to export to Poland goods to the amount of £35 million—raw materials and other goods valued at £20 million and capital equipment at £15 million. Poland is to export to Great Britain food, furniture, chemicals, etc., to the amount of £23 million. The Polish exports will increase from year to year. They will amount to £5 million in the first year, to £8 million in the second and to £10 million in the third. The conditions of payment for goods exported from this country have been fixed as follows: Polish buyers will pay in cash 40 per cent of the price of ordered goods on placing the order, 20 per cent on delivery and the remaining 40 per cent in three annual instalments. The credits extended to Polish importers come under the Export Credits Guarantee. Out of the total turnover an adverse balance of £12 million will arise for the Poles which will be covered as follows: £2 million from the Polish gold deposited here, £1,500,000 from Polish assets in this country and £800,000 from deliveries of Polish coal in the course of the first year. The Poles will also receive raw wool worth £1,500,000 instead of the surplus army supplies that were allocated to them. Thus the actual credit from which they will benefit will amount to over £6,000,000.

The Anglo-Polish agreement is one of a series of trade agreements that Poland has concluded or is still negotiating with the Western countries—Sweden, Norway, France, Switzerland, Italy and the countries of Latin America. It is only now, in the third year after the armistice, that Poland has been able to resume trade links with the West. In the previous two years Polish economy was still engulfed by the post-war chaos to an extent that made the resumption of trade very difficult. The unsettled political relations between the new Polish regime and the Western countries was also an obstacle to the renewal of commerce. Under such conditions Poland's trade was done mainly with Russia, as can be seen from the following table:

POLAND'S FOREIGN TRADE IN 1946*
(In Millions of U.S. Dollars)

Countries	Import	Export	Balance
U.S.S.R.	86.8	53.8	-33.0
Soviet Zone of Germany	7.1	7.3	+ 0.2
Sweden	16.6	22.4	+ 5.8
Denmark	2.5	6.5	+ 4.0
Norway	0.9	2.6	+ 1.7
Jugoslavia	0.9	1.1	+ 0.2
Hungary	0.9	1.8	+ 0.9
Romania	0.3	0.8	+ 0.5
Switzerland	0.8	3.1	+ 2.3
France	...	5.7	+ 5.7
Finland	...	0.4	+ 0.4
Bulgaria	...	0.2	+ 0.2
Austria	0.4	0.8	+ 0.4

Total 117.2 106.5 10.7

* January 1st to November 30th.

It is characteristic that Polish official statistics of foreign trade are most often calculated in American dollars. Though Russia is looming so large in eastern European trade, the rouble has not become the international currency or standard of value inside the Russian zone of influence. The value of Polish trade in 1946 was nearly half the pre-war level, but, because of the rise in prices, its volume was considerably lower. Of all imported goods, 78 per cent came from Russia and 53 per cent of all exports went to Russia. Over the year, however, the Russian share in Poland's trade has steadily decreased. In January, 1946, nearly 87 per cent of all exports went to Russia and 83 per cent of all imports came from there. The balance of the trade was adverse to the Poles to the tune of \$33 million, which was the virtual loan in goods advanced by Russia to Poland. As the result of a recent agreement, the Russian share will further decrease, because the Poles will have to deliver only 50 per cent of the originally stipulated quotas of coal to Russia—six and a-half instead of thirteen million tons in each of the next four years. But the Russian share in Poland's exports decreased much more quickly than in its imports. For most essential goods—food, raw materials and oil—Poland depends on Russia. So far Russian trade policy towards Poland has been quite liberal. On the other hand, the Russians have also encouraged the Poles to renew trade with the West. The reduction of the quotas of coal to be delivered to Russia has

given the Poles a bigger export surplus to be diverted to the West. In addition, the Poles have been enabled to draw on Russian gold to the amount of \$29 million for the payment of capital goods and raw materials which they may buy in hard currency countries. As the Russians themselves have so far been very careful in using their gold reserves for their own needs, this loan appears surprisingly generous.

It is also noteworthy that in the past year Poland's trade with the other countries of eastern Europe was less than its trade either with Sweden or with France or even with eastern Germany. It is nevertheless very probable that in the next few years regional trade between Poland and the rest of eastern Europe will be developed on a more systematic basis. The Poles have already negotiated commercial treaties with Czechoslovakia and Yugoslavia; and trade with each of these countries has been planned for five years ahead. The turnover between Poland and Czechoslovakia is to amount to \$200-300 million over the whole period and the turnover with Yugoslavia will not be much less. The idea is now canvassed in Warsaw that Poland and Czechoslovakia could jointly fill the trade vacuum left in the Balkans after Germany's collapse, an idea that had been propagated in a different political context by Poles and Czechs in London at the time when President Benes and General Sikorski produced their still-born agreement on Czech-Polish federation. It is now apparently realised that at least in the near future Russia, absorbed in its own reconstruction, will not be able to fill the Balkan economic vacuum. This gives the western Slav nations the chance to expand in the Balkan markets. For two reasons the idea appears to be more realistic now than during the Sikorski-Benes negotiations. After the detachment of the Silesian industry from Germany, the common Polish-Czech potential in heavy and manufacturing industries is probably big enough to serve, under favourable circumstances, as the basis for a rational exchange between industry and agriculture and manufacturing and primary production in the Danubian basin.

Whether such ambitious plans will succeed, depends on Poland's as well as Czechoslovakia's own industrial re-equipment. This again depends on their trade with the West. In the longer run, too, a regional Eastern European and Danubian trade association will not be self-sufficient. Its links with Russia will be very close, but this need not eliminate trade with the West. An expanding and planned regional economy, if it were not governed by purely strategic considerations, would tend to increase the demand for a wide range of foreign goods, some of which Russia would not be able to supply. In both Poland and Czechoslovakia, some of the industries' needs and consumers' tastes would best be served by goods from the Western countries; and the cutting out of trade with the West would entail a relative lowering of the standard of living.

But such speculations are still highly tentative. The immediate problem is illustrated by the following table, which shows the percentages of the various categories of goods in Polish imports and exports in 1946:

STRUCTURE OF POLISH TRADE IN 1946
(In Percentages)

Goods	Import	Export
Consumers' goods	54	13
Food	47	...
Capital goods	15	3
Industrial	8	3
Agricultural	7	...
Raw materials and fuel	31	84
Total	100	100

About half of all imports consisted of food of which Poland used to be an exporter. The Poles are now making an attempt to alter the structure of their trade. Last year's crops were about 60 per cent of average pre-war harvests. The food deficit was filled by Unrra. Supplies from Unrra have now come to an end, but the Poles hope to fill the gap from the better harvest expected this year and from promised Russian food supplies. Will this be enough to allow them to reduce radically the share of food in their imports and to increase that of capital equipment accordingly? The Poles take the optimistic view. The fulfilment of their three-year plan certainly depends on the import of capital goods, because 15 to 20 per cent of the planned investments are to be made with the help of foreign industrial equipment. Trade with Great Britain will certainly help the Poles gradually to shift the burden of their imports from consumers' to producers' goods. More than 40 per cent of their purchases from this country will consist of industrial equipment—the rest will be made up by raw materials. From the Polish as well as the British viewpoint a welcome beginning has been made.

THE BUSINESS WORLD

China's Debt Problem

THE creditor fallen on hard times rarely gains much sympathy or satisfaction. Britain has sold or pawned the best of her overseas investments, and desperately needs every pound of overseas income. But she finds herself in the ungrateful position of having to turn to countries even more seriously affected by the ravages of war for something on account. Such a country is China, whose sterling obligations exceed £60 million, on which, with scarcely an exception, coupons and drawn bonds have not been met since well before the European war. By that time, China had been resisting Japan for two years; the "China Incident" dragged on into the Pacific war, and not until eight years after did China again know peace of a sort. Lesser people than the Chinese would have thrown up their hands in despair at the appalling destruction and strain of those years; but instead they bent their energies to new tasks of improvisation and, be it added, to new wastes in civil war. It would be unrealistic, no doubt, to hope that China might squarely face the question of the sterling debt at a moment when its economy is racked by inflation, political confusion and administrative incompetence; if Britain has to reconstruct, China has to rebuild almost from the foundations of a peasant economy, and to embark once again on the nascent industrialisation of the 'thirties.

In these circumstances, some promise of economic and political stability is necessary before even tentative discussions would be worth while. China has meagre foreign exchange resources; its import requirements, were the means of payment available, would be almost boundless. Even the hardest creditor would recognise that this is a case in which the debtor needs time in which to pay. On the other hand, there is a good case, before the financing of China's post-war reconstruction is finally agreed, for "writing into the record" the extent of British financial help in the past; the sacrifices made in 1936 (and since) by British bondholders to assist China to recover from an economic crisis which American silver policy two years earlier had done much to exacerbate; and the inequity of any move to displace British claims in favour of other countries which are, fortunately, able to provide China with new finance. Like the rest of the world, China now looks to America and Canada for funds; the Export-Import Bank has recently granted \$66½ million, while Canada is furnishing a \$60 million loan under the Export Credits Insurance Act. There was also a rather vague promise of much more substantial aid from the United States; when the capital of the Export-Import Bank was increased, \$500 million was earmarked for China, on certain conditions, in the period ending this month—but this project must be presumed to have lapsed. The two loans recently granted, however, represent about half of the nominal value of China's outstanding sterling debt. Britain cannot at present compete in this financing field; it lacks both the financial resources, and the export capacity to translate them into real terms, which China so desperately needs; but Britain is no less entitled to recognition for past assistance to China. And the need for such recognition is underlined by the fact that, according to a recent study by Mr Arthur N. Young, a well-known authority, US wartime credits totalling \$45 million (secured on commodities) and the balance of US credits granted in the early 'thirties, have been repaid. Only a part of the credits granted

through the British Export Credits Department have been repaid. It would obviously be advantageous if the principal creditors and new lenders—the United States, Canada and Britain—could agree to act, if not actually in concert, at least only after consultation. A joint committee would be valuable.

An accompanying table gives particulars of the present sterling obligations of the Chinese Government. These total £60.9 million, of which rather over one-third is secured, directly or contingently, on the Customs Revenue. The table shows the extent of the reorganisation of the railway loans in 1936, which formed part of the bondholders' contribution towards the clearing of the financial jungle in China during the middle 'thirties. At that date, arrears of interest on all sterling loans totalled more than £17 million, and, of the £6 million odd representing the railway loans issued wholly or partially in London, nearly £5 million were cancelled. For three of the railways (Tientsin-Pukow, Canton-Hankow, and Canton-Kowloon) interest arrears at the end of 1935 totalled £5,880,000; the whole of this amount was absorbed by cancellation of arrears or by reduction of future interest. To-day, the extent of default on interest on the sterling debt as a whole is over £33 million; as for principal, £22 million is affected by default. Obviously, there is no hope—immediately at any rate—of meeting all these claims; in any case, they have accumulated over more than a decade of war and disturbance, and China has a strong case for seeking their abatement.

Several factors have changed the nature of the British bondholder's security since 1936. There was, formerly, no better covered obligation than the Chinese loans secured on the Customs Revenue. Before the Chinese Treasury law of 1938 was introduced, the Inspector-General of Customs had a free hand in the disposal of the funds collected by his staff, and the prior charge security of the Customs Loans was effectively recognised by the direct transfer of funds to meet their service by the Inspector-General to the paying agents. This is no longer the case. The Law of 1938 requires that payments of Customs duty must be made directly to Treasury officials stationed at each Customs House, and the Customs officials, themselves, have no say in their disposal. The old system worked admirably, but it had become incompatible with the national aspirations of the new China. But tradition dies hard in China, and it still appears that, although Customs duties are paid direct to the Treasury, the Customs administration still makes its book entries to cover, notionally at any rate, the requirements for service on the various loans. These entries, of course, are in Chinese national currency, but they appear to be made at the pre-war rate of 3d. to the dollar. The bondholder may dismiss this as a matter of empty form, and indeed, counting the credit is not the same as collecting the cash. Yet it may eventually be of some use, when the future of the Customs loans is being negotiated, to have these records available. Recent collections of the Chinese Customs give little guide to the position when trading and financial conditions in China become more normal. On paper, the Customs are flourishing, but it is literally paper, based on inflated prices. Collections last year are thought to have amounted to about 330 billion Chinese National dollars, of which Shanghai contributed over 90 per cent. For the current year, the budget

figure is C.N.\$620 billion, but severe restrictions on imports to conserve exchange have led to some falling-off in revenue.

These changes in administration will have to be recognised in a future settlement. But they are changes in machinery rather than changes in the underlying character of the Customs loans. Admittedly, the Chinese Customs Administration no longer makes the payments for the loan service, but that does

CHINESE GOVERNMENT STERLING LOANS

not mean that their security has been, or should be, set aside. It is still the responsibility of the Loans Department under the Ministry of Finance to supervise the service of Chinese Government bonds. The practical problem is to secure that the pledged revenues are made available to the department, to the required extent, and protected from the "clawing back" tendencies which all Treasuries, China's not excluded, show in highly developed form. It would be safest, perhaps, if the bondholders had some form of control over the pledged revenues, or their equivalent, and these might be deposited in a special account for joint supervision. It is unlikely, however, that the Chinese Government would be prepared to concede the principle of foreign control, in any form, over its revenues. But at the least it should provide—and it is also the least that bondholders may fairly expect at this stage—a regular statement of Customs collections, the sums segregated for the debt service, and the sterling available for interest and amortisation.

As for the railway loans, a major operation will be necessary to rectify the wounds of war. If the British railways are "a poor lot of physical assets," how would Mr Dalton describe the Chinese railways? In 1937, China had about 11,000 kilometres of single track, mostly of standard gauge. During the war, some of these lines were completely demolished, either by the Japanese or by the Chinese "scorched earth" policy, though nearly 3,500 kilometres of new railways were built. Indeed, the Chinese Ministry of Communications claims that nearly 10,000 kilometres of line are in operation, but many stretches are open only for intermittent traffic. The most important lines have suffered such extensive destruction and lack of maintenance in the last ten years that it could not be otherwise. Limited operating, slow speed, rails worn and of mixed section, improvised fishplates, sleepers decayed, and signals non-existent—that is a fair summary of the present position of the Chinese railways. In detail, the position is this:

Shanghai - Hangchow - Ningpo. — Demolished between Chientang Bridge and Ningpo.

Chekiang-Kiangsi.—Demolished except for 60 kilometres.
Canton-Hankow.—102 out of 119 major bridges destroyed; three through trains in each direction weekly, taking six days; track has been restored by timber bridges, improvised fishplates and spikes.

Nanking-Shanghai-Hangchow } Not greatly damaged, but
Peking-Tientsin } deteriorated through lack of maintenance.

Canton-Kowloon.—Extensively damaged, temporarily repaired to provide through service, but in a precarious condition.
Peking-Hankow } Sections of both railways in hands of
Tientsin-Pukow } Communists.

In 1943, a former Minister of Railways estimated that US \$100 million would be required for rebuilding destroyed lines and completing partly finished lines, and that another \$350 million would be required for a ten-year programme of equipment and rehabilitation. To-day, those estimates would be very greatly exceeded, and China will need considerable assistance in men, money and materials from abroad—largely, in present circumstances, from America. The Chinese authorities have paid much attention to the railways since the end of the war, and they have achieved miracles of improvisation. To have restored a through service on the Canton-Hankow line is itself an astonishing achievement. They have also regrouped the railways into ten separate systems. So far, however, there has been silence about the future position of the bondholder.

At the end of March, the chairman of the Hongkong and Shanghai Banking Corporation admitted that there was little hope of action to deal effectively with the Chinese debt until the currency and political situation had been cleared up. Mr Morse then proceeded:

However, there would be general satisfaction if the Chinese Government were able to give some public assurance to bond-

holders that the latter's rights, as established in the bonds they hold, will be maintained and will not be vitiated by the various government or semi-governmental loans and credits which have been concluded in the past year. Representations have, in fact, been made recently to the Chinese Minister of Finance about these matters and about the re-establishment of the Loans Service Committees, which were set up as part of the settlement of the railway loans in 1936 and 1937.

There is reason to believe that these representations have been of a friendly and informal character and the reaction of the new Minister of Finance to them will be awaited with interest. As an earnest of good intentions, the reconstitution of the

"Bottlenecks" in Containers

MR HERBERT MORRISON'S reminder last week about the need for collection of salvage, especially of paper, may have come as a shock to some local authorities. But the appeal is opportune, for Britain appears to be heading towards yet another crisis—a shortage of containers and packing materials. It is true that this may not affect the public directly or immediately; the effects may be felt only indirectly, or some time hence—for example through the export trade. But especially since the fuel crisis, the shortage has been causing grave concern to many industrialists and planners, particularly in the consumer goods' industries. Nor should this be regarded as a minor or localised problem. In many industries containers and packing are as vital as a key constituent of the product; a bottleneck here can be the limiting factor of output by causing a stoppage of the whole flow of production.

The need for containers in modern life is so ubiquitous that they are generally considered as an integral part of the product. In the huge development of the canned food industry the importance of the "can" is obvious. But who thinks of tooth paste or shaving cream without mentally including the tube or jar? Admittedly, these are particularly striking examples, but they illustrate forcibly the effects over a very wide range of commodities, many of them in vital categories, of the development of marketing technique in recent years. Few foodstuffs are nowadays (or at least were before the war) sold loose over the counter. The milk-bottle has replaced the jug; the newspaper has given place to cartons, grease-proof paper or transparent cellulose wrappings. This is not a mere question of habit; nor, with very few exceptions, are containers mere refinements imposed on society by a higher standard of living—a luxury which became established by clever advertisement. In the case of many perishable foods, they are clearly the indispensable means of bringing a large supply over great distances and of spreading the distribution both geographically and temporally. In other instances they are vital to the safety of the product, or in a hygienic sense, of public health. And, almost everywhere they are used to-day, they are essential to smooth running of the distributive channels and economic handling of the goods. The severe wartime restrictions on the use of wrappings and containers eliminated all, or nearly all, of those of a secondary nature, which served only "brand," good will or quasi-luxury purposes, as well as many which ministered primarily to convenience, whether of wholesaler, retailer or consumer. There has been some relaxation in this sphere since the end of the war, but, on the whole, still only the more or less essential wrappings are permitted.

This, then, is the setting of the problem. The impending crisis has been threatening since the beginning of the year, when container manufacturers had to reduce output owing to shortage of coal. During the shut-down period, food manufacturers and distributors, coming within the priority class, were allowed to continue functioning, but the manufacturers of con-

Loans Service Committees would make a particularly favourable impression. These were set up for certain railways before the war, with Chinese and foreign members under a Chinese chairman, expressly to meet the objection that loan agreements negotiated under the Empire contained stipulations which infringed China's sovereign rights. They were quickly swept away by the war, but not before they had proved themselves to be a valuable link between the railway administrations and the bondholders. Their restoration now, coupled with a general statement of policy on the sterling debt, would be a valuable step forward in the long march towards Chinese recovery.

tainers were not. In some instances serious dislocation was averted only by the granting of special permission to certain manufacturers to restart production. Since then, in spite of every effort to make up the loss in output, the position has remained far from satisfactory. And it may be many months before the threat of crisis has passed.

The extent of the dislocation and loss that would be caused if the shortage of containers developed so seriously as to cause a breakdown in supplies can be readily indicated. Already, large quantities of exports are being held up until sufficient packaging material can be obtained for shipment, and certain industries are experiencing similar difficulties on the home market. Foodstuffs, particularly the welfare foods such as orange juice, cod-liver oil, national dried milk, etc., have been given top priority for containers and packing material. Tobacco, cigarettes, medical stores, building stores and Army equipment also appear to be included in the priority category—without any order of preference having been allocated. Radio equipment, electrical appliances and similar goods come well down the list, but they equally require containers, and on the export side the need is urgent. Vacuum cleaners, to take a case in point, need careful packing with adequate materials if they are to be usable on arrival at their export destinations. The authorities, with good reason, have requested that orders from the food trades should be fulfilled, "if necessary by making reductions to other users." They suggest that savings in the vital materials could be achieved by using some other form of packaging—the authorities, apparently, have prudently refrained from attempting to specify what other forms exist—or by ensuring a higher degree of "returnability." But many containers are "expendable," designed to be used once only. If damaged containers are re-used, transport companies may refuse to handle them for fear of claims for theft and pilferage. In practice, therefore, the priority for the food trades means that, while food supplies are protected, other commodities, both for the export and the home market, will be held up until a larger output is available.

The shortage of tin-cans is likely to be more than temporary. A large part of the output of the tin-plate mills is allocated to the Ministry of Food, which controls its use not only for home supplies but also for export. The total quantities shipped overseas are relatively small and, in any case, releases are generally conditional upon the sale of the relevant foodstuffs to Britain. For example, tin-cans are sent to Eire so that condensed milk can be shipped to Britain. The petroleum industry is probably the second largest consumer of tin-plate containers, but its proportion of the total is far less than that of food, so that the scope for relieving the food categories at the expense of other users is small. The basic problem, however, is the limited tin-plate capacity in Britain, and no great increase can be expected until the present old-style mills are replaced by the new continuous-strip type. Output of the South Wales mills showed some recovery in 1946 over the previous year, but it was still

insufficient to meet requirements. As with many other industries, there exists a shortage of labour, workers being reluctant to return to the tin-plate mills, which were largely closed down under the wartime concentration scheme; but the introduction of a short working week has had positive results upon recruitment. The new plants are not expected to be in full operation for five years.

Little if any relief can be expected from external supplies. The major producer is the United States, which is covering only 65 per cent of its domestic requirements. As soon as the American allocation system is terminated, which it is expected to be this month, what little quantities have hitherto been exported will probably be diverted to the American market unless the business recession develops to curtail home demand. In any case, if the tin-plate could be purchased from the United States, the problem of dollar expenditure would arise. Another possible source of supply is Germany, where there are some good strip mills that could be restarted and possibly fed on Belgian billets. Such a policy would help to relieve the difficult position in Britain and at the same time save dollars.

★

The position of fibre-board containers is no better than that of tin-plate. Here, however, capacity presents no real problem; the production of containers is conditioned almost entirely by the supply of raw materials. Kraft liner boards are either manufactured in Britain or imported from America, Canada and Sweden. Although these sources of supply all happen to be hard currency areas, the limitations upon supplies arise mainly from physical rather than currency factors. In Sweden, output has not yet recovered to pre-war levels, although in trade circles it is known that quantities could be purchased there. In the United States, domestic demand has been so strong as to oust foreign customers. In the last month, however, for the first time since the war, the output of American mills is reported to have surpassed the requirements of the converters; thus providing a possible exportable surplus. Should the American business recession gather momentum, domestic demand will no doubt decline still further. The other main raw material for fibre-board containers is best jute liner board, which uses up to 60 per cent waste paper. It is here that domestic salvage becomes of crucial importance, and the drop in paper salvage returns since the end of the war has had a noticeable effect on output. Local authorities have been unwilling to collect paper salvage, and in any case the dustmen generally refuse to keep it separate from the general waste, so that large quantities of this much-needed raw material are lost.

It has been said that, given effective operation of the priorities of containers for the food trades, the shortage is not likely to make itself felt in this most vital sphere of all. But this apparently reassuring fact is itself the unhappy consequence of the ab-

normal winter. The coal shortage aggravated the shortage of containers and packaging, but the winter's ravages in agriculture, and especially in dairy stock, are now showing themselves in a reduced demand for cans. Output of national dried milk, condensed milk and the like in the first four months of this year was considerably smaller than was at first expected. Had the earlier expectations been realised, a really grave situation in containers for food would have now been imminent. The peak demands for canning of peas and other vegetables and soft fruits now meet the peak demand for canning of milk. But for the losses in yield from dairy herds, the crisis would have come to a head in this early summer, and planners would have faced the invidious choice of whether to can peas or fruit or milk. As it is, the general consumer will get his peas, but the infants will, willy-nilly, get reduced supplies of national dried milk.

It is in this sense only that the container crisis is not a crisis in food. But the food demands have not eased enough to assure the position of other industries. The real effect will be, and is being, felt in those industries producing consumer goods, whether for home or export. In many cases the packing stage is made an integral part of the production process. The whole organisational scheme is set to a certain pattern; many factories, for example, dispense almost entirely with facilities for storage of the finished product because their production lines flow direct to the transport loading bays. In such cases a lack of containers involves, almost inevitably, a general stoppage in production. Even where storage facilities are available, containers are still required, since many products cannot be stored without being packed. Good examples of such products and types of production are electric light bulbs and toys, both of which have an important and increasing export market. It would be interesting to know the extent to which the export drive has been hindered through a hold-up of shipments due to a lack of packaging materials; it is thought to be considerable, even though exports are, after food, given priority for tin containers.

The "container crisis" is a real threat; although, if its impact is mainly on exports, its effects may for a time be concealed from the public. But the ultimate loss, in terms of dislocation of supplies and a probable wastage of dollars, may be severe, whether the direct effects fall mainly upon home or export deliveries. In the planning stage, containers must be considered integrally with the product. Of what value is it to allow new factories and new industries to start production if their products cannot be shipped except at the expense of shipments from established firms? An expansion in the output of cartons could no doubt be achieved if there were adequate returns of waste paper. It may even be necessary to spend some scarce dollars to buy materials. But while the shortage persists, the greatest need is to ensure adequate co-ordination and a careful weighing of the priorities, at the planning level.

Tidying up the Finance Bill

To all who had not pitched their expectations too high, the outcome of this week's Committee stage of the Finance Bill should seem quite reasonably satisfactory—with the one striking exception that there has been no progress on the vexed question of the Bonus Issues tax. The Government held fast to all points of principle—it would have been unrealistic to expect it to do otherwise—but on many lesser points useful ground has been gained. A quite unusual crop of Governmental promises has been sown. On the wider plane, it is cheering to know that Mr Dalton hopes eventually to raise the earned income relief to a higher proportion than the one-fifth which obtained seven years ago. And, in detail, the most important of this year's tax innovations—the distributed profits tax—now promises to work more equitably and less frictionally than at first seemed likely.

On this issue, the Opposition assailed the whole principle of taxation which falls differentially on risk-bearing investors, but must obviously have been well aware that its plea would find no echo in Mr Dalton's heart; it failed even in its attempt to get preference shares treated on the same basis as loan capital. But on a wide range of miscellaneous points it secured undertakings either from the Chancellor or from the Solicitor-General—who in the all-night sitting on Wednesday was particularly tractable—to "look again" at the drafting before the Report stage. The most important of these undertakings relates to the treatment of the proceeds of share premiums on the winding-up of a company. The Opposition sought to ensure that distributions eligible for treatment as capital will be limited not (as in Clause 29 (1) at present) simply to the amount of the company's nominal paid-up capital, but to that amount plus accumulated share premiums. It would certainly be consistent with the principle of the tax, as explained more fully in a Note in these columns on May 17th, if this concession were granted—but presumably it would be limited to premiums received after January 1st last. Other promised concessions include proposals to extend from six to nine months the period after the end of a financial year in which a dividend relating to that year may be declared; to abate the tax liability of interest on unpaid War Damage claims, and to clarify the definition of what constitutes a "distribution," with particular reference to reconstruction schemes and mergers.

The one clear victory for the Opposition was in the matter of the anomalous Clauses 14 to 18 relating to retirement benefits, the curious implications of which were criticised in these columns last week. Captain Crookshank's attack was commendably restrained, but none the less effective. It was quite obvious, from the Chancellor's response and his undertaking to study the whole matter afresh "with members opposite," that he personally had not appreciated the implications of the proposals. Finally—though most unsatisfactorily—the tax on Bonus Issues seems to have emerged from discussion almost in its original form. The debate occurred in the night session, so that considered comment must await the appearance of the relevant official report; but it appears that the Opposition's broadside has had no perceptible effect. The Government, it is true, had itself introduced an amendment to Clause 50, but this appears to have done little more than assimilate the wording to Stock Exchange terminology, by substituting "Letters of Right" for "Rights." It is still no easier to see precisely how the tax will be calculated as in the circumstances the City Spokesman in the House did good service in asking the Chancellor to consider an arrangement whereby the amount of the tax would be computed and communicated to the company concerned in advance of the share issue.

Sterling Talks

With the rapid approach of July 15th the time table for completing negotiations on accumulated sterling balances is becoming strained. The discussions with Brazil are virtually completed but no formal agreement has yet been announced. Those with Uruguay are proceeding satisfactorily. Arrangements were completed with the three Scandinavian countries during the visit of Mr Ellis Rees of the Treasury to the three capitals concerned, but the terms of the agreements have yet to be made public. In all three cases the "expendability" of current earnings of sterling will be assured.

The Egyptian delegation has been in London for some days. It had its first meeting with the British negotiators on Friday of last week and since then much preparatory work has been done and the actual negotiations have begun. The most interesting comment on these particular discussions is a statement attributed to the Egyptian Minister of Finance and suggesting that Egypt may use her freedom to dispose of accumulated sterling between now and July 15th in order to switch part of the funds in question from low interest bearing short term securities to higher yielding stocks. There is, of course, no reason why such transfers should not be made and in some respects Mr Dalton may be grateful for the support which such operations would bring to the market for longer term gilt-edged securities. But there appears to be some lack of realism in the assumption that any sterling so transferred will be treated differently from that left in more liquid form. Such securities bought with pre-July 15th sterling would remain blocked and the amounts involved would have to be taken into account when calculating any writing off or "adjustment" that may be agreed upon. Any undue exercise of the present freedom with which accumulated sterling can be invested would, admittedly, have an undesirable effect on the interest burden represented by these debts and if it occurred on a really substantial scale it might call for some defensive move on the part of Britain.

The discussions on the Indian sterling debts have been postponed as a result of the immersion of the Indian ministers concerned in the political problems which require their whole attention. One aspect of the political separation of the country which immediately impinges upon the sterling debt discussions is the splitting up of the ownership of the accumulated balances between Hindustan and Pakistan. The problem, in turn, is merely part of the wider question of the currency regime that will operate in the two separate Dominions. There are hopes that a common currency may be maintained and that the Reserve Bank of India may continue to serve the whole of India as central bank and issuer of currency. This would facilitate the solution of the separation problem as it applies to the accumulated sterling balances.

Transport Bill Concession

Viewed realistically, the significance of this week's proceedings on the early clauses of the Transport Bill at the committee stage in the Lords—the political aspects of the Opposition's tactics are discussed in a Note on page 927—lies less in the three Government defeats which the lay press has spotlighted than in a voluntary concession from the Government. In the Commons, the Minister seemed to have set his face absolutely against any increase in the size of the Transport Commission, and was equally determined to avoid defining whether its five members should be whole-time or part-time. On Monday, however, Lord Addison accepted an amendment extending the membership to "not less than four members and not more than eight," excluding the chairman, who, with at least four members, will serve whole-time. Evidently, the Government had done some hard thinking on the merits of the case; a committee of five, as has been forcibly argued here in the past, would have been dangerously small for the exacting and complex functions it will be called upon to fulfil, lacking both elasticity and the capacity to work in sub-committee. The concession represents a welcome and solid gain.

Unfortunately, the same cannot be said of the changes made by a majority vote. They were certainly improvements of the Bill; but amendments on major points that are forced through the Lords in the teeth of Government opposition are obviously unlikely to survive the return trip to the Lower House. An amendment was carried which transfers from the Minister to the Commission the power of appointment of the Executives—a change which would do much to save the Commission from the invidious position that is inherent in the Government plan. But, for that very reason, it would undermine the main line of policy which runs through the whole scheme, an extreme extension of the principle of Ministerial responsibility. Reaffirming that policy, the Government is determined to retain the right of appointment. But if, on the Bill's return to the Commons, the original provision is likely to be restored, so that the strength of the Commission may be menaced from below, the Government has at least promised restraint in interference with it from above. On

the important question, in Clause 4, of the scope of the Minister's powers to give directions to the Commission, Lord Addison gave an undertaking that the powers will be used sparingly—whatever that may mean.

The second issue on which amendment was forced upon the Government was also fundamental—it would restrain the Minister from giving to the Commission any directions which would prevent it from paying its way. The Government tried to represent this as "unnecessary," on the ground that Clause 3(3) lays down that the Commission's revenue shall be "not less than sufficient for making provision for the meeting of charges properly chargeable to revenue, taking one year with another." But what the Opposition feared was precisely that the financial limitation imposed by this clause might not be held to circumscribe the Minister's power to give directions, and that in consequence a chaotic conflict might arise. Certainly, the possibility of such a clash would not be inconceivable if the two clauses had to be construed separately, and a rate structure duly worked out and approved might be hopelessly undermined. If the Government were to seek demonstrably non-economic or uneconomic objectives, unrelated to the efficiency of the transport system as a whole, it is plainly desirable that the issue should be forced to a decision in Parliament. The amendment seems to have put the matter beyond doubt; it is greatly to be hoped that, in essence at least, it will survive.

The other defeat for the Government was on an amendment to exclude the docks from the authority of the Docks and Inland Waterways Executive—a move designed, in conjunction with an amendment still to be considered, to leave with the Commission the power to review their activities. There is much to be said for keeping the docks under the general supervision of the Commission without tying them too rigidly to any one particular Executive in the initial period of the new transport set-up. Lord Swinton was on firm ground in arguing that the Commission will have its work cut out in any case during the formative years without bringing in the docks; these could later be brought under more direct control under the Commission as circumstances might dictate.

Russian Trade Negotiations

The trade discussions with Russia which were opened towards the end of April on the occasion of the visit to Moscow of Mr Harold Wilson, Secretary for Overseas Trade, have stalled for the time being owing to the Russian demand for a renegotiation of the 1941 civil supplies credit arrangements. Under this agreement some £100 million of goods were supplied to Russia against 40 per cent cash payment and 60 per cent credit, the credit to bear interest at 3 per cent and to be repayable over seven years. The deliveries under this agreement gave rise to some disputes, particularly on the question of pricing and qualities, and when the whole matter was reconsidered in 1946 on the occasion of Mr Marquand's visit to Moscow, certain concessions were made to Russia. Most important of these were the allowance of a discount of 1½ per cent on the price of goods still to be delivered under the agreement and the reduction of from 3 to 2 per cent in the rate of interest on the credit outstanding, namely about £55 million. The whole matter was again reopened when Mr Harold Wilson recently visited Moscow and opened though Mr Wilson had no authority to negotiate on this subject it was understood that satisfaction of certain Russian demands would be a condition of satisfactory trade relations. These demands, which have this week been considered by the Cabinet in London, are that the rate of interest be reduced to ½ per cent—which, according to the Russians, is the "right rate among gentlemen"—and that the period of repayment be extended over sixteen years. The only question under consideration is the revision of the terms of the outstanding credit. So far as can be ascertained, there is no question of fresh credits being granted. Any trade which may develop between the United Kingdom and Russia as a result of the discussions now under way is expected to be of essentially compensatory character, and no substantial overdraft or line of credit will be allowed to develop either way. If it does, it is probable that the technique of the payments agreements will be adopted and that any balance over a specified and modest figure will be automatically convertible into gold. If satisfaction is given to the Russian demands regarding the outstanding credit, it is probable that the commercial negotiations as such will be resumed in Moscow before long.

Obscurantism in Coal

On Monday last, the Minister of Fuel and Power announced that weekly figures of coal production, which have been issued

each week since the beginning of the five-day week, will no longer be published. Only the usual monthly output figures will be available in future. It is true that when the weekly figures were first issued the Minister said that they would be published for only four successive weeks. But the decision to suspend them now will none the less create an unfortunate impression. The informed public had begun to follow the weekly trend with an interest almost reminiscent of the daily count of enemy aircraft losses in those crucial weeks in the late summer of 1940. Certainly, an almost equal concern is justified, and more people than the Government perhaps realises already recognise it.

Figures of coal production and stocks have indeed achieved a certain notoriety over the last few months. The conflicting statistics quoted at the time of the fuel crisis and the difficulty of interpreting the summer coal allocation figures for industry, to say nothing of the notorious, unpublished "November quota" which serves as the official starting point for all published percentage figures of industry's coal allocations in 1947, all predispose the public to suspicion in approaching coal statistics. Only full and frequent figures, in a form which becomes well recognised and therefore understood, can restore confidence that the true position is being disclosed.

The timing of Mr Shinwell's announcement has not, in any case, helped to remove the unfortunate impression that the Government is more anxious to conceal than to reveal. The last published weekly figures embraced the Whitsuntide holiday, and were heavily down. Secondly, to add to the confusion, Mr Shinwell announced a "new" coal output target—or at least a new "interpretation" of the old one. He is reported as having said at Cardiff that to reach the 200 million tons target for 1947, average weekly production must reach 4.14 million tons from now until the end of the year. The ordinary arithmetic average weekly requirement is about 3.9 million. The "new" figure presumably allows for the fall in weekly output which may be expected during the holiday period and relates to the higher average output which must be achieved in the remaining weeks of the year. But the Minister did not say so. Nor did he show any real confidence that the post-holiday output will reach the new weekly objective—though obviously trying to appear optimistic, he referred simply to the prospect of well over 4 million tons weekly. The weekly figures exist—in more detailed form than has yet been revealed—and the public seeks to know what they are. What good reason can there be for refusing publication?

TDRs and Gilt-edged

The resumption of maturities of Treasury deposit receipts after an interval of seven weeks has afforded the authorities an opportunity of reducing further the outstanding total of this type of floating debt. This week the authorities resumed TDR borrowings, with an issue of £60 million, but the amount required of the banks was some £10 million less than the £66 million of their corresponding maturities, so that there was a small net repayment. The money market is hoping that this represents a continuance of the policy, which since 1945 has been pursued whenever opportunity offered, of switching the emphasis in floating debt borrowings from TDRs to Treasury bills. It is true that the clearing banks' holdings of money markets assets—Treasury bills and call money—have risen to very high levels by contrast with their experience during the war; even the ratio to deposits, which at one time was as low as 6½ per cent, has recently been restored to the relatively normal level of nearly 20 per cent. But in May (the complete figures were published in the *Records and Statistics Supplement* last week) the combined total of bills and call money dropped by rather more than £54 million. Were this trend to continue, the elasticity of the banking position would be considerably impaired, whereas, in view of the sharply rising trend of bank advances, there is need for much greater elasticity than during the war, when most of the additional deposits which accrued to the banks were automatically employed in Government securities of one kind or another. Except at times when the "tap" issues of bonds were flowing strongly, the counterpart of rising bank deposits was generally to be found in TDRs. It would be logical, therefore, to assume that if the trend of deposits is now turning downwards in consequence of a reduction in net borrowings by the Government, the Treasury's repayment of debt should take place in TDRs rather than in bills.

It would perhaps be unwise, however, to assume that the approach towards budgetary equilibrium necessarily means that

a declining trend of deposits is assured. In the past few months, as *The Economist* pointed out last week, the downward impetus may have been offset by Treasury borrowings for undischarged purposes; if it were true that these borrowings reflected accumulations of dollars on the Treasury account in New York, the eventual spending of the dollars would tend to accentuate the downward trend of deposits. On the other hand, the coming discharge of the sterling debt to Argentina will involve a corresponding increase in British Government borrowings from the domestic banking system, since the UK floating debt which is at present held by the Argentine authorities will in effect have to be taken up at home, and obviously will not be absorbed by the former holders of Argentine rails who will be the recipients of the resultant cash.

Preparing for Argentine Repayment

If the Argentine share-out proceeds according to plan, these influences may be expected to make themselves felt in the early autumn, when they are likely to synchronise with the first steps by the British authorities to prepare for the situation which is likely to arise in the gilt-edged market next year. At this stage it can hardly be doubted that the issue of compensation stock under the Transport Nationalisation Plan will be the signal for selling on a scale which will require substantial official operations if a reasonable equilibrium is to be maintained.

Obviously it is impossible to make precise forecasts at this stage, but it does seem that in the second half of this financial year these and other special operations will provide weighty offsetting influences against the effects on bank deposits of the improved position of the ordinary budget. In the circumstances, an appreciable expansion of the effective floating debt—that is, the portion of the debt held outside official quarters—seems probable in this period, and, in view of the need to minimise the pressure on the gilt-edged market, it is reasonable to assume that Treasury bills will carry a larger share of the burden than they have generally done in recent phases of heavy borrowing. If the banks were forced to take large additional lines of TDRs, they would be likely to be correspondingly more reluctant to increase their holdings of gilt-edged—and, in the absence of a tap issue, there would be no possibility of converting TDRs into gilt-edged. On the other hand, if the finance is obtained by bills, the elasticity which the banks obtain from a liberal holding of money market assets will give them at least an opportunity to expand their investment portfolios further if they so desire.

If the authorities really are seeking all possible technical devices to ease the problem of gilt-edged management in this prospectively difficult phase, there is one further point which ought not to be overlooked. Earlier this year there was a good deal of discussion of the way in which flexibility of the money market might be improved by standardising the currency of Treasury bills at 91 days, i.e. an even number of weeks, instead of the present system of three calendar months. The experience last month, when the usual dislocation was caused through the effects of the "lacking days" in February, has drawn attention again to the unnecessary friction which is occasioned in the market by reason of the absence of this quite simple reform. If there is a prospect that the bill issue is likely to be appreciably expanded in the autumn, a system which will ensure a more even balance between maturities and payments day by day will become more than ever desirable. Certainly the 91-day Treasury bill is a logical corollary to the rationalisation of the short loan mechanism which was achieved by the ending of bank window-dressing. The same is true of another project, of which less has been heard, for a 182-day Treasury deposit receipt.

International Bank Bonds

Preparations are now being made at the headquarters of the International Bank for Reconstruction and Development in Washington, and at the New York office which it has recently opened, for the initial bond issue of the bank to private investors. The intention is to make an issue of the bank's own bonds, amounting to approximately \$250 million, and thus providing the resources from which the \$250 million loan to France will in effect be financed. The exact amount of the issue may not be specified, and it is possible that the bonds may be on tap for some time and that more than the \$250 million in question may be collected if the response from subscribers over-reaches this target. The terms of the issue have not yet been fixed, but it seems probable that they will approximate fairly closely to those on which the loan to France was made, namely, a rate of

interest of slightly over 3 per cent with bonds maturing over a period of 30 years. The difference between this rate of interest and the 4½ per cent charged to France is explained by the 1 per cent guarantee fund commission which the bank is compelled to charge on all its loans. It has already been widely suggested that this guarantee fund commission is too high and that if it is adhered to it will make bank lending too expensive, thus encouraging only borrowers whose intention to repay and meet their obligation cannot be rated too high. If a change is to be made in this respect there will have to be an alteration in the articles of agreement of the bank. This may well be a matter that will come up for discussion at the second annual meeting of the governors, for which active preparations are now being made in London. The meeting will take place in September, in the building of the Institution of Civil Engineers.

The only interesting recent news from the International Monetary Fund is that this institution is devoting some attention to the problem of free gold markets and of the operation of monetary authorities in these markets. One of the obligations undertaken by members of the IMF is not to sell gold at prices other than those indicated by the designated parities of their currencies. This obligation has repeatedly been breached. Mexico, for example, makes a habit of selling gold coins for export at an appreciable premium. Certain central banks in Western Europe are suspected of operating in their own black market for gold by selling coins in order to reduce the premium on gold, hoping thereby to underpin confidence in their currencies. The practice has gained sufficient amplitude and notoriety to justify some investigation and perhaps action by the IMF.

Higher Steel Production

Both pig iron and steel output in May showed an improvement on April, but both were lower than in May, 1946. The May production figures issued this week by the British Iron and Steel Federation show that weekly average production of pig-iron was 141,900 tons, compared with a weekly average of 139,200 tons in April and 151,200 tons a year ago. Steel ingots and castings last month averaged 243,900 tons a week, compared with 236,400 tons in April and 261,900 tons in May, 1946. The *Economic Survey* "hoped" that the steel output for 1947 would reach the level of 1946. There was a wide gap, however, between the annual rate of output in May and the annual rate a year ago—12,684,000 tons compared with 13,619,000 tons in May 1946.

According to the Federation, the May figures still reflect the effect of recent fuel limitations. Unfortunately, with a coal allocation based on last summer's consumption, there is little hope of a spurt in output which might close the cumulative gap between the level of production in 1946 and the performance so far in 1947.

Brazil Tightens Import Control

Some perturbation appears to have been caused by the recent announcement that Brazil had tightened the machinery for import licensing and that at the same time commercial banks in that country had been requested to offer to the Bank of Brazil 30 per cent of the foreign exchange they purchase from their customers. The surprise caused by these developments springs largely from their timing, in particular from the fact that they followed the sterling agreement under which Brazil's current accruals of sterling were given the rights and privileges of inclusion in transferable accounts. In fact, this sequel is far from paradoxical. When the full details of the agreement with Brazil have been published, it will no doubt be found that accumulated sterling has been subjected to some form of funding, while current accruals of sterling will, of course, be freely expendable, and transferable for current purposes. The point to note is that henceforth sterling will be a decidedly harder currency for Brazil than it has been in the past, for Brazil will be deprived of the facility available to her hitherto to draw on accumulated balances to finance her sterling requirements. This, together with the dwindling dollar reserves at Brazil's disposal, explains the extension of the export licensing system that was announced this week. Since Britain is in the same position as Brazil and operates similar selective restriction of imports, strictures of Brazil's decision do not come very appropriately from this country. As for the requirement that the commercial banks sell part of their exchange receipts to the central bank, it merely reverts to the position that obtained until about a year ago and copies the procedure followed in Britain and many other countries.

Recovery in Rayon

The rayon mills have weathered the fuel crisis better than most industries. February was a bad month, but the fall in output was largely concentrated on the smaller continuous filament producers. By the end of April, production—taking the continuous filament producers as a whole—had recovered almost to the level of January. According to the Customs and Excise returns, total rayon production in April was 15.9 million lb., compared with 16.6 million in March and 13 million in February. The slight setback in April, which included the Easter holiday, was due to a fall in staple fibre production from 7.5 million lb. to 6 million, a decline only partially offset by increased output of continuous filament, which improved from 9.1 million lbs. in March to 9.9 millions in April.

Total rayon production is now above its pre-war peak of 15.1 million lb. a month. Average monthly production in March and April was 16.2 million lb., compared with 18.5 million lb. in January and 17.2 million lb. in the last quarter of 1946.

The wide range of uses to which rayon is now put is shown in an analysis of rayon deliveries to user industries published in last week's issue of the *Board of Trade Journal*. A summary is reproduced below.

RAYON YARN AND STAPLE FIBRE DELIVERIES
(January to March, 1947)

Rayon Yarn			Staple Fibre		
	Tb. lb.	%		Tb. lb.	%
Weaving	10,776	48	Cotton Spinning	10,794	7
Hosiery	3,241	13	Wool "	1,515	7
Warp knitting	2,381	9	Flax "	4,935	28
Industrial (Tyres, etc.)	3,969	16	Jute "	469	2
Miscellaneous	2,017	8	Silk "	262	1
Exports as yarn	2,960	12	Exports as staple fibre	3,362	16
Total	35,344	100		21,337	100

Weaving accounted for over 40 per cent of total continuous filament yarn (rayon yarn) deliveries for the first quarter of 1947. Industrial purposes, which include the coarser deniers now used in tyre manufacture, occupied second place—above deliveries to either the hosiery manufacturers or the warp knitters. Cotton spinning naturally took the major portion of staple fibre output (51 per cent). Rayon is now used for a large variety of purposes in the textile trades and in industrial uses, not only as a substitute for natural fibres but also as a yarn with its own distinctive qualities. The final abolition of the 6d. per lb. excise duty should increase the field of rayon's uses, but its ability to take advantage of this relief will depend on the availability of coal supplies. A cushion was provided for falling production in February by drawing on stocks, but output for the rest of this year will be much more dependent on regular coal deliveries.

Saar Currency

The French Government has this week announced its intention to proceed to an exchange of currency in the Saar territory, which as from June 15th will use the Saar mark instead of the German reichsmark. The exchange of currency is to be effected at par. The move is admittedly made to facilitate and prepare for the eventual complete economic fusion of the Saar territory with France; it anticipates a second currency conversion operation, namely from Saar marks into French francs. A provisional rate of exchange of 12 French francs to the Saar mark has been fixed but how ephemeral this figure must be is evident from the complete uncertainty with which the prospects for both marks and French francs must be viewed. For the former only a drastic surgical operation can secure any remnant of acceptability or value. The broad lines of such an operation have been drawn up but still await quadripartite agreement, which means that they may have to wait a long time before being realised. As for the franc, every day that passes in France, every incident of the labour situation, indicates the piecemeal disintegration of the *expérience Blum* with its attempt to secure a prices-wages stabilisation. A further devaluation of the franc appears, therefore, to be ultimately inevitable. The only questions that arise are what will be the most propitious timing for this operation and what will be the appropriate rate to which to devalue. Both questions will have to be submitted to the International Monetary Fund. They are no doubt already the subject of study by the experts of that institution.

June

The first long days of midsummer bring thoughts of travel. Whether you are beginning to plan your holiday or whether you feel that now would be an appropriate time for that long-deferred business trip, preparations have to be made. The Midland Bank is ready to assist you with the services of experienced specialists in exchange matters, by obtaining your foreign currency and by providing travellers' cheques and letters of credit which are readily encashable abroad. With an unrivalled reputation overseas, this Bank has thousands of agents throughout the world who are at all times ready to assist its customers.

MIDLAND BANK LIMITED

World Linseed Prospects

In spite of the development of substitutes, the world linseed oil position is still causing anxiety. Flax is grown over a wide area, but its primary purpose is for fibre. In Europe a "dual purpose" variety has been cultivated for some years, but the seed yield is still rather low. About three quarters of the world's output of linseed, which in 1946 totalled only 110.5 million bushels, is accounted for by Argentina, the United States and India—in order of importance. During the war, with the emphasis upon foodstuffs, the acreage of linseed declined in both India and Argentina. In the United States, on the other hand, as in Canada and the United Kingdom, it was expanded very rapidly in the early years of the war, and in spite of a significant reduction since 1943, it is still above the pre-war level. The low 1946 world output—about 20 per cent below the pre-war—was mainly due to smaller yield, although acreage was also nearly 20 per cent less than in pre-war years. Full details are given in this week's issue of the *Records and Statistics Supplement*.

According to the United States Department of Agriculture, prospects for 1947 are good, and the world output of linseed should be substantially above the 1946 level. In Canada the acreage is expected to show a 67 per cent increase, stimulated by a price increase of \$1.75 to \$5.00 per bushel for No. 1 grade. In view of the difficulty of diverting acreage from other crops to linseed, this is regarded as satisfactory, although below the target. In the United States, with a support price of \$6.00 per bushel for No. 1 seed, Minneapolis basis, prospective acreage is 70 per cent above that for 1946. With the continued lateness of the season, farmers may even plant linseed on ground intended for wheat, particularly as reports suggest a record wheat crop this year. The Indian crop is expected to be below average, but an export quota of some 27,000 tons of linseed oil, to meet the International Emergency Food Council's allocations, has been established for 1947-48.

In Argentina there is little prospect of increased acreage unless the Government amends its policy towards the farmers, who were dissatisfied with the 1946 price. Last year's acreage of 4.7 million acres was, with one exception, the smallest since the early 1920's, and output was also affected by locust damage and wet harvest weather. In November, 1946, the Government reduced the price of linseed to the growers from \$2.65 to \$2.27 a bushel, at the same time raising the export price. Purchases of linseed oil made by the United Kingdom and the United States for delivery in 1947 were concluded at between 30 and 31 cents a lb. (equivalent to about £170 per ton), compared with 25 cents in 1946 and 9½ cents in 1945.

The hope of increased linseed supplies, therefore, lies mainly in the American output. Domestic consumption in Canada is expected to be under 10 million bushels, so that there may be an exportable surplus. The United States, if the hoped-for increase in output materialises, will at least be a less significant purchaser in the world market, and may also be in a position to furnish additional supplies. Although the quantities involved will not be sufficient to cover world requirements, they may be just adequate to counter the present Argentine policy.

Coal for Building Materials

By the end of April, production of building materials had made a notable recovery from the low levels of February. There is no reason to suppose that this progress has not continued. But output of certain key materials in April was still well below that for last October, the best month, in most instances, of 1946. The extent of the lag, as at end-April, behind last autumn's production levels is indicated in the table below.

PRODUCTION OF BUILDING MATERIALS: MONTHLY PRODUCTION

	Bricks	Cement	Asbestos Cement Sheet	Clay Tiles	Plaster-board	Rainwater Goods†
	(mn.)	(Th. tons)	(Th. tons)	(Th. sqs.)	(Th. sq. yd.)	(Th. tons)
October, '46	442	766*	35.0	63.4	3,830*	...
January, '47	379	550*	34.5*	63.5	3,424*	6.19
February	247	192	11.9	46.0	1,598	4.13
March	277	366	25.9	44.8	2,780	6.93
April	349	601*	30.0*	45.6	3,711*	7.08

Source: Monthly Digest of Statistics

* Five weeks periods. † Includes cast iron and steel, aluminium and asbestos cement; asbestos cement output is for 5 week periods in January and April.

The building material industries are now in the summer coal allocation period. Their output between now and November, before autumn brings flooded clay and chalk pits and before they face the as yet unpredictable effects of next winter's coal

allocation, is vital for this year's housing programme. Sir Stafford Cripps, when he announced the summer coal allocation for industry generally, promised special treatment for the building material industries. Their coal allocation, he said, would not be based on last summer's consumption. An allowance would be made for their intervening expansion in output. It now appears that all producers of building materials will in effect receive each week the equivalent of their average weekly consumption in the period May to October, 1946. In addition, the Ministry of Works has been given a block allocation of additional coal for allocation to firms which have expanded output above the level of their average production last summer. The effect of this increased allocation will be, nominally, to provide this group of industries with 85 per cent of the coal they would have needed to achieve the output (after slight adjustments) required to meet the original housing targets. But in practice the effective allocation may be slightly better than this, owing to the way in which the supplementary allocation can be used. The Ministry of Works will no doubt be able to give preference to key industries, such as cement, and to others using a small amount of coal per unit of output, such as the Flettons brickmakers. Again, there will be scope for the Ministry in making its allocations, to have regard to the scale of production and efficiency of different firms.

On paper, at least, the net effect appears to be that the building material industries as a group will, in the matter of their summer coal supplies, fare rather better than most other industries. The crucial test in maintaining the flow of materials and housing components, however, will be the success achieved in obtaining actual delivery of the coal at the right works or factory at the right time.

Coal-to-Oil Conversion in Perspective

The Minister of Fuel and Power announced last week that, for the time being, further authorisations for conversion from coal to oil firing will have to be suspended. When present plans are completed, which Mr Shinwell hoped would be in the middle of 1948, total consumption of fuel oil will be at the rate of seven million tons a year, compared with 1,960,000 tons in the year ended April, 1946. This additional five million tons a year should represent an annual saving of about eight million tons of coal.

The advantages of a change-over from coal to oil where such relatively small savings in coal are involved clearly depend upon the chances of achieving conversions rapidly at key points in the industrial process. Even a few hundred thousand tons of coal are worth saving by importing fuel oil from Middle East sources if they stave off another fuel crisis this coming winter. The February fuel crisis underlined the significance of marginal coal supplies. Encouragement of conversion at such strategic points by the installation of standard types of equipment has been a keynote of official policy.

But it was inevitable that a halt would have to be called before long. The shortage of materials, especially of steel, for both plant and storage capacity has become increasingly acute. To limit the programme now is obviously wise, if to do so will ensure delivery by not later than the middle of 1948 of equipment for all schemes so far approved; there was a danger that the limited supplies of oil-burning appliances, too, might outstrip supplies of storage capacity, for instance. It is now clear that most rapid progress has been made in converting steel capacity. Mr R. M. Shone, of the British Iron and Steel Federation, recently estimated that as much as 1.8 million tons of coal a year might be saved by conversion schemes already approved.

When supplies of materials and the capacity of the oil industry itself make further authorisations of conversion feasible, the longer term problems will deserve closer study. By then it may be possible to estimate from the trend of coal production and relative costs just how far British industry should be encouraged to become permanently dependent on imported oil supplies. But by then, the fundamental issues of cost and efficiency should carry more weight than they have done at times in the recent past.

Inquiries into Building Costs

Three committees have been appointed, it was announced in the House last week, to exercise a continuous review of housing costs. The first two will keep house-building costs under review in England and Scotland respectively and make recommendations. The third will have the same terms of reference for enquiring into costs of building materials.

These terms of reference are wide enough to give the committees a broad purview of house building and its ancillary industries. But it is difficult to see how they can do much more than record facts of a kind that are already well known and make recommendations on isolated instances where economies might be obtained. It is true that the housing costs committees are likely to disclose large discrepancies in building costs between different areas. But since they must regard the available building labour force, the price and the flow of building materials to sites and the shortage of qualified staff in many local authorities' administrations as fixed—at least in the short period—the scope for constructive recommendations cannot be very great.

The committee on building materials prices is in a similar position. In this group of industries, many important factors in cost are already determined by official policy. Most of these industries are large users of coal. Their level of output and costs now depends on the amount of coal they receive from the Ministry of Works allocation, its price and its ash content. Many firms are being encouraged to instal new equipment, and its cost when finally installed may vary considerably from original estimates. It will therefore be exceedingly difficult either to assess the trend of production and costs over the next twelve months or to gauge the effect upon individual firms of, say, overall reductions in prices.

But to list the committees' difficulties is not to argue that they cannot do useful work. There is persistent upward pressure on building costs at present both from the side of labour and materials. So long as that pressure continues there is a clear advantage in having an organisation available which can maintain an overall review of costs and prices.

Dock Labour in Transition

The annual report of the National Dock Labour Corporation for 1946, issued at its meeting last week, is of particular interest, in that it coincides with the termination of the existing scheme and the beginning of the new national, permanent scheme for dock employment. The report covers the difficult period of the transition from war to peace—the period of decline from the high level of wartime earnings and uncertainty about the future organisation of the industry. Lord Ammon, the Corporation's chairman, is outspoken in his comments about unofficial strikes, which caused the loss of more than 40,000 manhours during the year; he condemns the "unofficial and quite irresponsible leadership" of the strike instigators. His remedies—a more lively interest by the rank and file in trade union branch activities and

greater confidence in the constitutional negotiating machinery—are, however, easier to prescribe than to put into operation.

The chief function of the Dock Labour Corporation in wartime was to ensure the maximum speed in the turn-round of ships, often under bombardment. This aim is hardly less important in post-war conditions, when delays in the clearance of cargoes may hold up vital exports. The Corporation aimed at securing a balanced and properly distributed labour force, to achieve which apparently requires a minimum manpower surplus of 10 per cent. The labour conditions of last year were, however, exceptionally difficult. Although some 5,000 men were dismissed as redundant and 2,000 retired, the effect of demobilisation was to leave the industry with 600 more men at the end of the year than at the beginning—but with a greatly reduced volume of work. At one stage in 1946, the Corporation was carrying a surplus of 9,000 men, or about 25 per cent of its total labour force of 37,000. This imposed an altogether uneconomic burden upon the finances of the Corporation; it paid out £400,000—or 50 per cent—more in attendance money than in 1945. This was met only by calling heavily on reserves and by increasing the percentage levy on the wages of allocated workers, which added to the burdens of the industry. On the initiative of the Corporation, a fact-finding committee was set up by the Ministry of Transport, to try to adjust the labour supply to the likely requirements at the main ports. The committee was able to agree upon the adjustments necessary, but not upon the means of making them, so that most of its findings have not been implemented.

There will be general agreement about the financial, economic and administrative advantages of having a national labour scheme for the docks—Glasgow and Merseyside were excluded from the Corporation's scheme. At the same time, it should be recognised that the National Dock Labour Corporation, for all its limitations, did good pioneering work in the decasualisation of dock labour and in the development of port welfare services in a hitherto largely casual and uncared-for industry.

Explaining the Stock Exchange

City institutions have remained surprisingly aloof from the modern growth of "public relations." There is scarcely a large body in industry, the professions or labour which is not nowadays ready to explain itself, and if need be to defend itself. "The City" has been under political fire for a decade or more, and it is increasingly called upon to cater for a larger number of cus-

COMPANY MEETINGS

F. FRANCIS AND SONS,
LIMITED

IMPROVED RESULTS

The forty-sixth ordinary general meeting of F. Francis and Sons, Limited, was held, on the 11th instant, in London.

Mr John Ismay (the chairman) said that the profit, including dividends from subsidiary companies, was up from £68,200 to £88,180. After making provision for taxation and payment of the final dividend of 15 per cent. the total of their undivided profits and reserves had risen from £73,043 to £86,257. They had retained over one-third of their profits in the business. Therefore the dividend, although an increase over the previous year, was still a conservative one.

They were acquiring a controlling interest in Keighley Lifts, Limited, Keighley, Yorks. He was confident that the link-up of the two companies would be of great advantage. Although they were producing entirely different articles there were many ways in which both the works and the sales departments could co-operate. The issued capital would be increased by 140,000 ordinary shares, and to pay the present rate of dividend on the additional capital would therefore call for a return of £7,000 a year gross. They had every reason to anticipate that the profits from Keighley Lifts, Limited, available to the company would far exceed that figure.

Shareholders might ask perhaps why, as the company only required 140,000 additional new ordinary shares to complete the present deal, the board should ask for power to increase their ordinary capital by as many as 400,000 shares, the reason being that they wished to be in a position to take advantage if, and when, a favourable opportunity arose to extend further their interests.

The report was adopted, and at a subsequent extraordinary general meeting the increase of capital was approved.

(Continued from page 955)

tomers of moderate means, instead of a smaller number of very wealthy clients, as a result of changing economic patterns and high taxation. The mysteries of banking, insurance and the Stock Exchange call for simple and informed explanation, first because the public which uses these institutions ought to know how they work, and secondly because ill-natured, prejudiced criticism should be stifled to give fuller opportunity for worth-while improvement and reform.

These reflections are suggested by the appearance this week of a short, popular book on the Stock Exchange and its place in the modern world.* Mr W. T. C. King has written a lucid account of all aspects of the work of the Stock Exchange, which is designed to provide for the small investor and the lay citizen very much what "the Radio Doctor" provides for those who are interested in preventive medicine. In other words, the book is popular in style; it explains how things work in the Stock Exchange; it is technical, where necessary, but always comprehensible, and it is well produced and illustrated. It is, perhaps, a little delicate to divide the responsibility for its appearance between the author and its sponsors. Evidently it is an independent work by the author, but the fact that the Stock Exchange Council have formally subscribed to its publication suggests that Mr King's views can be taken to carry the official endorsement of the Council. There is no reason for objection to this procedure. The Council could hardly be expected to wield a collective literary skill comparable to Mr King's, and it might have some diffidence—though it would hardly be justified—in itself claiming the credit for the reforms which it has undertaken since 1930.

For the general reader, perhaps, these form the most impressive section of the book. The Stock Exchange Council is, in legal form, an elected governing body of a private club, owing first duty to the interests of its members. But the legal form is widely

AULT AND WIBORG,
LIMITED

ACTIVITIES BROADENED

The annual general meeting of Ault and Wiborg, Limited, was held, on the 6th instant, in London.

Mr Gerald Wellesley (the chairman), in the course of his speech, said: Our financial year included the disastrous months of February and March. This notwithstanding, the turnover of our company and its subsidiaries has increased to such an extent that, despite a lower margin of profits on sales, the net earnings amount to £180,018. The directors recommend dividends totalling 30 per cent. on the Ordinary stock.

The board has always aimed to broaden the basis and widen the scope of the company's trading. Accordingly during the past few months we have acquired the entire issued capital of the following five companies: Associated British Cellulose, Limited, Allied Paints and Chemicals, Limited, Cecil Oliver, Limited, A. Learner and Company, Limited, and Wembley Paint Company, Limited, all of which are actively and successfully engaged in the production of paints, industrial finishes and metal decorating products. We have also opened a branch of Ault and Wiborg in Northern Ireland.

We are still faced with an acute shortage of raw materials, without which our business would automatically expand to a very much larger volume. Necessity, however, is proverbially the mother of invention, and our technicians have succeeded in producing satisfactory substitutes for many materials which we most urgently require. We continue to press forward with the export side of our business, but here again we are finding ourselves continually hampered by the shortage of raw materials.

The report was adopted.

APOLLINARIS AND PRESTA,
LIMITED

MR J. D. BROAD'S REVIEW

The fiftieth annual general meeting of Apollinaris and Presta, Limited, was held, on the 10th instant, in London.

Mr J. D. Broad, F.C.A. (the chairman), in the course of his speech, said: The year under review has again seen us operating under the Concentration Scheme for the Soft Drinks Industry, and our share of the profits has enabled us to make a distribution of 4½ per cent. to our debenture stockholders.

During the year under review our Presta factories at Elland, Yorks, and Colindale, Hendon, have been de-requisitioned. At Elland we were able to reinstate the plant and machinery within a short time, and deliveries commenced in October last. The reinstatement work at Colindale, however, was a much more difficult operation, and it was not possible to re-commence deliveries from that factory until April this year.

We are not yet in control of our Apollinaris Spring and Bottle Works in Germany. Colonel Broad has recently been to Baden Baden and the Spring, and we hope that the fruits of his visit will result in arrangements being made whereby we can export Apollinaris and restart the bottle works.

With regard to the Apenta Spring at Budapest, the position is very difficult, and recent developments are not encouraging.

The sale of our Buxton Water continues to develop, and we have been able to obtain permits for export to various markets abroad.

There is now some prospect of permission being obtained in the near future to import Vichy, Contrexeville, Evian, Vittel and similar French Waters on a quota basis.

Our sales of Cyder have been well maintained, despite a tendency to restrict supplies.

The report was adopted.

different from the practical fact. The Council's primary interest nowadays is the protection of the investor. It has no statutory limits within which it must legislate; its powers are wide, flexible and absolute—and, without doubt, more effective than the enormous system of regulations imposed by the Securities and Exchange Commission in the United States. The SEC was the American answer to the Wall Street boom and slump of the late 'twenties. In London, it was the Stock Exchange authorities which undertook reform from within. Mr King, while not neglecting the need to describe the way in which the Stock Exchange works, has usefully underlined the wider functions of the market in safeguarding the investors' interests, providing a free and fair market, and mobilising the nation's savings into the most useful channels. These functions ought to be more widely understood, and this book will certainly help in their understanding.

Shorter Notes

The official forecast of the United States wheat crop suggests that this year it will be 1,410 million bushels. This would exceed last year's record production by 250 million bushels. Of the total, winter wheat is expected to account for 1,093 million bushels and spring wheat 317 million bushels.

*

Statistics of the trade of independent retailers which have been published regularly in the *Board of Trade Journal* since October, 1946, are to be extended. The panel of traders making returns has been widened to cover the following trades: drapery; boots and shoes; hardware, electrical and radio shops; bookellers, stationers and newagents; jewellers and allied trades; motor and cycle dealers; toy and sports retailers. The first of the new figures, which refer to January, February and March, have now been published.

DUNLOP RUBBER COMPANY, LIMITED

MOST SATISFACTORY ACCOUNTS

SIR GEORGE BEHARRELL'S ADDRESS

The 48th ordinary general meeting of the Dunlop Rubber Company, Limited, was held on the 11th instant in London.

Sir J. George Beharrell, D.S.O., the chairman, in the course of his speech said:—

The accounts before you are in my opinion the most satisfactory and impressive ever submitted to a general meeting of this company. During 1946 the Dunlop organisation throughout the world was engaged in the process of conversion from war to peace, and in spite of many difficulties this was, on the whole, satisfactorily carried forward.

THE PLANTATIONS

When I spoke to you last year about the Plantations I gave you an indication of the immediate difficulties that confronted us, but said that looking further ahead I felt the estates would be able to render a good account of themselves. I am glad to be able to confirm this. The crop that is being harvested now exceeds the 1941 rate of production; our most valuable business in the form of concentrated latex has been re-established, shipments being now comparable in quantity and quality with those of 1941.

This has not been achieved without careful planning, heavy expenditure, and the most strenuous work on the part of our staff in Malaya under the most difficult conditions.

An outstanding factor in our recovery has been our progressive policy in developing large areas of rubber planted with high-yielding strains of buddings or clonal seed. Practically the whole of these mature areas survived the period of occupation with little damage and have, since tapping recommenced, produced at an annual average rate considerably in excess of 1,000 lbs. per acre.

During the past year important developments have taken place in the rubber markets of the world. I feel that we have now definitely reached the stage where the world rubber position can be discussed in a clearer atmosphere—free from the effect of those artificial restrictions which have so fundamentally effected the world rubber position since the beginning of the war. The situation is now under consideration by the International Rubber Study Group, whose membership is being considerably expanded, and it would be unwise of me to attempt to forecast the result of such international discussions, which, I feel, should be of vital importance to both producers and consumers. The Study Group's function is, of course, purely advisory.

TYRE DIVISION

Last year I expressed the hope that adjustments to the tyre rationing scheme would permit a wider distribution. By October, the scheduled output of car covers was reached and output generally was at approximately 93 per cent. of full normal capacity. This load was held for only two weeks, when reductions were necessary owing to difficulties in maintaining cord supplies. This, and the acute shortage of some raw materials, particularly carbon black, have restricted the industry's output, and tyres continue to be in short supply. The unavoidable shut-down during the earlier part of this year accentuated our difficulties, but by skilled distribution we succeeded in maintaining supplies to the public services and to the vehicle manufacturers. Cycle tyre production reached an all-time maximum, but here again output has been restricted until quite recently owing to cord shortage.

We are gradually reinstating the variety and attractiveness of the normal ranges of Dunlop tyres, in place of the war-time ranges, and only the inadequate supply of a few

essential materials stands in the way of tyres being made readily available to all.

ALL TYRES SOLD

You will understand that we sold all the tyres we could make, and in this connection you will be interested to know that the number of miles run by public service vehicles on Dunlop tyres was greater in 1946 than in any previous year of the Company's history.

Starting early in the year natural rubber became more freely available, and continued reconversion from synthetic, to natural was made, until by the third quarter practically all tyres had been changed back to natural rubber.

Although we may be handicapped by shortages of material from time to time, this change has enabled the quality of our tyres to be improved, particularly in the giant range, and the tread life built into giant tyres has been appreciably increased.

A substantial proportion of our tyre production is supplied to the manufacturers of motor cars and other road vehicles, and a section of our organisation is devoted entirely to these interests. You will know that there is a shortage of steel, and we cannot dissociate ourselves from the possible effects of this shortage upon the motor and cycle industries with which our own prosperity is linked.

I hope that in the allocation of raw materials, the outstanding importance of transport in all its sections and interests will receive the ready recognition of the authorities concerned.

EXPORT SALES MARKETS

A greater volume of goods was available for export than in 1945, in spite of the high priority given to major rubber goods for essential home industries and other requirements. There was further relaxation in the control of exports and we were enabled more fully to meet requirements in markets of our choice. Dunlop plants overseas have again been helpful in assisting to meet demands.

Certain overseas markets have been able progressively to relax their control of tyre sales and, in some, free market conditions have already returned, chiefly because of increasing exports from other countries. This has accelerated the change from a seller's to a buyer's market.

PLANS AND PROSPECTS

Production is our country's greatest need today. We have laid our plans to increase Dunlop productivity and extend Dunlop activities, as and when supplies of fuel, labour and materials permit. The response of our employees during the year under review gives me confidence that we can rely on their co-operation in our efforts to meet the national need and to adapt ourselves to changing circumstances.

Turning to the position which faces Britain as a whole, I need not remind you that our overriding need is for a great increase of production, in order to pay for essential imports and to maintain our standard of life. Without this our people must relapse into poverty and Britain cease to be a first-rate power. This position is becoming daily more and more fully recognised. We have the necessary skill in management, design and craftsmanship; our reputation for fair dealing and for high quality stands as high as ever; and I am convinced that as soon as those engaged in our factories realise that production is not going to be continually held up by failure of essential supplies, they will respond to the nation's need, and we shall achieve an output per worker surpassing in volume and value for money anything that has been accomplished in this country before.

The report was adopted.

GREYHOUND RACING
ASSOCIATION TRUST,
LIMITED

MR F. S. GENTLE ON RESTRICTIONS

The nineteenth ordinary general meeting of the Greyhound Racing Association Trust, Limited, was held, on the 2nd instant, in London.

Mr Francis S. Gentle (chairman and managing director) said that there were three reasons why the issue of the accounts had been delayed—racing restrictions, the Budget and rating. With regard to racing restrictions the Government made an Order during the fuel crisis which had the effect of suspending greyhound racing entirely as from February 11th. This discrimination whilst closing them entirely, allowed cinemas and theatres to continue. On the grounds that absenteeism must be prevented, the Government then called representatives of all sports to the Home Office and insisted upon their operating on Saturdays only, but horse racing was allowed to continue in mid-week and there had been no ban on cricket. The temporary Act was for a period expiring on June 30, 1948, and could not be extended except by new legislation but could be ended at any time by order of the Secretary of State.

There had been a possibility of some discriminatory tax, such as a betting tax, being proposed in the Budget. Happily the Chancellor did not propose such a tax.

RATING ASSESSMENTS

As to rating, for some years now Rating Authorities had been inclined to the view that all race tracks ought to be assessed on what was known as the profits or revenue principle. They had recently appealed successfully in the Scottish Court of Session against assessments on that basis, but in England large assessments had been made which were the subject of appeal.

During the year the restrictions on maintenance and building had to all intents and purposes prevented any progress with the improvement of facilities which they would have liked to have made. Active steps had, however, been taken to re-plan their stadia on the most modern lines and some progress had been made in improving totalisator equipment to meet the demand. The photofinish camera was now an established part of their equipment and had proved itself invaluable.

OTHER ACTIVITIES

The year 1946 had really been the first since the cessation of hostilities in which they had been able to return to activities other than greyhound racing. At the White City a full season of athletics had been held. At Harringay arena Roller Speedway, Ice Hockey, and Boxing, etc., had been operated and the Board were taking steps that the arena was used as far as possible in the current year. During the current year they had recommenced speedway racing at Harringay Stadium. Whereas in pre-war years they had let the track for that purpose, they were now operating the racing themselves, and so far the Board was satisfied with the results.

Profit and sundry income for the year was £2,090,000 compared with £1,616,000 in 1945, which was an all-time record. Of that amount taxation absorbed in total £1,649,000, an increase of over £200,000, although E.P.T. was mainly at the 60 per cent. rate.

The net profit of the Trust was £340,000 after appropriating £84,000 to reserve in the subsidiary companies. The directors recommended a final dividend of 45 per cent., making a total of 115 per cent. for the year. He had hopes that the present restrictions would be lightened, at any rate on some tracks, in the not too distant future, but till then it was obviously impossible to give any forecast for next year.

The report was adopted.

AMALGAMATED METAL CORPORATION, LIMITED

EFFECT OF WORLD SHORTAGES

The eighteenth ordinary general meeting of the Amalgamated Metal Corporation, Limited, will be held at Princes House, 95, Gresham Street, London, E.C., on the 17th instant.

The following is an extract from the statement of the chairman, Mr Walter Gardner, circulated with the report and accounts for the year to March 31, 1947:—

Non-ferrous metals have remained under control, and continue to be in short supply the world over. This state of affairs is deterrent and frustrating to business. The rise in values since the beginning of 1946 is not a healthy sign, for increasing production is slow in materialising. There are, of course, many reasons for this, upon which it is not proposed to comment now. However, the outstanding feature of the situation is that the United States has become an importer of metals.

A favourable feature for the Corporation has been the freeing of rubber from control during the past year, and, with most countries eager to purchase the commodity, and the producing areas—more especially Malaya—showing progress, the movement of rubber into consumption has been on an enhanced scale. It is all to the good that the London Market in Mincing Lane has reopened.

During the past year visits have been made by directors and other senior executives of both the British Metal Corporation, Limited, and Henry Gardner and Company, Limited, to various parts of the world. These journeys, have included visits to Australia and Canada, where we have had an opportunity of renewing, after the gap caused by the war, personal contacts with those engaged on the spot in the industries with which we have such important and valued connections.

During the past year the British Metal Corporation has acquired the entire share capital of Forest Hardwoods, Limited, a company engaged in the import of timber into this country and in the distribution of imported and home-grown timbers.

PROGRESS OF SUBSIDIARIES

The following notes in regard to some of our subsidiaries may be of interest.

Huntington, Heberlein and Company, Limited, the metallurgical and chemical engineering subsidiary of the British Metal Corporation, is fully employed at the present time with both home and export business, and has a number of important contracts in course of execution.

Colliery Engineering, Limited, specialises in plant for collieries, which includes the handling, cleaning and classification of coal at the surface. In recent years the company has introduced into the industry in this country new processes of very high efficiency to clean coal of all sizes mechanically.

Aerex, Limited, specialises in ventilating and fan plant of all kinds and of a very efficient character, principally for industrial work.

Henry Gardner and Company, Limited, have now entered the export fields for the sale of manufactured products in overseas territories. They are engaged in building up a network of associations in Malaya, India, Cyprus, South America, Canada and China. The association which both companies have with their agents, Messrs C. Tennant, Sons and Company, of New York, is of great and increasing value, whilst the British Metal Corporation, through its associated companies in Montreal and Calcutta, is well placed in Canada and India to further the company's business.

Great Britain's rôle in gaining her livelihood cannot in the future, any more than it has been in the past, be solely of an industrial character.

Commerce has always played a large part in her economy. Peculiarly situated as she is and highly populated, she must continue to be a world trader, and when the present sellers' market is over her position as the world's greatest importer must again be a factor of vital importance to the well-being of the world. Accordingly, the reopening of the Metal Exchange, if and when it becomes possible, should be a most beneficial measure to producers and consumers alike.

WILLIAM BEARDMORE AND COMPANY, LIMITED

EFFECTS OF NATIONALISATION

SIR JAMES LITHGOW'S REVIEW

Sir James Lithgow, chairman of William Beardmore and Company, Limited, at the company's annual meeting in Glasgow, on the 5th instant, stated that the demand for the company's commercial products still remains good.

The failure of the Ministry of Fuel and Power to obtain from the individual miner an output the least approaching what he was accustomed to give to his individual employer, to which the chairman referred last year, has made itself even more manifest. Attempts are now being made to obscure the issue by suggesting the necessity for recruitment of a personnel larger than was ever before employed on mining coal for home consumption.

Fortunately, much of the company's production is now for purposes enjoying a high degree of priority.

Continuing, he said Nationalisation had not produced cheaper, better and more abundant fuel. On the contrary, it seems necessary to reconcile ourselves to dearer, poorer and scarcer supplies, with all that that implies in the lowering of our industrial tempo and an automatic reduction of our national wealth. Even greater loss to the country's industrial prosperity must inevitably follow the handing over to centralised political control of the highly technical iron and steel industry. This loss will be most acutely felt on Clydeside.

CONSERVATIVE VALUATION

The chairman, in referring to the accounts, indicated that he was satisfied the fixed assets were conservatively valued and would be able to hold their own in earning capacity with any in the trade.

The liquidation of Newton Mines and Beardmore Diesels, two of the company's subsidiaries, will produce fully £100,000 in cash more than the 1938 valuation in the balance-sheet, and he stated that the value of holdings in associated companies as shown in the balance-sheet was very substantially below the cash value today.

Referring to the hope expressed twelve months ago that any doubts then existing as to the company's liabilities in respect of taxation and as to the assets in the shape of unsettled Government accounts would by now be cleared up, the chairman stated that this hope had not been fully realised, but sufficient progress had been made for him to be able to assure stockholders that the figures included in the accounts for these items were conservative.

After referring to the immensely strong liquid financial position of the company, the chairman said it was the declared policy of the board, as enunciated last year, to conserve these ample resources until some clear opportunity arises of utilising them in furthering the interests of the proprietors, as well as of the trade of the country. In the particular trade in which the company is such an outstanding unit political uncertainties counsel caution, but the directors were determined to maintain the company's plant and equipment to cover its existing lines of business in the most efficient and up-to-date condition.

The report and accounts were adopted.

BRISTOL AEROPLANE COMPANY, LIMITED

CONSIDERABLE PROGRESS

The thirty-seventh ordinary general meeting of the Bristol Aeroplane Company, Limited, was held, on the 3rd instant, at Bristol.

Sir William G. Verdon Smith, C.B.E. the chairman, in the course of his speech, said: Whilst we have reason to present with confidence the results of the company's work in 1946, the degree of optimism for the future of the company which our technical progress fully justifies must be tempered by restraint for economic and political reasons.

ACTIVITIES OF THE COMPANY

During 1946 the company's aircraft division concentrated partly upon the Brigand for the R.A.F. and partly upon the Bristol Type 170, known as the "Wayfarer" (passenger) and the "Freighter" (cargo). The Bristol Type 170, with Bristol Hercules engines, has been sold overseas in a number of countries.

In addition, steady progress is being made with the building of the Bristol type 167, Brabazon Mark I.

Our first helicopter has recently started flight tests, and helicopters of more advanced design are being discussed with the Ministry of Supply.

Our engine division had a successful and encouraging year. Bristol Hercules engines power all the Vickers' Vikings. They are used in our own Wayfarers and Freighters; also in the Short Silent flying-boats, the Handley-Page Hastings and Hermes aircraft and the Avro Tudor VII.

The Bristol Centaurus has been in steady production for the Brigand and Sea Fury, also civil variants for the Airspeed Ambassador, the Brabazon and other types.

Excellent progress was made with our Theseus propeller gas turbine, the first to pass an official type test. The Theseus will be installed in the Hermes V, whilst later types of Bristol gas turbines will be installed in the Bristol Type 167 Mark II and in the Saunders-Roe flying-boat.

Since the last general meeting good progress has been made with the Bristol 2-litre car; the early stages of production have been reached, and the car has been exceedingly well received by discriminating critics both at home and overseas.

A further branch of the company's activities is the production for the Ministry of Supply of aluminium houses. As this constitutes a specialised business, a separate wholly-owned subsidiary company has been established known as the Bristol Aeroplane Company (Housing), Limited.

A reduction of £2,571,534 in debtors is largely the result of final settlement of outstanding wartime contracts.

At the end of 1945 there was a sum of £799,939 due to our bankers, the end of 1946 found us with a balance at bank and cash in hand of £706,846 and tax reserve certificates of £1,118,700. To a considerable extent this arises from the E.P.T. post-war refund.

ALLOCATION OF PROFIT

In the profit and loss account the net profit is £639,405.

After usual charges, including income-tax at £285,000, there is a balance to be carried to the appropriation account of £346,721, which with the addition of the balance brought forward of £36,204, leaves £382,925 available. Out of this the dividend on the preference stock and a 4 per cent. interim dividend on the ordinary stock absorb £89,100, and £100,000 is being added to general reserve.

Out of the balance of £193,825 your board have recommended payment of a final dividend of 6 per cent., making 10 per cent. for the year, the same percentage as previously, leaving £84,925 to be carried forward.

The report was adopted.

GOVERNMENT RETURNS

For the week ended June 7, 1947, total ordinary revenue was £37,082,169, against ordinary expenditure of £67,124,340 and issues to sinking funds £760,000. Thus, including sinking fund allocations of £2,169,015, the surplus accrued since April 1st is £202,563,881 against a deficit of £196,938,000 for the corresponding period a year ago.

By order of the Board, FREDERICK BRAMLEY, Secretary. Montreal, June 9, 1947.

AVELING-BARFORD, LIMITED

At a Meeting of the Board of Directors held on Thursday, June 5th, the following resolution was passed:—

It was Resolved that a Dividend be paid on July 1, 1947, on the £250,000 5½ per cent Cumulative Preference Stock at the rate of 5½ per cent per annum for the six months from January 1, 1947, to June 30, 1947, and that the Preference Stock Transfer Books of the Company be closed from June 17 to June 30, 1947, inclusive.

By Order of the Board

Grantham, June 5, 1947

H. C. RYAN, Secretary

PARIS BY AIR FOR GRAND PRIX, Sunday, June 29th. Luxurious lunch, races, dinner, evening's entertainment, 21-25 guineas incl.—Anna Claire, 107a, Grosvenor Road, S.W.1. Vic. 5901.

The Initiative in Europe

WITH characteristic directness, Mr Bevin has been to Paris to take up with the French Government the question of Europe's response to Mr Marshall's offer. For the moment the response is being couched in strictly practical, immediate terms. This is inevitable, for the time is so short that it barely suffices even for assembling the necessary data for stating Europe's combined needs. There is, nevertheless, some danger in an approach that gets down too exclusively to brass tacks. It was argued in last week's issue of *The Economist* that only some gigantic conception of forward-looking statemanship is likely to ignite the necessary enthusiasm for the project in American opinion; and the reports of that opinion that have been coming across the Atlantic in the past seven days serve only to underline the judgment. There is a tendency in Europe—in spite of all past experience—to overrate the power of an American President or Secretary of State to "manage" Congress. It would be foolish, in concentrating on the technical details of a plan of European reconstruction, to forget the political aspect of the whole project. A combined list of requirements is not likely by itself to create much inspiration in America; it can so easily be represented as no more than a change from competitive begging to organised mendicancy. The statesmen of Europe would be wise not to be too practical; imaginative idealism may, in this instance, prove to be the most practical quality of all, since it may be needed to procure the dollars on which the practical calculations depend.

Nevertheless, it is manifest that the first task must be to draw up the statement of needs, and it is with this that the Governments are concerning themselves. The Quai d'Orsay has unofficially proposed the establishment of *ad hoc* committees to compile, chapter by chapter, the needs of the various European countries, and it is probably on these lines that the first conversations will develop. This process should not take long. For almost each of the main scarce commodities, there already exists a mass of information and statistics. Before the Unrra missions ceased work, they produced a series of admirable reports on the needs and deficiencies of most of the Eastern European countries. The United Nations Sub-Committee on the Devastated Areas (from whose report the Economic Commission for Europe was finally born) has accumulated a great deal of evidence and the Economic Commission itself has in its possession, as a legacy from the European Coal, Transport and Emergency Committees, detailed information compiled both on a national and a functional basis. It should not require many weeks to build on the basis of all these details a general statement of Europe's needs and to fix for the various items—food, coal, fertilisers, machinery—a scale of priorities.

But such a list would be far removed from the concept of European self-help which Mr Marshall clearly has in mind. The next task should, therefore, be to balance this first assessment with another list—the list of contributions which the European nations themselves could make to restore their economy. This idea of a common stock pool, which was one of the basic ideas underlying Lend-lease, was actually proposed

last autumn as one of the methods of carrying on a modified Unrra programme for another year. At that time the nations of Eastern Europe were prepared to contribute their quotas. Now a new start has to be made, but there is no reason why it should not follow the same lines. The outline of European self help would begin to look a little less shadowy if, for instance, Great Britain offered to put into the pool enough wool and rubber to cover the deficiencies. The French could contribute phosphates from North Africa. If the Russian harvest is good, there might be wheat as well as timber from the East. The Poles and the Czechs might renew the offer of some food and timber that they made last autumn, and a small quantity of Polish coal is already allocated by the European Coal Committee. Self-help need not, however, be confined simply to the contribution of commodities already available. This section of the "budget" should include an assessment of Europe's present and potential productivity, and an estimate of what outside assistance would be necessary to raise productivity in the shortest space of time. A section of this sort would necessarily be concerned with such questions as the provision of fertilisers and the best use to be made of mining and agricultural machinery.

The last phase in the elaboration of the European balance sheet would lie in setting Europe's needs against its contributions and drawing up, not a demand note for dollars, but a list of concrete needs—so much wheat, so much coal, so much machinery. Such an approach would have two advantages. In the first place, it would go back to the one really successful experiment in international pooling—Lend lease or, more accurately, Mutual Aid. In the second place, it would put squarely in the picture the interest of American cotton growers, machine manufacturers and farmers in securing what would, in fact, be a gigantic order sheet for their particular products. It is much easier for the economic isolationists in America to persuade the American producer that foreign aid is a drain on American resources, if it is presented to him as a general financial transaction and not as an order for the products he himself is interested to sell.

*

If the negotiations opened by Mr Bevin in Paris develop in the direction of a new plan of Mutual Aid for peace, the implementation of the plan will bring the negotiators immediately up against two difficulties. The first is the question of the Governmental machinery through which the plan can be elaborated. The second is the attitude of Russia. On July 5th, the European Economic Commission of the United Nations will meet at Geneva and it can be argued that, since its task is precisely to forward the reconstruction of Europe, its committees and its secretariat should be used as the instrument of the new policy. This may indeed prove to be practicable later on, but at the moment the secretariat barely exists and certainly has not yet a momentum behind it comparable to the energy with which the European nations will need to go to work to get their balance sheet drawn up before their last dollar reserves are exhausted. In fact, a large part of the fact-finding work ought to be well advanced by early July and for the moment the French proposals, not for diplomatic committees, but rather for *ad hoc* working parties of experts is undoubtedly correct. These bodies should be able, before the Economic Commission meets, to prepare the outline both of a scheme of reconstruction and of a plan for its implementation. If the Commission approves the steps already taken, there is no reason why the *ad hoc* committees should not continue their work as a sort of temporary secretariat to the Commission. Nothing would so quickly bring it to life and give it authority as to begin its career with an enormous and concrete job of work undertaken by the finest experts the European Governments can place at its disposal. But the vital thing in the next weeks is to get the experts to work.

The great political advantage of the Commission is that it includes the Russians and has the warm support of the Poles and the Czechs. But it is absolutely necessary to be certain that this advantage does not quickly turn into an obstacle to any sort of progress in elaborating the plan. Nobody who has worked in the United Nations in the last two years will under-estimate the Russians' capacity for delay and stone-walling, if obstruction is Moscow's desire—as it so often seems to be. Will the Russians in fact adopt any other attitude, once the Marshall plan comes before the Economic Commission? So far, the Anglo-French invitation to the Soviets to join in has received no reply. The only public comment in Russia has been blasts on the radio and in *Pravda* denouncing the Marshall approach as the Truman Doctrine under light disguise. But obloquy in *Pravda* is no certain sign that the Russians have finally made up their mind. They may be prepared to co-operate. They may play for time. They may decide to boycott the whole proceeding.

Speculation on their response is useless. The Russians will make up their own minds. What is important is that the nations which have already decided to co-operate with Mr Marshall should determine clearly and firmly how they intend to react to Russia's decision. If the Russians decide to boycott the plan, the co-operating nations must continue their preparations. Their need for dollars and for wider measures of reconstruction is too urgent to admit postponement. In this case, they will be obliged, regretfully no doubt, to by-pass the Economic Commission with its Russian membership and use their *ad hoc* committees to complete the plan. If, on the other hand, the Russians decide to co-operate, then their gesture should be welcomed and an immediate effort made to form some idea of what they have in mind, what their needs are, and in what field they are prepared to make specific contributions.

*

Either a blunt no or a sincere yes from the Russians will, in fact, permit the work to go forward. The risk is that the Russian answer will be "Yes, but—" and that the time spent in finding out whether the "yes" or the "but" is the operative word will ruin the whole plan. That might well be the Russian intention, for they could argue that they would block the Marshall plan more effectively by apparently supporting it and then using their "support" to delay it, obstruct it and sabotage it in every way from within. How can the Governments which wish to work out a quick and concrete response to the American offer test Russia's real willingness to work with them to the same end? The chance of genuine Russian co-operation is not one that ought to be missed. But the risk of Russian sabotage is not one that ought to be run. Clearly it will be necessary to apply objective tests to the Russians' intentions, designed to find out, not merely what they are willing to do, but also whether they are prepared to do it quickly enough. The first test could be the drawing up of a time-table, from which no subsequent departure could be permitted. The tempo both of European economics and of American politics require the matter to be decided this autumn. By Christmas, Europe's dollars will be running very low and Europe's needs will be very urgent. Moreover, since 1948 is a Presidential year, the best—perhaps the only—chance of securing Congressional approval would be at a special session to be summoned in October or November, before the regular session next January, whose proceedings will, first of all, be engrossed by the normal legislative business of the New Year and will later be overshadowed by the election campaign. In short, the plan must be ready at the latest by early September. With that deadline established, a time-table can be drawn up—late June to early July, establishment of needs; late July to early August, assessment of contributions and of possible aids to productivity; late August, elaboration of the final balance sheet. Any nation

falling badly behind this time-table, or attempting to delay others in elaborating their policies, must automatically be excluded from the scheme—which will either exist in concrete form by September or have no chance of securing Congressional support. Another obvious test is the test of contributions. The good faith of the participants in the plan can be measured by their genuine effort to contribute something to the common pool and the offer of these contributions, too, must fit rigidly into the time-table.

Every effort should be made, naturally, to prevent these tests from looking like attempts on the part of the Western

Juvenile Employment

THE recent statement by Mr Tomlinson that there will be about a million more children in state schools in the next five years is a matter of congratulation both to those parents who are responsible for the half-million additional births since 1943 and to Parliament for the additional education for the further 450,000 children who will be affected by the raising of the school leaving age. But congratulations of this kind will not solve the present juvenile employment problems arising from the fall in the birthrate ten to twenty years ago, and the withdrawal from the labour market of large numbers of boys and girls between the ages of fourteen and twenty.

It is extremely doubtful if many employers of juvenile labour have yet fully realised the consequences of this fall, and of the various calls on the potential labour force of boys and girls between the ages of fourteen and twenty which follow from the 1944 Education Act and the decision to continue military service. There is a general impression that office boys, messenger girls and young apprentices are few and far between, but little appreciation that these are long-term difficulties and involve a revolution in thought towards the employment of the young. The present general shortage of labour of all kinds masks the more lasting shortage of juvenile labour. An article in the issue of May 3rd discussed the present trends in the birthrate; it is the purpose of this article to consider what effects upon juvenile employment can be expected to arise from these various changes.

The table overleaf gives the salient features of the present and future position and compares these with the situation which obtained in 1938, when the numbers entering employment reflected the higher birth-rates of the years 1920-1924, and there were no compulsory barriers to their employment after the age of fourteen. Immediately before the war there were 3.5 million young people between fourteen and twenty, of whom only some half-million were at secondary schools, technical colleges, universities and other institutions giving full-time education, thus leaving a balance potentially available for work of almost

Nations to put Russia on the spot or to hustle the Soviets away from the Conference table. The friendliness of the intention to collaborate should not be in doubt. Yet it is equally clear that if some nations exclude themselves—by delay or by obstruction—the other nations cannot afford to hesitate or hang back. The enemies of Europe today—starvation, continental ruin and universal economic collapse—are too grim to be flirted with in some species of "phony war." Mr Marshall's offer may be the last chance of securing the tools of reconstruction. The European nations must show, with all they possess, their readiness to finish the job.

five million. By 1948 the very severe fall in the birth-rate in the early nineteen-thirties will have reduced the total number of children between fourteen and eighteen by over a million; to this natural fall in numbers must be added the young men on military service and the boys and girls between 14 and 15 who will be staying on at school owing to the raising of the school leaving age. The effect of all these changes will be to reduce the number of children available for employment from just under 5,000,000 to just over 3,000,000—a very severe drop for a single decade. No wonder employers are feeling the pinch.

There will be a further reduction in the number of young people in the labour market in the next decade, 1948 to 1958; but this will be due to the effects of legislation, not of a further fall in births. Indeed, owing to the rise in the birth-rate between 1940 and 1944 there will actually be more children in 1958 between 14 and 20 than there will be next year—slightly more. But by that time the school leaving age will presumably have been raised to 16 and part-time education will have become compulsory one day a week for all those between sixteen and eighteen. The balance available for employment will, therefore, have fallen to just over 2,000,000 as compared with 5,000,000 in 1938.

*

What will be the consequences of this radical alteration in the flow of recruits to industry and all the other forms of juvenile employment? This question can be looked at from a number of different points of view:—

- (1) The effect on the boys and girls themselves.
- (2) The effect on the employers.
- (3) The effect on the nation as a whole.

The effects of more and, it is to be hoped, better education on the young should be all to the good. For the highly complex demands of a modern state nine years of compulsory education is far too short. By the age of 14 the average child has only learned the rudimentary tools of education; far more than this is necessary both for acquiring the technical skills demanded in

A Capital Annuity!

... Part capital, part interest ... £80 per annum guaranteed for seven years of which, on average, £76 is capital repayment and £4 is taxable interest ... and, after the seven years, an annuity of £120 (subject to tax) continuing for life ... this can all be secured by a male life aged sixty-nine for each £1,000 invested now.

EQUITY & LAW

an industrial community and also for enjoying the fruits of leisure which those technical achievements should bring. By the age of fourteen it is only the rarer spirits who have learned to love knowledge for its own sake, or at least for its non-utilitarian advantages. Every year of education from then on should yield solid advantages for the community, and advantages both tangible and intangible for the individual.

But the gains are not all straightforward and simple; for those who have learned more also expect more. The adolescent and his family will not be content with blind alley occupations. Conscious of a greater mastery of skills the young boy and girl will expect to do work which is less routine. The year of military service will also have its effects, for it will serve to broaden a boy's horizon, and bring him in contact with others with different backgrounds and experience. These two new strands in the adolescent's development will make him expect more from his work and will leave him an unhappier individual, if the chances of the labour market cause him to be unsuitably employed or not employed at all.

† Full-time equivalent.

For the employer there are complementary adjustments. To begin with he must face the fact that the shortage of cheap juvenile labour will be permanent, and increasingly acute. He cannot within any estimable period expect to have a plentiful supply of errand-boys or young girls endlessly sticking on labels; if the opportunities he offers for advancement are poor, he is likely to find his young labour force vanishing; if his rates of pay are low he will be outbid elsewhere. In fact the shortage of young people may result in a quite artificially high value being put upon their services, a tendency which would be quite as unhealthy for the employee as for the employer, for the war has shown the disadvantages of putting into the hands of the young a wage-pocket that is disproportionately large in comparison with the earnings of those who are both more experienced and have heavier responsibilities. Already employers are attempting to outbid each other in attracting young workers by offering special facilities for further education, free training in working hours, and other inducements. These persuasions can easily be carried too far.

Indeed, for the employer there is a very difficult reorientation to be carried out. It has hitherto been traditional to give the youngest workers the duller jobs; within limits, and as a preliminary stage of training, there is nothing inherently wrong in this, provided the enthusiasm of youth is not completely wasted by it. In the past the cheapness of juvenile labour has been

exploited without much concern for the consequences; but if in future the employer is driven, through scarcity, to use his juveniles only on relatively interesting work, or at least on work which is planned to give his young employees a sense of progress, he is still left with the problem of finding workers who are willing to stick to routine work. However efficient labour-saving methods can be made, there must inevitably remain large blocks of work which can only be done by hand and with a small but necessary degree of human intelligence. Whence is the employer to derive this labour force?

There is also another problem for the employer of boy labour. The arrangements for conscription make continuity of service impossible. Deferment may obviate a break in apprenticeship, but it will only mean a break later when the young man has become really useful. And for those many occupations where there is no formal apprenticeship or training, the employer may not be willing, in spite of shortages, to take on boys at 16 with the certainty of having to release them, with conditions of re-employment, at 18. Recent discussions which have been going on between the Ministry of Labour and large business concerns reveal a considerable change in recruitment policy; whereas before the war recruitment for certain classes of work demanding a higher educational standard was generally at 16 after school Certificate, the obligations of reinstatement are causing these employers to consider recruiting young men after their military service, when there are no reinstatement obligations.

This question leads on to the third question—the effect of the shortage of young workers on the nation as a whole. There can be no doubt that improvements in the education of the young worker will in time also improve the quality of all, and industry and society may be expected to benefit from them. But the changes in the labour force at the stage of entry demand consequential adjustments later on. Not all the menial and trivial jobs can be abolished; somebody must do the fetching and carrying, the holding and the watching, and if it is not the young will it have to be their elders? The habits of part-time work developed during the war will be valuable here, for part-time workers, whose lives are also filled with other interests, are the readier to spend half their time on routine work in preference to scrubbing their own floors, or supplementing their old-age pensions with odd jobs. Women will almost certainly remain a useful source of part-time workers. What is more doubtful is how much work can still be drawn out of the retired pensioner, particularly since the present arrangements about old-age pensions have discouraged many of the incentives to work. Yet for an ageing nation it is extremely important that the period of employment at the upper end should be prolonged.

The normal inclination of many elderly men and women will be to cling to their life-long occupations, if they wish to work at all. But often this will not be socially desirable from the point of view of those below them on the ladder, or for the vitality of the organisations in which they work. Yet, is it feasible to "downgrade" an employee when he reaches, say the age of 65? A complete break is probably easier, but it will cause a waste of manpower, if the worker cannot then be cajoled to take on some work of a different kind, and such an adjustment will not, in any case, be easy, and can plausibly be argued to be a waste of acquired skills. It is impossible to provide a cut and dried answer to this problem, but with improvements in health and living standards the elderly person is still so hale and hearty that it seems ridiculous for him to withdraw from the labour market when juvenile labour is short, and the nation as a whole is crying out for more workers. A great deal more thought has still to be given by workers and employers to the distribution of work between the different age-groups.

Britain and Eire

THE debate in the House of Commons at the end of last week on conditions in Northern Ireland was quite like old times. For generations, British politics revolved round Ireland and British families were divided by the passions that Ireland aroused. But for nearly twenty-five years Ireland has reappeared at Westminster only at rare intervals, and with each reappearance the echo has seemed to be fainter. To those with memories, it is refreshing to find that the Irish problem is still alive and kicking. But, for all the heat that was engendered last week, it is fairly clear that the political issue has drifted, not so much into a dangerous deadlock as into a stalemate which, in Great Britain at least, there is no desire to disturb. The internal tactics and methods of the Ulster Unionists are frankly disliked. But the lessons of the war are very fresh in mind, and London will never give the slightest encouragement to any project for the unification of Ireland so long as Eire maintains its intention to remain neutral in a future war; and Dublin for its part will not desist from a jealous guardianship of neutrality so long as Ireland is not whole. Both parties prefer the continuance of the present position to the taking of any initiative to change it—and so the present position will—accidents apart—continue and the Irish political problem will be not so much solved as kept in cold storage.

However, there still is an Irish problem in active if unrecognised existence; only it is not political but economic.* It concerns the extent to which a much greater integration of the economies of Eire and Britain would be desirable and feasible. Whatever it may do politically, Eire cannot separate itself economically from Britain; but it can take steps to lessen its economic dependence and this is what, ably abetted in equal part by British policy, it has been doing ever since its declaration of independence. Eire has sought to increase its self-sufficiency in two ways. A variety of light industries and finishing trades have been fostered which are dependent, however, on imports of coal, coke, steel and also semi-finished materials that must largely be obtained from Britain. There are not the resources for extensive industrialisation and even today only 15 per cent of workers are engaged in industry as against 48 per cent in agriculture. It is certain, however, that there will be no turning back on a policy which symbolises the severance of the British connection and transforms Eire into something more than an agricultural dependency. At the same time, Eire has changed the shape of its agriculture, growing a much higher proportion of its requirements of cereals and sugar-beet and exporting a falling volume of livestock products to the British market. This has been in part a policy of necessity as well as choice. The "economic war" between the two countries in the thirties restricted access to the British market and Hitler's war has necessitated a further heavy expansion of the tillage area. The acreage under corn crops was last year twice its 1926 level, and the wheat acreage has risen over this period from 31,000 to 643,000.

Eire's neutrality in the war, which reduced its claim to receive essential requirements from the British pool, has seemed to prove the wisdom of the drive for greater self-sufficiency. But the policy, so far as agriculture is concerned, has been difficult and costly. The necessary expansion of crop production has been obtained only by compulsion, which has now been dropped in Britain but is to become a permanent feature in Eire. The maintenance of a high wheat acreage restricts the growing of feeding-stuffs for cattle; in the first world war, for instance, almost 400,000 acres more of oats and some 500,000 acres less of wheat were grown than in the last war. The net effect is to reduce the output and increase the cost of the livestock products which Eire is ideally suited by nature to produce.

Mr de Valera's Government has no intention of abandoning its policy of growing a proportion of its wheat and sugar-beet requirements, though the amounts may be reduced from the present levels when imported wheat and sugar are again available. But there are signs both in Dublin and in London of willingness to explore the possibility of increased supplies of Irish produce for the British market. The advantages to Ireland of increased exports are obvious. The export trade is still basic to Irish agricultural prosperity, and by extension to the prosperity of the whole country. Mr de Valera himself is perhaps by nature too politically detached, and too preoccupied with the social rather than the economic welfare of the countryside, to take an active lead in such matters. But some of the other Ministers know where the economic needs of Eire point. Moreover, they face an election in two years time, and a new deal with Britain, unencumbered with political conditions, is too good a prescription for enhanced prosperity not to be seriously considered.

What the Irish would, at the moment, most like to get in return is increased supplies of the coal, steel, fertilisers and other basic products that they so badly need. Conceivably something might be done immediately along the lines of a bargain of food for raw materials. But not very much could be done, for the raw materials are scarce in Britain and the only immediate increase that would be possible in Irish food exports would be a small one. But if the bargain is to be one looking to the future rather than to the present, there will presumably be no difficulty in buying most raw materials on the free market. Even so, a long-term assurance that coal would be available would be valuable to Ireland and not impossible to give, since the total Irish requirement is only about 1½ per cent of present British production. But in the long run, it will once again be markets that will be important to the food producer and not sources of supply of raw materials and manufactures. As a long-term bargain, the proposition is that Eire should once more, in its agricultural policy, consult the needs of the British market, while Britain, in its agricultural planning, should be able to count on a large and steady supply of livestock products that could be paid for in sterling. It is a proposition that ought to be attractive to both parties.

But there would be difficulties. In Ireland there is the traditional objection to doing anything that savours of giving favours to the British or becoming dependent on them. In Britain there would be the question whether the new orthodoxy of international trade would permit a long-term bargain on mutually agreeable terms. And on both sides there would be the difficulty of price. The prices that would have to be offered for Irish livestock products in any long-term bargain designed to stimulate the supply of them, while certainly lower than those guaranteed to British farmers would inevitably be higher than those prevailing on the world market or paid to Dominion or foreign farmers. The discrepancy would become all the greater when the present inflated world level of food prices breaks in a year or two—at the very time, in fact, that increased supplies of Irish produce could be brought on the market. There is a partial answer to this objection in the fact that Irish meat, eggs and poultry—although not butter or bacon—are fresh produce of a different quality from other British imports, and it is meat, eggs, and poultry that Eire should mainly supply. But this objection at least serves as a reminder that prices in any long-term contract with Eire cannot in safety be put too high.

But perhaps the major difficulty in striking any such bargain

would be to make sure that any large, assured and rising supply of Irish produce could be made available. The output of Irish agriculture has been extraordinarily stable over a long period of years; its character has been somewhat changed by the policies of the Government, but not its total yield. The proportion exported has dropped heavily from 50 per cent in 1926-27 to 36 per cent in the year just before the war and to 20 per cent in 1945. There has been a corresponding increase in food consumption inside Eire, which has greatly raised the standard of nutrition both on and off the farms. If there is to be a large and growing export to Britain of the livestock products that Britain wants, at prices that it can afford to pay, at least one of three things must happen. Either there must be a reversal of the tillage policy and increased imports of grain and sugar, which would be politically distasteful and technically difficult for some time to come. Or else there must be a reduction in feeding standards in Ireland. Or else there must be a great expansion in the total output of Irish agriculture.

The third course is obviously the best and most effective. But a large expansion may be difficult, despite the country's great advantages of soil and climate for livestock farming. In a country of smallholdings run by family labour, in which a policy of land subdivision has been forcibly pursued for social ends irrespective of its economic consequences, it is by no means certain that even price incentives will uniformly call forth

a higher output; whilst any measures to use compulsion to increase production—even such mild ones as the introduction of county agricultural committees on the British model—can be ruled out in a country where farmers are in a majority and ignorant individualism is still the political creed. However, there is very large scope for improving farm techniques, especially in the proper cultivation of grassland, by Government persuasion and example. In addition, the reorganisation of agricultural marketing could do much simultaneously to raise the farmer's price and to reduce the export price.

There are thus the makings of a long-term bargain that would be of advantage to both parties. On the Irish side, it involves a decision to pursue a Twenty-Year Plan of raising the output of Irish agriculture. On the British side, it involves a decision to extend to the Irish farmer some part of the benefits of guaranteed prices and assured markets that have been given to the British farmer. It would be a pity if the exploration of the possibilities were to be obstructed, as has happened so often before in Anglo-Irish relations, by suspicion of motives and by the obstinacy of national pride. Coldly regarded, it might be held that the initiative lay with the Irish to prove that they have something to offer. But no British advantage would be lost if it were made clear in advance that the prospect of assured supplies of sterling food is one that would engage the warmest interest of the British Government.

The War in Manchuria

THE struggle now going on in Manchuria is a civil war and something more. It is a local contest for control between the Chinese Central Government and the Communists, but it is also a new phase in an international struggle for ascendancy in Manchuria which has been going on, with variations of intensity, ever since 1895. It involves, indirectly, the restrictions on Chinese sovereignty in Manchuria imposed by the notorious secret treaty of the Big Three at Yalta. It is because of this treaty and the position Russia holds by means of it in Manchuria that the civil war, which can be regarded as China's internal affair south of the Great Wall, becomes to the north of it a duel between Chinese nationalism and Russia; with the Communists playing a rôle more familiar in recent European experience than in their Yenan days in China.

There appears to be in the West little understanding of the impression produced on patriotic Chinese by the publication a year ago of the Yalta secret treaty dealing, among other things, with Manchuria. The treaty was, of course, never intended to be published in this generation or century. By a strange paradox it was just because such unusual measures were taken to keep it secret that it had to be published. President Roosevelt felt unable to communicate it to the State Department—nominally in charge of American foreign policy—and the State Department, in its innocence, later on put out a statement about the Kurile Islands incompatible with the actual terms of the Yalta treaty; Moscow publicly protested, revealing that there had been a secret agreement about the Far East, of which the world had been told nothing, and the British and American Governments, in their embarrassment, decided that the best course was to publish the treaty in full and have done with it. To Western observers it seemed that the publication did not really reveal anything new because in the meantime, since the Yalta Conference, China had concluded a public treaty with Russia, granting in substance the concessions the Big Three had agreed that Russia should have from China. But, from a Chinese point of view, the disclosure of the Yalta agreement entirely altered the significance of the public Sino-Russian treaty. The latter had been presented in China as a freely negotiated pact, which was believed to ensure both the

authority of the Chinese Government in Manchuria and the reversion to China of the massive industrial equipment installed there by the Japanese. Moreover, for the rights granted to Russia—in effect, control of the trunk railways, the port of Dairen and the naval base of Port Arthur—diplomatic formulae were found which rendered the cessions less injurious to Chinese pride and largely concealed the extent of the surrender.

But the text of the Yalta agreement, when it was known, showed that there had been no question of free negotiation, that the terms had been agreed among the Big Three without China's knowledge or consent, and that the Chinese Generalissimo had been subsequently ordered to pretend to negotiate of his own volition an agreement embodying the terms. Further, the text of the Yalta treaty not only included a statement about the juridical position of the old Manchurian leases which was flatly untrue; it also referred to the compulsion to be applied to China in language of a brutal directness exceptional in diplomatic documents and deeply humiliating for any nation calling itself independent. Finally, by the time the Yalta treaty was published, it was evident that the Chinese Government had been tricked out of its share of the bargain ostensibly made in the Sino-Russian treaty, for the Russians had not facilitated, but had systematically obstructed, the extension of the Government's authority into Manchuria and had carried off to Russia as "war booty" the coveted Japanese industrial assets.

The public reaction in China to the disclosures was comparatively slight at the time, because the Government, for reasons of expediency, tried to damp down overt denunciation of a pact in which not only Russia but also the United States was involved. The Communists not merely refrained from denouncing it, but suppressed all mention of it by censorship in the territories under their control. To superficial observation, therefore, it might appear that Chinese political opinion was not seriously upset. But it would be a great mistake to suppose that the incident has been overlooked or forgotten. It has sunk deeply into the consciousness and memory of that portion of the Chinese people which is aware of international

political issues and forms "public opinion" in China. It has not failed to produce a deep distrust of all the major Western nations and a cynical contempt for their professed standards of behaviour, just at the time when it seemed that a happy, fresh start might be made in relations between the West and China. For all China's modern history, the thoughts and emotions of its revolutionary epoch, have turned on the struggle for national independence and sovereignty, for "abolition of the unequal treaties" and "rights recovery." Not everything, it is true, has happened to China as represented in the Chinese nationalist version; the foreigners in China have had their side of the case, which Chinese writers often ignore. But China has certainly been the victim over a long period of a series of encroachments and aggressions by various nations, culminating in the Japanese invasions from 1931 onwards. If the Chinese were to feel after the end of the Pacific war that their sovereignty had been fully restored, that the "imperialist" chapter of history was closed and that they could co-operate with confidence and on equal terms with other nations in the post-war world, it was essential that no fresh demands infringing China's sovereignty should be forced upon the Chinese in their time of weakness by their more powerful allies. It was essential that there should be no repetition of the "Twenty-one Demands" of 1915. But, in the event, there has been a new encroachment on China's sovereignty—for legal titles to what has been "restored" to Russia had, in any case, long since lapsed—and though it has been for the benefit of one nation alone, all the greatest Powers of the West combined to impose their dictate. This will be remembered in China for a very long time.

Immediately it means that the war being waged in Manchuria has a significance which is not allowed to emerge in the public pronouncements of either of the contending parties. The Chinese Government does not denounce the Yalta agreement or repudiate its own treaty of two years ago, but in view of its own tradition of policy it can hardly, if it controls Manchuria, take up an attitude different to that of or any part of it, take up an attitude different to that of Chinese nationalism after the last war. The Chinese then claimed that treaty rights based on the Twenty-one Demands "lacked fundamental validity" because they had been extorted under duress, and they tried in various ways to frustrate the operation of these rights without directly challenging them. The experience of the "railway empires" in Manchuria, whether Russian or Japanese, has indeed been that the system does not work unless the Chinese authorities in the country are either passively acquiescent or positively "friendly"; if there is a nationalist Chinese regime, which only accepts the situation under *force majeure* and is secretly striving to get rid of these foreign controls, then there is bound to be local conflict and friction leading probably sooner or later to violence. Whatever foreign nation holds effective control of the Manchurian trunk railways with Port Arthur and Dairen is an "over-mighty subject" for China, and it is therefore dangerous to allow an independent central Chinese Government to have authority in Manchuria, lest it should try to turn the tables. The Japanese

formerly supported the separate regime of Chang Tso-lin in Manchuria, as long as he was subservient to their interests and then murdered him when he turned against them; when his son also indulged in Chinese patriotism, they set up "Manchukuo" and sustained it with a Japanese military occupation.

A regional Communist regime in Manchuria, independent, in fact, of the Chinese Central Government, would give Russia just the "friendly," dependent Chinese administration needed to safeguard the newly-acquired Russian rights from Chinese nationalist interference or competition and to prevent an economic development of Manchuria financed with American capital. The great advantage which the Russians enjoy in comparison with the former Japanese militarists is that they have real and substantial Chinese helpers, who are their friends on principle and not merely opportunists like Chang Tso-lin, or puppets with no strength of their own like the "Manchukuo" rulers. The Communists represent a powerful, popular movement, which has long had a political organisation, army and civil administration of its own within Chinese territory, independent of any direct support from abroad; they have also given proof

of their patriotism in the past by their warfare against the Japanese. Russia can leave them to do the fighting needed to keep the Nanking forces out of Manchuria—or having failed to keep them out, to drive them out. Russian aid to the Communists has been indirect, but none the less effective; the Communists would not be established in Manchuria at all if Russia had honestly carried out the terms of the 1945 treaty, but the Russians then barred the entry of Government troops through Dairen on a frivolous pretext, while allowing Communist forces to enter Manchuria by land from North China and (gathering local reinforcements) to equip themselves from the arms dumps of the Japanese Kwantung Army which had surrendered to Russia. The Communists

have had a year and a half to organise their rule in the north of Manchuria and are now on the offensive against the Government forces, which in the end broke in by land from Hopei and advanced northward as far as Changchun.

Every war has many unexpected turnings, and the issue of this one is still doubtful. If the Nanking forces hold their own, Russian support of the Communists may take a more active form than hitherto. If, however, Manchuria as a whole were to be separated from the rest of China under Communist control, a new situation would arise in the Far East. The Chinese Communists would be much more closely identified than they have ever been before with the State interests of the Soviet Union and this must make a considerable difference to the character of their movement. On the other hand, the Kuomintang, or whatever party coalition succeeds it in Nanking, would have a perfect irredentist cause and programme for intensifying Chinese nationalism as a political force. The hope of a peacefully developing united China would have receded once again into dreamland and the unlaidd ghost of "Manchukuo" would still walk the earth.

NOTES OF THE WEEK

The Dam Bursts in France

The policy of blocking wages has been virtually abandoned in France. In the last weeks, the exasperated workers—effectively led by the *Confédération Générale du Travail*—have broken down the Government's resistance to increased wages by a series of crippling strikes. Substantial concessions have now been made to the bakers, the railwaymen and the gas and electricity employees, all of whom were involved in the wave of strikes. The metallurgical workers have also secured increased rates and the Government has now agreed to the negotiation of bonus agreements in all industries in which increased production has been registered during the last year. In effect, it will be impossible to limit the negotiations in this way. As one industrialist put it: "Everybody is asking for production bonuses, even the undertakers." In spite of the obscure language which has been used in announcing the Government's concessions, the truth is that a general advance in wages will now take place.

Some politicians—including, in the first stress of the strikes, M. Ramadier—have been inclined to blame the Communists for the agitations and stoppages of recent weeks; it is true that the Communists dominate the CGT, but the real reason for the strikes goes down to the roots of economic misery and undernourishment in France. The months before the harvest are always critical when supplies of food are running low. Last summer, when the Communists were in the government and the Truman Doctrine had not been dreamt of, a similar strike wave shook France and both wages and prices leapt away from the old controls. It is even possible that the workers' demands, far from representing Communist policy, are beyond the control of the CGT. There is evidence that some groups of workers will not be content with the present increases, and in recent months, an extreme left wing Union, the *Confédération Nationale du Travail* (CNT) has appealed to the strong anarcho-syndicalist undercurrent in France's working-class tradition, denouncing the Communists as bourgeois and betrayers of the working class. The leaders in this union press for a restoration to the workers of their 1939 purchasing power, and if discontent remains at its present depths, then their uncompromising (and irresponsible) attitude may weaken the leadership at present exercised by the Communists.

* * *

Threat to the Franc?

M. Daniel Mayer, broadcasting the Government's decision to permit the negotiation of bonuses throughout industry, said that the rise in wages would not be permitted to affect the price level. Nobody in France believes that this is possible and, in fact, the country is now witnessing the first serious breakdown of the Blum policy of price reduction. A rise in prices is believed by everyone, from the Governor of the Bank of France to the economic advisers of the CGT, to be inevitable and with another rise in prices the inflationary spiral will take one more spin for the worse.

The pressure on the franc is aggravated by the fact that during the course of the month over one hundred thousand million francs worth of Treasury bonds will fall due with little hope of their being extended. The Government's own expenditure is under examination to see at what point economies could be introduced, but the nationalised industries are all running at a deficit (the railways show a deficit of thirty thousand million francs—an increase of twenty thousand million on last year—and now the railway workers' bonus will add another ten thousand million to that sum) and both the State enterprises and the Treasury have been penalised by the 10 per cent cut in prices. Since millions of hoarded notes are still at large playing their part in speculation and the black market, it is not surprising that there should be talk of devaluing the franc, although officially such a possibility is strenuously denied.

Against such a background of uninterrupted economic dislocation the Marshall offer has caught French imagination as the one way out of a desperate situation. When M. Vincent Auriol, the French President, gave the proposal all the weight of his official approbation, he was speaking for great masses of ordinary French people who, after two gruelling years, are beginning to feel the exhaustion of pulling themselves up by their own bootlaces. The Communists have already started to campaign against "dollar diplomacy," but, like their colleagues in Italy, they may find themselves compelled to capitulate to a public opinion which, when concrete economic aid is at stake, runs sharply against them.

New Motor Taxation

The Chancellor of the Exchequer announced to the House of Commons on Tuesday a radical change in the basis of taxation of private motor vehicles. In future, instead of the present tax graduated in accordance with the size of the engine, there is to be a single flat-rate licence duty of £10 per annum. But the new tax is to apply only to new cars—to those registered for the first time on or after January 1, 1947. The object of the time limit is presumably to avoid the necessity for a countervailing increase in the petrol duty, since if the flat rate of £10 were applied at once to all existing cars there would be a serious loss of revenue. At present, hardly any cars pay less than £10 a year in licence duty and some 72 per cent pay more. The petrol duty is already high, and any further increase would either bear very heavily on commercial users or would make necessary a system of rebates which would be both complicated and open to abuse. The Chancellor's compromise is a sensible one, since it postpones the serious loss of revenue until a time when Mr Dalton or his successors may be "happy to lose revenue." There will, however, be some immediate loss of revenue, and to offset this the purchase tax on all cars costing (exclusive of purchase tax) over £1,000 is to be raised to 66½ per cent. This is acceptable at present, since these expensive cars are better exported; but for the long run the rate is too high even for anything classed as a luxury.

*

The purpose of the charge is avowedly to assist the export trade. For many years the system of taxation by horse-power has diverted the attention of British manufacturers and motorists to the ultra-small car—and to an excessive number of models of it. The manufacturer has had a protected market for his speciality—a market far more effectively protected by the system of taxation than by the customs duty—but the other side of the medal has been that he has been unable to compete abroad, except in a few special markets. The car large and powerful enough to compete all over the world has, indeed, been made in England, but in numbers too small for its price to be competitive. Now the way is open to concentration on a much smaller range of models. If the domestic demand—which is always likely to be the largest that the British industry has to meet—can be diverted to a size of car that can also be sold abroad, real mass production will be possible. One of the large companies, Standard, intends to produce only one size of engine, of 16 horse-power, which can be fitted both in cars and in tractors. Once they get used to it, British motorists will certainly prefer a car of this size, if they can get it cheaply. But in the meantime their tastes (and their garages) have been shaped for the smaller car, and if they are to be weaned away from it they will need a powerful price argument. In short, if the industry now has the courage—spontaneous or induced—to bridge the gap between the requirements of the home and export markets in one jump, and to concentrate very heavily on cars of about 16 h.p., the product, being cheap, ought to be acceptable both at home and abroad. But if they wait for the new system of taxation slowly to dissolve the present fashion in the home market and create a new one, then the transition will be very gradual and the present opportunity will be missed. There is the risk of a vicious circle appearing: unless there is standardisation, the big car will not be cheap; unless it is cheap, it will not be acceptable at home; unless it is acceptable, demand will not be concentrated on it; and unless demand is concentrated on it, there will be no standardisation. Only the Government can break the vicious circle by insisting on rapid standardisation.

But unfortunately the history of motor taxation does not give much ground for belief that the Government will ever press the national interest on the industry. Some of the manufacturers, to judge by the statements they have been making in the last few days, have evidently persuaded themselves that a flat-rate tax is what they wanted all along. But of course it is not so. Outside critics, this journal among them, have been advocating for many years a system of taxation that did not discriminate by the size of the car. But until recently almost all the manufacturers have notoriously been against it. Even now, the Government would not move until there had been a change of mind in the industry. If the Government would waste a little less energy on changing the ownership of industry and be a bit more forthright in asserting the national interest in the policies pursued by industry, they would better deserve the name of Socialists.

New Phase in Colonial Development

It is now clear that the groundnut scheme for East Africa was only the first step in a new phase of economic development in the colonies. An inter-departmental committee is surveying the opportunities for large-scale primary production in the colonial empire as a whole. A mission has left for West Africa to enquire into the possibilities of growing new crops by mechanised methods, and there is talk of another mission going to Sarawak and North Borneo to examine the possibilities of growing rice and manila hemp. Clearly, if these and other surveys are promising, huge capital sums will be needed, and more public corporations, on the lines of the one already envisaged for East Africa, will presumably be set up.

All this points to a bolder and more imaginative outlook on colonial development from the Colonial Office. The new economic policy is not, as might have been concluded from Mr Dalton's remarks in the House of Commons last week, a mere improvisation to provide this country with imports of food and materials which at present have to be bought largely from hard currency areas—though the dollar shortage has certainly given an impetus. The development foreshadowed is long-term development, the fruits of which may not appear until the dollar crisis is over. But each scheme will be started on the assumption that there is a readily available market for the commodity to be produced, and the experts who prepare the schemes will be allowed to assume some priority in the supply of capital equipment. This sort of strategy is designed to achieve its most encouraging results at a time of world shortages, for the schemes can shake down in a period of high prices.

*

There are, however, grounds for objection to the new policy, though they may turn out to have no real foundation. It is possible, for instance, to criticise it because it is centrally controlled. The initiative comes from the Ministry of Food or the Colonial Office or the Board of Trade; the experts are mobilised in this country and their briefs drawn up here; they are re-directed to another colonial region when their work is done. There is nothing new in this, for the Colonial Development and Welfare Act provides several millions to be used for central development of this sort. But care should be taken not to ride roughshod over local prejudices and wishes. The promise that the groundnut corporation for East Africa will eventually be handed over to the control of the local populations should be copied elsewhere. A second criticism may be that the new policy implies a reversal of attempts to diversify colonial economies and a return to the one-crop specialisation and dependence on exports that proved so disastrous in a time of world slump. It is important to realise, however, that the chief fault with colonial economics was not that they specialised but that their specialisation was inefficient; it was not that they lacked secondary industry but that they lacked capital. It is this application of capital on a large scale, whether to agriculture or industry is immaterial, that makes the new policy so important.

A third objection may be that these schemes are all very well now when there is a chance of large profits, but what will happen when world prices fall? Are the public corporations to be accompanied by price-fixing agencies on the lines of the proposed West African cocoa board? There may be a conflict of interest between the British taxpayer as guarantor of the loans floated by the corporations, who will want high prices to be maintained, and the British taxpayer as consumer of the commodities concerned, who will want low prices for food and materials. This very important point should be cleared up as soon as possible.

* * *

Dominion of Ceylon?

The announcement by the Secretary of State for the Colonies this week on the future status of Ceylon marks as big an advance in colonial constitutional affairs as the new development schemes foreshadow in the economic. Only last year Ceylon was granted a new constitution which took it a long way towards responsible government. There are reserved powers in matters of defence, legislation affecting communal interests, and external affairs—which includes foreign trade relations. But in other respects Ceylon has complete self-government exercised by a Cabinet responsible to a Parliament elected on the basis of universal suffrage.

As soon, however, as the first elections to be held under the new constitution have returned a new Parliament and a new

Government is in office, negotiations between it and the Imperial Government will begin, and if these are concluded satisfactorily immediate steps will be taken to confer upon Ceylon fully responsible status within the British Commonwealth of Nations.

It is worth noting that Mr Creech Jones did not say "full Dominion status," but in reply to a supplementary question he said that Ceylon would enjoy

that full degree of self-government within the Commonwealth which the term Dominion status is understood to imply.

Even this statement is not an unequivocal assurance of Dominion status, but the Ceylonese are unlikely to be content with less, for the promise of full independence to Burma had made them dissatisfied with the present constitution before they had had time to assess it. Nevertheless the British Government is taking a risk in the promise of fully responsible government, for although the communal differences are not so acute in Ceylon as they are in India, members of the State Council are elected on a communal rather than a political basis. The Sinhalese, the largest community, will have to show great responsibility when they have formed their first Government and begin negotiations with the Imperial Government and will have to remember that they are negotiating on behalf of other communities as well. If they do, and if Dominion status for Ceylon is now only a matter of months ahead and not years, it is worth contemplating with what speed this will have been brought about. It is only twenty-seven years since the Ceylonese Legislative Council was given an unofficial majority. It is only sixteen years since the grant of universal adult suffrage. There are now unofficial majorities in the Legislative Councils of a number of colonies including the Gold Coast and Nigeria, and the franchise is being extended—Jamaica, for one, has universal suffrage—in others. Perhaps, after all, another generation may see the complete merging of Empire into Commonwealth.

* * *

Hyderabad and Travancore

Since the acceptance by Congress and by the Moslem League of the plan for partition of British India, India's other main problem, that of the States, has emerged into the forefront of politics with the declarations of independence by Hyderabad and Travancore. There has always been the possibility that one or more of the Princes—or rather of their Prime Ministers, for most of the States are now governed by Ministers—would try to take the path of full sovereignty on the dissolution of the British Raj. Since 1939 the British Government has abandoned the attempt to persuade the Princes to agree in advance to enter an Indian Union and has taken the view that, as the rights and obligations of the Princes depend on treaties with the Crown, British "paramountcy" cannot legally be transferred to an Indian successor authority, so that all the Indian States are supposed to be left as independent units with the passing of the British Raj and can negotiate any form of union they please, or none at all, with the successor power or powers in British India. This is obviously a situation fraught with danger, for whatever the rights of the States in the eyes of lawyers, their capacity for maintaining themselves must vary with their size and strength. The majority are clearly too weak to stand alone and must submit to some form of incorporation in either Hindustan or Pakistan; there are about half a dozen, on the other hand, which might conceivably maintain their independence if there were no strong central power in India. The rulers of Hyderabad and Travancore have evidently made up their minds that, with the projected partition of British India, this condition is sufficiently fulfilled.

Hyderabad is about the size of England and Scotland together, with a population of some 17 millions; Travancore is about as large as Wales with 6 million people. Hyderabad has its own currency and a regular army; it is, however, completely surrounded by the territory of Hindustan provinces and has no access to the sea. Further, the majority of the population is Hindu, while the dynasty is Moslem and only two centuries old. But this fact impels the dominant Moslem minority to claim independence, for their position would be at stake if the State were absorbed in Hindustan; they may seek an alliance with Pakistan. In Travancore there is no Hindu-Moslem issue, as both dynasty and people are Hindu (with a large Christian minority), but the State has an isolated and very defensible position between the Western Ghats and the sea and a strong ancient tradition of local independence.

The Congress Party has given warning that any recognition of either of these States by a foreign nation will be regarded as an "unfriendly act." Their international status is at present dubious; Britain in renouncing paramountcy may consider them to have

legitimately resumed a former independence, but as yet they do not exist in relation to other governments. A Congress-ruled Hindustan may be expected to try to impose its sovereignty on recalcitrant States, by force if necessary; Mr Nehru has already threatened the seceders. But what would be Britain's position if Hindustan as a British Dominion should make war on Hyderabad?

* * *

Arab Opposition Hardens

The decision of the Palestine Arabs to boycott the United Nations enquiry is, in spite of the good advice to the contrary known to have been pressed on them by British officials, probably the right one from their point of view. For them the arguments in favour of co-operation were purely tactical, while those against were both tactical and strategic. The two main points in favour of co-operation were, first, the moral value to the Arab position in the world of a frank and helpful attitude and, secondly, the danger of allowing their case to go by default. The latter, however, was only apparent since it may be taken as certain that adequate documentation of the Arab case will in fact reach the United Nations Committee. As for the former, the Arabs may well argue (particularly after reading Mr Crossman's book) that correct behaviour did not help them much with the Anglo-American Committee.

Moreover, the present Palestine Arab leaders are not very good at putting their case in public. Some of them made a deplorable showing at the Anglo-American enquiry. By staying away from the present one, they are probably doing as much good as harm. But the main reason why the boycott is not a mere piece of childish petulance is of longer range. Fundamentally, the Arab case is that Zionism and the Mandate are a violation of elementary human rights, so that any proceeding which assumes their validity is itself invalid. So long as it rests here, on the right of a people to its own country, the Arab case is by Western standards unassailable. When it begins talking about economic absorptive capacity, administrative discrimination, all the matters of daily politics which arise from the working out of the Mandate, it dissipates itself. With the Zionists the case is different. When they want to appeal to first principles, they must look beyond Palestine to the Jews of the Dispersion and to their elementary human rights. In Palestine itself, on the other hand, they concentrate on practical issues, conscious that their fundamental case does not lie there. This is the special meaning of the Arab assertion that by bringing in the general Jewish problem, the United Nations have prejudged the Palestine issue.

But there is another and more ominous side to the Higher Committee's boycott. It shows that the Arabs are reaching the point of feeling that everyone is against them, of being confronted by a wall of injustice which no arguments can breach. It is a dangerous frame of mind which one day may break out in violence. The evil of the colonial system is that violence is so often the only way in which a subject people can draw attention to itself. And it makes little difference whether the remote, incalculable power whose mind it so difficult to change lives in Whitehall or Lake Success. Hitherto the mere fact that Jewish terrorism was keeping the spotlight trained on Palestine has provided some reason for Arab quiescence. But they have been taking good note of the effects of terrorism, and an increasing number of young Arabs now talk romantically of "taking to the hills," even if they do not actually join an illegal military formation. The vocabulary of "resistance" is catching. Moreover, even sane and educated Arabs have been affected by the reports brought back from Lake Success of the overwhelmingly "Jewish" atmosphere in which the United Nations proceedings on Palestine have been conducted—a natural consequence of the large proportion of Jews in the population of New York. The resulting mood of exasperation means that any United Nations recommendation may be condemned before it is read.

* * *

De Gasperi's First Victory

The parliamentary chances of Signor de Gasperi's Government look rather better than when he announced its formation a fortnight ago. At first there was some doubt whether this Ministry of Christian Democrats and non-political experts could secure a majority in the Assembly. In the last week, however, the combined opposition of the Communists and the Socialist supporters of Signor Nenni have received three rebuffs, and each time the voting in favour of Signor de Gasperi increased. The

last victory—by which, with a majority of 124, the Government secured the extension of the Assembly's life until January, 1948—has more than parliamentary significance. Both the Communists and the Socialists of the Nenni wing have been anxious to secure elections in the course of the next months. Signor Nenni probably reckons that the leader of the anti-Communist, Socialist Right, Signor Saragat, is likely to become a more formidable rival if he has time to organise his party and to build up a political machine throughout Italy. The Communists, elated by their striking electoral successes in Sicily in April, feel that they may have reached the peak of their popularity and that, in the next months, Signor de Gasperi's ability to secure dollar credits for Italy will make its impression on a hungry and under-employed population. The conviction that dollars are necessary is so widespread that the Communists have even had to abandon, however temporarily, their attacks on "dollar imperialism," and if, before the elections, sufficient credits have been received to secure the ration and increase employment, the Christian Democrats may have a strong electoral success when, finally, the Assembly is dissolved and the new elections are held.

Parliamentary success and better electoral chances do not, however, automatically secure the Government a smoother passage. The financial situation remains extremely delicate with a possible budgetary deficit of 312 million lire at the end of the year. To cover even minimum imports of food and raw materials, 200 million dollars must be found before the end of 1947. And these figures depend upon a level of output in Italy which a few disastrous strikes might quickly reduce. As in France, there is enough real misery and sufficient disparity between wages and prices for genuine discontent to abound. The hope of American help and President Truman's promise of diplomatic support are the only rifts in an otherwise sombre sky—so sombre indeed that President de Nicola has only with difficulty been persuaded to remain in an office he at no time wanted and now finds too onerous and discouraging to be borne.

* * *

Storm in the Tory Cup

The opening of the official Conservative Party Exhibition, called "Trust the People," in London last week seems to have been the occasion for an overt clash between the differing exponents of Conservative policy. Perhaps it is not inappropriate that the exhibition should be housed only a door or so away from the International Tea Centre; the setting for the storm is thus made more authentic. The Party's pamphlet on industrial policy was not well received by some sections of the Party and its supporters, notably by Lord Beaverbrook, but the exhibition, conceived in terms directly parallel with the pamphlet, has apparently provoked these sections into active protest. As a result, Mr Harold Macmillan was moved to launch a counter-attack on the more right-wing members of his Party in a speech made last Saturday. He protested that the policy outlined in the pamphlet was only an extension of fundamental Conservative principles into the conditions of to-day, and he concluded with a sharp rebuke to those for whom time, when not standing still, moves only backwards.

It is impossible not to link this dispute with the absence, and the reasons for that absence, of Mr Churchill from the political scene. To some Conservatives, Mr Churchill is not an ideal Party leader in Opposition. To others, good leader or bad, he is a man who from the nature of things cannot lead the Party for many years more. Mr Churchill's political mantle, in its industrial segments, has always possessed some of the magic qualities of the skin of the chameleon. The question is, therefore, not only on whom the mantle will descend, but also what tint the mantle will assume when worn by a successor. Certainly a full range of colour is available, from the deep and angry purple of Sir Waldron Smithers to the delicate and charming lilac pink favoured by Mr Harold Macmillan. The true struggle within the Conservative Party is between those who believe that what the Labour Government does must be wrong and those who believe that what the Labour Government does they could do better.

All this argument nowhere approaches anything like a real split in Conservative ranks. In fact, some cynical Socialists have been heard to say that the dispute resembles a conjuror's patter—its primary purpose is to divert attention from what is going on elsewhere. In any case, Conservatives of all shades have a great many unities that are not affected by one industrial policy or another. At best these differences are far more differences in emphasis than they are differences in kind. Out of all the disputants, Lord Beaverbrook is about the only one whom it is possible even to imagine voting for any other party at a General Election; and were that

to happen, any vote cast by Lord Beaverbrook would bring no comfort to Socialists or Liberals. The major matter for comment is not that the Conservatives are bickering over an industrial policy; it is that they should have an industrial policy over which to bicker.

* * *

A New Yardstick

The 1914 cost of living index officially passed out of existence on June 17, 1947, which is the base date chosen by the Minister of Labour for the new interim index of retail prices. How obsolete the old index had become is fully shown in the list of items, excluded from it, which will enter into the new index, and by the different weights attached to different items, on the basis of 1937/8 expenditure. Instead of the previous meagre fourteen food items, 47 items are listed in the new index. Most important of all, the handful of "other items" listed in the original index has been enlarged beyond recognition. It now takes account of people's expenditure on entertainments such as the cinema and football, drinks and tobacco, and on household necessities such as floor polishes and furniture, radio sets and vacuum cleaners. Food which was weighted at 60 per cent in the old index is now reduced to 35, and the "other items," which were only allowed 4 per cent, have been weighted at 16 per cent, with an additional 24 per cent allowed for items not included at all in the old index.

While it is clear that the new index will represent a much more accurate picture of working-class expenditure than did the old, it is difficult to understand exactly what the purpose of the temporary index is, unless it heralds the decline of the food subsidies. Some 2,500,000 workers, including workers in mining, building and civil engineering, electrical contracting, pottery, boot and shoe manufacture, and a number of industries covered by wages councils, have cost of living sliding scales, based on the official index, incorporated in their wage agreements. A revision of these agreements will now be necessary, and has already begun in the case of some of the wages councils industries. It is unlikely, however, that there will be any direct reference to the new index in these revised agreements. It is true that rises in the index after June 17th will undoubtedly be used as an argument in favour of higher wages when wage claims are put forward; but if, as is to be presumed, the Government really intends to reduce the food subsidies, the consequent rise in food prices will not raise the new index, in which food is given a comparatively small weighting, to the extent that it would have done to the old.

On a long term view, however, the value of having only a single cost of living index is questionable. What is really needed is a measure of the cost of subsistence which the Ministry of National Insurance and the Assistance Board can use in assessing the value of social security payments. People on the subsistence level do not buy vacuum cleaners, and, in their budgets, food and rent are weighted very high. Any attempt to assess their needs by reference to the cost of the diversified standard of living of the better off, who can switch their expenditure from one item to another in accordance with relative changes in prices, would give an entirely false picture.

* * *

Public Board Salaries

If any uncertainty yet lingered about the Government's policy in giving information about salaries and conditions of service in the new public boards, Mr Morrison's statement last week must have finally disposed of it. The appropriate Minister will provide this information for the top appointments—the board members themselves—but will take no responsibility for the appointment and remuneration of any of the other staff. These, he claimed, are functions of management, and

the Government believe that socialised boards should have the same freedom and privacy in this respect as does any other commercial undertaking.

This is certainly the right decision, and it is to be hoped that the new boards will conform to the most enlightened practice in publishing information about themselves in their annual accounts on their own initiative.

They have, however, still some very tough internal battles before they can straighten out their staff policy, and the battle is bound to be fought with the civil service traditions on the one side and those of business on the other. Which will prevail? On the civil service side there is all the apparatus of regular

scales of pay, promotion by formal machinery, seniority, and an assured upward ladder. Business is traditionally against this procedure, although inquiries made during the war revealed that many large business concerns were even more hampered by seniority rules than the civil service. But higher up in the managerial and executive grades one man can be receiving a thousand a year more than another, at the unfettered wish of the directors. Their decision is absolute, and no one can calculate with certainty that a fixed scale can give him £500 a year more after 10 years with a minimum of exertion in between.

This conflict of view must now be facing the members of the Coal Board, and will in due course face all public boards. Fortunately, by taking over existing colliery staffs, all sorts of divergences were inherited at the start. Will these be ironed out or will it be possible to tempt a mining engineer, who has received a good offer in South America, to come to the Coal Board? Will a Divisional Board be able to reward an able young man when Mr Snooks in the neighbouring Division is twice his age and has nothing positively against him? Some will maintain that a public board like a Government department must be scrupulously fair. The nation will only get its coal if a more daring game of snakes and ladders is played in the field of staff promotion and pay.

Care of the Aged

A committee of the British Medical Association has now published its proposals for the care and treatment of the elderly and infirm. To a certain extent they overlap the recommendations made earlier this year by a committee of the Nuffield Foundation. But, as befitted a medical committee, the BMA was particularly concerned with the care of the elderly sick, and its report consequently goes into more detail over medical and nursing arrangements. Here again, however, there is much in its recommendations that is familiar, though it is none the less welcome for the additional support. The disabilities of old people needing hospital treatment should be carefully assessed in the geriatric department of a general hospital. It is estimated that if this is done, about 40 per cent could be sufficiently reabled either to return home or to live in a hostel or home where communal care could be provided. About 40 per cent would probably be suffering from a fatal illness, and the remaining 20 per cent would be irremediable cases and need permanent nursing care in a long-term annexe of the general hospital—which would, however, continue to supervise them and re-assess them when necessary.

Provided—an important proviso—that sufficient co-ordination between the various authorities responsible for housing, hostels, hospitals and general medical services is forthcoming to permit free traffic between the various forms of accommodation and attention, the scheme seems to be a sensible and logical way to provide for the sick in the brave old world that is approaching—though it is arguable that too much prominence is given to the hospital and thereby to old people in sickness instead of in health. But it is clearly a long-term scheme, dependent on many factors, such as an adequate supply of hostels and homes, that will not be forthcoming for some time. It is to be hoped that in the meantime the BMA will use its influence to do something about the care of old people in the present, when they often die, entirely neglected, because the hospitals refuse to take them in. Local authority hospitals are under a statutory obligation to admit such cases on the order of a relieving officer, but they are now disregarding this obligation because of a shortage, not of beds, but of staff. Yet the public assistance institutions, whose care of the elderly sick tends to be condemned outright, do at least fulfil their statutory obligation of taking them in, feeding them and giving them some care and attention, however inadequate by the BMA's standards. If the institutions can make the necessary emergency arrangements—and they are equally short of staff—cannot the hospitals? It is high time that coroners revived their former practice of sifting to the bottom cases of old people found dead and placing the blame where it should properly fall.

Austria in the Toils

At the beginning of June, the American Government promised to ship between 40,000 and 50,000 tons of grain a month to Vienna to maintain the nation until the harvest. Now the outbreak of a maritime strike in the United States has led the Austrian trade unions to address a passionate appeal to the American dockers

to allow the foodships for Austria to be despatched. So precarious is the balance in the Austrian economy, that the failure of the ships to arrive would certainly precipitate yet another serious food crisis.

That only a few ships should stand between Vienna and starvation is an index of the little progress made in stabilising the Austrian economy, even though two years have passed since "liberation." The truth is that no way out of Austria's economic maze has yet been found, and it has taken weeks for the deputies of the Foreign Ministers even to agree upon a procedure for working out a factual report on the question of sorting out the real German assets from among 200 Austrian factories taken over by the Russians. An agreed report is not even in sight.

Behind the issue of the assets lies the broader and more vital issue of a sane economic future for Austria. A reasonable settlement might perhaps orientate the Austrian economy eastwards where there are ready markets for Austrian industrial goods. But what would be left of Austrian independence if the key factories in Austrian industry were Russian subsidiaries? Yet, on the other hand, what does the Western world offer beyond an alternation of competition and doles?

The effects of all this endless delay upon Austria's economy has led recently to Austrian efforts to break the diplomatic deadlock. That Herr Fischer should attempt to secure Communist representation in the Cabinet as the price of Russian moderation in the issue of assets is understandable. What is much more difficult to fathom is Dr Figl's willingness to enter into secret negotiations with the Communists behind the back of his Socialist colleagues in the Cabinet. The reason may be that the right-wing People's Party are finding Socialist pressure inconvenient in its demands for immediate nationalisation, land reform and control of the black market. Dr Figl may imagine that he could deal with the Socialists more easily if they could be played off against the Communists. But the chief reason for Dr Figl's discussions is almost certainly growing desperation at the deadlock and desire to coax the Russians into a more flexible frame of mind.

Socialists at Zurich

Few movements in Europe feel the pressure of the division between East and West in so concentrated a form as do the European Socialists, who met in conference at Zürich last week. The tension between the "bourgeois" parties and the Communists draws the Socialists into different combinations of government or opposition in every country in Europe. In the East, they are, except in Finland, the junior partners in coalitions dominated by Communists. In the West, they tend to co-operate with the Christian Centre and Right—in Holland, in France, in Germany, in Austria. Only in Italy, where they are out of the Government altogether, and in Norway, Sweden and Great Britain, where they form the Government, do they escape, if only temporarily, from the balancing act they are called on to perform everywhere else.

The tension between Right and Left has also in some cases succeeded in splitting the Socialists. Throughout Eastern Europe, the anti-Communist wing of the older parties has vanished. In the Russian zone the whole party has been swallowed up. The Spanish emigré movement is divided. Both Signor Saragat and Signor Nenni were present at Zürich, personifying the division in Italian Socialism. Nor is it likely that the tension will diminish. For some months past, Russian propaganda has been concentrating its criticism on the "Right Wing Socialists" who "split working class unity" and "play into the hands of the bourgeois." And events in Hungary have brought new pressure to bear on the Hungarian Socialists who have hitherto avoided Communist domination, yet retained inner unity.

Under these circumstances, it must be admitted that European Socialism is showing considerably more vigour and independence than might have been predicted a year ago. It is true that no decision was taken at Zürich to form a new Socialist International. The old International was dissolved at last year's Conference at Bournemouth and its re-establishment left an open question. This year, an International Committee was set up to consider the question and it will be on the agenda of the December Conference to be held in Belgium. But the various parties showed a measure of vitality and genuine independence in the chief debate of the Conference—the question of admitting the German Social Democrats as full Conference members. In spite of his bitter fight against the Socialist Unity Party and the Russian authorities in Germany, Dr. Schuhmacher, the German Socialist leader, had every opportunity to state his case and, in the event, Great Britain, France, the Netherlands, Luxemburg, Sweden, Finland, Norway, Denmark and Austria voted for the German Socialists' admission.

True, the pattern of division reappeared in the opposing vote of Poland, Rumania, Czechoslovakia and Hungary (with Palestine giving an understandably racial vote in the same sense). But if Belgium, Greece, Italy, Switzerland and South Africa had not abstained, the necessary two-thirds majority could have been obtained. No one denies the precariousness of the European Socialists' constant tight rope walk. But perhaps their powers of equilibrium should also not be underestimated.

* * *

Progress at Prague

The World Federation of Trade Unions has had prolonged teething troubles, but now, after the two and a-half years since the London conference, it appears that the organisation is reaching adult status. The fundamental difficulties arising from the different conceptions of the functions of trade unions between, for example, the British and Western European and the Russian, Polish and Eastern European movements, can obviously not be easily overcome, but at the Prague conference last week, the differences seem to have been definitely in the background and the conference, which some had thought would break down altogether, resulted in a remarkable measure of agreement. The only major differences arose on small points of procedure, and clashes, if there were any, took place, and compromises were arrived at, behind the scenes. The Russians and the delegations from countries under Russian influence seem to have been much more accommodating than their opposite numbers in the political sphere have been at international conferences. This was shown in the important decision to admit the German unions and to set up a bureau in Berlin to guide the German movement along the right path—a decision in marked contrast to the attitude adopted at the International Socialist Conference at Zürich.

Whether or no this harmony will be maintained in the future, there was broad agreement on a number of issues at Prague. The WFTU is determined to exercise a more direct influence on world economic affairs, and is still not satisfied with its position *vis à vis* the Economic and Social Council. It claims the right to speak, as well as to put items on the agenda at the Council's meetings. Secondly, the Prague conference agreed on a six point charter, embodying certain fundamental principles of social and economic progress, which it will submit to the United Nations. Thirdly, it agreed that the Franco régime must be removed, although the question of a trade boycott was, surprisingly enough, not pressed. There was also agreement that the Greek trade unions must be allowed to operate freely and democratically.

The British delegation to the WFTU, which has inherited the "feet firmly on the ground" attitude which Lord Citrine, its first President, strove to inculcate in the WFTU, urged the need to build on solid foundations of common industrial interests, and reduce the more political aspects. It emphasised the need for speedily establishing the Trade Departments, to take over, within the Federation, the functions of the old International Trade Secretariats. The conference, under the British lead, agreed on regulations governing the terms for the inclusion of these bodies, which will then have to be negotiated with each Secretariat. It had seemed almost impossible to arrive at any satisfactory basis, and previous negotiations had dragged on interminably, causing much impatience and irritation all round. It is to be hoped that any remaining snags in these negotiations will be overcome as smoothly as were the other disputed points at Prague.

Shorter Notes

A short debate on day nurseries last week should dispose of the idea that they are a solution to the question of how to get women back into industry on a large scale. In 1944, when local authorities were given a 100 per cent grant for the nurseries they established, the number in England and Wales was only 1,550 with places for 71,000 children. If it is assumed that there was only one child per mother, only 71,000 women were thus enabled to go into industry by the provision of nurseries. At the present time there are about 900 nurseries with places for 44,000 children and 370 nursery schools for 19,000 children.

It is unfortunate that the inevitable delays in school building continue to deprive so many schoolchildren of school meals and to compel the authorities, in the interests of equity, to make all those, who cannot prove need, pay for them until free meals can be provided for all. At present 2½ million children do not receive school meals, 1,920,000 have dinners on payment and 340,000 receive them free.

AIR FRANCE

TI

and Britain's true wealth

TI's direct exports have surpassed pre-war records by well over one hundred per cent. For the past financial year the figure stood at more than three and three-quarter million pounds.

A significant thing about this large sum is the fact that less than a fifth of it represents the cost of materials, while over three million pounds is overseas payment for British workmanship.

TI have embarked on a big reconstruction scheme at home which is aimed at the fullest possible use of British skill and experience. They know that Britain has enough of those two commodities to meet her own needs and the needs of half the world besides.

TI is a team of engineering industries which serve in more ways than may be realised. The component companies have made their own reputations in the fields of precision tubes, bicycles, electrical appliances and cables, wrought light alloys, pressure vessels, metal furniture and paints—the whole is TI.

SIAM offers

Siam has been quick to recover from the effect of war and her abundant natural resources are again available to British manufacturers. Export can be arranged for the following commodities:—

Sticklac	Shellac	Seedlac
Copra seed	Castor seed	Sesame seed
Gum Damar	Cinnamon	Soya beans
Hardwoods	Resins	Hides & Reptile skins
Zircons	Sapphires	Rubies

SIAM needs

Reciprocal trading is encouraged for the commercial and economic development of Siam. Improvements in industrial and agricultural production and the standard of living call for machinery and consumer goods of all kinds. If you are interested in Siam as a market, send your enquiries to:—

SIAM MERCHANTS (London) LTD.

the organisation devoted to two-way trading with Siam.

Write to:—

SIAM MERCHANTS (LONDON) LTD.

Letters to the Editor

Agriculture and Politics

SIR,—Mr Marquand, the Paymaster-General, has, during the last few days, told us that if our production drive fails "food rations might well be cut in half." Is this the moment to discourage the British farmer from putting forth the extra effort and investing the extra capital necessary for increasing his production? Coming as it does from such an important source, your article of June 14th can only have this effect.

The Agriculture Bill certainly promises "guaranteed prices" and "assured markets." Unfortunately, the guaranteed price system is today operating as much against the farmer as in his favour: it is, in fact, frequently a limit rather than a "guarantee." Thus he has to sell his eggs for less than their value on a free market and his wheat for about sixty per cent of what Canada is obtaining on the world market—for less also than wheat from the USA and the Argentine is costing us. We are paying to our own farmers £45 per ton and to India £53 per ton for linseed.

It is true that the bill promises not only "guaranteed prices" but "assured markets." I wonder, however, what *The Economist* would say about a company that claimed in its prospectus that it had "assured markets" when this assurance related only to "such parts of" their product "as in the national interest it is desirable to produce in the United Kingdom." Your "sweeping guarantees" are, in fact, merely an undertaking to tell farmers approximately what they will obtain for a product before they produce it—a position which most industries are able to take for granted.

What about the "very little" that the farmer is given in return? You say that "the worst that the farmer need fear is trial by his peers." Yet since 1939 between 3,000 and 4,000 farmers have been turned off their farms by their peers, and for every eviction a great number have been either helped or compelled to revolutionise their whole system of production in response to continually-changing national needs. To the control of tenant farmers has now been added the control of freeholders, large or small, and both can, henceforth, be evicted from land—and homes.

It is agreed that owning or occupying agricultural land is a trust; and this Bill does little more than give legislative expression to this conception. But if it is seriously suggested that it means "very little" to give to a Minister and to Executive Committees and Appeal Tribunals appointed solely by that Minister the right—unchallengeable in any court of law—to evict from land and home—then, Sir, I must contend that you have not sufficiently entered into the feelings of those who come within the sweep of such powers.

When food is short and dollars are still shorter, price is not the final consideration. But is it really quite fair to ask such a question as "If the price guaranteed to the British farmer is higher than the price at which food can be imported, how is the gap to be filled?" without mentioning that to-day the cost of overseas foodstuffs frequently exceeds the price paid for home production; and also that of the "price support measures" —over £180 million out of running into several millions annually—over £180 million out of just over £400 million—are for overseas products? In other words, the food subsidies are paid not so much to help the British farmer as to enable the consumer to buy all food, whether it be produced at home or abroad, at less than its true cost.

There is some doubt about the long-term adequacy of available supplies, especially of meat, animal fats and vegetable oils. These are not our concern at the moment. There is, however, no doubt about our dollar position; no doubt, that is, unless the United States is prepared to put us on the dole and we are prepared to be put there. The fantasy of being able to achieve 175 per cent of pre-war exports is believed in now by few. No one in his senses would for a moment deny the export drive. Every ton of export trade that we can win is vital to our standard of living.

Must we not now fight on all fronts, striving both for exports and for greater production of our own food? We have been told by a recent White Paper embodying the views of the Ministers of Food and Agriculture in 1944, lately confirmed by a conference representing seventeen leading agricultural bodies, that a minimum of £140-£150 million increased production is possible from our soil. Where else can we obtain a comparable quantity of food or saving of dollars? What will be our position if we fail to obtain it? Is it not dangerous for a paper of the

outstanding influence of *The Economist* to confirm the farmer in his ingrained fear that he will be let down the moment it is possible or safe to do so?—Yours truly,
DE LA WARR

House of Lords

[It is agreed that, for many foods, the world price is at present higher than the price paid to the British farmer. But if Lord De La Warr really believes that this state of affairs will continue, he is singularly innocent. We will venture the prophecy that, when the world settles down, the gap between the costs of the British farmer and the prices at which food will be on offer from overseas producers will, on the average, be larger, not smaller, than in the years before the war. Who is the better friend of the farmers, he who encourages them to take advantage of a moment when the policy of "guaranteed markets" seems to be relatively costless to obtain a promise that will prove to be impossibly burdensome; or he who, while supporting the principle of assured markets, urges that it be pursued in moderation and with a real effort to increase efficiency and get costs down? Whose advice, if followed, is the more likely to lead to the farmers being "let down"? We will ask Lord De La Warr for his answer in ten years' time.—EDITOR.]

Bonus Issues

SIR,—I would like to support your original view, and that of Mr Monroe and Mr Neuberg, on the subject of bonus share issues and evasion of surtax, as against Mr Eccles and Mr Pitman. Those who say that bonus share issues do enable surtax to be evaded argue that the sale of the extra shares enables the stockholder to "take" a capital profit, which is naturally not liable to surtax, as the income would have been if it was paid to him in dividends. To this it is replied (and I think this was the argument in your comment on Mr Eccles's letter in your issue of May 10th) that if a larger nominal dividend were paid instead of a bonus issue being made, the shares would rise in value, and it would be just as open to the stockholder to take his capital profit as if the bonus issue had been made. This is undoubtedly correct, on the face of it, in logic and arithmetic.

But surely it rests on the following two false assumptions:—

(1) That the firm concerned was in a position to raise its nominal dividend, say, from 5 per cent to 10 per cent, instead of issuing bonus shares, which would have enabled it to pay the same amount in dividends though still at the nominal rate of 5 per cent. If, however, the firm believes it to be psychologically impossible to raise its nominal dividend because it has reached the limit which public opinion (and in particular customers and wage-earners) is likely to stand without repercussions, then it cannot act in this way. In this case the issue of the bonus share is the easiest way of presenting the capital profit to the stockholders. You may say that the public is very innocent if it can be deluded in this fashion; but I suggest that the histories of such companies as BET indicate that this is the fact, whatever we may think of it.

(2) The rise in share values depends not merely on the rise in dividends, but on the probability of that rise being maintained in future years. If a bonus share issue is made, the Stock Exchange and the public accept this as far stronger evidence that the directors anticipate continuing high profits and dividends than if there is simply a single increase in dividends. In the same way, though in theory, the placing of the money to reserve should raise share values, in fact, it does not do so to the same extent, because it does not argue so strong a probability that the high profits will continue. In the case of BET before the war, it became a virtual certainty that a new bonus share issue would be made every year, and that the nominal dividend would remain the same. This very strong expectation of continuing capital profits raised the value of the shares more quickly than the less certain prospect of higher dividends would have done.

I suggest that it was for these reasons of psychology and probability that bonus share issues were, in fact, regarded in the City before the war (as I think you will agree) as methods of evading surtax. I think this is a case where psychology is as important as logic, and that it is accordingly much too sweeping as say that bonus issues do not, in fact, save surtax.—Yours, etc.,
House of Commons

DOUGLAS JAY

SIR,—In your comment on my letter of June 19th you say that the cash equivalent of a distribution of 5 per cent dividend plus 5 per cent bonus in shares is 5½ per cent. What you are doing, as is clear from your reference to a "wait-of a year," is to confuse the increase in income by virtue of the bonus share issued with the capital value of the said bonus share.

I agree with Mr. I. J. Pitman that "the bonus issue itself is never anything more than a fossilisation into the capital structure of profit balances until their distribution." But that is another matter and quite distinct from the one I set out to prove, viz., that in certain circumstances the issue of bonus shares does mean relief from surtax liability.—Yours faithfully,

F. NEUBERGH

9 Bishopsgate, London, E.C.2

[Before anyone can be said to be evading surtax, he must be shown to be receiving income (or sums which are "capital" only in the eyes of the law and not in those of the recipient), but not paying the full tax liability upon it. On this definition, which is surely the only reasonable one, Mr Jay's first example is not an evasion of tax at all. In the conditions that he postulates (which are surely very rare), a bonus issue is a means by which the shareholders can be given more income than they would otherwise receive—but they pay full tax on all they receive. And if the capital value of their holdings rises, that is the natural result of increased dividend payments. There is no evasion.]

Mr Jay may be right in his second example in thinking that the prospect of a repeated share bonus enhances the value of the shares. But so would a similar belief that the rate of dividend would be raised every year, without a bonus. What puts the shares up is the prospect of a rising income from them, and it is that which enables the shareholder to cash a part of his capital profit every year. The fact that the method chosen is that of a bonus issue makes no difference in principle, and it is therefore unjust to make it the object of a discriminating tax.

We do not understand Mr Neubergh's point. The market value of shares is (or should be) a function of the actual and prospective income they will provide. Take two companies each of which has, over a period of years, distributed exactly the same amount of money in dividends to its shareholders. Company A has done it by progressive increases in its rate of dividend, Company B by paying a steady dividend on a capital progressively increased by bonus issues. Over the period the shareholders of both companies have received the same income and paid the same tax, and at the end of the period their capital holdings (if no shares have been sold) will have risen in the same proportion, unless the market is crazy. Where is the evasion? It is true that a shareholder in Company B has been given an easy opportunity of taking part of his capital profit year by year by selling his bonus shares; but if he has done so, he finishes up with less capital than a shareholder in Company A.

[Attention is drawn to a Note on page 997.—EDITOR.]

Export Targets

SIR,—In discussing the pros and cons of our export targets, it seems a common fallacy for both optimists and pessimists to take as their yard-sticks the 1947 economic set-up, based upon the

territorial situation as it appeared in 1939 less the products of Germany and Japan.

Now surely if we discuss the world's economic set-up in 1947, we must measure it against the geographical background of the same year. This should give us a very much brighter picture of our prospects of both maintaining and increasing our export target. Whether or not the old world of before the war is played out can be left to the theorists to discuss. A new economic world is fast developing before our eyes. The enormous cultural and economic development of the African Continent, the Middle East, China and India is a fact that cannot be denied. There are great rewards waiting for those nations who realise this first. It is true that these new territories will not in the near future purchase boilers, railway engines, or possibly even motor-cars, but their consumption of bicycles, sewing machines and textiles will, in the not too distant future, be reckoned in terms of hundreds of millions sterling. This development must surely come about if the hopes and plans of the Colonial Development Council, etc., are to be fraught with any success at all, and yet references to these new markets, that may be termed world development areas, are conspicuous by their absence in most politico-economic surveys. It is in these markets, and perhaps in these markets alone, that the future of British trade will lie.—Yours faithfully,

B. W. GUSSMAN

Bottleneck in Containers

SIR,—Your article on the above subject in your issue of June 14th comes at an opportune moment. The container industry, which has so far struggled with reasonable success against enormous difficulties, is facing a gap between supply and demand more serious than ever before. During the war years containers were given an operational priority—supplies of raw materials were allocated for them on a scale which permitted all the more urgent demands to be met. As a result, more than 10,000,000,000 food cans alone were produced during the war years. Since the end of the war it has watched with concern competing priorities gaining ground, and materials which it could fairly claim for itself either being made available for exports or allocated to industries whose claims were perhaps more obvious though not more truly urgent and vital.

At the same time, if industry for home and export requirements is to expand, it must have more supplies of the means of distributing its products from factory to consumer. Many of the

From The Economist of 1847

June 19, 1847

SEVERAL circumstances combine, at this particular moment, to give more than usual interest to the commerce of Russia. In the first place, there have been given, during the last two or three years, some most unequivocal symptoms, on the part of the Russian Government, that its convictions are tending . . . towards a system of Free Trade. The superior sagacity of the present Emperor, who travels much, and who never travels without observing everything, is too great not to have convinced him how much the interests of that great raw-material and food-producing country would be consulted by adopting the principles of Free Trade. For a country like Russia, which possesses natural inherent means of wealth, easy of development, to neglect and waste such obvious resources for the purpose of stimulating and encouraging manufactures, which they can procure so much cheaper and better in exchange for their own products easily raised, is indeed a most fatal error. The resources which Russia possesses for the production of grain, flax, hemp, wool, tallow, timber . . . are such as could not be extended to their utmost limit for centuries to come, under the most favourable circumstances, but which could not fail to prove a source of great and increasing wealth.

Considering the proximity of Russia to this country . . . there is probably no other country in the world that possesses so much the power of profiting by the introduction of Free Trade in this country, provided they are willing to enable the people generally to consume them at a moderate rate. This feeling is rapidly gaining ground among men of influence in Russia, and we are sanguine of seeing, before long, some important steps taken in that direction. The experience which the present year will afford of the advantages of an extensive demand in this country for their produce, is likely to produce the best effects.

war-time restrictions and prohibitions on packaging are necessarily still in force. Many articles cannot be packed at all for the home market. The smaller sizes are frequently prohibited—it is not allowed, for instance, to make a tin to contain less than 5 gallons of lubricating oil, ½ lb. of coffee, 7 lbs. of custard powder or 7 lbs. of confectionery. As a result of printing restrictions, many packages now on sale are dowdy and unattractive.

It is true that the immediate crisis in food canning is less severe than it might have been had milk supplies been more plentiful. But even so, at the present time of peak demand, canners are being denied probably a third of their weekly requirements of being denied probably a third of their weekly requirements of cans, with the consequent ultimate loss to the public of large quantities of processed foods. Whilst we face inadequate supplies of goods and rationing persists, the need to preserve food and thereby to remove the time factor from crops as they are harvested is inevitable. To the extent to which the opportunity is lost so must stocks for future use be limited.

The container industry suffers from the diverse nature of its activities. Individual aspects, like the shortage of milk bottles, have received attention in the House of Commons from time to time. But the full scope and requirements of civilian industry have never thus been reviewed as a whole, in the light of the place which it fills in the national economy.

To save labour in the factories and the shops; to shorten queues and lighten labour in the home; to bring variety into the national diet; to display and advertise British goods at home and overseas, these are just a few of the grounds upon which the container industry stakes its claim for national priority. The effect of denying these claims is to withhold from more than a hundred manufacturing industries one of the most essential requirements for transporting their goods to the public, both at home and overseas.—Yours faithfully,

A Study in Irresponsibility

"American Foreign Policy in the Making, 1932-40." By Charles A. Beard. Yale University Press. London, Cumberlege. 336 pages. \$4.00.

THIS review of the American road to war by the dean of American historians raises some very interesting questions of historical methods. It is sub-titled "A Study in Responsibilities," and it is, in effect, an inquest into the question of who was responsible for taking America into Hitler's war. The peg is Senator Pepper's statement in 1945 that the peace of the world had been lost in the Senate Chamber in 1919. Mr Beard is successful in demolishing the too-simple charge that it was merely a "little group of wilful men" in the Senate who were to blame for repudiating the League and in documenting the consequences of President Wilson's rigidity. But when he proceeds to argue that the inadequacies of American foreign policy from 1932-40 were not due to a failure of popular understanding, but to the failure of leadership by the Administration, the limitations of his own understanding are very clearly revealed.

In great detail, Mr Beard surveys the public utterances of Mr Roosevelt from 1932-1940. He has little difficulty in showing that from the days of his pre-nomination deal with Hearst and Garner, Mr Roosevelt in his first term repudiated internationalism for a purely national approach to the problems of reform and recovery. Even after the President had come to appreciate the need for collective action to forestall a European war—at the time of the 1937 speech advocating the "quarantine of aggressors"—he still failed to put the issues squarely before the American people. The book is almost entirely made up of quotations linked together: President Roosevelt's own words are called as witnesses against him. This is a Republican tract. Congress has not yet got round to the investigation of war guilt that the Republicans so plainly hankered after when they won both houses. Mr Beard has pointed the way. His book is a perfect example of how partial, and therefore misleading, what purports to be scientific history can become.

The real problem behind Mr Beard's accusation of double dealing is that of leadership in a democracy. It affected not only Mr Roosevelt, but also Mr Wilkie, as the campaign of 1940 plainly showed. Both men favoured all aid to the Allies short of war; both were compelled, by the strength of the peace bloc

Irish Politics

SIR,—May I be allowed a brief comment on your note under the above heading on June 14th. After a temperate review of the position you state that "the Unionists in Ulster are prepared to resort to political jerry-mandering, to an unfair arrangement of Parliamentary Constituencies and so forth." In view of the proverbial shortness of the public memory, may I point out firstly that the original parliamentary constituencies of Ulster were fixed by the British Commons and for elections to the Imperial House remain the same today. Presumably, therefore, there is no question of jerry-mandering here. (I do not propose to refer to local bodies on account of the rateable factor and because the parliamentary are the vital elections.) Secondly, the same constituencies were fixed by the British Commons for elections to the Ulster House under a system of Proportional Representation. The first general election in Northern Ireland in 1921 resulted in the return of 40 Unionists and 12 Nationalists and Republicans. The Ulster Government abolished Proportional Representation (a system which the Labour Party also does not favour) and carved out single member constituencies. The last General Election in Northern Ireland resulted in the return of 33 Unionists, 2 Independent Unionists, 1 Independent, 4 Labour members (one of them a powerful advocate of the Union with Britain) and 12 Nationalists and Republicans. In other words, under widely differing systems, the number of Nationalists and Republicans returned from constituencies fixed by the British Commons was precisely the same as the number returned from constituencies fixed by the Northern Ireland Commons. In a comparison of the results of the first and last General Elections in Northern Ireland, is it just not a little difficult to substantiate a charge of jerry-mandering?—Yours faithfully,

194 Seacliffe Road, Bangor, Co. Down

ALBERT E. BURNS

in their parties, to speak very much less than they knew or believed. The problem was at its most acute in the United States from 1936-41, but who can deny that it recurs daily in every democracy?

In detail, the book is useful; in total effect it is purely negative. Mr Beard believes President Roosevelt consciously took the United States into the war and that in doing so he practised a deception upon the people. Would Mr Beard have preferred Mr Roosevelt to have shown greater candour, and so secured firm action earlier? It is clear that he would not, and that he remains the unregenerate philosopher of isolation. It is the privilege of the professor that he can ignore what the alternatives would have been; irresponsibility is not the prerogative of politicians.

A Bicentenary

"Princeton, 1746-1896." By Thomas Jefferson Werstenbaker. Princeton University Press. 21s.

PRINCETON UNIVERSITY celebrates its bicentenary this week. To any reader who understands the gentle art of skipping, this history of the university compiled by Mr Werstenbaker makes extremely interesting reading; not for its detailed accounts of quarrels and personalities, but because the College of New Jersey (as Princeton University was known during the 150 years here under review) shows in microcosm the dour fierceness of the struggle between Calvinism on the one hand and the growth of more liberal ideas on the other. The battle was long and bitter, for the founders were passionately Presbyterian, if those two words can be made to fit, but in the end the cause of enlightenment and growth triumphed, and the College was saved, but only just saved, by the forcefulness or tact of one or two of its presidents, particularly of two men, imported from Scotland, Witherspoon and McCosh, with minds more open to new ideas in education. It is the story of this Homeric struggle which will interest readers on this side of the Atlantic.

Since the founders believed that they knew all that could be known about God and the Bible, they worked with passionate sincerity. They trekked for months and years, on horseback or on foot, to gather in small sums of money to enlarge the log cabin which housed them, and to pay minute salaries to their devoted and learned professors. The students were all in training for the

Ministry, and lived in great poverty and under rules which today look fantastic in their severity. No student might step outside his own room without special permission. He was not allowed "to jump, holler or make any boisterous noise," or drink or speak to young women. The curriculum was confined to Hebrew, Greek and Latin, and there were no games or other relaxation.

Needless to say, this austerity brought about an inevitable reaction. Human nature asserted its rights. There was incendiarism, rioting and so much horseplay directed against the faculty as to bring the College into serious disrepute. Enrolment of new students fell menacingly and with it the financial resources of the College. At last the few members of the faculty (there was only one) who realised that the world had progressed in educational and scientific ideas since 1746 began to make their voices heard. The Presbyterians learned with consternation that their President McCosh (1868) had accepted the theory of evolution. From this date onwards things began to move more quickly. Best of all the alumni of the College, many of them distinguished as generals, governors, senators, etc., came forward and not only endowed the College, but increasingly took a hand in dictating its development. Several new faculties were opened, and finally the College in 1896 obtained its Charter as a university, and regained its honourable position as one of the most important centres of learning in America. About the last 50 years the author has not allowed himself to write in this volume, but it is to be hoped that he will continue his racy and illuminating story down to the present day.

Co-operative Research

"Co-operative Research in Industry." By D. W. HILL. Hutchinson, 1947. 147 pages. 10s. 6d.

In these days of enlightenment, general essays on the importance of research have a way of being taken as read; and Dr. Hill's book comes uncomfortably near to sharing their fate. Its value lies in two directions. It compresses into a readable form a great deal of history—not always accessible—of the way in which the present

organisation of technical and scientific research has been built up, both here and overseas; and it lays a welcome emphasis on voluntary co-operation as a form of industrial organisation. Research, which stinks less of the profit motive than most industrial operations, is a suitable field in which to demonstrate the value of freedom and organic growth; and Dr. Hill makes the most of his opportunities. What he unfortunately does not do is to offer more than a few broad comments on the current problems of money, scientific manpower, and the incorporation of research into the administrative routine of industry. And yet it is here, in the details of practical application, that the weight of present discussion should lie, at least on the scientific side; for most of British industry is passing beyond the stage at which it needs to be persuaded that scientific research is in general a good thing. A tantalising glimpse of American inquiries into the administration of research would have been particularly worth while expanding.

It is also unfortunate that, as so often in books of this kind, research has been taken as primarily technical and scientific. Investigations of the sociology of industry, of costing and accounting questions, of the economic background of particular trades, of the national income, of the impact of industrial development on the population problem or the social life of communities—these and many similar issues are all highly relevant to industrial development. Though the outlines of a framework similar to that on the scientific side are beginning to emerge, the organisation of research in these fields is still at the embryo stage reached in science around the end of the first World War. And, just because of this early stage of development, it is vital to promote as much clear thinking as possible about the shape in which the new framework should develop, and how best to fit it in with the parallel work in science and technology.

But it would perhaps be unfair to blame Dr. Hill for saying so little on this particular point. His handbook is primarily a description of what exists; and it is only too regrettably true that what exists in the field of industrial research is heavily over-weighted on the scientists' side. Though there may not be too much science, there is certainly far too little economics; and of the truth of this Dr. Hill has provided yet another useful demonstration.

AMERICAN SURVEY

A New Bi-Partisan Policy?

(From Our U.S. Editorial Staff)

WITH Senator Vandenberg's request for a new bi-partisan council to advise Congress and the President alike on the job of helping in Europe's reconstruction, one of the serious gaps in the functioning of the Truman policy appears to be under repair, and the process of creating a foreign policy in economic matters enters on a new phase. Both are clearly related. The functioning of the policy without Congressional action was impossible, and the likelihood of Congressional action has grown more and more remote since Under-Secretary Acheson resigned and collaboration between the Executive offices and Capitol Hill slackened. At the same time, the domestic economic situation has given the opponents of the policy their best ammunition. Those who wanted to cut appropriations all along the line saw no reason why estimates for European aid should not come under the axe. Those who complained at rising prices muttered that too many supplies were going to Europe. Those who foresaw a depression talked defensively of belt-tightening and door-closing without explaining what they meant or how they expected to accomplish it. The result of this confusion could hardly be the legislation which the Administration desired.

Mr Vandenberg's request for a "total balance-sheet" should do much to clear away the fog, whether it be intentional or accidental. His statement is clear and comprehensive. He believes that intelligent American self-interest (a phrase appealing both to the practical and the idealistic in this nation) demands sure information and the best available advice on "(1) the over-all latitude within which America may safely and wisely plan these foreign operations; (2) the basis upon which they should be undertaken; and (3) the over-all necessities, in Asia as well as Europe, which are calculated to be involved."

As if to refute the complaints that bi-partisan enthusiasm for continuing support of an American foreign policy is waning, this demand on the part of Mr Vandenberg for an inventory forms a visible link in a chain of speeches to which the highest political personalities in the nation are contributing. That it should come at this moment from the leading Republican member of the Senate Foreign Affairs Committee should reassure those who fear that American councils are too easily divided to make their part in European matters dependable or decisive.

The process of developing a foreign policy in economic affairs that shall have force, wisdom, and a trace of consistency is proving far more difficult than the process of developing a political foreign policy having comparable excellences. The project is newer, the guiding philosophy hardly ready for swaddling clothes, the consultative precedents still in the formative stage. The external problems with which such a policy must deal in 1947 are of a size and complexity that might stagger a nation far more experienced in manipulating world affairs than is the United States. The internal oppositions aroused by such an undertaking are not masked behind political exigencies, but come naked from economic interests that resent any hint of change in ways which have proved profitable to them. Thus the wool interests, traditionally entrenched behind their tangled fleeces, choose this delicate moment to extort from Congress action in their favour which might jeopardise the American position in world councils, and with it their own future.

Nevertheless, in spite of difficulties, confusions, oppositions at home and abroad, the process is continuing. If, as Mr

Somerset Maugham once said of life, it proceeds rather as a man who, called on to give a violin recital in public, must learn the instrument while playing, the important thing is that it does go on. The creaks and squeaks, the false starts and wrong turnings are clear in this democracy for all the world to hear and see. In spite of inexperience and ineptitudes at home and abroad, there is evident on the part of the policy and of the policy-makers an increased sense of direction, an enlarged appreciation of the relationships involved and of the scope which operations must cover, an improvement in the functioning of the mechanisms concerned.

That such an undertaking should be carried on in the regime of President Truman, a man from inland Missouri not by temperament or experience noted either as an innovator or a world statesman, is one of the factors to which history will call attention. The regime of his predecessor, as bold in innovation as he was brilliant, was notorious for the costly divisions that arose within his official family. Critics complained that Mr Roosevelt's example encouraged the exhibition of individual talent at any cost, and that despite his fondness for referring to himself as the one who called the signals and carried the ball, teamwork with him became more of an abstraction than a practised ideal. To President Truman, who knows himself not to be brilliant, teamwork is the way to get things done. He devotes his own not inconsiderable talents as a friendly person to winning the co-operation of his neighbours, and in his recent trip to Canada he apparently repeated the success of his visit to Mexico. Meanwhile he leaves to the high officers of his Administration the exploration and development of controversial details.

The speech which Mr Truman made before the Canadian Parliament was remarkable not only for the importance of its content, but also for its freedom from diplomatic vagueness. As summarised for the Canadians, the Truman Doctrine sounds as important economically as it is politically. Its purpose is "to restore the world to health, to re-establish conditions in which the common people of the earth can work out their salvation by their own efforts." It recognises frankly the implied challenge to "the internal strength, the economic stability, the moral stamina of the United States," that challenge which Senator Vandenberg spelled out in his statement two days later. It sets forth what appeared as "I believe" clauses in his famous speech before Congress, and became "We intend" clauses when he faced the Canadians. The one which has the clearest economic significance is "We intend to expend our energies and to invest our substance in promoting world recovery by assisting those who are able and willing to make their maximum contribution to the same cause."

To this Mr Marshall contributed at Harvard, "Our policy is directed, not against any country or doctrine, but against hunger, poverty, desperation and chaos. Its purpose should be the revival of a working economy in the world. . . . Such assistance must not be on a piecemeal basis as various crises develop." He then went on to the suggestions for European conference and planning which have aroused such wide interest on the eastern side of the Atlantic.

Another speech made in Los Angeles two weeks ago by Mr Cohen, Counsellor to the State Department, went into underlying costs. He admitted that previous American programmes looking toward economic reconstruction had "underestimated the ravages done to the European economy, the time

THE CRISIS IN INDIA

The most authoritative account of the background to the present situation in India is Sir R. Coupland's INDIA: A RE-STATEMENT (12s. 6d. net). It offers a concise survey of Britain's historical connexion with India, and of the character of the British Raj. It discusses the political developments of recent years up to the time of the Cabinet Mission, explains the policy of Congress and the Moslem reaction to it and the origin and growth of the demand for Pakistan.

which would be taken to restore its effective functioning, the substantial rise in the costs of American exports, and other factors." He set forth as first objectives, programmes that will "rebuild a self-supporting European economy," and he named the staggering sum of five billion dollars a year over a course of years as the cost of an effective economic foreign policy.

To this Mr Thorp, Assistant Secretary of State, in a speech at New York, added the warning that unless some way could be found of granting Europe credit or further loans, there would be "increased restrictions against American goods by foreign countries in an effort to husband their resources in hard currencies and to make sure that only essential imports are permitted." And then he went on to rub home the lesson that still goes so hard against the American grain, "It seems clear that the level of our foreign trade in the immediate future will be largely determined by the volume of American aid and assistance," and "absence of improvement in other countries will be a persistent drag upon our own economic system."

Ever since Mr. Truman first asked Congress for \$350 million for Greece and Turkey, Administration and public alike have

been engaged in exploring the ramifications of that request. Much of that exploration has been directed from an assumed centre toward a goal which was cloudy in the beginning, but is now clearing. Now, when the true magnitude of the undertaking is revealed the focus of interest shifts to an examination of the hitherto assumed centre—the American store of resources and functioning economic system from which aid must go out. What has been muttered in the wings is now a matter of headline conversation.

The reason for the shift at this time may be attributed to the nearness of Congressional adjournment and the need for speedy action, but this is not the whole story. What Congress does or does not do now is of immediate importance, but that figure of five billion dollars a year as a continuing programme which has been loaded on to the consciences of Congressmen—and by extension on to the consciences of all citizens—calls for major internal readjustments, as well as for a re-designing of the World Bank, the Fund, and other agencies of resource distribution. With that on its desk as a starter, the bi-partisan advisory council at the highest level for which Senator Vandenberg pleads cannot begin its work too soon.

The Shipping Outlook

(From Our US Editorial Staff)

THROUGH arbitration, negotiation and direct strike action during the past twelve months, the largest maritime union for unlicensed personnel in the United States has won three basic wage increases and two major changes in overtime payments. Another stoppage—termed a lock-out by the National Maritime Union (CIO)—has affected East Coast and Gulf ports since June 15th, when the old contract expired. Over the same period, in contrast, most of the European maritime industries have made only single adjustments of a minor nature, some have made no changes at all, and a few have even reduced the level of gross wage payments.

The competitive wage problem is not simply a matter of the trend of basic wages. Since 1938 the US basic monthly wage rate for able seamen has risen from \$72.50 to the present rate of \$182.85. The comparable United Kingdom increase has been from £9 12s. 6d. to the present level of £24 for practically all able seamen—that is, by a not dissimilar proportion. Where the competitive position of the American maritime industry has suffered real damage is in the category of abnormal supplemental payments, which have been largely a wartime and post-war development. On recent voyages the gross wage payments of American able seamen have averaged approximately \$270 per month, or about 150 per cent of the basic wage. Since supplemental payments to European able seamen are comparatively small, their gross wage payments average little more than \$100 per month, or less than 40 per cent of the American figure. Those who look to the operating subsidy paid by the US Government to offset such sweeping differences in wage costs do not understand the limitations on subsidy payments in the Shipping Act of 1936. Probably no more than 15 per cent of all US flag tonnage will be covered by operating subsidy contracts.

The long-term policy of the American unions has been one of forcing maritime working conditions into the mould of shore industries. Already seamen are paid overtime for standing their regular sea watches on Sunday. They are paid overtime for all shore work on Saturday as well as on Sunday. They

are paid special cargo bonuses, which in some cases cover coal, coke and other commonplace cargo items. They receive risk bonuses for entering European and other waters in which foreign vessels trade with no special premiums. A sailor whose vessel is detained three weeks in the security of the Port of London would receive a risk bonus payment of \$52.50. Least understandable of all are the so-called penalty overtime payments which must be paid at any time of day for work which has not been carefully defined as the seaman's responsibility in his labour contracts. The flexible nature of maritime labour, which is a tradition of the sea and is accepted by European seamen as a matter of course, is disappearing on American ships.

Because of boom conditions in ocean shipping, the disparity between American and foreign labour costs is not an immediate problem to the shipowner operating in foreign trade. To the coastal trader, whose tonnage was once 60 per cent of the total, the rapid inflation of American gross wage payments constitutes a heavy penalty today, and, as a partial consequence, privately owned tonnage operating as common carriers in the American coastwise and inter-coastal trades is less than 10 per cent of the pre-war level. For most cargo movements between points close to the coasts, water transportation remains the cheapest medium. But the narrowing spread between water and rail costs, combined with the flexible rate policies of the railroads, has enabled the railroads to cut deeply into the volume of traffic normally reserved for the water carriers. In this sense American seamen have already priced themselves out of part of the market, just as the coal miners are over-pricing their product in relation to oil.

With the foregoing thoughts running through their minds, the shipowners have entered a new period of negotiations with the unions. Six major unions have contracts which terminated on June 15th. Four more have September 30th as a termination date, and many other less important groups will follow the lead of the larger unions. The major demands of the unions for unlicensed seamen include basic wage increases in the neighbourhood of 20 per cent, health and welfare funds, longer vacations, a 40-hour week at sea and an increase in manning scales. On the grounds that the inflated cost structure already jeopardises the future of the maritime industry, the shipowners are taking a strong stand.

The US Navy and other administrative departments responsible for national policy take a serious view of the weak position of the passenger fleet. The two "Queens," which in the wartime summer months carried as many as 15,000 American troops on single Atlantic voyages, made a lasting impression on

American military authorities. Yet today the United States has only one first-class passenger ship of more than 20,000 gross tons with a capacity of more than 1,000 passengers. What is more, there is very little prospect that any large passenger vessels will be built without a major change in Government policy. Not a single new passenger ship is on the building ways in American yards. Furthermore, with costs at their present levels, the shipowners are taking a cautious view of their long-term prospects. Ships under consideration would range in cost up to \$75 million apiece for the super-liners, a level which is more than double pre-war costs and is more than four times the original cost of the smaller ss. *America*.

Three months ago the President appointed a Merchant Marine Advisory Committee consisting of four leading industrialists and a high-ranking naval officer to solve the passenger vessel problem. The Maritime Commission has presented an ambitious programme which is not likely to be accepted either by the Advisory Committee or by Congress without extensive reductions. The plan calls for almost 70 passenger vessels to be built at a gross cost of approximately \$600 million over the next six years. The Commission hopes that the ships will be built for purchase by the private operators, who would provide most of the capital. Failing that, they would be built on Government account for operation by the shipping companies as charterers or agents.

While foreign construction costs are considerably more than 50 per cent of US costs, the shipowners here insist on a construction subsidy of at least 50 per cent. They argue that the world construction cost ratios are meaningless, since few passenger ships are being built anywhere at the inflated costs of to-day. Only a part of the British wartime passenger vessel losses will be replaced and, as for Axis and other losses, replacements will be small indeed.

Even the optimists doubt that a new construction programme can be inaugurated until the next session of Congress and that many passenger keels will be laid for another twelve months. At best, the recovery of the American flag in the passenger ship field will not be apparent before 1949.

Not so long ago proponents of a large fleet under the US flag talked of post-war cargo and passenger tonnage which might be almost double the size of the pre-war fleet. The shipowners have been slow to accept such optimism and, because of the disquieting problems outlined, are now thinking in terms of a normal fleet of only 11 million deadweight tons.

American Notes

Week of Decision

In vetoing a Bill to reduce taxes by \$4 billion, Mr Truman has made history. Only one tax veto is on record, and that was not a Bill to cut taxes. That was the occasion in 1944 when Mr Roosevelt's veto prompted Senator Barkley to resign in indignation, and both houses of Congress to override the President with vigour and dispatch. The ringing phrase in Mr Roosevelt's message was that the Bill in question provided relief "not for the needy, but the greedy."

This is part of Mr Truman's indictment, and organised labour's chief criticism of the present Bill. But the President found other considerations even more compelling. He argued that tax relief now would increase inflationary pressures, thus hastening the day of reckoning; that Congress has not yet finally agreed, and may never agree, on the cuts in expenditure which provide the only excuse for such a reduction in taxes (a keen and deserved thrust); that the Budget surplus, now estimated by the Treasury at \$1,250 million for the fiscal year, should in good times be applied to reduction of the national debt rather than to reduction of taxes; and that the as yet undetermined costs of foreign rehabilitation and reconstruction do not justify a return to lower tax rates. To these sound arguments Mr Truman added that he himself was in favour of "the right kind of tax reduction at the right time"—a sentiment which the Republicans will sourly translate as meaning election year.

To the surprise of most observers, and the disappointment of the Republican leaders, the two-thirds majority necessary to override the President has not been forthcoming even in the House, where it was expected. The vote was 268-137, two votes short. In 1944 a Democratic Congress so keenly resented Mr Roosevelt's

veto that more members voted to override than had originally voted for the Bill. Mr Truman's action has postponed tax relief for at least another year, when it will be combined with omnibus reforms of the tax structure.

★

This was a courageous veto. Tax reduction, even when inequitable, is seldom unpopular. The veto assumes another risk. Publicists like Mr Walter Lippmann are now warning their readers of the deflationary effects of Treasury operations, which in fact, if not on paper, are withdrawing about \$1 billion a month from purchasing power. Mr Truman no doubt hopes that this may be counter-balanced by the Marshall plan for sustaining foreign purchases, which are exceeding imports at the rate of about \$1 billion a month. Should this not materialise in time, the double draught may well be chilling to hopes of continued prosperity.

Last week's bitter exchange between Mr Truman and Senator Taft has been underlined by deliberate blocking of tax reduction, the prime aim of the Republican Congress elected last November. At the end of this week Mr Truman must make his decision on the Labour Bill, which is even more Mr. Taft's baby. The Secretary of Labour has submitted a reasoned indictment of the Bill pointing out that it may not even prevent a coal strike, for it specifically permits men to walk out of "unsafe" premises, and Mr Lewis has shown before how convenient a device this provides. In New York gigantic rallies are being held, with Mr Wallace's blessing, against the "slave labour" Bill. There are unofficial protest walk-outs in the coal mines. At the same time, the maritime strike, with its threat to relief shipments to Europe, underlines the need for stronger Federal powers. Later in the month Mr Truman must come to a decision on the Wool Bill. The House has approved the provision for an import fee, with all it implies for the Geneva Conference, and the concurrence of the Senate is virtually certain. More than the basic issues of the 1948 campaign are being determined in this week of decision. Foreign policy cannot escape the consequences of the sharpening of domestic controversy. Nor will it be lost upon Senator Taft, whose field in the past has primarily been domestic legislation, what part foreign considerations have played in frustrating his domestic programme.

★ ★ ★

The Taft Thesis

Senator Vandenberg has clearly gone as far as was politically possible in endorsing the Marshall plan. It was very carefully qualified approval; really, the decision is postponed until a report is received from the bi-partisan commission he recommends. As in the case of the compromise on the Reciprocal Trade Treaties, Senator Vandenberg has constructed an escape clause which would save the principle involved by taking account of the practical opposition in Congress. How much of the effectiveness of the original policy is dissipated by this process is another matter. But it would have been impossible for Mr Vandenberg to rubber-stamp the proposals of the Administration, without greatly diminishing his influence on his own party, on which the Secretary of State must rely so heavily in the months ahead.

The opposition of which Mr Vandenberg takes account is what might be called the Taft thesis: that high prices at home are the direct result of relief overseas. This view was powerfully supported last week by Mr Herbert Hoover, whose current rôle in foreign affairs is not unlike that of Senator Vandenberg. In a letter to Mr Styles Bridges, chairman of the Senate Appropriations Committee, Mr Hoover expressed the fear that during the past two years America has been over-exporting, with inflationary results. He is equally alarmed lest the effort to increase imports creates unemployment and declining productivity in the United States.

Mr Hoover's letter, Senator Taft's sharp exchange with the President, and Mr Vandenberg's caution all reflect a growing realisation of the unwelcome fact that in the world as it is today, there can be no bi-partisan foreign policy hermetically sealed off from partisan domestic policy. Mr Hoover put his finger on the crux of the matter when he insisted that to continue foreign aid the United States must produce more or consume less at home. What he would like to see is a voluntary reduction in consumption of food in the United States to enable larger exports to the starving. In effect, this is a confession that American aid—even on the scale contemplated—could be accomplished with a minimum of inconvenience to the American consumer if an effective system of controls was politically possible. But this is a conclusion to which no one will expect either Mr Hoover or Senator Taft to come.

"AMERICAN SURVEY" is drawn from three sources. Articles described as "From Our US Editorial Staff" are the work of a small group of regular correspondents, resident in the United States. Articles with some such attribution as "From An Industrial Correspondent" or "From A Correspondent in Ohio" are from outside contributors. Everything printed without attribution is prepared in London.

Consumer Credits

Controversy on the merits and demerits of the regulation of consumer credit has been revived by April figures showing that debts owed by consumers reached a new peak of \$10.2 billion, by comparison with an end-1929 figure of \$7.6 billion, and with a pre-war record of just above \$10 billion reached in the autumn of 1941. In a letter to Mr Eccles, chairman of the Federal Reserve Board, the President has urged that Congress should make these controls permanent. They exist now only by virtue of an Executive Order under the Trading with the Enemy Act.

The Federal Reserve Board is now pressing Congress to authorise a permanent system of regulation for consumer loans and instalment financing of all types. The present controls date from September, 1941, and by 1944 outstanding consumer credits had fallen below \$5 billion, although the decline followed from the very sharp curtailment in the output of durable goods, rather than from the controls then imposed on the proportion of initial payments, and on maturity terms for instalment loans. At the end of the war, President Truman went on record in favour of the continuation of controls—a plea that was strongly supported by Mr Marriner Eccles, Chairman of the Reserve Board.

Controls have been resisted steadily, however, by banks and by industry. In late 1946, the regulations were eased and the list of durable goods to which controls apply was reduced by two-thirds, the main items now being automobiles, heavy household appliances, radios and furniture. Though dollar volume is at new peak levels, it is, of course, far below the earlier relationship with national income. If the 1929 proportions were to be restored, outstanding debt at this period might easily amount to between \$18 and \$20 billion. The failure to attain such a peak is again due more to the actual shortage of durable goods than to the stringency of present regulations.

Present reports suggest that the Reserve Board's plea for continuing controls has met with the solid opposition of the American Bankers' Association on the basis that evidence does not support the view that consumer credits "initiate turns in the economy—up or down." This is no doubt true as far as it goes, but there is abundant evidence to suggest that fluctuations in consumer credits can sharply accentuate swings in the business cycle. A further considerable rise in the total of these outstanding credits can be expected if business activity is maintained through the summer.

Wallace in Washington

Fresh from his triumphs in the West, Mr Wallace has invaded Washington to beard Mr Truman on his very doorstep. The Anti-American Activities Committee of the House has been galvanised into new activity. An attempt by the American Anti-Communist Association to ban Mr Wallace from speaking at the Watergate, a Government-owned auditorium, failed, but the committee promised to send observers. At the meeting, which was conspicuously boycotted by prominent Democrats, who to a man found they had urgent prior engagements, Mr Wallace repeated his now familiar accusations that the Truman Doctrine was provocative, negative, and would either lead to war or force Europe into the Communist camp. Unlike two prominent Republicans, Mr Vandenberg and Mr Stassen, who have found occasion to comment favourably on Mr Marshall's plan for European recovery, Mr Wallace ignored it. This is the stranger as the Marshall programme is no very distant cousin to the foreign theories with which Mr Wallace has been identified for many years.

It is hard to avoid the conclusion that Mr Wallace, having found a congenial theme in the wickedness of the foreign policy of the Administration, is loth to let even the facts deprive him of it. This unwillingness to sacrifice an issue, no matter how out of date, gives colour to the rumour, published on the West Coast, that Mr Wallace has been persuaded, by the crowds he has attracted across the country, to make the attempt to launch a third party in 1948, despite the fact that it would probably seal a Republican victory. "Avant moi, le déluge" is the thought. Mr Wallace evidently feels himself a latter-day Bryan. Wherever he has gone in the West he has reported "a new spirit

awakening, and the people preparing to resume their forward march toward a progressive America." Unfriendly voices find the chief element in this new restlessness a reluctance to face the difficult facts of contemporary life. But if Mr Wallace is right—and he has been right on big issues before—it is a pity that the eloquence which appears to have intoxicated the speaker as well as his audiences is not devoted to construction, rather than to mere denunciation. Attacks on America as "the centre of world reaction" and on universal military training as "the opening wedge of military big business dictatorship" are woefully out of focus and hardly add up to a programme. Mr Wallace is in danger, one fears, of succumbing to what H. G. Wells called the "perpetual peeve" of liberal journalism.

Re-opening the Melting-Pot?

Strangely enough, it is Representative Stratton, an old America-Firstster and ally of Colonel McCormick, who is sponsoring a Bill to open America's doors to 400,000 displaced persons now in German, Italian and Austrian camps. Such a step by the United States would go far toward settling the refugee problem (though not at once), both in itself and through the forceful example it would set the rest of the world. It would be an even more welcome token of American goodwill than approval of the International Refugee Organisation.

Those who have been concerned to rescue the last of Hitler's victims have been tantalised by the fact that even the small quotas of immigrants allowed under American law have not been filled for many years. From 1940 to 1946 the immigration authorities might legally have permitted the entry of 1,076,733; in fact, only 161,971 quota immigrants came in. This was partly because the way lay across the war zones, but also due to the fact that the immigration authorities have consciously refused visas on the grounds that any sign of generosity would immediately result in a lowering of the quotas by Congress. Nothing in America is more jealously guarded than American citizenship.

Under present law, unfilled quotas may not be extended in time, nor may they be transferred to other countries. The bias of the Immigration Act is toward immigrants from North-Western Europe, but the excessive quotas for Great Britain, Ireland and Germany may not be transferred to the countries from which most of the DPs come: Poland, the Baltic States, Russia and Yugoslavia. The Stratton Bill, on which hearings are now proceeding in a Committee of the House of Representatives, would admit 100,000 DPs annually for the next four years. It is warmly supported not only by the State Department and the President, but by Senator Taft, the great labour organisations, national minority groups and all the Churches. In these last two groups lies the secret, doubtless, of Mr Stratton's conversion. Only 20 per cent of the would-be immigrants are Jews; the vast majority are Catholic. The only active opposition comes from the fear of the American Legion that veterans' job opportunities may be jeopardised. Congressmen from the South and West, however, reflect the suspicion of foreigners common in their constituencies, and this prejudice, fortified by the exigencies of a crowded Congressional time-table, may well prove too formidable for a Bill which by next year may be tragically unnecessary.

Shorter Notes

The vote in the Senate on the revised Labour Bill was 54-17, six votes more than the two-thirds majority required to over-ride a Presidential veto.

Sugar supplies have proved sufficiently abundant to allow the Administration to abandon sugar rationing for domestic consumers, although rationing for industrial users continues and price control remains. This is a victory for Congress, which was most reluctant to extend rationing at all last March. The Administration may hope that this sweetening will reconcile Congress to the continuation of the few remaining controls which are essential to the foreign relief programme.

The State of Georgia has succeeded in persuading the Ku Klux Klan—anti-negro, anti-Jew, and anti-Catholic legacy of the Civil War—to disband. Faced by court proceedings initiated by the State, the Klan's "Grand Dragon" has decided that prudence is the better part of valour. The extent to which the Klan will be driven underground by this frontal assault will be watched with interest and some apprehension in America.

How does a pilot qualify for command of a Speedbird? First, he must have at least 800 flying hours to his credit and a very high medical category. Next, he must satisfy an exacting selection board that he is, potentially, the man for the job. Then comes training at the B.O.A.C. school. Theory, thorough and widely ranged; detail, with emphasis on relevant aircraft types; and lastly, flying instruction, when civil flying procedure of every kind becomes a matter of skilled routine. And now, with a 'B' licence and a 2nd class Navigator's Certificate, he takes his place in the Speedbird — as 1st Officer under a senior Captain. Later — much later — he'll be a Captain himself.

Italian Socialists: A Divided House

(By Our Correspondent Recently in Rome)

IN the first decade and a half of this century, under the leadership of Turati, the Italian Socialists were probably a more important political force than either the Socialists in France or the British Labour Party, but although they still produce gusts of vitality, they have shown signs of disintegration ever since. One group broke away and followed the interventionist, Mussolini, in 1915, another became Communist under Gramsci's leadership in 1921, others split off under Carlo Rosselli, and the last defection was that of Saragat in 1947. Incidentally, in 1919 a formidable competitor appeared in the shape of Sturzo's Popular Catholic Party with its revolutionary agrarian plans.

During the long Fascist period the smaller Communist party was more successful in preserving a skeleton organisation, and during the resistance to the Germans the Communist performance was superlative. In 1944 Gramsci's friend, Togliatti, returned from Russia and was able to assert his remarkable personality in a short time. Those who, in December, 1945, witnessed the first Communist Congress after the final liberation of Italy, felt that such a combination of organisation with enthusiasm spelt the epitaph of the Italian Socialist Party. In the elections to the Constituent Assembly in June, 1946, however, the Socialists rallied and won more votes than the Communists, only to split at their congress in January, 1947.

A Socialist Programme

To-day the official *Partito Socialista Italiano* (PSI) retains the leadership of Nenni, and it remains a predominantly working-class party because Nenni emphasises his proletarian solidarity with the Communists. But if Nenni's followers are mostly working-people, they belong to the older generation and their young people are probably with Togliatti. And if the Saragat breakaway is to be irrevocable, the fathers may follow the sons; it is not inspiring to belong to a political rump. With Nenni remain the more practically competent Socialists like Ivan Matteo Lombardo, recently head of a financial mission to the United States, and Rodolfo Morandi. It is the latter who, both in practice and by formulation, has given most substance to the present-day Socialist programme in Italy. It was in a sincere and intelligent speech in Milan on March 16th, when he was Minister of Industry, that he provided the most recent definition of Socialist policy. On this occasion he indicated that the liberation of Italy had given the Left political predominance with incomplete economic control, the major part of the latter remaining in the hands of the *entrepreneurs*. The general circumstances of the country made it necessary to accept this state of affairs as data for immediate action. The post-Fascist State was weak, yet the necessity for the rationing of raw materials and the subsidising of much economic activity gave it considerable control, and the Socialist Ministers should postpone all grandiose schemes and use the State machine—such as it was—to reshape Italian industry for the time being only by planning; it must be made internationalist instead of autarkic in outlook.

Since 1933 the Italian State has owned a considerable part of Italian industry through the *Istituto per la Ricostruzione Industriale*, but this covers mainly concerns associated with autarky and war industries. The directors of the IRI are mostly opponents of Socialism and recommend that the State shall sell out its interest in a series of industries with poor prospects as they stand. But Morandi and his followers are eager to make the fullest use of this instrument of the IRI which the new State has found in its hands and to plan a conversion of its industries. This provides one aspect of the effort to increase production and employment: another is to be the extension of a network of works or managerial committees (*consigli di gestione*) in the factories. Morandi, when in office, had a staff of left wing tendencies to help him draft these ideas into a Bill for industrial reform and a Bill for the national recognition of the *consigli di gestione*. For the moment he

abandoned more ambitious plans for workers' control of managerial policy and accepted what enough industrialists were willing to accept—meetings between directors and workers simply to discuss the technical aspects of increasing production.

Ostensibly Saragat broke away from Nenni's leadership as a protest against Communist penetration of the Italian working-class movement. It is certain that many people followed him in the best possible faith because they believed that he could create a movement more like the British Labour Party with a definitely Western orientation. They hoped that he would be able to rally to his PSLI (*Partito Socialista dei Lavoratori Italiani*) a large proportion of the middle class. The moderate progressives of the Party of Action, who had found it hard to survive the liberation, and other groups such as the Republican Party (which seemed a little pointless once the Republic had been set up) showed a friendly disposition, but they did not join Saragat. On the other hand, though he took with him about 50 out of 115 Socialist deputies, a number of trade union elections in the next few months indicated that he had no real support from the working-class. Along with the *Critica Sociale* group, who are the heirs of Turati and Milanese evolutionary Socialism, the PSLI embraces the uncompromising revolutionaries grouped around young Matteotti who condemn the Communists as deplorable reactionaries. These Left-wing Socialists (or as Moscow calls them, "Trotskyites") link up with the dissident Partisans and their inspirer, Conrado Bonfantini, who, after formal hesitations, have now been accepted as *Saragatiani*. Though the Anarchist Party still occasionally bursts into posters of its own, some of its people will probably find a home with Saragat. At all events, it is difficult to see how Saragat's heterogeneous following can inspire middle-class confidence, while it has been seen that it is unlikely, in spite of its name, to deflect the Italian workers from other allegiances. Indeed the working-people blame Saragat for the new right-wing Cabinet.

It would be foolish to deny that there is a great deal of passionate anti-Communism in Italy (on the Left as much as on the Right), but almost equally blind to doubt that Saragat's action has so far only strengthened the Italian Communist Party. More than ever those who wince at the continuation of grossly unjust social conditions tend to feel that only the Communists with their unity and leadership are capable of getting something done. The *Confederazione Generale Italiana di Lavoro* (CGIL) or Italian TUC has a good record since the liberation but its first post-Fascist Congress at Florence recently confirmed the strength of Communist influence within it. The Catholic Christian-Democrat Party has a big left wing and the ACLI or Catholic Workers' organisation is much more powerful than the similar body in France, especially among black-coated workers. But on the whole it seems that Vatican policy has been undermining its own leftists and diminishing Christian-Democrat influence in the CGIL.

Peasants and Labourers

The student of Italy can scarcely be reminded too often that the peasants still are and long will be a much larger social mass than the industrial workers or any other group. And here again there is a sharp distinction between Italy and France because Italy's political revolutions have lacked a social side and there has never been an Italian 1789 to give the land to the peasants and thus make them into a conservative force. Of course there are comfortable peasant proprietors in Italy but they are rare. The big categories are landless labourers, *metayers* and the proprietors of dwarf-holdings, all of whom are liable to be employed on other people's big estates and to suffer from land hunger. Forty and more years ago the Socialists had followers especially among the peasants of Emilia, but it was Sturzo's new Catholic party which gained most support as the result of the land-to-the-

peasants promises made by the Italian Government as by many other governments during the 1915-1918 war. Sturzo himself was a great force in his native Sicily, but the peasants of the Veneto and also of Lombardy supported him enthusiastically. One of the most remarkable developments in Italy in the last two years is, however, the conversion of many peasants to Communism. Of course Christian-Democrat influence in the villages remains very strong, but the April elections in Sicily showed the increase of Communist allegiance even in the primitive South.

Some of the Socialists who are given to self-examination blame their party colleagues for using Socialist and Marxist phrases, especially at Party Congresses, which they no longer mean, and it has been seen that men like Morandi hold that for the moment they should abandon wholesale theory and concentrate on unambitious practical and perhaps preparatory reform. It cannot be said that the Communists gain their recruits by being more revolutionary or even more Socialist. They have closely followed Morandi's industrial line while their promises of land to the peasants are often, like any other piece of deliberate demagoguery, without detailed content. In fact, Communism seems to be weakening Socialism in Italy not as a detailed political programme but rather as a way of life. When simple people in Italy join the Communist party, they seem to feel that they are doing it chiefly out of a feeling of social loyalty. They fling themselves devotedly into party work and explain with mystic faith that it is a matter of the solidarity of the people. The Socialists, divided among themselves, cannot offer such hypnotic unity. Nor do their divisions recommend them to men of practical sense. Thus it is difficult to prophesy a hopeful future unless and until the Saragat-Nenni division is bridged.

Big Business at Montreux

[FROM OUR SPECIAL CORRESPONDENT]

THE International Chamber of Commerce held its eleventh Congress, the first to be convened since the war, at the Montreux Palace Hotel last week. This meeting of some 500 delegates, representing 30 countries, achieved all that functions of this kind normally achieve; a valuable exchange of views between the great of the business world, the passing of copious and, for the most part, safe and fairly obvious resolutions, and last, but not least, a creation of good will, the imparting of mutual enlightenment.

It would be idle to pretend that much constructive and original thinking is done on occasions such as these. That is the role of the experts who prepare the documents and memoranda on which the debates at these conferences are based. The debates themselves bring into focus the points of differences that divide the approach of various national delegations to the problems placed before them. This in turn helps in the formulation of views which the International Chamber of Commerce is then able to bring to bear both on the Governments of countries from which it draws its membership and on the Economic and Social Council of United Nations on which the ICC has been granted the highest consultative status.

This status it shares with such organisations as the World Federation of Trade Unions and the International Co-operative Alliance, but it is probably safe to say that of all the consultative organisations attached to Ecosoc and to its commissions and specialised agencies, none speaks with a greater unanimity of voice than this representative body of international business and finance.

The Parallel with ITO

What lent the deliberations of the Montreux Congress special point and interest was the coincidence of another meeting a little further down the Lake of Geneva, at which the most crucial problems that confront the ICC, namely the shaping of a new code of international commercial behaviour, was being discussed by representatives of 18 governments. This problem held pride of place in the debates at Montreux, and the debates on commercial policy reflected very much the same points of difference as have emerged in the protracted inter-governmental discussions on the Charter of the proposed International Trade Organisation. The meeting at Montreux had before it the detailed commentary on the Charter prepared under the guidance of Dr Michael Heilperin, the ICC economic adviser on ITO. In general the speakers gave their approval to the ITO proposal, but as might be expected, there were some qualifications to that approval on the part of certain delegations, including the British.

Speaking for the United Kingdom, Captain Peter Lindsay pleaded the virtues of hastening slowly and added that while the British delegation wished as much as any to free international trade from restrictions that reduced its volume, it would be a long time before many countries could fully re-establish their balances of trade, and that pending such re-establishment some resort to defensive measures, which might well seem restrictive and even discriminatory, would be inevitable. The resolution on the Charter for World Trade expresses general approval of the efforts to establish by international agreement the basic principles of a sound international trade policy for the world, but it adds the following wise warning:

Too great an emphasis can easily be placed on the value of machinery as such. It is not enough to establish a new international organisation. What will count will be the spirit that member governments bring to the organisation and the common acceptance by all participants of clearly defined objectives. If there is good will and a real drive towards a common goal the desired results will be achieved even with imperfect machinery. If they are absent not even the most efficient machinery will prevent confusion and disintegration.

A Cardinal Resolution

The master, or key, resolution of the Congress was that dealing with economic expansion and stability. Though it says nothing that is particularly original, its statement of the general approach of the ICC to the basic problem of economic stability, deserves quotation in full:—

1. Economic stability and security must not be confused with immobility. If they are, there is a danger of petrifying the economic structure at a low level of well-being and of sacrificing the essential human liberties. In a dynamic expanding economy, there must always be ups and downs. The objective must be to moderate, not eliminate, the growing pains of the economy, in other words to prevent dangerously wide fluctuations without stifling change and growth.

2. Economic stability ought not to be divorced from expansion. Policies aiming at stability should be policies of expansion and not of restriction, and by expansion is meant the over-all growth of productivity, trade, investment and living standards throughout the whole world.

3. Government action alone cannot create stability and preserve freedom and growth. Like expansion, stability depends, both nationally and internationally, on the harmonious working together of a multiplicity of forces: governments, labour, agriculture, industry, trade and finance.

4. No nation can bring about stability within its own borders by purely national action, except by drastically reducing the actual or potential standard of living of its people and by sacrificing their freedom.

5. No nation can insulate itself from depression by restrictive trade policies, unless it is willing to accept for its own people a state of protracted stagnation.

6. The problem of reconciling the needs of healthy expansion with the needs of stability and social security is of great international concern. It can be dealt with only by internationally concerted co-operation, based on wholehearted recognition of the fact that the welfare of one country depends on the welfare of all.

7. Economic stability coupled with expansion calls for a multi-lateral system of world trade in which goods, capital and men can move and services be exchanged with the greatest possible freedom from country to country. Two-way trade is needed to enable the creditor countries to receive and debtor countries to pay; but bi-lateral balancing of trade and accounts is as great an enemy of world-wide economic stability as isolationism. Both spell stagnation, low standards of living and economic strife.

8. In the last resort, stability in an expanding world economy can be achieved only if the individual—whether he be worker, farmer, shop-owner, industrialist, merchant, carrier, banker, insurer, entrepreneur or investor—is given ample scope and incentive to take a responsible part in the sum-total of the economic process. What he needs is not regimentation, but guidance including an ample flow of reliable information.

Of similar general character are the resolutions on monetary policy (where we meet that old friend, the appeal to all governments to stabilise their budgets) and on the problem of maximum employment in a free society. Many of the resolutions dealt with more technical subjects, on which the International Chamber of Commerce should speak with even greater authority, and more expert technical knowledge, that it does on broader issues. Among these more specialised resolutions are those dealing with double taxation, uniform rules for international loan contracts, the status of foreign establishments, international commercial arbitration, trade terms, international sales contracts and international communications. On all these points the ICC can give valuable advice grounded on real experience and in making its views known it is performing a useful service.

Mountbatten's India

[FROM OUR BOMBAY CORRESPONDENT]

PROBABLY never before in political history has a whole country been able to listen to such a strange collection of speeches on its future as were broadcast in quick succession by the Indian stations on the evening of June 3rd, when details of the latest British plan for India were published.

Within a brief hour, the Viceroy spoke, followed by an announcer with the plan itself, Pandit Nehru for Congress, Mr Jinnah for the Muslim League and Sardar Baldev Singh for the Sikhs. As valedictories for the India that has gone, their speeches were not impressive. As welcoming words for the new order, they were worse. Only three good things could be said for the whole performance. The new plan brought procedure for handing over power nearer to the facts of the Indian situation as they are today. The Indian independence campaign reached the dignity of Dominion Status. And Mr Jinnah agreed to call off the Muslim League civil disobedience campaign in the North-west Frontier Province.

Otherwise no one was satisfied. Lord Mountbatten still thought a unified India best; Pandit Nehru had "no joy in his heart" in commending the scheme to his followers. Mr Jinnah wished to know whether it was a settlement or a compromise. But it was difficult for Jinnah to hide his triumph. Having got most of what he wanted, he could end his speech with "Pakistan Zindabad" (Victory to Pakistan). Sardar Baldev Singh did not mince matters. The Sikhs did not like the settlement, but it was the best in the circumstances.

India has seen so many supposedly epoch-making plans turn into waste paper almost overnight, that no very enthusiastic reception could be expected for the latest of the series. The air of lugubriousness attending its launching did not appear to improve its prospects, but it is perhaps just because no one expects too much of it that the Mountbatten plan has most hope of success. In many respects it simply recognises the state of affairs already existing in India. The promise of legislation for Dominion Status does little more than regularise the system in vogue since the Interim Government took office last autumn.

But the crux of the Indian situation is still the Hindu-Muslim dispute, with Congress and the Muslim League as the protagonists. Here the somewhat nebulous terms of the Cabinet Declaration of May, 1946, are replaced by what appears to be more straightforward procedure. Last year Indians were told that they must first gather in a Constituent Assembly in which the provinces would be grouped. Provincial group constitutions would be made and finally an Indian Union would be erected with the Princes' states as part of the edifice. There was an escape clause to the effect that a province could opt out of its group after the group constitution had been made, if it did not like the constitution.

Bitter controversy immediately arose over the interpretation of this clause and the method of voting laid down in the declaration. Congress was obviously anxious to prevent any province from leaving the fold. The Muslim League was wary of entanglements and finally refused to have anything to do with the scheme. It has taken four months of Mr Jinnah's masterly inactivity to reduce the existing Constituent Assembly's activities to a farce.

Having had some experience of the octopus-like proclivities of Congress claims, the Muslim League has refused to agree to anything that did not seem likely to place a limit on what Congress could do. The most obvious way out was to claim a separate country where non-Muslim politicians could be told they were not wanted. That explains Pakistan's popularity among many Muslims who otherwise deplore the division of India. The Mountbatten plan gives this protection to the Muslims because it allows provinces and even parts of provinces to decide which group they wish to join—Hindustan or Pakistan—before any constitution making starts (the reverse of the 1946 procedure). The separation idea is carried to its logical conclusion with plans for the temporary splitting of the Bengal and Punjab administrations into twins.

Just as important is the speed at which Lord Mountbatten proposes to act. While it is expected that Dominion Status will reach the Statute Book in Westminster by the end of July, the end of June has been set as the deadline for the completion of preliminaries in India. Past efforts to settle India's problems have broken down owing to the extreme slowness with which any plan was likely to be carried into effect. This gave an air of unreality to the whole business and far too much time for interested parties to think up alternatives. Opponents of Con-

gress often claim that that body could have made a great deal more progress if it had accepted offers and then agitated for more. Instead, say the critics, Congress too often rejected everything and then raised its demands. There is a good deal of justice in that criticism, but the Congress attitude was undoubtedly influenced by the fact that previous British offers were practically always matters of principle and not of action. When Dominion Status was previously offered—and rejected—no timetable accompanied the offer. There was perhaps some justification when Indian parties have refused to mortgage the future.

A Qualified Approval

However, it would be foolish to suppose that the present plan will come into effect without any controversy. The leaders have given only qualified approval. Mr Jinnah, in almost his last public statement before the present round of negotiations began, still claimed the Pakistan provinces, without the partition of the Punjab and Bengal and with a corridor between the eastern and western sections of the Muslim state. And the Mountbatten plan has been received with very mixed feelings by Congress and by the Hindu community. While the Viceroy was in London Mr Gandhi once more became vocal on the subject of a unified India. His cue was followed by the Hindu press as soon as the Mountbatten proposals became known and Nehru has been denounced as a traitor. This sudden revival of the undivided India thesis has been supported by that extremist Hindu body, the Hindu Mahasabha in planning to organise a "Black Day" in protest.

Lord Mountbatten claims that his scheme is a synthesis of Indian leaders' views and he took care to secure their approval before publishing it. There is thus no question of the leading figures in Indian politics either accepting or rejecting the plan in the usual sense of those words. The real problem is whether they can bring their henchmen under control. In fact the real danger to a peaceful Indian settlement does not come from the top men or from the general public (who want peace almost at any price), but from the intervening layer of lesser leaders whose horizons are narrow, but whose passions are high.

Mr Gandhi has thrown his weight on the side of the plan by pointing out that it is the only basis on which an agreement can be reached. He also asked the country "not to rebel against Congress." This extraordinary statement has drawn more fire from the critics of the plan who want to know what has happened to Mr Gandhi's democracy! They also ask why Congress has accepted this plan when plans such as the Cripps offer and last year's Union scheme (both of which would have unified India) were rejected. These questions mean little in the present state of the country; but they are quoted as an indication of the lack of realism and the determination to recriminate which exist in many circles.

Similarly, a certain amount of mischievous propaganda emanates from Hindu quarters to increase Muslim dissatisfaction with the proposed partition. The general aim is to show that in every way Pakistan will be the "little brother" of Hindustan. In a country where "face" means so much this line of talk may become troublesome. It is thus by no means impossible that the Working Committees of the Congress and the Muslim League may still further qualify approval of the plan, at any rate in an attempt to get just a little more advantage over the other party. On the other hand, the blatant fact that there can be no internal peace without a settlement does not allow much scope for bargaining. Nor does the Mountbatten timetable. The speed at which it will be put into operation is very nearly as important as its contents in saving the situation.

There is of course a lingering hope that partition will be the first step to union. This is probably wishful thinking but there are two factors in its favour. So far nothing has been said about India's armed forces. For the present they are apparently to be common to the two dominions. Secondly, divided India will be Dominions and not sovereign states. These facts reduce considerably the risk of civil war.

Moreover, the rapidly growing suspicion that the British would continue to control India through the States, even after quitting the provinces, promised some difficulties. But the freedom of action granted them has allayed it. And the presence of such a group pursuing its own conflicting aims in the midst of a harassed sub-continent could not augur well for stability. Indians have not forgotten that the selfish intrigues of these principalities were the prime cause of the British being able to conquer the country 200 years ago. They are not anxious to repeat the experiment.

THE SPIRIT OF ENQUIRY

The Black Crust! . . . a mystery of 1888

In 1888 Dr. Ludwig Mond noted an unexpected carbon deposit on some nickel valves. Laboratory experiments further revealed that carbon-monoxide readily combines with nickel to form nickel carbonyl which in turn can be easily decomposed. This reaction is the basis of the Mond nickel-refining process.

A spirit of enquiry and research has ever since continued to be characteristic of the nickel industry.

THE BUSINESS WORLD

Rubber in Review

POST-WAR developments in the rubber world have confirmed the prophets—not excluding those of the state trading organisation which the Government had built up during the war. Last year, as is well known, the anticipated profit to the British public through governmental post-war rubber dealing became a real loss when, in the autumn, 200,000 tons of rubber were sold to the US Government at 1s. a lb.—although the cost to the British Exchequer had been 1s. 2d. a lb. Faced with the possibility of a collapse in the world rubber market, the Government beat a belated retreat, deciding that it would be expedient, after all, to allow the London Rubber Exchange to resume its pre-war activities, as from the beginning of 1947. Since then there have been ups and downs in prices, but on the whole the tone of the market has not been cheerful, and at times there has been real pessimism about the long-term trend. It is only in the last week or so that any optimism has become apparent. There now appear to be two quite distinct groups of opinion. At the extremes are those in the first group who believe that the age of synthetic rubber has already passed and those in the second who hold that it is only a matter of time before natural rubber ceases to be an important commodity in international trade. But controversy between the rival protagonists will not of itself resolve the difference; and a dispassionate survey of the broad influences at work suggests that it is too soon to frame definite conclusions.

During the war it was generally believed that the Far Eastern rubber plantations would be so seriously damaged by the re-

smallholders, whose output in 1946 accounted for 57 per cent of the total. In the Netherlands East Indies, Indo-China and Siam, the position is still obscured by the political uncertainties, but there appear to be appreciable quantities of rubber available. Shipments from Indonesia to Singapore averaged 16,000 tons a month during the last six months of 1946; if it were possible to collect and market all the native output, exports could be considerably larger.

The problem of the Far Eastern production centres princi-

treating Japanese invaders that they would need at least seven years to rebuild to the level of their pre-war output. This belief provided, incidentally, further support for the plans to extend productive capacity for synthetic rubber. But events during the past year have belied all previous pessimistic forecasts. Indeed, there has been a complete *volte face*; instead of the expected dearth there is now a general fear of a prospective surplus. The reasons for this sudden change in the supply position are complex. The position in the Far East had been misinterpreted. The material damage done to the estates was far less serious than had been feared; the neglect of the rubber trees had not greatly impaired their productive capacity, and the power of recuperation was greater than had been expected. Despite labour difficulties, which still continue, production has recovered very rapidly.

In Malaya the increased rubber output has come largely from

pally in the estates. Labour costs have risen considerably; the increase in wages has been variously estimated as between 100 and 200 per cent. Moreover, great labour discontent is arising from the meagre rice rations and the prevalence of an active black market, while the political uncertainties are a further source of disturbance. Smallholders in general have a very large potential rubber output, provided they are allowed to plant new trees at will. As their costs of production are extremely low, the price of natural rubber from this source could decline quite appreciably from its present level of around 10d. a lb. without causing hardship. Table I, which shows estimated natural rubber production from 1941 to 1946, reveals a significant increase in output in countries other than the Far East, particularly in Africa.

The development of synthetic rubber in the pre-war period was largely in the hands of Germany and the Soviet Union; both countries were without direct access to the natural product and both sought, for strategic and political reasons, to be self-sufficient. Of an average world output before the war (1936-39) of 68,000 tons, these two countries accounted for 67,500 tons. The Japanese entry into the war and their occupation of the Far Eastern rubber-producing territories cut the Allies off from their main source of supply, and the output of the remaining areas was totally inadequate to cover requirements. But the drive for synthetic production in the United States after 1941 had phenomenal results. In that year the United States had accounted for only 5 per cent of an estimated world output of 77,500 tons, excluding Russia. By 1946 this proportion had risen to 92 per cent and the world total to 806,600 tons—even this total was below the peak production achieved in the previous year. Thus the problem of synthetic rubber production is in practice a problem of American production; but the manner of its solution is of crucial importance for rubber producers of the world. World output of synthetic rubber from 1941 to 1946 is surveyed in Table II.

Whitkirk Church

CENTURIES OLD ABBEYS, churches, castles, mansions of imposing exteriors . . . furnishings and decorations, priceless heirlooms of craftsmen of the past—these are the historic background of the Yorkshire of to-day with its thousands of craftsmen skilled in so many trades. This tradition is to be seen throughout Yorkshire, among its people, in its cities and towns, in its industries, and is the solid foundation upon which "The Yorkshire Post" is established. Owned, edited and published in Yorkshire it is indeed part of Yorkshire life, yet with that breadth of outlook which causes its viewpoints to be studied and quoted throughout the world.

You buy lifelong security —when you invest in a MILNERS Safe!

This is one of the "B" range of Milners' post-war designs—a masterpiece of security. Further details of this range will be sent on request.

How is one to choose a safe? Obviously, reputation is the surest guide. Here the name of Milners is pre-eminent. For over 100 years Milners have built safes and strong-rooms for nearly every world-famous concern, and Milners' safes are to be found in every quarter of the globe. Whether it's a specially constructed strong-room to protect a fortune, or whether it's a small safe to take care of personal treasures, you can be sure that you've made the wisest choice when you specify "Milners".

MILNERS — THE SAFEST SAFE INVESTMENT

Of the many synthetic types produced, Buna-S is still by far the most important; its output represented 83 per cent of the total in 1946. Butyl took second place with 11 per cent, while Neoprene types accounted for only 6 per cent of the total. Buna-S, a general purpose synthetic rubber, is the type most vulnerable to competition from natural rubber. Neoprene is a special purpose synthetic possessing characteristics which in certain respects are qualitatively superior to the natural product, for example in resistance to heat, oil and chemicals; in consequence, the demand for it is peculiar and restricted. Butyl

lies mid-way between these two extremes; within limits, it can be used for either general or special purposes.

America's case for maintaining synthetic production is two-fold. First and foremost is the strategic argument, the military aspects of which need no emphasis; but it is well exemplified in the fact that, even now, most of the US output comes from government-owned plants. Considerable capital has been invested in these plants, and capacity has increased so enormously that those most closely concerned with what was undoubtedly a great wartime achievement are naturally reluctant to give up so large an investment, even though it may be at the moment uneconomic to run. The second consideration is America's sensitiveness to the fact that its industry before the war wholly depended upon foreign supplies for a commodity of which it was the world's largest consumer. Rightly or wrongly, America fears that, if synthetic production ceased, so that the large US demand would again depend upon world supplies of natural rubber, her industry would again be at the mercy of price-raising restriction schemes mainly dominated by foreign producers. Costs of the synthetic product are governed to a large degree by the volume of output. The average cost of petroleum based Buna-S type fell from 30 cents a lb. in 1942 to under 15 cents a lb. in 1945, excluding depreciation or amortisation costs which, it is estimated, would not amount to more than 2 cents a lb. By 1947 it was expected that costs would be reduced

to about 12 cents a lb. or less, equivalent to 7d. The cost of the special purpose types are higher, but there has been a similar downward trend. Butyl, however, is proving to be the cheapest type. It is difficult to ascertain the accuracy of the estimates; but, unless discredited, they obviously provide America with apparent justification—so long as the price of natural rubber is around 10d.-1s. a lb.—for its policy of continuing production, as well as with a powerful lever in the market for the natural product.

But the competition between the natural and synthetic products is not simply a matter of price. The accompanying chart shows the main uses of rubber, on a proportionate basis, in the United States, the United Kingdom, Canada and France. From this it will be seen that between 60 and 75 per cent of rubber consumption is absorbed in the manufacture of tyres and inner tubes of all types. For this predominant purpose, natural rubber has as yet a definite, if not decisive, advantage. Its synthetic counterpart although having adequate elasticity possesses too high a plasticity to have equal durability and strength, at all events in fast-running vehicles. Consumers, too, have a definite bias in favour of the natural material, and, were they given a free choice, their preference would be reflected in sales. Under normal competitive conditions, there would need to be an appreciable price differential between the two materials to counterbalance this bias. Moreover, the processing costs in the manufacture of tyres and inner tubes are higher where the synthetic material has to be used. Thus, although for some, and perhaps many, of the other uses of rubber—accounting in all for about 30 per cent of total consumption—the synthetic types may be preferred even if marketed at higher prices, natural rubber at present has a definite advantage for the main use. In the United States, the war-

time order (R.I.) stipulating the amount of synthetic rubber which must be combined with natural in the manufacture of rubber goods is still in force and apparently is likely to be retained for some time, in spite of the fact that American consumers would prefer certain products made entirely from natural rubber. But the issue cannot yet be regarded as decisively determined; Buna-S and the other types of synthetics are new materials, and past experience has shown that rapid strides in development can take place over a relatively short space of time. With the intensification of work in the field of

crystal chemistry, it may well become possible to overcome the defects in Buna-S and make it equally suitable for transportation purposes. Nor must the development of even newer materials be overlooked. There would, however, still remain the problem of re-directing the consumer's preference; but this would probably not impose any insurmountable difficulty once the progressive advertising experts had got into their stride.

The trend of rubber consumption seems to be quite definitely upwards. Table III compares recent experience with the pre-

war period (1936-39). Last year's estimated total consumption was 1,455,000 tons, or 130 per cent of the pre-war level. At the third meeting of the Rubber Study Group held last November, prospective consumption was calculated at 1,700,000 tons in the current year and 1,675,000 tons in 1948, on the assumption that industrial activity was maintained. From the motor industry, of course, the rising demand springs not only from the output of new vehicles, but also from replacement; as tyres and inner tubes again become in freer supply large numbers will be absorbed. On a longer view, the extent of travelling will in-

SAFE AS HOUSES

But are they? Is *your* house safe, in the sense that it is the best place to keep your cash? How much wiser it is to open an account at the Westminster Bank, where your money

will have complete protection, yet always be readily accessible. The process is simple and the account can be opened with a modest sum. The Manager of your local branch will be glad to tell you of the many ways in which the Westminster Bank can be of service to you.

WESTMINSTER BANK LIMITED

crease, and the crucial factor from the point of view of rubber demand is car-mileage. In the United Kingdom alone, the mileage per car will jump significantly as soon as it becomes possible to lift petrol rationing—provided that no other restrictions are imposed upon the motorist.

The world rubber market is at the moment burdened with fairly substantial stocks of rubber. At the end of March, 1947, the total stock of both natural and synthetic was estimated at 1,035,000 tons, or about the same as at the end of 1946. Of this total 895,000 tons comprised natural rubber and 140,000 tons synthetic types. The significance of this million-ton stock must be construed in the light of the apparently definite prospects of an increased output. Table IV gives the prospective supply position up to 1948 as agreed by the Rubber Study Group, whilst in Table V the stock position has been projected to the end of that year. From these data it appears evident that the problem of excess production may begin to make itself felt by next year.

But it is certainly premature to attempt to draw conclusions about the consequential effects. The world industry is in process of a large change, and the eventual balance between the three elements—synthetic production, estate production and native production—cannot yet be foreseen. The potential development in output from the smallholders alone could conceivably cover about 70 per cent of world consumption estimated at 1.7 million tons. The demand for rubber is likely to be maintained and wherever consumers are able to exert their preference, it is likely to be in favour of natural rubber, at least for tyres and inner tubes. Whether synthetic production will be maintained at the present level and for how long, and whether American consumers will be forced to take only a stipulated amount of natural material in any rubber product they purchase, depend on political decisions which it would be unwise to forecast at the moment.

The demands of the war years have greatly altered the relative importance of the exports of Cyprus. Whereas copper, carobs and asbestos formerly headed the list, recent trade figures show that exports of wines and spirits, buttons, potatoes and tobacco have greatly increased, while those of copper and asbestos have diminished.

As conditions return to normal throughout the world, fresh demands may well cause other changes in the relative importance of the Island's industries. Modern commercial development calls for careful and continuous study of local market conditions. Full and up-to-date information, backed by an intimate knowledge of the Island, is available to merchants and manufacturers interested in trade with Cyprus.

Labour and Incentives

THE decision of the Court of Inquiry set up by the Ministry of Labour to investigate railway wages will be awaited with particular interest by the travelling public, but by no means by them alone, for the Court's findings will have repercussions far beyond the railway industry. Although the railwaymen's claim was actually lodged with the companies before the publication of the "Economic Survey," with its homily on wages policy, this claim is the biggest to be considered since the Government laid it down that increases in wages must be accompanied by corresponding increases in production, and that the nation could not afford shorter hours unless they could be shown to increase output per man-year. The railway trade unions' claim, for an all-round increase of £1 a week and a 40-hour week for operative grades and a 35-hour week for clerks, can thus be regarded as a test case for industry generally.

Mr John Benstead, General Secretary of the National Union of Railwaymen, has assured the Court that he was "not unmindful" of the contents of the White Paper and of the need to prevent inflation, but maintained that the wages and conditions of workers in the "depressed industries, of which the railways are one," should be exempted from any general wages stop. This statement reflects a dilemma which confronts not only the Court of Inquiry, but the Government itself. As a result of the miners' resolution at the Margate conference, the Government is pledged to raise wages and improve conditions in the undermanned industries, in order to attract recruits. But if the Government is to implement its pledge it will obviously have to face the difficult issues of deciding which are the depressed and undermanned industries, and by how much their wages need to be raised to achieve the optimum distribution of manpower. The evidence given by Mr Morrison this week on the slow rate of recruitment to these industries—except for coal and clothing—emphasises the need for speedy decisions on policy. Any such decisions would naturally be interpreted as the first positive steps to implement a wages policy, and as such would be bound to raise an immediate storm of protest among the trade unions, which still jealously guard their autonomy in this matter.

There is little doubt that the railway unions have made a *prima facie* case for wage increases; and railway workers may perhaps have reason to feel aggrieved if they are to be prevented from sharing in the general trend towards reduced working hours in industry, simply because their claims are being heard rather late. There is equally no doubt that working conditions and welfare provision leave much to be desired, and there is a real danger that dissatisfaction with pay and conditions will lead to an increasing drift of manpower from the railways.

It is clear, however, that the companies, for their part, have a case for rejecting the men's claims—even if it is to be the State and not they who will bear the immediate burden. The wages and hours claim, if conceded in full, would, according to their estimate, cost nearly £90 million in wages and operating costs, and inevitably the burden would be passed on to the public in the shape of higher fares and transport charges. The companies' own estimate is that an increase over pre-war rates of 65 per cent for passenger fares and 70 per cent for transport charges would be required.

Perhaps even more important than the effect upon transport charges is the possible repercussion upon the attitude of other industrial workers. Suppose it be admitted that the railways are in fact a "depressed industry," and that wage increases and reduced hours are necessary to provide an incentive to recruitment and prevent widespread stoppages on the railways and in

railway workshops. But how, then, will other trade unions react—even to a partial granting of the claim? The raising of wages in one sector of industry, even a depressed one, would almost certainly be regarded as a signal by other sectors, not so depressed, to go ahead with wage claims, and possibly to press their claims even to the point of unofficial strike action.

Some trade union leaders are well alive to the dangers. In his speech at the annual conference of the Amalgamated Engineering Union this week, the president, Mr. Jack Tanner, faced the issue squarely. Referring to the claims for wage increases in the undermanned industries, he said "There is a danger that a square deal for these industries may provoke less justified claims by workers in other industries. . . . It is essential that trade unions maintain a statesmanlike policy of tolerance and restraint."

The differences between wage rates in various industries, undermanned and otherwise, are shown in the following table:

MINIMUM WAGE RATES IN SELECTED INDUSTRIES.*

1. UNDERMANNED AND "DEPRESSED" INDUSTRIES.

Agriculture	
Men, 80s. a week. Women, 60s. a week.	
Coal mining	
Underground workers, 100s. a week. Surface workers, 90s. a week.	
Textiles	
Cotton spinning: Weekly rates varying from 60s. 1d. for winders and reellers to 87s. 9d. for ring jobbers.	
Woolen and worsted spinning: Weekly rates varying from 53s. 9d. for first drawers to 111s. 8d. for overlookers.	
Jute: Weekly rates varying from 46s. 10d. for female single spinners to 91s. 6d. male loom tenters.	
Boot and Shoe Manufacture	
Men, 85s. a week. Women, 62s. a week.	
Pottery	
Weekly rates varying from 75s. for male labourers to 93s. for skilled grades; women's rates varying from 49s. 6d. to 54s. 6d.	
Railways (Industrial areas)	
Rates varying from 85s. for labourers and goods porters to 126s. 6d. for drivers after six years.	
Railway workshops (Industrial areas)	
Rates varying from 85s. for labourers to 103s. 6d. for patternmakers.	

2. OTHER INDUSTRIES.

Heavy chemicals (other than London)	
Men's labourer rate, 1s. 11d. an hour.	
Women's day work rate, 1s. 3½d. an hour.	
Engineering	
District variations in labourer's rate from 84s. per week, Northern Ireland and Portsmouth, to 89s. 3½d. London. Fitters and turners rates from 101s. Bradford and Leeds, to 106s. 11d. London.	
Women's rate 62s. 6d. a week.	
Shipbuilding	
Rates varying from 85s. a week unskilled to 104s. for fully skilled classes.	
Printing and Bookbinding	
Rates varying according to grades of towns and machines operated. Highest rate rotary machine operators on morning newspapers in Grade 1 towns, 129s. weekly.	
Docks	
18s. per day in smaller ports, 19s. per day in larger ports.	

The problem of increasing wage rates, as a means of stimulating recruitment in the undermanned industries, is only one aspect of the question of incentives. No less urgent is the problem of incentives to output; and on this issue, too, Mr Tanner offered sound counsel. He appealed to the engineers to change their attitude to such matters as "time and

* Ministry of Labour: "Time Rates of Wages, August, 1946."

motion study . . . which have nothing of Bedaux about them." The trouble is that these methods have for so long been associated in the minds of the workers with unemployment, or with increased profits for the employers at the expense of the workers, that the rank-and-file find it difficult to accept the idea that such methods can actually benefit the workers by ensuring the maximum return for effort and eliminating rate-cutting, which has been one of the root reasons for the workers' opposition in the past.

At the moment, the battle of incentives has been joined most fiercely in the building industry. The building union leaders are adamant in their refusal to accept any form of payment by results or bonus schemes as an incentive to higher output. Indeed, they seem unwilling to admit even that output per man is unjustifiably low in the building industry at the present time. It is hard to discern the real reasons for their rejection of such schemes. The argument of Mr Richard Coppock, Secretary of the National Federation of Building Trade Unions, is that it is impossible to arrive at any "reliable datum or criteria from which building production can be measured or judged."

Many building operatives, however, are ahead of their leaders on this issue. An "unofficial" deputation of London building stewards assured the Minister of Health that they wanted to see bonus schemes operated on local authority jobs, instead of on private contracts only, as at present, provided that the men on the site, through their unions, had a voice in deciding the terms and methods by which they were applied. They added a number of other conditions, such as an increase of the guaranteed week beyond the present limit of 32 hours, the improvement of welfare and amenities and the development of joint site committees. These are not unreasonable requests, and the fact that the builders themselves are prepared to accept

Business Notes

Malaise in Gilt-edged

The gilt-edged market on Tuesday made a half-hearted attempt at recovery from the weakness of the previous fortnight, but promptly relapsed on the following day. The daily seepage of values has carried some stocks back to within a little of the lowest levels reached during the fuel crisis. It is true that the movement had proceeded very gradually, almost unobtrusively, with only fractional falls on most days. There has been no sign of heavy selling. The market for medium-dated stocks has faced little more than the "natural" stream of selling orders arising from liquidation of deceased estates and similar causes—but it has faced it without the support upon which it normally depends. At both extremes, however, the pressure seems to have been rather greater—in the irredeemables because they are now quite friendless and in the shortest-dated issues because of industrial sales for reconversion finance. These sales have had the greater effect because the discount houses, though by no means stretched to the wider limits of absorption which their additional capital permits, are believed to have taken their fill of very short bonds. But although, in general, the pressures have not been heavy, the movement is nearing the point at which the main source of weakness, the general lack of support, might turn to widespread selling. On the other hand, the narrowness of the market at present does afford scope for tactical official intervention.

Unless the authorities embark upon an ordered campaign of support, it is hard to see the possibility of anything more than a technical recovery. Public attention, fortunately, is less closely focused upon the market than it habitually was last year and in the early spring. Otherwise it might have reacted rather sharply to the frank admissions of the change which has occurred in official policy. The implications have naturally not been lost upon the big institutional investors, which sufficiently explains the lack of support; but they are only gradually filtering through into the public consciousness. If the market can be held at or above its present level, the public may remain quiescent. The authorities, however, seem unlikely to intervene to give support except at moments when it appears that substantial effect can be exerted

incentive schemes, in spite of the leaders' opposition, is encouraging.

If any alternative incentives for increasing individual output could be suggested, the objections of the builders' leaders would carry more weight. As it is, there is no evidence to suggest that the granting of their claim for an increase in wages to 3s. an hour would, by itself, have any direct bearing on output. On the contrary, the increase of 6d. an hour granted in January, 1946, was not accompanied by any higher productivity, although a specific pledge to this effect was given in the agreement. It is perfectly true that the uneven flow of materials and components, and the bottlenecks in timber and cement, contribute to the general slowing-down of the tempo of production and the low morale of the operatives. But these factors by themselves are no argument against introducing a system of incentives for individual output.

The announcement on Wednesday, by the Parliamentary Secretary to the Ministry of Works, that a wartime regulation, prohibiting the payment of incentives to building operatives, is to be revised, should open the way to a serious attempt to tackle the problem. It is to be hoped that the industry will seize this opportunity by acknowledging the need for incentive schemes to raise output per head.

The railway operatives and the builders have been able to consolidate their wartime gains. They are now in a strong bargaining position to press for shorter hours. It would be inimical to the prospects for industrial recovery this summer if these reductions were gained without improved output per head. There have been signs recently that the pressures of inflation are relaxing: but they would certainly acquire a new and dangerous vigour if there were to be a new round of wage increases.

for relatively small outlay. If Mr Dalton's recent emphasis upon the need for reducing the floating debt can be taken at its logical valuation—in other words, if he desires real and not merely nominal reduction achieved by the mere cancellation of internal credits—it can only mean that the departments hope to lighten

their load of irredeemable and longer-dated stocks before the rail "take-over" operation confronts them. If that is so, the talk of "advancing to further objectives later" can be no more than pious hope.

The accompanying table, which puts the recent trend in perspective, brings out two rather striking facts. The first is the ominous weakness of the undated stocks. The "Dalton" 2½ per cent stock is now fully six points below the price at which it was offered little more than six months ago, and the yield on 2½ per cent Consols is actually higher than it was at this time last year. Secondly, though the medium dated stocks have naturally fared better, the reduction in the yield basis over the year is rarely more than one-eighth per cent—and that in a period in which bank deposits have been expanded by substantially more than £600 million. Indeed, the market as a whole is now actually below the level at which it stood before the crack opened up in

May, 1946, by the ill-judged terms of the tap issue of 2½ per cent Savings Bonds. While the indirect rail route into gilt-edged remains open, there is little hope that that elusive and often misunderstood factor, the weight of money, will have the importance which the market normally attaches to it. Many potential buyers of gilt-edged are still buying rail stocks at a discount instead. On a rather longer view, however, it remains true that institutional investors are hard put to it to find alternative investments.

Coal Priority for Steel

The shortage of steel has now reached an acute stage, surpassed only by that of coal. It is retarding shipbuilding activity, hampering the motor trade, holding up the coal-to-oil conversion programme and, in general, delaying the expansion of capacity in capital goods industries. The urgent need for more steel has now been recognised by the Government in giving the industry priority treatment in coal deliveries.

In his fortnightly press conference on Friday, Mr Morrison announced that the steel industry will receive sufficient fuel this summer to meet all its requirements. This should mean a rate of production of about 12.7 million tons a year during the summer months, rising, according to Mr Morrison, to a rate of over 13 million tons in the last quarter of the year if fuel supplies are adequate by then.

Mr Morrison admitted that the decision involves taking a chance. The risk is, in fact, greater than he seemed to infer. For, though coal stocks have increased from below 6 million tons on May 1st to 8.4 million tons by June 7th (compared with the target of 15 million tons by end-October), it is not possible to say from the global figure how far this represents progress in stock-building by industry as distinct from the public utilities. But the gamble has to be made. Steel supplies are vital. Even after this revision of the coal allocation, industry will not secure increased steel supplies much before the end of the summer. The main immediate contribution will be to sustain production of pig-iron and semi-processed steel, stocks of which have been dangerously depleted by the effort to keep up finished steel production.

Unfortunately, better steel supplies cannot make an effective increased contribution to the export trade in the crucial weeks which lie just ahead. Mr Morrison's disclosure of the May trade figures show just how serious the position is. While exports in May, at £89.7 million, almost regained the level at which they stood before the fuel crisis, they are only just equal to the 1938 volume indicator, and the gap between imports and exports and re-exports for the month was £56.4 million. Imports by value reached a new high level of £153.2 million, but represent only 75 per cent of the 1938 volume; the effect of the rise in prices in America is now becoming more clearly apparent.

Meanwhile, unemployment, between mid-April and mid-May dropped by 100,000 to 332,000—the lowest level for 18 months. That is encouraging, and the recent experience in the Development Areas is particularly so. The proportion of unemployed to the insured population for the whole country is now 2 per cent. In Scotland the proportion fell from 4½ per cent to 4 per cent, in the Northern Region from 5 per cent to 4 per cent, and in Wales from 7½ per cent to 6½ per cent. Yet the labour position generally is still far from satisfactory. Recruitment to the "undermanned" industries, apart from coal and clothing, has been slow, and during the first four months of the year the rate of increase was under 2 per cent compared with over 3½ per cent in the coal industry. This emphasises the need, indicated in an article on page 992, for providing incentives for recruitment to these industries.

Sterling Talks Progress

The latest news from the sterling debts front is of satisfactory progress in the negotiations almost all along the line, but no final objectives have yet been reached or, if so, the fact has not been announced. The signature and publication of an agreement with Norway, which was always known to be a comparatively easy one to negotiate, are said to be imminent. Another imminent agreement is that with the Czechs. Its terms have already been initialled. The discussions with Brazil have ended, and Mr Machado has returned to his country, but it is unlikely that any statement about the terms on which accumulated balances will be funded and released will be made until negotia-

tions with the more important sterling area countries have been safely completed. The discussions with Uruguay are proceeding satisfactorily. There have been more meetings with the Egyptians, and all that can be said about them is that at the rate at which progress is being made, it seems that at least another fortnight may have to elapse before any final conclusions are reached. The Finns are about to begin their discussions. Payments with that country are at present governed by the agreement of August, 1945, by which 12½ per cent of Finland's sterling earnings was earmarked to pay off earlier inter-governmental obligations. The intention is to negotiate a normal payments agreement with Finland and to deal, among other matters, with the question of availability of current sterling. The Danes will be coming over soon, primarily to discuss the question of prices of their agricultural exports to this country, and it is expected that this opportunity will be taken to complete a financial agreement with them. The talks with Sweden and Switzerland have been interrupted for the time being, and the arrangements with them will probably be the last to be concluded with non-sterling area countries.

The position of the Indian sterling debt remains highly intriguing. As a result of the partition issue, in the discussion of which the Finance Minister is taking a prominent part, it now seems unlikely that an Indian delegation will be able to reach this country before August. In consequence, the problem of the July 15th situation will almost certainly have to be resolved by an *ad hoc* and perhaps unilateral decision. Something will have to be done on the British side to circumscribe the freedom with which India will from then onwards be able to draw on accumulated sterling balances. It would be both unreasonable and damaging to block these balances, especially as India is now a net spender of sterling, and would, therefore, have no resources with which to finance her expenditure outside the sterling area, and, furthermore, would have to restrict purchases within that area to the amount of her current income. The position will probably be met by allotting India a ration of freely available sterling out of her accumulated balances, the figure to be fixed without prejudice to subsequently negotiated arrangements.

More Transport Amendments

The Lords this week have made further inroads into the Transport Bill, but even so, the progress of the Bill through the Committee has been rather more rapid than in the first two days' proceedings discussed in these columns last week. Opposition, however, has never really reached the grand scale. One gets the impression that, on the really critical matters, amendments were moved with the intention simply of registering a protest rather than of pressing the issue firmly to a conclusion. On Clause 16, the crucial compensation Clause, an attempt was made, rather ineffectively, to point a contrast with the Argentine rail deal—a stratagem which did, however, trap Lord Nathan into a defence of Stock Exchange valuation of the British railways as "fair" while declaring that the similar valuation of the Argentine rails was no more than a Stock Exchange "guess." Lord Beveridge's valiant attempt to compel the Chancellor to buy back rail compensation stock at par or any time during the first decade of life was of course predestined to failure, and Lord Swinton equally failed to draw the Government in the matter of the redemption date for the stock. These points the Government dismissed with the airy assurance that the matter might "safely be left to the Chancellor . . . to have a sense of propriety and justice in carrying out the provisions set out."

Some notable amendments on matters of principle were, however, carried against the Government. On Clause 39, an amendment to permit A and B licence-holders to operate within a distance of 80 instead of 40 miles, and within 50 instead of 25 miles from their operating centres, was carried. There is certainly a strong case for allowing A and B licence-holders to compete with the Commission's transport outside the 25-mile radius. Indeed, the Government admits that the figures of 25 and 40 are arbitrary. But the idea of competition for the "medium" distance traffic is so contrary to the philosophy which underlies the Bill that these amendments will scarcely survive on the return to the Commons. Once the principle of monopoly has been accepted for long distance traffic, it is naturally impossible to avoid an invidious and arbitrary definition of the distinction between short and long hauls.

An amendment, less vital to the structure of the Bill, was carried against the Government exempting a vehicle, already granted an A licence for carrying certain goods exclusively under

Co-operation in developing AUSTRALIAN TRADE

This Bank is equipped to provide essential information to business houses planning to enter the Australian markets or develop existing connections. Over 400 branches and agencies at leading trade centres furnish regular advices of current business trends, which data is promptly available to British Exporters and Importers.

TRADE WITH THE EAST

THE CHARTERED BANK OF INDIA, AUSTRALIA AND CHINA provides a complete banking service, backed by nearly a century's first-hand experience of Asiatic economic conditions, for every financial operation connected with TRADE, INVESTMENT AND TRAVEL IN THE EAST. The Bank's branch system, under British management directed from London, serves

INDIA · CEYLON · BURMA · SINGAPORE
MALAYAN UNION · BRITISH NORTH BORNEO
SARAWAK · CHINA · HONG KONG
THE PHILIPPINE REPUBLIC
FRENCH INDO-CHINA · SIAM · INDONESIA

Merchants and Manufacturers planning to establish, renew or extend business relations with the East are invited to consult the Managers in London or Manchester.

contract, from treatment as a long-distance haulier. A second amendment included milk among the various classifications of exempt goods. A further Government defeat on Tuesday concerned a point of greater substance than might at first appear. Its effect, in cases in dispute, is to shift to the Commission the onus of proving before the arbitration tribunal that a road haulier's undertaking is of such a character that it falls to be acquired (under the terms of Clause 39). This seems to be a matter of common justice, but, in an industry where the records and accounts of firms vary considerably both in their completeness and the back periods for which they are kept, it may put upon the Commission a difficult—and, in some cases, even an impossible—task. That presumably explains why the Government was uncompromising on the matter; if the amendment survives, it might limit significantly, and will certainly obstruct, the effective power of the Commission to take over the smallest undertakings.

In their first four days' sittings, the Lords have dealt with 54 clauses of the Bill. Important modifications, many of them undoubted improvements, have been made on issues of principle. Some of these will obviously prove unacceptable when the Bill returns to the Commons but the Government still has a chance to think again on issues which, though of real moment, are evidently separable from the basic principles to which it is now almost bound to adhere.

Concessions for Consumers

Mr Dalton has had second thoughts—or rather, third thoughts—on the imposition of purchase tax on domestic cooking and heating appliances. In his first budget, he relieved these articles of purchase tax, but last April he decided to restore the tax at a rate of 66½ per cent. "In present circumstances," said the Chancellor then, "the exemptions can no longer be justified." This was an allusion to the need to limit electricity consumption during and after the fuel crisis. Now he is persuaded that these exemptions can be justified after all. The tax on these items is to be lifted once more, with effect from April 16th. These withdrawals will cost the revenue about £8,000,000 this year and about £12 million in a full year.

This concession to the consumer is, in fact, much more important from a revenue than from a fuel point of view. Electrical appliances for the home market are produced on a quota basis, and a reduction in price which may stimulate demand will not lead to an increase in supplies for home consumption. The concession simply means that those who are able to obtain electrical appliances will have to pay less for them. Production of the electrical gadgets which are large users of electricity, such as electric fires, is already discouraged by a fairly recent reduction in their quota. Other articles, such as cookers, are still largely reserved for priority consumers, and quotas for home production are related to the housing programme rather than to the seven or eight years backlog of consumer demand.

Nevertheless, the public will be able to draw a little comfort from a fall in the price of electrical appliances in a week which has seen the announcement of increased retail margins with consequent increases in clothing prices. And the decision to make the tax concession retroactive is an impressive gesture—which will cost the retailers more in effort than the Chancellor in hard cash.

Taxing in the Dark

Scrutiny of the official report of the debate on the anomalous Bonus Issues Tax in the early hours of June 11th—*Hansard* was not available when last week's issue of *The Economist* went to press—unfortunately confirms that the Government's proposals have survived both the Opposition's attack and the unanimous condemnation by impartial experts outside the House. Mr Dalton may be thankful that the timing of the discussion saved him from the usual publicity, for this night's work has not enhanced his reputation for fiscal justice or honest argument. The tax is, indeed, among the most extraordinary ever propounded by a British Chancellor. It can fairly be argued, as the Opposition did argue, that the "bonus" which the Chancellor pursues is in principle a thing without substance, a will-o'-the-wisp, a mere figment of book-keeping. Alternatively, if in some cases the figment in practice unnaturally acquires some substance, the tax will be levied not upon that substance but upon a larger quantity which bears no necessary relationship to it. Finally, the tax falls upon the wrong person—not the shareholder who alone could

derive any advantage from the bonus, but upon the company whose operations give rise to it. Mr Dalton's only reply to the last charge—of taxing the wrong person—is that administrative convenience so requires. To the second charge—of taxing the wrong element—he says he must get a "reasonable" revenue. And to the primary charge, that the whole plan is economically and financially indefensible, he really makes no reply at all.

It should in fairness be observed that even the best of the Opposition speakers, lucid and forceful though they were generally, were not wholly free from the taint of muddle-headedness which encrusted the arguments in support of the plan. But it was Mr Dalton himself who perpetrated the worst *gaffe* of this extraordinary session. "Surely," he asked,

it would be much better to have a firm in the cotton industry that had spent money on getting good, up-to-date plant, rather than putting a lot of money into reserve and distributing bonuses to shareholders?

The implication here is such stark nonsense that it must be presumed that the Chancellor (at 3.30 a.m.) had a momentary aberration; though when challenged he virtually repeated the false antithesis.

The truth is, of course, as the Opposition repeatedly emphasised, that the capitalisation of reserves by bonus issues is the one sure way of ensuring that they are not distributed to shareholders, and the ability of a company to make such issues therefore tends to promote a genuine ploughing-back of profits into the business. But the converse argument, that inability to make bonus issues will necessarily encourage larger cash distributions (though it may have some validity in practice) is not really consistent with the Opposition's basic case, that a "pure" bonus has no inherent worth. This argument implies that scrip and cash payments are alternative methods of distributing profits to shareholders. But in fact, unless there is a cash distribution, the shareholder can "cash in" on his accumulating interest in the equity only by selling part of that interest, and he can sell part of his holding whether or not he receives a bonus share. The only difference—and it is here that the theoretical will-o'-the-wisp may acquire a little substance—is that the virtual share-splitting which the bonus issue involves may make the shares more marketable and so facilitate the act of parting with capital; equally, the receipt of the scrip may put ideas into shareholders' heads.

Politics versus Finance

Some of Mr Dalton's more enthusiastic supporters tried to prove the "reality" of bonuses by showing that, in particular cases, a company's total equity capital, after deducting the new cash subscribed, was worth more on the market some time after an issue on bonus terms than it was before. But this does not prove anything. If, on a free bonus issue (to take that case because it is the most readily intelligible), the market value of the existing shares does not fall by an amount precisely corresponding to the market value of the new shares, the difference ought to reflect two ingredients only: First, the factor of improved marketability, which is irrelevant in this context because it could equally be achieved by a straight share-splitting, which Mr Dalton has not yet attempted to tax; secondly, the fact that the making of the bonus draws attention to, but does not itself constitute, the improved prospects or expansion of the business. The expansion of the equity is not necessarily reflected smoothly in the market worth of the business as the progress proceeds; it may, and often does, occur in jerks which, if not stimulated by a bonus announcement, will be provoked in other ways; in neither case is the appreciation a proper subject for taxation. Finally, if in practice and in the short run there is any third ingredient in the capital "profit," it can derive only from the ignorance of the investing public—from the still quite widespread belief that a share bonus really is "something for nothing."

If there really is any proper subject for this odd impost, it would fall only upon that hypothetical third ingredient: there would then be a muddle-headed tax on public muddle-headedness—which would be poetic if not fiscal justice. Failing that, it ought at least to be related to the net appreciation of the equity as a whole (after deducting the new money). Instead, it pursues the least defensible objective of all, and falls upon the net worth of the new shares alone, entirely ignoring the consequential and more or less corresponding depreciation which the beneficiaries suffer upon their original holdings. To Mr Dalton this may make political sense, as a means of propitiating ill-informed rank-and-file supporters. But it is fiscal nonsense.

Cable and Wireless Valuation

In the months which have elapsed since stockholders in Cable and Wireless (Holding) first knew that their property was to be taken over they have had no intimation of what the final value of their holdings might be. The annual report for 1946 now holds out some hope that the valuation of their interest in the operating company may be known some time in October. They are also presented with a consolidated balance sheet in a new form which enables them to frame a reasonable approximation of the value of the remaining assets. The account is compiled on the basis that all transferred communications assets have passed to the Government, leaving only investments, liquid assets and the equivalent of the operating company's shares. If these shares are assumed to be valued at par and all claims against the company, including those of outside shareholders, are deducted from gross assets, there are total net assets of £37,609,000—or £38,909,000 odd if quoted investments are taken in at market values at the end of last year. On this higher figure, after deducting the £16,766,591 of 5½ per cent cumulative preference capital, there would be a break-up value of some 320 per cent for the £6,883,103 of ordinary stock.

It would be rash to attempt a forecast of the valuation of the stock of the operating company, but there seem good grounds for supposing that it will be fixed at something over par. If, therefore, there were to be a straightforward liquidation of the Holding company, the preference stockholders would receive par and the ordinary, possibly, something of the order of 350 per cent. If the consent of both classes has to be obtained to a scheme for distributing assets, it is quite certain that the preference holders will demand a very substantial premium before they abandon the right to a moderately well-secured 5½ per cent. Between this position on break-up value and that which would obtain if the company continues in operation as an investment trust, there is a striking contrast. On the suppositions that the operating company stock is valued at 110, that the security allotted in exchange is sold at the notional price of issue, and that the earnings on the whole assets—thus raised to over £40,500,000—are 3 per cent, the return on the ordinary shares would be under 4½ per cent. If a return of 4 per cent could be achieved, the amount earned on the ordinary would still be only some 10 per cent on the nominal value, or less than 3 per cent on the assumed break-up valuation.

On the publication of the figures, the ordinary stock rose by one-ninth to 171, while the preference stand at about 122. Evidently, some compromise solution will have to be sought. The idea of a gigantic investment trust with £40 million of assets is not likely to appeal to either the Government or to other authorities. Probably some return of capital will be considered desirable. But that will not of itself solve the conflict of interest between the two classes of stockholder. It is perhaps worth carrying a step further the analysis of the background against which an agreed liquidation would be possible. On the basis of earning power of 3½ per cent, it would be necessary to give the preference stockholders a premium of some 57 per cent for them to maintain their income. To give this premium would mean reducing the assumed valuation of the Ordinary from 350 to about 212. On the same basis of earning power, the amount available for the ordinary capital, if the group continues to run, would be about 6½ per cent, giving a rate of earnings of only £3 16s. on the present price.

Japanese Cloth for Lancashire

The Cotton Board has announced that the first 30 million yards of Japanese grey cloth, out of a total 64 million yards to be imported into Lancashire for finishing and re-export, is expected to arrive before the end of this month. The original arrangements, so far as they were known, were discussed in *The Economist* of March 15th. It now appears that the cloth will be paid for in dollars. The price agreed upon is not known, but it is higher than the prescribed price paid for grey cloth manufactured in this country. In addition to the cloth from Japan, quantities of high quality grey cloth are coming from America on private account. After it has been finished, the cloth will be shipped to colonial markets, especially to West and East Africa. The short-term advantages of the scheme to this country are clear enough. At the cost of a draft on its dollar resources, this country obtains a quantity of semi-finished cloth sufficient to open out, at least temporarily, the bottle-neck in spinning and weaving in Lancashire. Its export to the colonies is intended to increase the incentive of producers there to increase their cultivation of essential fats and other commodities. These

commodities will help to feed the British consumer and will earn—or save—foreign exchange, including dollars. As a short-term scheme it has its merits, but the authorities' reluctance to publish the purchase price of the Japanese cloth—or even to draw attention to the fact that it is payable in dollars—suggests that this country has paid a large price for this temporary accommodation.

The fuel crisis in February, which brought a sudden severe fall in spinning output in Lancashire, obviously made the import scheme seem the more desirable. Since then there has been a notable recovery in production and, even more encouraging, an improvement in employment—including that of female spinners. Average weekly yarn production was 12.94 million lb. in April, a level exceeded only twice since the end of the war—in October and November, 1946. Women actually at work in the spinning mills in April numbered 74,200, compared with 71,700 in March, and with the previous post-war peak of 72,300 touched last November. It would be premature to put an unreservedly optimistic interpretation on these output and employment figures, for any further improvement obviously depends upon the regularity and size of coal deliveries during the summer months, and these, at best, are based on last summer's consumption levels. But it can be said that at least the industry has climbed out of the trough of enforced inactivity of February last, even if it has little opportunity of making up the arrears of production.

Borrowing Orders in Force

This week has brought into force the first group of orders made under the Borrowing (Control and Guarantees) Act which received the Royal Assent as long ago as last July. The details of the new orders were summarised in *The Economist* of May 31st. Interest now centres in their main effects and in the policy behind them. The broad effect of the new orders, and of such elements of Defence (Finance) Regulation 6 as are retained, is as follows. All placings are free of control by the Capital Issues Committee, since they are not offers to the public. They are, however, subject to the consent of the New Issues Committee of the Stock Exchange, which would be likely to reject an application for a placing if, *inter alia*, it appeared to exceed in total amount the size and type of operation properly dealt with by that means.

The alternative methods of issue to the public by offer for sale or by prospectus or by offer of rights to shareholders are quite differently treated. Under a placing, it is a matter of indifference to the Treasury whether there is any creation of new capital by the company whose shares are offered, but all other issues are subject to consent of the CIC if such creation is involved. If the operation is merely a re-sale of existing securities no permission need be sought unless, within the past two years, the company in question has availed itself of any of the exemptions from control which have been permitted. If, however, any new capital has been created—although properly created—under those exemptions, any offer for sale or issue by prospectus, apparently of that capital or of any other, must be submitted to the CIC.

There appear to be here three different elements of policy. There is first of all the carry-over from an earlier period of the official bias against any form of offer to the general investing public. The underlying fallacy therefore remains, since it is the total supplies of stock of a given character which determine the relative levels of prices of different classes of security. The method of issue is quite immaterial from the standpoint of competition with other avenues of investment. Secondly, there is presumably the over-riding desire to restrict the demands of industry to some notional total of new money conceived to be "available," and, within that total, to objects which are in accord with Government policy. Finally, there is the ban on offer of existing stock in those cases where the existing exemptions have been used. So far as it was possible to follow the Chancellor's remarks on this point, he appears to believe that there is a danger that his regulations for bonus issues may in some way be infringed if every step has not received Treasury sanction. Argument on the bonus question is clearly useless. It is probably true that the amount involved under this head is not likely to be large, but the total number of cases may be considerable, and the placing of this burden upon the CIC is likely to lead to still greater delays in granting permission for issues of substance and importance. It seems a giving complete freedom of issue for existing securities, since the only valid point of the three is the second, and that is of mainly theoretical significance. The only really effective way of limiting "investment," in the real sense, to available resources is by physical controls.

Courtaulds Expansion

Although the general shortages make it impossible for Courtaulds to reinvest the proceeds of the sale of the Viscose Corporation, there is some evidence in the preliminary figures for the latest accounting period of a considerable expansion in turnover and profits. Owing to the decision of the board to adopt the fiscal instead of the calendar year for the accounting period, the figures now presented cover 15 months to March 31st. Last year was a time of rapidly expanding rayon production, but some of Courtaulds works have suffered from the fuel crisis. For this reason, conversion of the figures for five quarters to an annual rate understates the improvement achieved. Making this comparison, the profit before depreciation and deferred repairs (for which provision was at an increased rate) was £5,905,601, or at a rate about 3½ per cent above that of 1945. Depreciation was very heavy, as it includes the special allowances on new plant permitted under the Finance Act, 1945, and the annual rate of profit before tax showed a fall from £3,243,691 to £2,983,089. Taxation, however, is much reduced, owing to the special depreciation already mentioned, to the cut in EPT and its disappearance after 1946—with of course the substitution of distributed profits tax—and to the fact that income tax has been computed on a twelve months' basis in relation to the fiscal year ending April next. The net result of these adjustments is that the actual profit is more than doubled at £2,083,830, compared with £1,007,086, while the yearly rate is increased by some 65 per cent.

Out of this increased amount the directors are making a total distribution of 9½ per cent, equivalent to a yearly rate of 7.6 per cent compared with 7.5 per cent in each of the six calendar years, 1940-45. After meeting the preference dividend and adding £347,440 to contingency reserve, the earnings on the ordinary capital amount to 11.1 per cent, equal to a yearly rate of 8.9 per cent compared with 6.3 per cent for 1945, when there was an over-distribution, and with an average of 7.8 per cent for the period 1940-45. In addition to the re-expansion of old factories and its growing interest in Nylon Spinners, the company is erecting at least three new factories in the development areas and extending some existing works. The rayon industry is at present less subject to labour shortages than the older textile trades, but it is hampered both by some lack of materials and by the slowness of construction and plant deliveries. At the current price of 52s. the shares yield less than 3 per cent, a clear indication of the potentialities of expansion which the company's very large cash reserves promise once shortages can be overcome.

* * *

Rumanian Oil—Soviet Strategy

News from Bucharest plainly reveals the further development of Soviet oil strategy in Rumania, the early course of which was traced in some detail in *The Economist* on December 28th last. Having first secured for a period of six (later extended to eight) years all the oil that could be brought within the scope of reparations, the Soviet authorities proceeded, under the trade pact of 1945, to form, on the pattern applied to other key industries, a "joint" Russo-Rumanian oil company, Sovrompetrol. They contributed to this venture the German assets claimed under the Potsdam agreement, while the Rumanians brought in the only two major oil companies predominantly owned by Rumanian capital (representing about 30 per cent of Rumania's production), in addition to oil royalties and valuable concession territories and rights, and also granted important privileges in respect of oil exploration, taxes, dues, etc., such as have never been enjoyed by the British and American concerns operating in Rumania.

Although this joint enterprise was nominally meant to be a fifty-fifty partnership, the Russians, in fact, not only hold all the key posts in it, but have, it is understood, so framed the valuation of the respective contributions to date that they claim a 70 per cent interest. Earlier this year, during the trade talks in Moscow, the Russians raised new demands. As a result, the Rumanians have granted further oil concessions and exploration rights and an exclusive claim to the royalty crude oil due to the State. In addition, the Rumanian Government has promised—(1) To pay Sovrompetrol \$4 million, over one-half in free foreign currency, as compensation for loss of profits and inadequate depreciation resulting in 1945 and 1946 from the low prices fixed by the Government; (2) that Russia's 70 per cent share in the company's profits may be remitted to the Soviet Union in dollars; (3) that the company may this year export 70,000 tons of petroleum products against payment in free exchange; and (4) that it may use the

entire proceeds of a large proportion of its products to buy oil-field materials and equipment abroad.

None of these rights and privileges is enjoyed by the British and American companies. Not only have they been paid miserable prices for their products in lei, but their shareholders have received no return on their investments since 1940. Although critically short of materials required to stem the decline in their production, the companies have no prospect of importing them because they are not allowed to export any oil and therefore cannot obtain the foreign currency to pay for imported supplies. Hitherto, the Russians themselves have been subjected to these disabilities—as a natural consequence of their prevention of any worthwhile oil exports. Now, Sovrompetrol, by selling oil abroad and thus obtaining foreign currency, will be able to purchase the much-needed materials and supplies, and thereby to check and even reverse the decline in its own production, while production of the foreign companies is bound to fall further.

Higher Sales of Household Goods

April is usually a month of brisk sales in the retail trade. This year there was a notable recovery in the turnover of household goods, but other categories in the Bank of England retail statistics published by the Board of Trade showed only minor changes on March. Sales were higher in all categories, however, than a year ago. The salient features in the statistics for April are shown in the table below, which compares April turnover per week with the corresponding period of 1946 and the best months of last year.

INDEX NUMBERS OF SALES PER WEEK
(Average for 1942=100)

	Apparel	Household Goods	Non-Food Merchandise	Food	Total
March 1946	110	165	124	120	121
April 1946	144	177	139	118	126
October 1946	157	213	159	126	140
Nov. 1946	157	225	174	128	146
March 1947	156	189	156	131	141
April 1947	157	225	158	130	141

INDEX NUMBERS OF STOCKS: END OF MONTH

	Women's Wear	Men's & Boys' Wear	Footwear
March 1946	87	67	67
April 1946	87	63	64
October 1946	89	66	67
November 1946	94	72	77
March 1947	98	73	86
April 1947	109	79	83

Sales increased less rapidly between March and April this year than they did in 1946, but this was due in part to the fact that the issue of clothing coupons occurred in March this year, but in April last year. This year, therefore, much of the buying pressure from the public had spent itself during March. The stock position remains fairly encouraging. As the table shows, stocks were up on the month in women's, men's and boys' wear, but declined slightly in footwear.

It is still too early in the current retail trade year to draw definite conclusions about the earnings' prospects of the larger shops by comparison with 1946. Turnover and stocks are at encouraging levels considering the effects of the fuel crisis—upon textile output in particular. But optimism should be tempered with the caution that the effects of the crisis have yet to work themselves out fully upon supplies of consumer goods. It is also noteworthy that April's comparatively good results were not well spread: they were mainly due to higher sales of apparel in Central London and of household goods in other districts. The problem of high retailers' costs and uncertain turnover later this year was underlined in Parliament last week when Sir Stafford Cripps announced that retail margins on cloth and clothing would be adjusted (that is, upwards) from a date to be announced some time this week. Reduced turnover, lower margins and rising costs in the earlier months of this year will, in combination, offer a sharp threat to company earnings for 1947.

Tea Ration Assured?

The response of the Indian tea-growers to the Ministry of Food's contract offer, would certainly have caused a stir in Mincing Lane, if that market were in full operation. Some 309 million lb., it is understood, has been offered, although the Indian Government had given permission for an export of only 200 million lb. Negotiations are now proceeding for the export of the total quantity tendered. The contrast with the Ceylon response is striking, although the price offered to both producing areas was similar. The recent slump on the Colombo market may well have affected the decision of the Indian growers, who are, after all, the largest producers, whilst the United Kingdom is the largest consumer. In any case, political considerations may also have played a part. The creation of Pakistan is bringing with it a number of unknowns, and it seems that the Indian tea area will fall largely into the eastern province. It is therefore in the growers' interest to have at least one certainty—that their crop is purchased at a fixed price.

From the United Kingdom's point of view, the news is encouraging. Assuming that the total amount offered is, in fact, shipped, Britain will have secured 404 million lb. from Indian and Ceylon. In 1946 some 21 million lb. was obtained from other sources, mainly Africa. This will give an annual supply of a little under 190,000 tons compared with an annual consumption, on the present ration basis, of 200,000 tons. The present stock position could possibly only just permit an off-take of 10,000 tons, so that, unless additional supplies are forthcoming from the Netherlands East Indies or other sources, the maintenance of the ration appears to be somewhat in doubt. Were the Indian Government to permit the Ministry of Food to export only the 200 million lb., a cut in the tea ration would seem, from current data, inevitable.

* * *

BIS and IBRD Co-operation

The seventeenth annual report of the Bank for International Settlements deals frankly with a matter which for some time past has been a subject of uncertainty and even embarrassment: the relationship between this institution, the first experiment in creating a central bank for central banks, and the new international institutions in Washington. Among some of those who sponsored the Bretton Woods institutions, there seems to have been a deep and apparently irrational prejudice against the BIS. The strength of that prejudice appears to have been waning recently, for this latest report of the BIS announces that the chairman of that institution has had conversations in Washington with the President of the International Bank on the question of co-operation between the two. A memorandum on the practical possibilities of co-operation in research and exchange of information has been worked out and approved. The BIS has also declared itself ready to facilitate, by all possible means, the task of the International Bank in Europe. The fact that the BIS has a good deal

to contribute in this sphere to the newer international organisation has emerged year by year from the quality of its reports. The report for the year to March 31, 1947, affords the usual panoramic survey of world economic affairs. From the wealth of material presented only a few points can be selected here. After an analysis of changes in gold reserves, the BIS shows that, for the world as a whole, the published reserves were no greater at the end of 1946 than at the beginning; even when account is taken of unpublished reserves, the net change over the year was apparently an increase of no more than \$200 million, compared with a production of new gold amounting to about \$960 million. "Only one conclusion can be drawn from these facts: the newly produced gold has 'disappeared,' some of it being accounted for by an increase in the industrial use of gold, but the largest part having found its way into private hoards in Europe and Asia." The passages in the report dealing with domestic credit conditions stress the welcome anti-inflationary pull which has been exerted in some countries by the surplus of imports achieved by drawing on foreign credits or by supplies brought in through Unrra and other aid. The report in its concluding sections makes a plea against the tendency to treat such problems as the budget situation, the balance of payments, prices, wages, etc., as separate questions:—

"It would, for example, be too limited and too superficial an approach to try and deal with the problems of the balance of payments simply by cutting down imports and artificially stimulating exports, without attending to the volume of monetary purchasing power in the domestic economy. For experience shows that an inflationary expansion of purchasing power at home acts as an attraction for imports and a brake on exports, thus aggravating the disequilibrium in the balance of payments. Only too often is this connection between the methods of internal financing and the outcome of the balance of payments overlooked."

In its comments on the dollar problem the BIS report is extraordinarily up to date:—

"Foreign loans and other assistance may still afford relief by providing badly needed commodities; but little lasting good will have been done if the borrowers fail to take advantage of the foreign resources as providing a breathing-space in which a coherent series of domestic measures can be taken; in other words the loan should be considered and employed as part of a comprehensive plan for financial and monetary rehabilitation. . . . What is needed, then, is a co-ordinated programme into which international investment can be fitted as one of the measures essential in itself but fully efficacious only if supplemented by domestic action."

That might have been penned after the formulation of the Marshall plan.

* * *

Nationalisation of Netherlands Bank

The text of the Bill that will nationalise the Netherlands Bank was published this week. The Bank is to remain a limited liability company but all its shares will be held by the Netherlands Government. The present shareholders will receive as com-

pensation registered Government stock amounting to twice the nominal value of their shares. As interest on this stock is 2½ per cent, the holdings will be taken over on a 5 per cent basis. Since the annual dividends for the years 1944 to 1946 were 5½, 5 and 3½ per cent respectively, the compensation terms cannot, from the angle of income, be deemed harsh. On the basis of capital values they are reasonable, since the market value of the shares has recently stood slightly above par, while a 5 per cent Dutch Government bond would stand at a considerable premium. The bill states that the object of the nationalisation of the central bank is to regulate monetary policy for the benefit of the country. One of the few changes that will be brought into operation when the bill becomes law will be the nomination of directors, which will be brought solely within the competence of the Government. The Finance Minister will also have power to issue directions to the managing director of the Bank, though only after consulting the advisory council.

The nationalisation of the Netherlands Bank is a measure of the change that has occurred in the political atmosphere of Europe over the past decade. Ten years ago such a proposal would have been received with angry consternation by a large section of the solid Dutch burghers. Today the bill does not merely fail to arouse any opposition; it is almost universally accepted as an inevitable development. That this should be so, not only in Holland but over Western Europe as a whole, must in large part be attributed to the power of example and in particular to the nationalisation of the Bank of England. This is in truth a case of "when the old lady turns we all turn."

* * *

Argentine Accounts

A Bank of England notice issued to banks and bankers announces that Argentina has been brought into line with the other countries which have "transferable sterling" arrangements. When Argentina was included in the countries with which such arrangements were concluded, certain restrictions were placed on the freedom with which it could deal with items of a capital nature, such as moneys arising from the redemption of bonds and legacies. These funds continued to be blocked when they accrued to Argentine accounts. In addition, residents in Argentina who had Argentine sterling area accounts and "old" sterling accounts were able to transfer only limited amounts of this sterling for their maintenance. These restrictions are now cancelled, and in all respects Argentine accounts will rank with the sterling accounts of other countries whose holdings of current sterling are now "transferable." The change involves the disappearance of Argentine sterling area accounts and also of "old" sterling accounts. In future these will be described as "Argentine accounts" and will be available for payments in the sterling area and also for transfer to Argentine transferable accounts. They will thus become fully convertible.

* * *

Scrap and the Metal Position

The importance of scrap metal has increased as the supplies of virgin metal have become shorter. The contribution that it is now making to British metal manufactures is indeed significant. According to Mr Wilmot, the Minister of Supply, in an address to the National Association of Non-ferrous Scrap Metal Merchants, if it had not been for the scrap put into circulation

in the United Kingdom, allocations of lead to British consumers would have been little more than half their present level. Because scrap metal is vital to the British economy nowadays, exports are permitted only in exceptional circumstances and then on condition that the copper or lead content is returned.

During the past few months the Government has been shipping unwrought copper, brass ingots and brass scrap to the United States and Canada for refining. The metallic copper content is to be returned to this country. Mr Wilmot said that this will enable the Ministry of Supply to put "something like 140,000 tons of electrolytic copper into consumption at a time when virgin metal is at or near the top of the market." This quantity represents about 43 per cent of the United Kingdom's copper requirements for 1946, and it will certainly help to relieve the copper position. But, unless appreciable quantities arrive within the next six months—some have already been received—the arrangement will not be so opportune as the Minister has suggested. Although world copper output was retarded in 1946 by labour disputes and other difficulties which, it is said, "deprived the world of something like 400,000 tons of new copper," current reports suggest that production is again increasing.

Aluminium scrap recovered at Government Depots from crashed aircraft has made a notable contribution to the pre-fabricated housing programme and has also played an important part in the production of rain-water goods and windows. On the whole, the disposal of the large quantities of scrap made available at the end of the war has been carried out in an orderly manner. But it seems strange that while the need for scrap and salvage is so great, the collection of small amounts of lead—the metal in shortest supply—constitutes an offence under the Prevention of Crimes Act of 1875. According to this Act, it is an offence to offer for sale parcels of lead of less than one hundredweight. Although it might be patriotic to sell the Minister of Supply a length of gas-pipe, it would be illegal to do so.

* * *

Shorter Notes

After *The Economist* went to press last week a statement was issued by the Ministry of Fuel and Power to the effect that arrangements are being made to import an additional one million tons of oil for coal-to-oil conversion schemes. This additional tonnage, however, will not be available until the third quarter of 1948.

* * *

A levy on the imports of raw silk, for the purpose of financing research at the Shirley Institute and the Silk Design Centre, has been approved by the Board of Trade in conjunction with the Joint Industrial Council for the Silk Industry and the Silk and Rayon Users' Association. The levy will amount to 4d. a lb. on imports of raw silk, thrown silk, spun silk and silk noil yarns, with ½d. a lb. on waste silk and noils. It will be payable on the sale of the material by the importer to the processor in this country.

* * *

In the chart which appeared on page 856 of *The Economist* of May 31st, the 2 per cent of dried egg supplies attributed to New Zealand should have referred to Australia, and the 6 per cent attributed to Australia should have referred to Argentina.

SECURITY PRICES AND YIELDS
A fuller list containing 370 securities appears weekly in the *Records and Statistics Supplement*. Notes on the following company reports also appear in the Supplement: Associated Newspapers; Marks and Spencer; Bleachers' Association; Harland and Wolff.

J. LYONS AND COMPANY, LIMITED

SATISFACTORY RESULTS

MR HARRY SALMON'S REVIEW

The fifty-third ordinary general meeting of this company was held, on the 16th instant, at the Trocadero Restaurant, Piccadilly Circus, London, W., Mr Harry Salmon, M.P., one of the managing directors, presiding.

The following is an extract from Harry Salmon's statement:—

We feel you will agree that the year's result is satisfactory, and that the Accounts show that, despite all the difficulties of the past decade, we have been able to maintain the sound structure of the business.

The balance from trading account is £985,425 which shows an increase of some £15,000 over last year. This figure is arrived at after providing for contingencies, and making allocations to those reserves which will provide something towards the cost of replacing plant and equipment and of restoring our premises to the first class condition in which they used to be maintained—a formidable task which will require large sums of money and take a long time to accomplish.

We propose to pay the same rate of final dividend as last year; this, with the interim dividends paid in December, and the dividends on preference stocks for the year, absorbs a total of £908,012. The balance brought in from the previous year was £551,461, but we do not think we need any longer retain so large an undistributed balance in the profit and loss account. We have, therefore, transferred the sum of £500,000 to the reserve which, as shown in the balance sheet, now stands at £2,500,000. Including the £77,413 undistributed from the year's trading balance, the amount now carried forward to the next account is £128,874.

PAST YEAR'S DIFFICULTIES

It is not easy, in 1947, to comment upon the company's affairs, without repeating much of what I said last year. All the difficulties, or almost all of them, which we had to face in the previous year were present again, while some were even more acute, due largely, of course, to the continued world shortage of commodities. The fuel crisis in February, naturally, affected our business; some sections were for a time closed down completely, though others, dealing with essential products, were able to resume production after short periods of closure. It has been acknowledged by the Minister of Food that 1946, of which 9 months fell within the company's year dealt with in these accounts, was a far more difficult year than he anticipated. Our experience fully endorses that; indeed, we can say that in hardly any of the commodities with which we deal, nor in the materials which we require in our production or distribution, has there been any alleviation of the stringency we have experienced for so long. There is, unfortunately, even now little prospect of relief.

In the meantime, the prices of many commodities have risen, and so have costs and charges of almost every kind. Unfortunately, an increase in production, which would help to offset the higher costs, is not possible. The result has been, therefore, an increase in the prices we have to charge; for increased costs must eventually fall upon the consumer. We cannot view that process with equanimity, for it leads to further increases in costs, which only still higher prices can meet—another step in the process of inflation.

NATIONALISATION AND DISTRIBUTION

The nationalisation of inland transport, which will shortly be carried out by the Government, must have some effect upon our distribution system, where complete freedom to choose the most expeditious and

efficient means of transport for our goods has, in the past, been of great advantage to the public and importance to us. While the Bill gives the trader the right to choose between such facilities as may be provided, it does not prevent differentiation in charges, nor does it retain any element of competition between the various forms of transport. Fortunately, the proposal, originally embodied in the Bill, to control the operation of traders' own vehicles has been dropped, so that we shall retain the right to carry our own goods to any destination, which will do something to minimise the adverse effect.

I am glad to be able to say that, we again received the loyal co-operation from our employees to which we have always been accustomed. That co-operation is shown at its best in times of special stress, such as the period of exceptionally bad weather and the fuel crisis. In those periods, our employees, working in conditions of the utmost difficulty, kept our services going, with a determination and goodwill which deserves the highest praise.

Our present tasks are as arduous as any we have ever faced in the past, and they call for the highest degree of effort and vigilance, but I want you to know that we accept the challenge they offer to further effort. We are confident that we can maintain our pre-eminence in our particular sphere, and, when the opportunity comes, make further progress.

In addition the Chairman made the following statement:—

In commercial, industrial and political circles today, widely differing views are being expressed on how the solution of the country's present problems is to be found. Some think it will be found in the elimination of the profit motive. Opposed to them, are those who, like us, are convinced that freedom from unnecessary controls, and the encouragement of private enterprise will bring forth the extra effort and the extra production which everyone agrees the country needs.

OVER-ELABORATION OF CONTROLS

Undoubtedly, more coal and power must be produced, and there must be more work by everybody; above all, industry wants some encouragement and scope for initiative. We realise that the state of the country's affairs calls for some measure of central planning and control. But we agree with those who think that the planning should attempt to lay down merely the broad pattern, with government decisions on general lines only, the details and execution of the plans being left to industry and commerce. The present controls are over-elaborated; they put too great a burden upon industry, and, therefore, upon the community; and they absorb an excessive share of the restricted manpower. Those who administer businesses have to devote far too much of their time and energy to digesting the many regulations (which are full of pitfalls), issuing instructions for their observance and ensuring that they are observed. Then, at a time when the full energy of every employee, in a business like ours, should be used in the task of feeding the public, large numbers are occupied in feeding the insatiable appetite of our legislators for completed forms. Our hope that this diversion of manpower would progressively diminish has not been realised.

We are convinced that, if more freedom were to be given to the enterprise, initiative and experience, both of management and workers, which built up our great industries and commercial enterprises, those who possess these qualities will be found equipped and eager to use them for the benefit of the community.

THE BRITISH SOUTH AFRICA COMPANY

THE RAILWAY SALE

The forty-ninth ordinary general meeting of the British South Africa Company was held in London on the 5th instant.

Sir Dougal O. Malcolm, K.C.M.G., the president, in the course of his speech, said: I think you will agree that it has been a very good year. Our total receipts at just under £1,000,000 exceed those of the previous year by very nearly £175,000. The profit of £453,000 exceeds the previous year's by nearly £80,000. We propose a dividend of 11½ per cent., less income tax, as against 10 per cent. in the previous year. I think you will agree that our position is a very strong one.

Our total investments in Rhodesian mining companies and other mining companies stand at a little under £4,000,000, and we have our important interest in the royalties which as owners of the mineral rights in Northern Rhodesia we receive on the output of the mining companies there. Our mineral revenue for the year was £410,000—more than £100,000 better than in the year before—but those figures reflect values upon which royalties were paid for the year ended September 30th, 1946, which for copper, lead and zinc averaged respectively about £61, £43 and £45 per ton, very different from the averages of about £77 for copper for the first six months, about £65 for lead and about £57 for zinc for the first three months of our current financial year, and still more from to-day's prices of over £120, over £90 and over £60 respectively.

A FAIR BARGAIN

With regard to the purchase as at March 31 last by the Government of Southern Rhodesia from Rhodesia Railways Trust of the whole share capital of Rhodesia Railways, Limited, for the sum of £3,150,000, I consider that it is a fair bargain, and that, like all fair bargains, it should enure to the benefit of both sides. I do not think that anyone can say that it is an extravagant price for the Southern Rhodesia Government to pay or, on the other hand, that it is materially less than fair to us, so I say that it is a fair bargain; and I can add that, the decision in favour of purchase by the Southern Rhodesia Government having been arrived at in the highest quarters, the negotiation about the price was conducted in the most friendly and agreeable spirit.

It never looked or felt like getting into a quarrel. Some sentimental regret may be felt at our parting with what, along with our mineral rights, has been one of the main instruments for the carrying out of our founder's policy for the incorporation of Rhodesia in the British Empire, for the effective occupation of the country, and for bringing it to its present stage of civilisation and development, but change is the law of life.

THE OUTLOOK

Do not think that we are approaching the twilight of the Charter. Far from it; our company never yet offered fairer prospects. The Rhodesia Railways Trust, in which we hold so vastly preponderant a share, will continue on its course as an ordinary trust and investment company, substituting others for what has hitherto been its main investment. The British South Africa Company itself can apply its abundant resources to other productive enterprise, particularly, of course, in those regions, whether of Rhodesia or of the Union of South Africa, which owe so much to the life-work of Cecil Rhodes.

The report was adopted.

B. LAPORTE, LIMITED

MR L. P. O'BRIEN'S REVIEW

The fortieth ordinary general meeting of B. Laporte, Limited, was held, on the 18th instant, at Luton. Mr L. P. O'Brien (chairman and managing director) presided.

The following is an extract from his statement circulated with the report and accounts for the year ended March 31, 1947:—

Twelve months ago I drew attention to increasing costs, and said that we should try to offset them by improved efficiencies and use higher selling prices as little as possible. In regard to some principal processes we did develop better methods, but there were difficulties and delays in obtaining plant items which, normally, one would not expect to experience, and so we did not during the past year beat the constantly rising costs of manufacture, packages and transport by obtaining better efficiencies or getting more production out of the plants, nor were we able to complete planned additional units. However, for the first three-quarters of the year business was good and the results were not unsatisfactory.

During the winter we were short of fuel and had to shut down boiler plant. Much of the fuel supplied at high prices was of poor quality, with high ash and moisture contents. We were involved in extra handling costs through mixing poor coal with any good qualities received. The steam-raising costs were higher than ever before. During recent years many advances have been made by the company in fuel economy resulting in a reduction of the amount of coal used per ton of product. The effects of these are that now there is little margin for further economies, and shortage of fuel is immediately reflected in reduced output of products. Short supplies and bad qualities had a severe restrictive effect on outputs of our chemical products.

EXTENSIVE USE OF ELECTRICITY

Electricity is used extensively in our manufacturing processes, and over many months and day after day we received instructions to shut down units of production in order to reduce the load. From February 10th to February 26th (with minor exceptions) we were without electrical energy for productive purposes. Practically all plants were closed throughout the works.

SHORTAGE OF RAW MATERIALS

We have also been short of important raw materials. In the fourth quarter-year, during the national crisis, we suffered heavy loss through reduced outputs and sales, whereas there was practically no reduction in wages and other expenses. Most of our plants are designed to operate continuously and intermittent working results in plant deterioration, higher repair costs and lower efficiencies, as well as reduced outputs.

Our barytes mines—for raw material for our barium range of products—are in remote areas and some of them were not accessible for many weeks owing to snow-blocked roads, during the past exceptionally severe winter. Consequently, barytes costs were higher.

The foregoing are some of the reasons why the trading profits of the parent company declined significantly.

In view of the importance of export business to this country, members may like to know that our principal products are essential raw materials to other home manufacturers whose own direct exports are comparatively of much higher value and, therefore, by direction, your company willingly gives first priority to such manufacturers.

THE SUBSIDIARY COMPANIES

Your six British subsidiary companies also felt the effects of the national setbacks which

occurred this winter, but, with the exception of National Titanium Pigments, Limited, not to the same extent as the parent company. Extensions to buildings and plant of N.T.P., Limited, to increase the present output, are nearing completion, and it is expected that this company will be able to sell all that it can make. Your directors are well satisfied with the trading results achieved by John Nicholson and Sons, Limited.

The mining position of Malehurst Barytes Company, Limited, is improved as against the prospects twelve months ago; therefore, this subsidiary expects to be able to continue to supply a fair quantity of greatly-needed ground and bleached barytes. All the subsidiaries made profits and paid satisfactory dividends. They should continue as sources of strength to your company.

Your directors feel justified in recommending the payment of a final Ordinary dividend of 10 per cent., plus a bonus of 2½ per cent., both less tax, thus making a total of 17½ per cent. for the 12 months to March 31, 1947. In addition, it is proposed to add £10,000 to the pension and benevolent fund, and £10,000 to general reserve account, leaving £21,305 to increase the amount carried forward.

CONSOLIDATED ACCOUNTS

Your directors now present consolidated accounts for all companies in the Laporte group (excluding the Australian subsidiary). They disclose a healthy state of affairs and a good liquid position.

STRONG DEMAND

The company and its subsidiaries commenced the current quarter with a strong demand for their products, and are in full production, with the exception of the barium departments which still operate only partially, owing to reduced supplies of raw materials arising from suppliers' fuel shortage. Consequently, temporarily we are unable to satisfy the normal needs of our customers for hydrogen peroxide, sodium sulphide, blanc fixe, barium hydrate, barium carbonate, barium peroxide and sodium percarbonate. Meanwhile, costs of production continue to increase. From the beginning of June the company will be liable under agreement to pay the same amount of wages for 44 hours as was paid for 47 hours to day-workers, and 48 hours for shift-workers.

PLANS FOR DEVELOPMENTS

Before the war the demand for the products of the company exceeded manufacturing capacity, and there has been little opportunity in recent years to remedy the situation. Extension of manufacturing resources is a major problem at the present time, and will continue to be during the next few years. The company is now placing orders for an electrolytic hydrogen peroxide plant at Warrington. The value of orders placed with contractors at the present time is approximately £250,000, but owing to delayed dates for promised deliveries of plant items it is not expected that the whole of this sum will be expended during the current year.

Your directors are going forward with their plans for future developments by the company and its subsidiaries, in the faith that the present national fuel and electricity supply difficulties will be surmounted within the next two or three years, and that costs of production in Britain, based on improved technique and willing co-operation between all engaged in industry, will enable the company to be competitive in the world's markets.

The report and accounts were adopted.

BROADCAST RELAY SERVICE LIMITED

EXPANSION OF ACTIVITIES

MR J. S. WILL'S ADDRESS

The nineteenth annual general meeting of Broadcast Relay Service Limited, was held in London on the 19th instant. Mr J. S. Wills, the chairman, in the course of his speech, said that since the end of the financial year Mr Allan Miller had, to the deep regret of the Board, resigned his position as chairman and managing director owing to his decision to relinquish full-time business activity. He (Mr Wills) said that he had been invited to joint the board, and upon Mr Miller's resignation was elected chairman and managing director. Stockholders would be aware of Mr Wills' connection with British Electric Traction Company Limited, who, for some time, had held an interest in Broadcast Relay Service Limited, and had recently increased its holding, but not to such an extent as to secure control. Broadcast Relay Service Limited, had not become a subsidiary of any other company or group. It retained its independence and would continue to be developed solely on its own merits and in the interests of its stockholders, employees and subscribers. Mr Miller retained a substantial interest in the company, and his advice and accumulated wisdom would still be available.

GROUP TRADING PROFITS

Group trading profits had risen by £63,000 to £451,000. After an interim dividend on the Ordinary Stock at the rate of 5 per cent., free of tax, and the proposed final dividend at the rate of 8 per cent., free of tax, £28,000 was added to the amount carried forward now standing at £70,761. During the year the group had raised £1,000,000 extra capital by the issue of preference shares and by way of mortgage on the group's freehold and leasehold properties. This was being utilised in expanding the group's activities, in repayment of bank loans and augmenting the group's resources for further developments.

He considered the company's overseas activities would be an important factor in the future and so an overseas holding company—Broadcast Relay Service (Overseas) Limited—was recently formed with a nominal capital of £600,000, of which a proportion had been subscribed and the balance was on call to finance new development overseas.

ACTIVE DEVELOPMENT

The past year had been one of active development and considerable expansion to which the only limiting factor had been the scarcity of materials. Many thousands of new subscribers had been connected to Rediffusion services and a promising start made with the development of new areas. The company's services had been made available in additional blocks of flats, and in hotels, clubs and offices, while "Music While You Work" equipment had been installed in many more factories. As regards the extension of the company's licences beyond December 31, 1949, whilst he was confident they would be extended, no decision on this matter had yet been reached.

The factory at Wandsworth was engaged in developing a valuable export market for radio heating and communication equipment. Overseas, the group was now entering upon a period of rapid expansion—steps had been taken to operate both Rediffusion services and broadcasting stations in many parts of the world. Their first broadcasting station overseas—Radio Trinidad—would be on the air within the next few weeks.

The report was unanimously adopted.

WHITEHALL ELECTRIC INVESTMENTS LIMITED

The twenty-fifth ordinary general meeting of Whitehall Electric Investments Limited, will be held on the 24th instant, at Winchester House, London, E.C.2.

The following is a summary of the report for the year to March 31, 1947:

The consolidated gross income amounts to £274,283 against £269,530 last year.

The valuation of the assets is as follows: Quoted investments:—

	£
\$6 preferred stock of American and Foreign Power	1,694,451
Other Investments	2,169,867
West of England at cost	865,000
Unquoted investments and net floating assets	326,454
	<u>5,055,772</u>

The valuation attributable to the ordinary stock of the company (after deducting the 6 per cent. cumulative preference stock) excluding Athens and taking West of England at cost is £3,629,722.

In Greece the government and people have made strenuous efforts during the past year to repair the ravages of war, and they have been aided therein by Unrra and other friendly international and national authorities. The U.K. and the U.S.A. have sent expert missions to consult with the Greek Government concerning the country's needs, and they have given valuable help in cash and in kind. Recently the British Government requested the U.S.A. to assume the major responsibility in the provision of financial aid to Greece; and the U.S. Congress has authorised for the period to June 30, 1948, the sum of \$300 million.

The Athens electricity and transport companies have made good progress in the restoration of their services. The electricity company sold 194 million kWh in 1946 compared with 188 million kWh in 1939. The number of passengers carried by the transport company at approximately 150 million was equal to the number carried in 1939.

The companies brought about this successful restoration by the intensive repair of their installations which they financed out of their own resources. Nevertheless much remains to be done to fulfil the needs of the inhabitants of Athens and Piræus for electricity and transport, and a long-term scheme of capital works is under continuous study. Your board is of the opinion, subject to U.K. Exchange Control, that your company will be justified in finding a part, but not the whole, of the large amount of new money which the undertakings require; and, with the other shareholders in the enterprises and with the debenture holders, is making every endeavour to ensure that new money be obtained and that the undertakings be thus enabled to provide more generating plant, extensions to the transmission and distribution systems, and additional rolling stock. It is not possible to estimate when the company's investment in Greece may again yield a return. Physically the undertakings are in better shape than it was dared to hope a year ago. Commercially they are sound, and the demand for their services continues to grow. The fundamental problems remain those of drachma, sterling and dollar exchange. Granted an improvement in economic conditions and the ability to secure equipment and materials, there is every reason to expect the companies will regain their prosperity.

In the West of England, sales in 1946 reached 63 million kWh, an increase of approximately 10 per cent. over the previous year, notwithstanding the efforts of the com-

panies to assist the government by discouraging domestic consumption. Had it not been for these efforts, the increase would have been much greater.

The bill for the nationalisation of the electricity supply industry is now before Parliament and the basis proposed for the acquisition of your undertakings is broadly the adjudged market value of the shares and debentures of the holding company, West of England Electric Investments, Limited, to be satisfied in government stock. These

UNITED SUA BETONG RUBBER ESTATES, LIMITED

NEED FOR REALLY FREE MARKETS RESTRICTIONS STILL HAMPERING OPERATIONS SIR JOHN HAY'S VIEWS

The 38th annual general meeting of this company will be held at 19 Fenchurch Street, London, E.C., on the 14th proximo.

In the course of his statement to stockholders, Sir John Hay, the chairman, after reviewing the company's activities during the year 1946, states that the estimated output of rubber for 1947 is 17,500,000 lbs. He then goes on as follows. Although I have no desire to awaken past controversies, I feel I ought to say that there is nothing which has happened since I last spoke on the subject of the price of rubber which would lead me to modify the views then expressed. I can detect no merit in a series of *ad hoc* decisions unrelated to any discernible policy or plan which result in loss in the present and no assurance of compensating benefit in the future. Some of the surprise and disappointment which has been aroused by the recent heavy fall in the price of rubber is due to the somewhat widespread belief that the rubber market is now free. This is only very partially true. In the producing territories there are now no restraints on production or shipment, but in the main consuming country, namely, the U.S.A., there is, however, now in force an extreme form of restriction on the use of natural rubber and on the quantity of stock that may be held by any consumer.

This is accompanied by the enforcement of the use of domestically produced synthetic substitute in specified proportions over a wide range of manufactured articles. It is significant that, in a country which is regarded as the stronghold of free enterprise and non-Government interference with trade, these measures should have the support of the industry itself which in the past has professed to be shocked by the much milder regulatory steps introduced on the producers' side in circumstances where the need for such a measure was indisputable if economic disaster in Eastern territories was to be avoided.

NATURAL v. SYNTHETIC

The inference is quite clear. Synthetic "rubber," despite all the claims that have been made, cannot withstand the competition of natural rubber. Confirmation of this is given in statements of unusual frankness made in the U.S.A. Of these I give three examples:—

"... our synthetic rubber plant would, under free market conditions, soon find itself in vast surplus, and these important facilities would fall into progressive disuse and deterioration."

A correspondent of the Wall Street Journal expresses himself in language more picturesque:—

"Let free competition have full sway and—except for a few special purpose

terms are open to serious criticism in that no account is taking of the intrinsic value of the undertakings, and the West of England company is collaborating with other similar interests in seeking fairer compensation.

The American and Foreign Power Company plan of reorganisation is still under consideration by the U.S. Securities and Exchange Commission.

Viscount Cowdray has been elected a director of the company and a resolution will be submitted for his re-election.

products—the synthetic rubber industry would go down the drain like Saturday night bathwater."

And may I also quote the words of no less a person than the President of the United States himself in his message to Congress in February last:—

"With an adequate world supply of natural rubber and a free choice of materials by industry the use of synthetic rubber in the United States might fall substantially below the permanent production goals considered to be the minimum for the needs of national security."

EFFECT OF DISCRIMINATION

Whilst it is gratifying to have these authoritative testimonies to the unique quality of our product, this illrequiting discrimination against its use cannot but have serious consequences which will extend far beyond the bounds of producing territories. In estimating these it is important to bear in mind that prior to the war the U.S.A. consumed nearly as much rubber as the rest of the world. With its present greatly expanded economy and the general impoverishment through war of so many other consuming countries, the U.S.A. is both relatively and actually a far greater potential user of rubber than formerly.

There are secondary causes which serve to aggravate the situation. Formerly, the London rubber market, acting as the world's main distributing centre, gave ready facilities for the free sale and purchase of rubber. This market, closed during the war, was reopened this year, but is now subject to certain restrictions designed to eliminate what is termed "speculation." These restrictions hamper to some degree the free sale and purchase of rubber. Moreover, the restraints imposed by America on free enterprise, coupled with the knowledge that large stocks of rubber are held by Governments whose actions are unpredictable, all tend to the exercise of an excusable caution expressed in a not too great readiness to accept the risk of purchasing when the main consumer is out of the market. Thus deprived of his former market facilities the producer, generally speaking, is in no position to withstand the tactics of the near-monopoly buying of the chief consuming country.

PRICES AND IMPORTS FROM U.S.A.

The official reason given for the partial embargo on imports of natural rubber into the U.S.A. is national security. But the United States rubber industry has been less discreet and made it fairly evident that it supports these measures as a means of keeping the price of natural rubber down and has expressed the view that the present price is high enough, if not too high. If the price of rubber is to be related to prevailing values, as it surely in fairness should, then that view

can only rest on the exercise of power and not on any sense of just dealing, as the following figures demonstrate:—The price of rubber is about 11 per cent. above 1939 values. In contrast with this quite insignificant increase we find that the prices of our imports from the U.S.A. have risen to the most alarming degree. Lard has risen by 335 per cent. Cotton by 296 per cent. Wheat by 279 per cent. Tobacco by 143 per cent. Lubricating oil by 168 per cent. Pork is comparatively almost cheap, having risen by a mere 134 per cent.

Rubber is still the biggest of all our exports to the U.S.A. and is capable of providing an amount of dollar exchange equal to the total of all United Kingdom domestic exports. That being so, any distortion of the price of rubber in relation to U.S.A. imports must be a matter of very great concern, particularly in present circumstances, to this country as well as Malaya. In terms of the inter-changeability of rubber for imported goods from the U.S.A. as between relative values prevailing in 1939 and now, and taking the unit in each case as one English lb., we find that whereas we received in 1939 1½ lbs. of cotton for 1 lb. of rubber, we now get less than ½ lb.; lard equivalent was 2½ lbs., now ½ lb.; tobacco 9 ozs., now 4 ozs.; lubricating oil, one gallon, now ½ lb. of pork becomes ½ lb., and whereas for ½ cwt. of rubber we got 1½ bushels of wheat we now get only ¾ bushels. In other words, in terms of U.S. imports to this country the present price of rubber is equivalent only to a quarter to one-half of the 1939 price.

THE DOLLAR CRISIS

We are all by now only too painfully aware of the dollar crisis. It is no longer a matter which concerns only those whose business it is to deal with the problems of international trade. It pervades our whole economy. It enters into the direction and conduct of every phase of business. It determines what we shall eat, what we shall drink and wherewithal we shall be clothed. The Chancellor of the Exchequer has stated that the problem of bridging the gap between imports and exports is "by far the greatest and gravest of the immediate economic problems to be faced" on which depends "the whole future of our country and the standard of life we shall enjoy in years to come." But as long as this wide disparity in prices prevails between our exports and imports, how can we hope to bridge the gap? When the rubber problem is set in this larger context it surely becomes evident that if the discriminatory practices now in force in the U.S.A. are continued they will be productive of serious consequences extending far beyond far distant Malaya. The obvious remedy for the present situation is to remove at once the partial embargo on imports of natural rubber into the U.S.A. and permit full freedom of competition between the natural product and synthetic substitutes.

No industry, any more than a State, can continue "half-bond, half-free." Either it must be freed altogether, or one restrictive measure will beget another and this reactionary policy, an unhappy example in which has been set with least justification by the great creditor nation, will perforce have to be followed by debtor countries. Thus begun, this retrogressive process will extend in an ever-widening and vicious circle. These are the immediate and urgent matters which should be engaging our attention. We should not be diverted from them by highly speculative estimates, relating to an uncertain future, with their gloomy forecasts of surpluses which may never arise if the principle of freedom of trade, so ardently professed, is more consistently practised.

Forward sales.—In finishing this statement I should mention one matter of domestic interest. We have sold forward over 6,000,000 lbs. of rubber for delivery during the current year at 1s. 0.23d. f.o.b.

LUNUVA (CEYLON) TEA AND RUBBER ESTATES, LIMITED

STRONG FINANCIAL POSITION

The fortieth ordinary general meeting of this company was held, on the 12th instant, in London, Mr H. J. Welch (the chairman) presiding.

The following is an extract from his circulated address:—

The company made a profit of £127,460 on tea and £27,720 on rubber. Sundry receipts and interest yielded £9,616. After providing for London expenses, reserve for buildings, machinery, etc., and Ceylon taxation, there is a credit balance of £135,282. The proposed final dividend of 10 per cent. will make 15 per cent. for the year—an increase of 2½ per cent. over the dividend for 1945.

As compared with 7,424,181 lbs. in 1945, the tea crop in 1946 amounted to 7,490,785 lbs. The f.o.b. cost of production was 1s. 6.51d. per lb., or 1.43d. more than in the previous year. The average net price realised was 1s. 10.4d. per lb. as compared with 1s. 9d. per lb. last year. The rubber crop amounted to 1,712,887 lbs., a decrease of 118,937 lbs. as compared with 1945. The f.o.b. cost of production was 1.07d. per lb. less than for the previous year, and the average price realised was 1s. 3.78d. per lb.

We have budgeted to produce during the current year about 8,069,200 lbs. of tea and 2,093,700 lbs. of rubber. We have sold the major part of our 1947 exportable tea crop to the Ministry of Food. As far as we can see, this year promises to be a satisfactory one for shareholders. The financial position of the company is a strong one, and this should help it to meet successfully any adverse conditions which may arise in this or future years.

The report was adopted.

ANGLO-DUTCH PLANTATIONS OF JAVA, LIMITED

DISAPPOINTING DELAYS

The thirty-seventh ordinary general meeting of the Anglo-Dutch Plantations of Java, Limited, was held, on the 13th instant, in London, Mr W. H. Daukes (chairman and managing director) presiding.

The following is an extract from his circulated statement:—

Disappointment is added to disappointment in the continual delays we, in common with all other business interests in Java, suffer as regards the recovery of our properties. The total planted area at the end of 1940 was slightly in excess of 123,000 acres. By the end of this year or early next year the debenture stock will all have been redeemed, so that the total capital of the company will be represented by the £3,000,000 of ordinary stock. The cost of rehabilitation is an unknown quantity. I will, however, hazard an estimate of £10 an acre. This would mean an addition of £1,000,000 to our capital and the raising of the cost to £40 an acre, a very low capital figure.

The board have been considering for some time past the best method of raising the additional money that will be required. The board are putting forward no proposal at the moment as they must be quite convinced of the security of the tenure of their property under the new regime and will require convincing by the test of any new economic regulations as regards the welcome which is to be extended to foreign capital in the future. A more generous policy, for instance, for the remittance of money home will be essential if permission for the raising of further funds is to meet with any success.

The report was adopted.

LONDON & MANCHESTER ASSURANCE COMPANY, LIMITED

FURTHER PROGRESS

The seventy-eighth ordinary general meeting of this company was held on the 18th instant in London.

Mr A. H. Dawes (the chairman) said that although the last 3 months of their year had been difficult for the outdoor representatives owing to the unusually severe weather, the year as a whole had been one of substantial progress. The total income from all sources had amounted to £6,123,920, an increase of no less than £392,017 over the previous year. The total funds had risen during the year by the record sum of £2,130,906 and amounted at 24th March, 1947, to £33,395,608. For the first time the premium income exceeded the two million mark in the ordinary branch and the two and a half million mark in the industrial branch.

In the ordinary branch the total of new sums assured at £5,866,635 showed a substantial increase of £2,387,275 over the previous year. In the industrial branch the premium income amounted to £2,581,076. This showed an increase of £109,703 compared with the previous year's increase of £60,426.

The directors had declared a reversionary bonus of £1 per cent. on the sum assured in respect of ordinary branch with profit policies in force on 24th March, 1947, and still existing, the cost of the bonus being £266,955. Out of the industrial branch surplus, £165,897 was being allocated to industrial branch policy-holders (1) In the form of an increased reversionary bonus. (2) By relieving from further payments whole-life assurance policies where the life assured was of advanced age, and (3) By increasing the sum assured under certain maturing endowment assurance policies.

The report was adopted.

UNION CORPORATION, LIMITED

GROSS PROFIT EXCEEDS £1,000,000

The ordinary general meeting of shareholders in the Union Corporation, Limited, was held in Johannesburg, on the 27th ultimo.

Mr. P. M. Anderson, the chairman, in the course of his speech, said:—

The gross profit for 1946 exceeded £1,000,000 for the first time in the history of the corporation. The net profit was £635,615, an increase of £98,502 over the figure for the preceding year; £488,400 was used for the payment of dividends totalling 6s. per share, free of United Kingdom income tax, on the increased issued capital of the corporation, as compared with a net payment of 5s. 11.7d. free of tax on the smaller capital for the preceding year.

As a result of the issue of shares by the corporation last year the surplus of cash assets over liabilities shows an important increase. This is partly offset, however, by an increase in the contingent liability for uncalled capital on shares in other companies, of £398,224. Shares and debenture holdings have also increased on balance by £305,065, largely as the result of our new holdings in the Orange Free State.

In the Budget speech of February, 1947, the Minister of Finance announced a 10 per cent. reduction in the scale of taxation payable by the gold mines. This represents a further stage in the reduction of the very heavy war-time taxation to which the industry was subjected. In addition the Budget proposals will allow a more rapid amortisation of post production capital expenditure. Welcome though these reductions are, it cannot be stressed too often that the gold mining industry is still labouring under high discriminatory taxation out of all proportion to that borne by other industries.

The report was adopted.

GEDULD PROPRIETARY MINES, LIMITED

LABOUR TROUBLES

The forty-sixth ordinary general meeting of Geduld Proprietary Mines, Limited, was held at Johannesburg, on the 6th ultimo.

Mr P. M. Anderson, the chairman, in the course of his speech said:—

The ore milled amounted to 1,265,000 tons, or 28,000 tons more than in the previous year. The yield per ton milled declined by 0.1 dwt. to 4.23 dwts., but the ounces produced were slightly higher at 267,789 ounces fine which, coupled with a 3d. per ounce increase in the price of gold, increased the working revenue by £6,051 to £2,316,876. Working costs totalled £1,493,517 and there remained a working profit of £823,359.

The amount just mentioned for working costs represents an increase of 1s. per ton milled and follows increases of 1s. 4d. and 1s. 9d. per ton milled respectively for the two previous years making a total increase of 4s. 1d. per ton over three years. This increase is due partly to increased benefits granted to employees and partly to the carrying out of certain maintenance work which had been previously deferred on account of the war, but the most important factor has been the ever-mounting cost of stores.

Dividends totalling 10s. 6d. per share were declared. Ore reserves recalculated at December 31st last reflect, for reasons given in the consulting engineers' report, a decrease of 1,200,000 tons to 5,000,000 tons. The first quarter of this year has witnessed a much more severe strike of European employees. As a result the ore milled for the quarter, at 256,000 tons, was 65,000 tons less than that treated in the quarter ended December 31st and the working profit at £112,694 was about £70,000 less than anticipated.

The report and accounts were adopted.

EAST GEDULD MINES, LIMITED

ORE RESERVES, 12,800,000 TONS

The twentieth ordinary general meeting of East Geduld Mines, Limited, was held at Johannesburg, on the 6th ultimo.

Mr P. M. Anderson, the chairman, in the course of his speech said:—

The ore milled at 1,862,000 tons again showed a small increase, but the yield per ton milled declined by nearly 0.1 dwt. to 5.63 dwts., so that the output of gold at 524,445 ozs. fine was 4,425 ozs. lower than that of the previous year. The working revenue of £4,535,386 was 8d. per ton milled lower and working costs at £1,667,110 were 1s. per ton higher, so that the working profit at £2,868,276 was down by 1s. 8d. per ton. The increase in working costs is mainly attributable to the higher cost of materials and to a lesser extent to improved benefits to European employees, as well as more development work done.

The provision for taxation amounted to £1,753,174, being £296,429 lower than for the previous year, due partly to the amended rates of taxation and partly to the reduced profit. Dividends totalling 11s. 9d. per share or 1s. more than for the previous year were declared. In all we have this year provided £92,480 for silicosis, which represents a surcharge of about 2½ per cent. on our total wages bill in respect of the employees concerned.

Ore reserves recalculated as at December 31st last at 12,800,000 tons were 450,000 tons less than those for the previous year, but the value at 5.2 dwts. over an estimated stopping width of 59 inches remains unchanged. The development footage driven totalled 15,143 feet, of which 10,230 feet were sampled and disclosed 4,425 feet, or 43 per cent., payable, averaging 15.2 dwts. over 26 inches.

The report and accounts were adopted.

GROOTVLEI PROPRIETARY MINES, LIMITED

FURTHER RISE IN OUTPUT

The fortieth ordinary general meeting of The Grootvlei Proprietary Mines, Limited, was held at Johannesburg, on the 6th ultimo.

Mr P. M. Anderson, the chairman in the course of his speech said:—

Despite the continued shortage of labour and the strike of employees, members of the Mine Workers' Union, in March, the tonnage milled for the year ended December 31, 1946, namely, 1,922,000 tons, was higher by 7,000 tons than the previous record figure set up in 1945. The yield at 5.15 dwt was a little lower than the figure of 5.18 dwt the previous year, which resulted in a slight reduction in the working revenue to £4,278,856 from £4,284,301 in 1945. The continued rise in the price of materials, some increased benefits to employees, and the additional footage of development done, resulted in a rise in working costs from £1,889,168 or 19s. 9d. per ton milled in 1945, to £2,108,979 or 21s. 11d. per ton milled in 1946.

The amount provided for taxation, namely £1,083,853, was, however, lower by £390,995 than the previous year's figure so that the net profit rose by £160,826 to £1,072,646.

The pre-production capital expenditure will be fully amortised for tax purposes at the end of the first ten-year milling period, with the result that there will be an increase in the amount to be provided for taxation. In order to avoid the consequent drop in distributable profit, it has been decided to increase the milling capacity by 330,000 tons to 2,250,000 per annum.

During the first quarter of 1947 the tonnage milled was 361,000 tons and the working profit £266,688.

The report and accounts were adopted.

MARIEVALE CONSOLIDATED MINES, LIMITED

RECORD MILLING RATE

The twelfth ordinary general meeting of Marievale Consolidated Mines, Limited, was held at Johannesburg, on the 7th ultimo.

Mr P. M. Anderson, the chairman, in the course of his speech, said:—

Despite two minor strikes and a shortage of labour, the tonnage milled was 649,000 tons, an increase of 22,500 tons over the previous year, the highest milling rate so far achieved in the company's eight years of production. The yield of 6.01 dwts. was 0.27 dwt. higher and the revenue at £1,687,703 was accordingly £134,099 greater than the previous year. Working costs were, however, higher, so that the working profit fell slightly by £3,106 from £498,841 to £495,735. The increase in working costs from 33s. 8d. per ton to 36s. 9d. per ton reflects the continued rise in price of stores and equipment, as well as some increase in benefits to employees. The amount provided for taxation—£175,122—was lower by £109,947, so that the net profit rose from £207,909 to £308,917. Two dividends totalling 1s. per share, or 2d. more than the previous year, absorbed £225,000, leaving £259,449 to be carried forward.

Development footage was increased during the year, 23,934 feet being driven as against 19,226 feet in 1945. Of this footage, 8,860 feet were sampled and 3,075 feet or 35 per cent. were payable, averaging 286 inch-dwt. The ore reserve as recalculated at the end of the year remained at 2,500,000 tons at the same average grade of 6.0 dwt. For the first quarter of 1947 the tonnage milled was 138,000 and the working profit was £68,714.

The report and accounts were adopted.

VAN DYK CONSOLIDATED MINES, LIMITED

EFFECTS OF STRIKES

The thirteenth ordinary general meeting of Van Dyk Consolidated Mines, Limited, was held at Johannesburg, on the 7th ultimo.

Mr P. M. Anderson, the chairman, in the course of his speech said:—

During the year your company, in common with most other producing mines on the Witwatersrand, suffered from two short strikes, one by European employees in March and the other by native employees in August. Both these strikes affected the tonnage mined for short periods, but in spite of this the total tonnage milled in 1946 was 1,188,000, which is only 500 tons lower than in 1945. As shareholders know, the dissension within the Mine Workers' Union, which gave rise to the short strike in March, 1946, had nothing whatever to do with terms of employment or with relations between your company and the employees concerned. A similar strike during the first quarter of 1947 resulted in a much more serious dislocation of work.

The yield during 1946 was 3.92 dwts. per ton—namely, 0.05 dwt. per ton lower than in 1945, and working revenue for 1946 was accordingly £2,013,404, which is £26,413 lower than 1945. The net profit was £323,378 as compared with £259,449.

Development was again reduced and confined to areas which seemed most promising. The funds required for the development programme are considerable, and your directors came to the conclusion during 1946 that the interests of shareholders would be best served by discontinuing the payment of dividends for the time being in order to conserve profits for the financing of No. 5 shaft and initial development therefrom. The operations of your company were seriously affected by a strike of European miners during February and March, 1947.

The report and accounts were adopted.

ST HELENA GOLD MINES, LIMITED

SATISFACTORY PROGRESS

The first ordinary general meeting of St. Helena Gold Mines Limited, was held at Johannesburg, on the 6th ultimo.

Mr P. M. Anderson, the chairman, in the course of his speech said:—

The expenditure on the acquisition of the company's properties and on its shafts, plant and equipment and other items totalled £735,808 as at December 31st last, leaving in hand a balance of cash and cash assets, less liabilities, amounting to £586,992. In addition there remains an amount of £1,177,200 to be called up on the partly paid shares as and when further funds are required. Work is proceeding on the erection of housing for European and native employees and a number of buildings essential for carrying on preliminary operations have been completed.

The No. 3 shaft (30 deg. incline) has been fully equipped at surface and at the end of last month it had reached a depth of 258 ft. measured on the incline. Owing to the soft nature of the ground and the slow delivery of equipment, progress has been slow, but the rate of sinking will be more rapid when better conditions are encountered.

The South African Railways and Harbours has commenced work on the construction of a railway line, which will serve the mines in the Odendaalsrust area, and the Government has announced that plans are in hand for the supply of water by pipeline from the Vaal River some 50 miles away. In view of the difficulties inseparable from opening up a property in a virgin unpopulated area, I feel that the progress made by your company in the short period of its existence has been satisfactory.

The report and accounts were adopted.

GOVERNMENT RETURNS

For the week ended June 14, 1947, total ordinary revenue was £36,407,111, against ordinary expenditure of £35,849,788 and issues to sinking funds £170,000. Thus, £2,339,015, the surplus accrued since April 1st is £202,951,204 against a deficit of £219,649,000 for the corresponding period a year ago.

On June 13th applications for bills to be paid on Monday, Tuesday, Wednesday, Thursday and Friday were accepted as to about 49 per cent. of the amount applied for at £99 17s. 5d. and applications at higher prices were accepted in full. Applications for bills to be paid on Saturday at £99 17s. 6d. and above were accepted in full. £170 million (maximum) of Treasury Bills are being offered for June 30th. For the week ended June 21st the Banks will be asked for Treasury deposits to a maximum of £50,000,000.

JUNE 18, 1947

ISSUE DEPARTMENT

Neither the British nor the American Government is likely to find this approach very satisfactory. The first conference held by the ECE, at the beginning of May this year, brought to light some considerable divisions of opinion between East and West. The East European states, led by

Russia, were anxious to bring to an end at once the work of such functional committees as the European Coal Organisation (of which Russia was not a member) and the Committee for Inland Transport (on which Russia played no part); they also pressed for the immediate demise of the European Emergency Committee and the transfer of its powers to the Economic Commission for Europe. In all this there was a patent desire to reduce Western influence even at the risk of wrecking international machinery which was actually and effectively at work. Again in question of procedure, the attitude of Russia and the Eastern European states was to press for the time being for a two-thirds majority rule which in effect would mean a veto on all decisions unacceptable to the East. These and other minor incidents convinced the delegates from Western Europe that any work done through the ECE would be hampered and delayed at every turn by the intense suspicions felt by Russia for all things Western and its determination to use any means—procedural or otherwise—to block policies to which it took exception. Somewhat naturally, the governments in the West now tend to argue that to submit the Marshall plan to such a body would simply risk endless delay and infinite frustration when the relentless passage of time remains the most important factor of all.

Yet how miserably sterile it would be if a matter of machinery were to block the Marshall plan at the outset. The difficulties presented by the ECE are after all difficulties which will arise in any case now that Russia is taking part in the discussions. Whatever machinery is set up will have to deal with intense Eastern suspicion and with stonewalling on unacceptable points. Is it certain that this opposition will be any worse inside than outside the ECE? There are, moreover, some arguments for using the Commission. It is a child of the United Nations. Its legacy from the earlier European functional committees enables it to provide factual material and an embryonic organisation for dealing with some of the problems. Above all, the Powers are already represented in it—including the United States. Might it not therefore be the course of wisdom to reach a compromise between the Russian and the Western views?

A possible course of action might lie in strengthening, by the inclusion of the best technicians available, the various committees and panels which are waiting to be transferred from the European Emergency Committee to the ECE. Russia should be asked to appoint representatives to them immediately and they might, in a general way, be placed under the supervision of the ECE on July 5th. The governments would continue to choose and pay them, but they could be temporarily seconded to ECE. The matters covered in this fashion would be transport, food and agriculture, coal, public utilities, soft timber, fertilisers and alkalis. No committees or panels exist for dealing with iron or steel, textiles and their raw materials, fuels other than coal, rubber, machinery of all sorts or questions affecting labour. In these spheres, panels would need to be set up at once and they too might be grouped under the general responsibility of the ECE. But would this approach differ in any way from Russia's probable proposals? Would it avoid the strictures of delay and obstruction already raised by the first meeting of the ECE? The answer surely is that with the mere presence of Russia in the negotiations these risks must be run, and the Western nations do not need so much to bypass the ECE from the first as to restrict its responsibility to that of general supervision and to have their alternative plans ready if they become convinced that the Commission is simply incapable of providing a working organisation. It should be clearly understood from the start that the British intend to abide by a

timetable, and that they are not prepared, except within very narrow limits, to sacrifice this timetable for the sake of unanimity. If decisions are delayed and endless argument develops, Mr Bevin should take the lead in drawing up concrete proposals with those nations—Eastern or Western—which accept speed as the first criterion.

★

The first points on the agenda of the Powers should present few difficulties. Europe's needs are not hard to assess since a mound of factual information already exists, and the task of the technical committees would be rather to disentangle the detail and work out priorities than actually to establish facts. But the moment the problem of Europe's own contribution is tackled, the Powers will be faced with a problem of very great complexity. In many fields, particularly in the vital field of coal and steel production, it is an obvious fact that the difference between pre-war European production and the present low levels is accounted for almost precisely by the catastrophic fall in German production. It is the reduction of German industry to stagnation that is, above all, responsible for Europe's failure to recover, and it is difficult to see how a sensible scheme for Europe can be evolved without taking account of this fact. But if sheer force of circumstance elbows the German problem into the centre of the European discussions, the Powers will find themselves facing once again the two great unsolved problems of the Moscow Conference—the Russian attitude to reparations and the French attitude to German re-industrialisation.

The question facing the European Powers today is whether, within the framework of the Marshall offer, a new approach is possible. The essence of the idea is that, once Europe's own contribution to its needs has been assessed, the United States will assist in making up the balance. The bearing of this on the Moscow deadlock is obvious. In any honest assessment of Europe's needs, the Russian claim for help must be very large. Germany's potential contribution is also enormous. Would it not be possible to take the question of German industrial reconstruction out of the context of reparations and place it in the wider framework of "mutual aid"? That Eastern Europe, on the basis of sheer need, would have a claim to a large part of what Germany could contribute is obvious, but Western Europe would gain equally from the revival of economic activity. The idea of reparations as such has become completely unreal in the face of Germany's inability to produce at all. But when German production has revived, it is entirely reasonable that a large claim upon it—a larger claim proportionately than on the production of any other European country—should be stated in favour of the needs of Europe as a whole. American capital would assist the process, not as a direct contribution to balancing the budget of an Anglo-American Zone, but rather as a contribution making good the deficit in an overall European balance-sheet. In short, the aim would be to break the deadlock at Moscow by substituting two wider conceptions for the old categories—mutual aid instead of reparations and the European economy as a whole instead of the balancing of German production between Western help and Eastern demands.

But even if this transformation were possible, French objections to the re-industrialisation of the Rhineland would remain, and it would clearly be unwise to alienate a vital partner and neighbour in Western Europe for the problematical good will of the Eastern European negotiators. Two types of safeguard for France's legitimate fears have been discussed. The first, proposed by the French themselves, is that the reconstruction and expansion of the steel industry in France should take precedence over Germany's and that a higher proportion of German coal should permanently be despatched to Lorraine. Such

policy is not inherently impossible, but the first step is to increase German coal output, and this process is inseparable from general industrial revival in the Ruhr. Priorities for France could, nevertheless, be included in a long-term scheme. The other suggested safeguard is that some sort of international supervisory body should oversee the development of the Ruhr as a whole. If such a body were to be composed of the West European nations only, it would raise no particular difficulties. But clearly the Russians will press to be represented, and the record of such bodies as the Kommandatura in Berlin discourages optimism for the working of such an inter-Allied body. If it were accepted as a solution, the Western Powers would need to frame a procedure which would safeguard their voting position and might reasonably ask a *quid pro quo*, possibly in the shape of similar supervision of the Silesian industrial complex.

★

Problems of procedure and problems of the agenda will bulk large in the news in the next weeks. They are bound to attract most of the reporting and most of the comment, and for that reason there may be some loss of perspective on the Marshall

offer as a whole. European agreement and the hammering out of a workable plan is one element only in the total problem. There remain the question of presentation to Congress and American public opinion and the question of securing the necessary American credits. A European balance-sheet which contained within itself nothing more sensational than claims pressed collectively instead of singly has little chance of firing a public mind equally ready for generosity on the biggest scale and for hard-headed haggling on the smallest issue. And behind the question of presentation lies the even greater problem of mobilising Congressional support. It is no use denying that the prospects for a bipartisan foreign policy look, after the fight over the Labour Bill, darker than ever before. Nor is the entry of Russia into the talks an asset in many American circles, however essential it may be at the European end. These difficulties are not immediate in the sense that they will not arise until the plan is at least formulated. But the statesmen in Paris cannot afford to forget the tough perspective in which the American and not the European reaction will carry the most weight. There are at least three more rivers to Jordan and the broadest may well come last of all.

Lords Test Match

THE House of Lords is evidently on probation again. It has been considering the Transport Bill and in doing so has, not unnaturally, inflicted a number of defeats on the Government. "We shall see in due course what is done about it" (the Transport Bill), Mr Herbert Morrison is reported to have said last week, "and according to what the Lords do we shall consider our future constitutional policy." Such a statement can mean anything or nothing; its impression depends very much on the tone of voice in which it is uttered. But, whether by Government design or by the incidence of events, the cloud of constitutional reform has crept back on to the horizon.

Disputes between Lords and Commons have something of the quality of test matches. No one knows in advance whether the contest will be one of dramatic interest and decisive conclusion or whether it will drift into a series of timeless first innings culminating in yet another drawn game. On the whole the draw theory prevails. Arguments over the future of the House of Lords may start on the lofty heights of principle but they tend to finish in the lower swamps of practical difficulties and innumerable alternatives. There is, of course, no logical justification in Britain today for the existence of two independent legislative assemblies each having concurrent and virtually

sovereign rights of legislation. It should be possible for the political genius of the British people to evolve some arrangement of their future functions which would retain the wisdom and experience of those peers who do in fact make up the House of Lords—they are barely one in ten of its total nominal membership—while leaving beyond dispute the political supremacy of the popularly elected assembly. But it is very difficult to put any such plan down in black and white, and once the conflict between the two Houses is raised to the level of the conscious in the minds of the protagonists it becomes increasingly difficult for them to remember that relations between the two assemblies are fluid, are still in a state of constant modification and mutual adjustment, and that they are affected even by so intangible a thing as an argument over the future of the House of Lords.

That the relations between the two Houses do change is obvious. Recently Lord Salisbury accepted the principle that the Lords should not reject outright a measure proposed in an election address of a Party and carried through by that Party when it has won its majority of votes in the lower chamber. Such an argument would have been traitorous, if not incomprehensible, to Lord Halsbury only thirty-five years ago. Nor is the reason for the change hard to find. Death removes as

many peers as it does members of the lower House. The Lords may never suffer from the drastic purge of a general election, but over thirty years mortality is just as efficient as the ballot box.

It is reported that the programme makers of the Labour Party are considering whether to include in their projected platform for the next election the issue of "The Peers versus the People." Before they do so it might be as well for them to think over the events of the first half of this century. Admittedly the picture is crowded and the high-lights of conflict vivid and attractive. But when the detail of the tapestry is studied it is possible to advance certain general propositions of a more sobering nature.

*

The first is that little has been solved by black and white plans. The fight over the Parliament Bill in 1910 and 1911 was the bitterest political battle of the half-century. Yet what use has been made of the Parliament Act of 1911 in the thirty-six years of its existence? Its mechanism has been used for two Bills and two Bills only, the Irish Home Rule Bill and a Bill to disestablish the Church of Wales. Is it only a coincidence that neither Bill ever became an effective statute and that the controversies aroused by each were either dead or fought in quite a different form only ten years after the Bills had been introduced into the Commons? The Commons defeated the Lords in 1911 by the use of a threat which was never put into operation. May it not be that the only effective threat is one that is never carried out?

The second proposition is that inevitably a second chamber has a different political complexion from its companion. This arises from another dilemma in constitution making. It would, logically, be ridiculous to have two legislative assemblies each elected at the same time by the same electorate and having the same length of life. Yet, as soon as any one of those factors is changed in the case of one assembly and not in the case of the other, the two bodies are themselves bound to differ. And, if they differ, then at some point in time they will conflict. The only answer would seem to be to define and separate the functions of each so that in no circumstances can they conflict. That brings us to the third proposition.

The third proposition is that it is exceedingly difficult, if not impossible, to draw any formal and exact line on paper dividing the functions of two assemblies both of which have the duty to consider legislation, and the acts of government, in the making. It is attractive to imagine that one body shall perpetually be sober, submissive and socialist, that it will content itself with the offering of good and acceptable advice and the duty of formal revision. If a chamber is given the right to advise it will, being human, expect that advice to be followed and the conflicts that follow rejected advice can, as any student of family life knows, be just as bitter as those which arise from problems of policy or jurisdiction. If a chamber is given the right to amend any form of words, at some stage or other it will make a revision that in appearance is one of form but which others will claim is in reality one of substance. And if the advice offered or the changes made are ignored, and if there is nothing that the other assembly can do about it, that second chamber will wither away as effectively as the post of Governor-General of the Irish Free State withered away.

If these propositions are accepted, there is no case for reforming the House of Lords. There may be a case for abolishing the House of Lords. It is galling for a Party with a majority in the Commons to see its best loved productions whittled down by the Lords, just as it is equally galling for the Lords to see measure after measure with which they are in complete disagreement slide through their House when on paper they still have the full right to stop their onward course. Would it

perhaps be kinder to both Houses to put the Lords out of their agony?

That, no doubt, is the proposition that the Labour Party will debate, in private and perhaps in public, over the coming months. Yet if it is wise it will shrink back from the drastic action of giving the British people a government by one sovereign assembly alone. That the House of Commons is supreme is now universally accepted; and any real attempt by the Lords to thwart the Commons would be as universally condemned. The role that the House of Lords performs is a small one, on its own admission. But it is a necessary role and it is well performed. The record of the present House of Commons is hardly evidence for the thesis that one chamber can show the tolerance of dissenting views and the patient attention to detail that are necessary to the process of legislation. Nor does the record of the House of Lords in the present Parliament provide any evidence for the thesis that it is attempting to thwart the popular will—the irritable remarks of Ministers to the contrary notwithstanding. The leader of the Conservative majority in the Lords has declared the principle that the Lords' duty is to accept the principle and improve the detail of any Bill passed by the Commons, and he has proved his sincerity by advising his followers not to vote for several "wrecking" amendments. And if the Government think that some of the amendments that have been carried against them are in fact alterations of principle, they still have an opportunity in the Commons to put back the original wording. This is only the first innings of the test, and no constitutional issue will arise until and unless the Lords persist a second time in disagreeing with the Commons. All that they are doing at present is giving the Government an opportunity to think again on a number of points of detail. No second chamber could very well be expected to do less. And it is a very good thing that there is a second chamber to do as much.

*

Once it is accepted that there should be a House of Lords of some kind, the arguments for leaving the present House of Lords as it is become of overwhelming strength. The ideal House of Lords, after all, is one that is content with the small role that the House of Commons is prepared to allow it to play. By and large, the present House of Lords is so content—that is implicit in Lord Salisbury's principle—and the reason is precisely that it is so conscious of the weakness of their position in a democratic age. Once the members of the House of Lords were given a more justifiable title to be accepted as legislators—and almost any principle of selection that anybody could suggest would be more logical than hereditary right—they would inevitably begin to think that they too had a mandate. A reformed House of Lords would almost certainly be a much more troublesome House of Lords. Labour Ministers can, if they choose, dispense with a Second Chamber altogether, though they must not expect the majority of the country to follow them if this is their decision. But they cannot reasonably expect to have a Second Chamber that gives them more help and less trouble than the present House of Lords—not even if they packed it entirely with life-long members of the Labour Party.

There is one small change in the House of Lords that might improve its membership without altering its powers. That would be to extend the precedent of life peers from the Law Lords to ordinary members, who might then be reinforced by many men who hesitate to put the burden of a title on their sons. But, this detail apart, the only sound way to reform the House of Lords is to go on talking about the reform of the House of Lords, and to go on doing nothing about it. That has reformed it far more effectively than the Parliament Act 1911, ever did.

The Lean Years

EVERYONE expected that the world war would bring in its train a severe dislocation to agriculture, but it was confidently hoped at the time the fighting ended that at least within one or two years the beginning of a steady, if gradual, improvement would become evident. It is now almost two years since VJ day, and the prospects seem worse than they were then. The American call for an international food conference has made even the optimists realise that the situation next year will be no better than this, in spite of bumper harvests. A conference may help in clarifying the position; countries may even be persuaded that their own diagnosis is wrong; but at least it is certain that a conference will not increase the world food supplies, either by expanding production or by restricting consumption in the lands of plenty.

As with so many other of the world's economic problems, the shortage of food is not so much a matter of underproduction, as of mal-distribution of both production and consumption and the lack of effective machinery to adjust supplies to needs. Broadly, there is increased output and a higher level of feeding in the Americas, with reduced supplies and limited rations in the rest of the world. During the war years, the estimated world population has increased by 3 to 5 per cent, while food production on the average is still below the pre-war level. This simple fact alone would account for a shortage. It is not sufficient for agricultural output to regain its 1935-39 average, it must exceed it by more than this percentage if the average pre-war standard of living is to be attained. And even the pre-war average may not be enough, if some countries keep the gains in feeding standards that they have secured during the war years. Moreover, the Western Powers are taking a more realistic interest in the welfare of the Asiatic peoples. A famine in India is no longer merely an excuse for headlines. Failure of the rice crop means a diversion of grain supplies to the distressed area. In equity and in theory, these diverted supplies ought to be taken away from those who have most to spare. But in practice the only point at which such deliberate acts of policy can be brought to bear is at the point of international allocation by the International Emergency Food Council. It is not the consumer who has most to spare whose wheat goes to the East but the importing nation which is adjudged to be furthest away from starvation—which often means Great Britain.

The IEFEC has done some very good work, and it would be unjust to disparage its results. But like Uno it has not been able to invade the sovereignty of its states members; it has only been able to do what they have been prepared to agree to. It is one thing to distribute an exportable surplus among needy nations; it is another to allocate world output according to national requirements, which would require an impossible degree of international control. Had it been politically possible for the United States to make sacrifices of its own consumption in fact as well as on paper, in order to make more food available to the hungry world, her moral leadership of the world would have been assured.

The increased world demand for food has been caused by two factors. The first has been the increase in population, but secondly, increased prosperity and a higher standard of living have meant a larger consumption per head. In the food producing areas the individual increase in consumption has been striking; in the consuming countries the larger demand is still a potential, kept within bounds by rationing schemes. Higher money incomes would in any case have meant a higher demand for food. But what has been, perhaps, even more important during recent years has been the additional inflationary demand

for food in the producing regions caused by increased prosperity and limited opportunities for expenditure.

The great attention paid in many countries to the raising of standards of nutrition, and particularly the introduction of milk welfare schemes such as have become familiar in Great Britain, have meant that for some years to come, the world demand for milk will be greatly in excess of supply. This will have a dual repercussion; it will tend to limit the supplies of milk available for other purposes such as butter and cheese; and it will also cause a deterioration in the quality of meat, if not an actual reduction in output. Liquid milk cannot travel very far and domestic agriculture in those countries where the consumption of milk is being stimulated will assume a bias not merely towards dairy farming in general, but specifically towards the production of liquid milk. Great Britain affords a good example. With a cattle population among the highest ever recorded, and an output of milk which would have seemed impossible before the war, the average consumer in the United Kingdom is still restricted to an absurdly low ration. Nor does the immediate future hold much promise of an increase. Milk yields are not yet back to the pre-war level, but given adequate concentrated feeds and proper stock management there is every possibility for them to rise above it. The cost to the nation of milk consumption schemes is, in fact, the loss of production of the other dairy products and meat, which has to be incurred.

The livestock position is aggravated throughout the world by the shortage of feeding-stuffs. The emphasis on bread-grains (wheat and rye) during the war caused a reduction in the output of maize and oats, while the ploughing up of pastures only accentuated the shortage of livestock feed. In 1946 a bumper American maize harvest boosted the world output to well above the pre-war level, but the supply of feeding-stuffs in general is still far from satisfactory. Concentrated cattle feeds depend on the supply of oilseeds, and world output is at the moment barely 75 per cent of the 1935-39 average.

Arable crops, which nowadays are of basic importance to the food supply, have been affected by the dearth of fertilisers. The change of emphasis from indirect consumption of crops—that is, through the medium of livestock—to direct, caused a greater exhaustion of the land, while the supply of both farmyard manure and artificial fertilisers has been reduced. But as the world's chemical production is restored to more peaceful uses, the yields per acre, other things being equal, should increase. The supply of agricultural machinery can also be a serious limiting factor to production, even in Europe where much of the farming is carried out on a peasant basis. The mechanisation of agriculture will have to be pursued with even greater thoroughness than in the past, particularly since the migration of labour from country to towns has been speeded up by the war. Much will depend on the ability of the industrial areas to produce the necessary equipment. A shortage of fuel may indeed cause a shortage of food.

The food situation in both North and South America is essentially the same—increased population, a higher individual level of purchasing power, increased industrialisation and, at least in the United States, a tendency to start importing foodstuffs. So long as the American national income is increasing, the larger domestic demand is certain to exert its influence on the exportable surplus of foodstuffs. In 1946, when the world was literally starving after grain, quantities which could otherwise have been exported from the United States were fed to cattle to cover the increased home demand for meat. Any basic change in the American economy may take decades, but it would be unwise to refuse to see the beginning of a development taking place—

the changeover of America from a world food producer to a world food importer.

Of all the main world agricultural producers, the only two which have continued the rationing of domestic consumption in order to safeguard their exportable surpluses are Australia and New Zealand. It is true that this may only be a long-term investment in maintaining vital pre-war markets, but the gesture is significant. Output in the two southern Dominions has been largely affected by the labour problem. Many of the men returning from the Forces are refusing to go to agriculture; the general emigration to the towns is indeed serious. In the dairy industry a complication has arisen in the introduction of the 40-hour week—to which, unfortunately, the cow cannot be made to conform. But although this will necessarily increase costs, the policy will prove itself, if in fact it does help to improve to attract more people back to agriculture.

In Britain, the emphasis must be largely on dairy farming and particularly on liquid milk. Unless considerable improvements in yields is obtained, the domestic production of butter and cheese is unlikely to regain its pre-war level. It is even problematical whether home-produced meat will again be available in adequate quantities. Small baby beef finished off at 10 cwt. in 18 months, would be ideal for the British economy; but nowadays that would only be possible, firstly by the provision of a sufficient number of store cattle from an outside source (for example, from Eire), secondly by a rapid reversion from arable to cattle and sheep farming and thirdly by the adequate provision of artificial feeds. In any case, the existence of a large dairy herd in Britain will increase the available supplies of veal and inferior cow-beef.

The agricultural recovery in certain European countries has been amazing, but the overall position is still far from satisfactory. The grain areas of the eastern states and the dairy produce of the Baltic countries have been re-directed to Russia and therefore tantamount to a loss to the world market. The Soviet Union has an exportable surplus only when it is politically necessary. This year, it is estimated that Europe will

require some 25 million tons of bread-grains from outside sources and a further 5 million tons of feed grains.

The major grain problem at the moment is one of shipment. The United States is finding it extremely difficult to maintain deliveries, which are already well behind schedule. The pressure of the high level of industrial activity on the transportation system is undoubtedly a factor, but there also seems to be from time to time a recurrent shortage of shipping space. This is certainly true of Argentina. On the whole, however, from 1949 onwards, the world grain position should improve.

Unfortunately the same is not so true of the livestock situation, covering meat and dairy produce. Owing to long-term nature of trends, and the fact that supplies of feed will not be adequate until about 1950, there is little hope for supplies being adequate to enable rationing to be abandoned before about 1952.

Underlying gloomy prognostications such as this, however, there is one large assumption that it is as well to bring out into the open. This is that the level of individual demand for food will remain as high as it is today. The demand for food is exceptionally high today in most countries, though its effects are different. In every country there is a tendency to take it for granted that this higher demand for food is a permanent and irreversible change, sanctified by a deliberate decision of statesmanship. But in fact, though political acts (such as the British food subsidies) have played some part, the high demand for food is mainly the result of hyper-full employment, of monetary inflation and of the shortage of other consumption goods. It is basically due to the fact that, in every country, the people have more money in their pockets than ever before and less to spend it on.

There is a certain compensation in this as in other economic affairs. If the world remains inflated and fully employed, it will continue to have food rationing in all but a few fortunate countries, and high prices for food there. But if—or when—the inflationary bubble is pricked, the world will be able to console itself to some degree by making a beginning with the dismantling of its apparatus of food control.

Italy's Former Colonies

EACH summer London fills up with Britons on leave from hotter climates. This year a contingent from Italy's ex-colonies is included in the crowd. The sight serves as a reminder that, until further notice, the British Government is caretaking in Libya, Eritrea, and Somalia, at some expense to the British taxpayer. The present position is that their fate should have been settled by the Italian Treaty. But the Big Four could not agree about it. The Foreign Ministers therefore arranged in Paris last June that Italy should renounce sovereignty over the African territories and that their future should be decided within a year of ratification of the peace treaty. Mr Bevin secured that, in the interests of continuity, British military administration should carry on. Finally, failing agreement, he and his colleagues agreed that they would refer their conundrum to the United Nations Assembly and abide by whatever decision it should take. This process of ratifying the Italian Treaty is not yet complete, though a simultaneous deposit of ratifications now seems imminent. The year of decision has therefore not yet begun. All that has been agreed is that a Four-Power fact-finding mission shall leave for the territories and report back to the four Foreign Ministers.

The colonies concerned are all pre-Fascist acquisitions upon which Mussolini lavished money and attention, not because they were economic assets—all three were liabilities—but because of his hunger for Empire and of his policy of keeping Italian emigrants on Italian soil. The demographic results were not

good. Libya, at Marshal Balbo's zenith, housed 89,000 Italian officials and colonists as against 750,000 Arabs; Eritrea—a stable little dependency until its economy was upset by misuse of the country as a base for the attack on Ethiopia—held some 70,000 Italians as against 800,000 Eritreans. Somalia, which is an unappetising desert, never accommodated more than 3,000 permanent Italian residents, now only anxious to escape the climate and get home again. Superficially these three lands have points in common. All flank the main trade and strategic route along the Mediterranean-Red Sea passage. All possess strategic possibilities and none of them has wealth to export.

Libya is bound to perplex the Big Four the most because it is nearest to the shadow-line between East and West. Indeed, since President Truman inaugurated his Greek-Turkish policy, it has been uncomfortably close to that line. At the same time it is the most discontented of the three territories. For three years—from 1940 to 1943—it prospered on lavish spending, now by Rommel's soldiers, now by Montgomery's. For two years after that it lived on hope and—like the desert sheep—on the accumulated fat of its tail. Now that fat is exhausted, and to crown everything Tripolitania suffered during last winter a really grave drought.

The natural division of the territory into two provinces has been perpetuated by the British Military authorities. It will be remembered that the Italians found the Tripolitans easier to conquer and to manage than the hardy, fanatical Senussi of Cyrenaica. They ran Tripolitania as part of metropolitan Italy

and settled there rather than in Cyrenaica's pleasanter hills. The Senussi hated Italy, and helped the Desert Rats. For this and other reasons the British have treated Cyrenaica as an ally and Tripolitania as ex-enemy territory. For instance, in Tripolitania 40,000 Italians have been allowed to remain; in Cyrenaica all are gone. In Tripolitania the Italian penal code is still administered in Italian courts; Cyrenaica is ruled in Arabic by British military decree. Yet even the Cyrenaicans do not like their lot. Both territories are influenced by Arab League propaganda and are bitterly disappointed that the welcome victory of 1943 has not brought them independence. Both would oppose by force any return of the Italians, and this in spite of good relations between Italian farmers and Tripolitanian Arab labourers. Both are united in wishing that their country shall not be partitioned into two. The Cyrenaicans (who have no love for Egypt because of Egyptian treatment of the Senussi during the war) want Libyan independence on a budget to be balanced by leasing bases to great Powers. The Tripolitans are divided into parties that agree with this view and parties that favour some link with the Egyptian crown.

The Eritreans are even more divided in their wishes because they are a more mixed bag from the standpoint of race, religion, language and history. They are neither so discontented nor so anti-Italian as the Libyans, first because they were prosperous under Italy, and second because they are enjoying, under an all but forgotten British military administration that is running an economy in a teacup, a self-contained prosperity. They prefer to forget that this cannot last once general trade is resumed. The 20,000 Italians who remain in the territory include redundant technicians and are many of them unemployed and maintained in British relief camps, but the Eritreans are enjoying more schools and more business openings than they have ever known.

Somalia presents a problem that is simpler from the standpoint of local wishes, but is a political puzzle. Somali tribal lands extend over the three Somalilands, as well as into Keftya and the Ogaden province of Ethiopia. As the Wal-wal incident so memorably displayed, the tribes wander from one territory to the other according to seasonal and tribal rights to wells. The logical solution for them would be to place all under a single trusteeship. But when Mr Bevin suggested this, with

Britain as trustee, Mr Molotov rejoined that he was not going to subscribe to "enlarging the British Empire at the expense of Abyssinia."

The Big Four are not the only outsiders with an interest in the problem. All the neighbours are anxious, some for a frontier adjustment, others for outright annexation. The Emperor of Ethiopia, for instance, claims the whole of Eritrea and Somalia. He is backed by his band of admirers in this country regardless of the fact that to run Eritrea as it is now being run would cost one-fourth of Ethiopia's total annual revenue, which is £4,500,000 yearly. Similarly, Egypt, and indeed the whole of the Arab League, is interested in the fate of Libya. If there is not to be independence, an Arab state will ask to be one of the trustees. France, on the other border, is wholly opposed to Libyan independence out of understandable fear that this would upset Tunisia and Algeria. Britain is determined to keep a promise to the Senussi—first given by Mr Eden in 1942 and reiterated by Mr Bevin—that they shall "never again fall under Italian domination." The Americans favour three international trusteeships. The British have an innate dislike of management of backward peoples by a team that may not be homogeneous.

Last but not least of the interested parties is Italy, where an unemployed Ministry of the Colonies has not yet been disbanded, and where the Italian residents in Tripoli are a direct and often poignant spur to a continued Italian interest. Naturally, there can be no question of restoring Italian sovereignty. Britain will not break its promise to the Senussi; some sort of trusteeship there must be, yet no one of the Big Four will allow that any one of the others shall be sole trustee. What alternative remains? Only that of some form of international trusteeship. Admittedly, there are very strong and valid objections to the principle of mixed administrations. Not all work with the relative smoothness of Tangier, and the British legitimately distrust organisations which parade Europe's quarrels before African eyes. But given the impossibility of restoring Italian sovereignty and the equal impossibility of the Great Powers agreeing on a single trustee, a mixed administration seems the only solution—except for Eritrea—in which case there would be every reason for including some Italians in its working, particularly on the technical side.

But the final decision is still some way off, and till it comes British military administration must pursue its thankless way. The work it has done should not be underrated. Caretakers are always expected to do a good job without spending on the fabric. It has throughout lacked funds, and lost good personnel through demobilisation, and has nevertheless produced at least in Eritrea a stable economy, and in Tripolitania a territory which, until the drought, paid its way. A well-chosen mission of experts under Sir Bernard Reilly has just framed recommendations on the policy to be followed until settlement is reached: notably in regard to foodstuffs, imports, and the employment of more Arabs, including Egyptian technicians, in the Libyan administration. It has increased schools, taught husbandry and other crafts, and improved the lot of many Africans. In fact, both the staff and the peoples it cares for would face the future in better heart if either knew where they were going to be in 1948 or 1949.

NOTES OF THE WEEK

Five-Day Fall

There is a danger that a lot of ill-feeling will be stirred up about the five-day week in coal, and this will not be improved by the empty threat of the restoration of work on six days. It is no use pretending that, because its results are disappointing, the five-day decision can be reversed. The five-day week in the mines must now be accepted as permanent, and the miners, Mr Shinwell and the Coal Board must settle down to the unspectacular, long-term job of producing more coal by more efficient technical management, improved labour relations, and better planning.

The trouble is that the issue of the five-day week has taken all the lime-light, and as it was primarily a political decision between the Government and the miners and was only connected secondarily with the nation's needs for coal this winter and next, no one ought to be surprised at the results. The possibilities for improving output by the shorter week have, however, been so over-emphasised that the disappointment over the actual results is now made to look far greater than it should be. In point of fact, no one who knew the facts and made estimates in cold blood expected there to be anything but a fall in output. Given the same degree of mechanisation and the normal and very human attitudes to hard work, it was not to be expected that the initial enthusiasm could be maintained or that output on five days would equal that of six. As it is, a labour force of 699,000 in May, 1946, produced an average weekly output of 3,700,000 tons during a six-day week, and a labour force of 714,000 in May, 1947, has produced a weekly output of 3,500,000 tons during a five-day week. Improvements in manpower and management have thus all been swallowed up by the shorter week.

It is still too early to compare the June figures with those of April, immediately before the introduction of the five-day week, but output has dropped fairly steadily since the first fine fervour of the early days of May, and it has dropped proportionately more in those areas or divisions with good output records. In areas where the record of absenteeism in the past has been good, weekly output has naturally been more affected by reducing the number of shifts than in areas where attendance on the sixth day was bad. In Yorkshire the swing has gone yet further: in April output was far below that of a year before; it picked up well in May and fell again seriously at Whitsun and has remained low since, thus showing only too clearly that exhortations for better output which had a response at first are being cancelled out by the more deep-rooted difficulties of work in the mines. Neither manager nor miner really changed his spots when ownership changed hands, and there is a long up-hill battle to be fought while the Coal Board engenders a new atmosphere with a management competent to deal with both the technical and labour problems before them. Great skill is needed, for, quite apart from the feuds of the past, the miner is intensely conservative, and will resent the necessary reorganisation of pit work even if it is a nationalised board which is carrying it out.

£100 Million for the Colonies

More light was thrown this week by the Secretary of State for the Colonies on the new phase in Colonial development which was commented on in *The Economist* last week (page 969). A few years ago, the establishment of a Development Board for the Colonies was frequently canvassed unofficially. The Colonial Development Corporation, announced by Mr Creech Jones on Wednesday, will not have such a wide scope as was envisaged by the supporters of the Development Board, for it will be subordinate both to the Colonial Office and the Colonial Governments. But it has this much in common with the earlier proposal. They are both based on the realisation that capital on a far larger scale than is made available under the Colonial Development and Welfare Act is needed to raise the standard of living in the colonial empire. Moreover, although the new corporation will have to obtain the consent of the Colonial Office and the Colonial Governments for its projects, it will be able, as the supporters of the Development Board urged, to take the initiative in putting them forward. Here there will clearly have to be co-operation with other Government Departments as well. In fact, a two-way flow of ideas can be foreseen. The Ministry of Food may want more edible oils and may suggest to the corporation that they could be profitably supplied by a certain colony. The corporation may want to develop cotton growing

in a colony and will ask the Board of Trade whether there would be a market.

It is envisaged that the corporation's activities will be mainly concerned with agriculture which is in particular need of the application of capital on a large scale. But in all its undertakings the corporation is expected to operate on commercial principles. It will be expected, that is, to make a profit—at least over its whole operations, though the possibility of some losses cannot be ruled out any more than they can in private enterprise. It is not, moreover, intended to supplant private enterprise—Mr Creech Jones emphasised this—but to supplement it, and he made the welcome declaration, coming from a Labour Minister, that the Government welcomed private investment in the Colonies provided it was in harmony with plans for social and economic development.

There will thus be four channels through which capital will reach the Colonies: ordinary private investment; the development corporations of Barclays Bank (Dominion, Colonial and Overseas) and the Standard Bank; the public corporations owned by the Colonial Governments such as that which is to run the enemy plantations in the Cameroons; and now the new corporation with its capital of £100 million—the £25 million needed for the East African groundnut corporation will be provided for separately. At long last, it seems, the third colonial system—which aims at raising the Colonies' standard of living—is well launched.

Mr Attlee and the Civil Service

There is no doubt that Mr Attlee's emphasis in the House of Commons last Tuesday on the fine record of the Civil Service was timely and deserved; for years the Civil Service has been the undefended butt of criticism, and the Prime Minister is exceptional in the appreciations he gave to it, both this week and recently at the Labour Party Conference. But while agreeing with his tributes, it is impossible to feel satisfied with his statements about the future plans for reducing the size of the Civil Service. Ministerial and official committees have for six months been considering how to reduce the size of the Civil Service; the upshot of their deliberations appears to be to expect no large reductions at the present time.

This is really disturbing, because it shows that there has been no radical reconsideration of the systems of controls, nor of the internal organisation of the Civil Service. All the committees can have done is to chip a little here and allow a little easing there. The Civil Service on April 1, 1947, was only 13,000 lower than it was at its peak in 1943, and this after the war effort has been unwinding itself for nearly two years. It should have been possible to make some more positive statement about these winding-up operations which Mr Attlee said were expected to reduce numbers by about 60,000. But how soon? And why has the reduction not been more rapid? Nor is it any consolation to be told that 44,000 staff will be released when rationing and other controls come to an end, when no date can be given for these events and the onus for their continuance is put upon Parliament. The parliamentary machine is not designed to scrutinise the detailed systems of controls; the Government must take the initiative and they appear to be making no real effort to do so.

The impending increases in staff due to the absorption of the Relieving Officers into the Assistance Board, of the Friendly Societies into the Ministry of National Insurance and the country agricultural committees into the Ministry of Agriculture are the inevitable corollary of recent legislation. But these changes might be the occasion for a considerable improvement in manpower statistics. The Ministry of Health has just issued a circular to local authorities eloquently imploring them to reduce the numbers of staff they employ and quoting—very unconvincingly—the example of the Civil Service. The darkest obscurity envelopes the figures for local government, and the most assiduous inquiries fail to illuminate the gloom. Double counting of individuals is known to happen, and a local inquiry recently revealed that one man was returned five times because he worked in turn in five different offices of the same authority.

And what about hospital staffs? Mr Bevan has repeatedly claimed that doctors and nurses in the new health services will not

be civil servants; that is right, but who will account for their numbers? The public should know whether an increase in local government staffs is mainly due to a desirable increase, for instance in the number of teachers, or to undesirable increases in less useful fields. At present the global figure of a million local government servants conceals good and bad alike.

Convincing Mr Clayton

Mr Clayton declared before he left Washington that his visit to Britain had no connection with the Marshall plan and indeed, there are enough economic problems outstanding between the two countries to occupy a week of discussion quite apart from the new problems raised by Mr Marshall's offer and the Paris talks. The International Trade Conference at Geneva is reaching a crucial stage. Even more important, Britain's dollar supplies are becoming critical. With the draining this week of \$100 million, only \$1,700,000 are left of the US credit. Even though the coming into force of the free convertibility clause on July 15th will probably not lead to an immediate deterioration of the situation, there are some awkward problems ahead, among them, for instance, Canada's increasing dollar shortage.

In these conditions, it is essential that the British Government should convince Mr Clayton that with the best will in the world, the British are not going to be able to avoid a dollar crisis. Mr Dalton and Mr Bevin would speak, however, with greater weight if there was not evidence of a certain levity in the Government's attitude towards possible curtailments in the imports programme. The freeing of certain sections of trade has led to anomalies such as the use of dollars to purchase food supplies which could be obtained in soft currency. This fits into the general American disapprobation of "discrimination," but proves once again that world exchanges cannot yet be managed on the basis of theoretically perfect free trade. The Government's decision to do nothing for the time being to cut food imports also has the effect of masking, not only from the people of this country, but from the American producer the fact that by the turn of the year, the dollars available to Britain for purchasing the products of American farms may have slid away. Yet until the Government stops hoping that something—a Marshall plan or whatever—will "turn up," can Mr Clayton be convinced of the threatening crisis in Britain's overstrained economy?

The Government's attitude is all the harder to grasp in view of the obvious uncertainties of the Marshall offer. Mr Snyder, the Secretary of the Treasury, has reminded the world that sections of American opinion regard it as more an invitation to European self-help than a guarantee of American support. And European self-help is not a short term solution for Britain's oncoming dollar crisis. One can only suppose that after all the Marshall offer was discussed by Mr Clayton in Downing Street. If so, it is to be hoped that he threw some light on one troublesome point. Are any future British needs to be considered simply in the European context? Is a European pool to be the only future source of aid and will Britain have to find its place in the European queue? Or may the unique position of the Commonwealth in American affairs entitle Britain to separate consideration?

Left or Right in France?

Almost a chance has prevented M. Ramadier's Government from being defeated on the issue of the desperately unpopular financial measures introduced to save the tottering franc (which are discussed in detail in a Note on page 1037). The Finance Commission of the Assembly rejected the proposals which included a large increase in fares, the removal of the bread subsidy and a directly inflationary measure in the shape of raising the ceiling of advances authorised by the Bank of France to the Treasury. On reconsidering the issue, however, the Commission reluctantly reversed its earlier vote, and the measures were presented to the Assembly. Meanwhile, the news had come of the opening of the talks on European reconstruction in Paris. No one was anxious that France should be both host and delegate without a Government. And the harmless but rude workers' demonstrations against the Assembly on Sunday stiffened the Deputies' mood. In the event, they voted for the measures by a small majority.

But clearly the crisis continues. Its essence is that the French economy is very nearly at a parting of the ways. There can be no restoration of stability, no increased consumption, no genuine salvation of the franc unless the load of taxation is laid on those who can afford it—those who are making enormous profits from

the sale of food and drink or those who have accumulated private hoardings of gold ten times as great as the depleted reserves in the Bank of France. To increase the burden on the workers and the salaried classes is really indefensible—Mr Schumann admitted that the pressure on them was already iniquitous at the beginning of this year. But to institute draconian measures against the bourgeoisie would lose M. Ramadier the votes of the Right which he needs to sustain his non-Communist Government Coalition and might paralyse still further the "free" sector of French production—which is still the major part of the French economy.

But the organised workers are most unlikely to resign themselves to the latest measures. Already the miners in the North are on strike; there is evidence that the movement may spread, and there can be no doubt of its political character. It is concerned not with wages but with the Government's economic policy as a whole. The Communists are not likely to quieten the workers' discontent, and the left wing of the Socialist Party may go with them and refuse M. Ramadier a vote of confidence next week. M. Ramadier is thus faced with the choice of governing France either with the Right or with the Left. There can be little doubt that France has small hope of stability if she chooses the Right.

Unhappy Birthday

A second somewhat sombre birthday was celebrated by Uno on Thursday. Those public figures who took notice of it discreetly made no references to the principles and ideals that were established in the Charter that was signed two years ago. Instead they referred, as did Sir Alexander Cadogan, to the fact that "the machinery has been established; that machinery is now at work." To feel satisfaction at this is fair enough, for the bringing together of non-political experts and civil servants to study all manner of economic, social and administrative problems does a lot of good, even when their discussions are prolonged and painful, as they have generally been in such bodies as the Military Staffs Committee and the Economic and Social Council. Yet two years have not been enough to create the nucleus of a really first-class international secretariat that can be depended on to rise above national interest and the influence of individual governments. In this, and in other respects, Mr Trygve Lie, the Secretary-General of Uno, has not come up to expectations, and has won for his office little of the prestige it should enjoy.

The ordinary man's test of Uno is to ask whether it will be able to keep the peace. If he is told that Uno is really nothing more—in a crisis—than the great Powers which belong to it, he asks why then is a United Nations Organisation necessary at all. The answer for the moment is that the Security Council has considerable prestige among the smaller and more quarrelsome governments which might embroil their Great Power patrons by reckless and violent policies. The threat of an appeal by the United States to the Security Council quickly brought Marshal Tito to reason after his gunners had shot down two American aircraft. The feeling of obligation to use United Nations methods certainly restrained British naval officers from opening fire on the Albanian coastal batteries after the mining tragedy of the Corfu Strait. And there is just a possibility that the Security Council's commission of inquiry into the Greek frontier troubles will find a way of depriving the genuine Greek "rebels" and their Yugoslav and Albanian auxiliaries of the kind of successes that the Sudeten Germans secured in pre-war Czechoslovakia.

The report of the Greek Commission went before the Security Council yesterday. Nine of its eleven members—the Soviet and Polish representatives disagreeing—want to see new conventions on frontier conduct between Greece and her neighbours and a permanent Uno commission or commissioner to supervise their execution. If the Security Council can get the Russians to accept some such arrangement, and if a Uno commission can in fact keep the Greek frontiers quiet, then faith in its power to give justice and keep the peace will revive a little. It will not revive a lot until the Military Staffs Committee show some signs of agreeing on the kind of forces Uno should have; above all, until some method has been found for supervising the development and use of atomic energy.

Agriculture Bill in the Lords

The debate on the second reading in the Lords of the Agriculture Bill did not break much new ground, except to call atten-

tion to the difficult position of the agricultural landlord under the new dispensation. There is a real danger that the landlord will become, as he was variously called, a mere rent-receiver or mere cypher, unable without great difficulty to dispossess his tenant or to farm himself, or even to shape agricultural policy on his estate. His tenant cannot be stopped from erecting new capital equipment (so long as the Minister's consent is obtained) for which the landlord subsequently becomes liable to compensation, while the landlord himself can be ordered by a county agricultural committee to erect new equipment.

This was the gloomy picture that some peers painted, and there were suggestions that one way to stimulate the landlord's initiative would be to permit higher rents. It is true enough that agricultural rents in England today are no higher than seventy-five years ago, despite the great change in the value of money, and that the return on the capital invested is poor. This fact is partly an indication of the need for new, up-to-date capital, and it is also true that if the state, as is sometimes urged, were to provide part or all of the huge sum needed, rents would have to be substantially raised. But the possibility of raising the rent is also there for the landlord—if he can provide the capital to invest.

The Bill continues in being machinery for arbitration on disputed rents, so that it is difficult to accept the case put forward for the creation of special rent courts—although if the landlord were statutorily required to devote a minimum proportion of any rent increase to farm-improvements, his difficulty in raising it might be lessened and efficiency increased. The low level of rents is largely a symptom of agricultural stagnation in recent years.

In practice the control exercised by the county committees will not generally be so great as to prevent or deter a landlord from improving his estate in his own way—if he has the means and initiative to do so. But it is true that he may find it hard to get rid of an indifferent tenant. To increase the stability of tenure on English farms—already fairly great—may have some good psychological effect. But there is truth in Lord Bledisloe's blunt warning that

We have today a relatively low average standard of farm practice, but, like our farm stock, we still have some of the best in the whole world, although nowadays we also have some of the worst. I would venture to suggest that the Government courageously resist the temptation under this Bill to afford any fixity of tenure to people in the latter category.

* * *

An Official Secret

On June 11th, Dr Summerskill, Parliamentary Secretary to the Ministry of Food, revealed in a parliamentary answer that a monthly survey is made for her department of the domestic food consumption of a random sample of 900 families. That such a survey is undertaken is common knowledge. Indeed, an estimate of £95,000 to cover the cost appears in the Ministry of Food's vote. It is also understandable that the Ministry should use the survey method to throw some light on how the controlled distribution of food affects individual families, including people living alone. To what extent do people obtain their requirements of calories from unrationed foods such as vegetables? To what extent do they buy imported "luxury" fruits? To what extent does the food they buy and eat at home, as distinct from what is available to them in canteens and restaurants, fulfil their dietary needs? Clearly, if the Ministry can obtain reliable information on these sort of questions, it is entitled to.

But what is quite inexplicable is why it should not make the information public. Amid all the recent arguments about whether the country's diet is adequate or not, Mr Strachey never gave the results shown, presumably, in this survey. He relied, as always, on the amount of food, translated into calories, made available for consumption and divided by the number of consumers. This average figure of the food people can, in theory, obtain is clearly nothing like so accurate as the amount they actually buy. There is no reason to suppose that the survey shows that people are not nearly so well fed as the figures Mr Strachey does reveal make out. But by withholding its findings the Ministry only helps the cause of those who claim that Britain is dying of starvation. Dr Summerskill promised that members of Parliament who wanted to see the survey could do so. But repeated requests to the Ministry of Food have failed to secure a similar concession for the press. When public money—to the £95,000 paid to the market research organisation that undertakes the survey should be added the cost of the Ministry's officials who work on it—is used to collect information of public interest, any Ministry should show very good cause why it should not be made public.

Out-of-Date Means Tests

The letter from the Rt. Hon. J. R. Clynes in *The Times* last week, besides raising a personal tragedy which, no doubt, will soon be effectively remedied, has called attention to a much wider problem. So, too, has the recently published *Annual Report of the Poor Persons Committee of the Law Society and the Provincial Law Societies for the year 1946*. The problem is the injustice inflicted on many by the retention of an out-moded monetary standard as a condition precedent to one form of relief or another. In the case of Mr Clynes it was a regulation adopted when a pension fund was set up for ex-MPs before the war. In the case of the Poor Persons Committees it is the existence of an income-limit for the granting of facilities for assisted litigation to those unable to pay the full cost of professional assistance. The cost of living index has at least seen to it that wages did respond to a rise in the cost of living. Parliament has done something to assist those granted pensions at a date when the pound was worth a good deal more than it is today. But these are two cases—there are others—in which a rigid standard, fair enough when imposed, is now an instrument causing injustice. At the moment, in the case of assisted litigation for the civilian population, no assistance can be given where the income of the applicant exceeds £4 per week or where his capital assets are worth more than £50 and in the case of single people the income limit is even lower. Comparable instances are the upper limits to the weekly sums which magistrates may order to be paid in cases of separation, or for the support of illegitimate children.

Another aspect of the same problem arises under the Hire Purchase Act of 1938. When that Bill was before the Commons, to obtain agreement among the trade interests involved, it was agreed that the Act should only apply where the sum involved (with two exceptions) did not exceed £100. The argument was that as the Bill was designed to protect the working classes and as they rarely entered into commitments involving more than £100 at any one time, the limit was fair and just. It may have been then. If it remains just now, it is only because it is impossible for most people to obtain permission to buy £100 of new furniture at any one time, not because £100 is all that is needed to furnish a house.

Some of these regulations can only be changed by Act of Parliament. Some can be altered by Ministerial order. In any case the moment has surely come when the Government should appoint a Departmental Committee to investigate the whole problem, to list and publicise those cases where out-of-date monetary limits of this kind are causing injustices and to propose remedies for their removal.

Montgomery on Mission

The visit of Field-Marshal Montgomery to Australia and New Zealand takes him via Palestine and India through a part of the world which may well become, as the years pass, a powerless area beside which the vacuum left by Germany's defeat will seem negligible. With the two future Dominions of India uncertain in strength and loyalty, Burma still thinking of full independence, Ceylon moving towards Dominion status, South Africa hesitant and divided over its strategic interests, and with Australia engrossed in the problems of the Pacific, the security of the Indian Ocean and the nations fringing it is liable to become the business of nobody in particular. It is usual to say that the coloured peoples unconsciously—and in their calmer moments consciously—rely on British power and advice; and it is reasonable to believe that in a crisis South Africa and Australia line up without hesitation beside Britain. But that is really not quite good enough.

Economic planning as it is being practised in this country implies planning of all vital resources and expenditure. It follows that imperial defence should be planned to an extent which was neither practicable nor desirable before the war. For the share of it falling to Britain makes tremendous demands on manpower, industry, shipping, skill and money. Just how much has never been properly assessed, and that is typical of the rather vague way in which Ministers discuss the problem. The argument of the Labour Party rebels who were routed at Margate, ill-documented and strident though it was, has not been properly answered. They asked whether Britain could afford to be a great Power on present strategic and economic assumptions; whether Britain's future strength did not depend on a full and rapid economic recovery to which much of the manpower and resources allocated to imperial defence should be devoted. It is of course a good half-answer to say—as has been said in *The Economist*—that large forces have to be maintained "for the time being" in the Middle East and India, because it is uncertain what future arrangements will be

made for the protection of vast and vital interests. But supposing no future arrangements, whether international or regional, take shape in the next five years—is a huge share of the burden of effort still to fall on Britain? Is it not time to recognise—that all foreign governments take for granted—that for strategic, economic and power-political purposes the Commonwealth is one Power?

It is easy to understand the constitutional, historical and political reasons which make Ministers cough discreetly before broaching such an idea with the Dominions; and it is not difficult to understand why there should sometimes be fear and distrust in the Dominions of a British foreign policy which is so largely concerned with Europe. But for the next ten or fifteen years the only strategic problem likely seriously to worry the imperial staffs is not exclusively European: it presents itself in the Pacific, in India, in Persia, on the imperial route through the Mediterranean—as well as in Europe.

The CIGS says that he is visiting India to discuss the future of the Indian army, and Australia and New Zealand to discuss training. It would be surprising, indeed alarming, if his attention were not also attracted to these broader questions, which remain very much as the Dominion Prime Ministers left them when they were in London just a year ago. If the CIGS can return from a courtesy visit to Moscow with suggestions for a revision of the Anglo-Soviet Alliance, it should not be difficult for him to return from Australia and New Zealand with suggestions that the Empire Ministers should resume discussions of the British Chiefs of Staff defence plan for the Commonwealth.

* * *

Bluff in Budapest

The platitudinous statements of Mr Dinnyes, the new Hungarian Premier, throw little light on the government's intentions. He stresses the necessity of co-operation between peasants and workers, which has always been a slogan of the Small Farmers' Party. The newly appointed secretaries and members of the Executive of the party belong to its left wing which far from representing the "true peasantry" in contrast to the bourgeoisie, is led by middle class town intellectuals. The party's new chairman, Mr Dobi, has promised a purge from its ranks of "all who made common cause with the conspiracy in their hearts, their ideology or their conduct." This can of course be made to cover almost anything.

The real cause of Nagy's removal has been stated with surprising frankness in the speeches of some Communist leaders. Vice-Premier Rákosi on 5th June stated "we did not wish to be overtaken by the fate of France and Italy." The Communist member of Parliament I. Kovács, speaking in the provincial town Szolnok on 8th June, said that "the clique around Nagy intended to evict the Communist Party from the Government once the Red Army had withdrawn," and that the Foreign Minister Gyöngyössi "while proclaiming friendship with the USSR, had sought contacts with the West."

In other words, if the leaders of a party, which possesses an absolute majority in a freely elected Parliament, decide that they will at some time in the future leave the coalition and form a government by themselves, they are committing a "treasonable plot" against "democracy." If the government of the United States, one of the three victor powers represented on the Control Commission in Budapest, protests against the arrest by the Soviet authorities of a leading politician, or asks to see the "confession" made by this politician which "inculcates" the dismissed Premier, that is intervention threatening Hungary's independence. "Democracy" always means the policy advocated by Communists and (as long as they "co-operate honestly") their Socialist allies. "Independence" is by definition any state of affairs approved by the Soviet Union, whose interests are *ex hypothesi* identical with Hungary's. In the "popular democracies" of Eastern Europe these words are consistently used with these meanings, and it is important that the western public should understand them.

The most revealing statement of intentions to date is the statement of the Socialist Rics, the Minister of Justice, on proposed restrictions of the franchise for the forthcoming elections. These will exclude all who have been "condemned for crimes against the Republic or democracy"—a phrase which may cover anyone temporarily interned by the police since 1945—and all relatives of such persons "up to the degree of cousin" who have resided in the same house with them. The age of voting will also be raised from 21 to 22—an interesting comment on the claim of the Communist Party to have won the youth of Hungary.

Fifty-five Days to Go

Lord Mountbatten's tactics for covering the evacuation of the British Raj from India appear to consist in keeping everybody so busy that the new India will take shape before anyone has time to think about it and British official responsibility can finally be unloaded while the going is still good. There is a sense of extreme urgency, for with the British control now so attenuated, there is a danger zone before the day of transfer and a serious upheaval before the day or a failure to carry through the arrangements for an orderly transfer would make a sorry conclusion to a tale which so far has turned out more happily than many observers of the Indian scene dared to hope. To impress officials in New Delhi with the need for haste, the Viceroy has circulated a special desk calendar with the warning on June 22nd "55 days left in which to prepare for the transfer of power." Outside the capital the agreed plan is being rapidly carried out; the Bengal and Punjab legislatures have both—as was expected—voted for partition, and the preparations for the North-west Frontier Province referendum are well advanced. Steps are being taken to provide Pakistan with the essentials of a capital city in Karachi, which is to be for the time being the seat of Mr Jinnah's Government; there is talk of building later on a new city on the upper Indus to be called after Pakistan's founder.

The Viceroy's calendar shows that the transition to Dominion Status is reckoned as the "transfer of power," as indeed it is, for the Viceroy thereafter will be able constitutionally to act only on the advice of the two Indian Governments. But it appears that June of next year remains the date for the final renunciation of sovereignty, after which Hindustan or Pakistan will be free to decide whether to leave the Commonwealth or not; until then they are to be Dominions—though, as a Dominion can at any time in theory secede if it wants to, even this is hardly a restraint. Whether the two Indias will want to continue as Dominions will depend partly on their experience of the new relation in the coming months, partly also—and psychologically this is of vital importance—on whether a sufficient evolution can take place in English verbal usage. Indians do not like the term "British Commonwealth of Nations," because it seems to imply a British supremacy and Indians rightly point out that they are over three-quarters of the people in it. But why should it not be called just "the Commonwealth" and why should not a Dominion be alternatively "a Commonwealth Nation"? There may be some distress at the shedding of the adjective "British," but some such adaptation of language is required if the desirable fact of voluntary association is to be finally separated from the idea of imperial rule.

Greater Syria

The Greater Syria project will, for the first time, be an election issue this summer. In the Syrian elections on July 7th the Government will have to contend with a strong opposition which will have the union of Syria, Lebanon, Transjordan and Palestine in a single state as its undeclared but generally recognised aim. The natural swing of popular feeling against the Government of the day has operated in Syria, together with more local causes, to divide the electorate, according to some estimates, about evenly for and against the Government.

The present Government of Syria, although based on a comparatively small landowning and merchant class, includes some of the most deservedly respected figures in Arab politics. President Shukri Quwatly, in particular, has always had a high reputation for personal integrity. Their prestige has, however, suffered from their two years of office. There are the usual economic difficulties aggravated by maladministration—bread in Damascus, capital of a wheat-exporting country, is twice the price of bread in Beirut, which imports it. There are the usual accusations of corruption. Above all, the stock grumble of Middle East rural populations against the neglect and inefficiency of the central Government is intensified in Syria by the separatist tendencies of the Druze and the Alaouites.

But on the whole it may be doubted whether there will be a change of régime this time. Governments are apt to win elections in the Middle East as in the Balkans. In Syria the usual accusations of rigging are being made, particularly in connection with electoral changes based on the recent census, which have had the effect of increasing the representation for Damascus, the stronghold of the Government, to 21, and reducing that for Aleppo, an opposition centre, to 15. In 1942 the estimated population of Aleppo was only slightly less than that of Damascus, while in 1938 it was greater.

As for Greater Syria, the fact that the project in its present form is a personal ambition of King Abdullah, which he has been purposefully pursuing since he was freed from British restraint over a year ago, does not necessarily disqualify it for Arabs, who still take a largely personal view of politics, and who regard the Hashimites as the only unquestionably royal Arab family. It does disqualify it for the present rulers of Syria, who have no desire to give up their present position of power and privilege to a king. In this they are supported by the Communists and other convinced Republicans, and it is noteworthy that the Syrian opposition has left it open whether their greater Syria is to be a monarchy or a Republic.

Lebanese support for the Greater Syria project is mostly concentrated in the Moslem north and south, which would welcome any means of being rejoined to the Syrian hinterland from which they were detached by the French 27 years ago. The Lebanon proper, with its Christian majority, is so fearful in any case of the surrounding Moslem sea that it might make the best of a bad job by accepting the protection and respect for its rights which King Abdullah is believed personally to have offered.

* * *

Bargaining by the Jews

The Greater Syria project gains an added topicality from the United Nations inquiry in Palestine. In the event of a partition of Palestine, it would offer a means of disposing of the Arab part by joining it on to Greater Syria. The royalist character of the project at present, however, is a complication, for though Abdullah has supporters in Palestine, they do not include the principal Arab leaders or the progressive youth. There are many who do not like the frequency with which Ministers are changed at Amman and who accuse him, rather unfairly, considering what an oasis of good government Transjordan on the whole is, of subservience to Britain. He has also been much damaged in Arab eyes in the past by Zionist publicity favourable to him.

The Jewish Agency's public re-assertion this week of the demand, made originally at the Biltmore Convention in New York in May, 1942, for a Jewish State over the whole of Palestine is not likely to affect the issue of partition one way or the other. If there is any bargaining to be done, the Oriental principle, which has always been followed in Palestine, is to raise the initial demand as high as possible, so that subsequent concessions may be less disastrous. And it was doubtless felt necessary to erase any impression of willingness to compromise which might have been left by Mr Ben Gurion's recent indiscretion, when he publicly admitted the possibility of partition, and for which he was officially reprimanded by the Jewish Agency Executive, of which he is a member.

Yet the main attraction of the Greater Syria project is not its relation to the future of Palestine, on which the United Nations may take quite other views, but, first, that it aims at re-joining what belongs together and was arbitrarily divided up by the Powers, and, secondly, that it can be accomplished piecemeal. But apart from the internal obstacles in the countries concerned, it has powerful opponents outside.

In the Arab League charter there is express provision for member states to enter into closer association with one another within the framework of the League. Yet every such change would affect the balance of power. Any plan to increase the power of the Hashimite family will be opposed by King Ibn Saud, who is consequently a strong opponent of the Greater Syria project. Egypt, too, is against it, first, because it generally aligns itself with Saudi-Arabia in League politics, secondly, because it does not like Transjordan's dependence on Britain and, thirdly, because Egypt's own hegemony, which is the condition of its interest in the Arab League, might be threatened by a Hashimite Greater Syria in association with a Hashimite Iraq.

The Foreign Office, as is understandable in view of the complications, has carefully kept out of the Greater Syria question. It now has a separate Legation in Damascus with a Minister of its own, instead of covering both countries with a single Minister based on Beirut. Relations with President Shukri Quwatli and his Government are excellent, as they are with King Abdullah and King Ibn Saud. British officials and advisers in different camps may sometimes find it difficult not to commit themselves one way or the other, but that is inevitable in the circumstances. Britain has the best of all reasons for holding aloof, that of not knowing whether British interests would be better served by the success of the Greater Syria project or its failure.

Rhine and Moselle

With Europe so much more hungry than thirsty, it would not be in the best of taste to welcome with normal, hearty approval the prospect that the great and good Hocks and Moselles are at last to be released from the vaults of the French Zone of Germany. It now seems highly probable that from September 1st onward some 200,000 hectolitres (4,400,000 gallons) of Rhine and Moselle wines, two-thirds of it of good quality, will be on offer for export—if the dollars and the bottles are available. And it is just possible that some may be exchangeable for sterling.

Some will certainly denounce roundly as indecent at this time any interest in the thought of seeing and tasting again the Hochheimers, Johannisbergers, Rupprechtbergers and Berncastlers. Not so the Germans of the Rhineland and their French governors who have to find dollars to buy abroad over 25 per cent of their scanty rations. For the first quota of wine to be released should earn between 10 and 15 million dollars, even on a pessimistic estimate; and that means a contribution of 11 or 12 per cent towards the \$90 million needed to pay for the imports scheduled in the French Zone programme for the first half of this year. The French reckon that there are over half-a-million hectolitres of good wine in stock, an estimate based on a stocktaking by Germans, with allowance made for oversights and lapses of memory—for the wine-grower is like the peasant and likes to keep something in hand.

Why have two years of occupation passed before this important export trade is revived? The answer does credit to the good sense and honour of one set of French officials, and damage to the reputation of another. In 1945 the first vengeful idea was that the handling of the Rhineland and Palatinate wines should be left to an Alsatian monopoly, Alsace having suffered severely from the war and the organised devastation of the German retreat. The first experiments with inferior wines turned into brandy or into table wines with French labels did no credit to anyone. The French authorities in the Coblenz area stoutly defended the good wines from the depredations of the monopoly, and after eighteen months of dispute "froze" them. Further argument brought a victory for the men on the spot, and enlightenment spread so rapidly that there was even talk of forming an Allied body to distribute fairly this German treasure. Had there been a European Wine Commission, Mr Strachey would probably have had no difficulty about deciding how much Hock and Moselle Britain can afford; he would have been given a ration. As it is he will face a difficult choice between austerity, the clamour of the clubs and the chance of doing a good turn to a hard-pressed part of Germany. It may be useful to recall that Laurence Sterne described Hock as "a good wine for curates."

Shorter Notes

In a debate in the House of Lords on June 25th, Lord Pakenham announced the Government's acceptance of the Scarborough Commission's report on the development of Slavonic, African and Oriental studies. Appropriate interdepartmental committees are being set up, and there will also be two sub-committees of the University Grants Committee, one to deal with developments on the African and Oriental side, the other on the Slavonic side. Revenue grants up to £125,000 will be provided for the universities in the academic year 1947-8, as well as grants for post-graduate studentships.

To help to ease London's traffic congestion at the peak hours of travel, the London County Council have arranged for a year's experiment whereby about half of their 4,400 staff will work from 9 a.m. to 4.30 p.m. (5 p.m. on Fridays) and 9 a.m. to 12 noon on Saturdays, and the other half will work 9.30 a.m. to 5 p.m. (5.30 on Fridays) and 9.30 a.m. to 12.30 p.m. on Saturdays. The earlier hours will operate consistently for five of the Council's departments.

Outlet for Output

COMPLETE distribution to meet the total needs of the country depends on goods finding their way through all the widely-scattered retail outlets. But these goods must be directed through some channel, and that is where the wholesale textile distributor comes in.

Through the wholesaler, who buys in bulk and carries stock according to the standards laid down by the Wholesale Textile Association, the manufacturer is relieved of much costly detail and ensured a nationwide distribution.

Issued in the interests of Economic Textile Distribution by

The Wholesale Textile Association, 75 Cannon Street, London, E.C.4

SIAM offers

Siam has been quick to recover from the effect of war and her abundant natural resources are again available to British manufacturers. Export can be arranged for the following commodities:—

Sticklac	Shellac	Seedlac
Copra seed	Castor seed	Sesame seed
Gum Damar	Cinnamon	Soya beans
Hardwoods	Resins	Hides & Reptile skins
Zircons	Sapphires	Rubies

SIAM needs

Reciprocal trading is encouraged for the commercial and economic development of Siam. Improvements in industrial and agricultural production and the standard of living call for machinery and consumer goods of all kinds. If you are interested in Siam as a market, send your enquiries to:—

SIAM MERCHANTS (London) LTD.

the organisation devoted to two-way trading with Siam.

Write to:—

SIAM MERCHANTS (LONDON) LTD.
4, Henrietta Place, London, W.1. LAngham 3186/1350.

Agents:

Siam Merchants, 115a/115b, Charoen Krung Road, Bangkok, Siam.
Siam Merchants, 17/23, West 60th Street, New York.

Agents also at:—Singapore, Rio de Janeiro, Marseilles, Genoa, Bergen and Oslo.

Letters to the Editor

The Initiative in Europe

SIR,—In your interesting leading article entitled "The Initiative in Europe," you suggest that the European balance sheet should be drawn up not as a demand note for dollars, but as a list for concrete needs—wheat, coal, and machinery—because it would thus emphasise the interest of the American cotton growers, machine manufacturers, and farmers in securing a market for their products. May I suggest that such a balance sheet would also clarify thinking in Europe? It has become the practice of the extreme right and of the extreme left to speak of "dollar domination" and "dollar diplomacy" as if the dollar were something which had a meaning in itself, and did not represent the concrete things of which you speak. When a leading politician says that "We do not want American dollars" his words seem to make sense, but if they are translated into the statement that "We do not want American food and machinery" they appear to be less reasonable.

Two unfortunate consequences follow from the present practice of speaking in terms of the dollar. The first is the creation of a prejudice against the United States of which most Americans are conscious. The money-lender has always been unpopular, and therefore a country which lends money will inevitably be regarded in an unfavourable light. On the other hand, a person who lends or gives food and other supplies to those who are in immediate need of them is regarded as a good Samaritan. As long as American aid is stated in terms of dollars the first point of view will be emphasised, but if it is described in concrete terms then the actual help which the United States may give will be more clearly realised.

The second unfortunate consequence of speaking in terms of the dollar is that the average European fails to realise that the Marshall plan does call for a definite sacrifice on the part of the United States. American gold and paper dollars may be almost limitless, but the concrete goods which they represent are not. If the United States were to send over sufficient wheat, meat, and fats to feed Europe adequately there would be a marked stringency at home. The problem therefore is not the comparatively simple one of making a loan of dollars, but the difficult one of determining to what extent the American people are prepared to limit their own consumption in the interest of the less fortunate people of other countries. I believe that the American people will be the more ready to do this if the Europeans make it clear that they understand what the United States is being asked to do.—Yours faithfully,

A. L. GOODHART
University College, Oxford

Juvenile Employment

SIR,—This article last week poses the question, "Whence is the employer to derive this labour force?" i.e., the labour force necessary to perform the dull routine jobs of an economy which has pushed division of labour to an extreme limit. In the light of the statistics presented and on the general trend of the article the question seems unanswerable, but surely the solution lies in the increasing rationalisation and mechanisation of the jobs in question, to which only scant attention is paid in the article.

On the assumption that the juvenile labour force of 1958 is to be less than half that of 1938, firms will have to examine their present systems of working with a view to eliminating all non-essential tasks and reducing essential tasks to a minimum. There is still enormous scope for the introduction of more efficient working methods, and generally the more routine and uninteresting a job appears the more likely is it that it can be performed by a machine—the old wasteful method of sticking stamps on envelopes can be replaced by machine-franking; the addressing of envelopes can be done by addressograph machines or perhaps eliminated by using window envelopes; and presumably the boys who have acquired a higher education through extended schooling and service training will not require such a lengthy period of apprenticeship.

If our industry and commerce could be further rationalised and raised to a higher pitch of efficiency a juvenile labour force of just over two millions in 1958 might still be sufficient to cope with the jobs which still require to be done by boys and girls.—Yours faithfully,

A. R. SINCLAIR

42 Dalkeith Road, Edinburgh

The War in Manchuria

SIR,—I would like to challenge the statement in your article on June 21st that "the Communists would not be established in Manchuria at all if Russia had honestly carried out the terms of the 1945 treaty. . . ." In fact, there was a considerable amount of Communist organisation in Manchuria long before the end of the war. Eighth Route Army guerrilla organisations started to expand into Manchuria in 1941, and by the end of the war covered a large part of Jehol and southern Liaoning provinces. Besides the Eighth Route Army there was Chou Pao-chung's "United Northeastern Army," which had developed from some of the original guerrilla groups in the early 1930s. This claimed to have controlled a force of 300,000 in 1938, though, by the end of the war, it had been driven back to guerrilla areas in the north-east of Manchuria.

The Russians allowed these local organisations to develop but in August, 1945, they actually disarmed some regular Eighth Route Army units that tried to penetrate into Manchuria and, at the beginning of September, Russian officers flew to Yenan to request Communist headquarters to stop any further attempts to move regular troops into areas held by the Russians.

The Russians could actually have given the Communists the whole of Manchuria with a large armaments industry in working order simply by evacuating Manchuria, without looting Manchurian industry, at the end of the three month period agreed in the original treaty. Even with the free use of Dairen it is unlikely that the Kuomintang could have got large forces into Manchuria in November, 1945.

In fact the Kuomintang could only move its armies to the North with American assistance and, up to the beginning of 1946, the Kuomintang position in North China depended very largely on support from the Japanese. It would, therefore, be more accurate to say that, if the Americans had honestly kept

STORY OF THE BATTLE OF WATERLOO. Part I and II. By the Rev. G. R. GLEIG. Murray's Home and Colonial Library.

WE are surprised, after having heard and read of the battle of Waterloo for the best part of a life, at the freshness Mr Gleig has imparted to the tragic story. His descriptions are at once vivid and exact. They will be read with pleasure by the civilian, and will be studied by the soldier. He seems to have neglected no source of information, and has made his book as complete as it is interesting. Whatever may be the cause in which men are engaged, it is impossible to avoid feeling sympathy with heroic achievements. We admire the moral grandeur we have no desire to imitate, and can scarcely feel less respect for the noble exertions of the discomfited enemy than for those of the victorious friend. Indeed, at this distance of time, when we know nothing of what might have been the consequences of defeat, and fancy we have derived either for England or her allies but little solid advantage from victory, we feel almost as much sympathy with the struggling emperor as his stern conqueror. If the former was fighting only for his personal aggrandisement, we never fancy the latter sympathising with the millions, and exerting his consummate skill to raise the crushed masses into life and intellect. Wellington ever marched in the cold path of duty to his sovereign and attachment to his order, and never once strayed on the side of popularity. He never fought the battles of the people. His great opponent was originally their hero, and only became the despot when he had seized the power which others had claimed by birth and for centuries. . . . The story has, however, many charms. It was the last great battle in Europe. It decided the fate of many kingdoms. It was fought, on both sides, with great skill and great courage. It kindles all our sympathies, moral and political. . . . Mr Gleig's spirited narrative will make it, now that it is passing away from the recollection of the living generation, and now that all those who took part in it are fast leaving the scene, familiar in all its details to the rising and all future generations. The "Story of the Battle of Waterloo" will be as popular as Southey's "Life of Nelson," or one of Dickens' novels, and will be one of the "hand-books" for posterity for many years.

to their declared policy of disarming the Japanese and not intervening in the civil war, Chiang Kai-shek's forces would not be established in either Manchuria or North China.—Yours faithfully,
MICHAEL LINDSAY.

Balliol College, Oxford

[The text of the Sino-Soviet Treaty makes it quite clear that Russia bound itself to recognise only the Nanking (then Chungking) Government as the authority to which it would hand over in Manchuria; hence, on the basis of its own undertaking, it had no right to allow forces hostile to that Government (whether they came originally from inside or outside Manchuria) to "develop," as Mr. Lindsay puts it, and equip themselves with war material surrendered to Russia. If the Russians had not done this and had allowed the use of Dairen, there is no reason why the Chinese Government should not have put enough troops into Manchuria in three months for an effective occupation, for the Communists' local organisation in Manchuria before the Japanese surrender was not at all comparable to their hold on Hopei or Shantung.—EDITOR.]

Colonial Development

SIR,—In your issue of June 21st, discussing the new phase in colonial development, you point to a number of grounds for objection. There is one which you have omitted to mention which, although not of immediate importance, may develop very serious consequences in the future. If, as is to be presumed, the capital for these new development schemes is to be found from the United Kingdom Treasury and the United Kingdom Government is constituted the sole buyer on the bulk purchase principle, the colonies concerned, especially the smaller ones, will become economically the dependents of Whitehall. Indeed, the hold upon these colonies is likely to become so tight that they will lose their economic identity altogether. The conception of colonies as partners within the British Empire which has been gaining rapid headway during the last few years will thus disappear, for we appear to be going back some three hundred years, to the time when colonies were regarded simply as supply depots for the mother country.—Yours faithfully,

W. A. WELLS,
News Editor, Empire Industries Association.
9 Victoria Street, S.W.1.

If Roosevelt Had Lived

"Where are We Heading?" By Sumner Welles. Hamish Hamilton, 1947. 324 pages. 15s.

IT is always a hazard to write a study of contemporary international politics. The flow of events is so rapid that the book is in danger of being out-of-date almost before it is published. It cannot be said that history has been very kind to Mr. Sumner Welles. It is not his fault that the enunciation of the Truman Doctrine followed the publication of his book in the United States, or that the Marshall plan was announced within a week or so of the book's appearance in this country. But inevitably the value of his comments is much reduced by this unfortunate piece of timing.

A more serious criticism is, however, that his study does not really either lead up to or throw light on the two major events in recent American history. The Truman Doctrine and the Marshall plan are, after all, only two more attempts to deal with the world's most intricate and intractable problems—American-Soviet relations and the restoration of world prosperity. But Mr. Sumner Welles's rather discursive comments on five years of international diplomacy does little to concentrate attention on these two major problems, and does not throw much light on American reactions to them.

In the vital field of American-Soviet relations, Mr. Welles does very rightly insist that the choice between one world and two worlds is the most fateful choice mankind has to make, and he sees the relationship between America and Russia as the key to the future of the United Nations. He also has some pages of sympathetic and imaginative understanding of Russia's difficulties and historical weaknesses which are a welcome change from the hysterical condemnation of all things Russian which seems to be the common coin of politics in the United States to-day. But do his solutions for improving Russo-American relations take us very much further? His chief thesis is that all might have been well if President Roosevelt had lived. The President had established a good personal relationship of confidence with Stalin. On this basis he would have secured Russia's friendship by firmness

Communism in Eastern Europe

SIR,—Allow me to point out an inaccuracy in your special correspondent's article in your issue of June 14th, when he writes that "Czechoslovakia was the only country east of Germany where Communists experienced political freedom between the wars. Elsewhere, though there were brief parliamentary periods when some of the opponents of the old regimes were able to criticise, the Communists were always outside the law."

The above was certainly not the case in Greece. From 1926-1936 the Communist Party enjoyed complete freedom, and actually had 15 seats in the Chamber elected at the elections of January 26, 1936. In fact, in the Chamber in question, they held a commanding position owing to the two main bourgeois blocs being evenly balanced. During the same period (1926-1936) Communists were elected as mayors in three of the principal Macedonian cities—at Salonika (Patrikios), Cavalla (Partsalides) and Serres (Menychtas).

It was only after August 4, 1936, the date when the parliamentary regime was abrogated by Metaxas, that the Communist Party, together with all other political parties in Greece, was suppressed.—Yours faithfully,

A. A. PALLIS

Day Nurseries

SIR,—In your issue of June 21st in "Shorter Notes," you state that at the present time about 63,000 babies are in the nurseries and therefore presumably about 63,000 mothers are enabled to go into industry. May I point out that approximately 12,600 attendants (probably an under estimate) are required to look after these babies so that the net effect of the nurseries is considerably smaller than you imply. Furthermore, these younger unmarried women would often be of more value than the mother of a family who so often has to stay away from work.—Yours faithfully,

16 Bishopswood Road, Highgate, N.6

Books and Publications

on principle (for instance, the points of the Atlantic Charter) and flexibility and patience on detail. Once the President died, Mr. Welles avers that confidence vanished, and that Mr. Byrnes, by a mixture of appeasement and stubbornness, brought out the worst in Russian diplomacy.

Now, one may well deplore, with Mr. Welles, the tenure of office of Mr. James Byrnes. But even with better relationships, the diplomatic exchanges might have proved equally abortive. One factor which might have made a tremendous difference to the Russians' attitude—the offer of a large loan for reconstruction from America—was broached as early as 1943, and President Roosevelt's successors cannot be blamed for the fact that this opportunity was allowed to slip. Mr. Welles does not mention this point.

This omission is part of a wider omission—the author's relative lack of interest in the economic dilemma facing Europe and the world. There is nothing in Mr. Welles's pages to suggest the onset of the tremendous dollar crisis which has occasioned the Marshall offer. Mr. Welles mentions with approval the various American moves to restore a world-wide system of free trade—the setting up of the World Bank, the ITO, and the Import-Export Bank, the extending of the loan to Britain. But he mentions none of the obstacles to sane economic relations between America and the world and, by an almost Freudian lapse, his own reference (on page 289) to the basic difficulty—that the United States must "recognise the need, for her own long-range benefit as well as for the shorter range requirements of general world recovery, of becoming increasingly an importing country"—is rendered completely meaningless by reading "becoming an increasingly important country."

The direction in which Mr. Welles wants the world to lead—one world based on the United Nations and on freedom and on rising standards of living—is one which all liberal men will welcome. Equally they share his fear—that a permanent division of the world and atomic war may lie ahead. But they want to know how to get from here, with all its fears, to there—where some hope lies. But Mr. Welles has not shown himself a very constructive guide to this journey.

National Labour Policy

"A National Labor Policy." By Harold W. Metz and Meyer Jacobstein. The Brookings Institution. 164 pages. \$2.52

READERS of this book will fail to find in it the Key to the present crisis in America over the new Labour Bill, for it gives only half the picture.

In 1945 the Brookings Institution published *The Labor Policy of The Federal Government* by Mr Metz. Within a year of its publication the wartime structure of labour controls had collapsed; the War Labour Board was abolished and its successor, the Wage Stabilisation Board, was short-lived. The country was thrown back on the machinery and policies left over from the New Deal, notably the Norris-LaGuardia Act and the Wagner Act. By the time 1946 was over, with its hectic succession of industrial disputes in almost every industry, it was apparent to everyone except trade union leaders that such machinery and policies were inadequate. What was lacking was agreement on what should take their place. This further Brookings study is an attempt to formulate a policy, based on the facts in the earlier volume, and not too obviously biased in favour of any of the contesting parties.

The authors advocate, not surprisingly, many of the measures which the present Congress has attempted to embody in its present Labour Bill. They would ban the closed shop, outlaw jurisdictional, sympathetic and "feather-bedding" strikes, make unions suable for violating their agreements, reform the constitution and powers of the National Labour Relations Board and take the Conciliation Service out of the Department of Labour. They would even go further than Congress by forbidding industry wide bargaining powers and by reviving the injunction. For all these proposals they have little difficulty in elaborating a theoretical justification based on a series of premises about national and communal interests. The trouble about such an approach is that it is precisely the lack of adequate agreement on the priorities of national need that is at the root of the present discontents, and the authors' major premise—that productive efficiency is the final determinant of a labour policy—is not accepted by organised labour in the United States. The union revolt now going on against the "slave labour" Bill passed over the President's veto is the measure of the authors' failure to come to grips with the human factor in American labour relations. In view of the known difficulty of securing the acceptance by labour of such curbs on its power—the authors quote many instances of the political bargaining strength of labour—it is a pity that this study did not explore the advantages to be derived by labour itself from certain reforms, such as the abolition of restrictive practices, and the imposition of certain democratic internal controls on trade unions. As it is, the reader is left with a certain sense of unreality, even futility, about proposals whose abstract justice makes little contact with political practicality.

Election Retrospect

"The British General Election 1945." By R. B. McCallam and Alison Readman. Oxford University Press. 131 pages. 18s.

IN its quiet way this is a fascinating book. It differs radically from the usual highly coloured partisan descriptions of election events by being a serious and impartial attempt to analyse the temper of the public, the propaganda of the parties, the attitude of the press, the machinery of elections, and the day to day crescendo of excitement of a British General Election. The authors did the work as a piece of sociological research for Nuffield College, but in spite of this intentionally academic approach, the book catches and reflects much of the turbulent mood of the election weeks.

From the distance of nearly two years it is both amusing and interesting to be reminded of contemporary reactions to the Laski affair and to Mr Churchill's speeches, of the changes of tactics of the two main parties as the campaign developed, and to have digested and assessed the part played by the principal national newspapers. Time blurs such impressions quickly, and in any case no individual during his normal day's work has the opportunity to cover the whole field in this way. It is the more the pity that, as the authors themselves admit, their resources did not extend to a wide coverage of individual election contests in the constituencies. Because they had only themselves to depend on the authors could only visit a handful of constituencies, and these for only a day or two, so that they were necessarily limited to a first hand description of only a few meetings and a tiny

sample of election campaigns. A much wider system of reports would have been a valuable supplement, and it is to be hoped that Nuffield College will be able to provide more liberal funds next time a general election appears to be brewing.

As the result of this limitation impressions of popular reactions had to be largely restricted to newspaper reports most of which had a strong political bias. Yet the most valuable aspect of the book is its impression of political stability beneath the surface of propaganda, of the reserves of common-sense possessed by the British public in the face of electioneering tactics, of the increasing significance of education among the electorate, and of the basic honesty of the whole election machine compared with systems abroad. One of the authors' most interesting comments is on the public's complete confidence in an innovation which allowed the ballot boxes to remain uncounted for three weeks while the service votes came in. In how few countries would political honesty have been so unquestioningly assumed?

Nutrition in Industry

"Nutrition in Industry." International Labour Office. Montreal, 1946. P. S. King and Staples, London. 180 pages. 6s.

THE report published by the International Labour Office on nutrition in industry is confined to a study of industrial canteen developments in three countries—Canada, United States and Great Britain. Nevertheless it makes a valuable contribution to the study of a problem which has hitherto been largely ignored, but which is vitally important from the point of view of maintaining industrial health and productive efficiency.

In many respects, the position and the measures taken in the three countries are surprisingly similar. In all three, little had been done before the war, apart from the efforts of the more far-seeing employers, to provide feeding arrangements for their employees. In all three countries, the war gave a tremendous impetus to the development of industrial canteens and showed that adequate, reasonably-priced meals on the job were an indispensable factor in maintaining industrial morale and raising production, particularly when large numbers of "uprooted" war workers were involved.

The report outlines the steps taken by government and non-government agencies to develop canteens and improve nutritional standards in each country. In Canada and the United States this was done on a voluntary basis. In Britain, on the other hand, industrial canteens became compulsory at an early stage of the war, with the result that their number increased from 1,650, mainly in larger works, in February, 1941, to 12,245 in larger and smaller works, building sites and docks, by March, 1945.

The great question for all three countries is whether the war-time advances can be incorporated into the permanent industrial structure. In Britain, although the proportion of workers who use the facilities is often disappointingly small, there is no doubt that the factory canteen has come to stay. In America, a large number of the employers who established canteens as a wartime emergency are prepared to continue the practice in the future. The ILO report is, as might be expected, very definitely in favour of the retention of industrial canteens and their extension as rapidly as possible to all works now without facilities.

There is still need for further research on the subject, not only into the number and types of canteens, but into the diets and in particular to the relation of diet to industrial health and output. This is a task which the ILO would be well equipped to undertake.

AMERICAN SURVEY

Congress and the Veto

(From Our US Editorial Staff)

THE President's power of veto, which derives from the first Article of the Constitution of the United States, is an essential part of the American system of government. It is a loaded gun given to every President by the founding fathers for the protection of the Union against the mob. It must be used sparingly—too frequent use irritates even a President's most dogged supporters—and is often most effective when merely pointed. Mr Truman, intent on keeping the goodwill of those Republican leaders on whom he depends for his bi-partisan foreign policy, has been careful in his handling of such a dangerous weapon.

Every Bill, after passing the two Houses of Congress, is sent to the White House for signature by the President, who can do one of three things. He can do nothing—in which case the Bill becomes law at the end of ten days except at the end of a session, when inaction becomes the "pocket veto." He can sign it and the Bill becomes law at once. Or he can send it back to whichever House originated the legislation with a message explaining his objections. The Bill is then reconsidered and, if passed by a two-thirds majority of both Houses, becomes law. The power to check given to the President is thus balanced by the power to override him given to Congress.

The veto of a similar device is necessary to any system of government in which the executive and the legislature are separate and can belong to opposing parties. Where the executive springs from, and is a part of, the legislature, as in the English system, it is unnecessary; defeat for the Government is followed by resignation. In the United States, neither President nor Congress can resign. No President can be expected to administer acts of which he disapproves without an effective method of protest. For this he is given the veto. Nor can a legislature be expected to watch its efforts destroyed without a means of redress. For this it is given the power of overriding the veto.

Among the objects of the Constitution were, according to the preamble, to "establish justice" and "secure the blessings of liberty"—but not to promote representative government, of which the signers were afraid. The House of Representatives was to be popularly elected, but the Senate was until 1913 nominated by the State Legislatures, and the President (as he still is in theory) chosen by an electoral college of electors from each State who were to make their decision in objective seclusion. Such a system was designed to ensure an aristocrat as President and an aristocratic Senate. It made passage of a popular Bill unlikely for, if accepted by the House, it could be stopped in the Senate. Should the Senate nod, the President stood as the last line of defence, armed with the veto. This would delay the enemy until one-third of the Senators awoke to the danger and voted to uphold the President.

There later developed, within the letter, but outside the spirit, of the Constitution, a method of electing the President by popular vote. Andrew Jackson was the first such President,

a man of the people, a departure from the aristocratic tradition. In his hands the veto ceased to be a weapon of the established interests against the mob. Jackson used it to defend the common people against attempts to encroach on their rights. In a famous message to Congress he said "It is to be regretted that the rich and powerful too often bend the acts of government to their selfish purposes... When the laws undertake... to make the rich richer... the humble members of society have a right to complain of the injustice of their government." Such an idea astonished Congress, and Daniel Webster considered that "It manifestly seeks to influence the poor against the rich" which, indeed, it did.

*

Mr Truman has adopted the Jacksonian conception of the veto. He first used it on an important measure last summer while he still had nominal control of Congress. He returned to Congress what he considered to be an inadequate price control and rationing Bill and tried to rouse the people to come to their own rescue. The occasion was a proper one. The fight was between the people and their representatives, who were betraying them to pressure groups. But he was beaten for two reasons. He had vetoed a weak Bill in the hope of getting a stronger one. Congress could and did refuse to give it to him. And the people, tired of controls, had decided that they would rather pay too much than do without.

Since that time he has been more careful and has avoided a major engagement until last week. Then the time came when he was forced to act. He vetoed the Tax Bill and the Labour Bill within a few days of each other. Both vetoes took courage at a time when Administration needed all its Congressional goodwill in readiness for developments in the Marshall plan. The veto of the Tax Bill was sustained in the House—that is, the two-thirds majority necessary to override it was not forthcoming—but at the price of some bitterness from conservative supporters of the President's foreign policy. It was a veto which could easily be misunderstood. Tax reductions are popular even if unjust in their application and almost every voter will be disappointed in his hopes of tax relief as a result of the President's action. Mr Truman has been rescued by Republican spokesmen who did their best to destroy their own case with the people. Keeping their eyes firmly on their financial backers, they complained of Mr Truman's adherence to the "now discredited New Deal spending philosophy," thereby explaining better than Mr Truman himself had done the nature of the Tax Bill he had killed. Republican leadership can be counted on to continue this form of aid to the Democrats.

The Labour Bill is a more delicate matter. Even Labour's friends have been disappointed at the irresponsibility of its leadership since the end of the war and there is a majority of the country in favour of some legislation regulating its powers. Aware of this, the Republican majority wrote an omnibus Bill carefully calculated to put the President on the spot. It is a repressive measure which nevertheless includes some of the features which were generally believed to be necessary. It has the support of the Southern Democrats, now the majority of the President's supporters in Congress, and it has easily been passed over the veto, making the President's gesture an empty one. But the gesture was necessary. Next year is election year and the support of Labour is vital if Mr Truman is to have any chance of re-election. The passage of this Bill over his veto and against the votes of the Democratic

"AMERICAN SURVEY" is drawn from three sources. Articles described as "From Our US Editorial Staff" are the work of a small group of regular correspondents, resident in the United States. Articles with some such attribution as "From An Industrial Correspondent" or "From A Correspondent in Ohio" are from outside contributors. Everything printed without attribution is prepared in London.

Congressmen from the big cities can be counted on to show Labour which party is its true friend, and, it is hoped, will counter any tendency to support a third party.

When Congress adjourns at the end of July and Mr Truman puts his gun away he will be able to count the casualties. His weapon is an old one and sometimes backfires. If it has done so, the first victim may be the bi-partisan foreign policy and its latest child, the Marshall plan for the rehabilitation of Europe. Congress will not meet again until January unless called to a special session. By the New Year it is thought that the imminence of the presidential elections will make consideration of any such contentious measure as "Aid to Europe" impossible. If the Marshall plan becomes concrete a special session in the autumn is inevitable. The mood of Congress in such

circumstances is always doubtful. Men who intended to spend the autumn building up their next year's campaign at home have a prejudice against any piece of legislation which has brought them back to Washington. Anger at the President's success in stopping the Tax Bill will be mixed with triumphant bitterness over the episode of the Labour Bill. This will not be the atmosphere in which the Administration would want to introduce a plan for giving help to Europe on an unheard-of scale. The President must have counted all these costs with care. While he risked support for his foreign policy by his vetoes he helped his own re-election, without which none of his policies would have any value. If he calls a special session he will present Congress with facts and fears gloomy enough to give his legislation a good chance of success.

Labour versus the Law

DESPITE a gallant rearguard action by the Republican Senator Morse and by those Democratic Senators who still follow the President's lead in labour matters, the Senate voted last Monday, by 68 votes to 25—6 more than the necessary two-thirds—to override the veto of the Taft-Hartley Labour Bill. What the unions have chosen to call the "slave labour" Bill is now law, and the epidemic of unofficial strikes which greeted the news is an indication of how bitter feeling among union members is likely to be. The law which Mr Truman condemned as unworkable is to be put to the test, under the eyes of a "watch-dog" committee of Congress, appointed to consider any amendments which may become necessary. If the chairman of the Committee proves, as is suggested, to be Senator Ball, who fought hard for an even more drastic measure, the Administration will be allowed a minimum of discretion in administering the complex provisions of the new law. Congress has triumphantly celebrated the anniversary of the President's veto of the Case Bill.

Quite apart from its political implications, the passage of the Taft-Hartley Act is an event of major importance in the history of American labour legislation. In "rectifying the bias" of present labour law, it substantially modifies the Wagner Act and the Norris-LaGuardia Act, the corner-stones of labour's rights; for the first time, a detailed code of conduct for labour relations is drawn up. The balances of power between industry and labour, and between one labour union and another, are substantially shifted; the role of government in labour disputes has been enlarged, rather than diminished, by a Republican Congress.

It is possible to argue that to legislate for union responsibility is futile; that no law can create the will to peace and production where it does not exist. But this is not the American approach: the United States is at once the most lawless and the most law-ridden country in the world. It is not even President Truman's view: time and again he has argued that limited legislative reforms are necessary to deal with the problems of strikes affecting the national welfare, jurisdictional and sympathetic strikes, and boycotts. The quarrel between Congress and President is less over ends than over means.

The new law justifies to a sobering degree its designation as an omnibus Bill. Its avowed purpose is to minimise industrial strife by defining, under law, the responsibilities and privileges of labour and management, and their common duty to the community. Nothing that could conceivably be relevant has been scamped. The right of labour to organise and bargain collectively through representatives of its own choosing is expanded to include the right not to organise, except where the union shop has been accepted by the majority of the employees. After recapitulating the offences which constitute unfair labour practices by an employer, the Bill breaks new ground by listing unfair union practices: coercion of employees, either directly or through pressure on an employer; refusal to bargain collectively; jurisdictional strikes and boycotts; excessive initiation or union fees; "featherbedding" (restrictive) practices (in which a union forces an employer to pay for work not done, as is the case when Mr Petrillo forces vendors of canned music to hire

stand-by orchestras who never play a note); and refusal to follow the procedure outlined to diminish strikes. The National Labour Board is given the right to secure injunctions to halt unfair labour practices on the part of either employers or employees, but cases against unions must be given priority.

The heart of the bill—if so sprawling an organism can be said to have any centre—is the procedure to encourage peaceful settlement of disputes. The prescription is, briefly, the mixture as before, only more of it: the cooling-off period first used in the Smith-Connally anti-strike Act, but lengthened to 60 or 90 days instead of 30. During the 60-day period enjoined for the ordinary strike, no employee or employer may indulge in a stoppage; striking employees may be dismissed. In strikes threatening the national interest, exceptional measures are invoked. The President may appoint a board of inquiry, which is to report purely on the facts, without recommendations; the Attorney-General may secure a court injunction preserving the *status-quo* for 80 days. At the end of that period, if no settlement is in sight, a secret ballot will be taken, asking pressingly of each employee whether he really wishes to reject the last offer made by the employer. This offer may, at the employer's choice, be confined to a plant, or a region, or it may be industry-wide. The union has no similar freedom. To this extent, the discouragement of industry-wide bargaining still persists in the bill, despite the efforts of Senators Morse and Ives. If the vote is in favour of a strike, the President is then instructed to forward the facts, with such recommendations as he chooses to make, to Congress. What happens then is Senator Taft's secret.

In his veto message, the President is scornful of this solution, which is likely to make every big strike a political issue. He also argues, with some force, that the imposition of a cooling-off period, for whatever period, does not diminish strikes, because it is founded on the unrealistic assumption that major strikes today are decided upon in a moment of passion. In fact, after the "cooling-off" period, workers almost invariably vote to support their leaders. But it is very difficult to think of an effective substitute, and if the President has found one, he has not thought fit to divulge it.

A very important and controversial section of the Bill gives the National Labour Relations Board the right to determine which are the appropriate unions for bargaining purposes. Craft and professional groups may not be forced, although they are permitted, to join mass production unions, and the Board is given the task of deciding what union is entitled to perform work in dispute. The Board, that is, will have the power of life and death over many unions; it is being thrown to the jurisdictional wolves. At the same time that Congress has imposed these and other vast responsibilities upon the Board (which now has, for example, the unenviable task of deciding what union fees are excessive) it has weakened the Board by providing that new appointments (the number of members if raised from 3 to 5) must be approved by the Senate, an insistence which will make it harder to secure competent men; by ruling that it may not engage economic analysts, or, in certain cases, even appoint arbitrators. It must perform most of these complex new duties unaided. The result of piling new responsibilities upon an

agency diminished in resources will almost certainly create intolerable delay and bitter discontent.

The chaos which may follow the carving up of present union empires (particularly those of some of the constituents of the Congress of Industrial Organisations) will be increased by the ban on the closed shop, which particularly affects the American Federation of Labour. Over 4 million workers now enjoying the closed shop must, if they can, transfer to the union shop, a form of security which provides that although the employer may hire a non-union man, he must join the union within 30 days. This seems an insignificant change, but it involves some of the "booby traps" with which the law is lined. A union shop is permitted only if a majority of all qualified employees vote for it, not merely a majority of those taking part in the election. In other words abstention is a vote against union security.

The Bill also makes unions—but not their individual members—liable for damage suits by employers. Mr Truman protests that this provision will discourage the signing of no-strike pledges like that recently concluded in the steel industry, because unions cannot guarantee that there will be no wildcat, unofficial strikes. But may it not also be true that if heavy damages are involved, unions will find some means of outlawing wild-cat strikes? And is not this observance of contracts the very minimum that unions should contribute toward industrial stability? It should be said that the authors of the bill are equally confused: they want strong unions able to enforce contracts, but they have cultivated every means of weakening the unions' authority over their members.

A provision which has aroused unreasonable objection from the President is the insistence that to enjoy the services and protection of the National Labour Relations Board, unions must file detailed statements of salaries paid, revenues, and expenditure. In view of the racketeering history of some unions, this is a reform long overdue, and if there is adequate assurance of secrecy, it should do well-run unions no harm. Five other provisions should receive brief mention. Government employees are forbidden to strike, and penalties on the model of Governor Dewey's law in New York are imposed if they do. Union welfare funds are subject to regulation. Employers are under no obligation to recognise foremen's unions. No union may enjoy the privileges of collective bargaining unless all its officers sign statements that they are not Communists. A ban is imposed on contributions by corporations or by labour organisations to political parties (the CIO's Political Action Committee is not, apparently, intended).

*

Like most omnibus measures, the Bill is a mixture of good and bad. It is neither as good as Senator Taft believes, nor as "shocking" as President Truman endeavoured to show. No one can deny that it is capable of opening the door to many abuses. Whether these will materialise depends, first, on the central administration of the Act, and the character of the two new members, and secondly, on the good sense of American employers. The law will provide an acid test of how much American management has learned since the days of Mr Herbert Hoover. If they so wish, employers can bleed the unions white by endless litigation; in any event, the new Act will prove, like the Wagner Act, to be a Bill of full employment for the legal labour force. Labour's co-operation is more doubtful; and by neglect of the human factor, and the realities of union life, the justifiable aims of many parts of the Bill will not prevent it, in practice, from doing more harm than good to industrial peace.

The union campaign to repeal the Act is in full swing; it is merely a continuation of the campaign to force a veto. There will be an immediate challenge of the constitutionality of the Act. Two probable results in union politics are fairly evident. The AFL appropriated \$1,500,000, and actually spent \$1,000,000, in the fruitless effort to defeat the bill. It is a very short step now to the creation of a political arm like the CIO's Political Action Committee. The labour federations now have a burning common grievance, which must further co-operation, if not outright merger, between the two.

In Britain it may be wondered whether this is not America's Taft Veto decision; whether the Bill will not provide the final

spur to a third party. The answer is almost certainly negative; one of the motives for the veto was to deprive the advocates of a third party of precisely this issue. Realists in the Labour movement know that the only chances of repeal or substantial amendment lie with a Democratic victory; they would evaporate with the Republican triumph a third party would ensure. In his veto of the tax and labour bills, Mr Truman has returned to the Roosevelt design for victory. The Solid South can be offended, but as yet it cannot be alienated. The important thing is to get out the vote in the big cities, and most of America's 15 million union members and their families will go to the polls next year to register their protest. Senator Taft, who has given his name to the Bill, may not be so proud of its paternity when the squalling infant is thrust into his arms at next summer's Presidential Convention.

American Notes

The Impact of Foreign Aid

Whatever else may be lacking, Congress and the President at least will not suffer from insufficient guidance on the probable impact of the Marshall plan upon the domestic economy. The President is so enthusiastic over Senator Vandenberg's proposal for a bi-partisan committee, that he has made it triplets. Of the three committees he has designated to study the limits within which American aid can be safely extended, the most important is a non-partisan group of business, labour and financial leaders, headed by Mr Harriman, the Secretary of Commerce. More limited terms of reference are assigned to a committee of specialists to be named by the Secretary of the Interior, and to the President's Council of Economic Advisers. The first will study the effect on America's national resources, the second the impact of foreign relief on the economy in general. None of these groups has the political cast contemplated by Senator Vandenberg in his insistence on a bi-partisan committee, but this fourth advisory body is foreshadowed by the President's hearty support for a council made up of both Republicans and Democrats.

The "Aid Europe" plan is gaining new support, in some cases of doubtful value. Mr Henry Wallace has at last made the sensational discovery that the Marshall plan "is what I've been advocating all along." This is a moment which the Administration must have been awaiting with fear and trembling. Senator Byrd is a reinforcement of quite another colour. Long one of the most entrenched advocates of economy at home, he is enthusiastically developing the line that if "we adopt an expanded global venture," we must tighten our belts at home, prepare to make sacrifices abroad, and face the need for continued high taxes. This is a gift horse that Mr Truman's advisers will do well to look long in the mouth.

The air of economic realism which probable opponents of the Marshall plan have adopted is the most remarkable aspect of its reception in the United States, and the Administration has wholeheartedly fallen in with the view that an inventory of American production and resources is an essential prerequisite to decision. This is a logical move; it will certainly prove an essential link in formulating a policy which stands some chance with Congress. But until the reports are in, it will be impossible to tell whether it is Mr Truman's or Mr Hoover's hand on the trigger of this uncertain weapon.

* * *

The Consumer Market

To judge by the most recent business reports, there has been a fairly general disposition to reconsider earlier conclusions on the imminence of a business setback. The May employment figure, for example, touched a new peak at 59.8 millions, including 1,500,000 Servicemen, and unemployment, which a few weeks earlier had looked like touching 3,000,000, was in fact held to below the 2,000,000 mark. Similarly, the April setback in the Reserve Board's production index was accounted for in the full analysis by a decline in textile output—for long a touchy spot—assisted in the main by stoppages following quite small labour disputes.

Most observers, however, would still contend that industrial activity is maintaining a somewhat uneasy equilibrium at the present high level, and a new round of forecasts for recession later this year have followed from a survey of consumer buying plans in 1947 by the Federal Reserve Board. A year ago a similar survey,

based on an extremely careful projection of sample consumer plans, led to consistent appeals by the Reserve Board for the continuance of high margin requirements for security deals, and for the retention of strong consumer credit controls. The predictions of persistent inflationary pressures were, in fact, so well borne out that 1947 estimates are now attracting the more attention because they give official endorsement to the view that pre-Christmas activity marked the peak of the buying spree, and that consumer buying will in future months be influenced far more by considerations of price and quality.

Over the field of durable consumer goods generally, the survey suggests not only a decline in expenditure estimates, but a fall by comparison with actual dollar spending in 1946. The exception, notably, is for automobiles, where the Reserve Board forecast confirms all trade suggestions that demand is still a very long way from saturation. Here, planned expenditures for 1946 totalled \$5.5 billion, and actual purchases (of both new and used cars) totalled \$4.6 billion—a reflection of the disappointing output total for the year. In 1947 consumers are apparently willing to spend at least \$7 billion. For other selected durable goods, where 1946 expenditures were for \$4.2 billion, with actual purchases only very slightly below that level, the 1947 estimate is for \$3 billion only. For houses in urban areas the shortfall on 1946 figures gives remarkable confirmation of recent trade reports. Here, planned purchases for 1946 totalled about \$17.5 billion, with actual purchases at \$14.5 billion. The range of 1947 estimates is extremely wide—between \$13.3 billion only and \$26.2 billion. This very widespread uncertainty in the face of housing shortages more acute than at any previous period in turn reflects the general reaction from the sharp rise in building costs.

No Precise Forecast

The Reserve Board has been careful to stress that the survey (only preliminary data are so far available on this side) cannot

represent any precise forecast of consumer expenditures. The 1946 test gave a remarkably close correlation with total figures, but there were sharp variations on individual estimates owing, in the main, to durable goods shortages. But apart from the technical limitations of such a survey (based on 3,000 interviews as representative of a broad mass of 46 million "spending units") results must be accepted as a split-second "still" in a continuously moving film where the scenery sometimes changes with disconcerting speed. It is a little surprising, for example, to find that fifty-five per cent of consumers questioned in 1947 believed in the continuance of economic activity at or near the current level, against 35 per cent only last year.

This quite general confidence in the future of business activity follows through to plans for future drafts on savings, and for the extension of consumer credits. Confining its survey to holdings of Federal securities and bank deposits, the Reserve Board found that liquid assets on this definition increased by about \$8 billion over 1946. But this overall figure concealed a decline of about \$10 billion among the lower-income groups, of which nearly one-quarter expended all liquid assets in these forms.

Another noteworthy feature is that about 40 per cent of savings were spent for day-to-day expenses, medical care and emergency items, a trend which suggests that there is no great cause for satisfaction in the fact that the low-income group (units with less than \$2,000 yearly) fell from 21,900,000 to 18,500,000. None the less, nearly 40 per cent of consumers questioned indicated their willingness to make fresh drafts on savings. Only 28 per cent were willing to declare their willingness to do so last year, although the proportion of dis-savers turned out, in fact, to be about the same as the estimate for 1947. Nearly 40 per cent indicated their willingness to buy durable goods on credit (against 32 per cent actually borrowing in 1946), while more than 40 per cent of home buyers now wish to borrow 60 per cent or more of the cost.

THE WORLD OVERSEAS

Burma—A Tragedy of Waste

(From Our Special Correspondent in Rangoon)

THE resolution passed by the Constituent Assembly on Monday, June 16th, proclaiming a sovereign independent republic of Burma, had been expected ever since the powerful Anti-Fascist People's Freedom League had made public the details of its own draft constitution several weeks earlier. The League has some 200 seats in the Assembly out of a total for ministerial Burma of 210; and it struck many observers as significant that, at the opening meeting of the Assembly it was the flag of a political party that flew over the assembly hall: the League's red flag with a yellow star, instead of the official Burma flag, the Union Jack with a peacock superimposed.

A small number of educated Burmans, who have travelled and who appreciate the present unhappy condition of Burma and the inexperience of their countrymen, regret the resolution and would like to have seen Dominion status accepted at least for a few years. But the young nationalist leaders have been shouting full independence too long for them to go back at this stage. Withdrawal of the claim would only have weakened their own position and strengthened that of the Communists, and of the small opposition groups headed by U Saw, Dr Ba Maw and Thakin Ba Sein. Dominion Status has always been suspect to Indian and Burmese nationalists, the words "dominion" connoting in their minds domination and "status" inferior status. All those ties of blood, sentiment, language, tradition, and the symbolism of the Crown, which unite the English-speaking Dominions, do not exist in Burma. If, immediately after the liberation of Burma, we had adopted bold policies and given freely then what we have been forced by threats to give now, the tale might have been a different one. The Burmese might have been content with Dominion Status, once they discovered what it really was. There existed then a great fund of goodwill towards the British which was steadily dissipated during the 18 months culminating in the

London conference of January. A man who saw this very clearly at the time was the present Viceroy of India.

Although they have felt compelled to go through with the resolution of independence, nearly all the nationalist leaders understand the advantages to Burma of a close association with Great Britain. Their short tenure of office has made them aware of some of the complexities of administration. Burma's finances are in an unsound condition and the recent Treasury Mission, while it agreed to meet most of the deficit for the present financial year which ends on September 30th, made no promises for the future. Burma, for several years to come, will require large military, naval and air force missions; the maintenance of adequate missions and of an army on the scale that is required, is beyond the present financial capacity of the country. Sponsorship before the manifold international bodies that an independent Burma will join is another advantage that would accrue from a formal association with some outside power. There is a deep-seated fear in Burma of Indian and Chinese pressure and economic penetration, and no particular urge towards reliance either on the Soviet Union or the United States. The obvious Power for Burma to turn to for help in these matters is Great Britain; as its political influence in Burma decreases, its acceptability for this rôle increases. The most experienced man the nationalist leaders can call upon, U Tin Tut, formerly in the ICS and now Minister without Portfolio in the Interim Government is at present in England discussing these questions.

The exact implications of the resolution of independence remain to be seen. It should be noted that the wording proclaims an independent republic, not an independent state. But it is difficult not to feel that the young nationalist leaders are trying to have the best of both worlds, the glamour and prestige of a sovereign republic and the material advantages of membership of the British

Commonwealth. The advantages to Burma are fairly obvious; less so are the advantages to Britain. The attitude of Whitehall during the coming months is likely to be—and quite rightly—"What do we get out of all this?" Britain cannot be expected to go on putting money into Burma just for the sake of old times, nor is it in a position to do so. Its main need is for protection of commercial interests. At present the young nationalists seem hell-bent on pushing through schemes for nationalisation which will press hard on several of Britain's main interests and which, if it be accepted that the most important thing for Burma today is to stimulate production and increase revenue, are against the real interests of the country.

Dacoity and Anarchy

Burma today presents a tragic spectacle. Its *per capita* wealth, in terms of the ratio between natural resources and population, is probably the highest of any country in Asia. It is a tragedy of waste, tragic because largely so unnecessary. The world is clamouring for Burma's products, especially for its rice, but the export surplus from the coming harvest will certainly not be higher than the last (about one-quarter the pre-war surplus) and may be much lower. The failure to restore production can be attributed to a single cause, the failure to restore law and order. Dacoity is still rampant, and in the Arakan the Communist Party is running what is virtually a parallel government, with its own administration and its own courts. The peasants will not work the outlying fields, timber contractors cannot reach the more distant forests, because of marauding gangs of well-armed men, many claiming allegiance to political parties and carrying out oppression in their name. Operation Flush, the big combined military and civil operation that was put on earlier this year to try and curb dacoity in central Burma, is generally admitted to have achieved almost nothing. As soon as the troops were withdrawn the gangs filtered back. The operation failed because it was directed at the leaves, not at the roots, of this vicious growth. As long as private armies are permitted by law, as long as the League leaders concentrate on building up their own private army, the so-called People's Volunteer Organisation (young village lads, who in many districts are scarcely distinguishable from dacoits), and on weakening the hands of the police and all the normal agencies which maintain order, so long will the present semi-anarchic conditions continue. Before the April elections it was said that the Government, composed of League leaders, was reluctant to take strong measures because of repercussions among the voters. The elections are over and the League has an overwhelming majority, but the situation is still allowed to drift.

The administration is running down and that old freedom of civil servants from politics, which the British tried to maintain, has gone already. All appointments, even those formerly at the

discretion of District Commissioners, are now being made from the Home Ministry in Rangoon. The Ministry issues orders for the transfer even of constables if there are political objections against them. It is the beginning of party rule. Consequently, Burmese officials of nearly all grades are acutely uneasy. They do not know when they are going to be dismissed or posted suddenly to the other end of Burma.

Against this troubled and uncertain background the British commercial community gives the impression of facing the future with a considerable, if not an excessive, degree of confidence. The importers and exporters have hitherto made considerable profits; they will presumably continue to do so as long as the present shortage of goods continues. The Burma Oil Company has spent large sums in restoring its oil wells, although the latter are not yet in production. Such a technical business as the extraction of oil will doubtless be the last to pass out of western hands. The same consideration applies in a lesser degree to the wolfram, silver, lead and tin mines. It is probably the firms dealing in timber, rice and inland transportation, which have most reason to be anxious about the future, for it is in those fields that the young nationalists seem keenest to try out the practical application of the magic word "nationalisation." Aung San, however, has stated publicly that, although a socialist state must remain the objective, Burma must pass through an interim capitalist phase if the economy of the country is to be restored. Many people in Rangoon feel that the appointment of a British High Commissioner to Burma is already overdue, and that there is a real need for someone to organise the British interests into a solid bloc.

"Centre of the Universe"

Any student of the Burmese scene is bound sooner or later to come to the conclusion that a key factor in the situation is the boundless self-confidence—some call it conceit or even less polite names—which is a characteristic of the Burmese. (It presents a contrast with the comparative humility and amenability of the Indonesian nationalist leaders). The Burmese are, of course, conscious of a proud tradition, especially a warrior tradition, behind them. Mandalay in the days of the Burmese kings was known as "the centre of the Universe." In more recent times few Burmese, especially among the political leaders now in power, have been abroad. The mountain ranges that cup the country have caused a curious insularity. The young leaders have reason to feel pretty pleased with themselves, for they have virtually achieved their objectives and they have put their country (admittedly a simpler problem) ahead of India on the road to independence. But this self-confidence, when it comes to negotiations on practical straightforward matters such as the future relations between Britain and Burma, often makes them difficult to deal with. It is a factor which must be constantly borne in mind.

Turning Point in Hungary

(From a Special Correspondent)

THE recent crisis appears to be a landmark in the political development of Hungary. For two years the country was ruled by a coalition which genuinely represented the majority of the nation. There was always friction between the conservative Small Farmers' Party and the Left Block of Communists and Socialists, but until the conspiracy crisis of February it was possible to hope that a more or less solid form of democracy would be created, which could combine social change with political liberty, and could maintain friendly relations with both East and West. But though Hungarian public opinion desired this, it has not been achieved. The extremists have had their way. The main responsibility for this must certainly fall on the Communists, who with Soviet backing have long had the lion's share of power and have been able to decide the general trend. But blame must also be shared by the extreme Right, who, believing rightly or wrongly that they had the sympathy of the United States, have provided the provocation which the Communists needed as an excuse for their policy. Now it seems certain that Hungary will evolve in the same direction as Bulgaria and Rumania, towards a dictatorship in which the Communists hold the real power, the Socialists are thrown a few crumbs from the table, and rump peasant and bourgeois groups are kept in the Government as window dressing. The new Premier Dinnyes is a docile nonentity, and the Small Farmers' Party has been reorganised in

such a manner as to give the key positions in its machine to members of a "fellow-travelling" left wing. It is officially announced that a new electoral law is being prepared which will greatly restrict the franchise. The present moment, therefore, affords a good opportunity to consider the main problems which have faced Hungary during two years of coalition.

The first achievement of the coalition was the land reform, carried out in the spring and summer of 1945. This was absolutely necessary in order to break the political power of the old ruling class of landowners and "gentry" and to satisfy the demands of the peasants for social justice. It has been violently criticised by the Right in Hungary and abroad, and all Hungary's economic misfortunes have been attributed to it. It undoubtedly caused economic dislocation, but it is the belief of serious observers that if there had been no reform, dislocation would have been even greater, as the peasants would have refused to till land which was not theirs and whose owners had fled with the German Army. No one but an irresponsible demagogue believes that the reform has solved the peasant problem in Hungary. There is not enough land for everybody, and several hundred thousand peasants remain landless agricultural labourers, many of them unemployed. The new smallholders lack livestock and implements, destroyed during military operations or removed by the German or Soviet armies. Nevertheless, progress has been made in the development of in-

tensive crops, which all agree should be encouraged at the expense of cereal production. For instance, the gloomy forecasts of sugar manufacturers concerning beet supplies from small farmers were proved wrong in the harvest of 1946. Even in the exceptionally difficult circumstances of that year, the factories received as much from the new owners as they had had in the past from the well-equipped big estates.

An Impressive Recovery

Much depends on the progress of agricultural co-operatives. Plans are being made in the light of Danish and Soviet experience. Probably the latter will predominate under the new regime. A new law on co-operatives provides for greater centralisation, and it may be that the co-operatives will be used, as in the USSR and Yugoslavia, as much for political and administrative control as for economic ends. The fear of "collectivisation" certainly exists among the peasantry. But there is no doubt that some system of co-operative cultivation is essential in order to raise the efficiency of Hungarian agriculture. The main difficulty of the farmer to-day is the disparity between agricultural and industrial prices. Until the manufactured goods required in the villages are available at reasonable prices, cash payments are of little value to the peasants. The system of compulsory deliveries of foodstuffs at fixed prices is extremely unpopular, but clearly cannot be dispensed with. The only cure to the "price scissors" is more efficient industrial production.

In comparison to the chaos of 1945, Hungary's industrial recovery is impressive. Workers and engineers have made heroic efforts. But it is not yet possible to estimate its real value. Ingenious improvisations were made from dwindling stocks. These have postponed but not removed the need for real replacements, the extent of which is far from clear. There are well-qualified economists, by no means unsympathetic to the regime, who take a gloomy view. The state enterprises were run at a loss under the old regime, but the deficit has now notably increased, and this is also true of the nationalised coal mines. Nationalisation has been piece-meal, and demagoguery has been preferred to planning. Private firms producing goods which go to the USSR as reparations have not received the payments due to them from the Hungarian Government. As their reserves were used up, they were forced to apply for credit to the banks, which until this month were nominally privately owned, but were in fact closely controlled by the Supreme Economic Council. The growing debts of industry were fiercely denounced by the Communist newspapers as proof of the incompetence of the "reactionary and anti-social capitalists" controlling the firms. With characteristic dishonesty they made no mention of the Government's debts to firms for reparations deliveries. Instead of carrying out a consistent policy of nationalisation, the Communists have preferred to maintain the private owners as whipping-boys. The result is a general insecurity in which everyone has an inducement to avoid hard work and responsibility.

Overhanging the whole economy are Soviet demands. In addition to the constant drain of reparations, whose justice is generally admitted, is the cost of maintaining the army of occupation, which most Hungarians had optimistically expected would cease after the Peace Treaties were signed in February. A new blow has been the Soviet demand that obligations arising from confiscated German property should be paid by the Hungarian Government, the USSR accepting only assets and refusing liabilities. Hungary will not get a penny of Germany's huge war-time debt to her, but must pay to the USSR all debts contracted towards German firms, and must pay them at the Reichsmark-dollar exchange rate of 1938. This places an additional strain on the Hungarian economy, which will amount to not much less than the total sum of reparations proper.

Parasitic Officials

The stabilisation of the currency has been successful, but has involved the hardships of deflation. Wages and salaries are very low. Civil servants and teachers are especially underpaid. An Assistant Under-Secretary of State may receive no more than 800 florint (£16) per month. University professors have real difficulty in keeping their families from starvation. Curiously enough, journalists are well paid, receiving generous expenses allowances and some forms of payment in kind. Black marketeers in textiles flourish. Vaczi Utca (the Bond Street of Budapest) is stocked with luxury goods that would astonish a British housewife, and there are a fair number of customers. At the other end of the scale there is serious unemployment, especially in the building industry and agricultural labour, but also in other branches.

Concealed unemployment is still more striking. The three bureaucracies—state, political parties and trade unions—are heavily overstaffed. Supporters of the regime admit this, but argue that something has to be done to save people from starvation and to maintain their self-respect. There is force in this argument, but it is also true that preference is given not only to those who genuinely accept the ideas of the Left, but also to the much larger number who pay lip-service to them with servile hypocrisy. And as Sulyok, the leader of the Right-wing oppositional "Freedom Party," points out, the maintenance of hordes of parasitic officials forces down the wages of those who do useful work.

During the coalition regime Hungary enjoyed a remarkable degree of political freedom. Very frank speeches were made in Parliament, and the press could discuss any subject except the USSR without hindrance. Political democracy was not as complete as it appeared on the surface, for the Communist Party, by the usual "infiltration tactics," obtained a disproportionate share of the key posts in the police, especially its political and "economic" sections, established something approximating to "political commissars" in the army, and took almost complete control of the "frontier guards" (based on the "Frontier Troops of the NKVD" in the USSR). However, intellectual life was incomparably more flourishing in Hungary than in the countries to the south-east. This will now presumably change.

The Hungarian educational system was largely based in the past on the Catholic Church, which on the whole provided the best schools. At present these are supported by funds from the state. Some months ago the Government decided to make religious instruction in state schools voluntary. The proposal actually came from the Small Farmers' Party Ministers, but was inspired by the Left. In itself it seems a very reasonable measure, but it aroused widespread opposition. It is feared—probably not without reason—that in working-class districts, trade union pressure will be used to force workers to "request" that their children be given no religious instruction. In the countryside there is little prospect of this, but the peasants regard the measure as a first step to persecution of their faith, and the priests do not feel obliged to reassure them. It seems that there has been a considerable revival of religion in Hungary since the end of the war. This may be only a temporary result of misery and insecurity, or it may prove permanent. In any case it increases peasant hostility to the Government.

Friction with Neighbours

Though to the average Hungarian the most pressing worries are economic distress and fear of dictatorship and Soviet domination, nevertheless the treatment of Hungary at the Peace Conference also caused genuine and widespread discontent. What is known of the situation of Hungarians in neighbour states is not comforting. In Yugoslavia linguistic rights are guaranteed, and at least Hungarian Communists are represented in the Belgrade Parliament. But the rigid centralist dictatorship weighs heavily on all Yugoslav subjects, and at the lowest levels the Serbian official is only too inclined to feel that his duty as Communist and patriot requires him to "keep the Magyars in their place." Much the same is true in Transylvania, although the Rumanian Government seems sincere in its aim to secure equal treatment for Hungarians and Rumanians. The Rumanian Premier, Groza, is popular in Hungary, and the warm reception which he received on his recent visit to Budapest was doubtless genuine. But the Czechoslovak state discriminates most strongly against its Hungarians. For two years Hungarian children in Slovakia, even in purely Hungarian villages, have received no education. These depressing facts are, of course, still further magnified by propaganda inside Hungary. They strengthen the nationalist, anti-Semitic and neo-Fascist tendencies which are strong beneath the surface.

The extension of Soviet-American tension to the Danube Basin is a cause of alarm to all but the extremists on both sides of the barrier in Hungarian politics. The atmosphere of Budapest in 1947 differs from that of neighbouring capitals. There is little of the arrogant optimism of Sofia or the snarling xenophobia of Belgrade. Two defeats have created a sadder, and in some ways perhaps a wiser mood. There are dogmatism and intolerance at the lower levels, but the leaders (and this is to a large extent true of all the parties) know that things are not simple. They know that their country is at the very heart of Europe, and that if Europe is torn in two by forces from beyond the Urals and the Atlantic their nation is doomed. And they know that there is very little that they can do about it.

Turkish Democracy and the American Loan

[FROM A CORRESPONDENT IN ANKARA]

THE promulgation of the "Truman Doctrine," coinciding with the announcement of the American naval visit to Istanbul that has since taken place, provoked angry rumblings in the Russian radio and press. The pardonable Western habit of ignoring as familiar and predictable disciplined thunder from the East should not keep us this time from examining the question on its merits. If the European scene is viewed in the current transatlantic manner as one of several theatres of an undeclared war between the Soviet Union and the United States, and Russian polemics in the past two years are thought to herald an impending act of aggression against Turkey, the strategic case for forestalling a Russian move is unanswerable. In Britain, happily, there are still many to whom this tough view appears too "realistic" to be sound and who ask the awkward question: Ought Turkey to be counted among the "democracies"? Has the assumption implicit in President Truman's offer, that in giving Turkey a dollar injection the West is fortifying one of its ideological outworks, any basis in the realities of Turkish political mentality and governmental practice? The answer is neither obvious nor, as yet, conclusive. But if the existence of an articulate and effective opposition is accepted as an important criterion of democracy, an attempt to analyse the position from this angle is possible and timely.

The appearance of opposition parties in the summer of 1945 was a novel event in Turkish politics. For over 20 years, with one brief victorious interval, Atatürk's Republican People's Party had ruled unopposed. If an organised opposition has arisen now, it is a symptom indicating, among other things, that the initial revolutionary impetus has spent itself, and the prestige of the ruling set has worn thin. The Kemalist system can be said to have entered an evolutionary phase in the early nineteen-thirties, when the victory over external interference and domestic reaction had been consolidated and, faced with new problems, the nation began to look more searchingly at its new institutions and leaders. But the progressive depreciation of liberal values in the years following kept this tendency from expressing itself in a democratic reform movement, and even repressed it in favour of the fashionable authoritarian trends.

Party Without a Programme

The emergence, among other smaller groups, of the Democratic Party under the leadership of ex-premier Celâl Bayar was clearly connected with the rejuvenation and apparent triumph of democratic ideals in World War II. It would be false, however, to attribute it in any literal sense to foreign influence. It was rather the expression of a vague, pent-up impatience felt by an educated and progressive section of the nation, many of them old Kemalists themselves, with what they regard as the intransigence and intellectual barrenness of an entrenched and inbred political system. No process of ideological clarification within an organised movement preceded it, and the favourable world conditions of 1945 propelled the new party on to the political scene practically without a programme.

Indeed, certain conditioned reflexes of the Kemalist Turk, embodied in constitutional law and administrative practice, did not leave the new party much latitude in the choice of a platform. Causes like Communism, "religious reaction," and monarchism are outlawed and give an alarming colour to such respectable Western labels as Socialism and Clerical Conservatism. Racial doctrines and radical nationalism, though far from unpopular among semi-educated youths, would have impaired the new party's prestige abroad and were, moreover, abhorred by all responsible men of the budding opposition. There remained domestic issues directly arising from the conditions that had given the opposition movement its wide appeal: the single-party system, the personal union of president and leader of the People's Party, the repressive press laws that make the Government machine sacrosanct, the uncontrolled powers of the executive—especially provincial governors and police—which nullify fundamental civic liberties, and so forth. The National Congress of the Democratic Party last January charged the parliamentary party to enforce the abolition of these laws and practices or withdraw from the Assembly. In their hard struggle through several elections to secure fair representation against a rival that fought with all the weapons of the party-state, the Democrats have thus come to make their goal the enforcement of the basic rules that are taken for granted in working democracies. Stated baldly, they became

a party in order to start parties; and the formulation of a long-term programme to deal with the large economic and social issues facing the country was deferred.

Sanity and Balance

The Democrats have come out against economic bureaucracy and for a more liberal labour legislation. But their few declarations on such concrete issues have been rather vague. It is true that the obsolete electoral laws and the restrictions of individual freedom that still persist represent serious national problems. But so do the relations between state and church, economic policy and the treatment of minorities, to name but a few. With the present scanty data it is hard to predict what the Democrats would do, if the handicaps they complain of were removed and a free election gave them a majority. Some suspect that they are purposely screening their main programme behind topical issues, in a shrewd attempt to rally to their ranks all the heterogeneous components of the large floating opposition that is bound to exist under a single-party system that has turned two decades, and lost its founder and its original inspiration. But Celâl Bayar's character and political record make this an improbable interpretation. He is essentially not a demagogue. His own roots are in the party he opposes, and under different circumstances his struggle might have been conducted within the People's Party rather than outside. The Hitlerian tactics of incompatible promises and iridescent rhetoric are hardly to his taste. Nor, incidentally, are those potent catalysts present—mass misery and a disoriented intelligentsia—which elsewhere have dramatically accelerated the mysterious chemical change by which revolutionary movements are born.

The Turkish political temper, though haunted by some traditional phobias, is fundamentally sane and balanced, and if governmental practice has been technically "undemocratic" in important respects in the past there is, at least, little to suggest that the Turkish part of the population has disapproved of it. Celâl Bayar doubtless shares his countrymen's abhorrence of Russian Bolshevism, and possibly, too, their obsolete belief that Socialism is one of its manifestations. With an eye to the western world and the lesson of the Fascist war, he also declines to invoke in his support the benighted racial chauvinism of the extreme Right. He is thus confined to the middle field in politics, where he finds the Government party firmly entrenched.

If the Democratic Party's political philosophy is ill-defined, comment on it is equally so. At present it is a rallying place of widely divergent ideas and dissimilar social elements. But its peasant following is as yet insignificant. This is, of course, a fundamental weakness in this peasant country. One reason is that the Democrats have found it impossible to cover the provinces effectively, and administrative organs, to put it mildly, have not encouraged them to try. Another reason is that the Anatolian peasant, broadly speaking, is anything but dissatisfied, as he has reaped the full benefit of the sharp rise in food prices since 1940.

As an urban party in an agricultural country, the Democratic Party is at present at a very serious disadvantage. Its average following in the larger cities may be put at 80 per cent of the electorate. In the villages it is probably less than 5 per cent. The elections to the National Assembly last July gave it about 15 per cent of the seats, though it claims that, given time, it could do much better. In fairness, however, to the People's Party, it must be said that they have earned their success on the land. But the balance of power between the two parties will not materially change unless the Democrats succeed in splitting the peasant vote.

End of the War of Nerves

On the subject of the American loan, however, as on foreign policy generally, there has been no disagreement between the two parties. It would have been imprudent indeed of the Democrat Party to show anything but unqualified approval of an event which ended the war of nerves with Russia and brought an influx of capital which nobody in Turkey bothers to call a loan. In a recent press interview, President İnönü confirmed the general surmise that the loan will go entirely into armaments. A credit from the Bank of Reconstruction and additional credits to be granted by America from time to time for specific projects are expected to take care of an important part of Turkey's purely economic needs. The Democrats follow these developments with particular interest, hoping that the People's Party will now recognise the usefulness of the opposition's hitherto somewhat shadowy existence, and with the world's attention focused on Turkish affairs, will be inclined to make really important concessions to democracy.

THE BUSINESS WORLD

Sterling after July 15th

LITTLE more than a fortnight from now sterling must again assume the full status of a convertible currency so far as current transactions are concerned, and the arrangements that must precede the arrival of this date are now being hurriedly completed. By July 15th few gaps will be left in the series of agreements with sterling area countries, and in the adjustments of monetary and payments agreements with non-sterling countries, to meet the demands of convertibility of currently earned sterling. The only important gap will be provided by India, where postponement of the necessary discussions has been made inevitable by the pre-occupation of Indian Ministers and officials with the political and economic problems of partition.

All these arrangements are being made on the unquestioned assumption that convertibility of current sterling is an irrevocable decision. There can, in fact, be no going back on this particular commitment of the Anglo-American loan agreement. Indeed, it can be argued that to ask the United States Government now to release Britain from the obligation to make sterling convertible on July 15 would be to advance the threatened exchange crisis far more surely and rapidly than by assuming the uncertain and probably small additional cost of such convertibility. It is probable that foreign countries entering into long-term contracts for bulk deliveries of materials and foodstuffs to Britain would, if the sterling due to them was not convertible, demand payment in dollars or would require gold or dollar collateral against their forward contracts. If Argentina, Brazil and other suppliers were to take up this attitude, Britain's remaining gold and dollar reserves might be earmarked and immobilised in a matter of weeks.

If it be assumed that convertibility is an irrevocable step, arrangements must be made for dealing with accumulated sterling balances. That need emerges from the simple fact that accumulated sterling will not be convertible, except in so far as it is gradually released, and must therefore be somehow segregated from current accruals of sterling which will be convertible. The hue and cry about partial cancellation has died down for the moment, and the view is generally taken that any such adjustment of the debts can be achieved only by mutual consent of both parties. What matters to Britain is not whether the repayment instalments of these balances are expected to end in the year 2,000 or the year 2,050, but what proportion of them is to be released over the next five years or so. The next millennium can, at this moment, be left to look after itself; and the negotiators will be well advised to confine themselves now to comparatively short-term arrangements.

Those arrangements for the release of sterling balances and for the "unrequited exports" which the released amounts represent, must be seen as a global problem. Some order of overall magnitudes is no doubt present in the minds of the British experts as defining the total of the concessions they could give to the creditors in the shape of such releases. The financial agreement between the United States and the United Kingdom envisages such a total, namely one of £43,750,000, this being the annual payments on account of accumulated sterling balances which can be regarded as current transactions when calculating the balance of payments of the United Kingdom for purposes of the waiver clause on interest due on the American line of credit. Any payments in excess of

this figure would be regarded as a capital transaction. If such an annuity is to include both releases from the capital of the balances and interest on their outstanding amount, the releases would be small, as indeed they must be if the resultant burden on the British balance of payments in the immediate future is not to be intolerably heavy.

There is no reason, however, why the present abnormal strain upon Britain's productive resources should dominate the arrangements with the creditor countries. Those arrangements should, in fact, have sufficient elasticity to allow the annual releases to expand as and when British productivity is able to take such expansion in its stride, and as the volume of world trade begins to recover (but, equally, to permit them to contract again if British productivity or world trade were to relapse). This brings into play another implication of the Anglo-American financial agreement, namely, its stipulation that releases from accumulated sterling balances shall be freely available for current transactions in any currency area without discrimination. Since any sterling released from accumulated balances will thus be expendable for current purposes anywhere in the world—equally with newly-earned sterling—Britain's capacity to repay these balances will depend absolutely upon its capacity rapidly to supply, on competitive terms, the goods which its creditors need. This, however, is the whole essence of the concept of convertibility or transferability of sterling. By conceding convertibility, Britain will lose whatever element of protection its export industries may have derived from the wartime operation of the sterling area arrangements. This may seem a surprising moment at which to throw that protection away, but sooner or later that step would have had to be taken. Indeed, for currently earned sterling, it has had to be taken—for the obvious reason that most of Britain's overseas suppliers would have been unwilling to continue to sell against anything but convertible exchange. It would have been extremely difficult to have segregated currently earned sterling which was freely transferable, from released portions of accumulated balances which were subject to certain restrictions. To have followed such a policy would have involved the ultimate emergence of further differential rates of exchange for sterling. It is bad enough to see blocked sterling quoted at about 2½ dollars to the £. It is questionable whether any conceivable advantage could be derived from a system involving further differential rates, with its consequent "balkanisation" of the structure of sterling exchange.

There is, however, no reason why this free availability of sterling released from accumulated balances should not be reconciled with elastic arrangements to permit of increases in releases against additional exports; and no opportunity should be lost of inducing the United States to accept an interpretation of clause 10 of the Loan Agreement (defining the manner in which accumulated sterling balances should be settled) which would allow of such elasticity. The whole issue could, in fact, be circumvented were Britain to make tied loans to her creditors in order to finance specific deliveries and then to earmark their sterling balances for repayment of the loan. This, apparently, would accord with the purest doctrine of the Loan Agreement, dishonest though such a subterfuge would be. Far preferable would be an open discussion of the clause with the United

States, and its reinterpretation—if that were necessary—to make plain that no discrimination occurs if the holders of sterling balances, having bought on competitive terms in Britain and finding at some later date that they have run into a deficit on their balance of payments with Britain, liquidate that deficit by mutual agreement, by drawing on the accumulated balances. If such a reinterpretation involves a little metaphysical juggling, that is a process with which the experts of the US State Department and Treasury should by now be familiar. It should be added that Britain is unlikely to welcome such "supplementary exports" in the near future. The main concern of the British negotiators in the current discussions should be to keep the releases down to the lowest possible figure. But a time may come when this country may positively welcome an acceleration of repayment of these sterling debts, even though it should never be forgotten that the means by which they are repaid will always be "unrequited" exports.

The arrangements that will operate after July 15 should obviously take full account of the atmosphere of international monetary disorder in which they may have to operate in the not distant future. Despite all the efforts that are being made in Europe and the United States to avert an international dollar crisis, any objective calculation of the odds must, unfortunately, lead to the conclusion that the crisis will be upon us in a matter of months. On that assumption, the arrangements now being made with sterling area countries, and the payments and

monetary agreements with non-sterling countries, should be looked upon as a hedge against disaster. Those arrangements and agreements incorporate the convertibility of current sterling and are, therefore, fully compatible with the requirements of the international system which is gradually evolving under the International Monetary Fund. An international dollar crisis on the threatened scale may, however, give the Bretton Woods system an air of strange unreality before long. If matters really did shape in this fashion, it would be doubly useful to have in the sterling arrangements, an anchor of stability and a rallying point for confidence.

But if the arrangements really are to serve such a purpose, much will have to be achieved. First and foremost, Britain's productive effort will have to make much more rapid headway than at present seems in prospect—that is a consideration which is basic to every problem, political as well as economic, which Britain now confronts. On the more technical financial plane, however, much can be done. In particular, no effort should be spared to give to sterling through these arrangements the greatest measure of strength and stability. That means going ahead with the arrangements for making sterling convertible for current purposes, accepting the risks that may be inherent in granting convertibility not merely to current sterling but to releases of accumulated balances and, finally, abstaining from any unilateral blocking or repudiation of debts which would damage the interests of the debtor far more, perhaps, than those of the creditors.

Chemicals in the Production Drive

IN the production drive the most publicised element has naturally been the need for harder and more continuous work. But, however much enthusiasm can be instilled into the labour force, there are obvious limits to what muscle and brain and nerves can stand. On a medium-term view, the chances of making good the inroads into national capital and then of moving towards a better standard of living depend equally, and perhaps primarily, upon using existing resources—of manpower and materials—more efficiently.

The problem of raising the efficiency of the economy—optimum usage of resources is perhaps a better definition of the goal—is many-sided. Plant modernisation, improved lay-out, standardisation and better organisation are the facets which perhaps have most caught the public eye. Little has been heard of what is being achieved, and of how much more could be achieved, by the fuller application of the results of chemical research, both within and without the chemicals industries. New materials attributable to the industrial chemist from time to

time seize the public imagination when they are embodied in consumers goods, but even the most spectacular, such as nylon, are a poor indication of the full possibilities. The chemist's main contribution, in many cases, lies in the technique of production itself or in economising scarce materials, and thus is often invisible to the final consumer. Equally it may take the form of substituting for traditional industrial methods new processes which make use of chemical reactions—a particularly significant substitution in present conditions, because such processes usually require only a comparatively small, though highly-skilled, labour force.

Even within the chemical industries themselves the scope is so wide as to defy definition. Where such processes or such techniques can be applied commercially, they give rise to a large and ever-widening field of end-products—from drugs and fertilisers to petrol and lubricants. Moreover, from the point of view of exports, the products of these industries have the great advantage that they possess a high "conversion factor"—the

cost of the raw material is low by contrast with the selling value of the end-product. Enterprising firms throughout the whole field of industry are constantly exploring the possibilities of new processes, materials or products. But plainly there is a case for a broadly-based drive to demonstrate the potentialities to other firms; to promote centralised or co-operative research and pilot plant testing, where individual action is impracticable or uneconomic; and to ensure, so far as possible, that there is interchange of ideas, if not actual collaboration, between those already well-organised. As many of the Working Party Reports have emphasised, such an interchange is indispensable if the best results are to be achieved, for work in each of many different fields acts and reacts upon others. A new material from one industry may have great value if consequential chemical problems of production technique or subsidiary materials in a user industry can be speedily solved, but little immediate value otherwise. Conversely, a scheme to devise a more efficient production technique may be frustrated unless the suppliers of raw material—perhaps even a minor material in the process—can adapt its chemical properties accordingly.

The layman who seeks instances of actual achievement to demonstrate the potentialities should perhaps think less in terms of nylon—or other exciting new products—than in the developments which enable steel or brick furnaces to be fired more efficiently, or in the growing range of chemicals which are now coming in increasing quantity from crude oil for use in industry. And he should bear in mind the intricate pattern of action and reaction. It remains true, however, that the chemical industries, responsible for most of the new products as distinct from processes, are the essential foundation of all this development; and in Britain these industries are already large and experienced.

In a sphere so large and ill-defined, it is possible here to give only the broadest indication of the potentialities. They may conveniently be considered under three heads—power for industry; public diet and health; and supplies of key materials for industry.

Though assistance in the development of power resources other than coal would be of unique importance, there is no likelihood of very great strides in this direction for some time to come. At most, the chemist can assist in the switch of emphasis from coal to oil as a source of power. But, so far as can be foreseen, there are severe practical limits upon the amount of coal-burning industrial equipment which can be switched to oil. The chemist's main contribution here will probably be to improve, in collaboration with the engineer and the metallurgist, the efficiency of fuel consumption by adjusting not only fuel to industrial plant and machinery but also machinery and plant to fuel. Such developments should not be underestimated. The reciprocal adjustment of the metal in machines or of materials, such as refractory bricks, to the characteristics of fuels, is of immense importance to industrial efficiency and to the international location of industry. It may decide, for instance, what kind of oil refineries shall be built and whether they shall be located near the oil fields or near the markets for the end-products. Of course, if within the next ten years atomic energy can be harnessed to industrial uses—a development towards which chemistry, as well as physics, has an important contribution to make—a new situation would arise. Power might conceivably then be taken largely from nuclear fission. In the present context, the implication of that might be that the chemicals industry might become the principal claimant upon the resources of coal and oil, instead of depending mainly upon their by-products as it does today. This would not only ensure a much more economical use of coal and oil than at present, but would revolutionise the structure of the chemical industry.

Under the second head, the contribution which chemical

research can make to the welfare of the working population touches almost every aspect of modern life. It ranges from the food producing and food processing industries to medicine and the entertainment industries: from fertilisers and oil-from-seed extraction to drugs and photography and cosmetics. Two of these categories are outstanding. These are fertilisers and drugs, which not only make a direct contribution to agriculture and health respectively, but are important in international trade. Fertilisers and insecticides may be taken together as being within the same trade category, although they have no common chemical base. In 1938, Britain exported about 726,000 tons of fertilisers, equal to 19 per cent by value of total chemical exports. By 1946, exports were over 1,180,000 tons, or 16 per cent of total chemicals exported. Drugs and proprietary medicines have shown a remarkable expansion, having increased from an export value of £3.3 million to £12.8 million over the same period. Comparable figures of exports from the United States over a similar period show both the size of the potential market and the degree of competition to be expected. United States exports of drugs and toilet preparations in the years 1936 to 1938 averaged \$25 million per annum; towards the end of 1946, the annual rate of export was \$172 million.

Fertilisers and insecticides obviously have key significance both for the restoration of the war-devastated agricultural areas and as a means of increasing agricultural yields. They are important both for home consumption and export. Provided that the manufacturing capacity can be made available, this country is fairly well placed for development along these lines. Fertilisers are obtained from nitrogen (which can be taken, in theory without limit, from the air), or from potassium and sodium compounds and from phosphorus. The main sources of these raw materials are Germany, Chile, France—and now Spain. There is no problem, as yet, of a world shortage of materials, but their availability is to some extent dependent upon the rehabilitation of Europe. Insecticides are mainly produced from readily available materials in this country, and present no import problems.

The drug group is very large and chemically very complicated. But three categories are now especially important—the sulphanilamides, the anti-malarial drugs, and penicillin. Here, as in so many other chemical fields, this country has made a major contribution to fundamental research. But it is hampered in development, first, by lack of capacity, and, when that has been made good, by the need to invade quickly the export market in order to achieve a sufficient turnover to justify large-scale production methods. The products in the sulphanilamide group (among which the best known drug is "M and B 693") are now being made on a large commercial scale. There is already an established and growing market for these drugs, both at home and for export. Penicillin, which basically is produced by a mould culture and is not yet a chemically synthetic process, was discovered in this country. America, thanks mainly to its large domestic market and greater resources of equipment, is producing on a larger scale than Britain, but production here is increasing. Some 20,000 mega units a month were being produced in 1945; by March, 1946, the figure had risen to 178,000 mega units, and to 373,600 mega units by March this year. It should be noted, however, that for commerce the mega unit is a very small unit of measurement. The new drug, streptomycin, is, like penicillin, an excretion from a mould—not a synthetic chemical. This is still in the development stage, but its production on a large scale will in the end be a problem of equipment capacity—not of imported materials. In the anti-malarial group, Britain is in the forefront with paladrine, a synthetic anti-malarial drug which has already established a claim to superiority over quinine, atabrine and mepacrine. The availability of all these new drugs on a large scale could

have a revolutionary effect on public health, both at home and abroad, in an all-out attack on venereal disease and malaria.

The third sphere in which the chemicals industry and the application of new chemical methods may make a major contribution is in raw materials for industry—first, by conservation and development of existing or natural materials and secondly, by developing new or synthetic ones. In the first category, there is evident scope for further development of alloys in metals to reduce wear and tear and to align them with new developments in fuel combustion. An example of immediate interest is the adjustment of metals to increase the efficiency of jet propulsion.

The development of new, synthetic materials opens the way to a vast field of end-products which could significantly increase the export potential—and, in a few cases, reduce the need for certain imports. These materials include moulding powder for the plastics industry, synthetic rubber, dyestuffs for textiles, detergents and wetting agents. There are also a host of other chemicals, vital in varying quantities for all industrial communities. In some of these categories, such as dyestuffs, the British chemical industry has made great strides in the last thirty years, and has already established a major industry for home and export. The country which can provide such materials cheaply is, in a twentieth-century sense, the workshop of the world.

The common chemical problem in this field is the synthesis of carbon compounds. These compounds are taken mostly from oil or coal. But for some there are further sources. Cellulose—which is the basis of some plastics, including rayon—comes from a vegetable carbon source such as cotton linters and timber. So does industrial alcohol. But in all cases the basic material must be available cheaply and in large quantities, and there must be cheap power to carry out the

chemical synthesis on a large scale. Vegetation with a high cellulose content needs strong sunlight, so that the obvious source for such raw materials is the tropics. (The question naturally arises—though the answer is not yet in sight—whether the colonies might become a large-scale source of cellulose, even producing the plastics if cheap power could be obtained for processing.) But the other carbon compounds are dependent on coal and oil. The economic problem for Britain, then, is to use indigenous coal resources and import such an amount of oil—whether crude or refined—as to ensure the optimum balance between supplies of fuel for combustion and for chemical synthesis. But to achieve such a balance involves reopening many technical problems which have been solved in the past mainly on the assumption that the chemical industry in this country should be based on coal; and it involves, too, reopening the problems of oil refinery capacity in this country—in short, it raises acutely the question of how much oil should, on a long view, be imported as crude and how much as refined. The growing possibilities of chemicals from oil make a decision on this last issue the more urgent. That it is already receiving attention can be seen by such developments as the repeal of the duties on hydrocarbon oil for chemical synthesis in 1945 and the increasing oil-refinery capacity in this country—capacity so constituted as to yield a given proportion of carbon compounds for chemicals as well as petrol and oil for combustion.

Next month, the Chemical Society celebrates its centenary. The second century of fundamental research under the Society's aegis is opening full of promise. The application of this research to industrial problems has never been more urgent for this country's economic development than today. No industry, with the possible exception of coal, has a higher claim than the chemical industry on that portion of the nation's resources which can be reserved for long-term development.

Business Notes

Mr Dalton Hears the Bell

The response to last Tuesday's news of the terms of the £32 million loan for Southern Rhodesia, and the terms themselves, strikingly underline the change which has come over the gilt-edged market in recent months. Throughout last year, whenever the aspiring Goschen at Number Eleven marched with his flanking trumpeters upon the City, the professional operators promptly clicked their heels and fell into step, with the army of investors not far behind. However ambitiously the terms of an issue were pitched in advance of the market level, the market at once came into line and even pushed ahead on its own. The big operators might have real doubts about the longer or even the medium term view, but so long as the Chancellor with his power of credit creation was in the market, they felt sure that the going was good for them. An ancient cliché affirms that no bell is rung in the Stock Exchange when prices reach the top. But is rung in the approaching fuel crisis rang that bell, and it was heard by everyone—except the Chancellor. In early April, although gilt-edged prices had rallied only moderately from their collapse during the crisis week, two Corporation issues—for Derby and Newcastle—were offered on precisely the terms to which the market had been screwed up before the debacle—2½ per cent at par, 1970-75. The Chancellor had stopped up his ears and shut his eyes and pretended brazenly that nothing had happened.

It is very different now. By easy stages since the Budget speech the familiar aspirations have been steadily deflated from ostentatious and belligerent confidence to sober acknowledgment that the critics' arguments about what was reasonable and practicable were right after all. The Chancellor's second thoughts about credit creation and floating debt have been fully analysed in these columns in recent weeks. Now the recantation process takes a further and more pointed turn. The Treasury authorities make the admission which they strove so hard to avoid two months or so ago. The Southern Rhodesian stock is offered at a full point less, and has five years shorter life, than the much-vaunted terms for the earlier Corporation issues and the last Australian Government conversion.

These terms, moreover, were below the market, though less evidently so than might be surmised from the substantial consequential falls which occurred throughout the gilt-edged list. On the news, the sensitive irredeemables dropped by ½—the "Dalton" 2½ per cent (1975 or after) to only 92½—and the 2½ per cent Savings Bonds, 1964-67, which are regarded as Mr Dalton's second line of defence for his 2½ per cent basis, went below par—if allowance is made for accrued interest. The redemption yield on the new loan is a little over £2 11s. per cent to the latest date, which compares with £2 8s. 11d. per cent on the 2½ per cent Savings Bond before the announcement and £2 10s. 9d. for the recent Australian issue.

* * *

The "Departments" Retire

What really shook the market, however, was not the price differential which these yield comparisons imply, but that fact that the loan was being underwritten through the normal City channels. This, more clearly even than the concessions in price and life, reveals the nature of the Chancellor's awakening to realities. Not since pre-war days has any Governmental or public authority offer been underwritten except through official channels. Mr Dalton had preened himself repeatedly on the success of this arrangement, and only two months ago was drawing attention to the benefits which local authority borrowers secured from the absence of any charge of underwriting commission. The "strong arm of the National Debt Office," he declared, stood behind such borrowers and also made "useful profits" for the taxpayer at the expense of investors who were "too slow-witted" to get in first.

It is true that special considerations apply to this issue. The £32 million includes some £10 million of "new" money (mainly required for railway maintenance and development), which is relatively large for an overseas issue; and the counterpart of the conversion (which arises from the taking over of the Rhodesia Railways) includes stock in a different investment category from the new issue. It may be that, within the Treasury, conservative prin-

ciples of traditional finance still sit cheek by jowl with the unorthodoxies of the cheaper money drive, and that to have extended the war-time underwriting practice to this issue would have defied some still cherished canon. But it is tempting to conclude, as the market has already done, that a much more far-reaching change is implied. Certainly, this is not likely to be only an isolated instance; but it may be unwise to take it for granted that corporation finance will in this respect return to its former ways, for the extension of Treasury control over other aspects of corporation borrowing has been very marked and is unlikely to be relinquished.

Yet the fact remains that the two last Corporation issues, so obstinately offered on the "standard" terms in April, were mainly left in the hands of the National Debt Commissioners—who took up 81½ and 88½ per cent respectively. The comment in this column at the time of those issues was that the Commissioners would have to work hard if the Chancellor's prescription was long maintained. Now, it seems, they are to be exempt from the general drive for harder work. But for them the rule of work-or-want does not apply. What Mr Dalton deemed "good business" for the taxpayer before may be no longer so. It is cheaper for the authorities to take a holiday and save their ammunition. So the business goes to the City, which is glad enough to take its 1 per cent underwriting commission, particularly for the prospect of more work to come.

Sellers' Export Market Ending

The sellers' market for exports is fast coming to an end. Indeed, Sir Stafford Cripps on Wednesday said so quite categorically. "From everywhere," he said, "we receive the warning that the sellers' market is disappearing—it has already disappeared as far as some commodities are concerned—and we are right on the verge of a period when we shall have to rely not only on the quantity and quality of our production, but also upon the power of our salesmanship."

This is the most outspoken warning yet, but it is certainly opportune for the detailed trade returns for May do nothing to relieve the rather depressing impression left by the preliminary figures given by Mr Morrison ten days ago. Although the immediate repercussions of the fuel crisis had evidently exhausted themselves, the volume of exports was still well below the end-1946 rate, which suggests that the secondary effects may be even more pronounced than was at first expected. It is true that, on a value basis, exports last month, £89.7 million, were the highest for the year, except for January, and also exceeded the monthly average of the fourth quarter of 1946 by nearly £1 million. On the basis of notional months of 26 working days each, the May value total shares with April the position of highest for 1947, as the following figures show:—

October, 1946...	£ Mn. 87½	January, 1947...	£ Mn. 82½	April, 1947.....	£ Mn. 89½
November, 1946...	87½	February, 1947...	82½	May, 1947.....	89½
December, 1946...	90	March, 1947.....	82½		

But it is the relative stability which is cause for anxiety. Even before the fuel crisis, the strong impetus of the early summer had petered out, so that ostensibly reassuring comparisons of recent figures with the end of 1946 are apt to be misleading. If the 1947 target is to be achieved, exports should now be showing a steady increase. But on a volume basis, in spite of the quite definite improvement on April, exports are still well below the average for the fourth quarter of 1946. The 1938 volume indicators are set out below:—

October, 1946....	117	January, 1947...	112	April, 1947.....	98
November, 1946...	117	February, 1947...	95	May, 1947.....	104
December, 1946...	103	March, 1947.....	98		
Fourth Quarter...	111	First Quarter....	101		

On the assumption of constant values throughout 1947, the Government export plan allowed for a monthly total of both exports and re-exports of £100 million. So far the average monthly rate in 1947 has been £91 million. If, therefore, the annual total is to be fulfilled, exports and re-exports must be at the rate of £108 million a month for the next seven months—an increase of 11 per cent over the May figure of £97 million.

On a value basis, all items in the manufactured category, with the exception of machinery, apparel and footwear, showed increases on the month. Exports of metal goods exceeded the record January figure by £500,000, while shipments of vehicles recovered from their low level of recent months and reached a new peak, at £13 million. One of the disappointments was the drop in the

export of machinery; the tonnage figure for May was the lowest since September, 1946, and some 10 per cent below the average of the past six months. The controversy dies hard as to the relative priorities of capital equipment between the home and export markets. But come what may, unless machinery exports can be maintained at least at last year's level, the overall export target will look very distant.

Coal Production Setback

This has been a gloomy week for coal. Some straight talking to Yorkshire miners on the need for higher production and the first hint to the miners that a return to a six-day week was not to be ruled out if coal output did not improve, came from Mr Shinwell at a National Union of Mineworkers' rally at Barnsley last week-end. He was supported on the platform by an impressive delegation from the Cabinet—an indication of the official disquiet at the coal-production situation. During the week there have been two unofficial strikes in the industry—one by clerks in South Wales, one by surface workers in Lancashire. Finally, the coal output figures for the first two weeks of June have done nothing to relieve the new sense of disquiet. For the public, at any rate, the coal barometer has slumped one degree further from "change" towards "stormy"—with renewed warnings from the Ministry of Fuel and Power of the need for more economy from householders in the use of fuel from now until the end of the year.

Total coal production was 3,924,700 tons in the week ended June 14th and 3,872,600 tons in the previous week, compared with 3,986,800 tons in the average of the first four weeks of May: that is, including the Whitsun holiday week.

The figures give cause for concern for two reasons. The drop in output suggests that the first flush of enthusiasm to hit a high coal target on the introduction of the five-day week is already passing. Secondly, the reaction having set in, output may now be establishing itself at a level which is barely adequate to meet even the 200 million tons set as an irreducible minimum target for 1947. A level of production which hovers between 3.9 million and 4 million in the average week for the rest of this year would barely reach that target. What will probably happen now is that average weekly production will fall in the summer holiday season and that from about October onwards the industry—helped by new recruits—will have to make every effort to surpass 4 million tons a week in order to make up leeway.

The analysis of shifts worked and output per man-shift for May reveals no unexpected trends. Shifts worked per man-shift at the coal face in the average of the last four weeks of the month (which covers the period from the inception of the five-day week) numbered 4.56, compared with 4.78 in April and 5.18 a year ago. This fall was partly offset by an increase in output per man-shift at the coal face from 2.77 tons to 2.88 tons on the month, compared with 2.78 tons a year ago. But May's results were affected by strikes and holidays. A better idea of the trend of shifts worked and output per worker should be available when the May and June figures can be compared. One of the brighter spots in the industry's record at present is the continued expansion of the labour force. Recruitment in May was higher than in April, but wastage was even greater, leaving a net increase of 4,100 recruits compared with 5,000 in April. An increase in the trained labour force is all-important if coal supplies are to be sufficient to keep industry in operation this coming winter. But little benefit from an increasing labour force will result if unofficial strikes such as those in the Durham coalfield last month and in Lancashire this week continue to recur.

Prospects for the Franc

Supplementary budget proposals passed by the French National Assembly this week after a bitter debate, and amid scenes of public protests and demonstrations outside the Assembly buildings, are a courageous attempt to restore some semblance of balance between outgoings and revenue. The budget for the current year never pretended to achieve equilibrium, but the prospective deficit had been enormously increased by the recent wage concessions that followed the strikes of railwaymen and other servants of the State. The position is being helped towards equilibrium by cutting expenditure to the amount of Frs.16,000 million, suppressing subsidies by Frs.46,000 million and raising additional taxes of Frs.42,000 million. The proposals represent severe budgeting; the tax on tobacco for example, is doubled, while the suppression of subsidies will have a marked effect on the

cost of living. This last development, taken in conjunction with the all-round wage concessions now being granted, mark the end of the Blum policy of holding the wages-prices line.

It may also mark the end of the attempt to hold an exchange rate for the franc which was already overvalued in the circumstances that prevailed until the *expérience Blum* foundered, but which now threatens to become wholly artificial. The need for drastic budgetary measures is evident in the progressive demoralisation of the market for Government securities in France. The Government has for some time past been unable to sell any fresh securities to the public and has found increasing difficulty in renewing maturing debt. As a result of this and of the current budget deficit, the French Government has had to require the Bank of France to raise the limit of its advances to the State from Frs.100,000 millions to Frs.200,000 millions. The magnitude of this increase in the scope for the most inflationary of all forms of deficit financing is ominous. On the same day as the agreement for additional lending to the State was signed, the Bank of France also signed an agreement to transfer to the French Stabilisation Fund Frs.250 millions of gold. This is mainly required to meet dollar expenditure.

Financing South Wales Steel

Preliminary particulars of the important scheme for financing the Steel Company of Wales were due to be released just as this issue of *The Economist* went to press. They provide for raising for cash, over a period of years, some £55 million in addition to an allotment of ordinary shares, possibly to the value of £10 million odd, to the founder companies on account of assets transferred. These companies, it may be recalled, are Richard Thomas and Baldwins, Guest Keen Baldwins, Llanelli Associated Tinplate and John Lysaght. The broad outline of the proposals—further details will be available in about a fortnight—is that the founder companies shall take up for cash a further £5,000,000 of ordinary capital on which only 1s. per share will be paid in the first place, that the public shall be offered £15 million of 3 per cent ten-year first mortgage debenture stock, and that the Finance Corporation for Industry shall provide, over a period of five years, £35 million against the security of a 20-year convertible debenture.

As to the last operation, a 3½ per cent debenture will be issued by the company as collateral security, but all sums advanced by the FCI will carry 3½ per cent during the life of the first debenture issued to the public. Thereafter, the rate will be reduced to 3½ per cent. The FCI will have the right for the first ten years to convert 30 per cent of its holding into 4½ per cent cumulative preference shares and an equal amount into ordinary shares. The two conversions must be simultaneous and both are to be made at par. During the conversion period none of the 3½ per cent debenture may be paid off.

No explanation is given for the adoption of this particular method of finance, but it is evident that in existing circumstances the acute uncertainty as to the future ownership of concerns in this industry makes equity issues to the public impossible. It is therefore essential that, apart from the founder companies, the FCI should bear the risks, and it is only fair that it should have the opportunity of reaping a large share of any benefit which emerges. The scheme appears to be as sound a one as could be evolved to fit into the peculiarly difficult circumstances in which

it is brought to birth. Were political conditions different, many investors would willingly take up equity capital.

The allotment of ordinary shares to the founder companies is to be made on the basis of an independent valuation of the assets transferred. If the estimate of £10 million is provisionally accepted, and if the conversion rights are fully exercised, the company will have in ten years £14 million of 3½ per cent debenture stock, £10½ million of 4½ per cent cumulative preference shares and an equal amount of ordinary capital, all arising from the FCI holding, and in addition some £15 million of ordinary shares in the hands of the founder companies. There will also be the £15 million of first debenture stock falling due. If by that time the group is earning good profits, these debentures could presumably be replaced by ordinary shares, with the result that the capital structure of the company would present a very healthy appearance, with the equity substantially in excess of debentures and preference taken together. It is likely to be five years before the plant is well run in, but in the meantime some of the transferred assets will be earning revenue. The construction programme has received the assent of the Government and the dollar exchange is assured to meet orders which have been placed in advance of official sanction. The financial scheme still awaits the approval of the CIC.

The Fund and Gold

For some time past the International Monetary Fund has been studying the problem of international transactions in gold at prices substantially above the monetary parities of the countries in which those transactions have taken place. The matter was brought to the notice of the IMF, largely on British initiative, prompted by the many implied threats to the British gold and dollar reserve involved by the increasing seepage of gold into the areas of the Middle East and India, where the price of the metal is quoted at well above the official sterling and dollar parities and has attracted a great deal of gold, provided not only by certain producers but by monetary authorities of Latin-American and other countries. This week the International Monetary Fund has circulated to its members the following statement of its views on such transactions in gold:

The International Monetary Fund has given consideration to the international gold transactions at prices substantially above monetary parity which have been taking place in various areas of the world. Because of the importance of this matter the Fund has prepared this statement of its views.

A primary purpose of the Fund is world exchange stability, and it is the considered opinion of the Fund that exchange stability may be undermined by continued and increasing external purchases and sales of gold at prices which directly or indirectly produce exchange transactions at depreciated rates. From information at its disposal, the Fund believes that unless discouraged, this practice is likely to become extensive, which would fundamentally disturb the exchange relationships among the members of the Fund. Moreover, these transactions involve a loss to monetary reserves, since much of the gold goes into private hoards rather than into central holdings.

For these reasons, the Fund strongly deprecates international transactions in gold at premium prices and recommends that all of its members take effective action to prevent such transactions in gold with other countries or with the nationals of other countries.

It is realised that some of these transactions are being conducted by or through non-member countries or their nationals. The Fund recommends that members make any representations which,

in their judgment, are warranted by the circumstances to the Governments of non-member countries to join with them in eliminating this source of exchange instability.

The Fund has not overlooked the problems arising in connection with domestic transactions in gold at prices above parity. The conclusion was reached that the Fund would not object at this time to such transactions unless they have the effect of establishing new rates of exchange or undermining existing rates of other members, or unless they result in a significant weakening of the international financial position of a member which might affect its utilisation of the Fund's resources.

The Fund has requested its members to take action as promptly as possible to put into effect the recommendations contained in this statement.

* * *

Free Gold Markets

The transactions to which the Fund takes exception are those which involve exchange operations and which, therefore, imply a threat to exchange stability. There can be no direct objection to Indian gold mines, for example, being allowed to sell their gold to private hoarders in India at the prevailing Bombay market price, though even this phenomenon, since it reflects upon the confidence in the rupee, is a matter which falls well within the orbit of attention and interest of the IMF. But the matter acquires a more serious character when a country such as Mexico, for example, acquires gold at the official price from the Federal Reserve Bank, and having coined it ships it to the Middle East, from where it is smuggled to India and other markets where metal commands an artificially high price. Another example was the sale of Ethiopian gold in the Egyptian bazaars. For a time these operations were made against payments in dollars, but, as dollar supplies are becoming increasingly scarce, it has been found that there has been increasing tendency for payments to be made in sterling, and that the sterling has in turn been used by the recipients in order to meet current requirements for imports from the sterling area.

Quite apart from this damaging effect on the sterling position, some account has to be taken of the unfavourable effect of these officially tolerated gold sales at a premium upon the large producers of gold who are compelled to sell their metal at the official price.

The South African and Canadian producers have been putting some pressure to bear on their authorities to allow them to have access to the free markets in gold, and in support of their case have pleaded the precedents set by countries like Mexico, Peru, Chile and Ethiopia which have been able to sell their gold not merely in their own countries but outside it at prices well above the official dollar and sterling parities. The intervention of the IMF should have the effect of stopping a good deal of the flow of metal to these free markets. It will not, of course, abolish those markets. The premium on gold quoted in the Middle East and Bombay may rise further, as certain channels of supply become effectively closed by the IMF initiative. But some gold will continue to reach these markets; one source of supply which will not be influenced by the IMF move is Russia, which has been selling a certain amount of its output in the Middle East. Dishoarded metal will continue to provide a certain source of supply. The move by the IMF will set at rest recent rumours that there might be a general freeing of the gold market throughout the world. It also seems to put out of court another suggestion of which much has been heard recently—namely, that the IMF might decide upon a general revaluation of gold in terms of all its members' currencies.

* * *

Nationalisation and Victimisation

The opening of the report stage of the Electricity Bill in the House of Commons has been characterised by a number of last-minute amendments submitted by the Government, and by an important debate on the possible victimisation of the directors and employees of companies following nationalisation of the industry.

A new clause was moved by the Opposition to prevent victimisation of anyone who, before the passing of the Act, assisted in opposing or criticised nationalisation of the industry, and to prevent the Minister or any electricity board from discriminating against him. The principle is important and Mr Shinwell, in his rejection of the amendment, hardly succeeded in making his attitude clear. It is true that, on the question of eligibility for employment or promotion of technicians and other employees in the industry, he would not allow any of the proposed boards to inquire into their political opinions. He affirmed that when making appointments he would apply the same principle as he

had done with the National Coal Board and appoint persons with the highest qualifications, irrespective of their political views; yet, a few moments later, in remarking that company directors would have an opportunity of serving the industry under nationalisation, he added: "But that does not mean that I shall appoint them to boards of management."

It is important to know what the Minister really does mean. Does he intend that those who have opposed nationalisation up to the passing of the Act, but by reason of their qualifications and personal integrity are fully equipped to assist in running the industry once it is nationalised, are to be automatically excluded from the higher posts? If it does mean that, the principle is surely wholly unacceptable in any context and, as applied to electricity, would prevent the industry from drawing upon a large and probably indispensable fund of experience and ability—an act of self-denial which the Government, the industry and electricity consumers can ill afford. Mr Shinwell is under an obligation to clarify his attitude—even though the amendment was defeated.

As already agreed in principle in Committee, Mr Shinwell moved an amendment to widen the interests represented on the consultative councils. The Government has also accepted in principle an Opposition amendment that electricity supplied to railways shall not be subsidised at the expense of other consumers. But these and other amendments made before the Bill goes to the Lords have not materially affected its main framework.

* * *

Transport Bill Through the Lords

As this issue goes to press, the committee stage of the Transport Bill has one more day to run in the Lords. The past week has produced another crop of important amendments, but some of those that have been written into the Bill have been simply consequential upon changes made earlier on important matters of principle in the face of Government opposition. Amendments of this character are those that flowed from the separation of the docks from the inland waterways executive, and the doubling of the distances for short hauls as defined in the Bill.

Apart from these changes, which were discussed in these columns last week and the week before, consideration of the later clauses of the Bill has been marked by minor concessions by the Government and continued sniping by the Opposition at the monopoly powers of the proposed Commission. Last Friday, the Government moved an amendment to permit sums up to £2,000 to be paid in cash where total compensation does not exceed £20,000. More significant was the amendment forced through against the Government by which the Transport Commission would be obliged to apply to the local traffic commissioners for licences to run vehicles—an issue which the Government regarded as one of basic principle. But later on, an Opposition amendment which would give independent operators the right to make representations to the transport tribunal on charges schemes was withdrawn. On the compensation issue, additional formal protests—registered especially in an amendment moved by Lord Balfour which he never intended to press—hardly carried the matter further; Lord Nathan rested his reply simply on the inadequate contention that, although many investors felt that their income was being "unfairly diminished," they would have fared even worse if there had been no nationalisation plan—because there were limits to the extent to which their position could have been "ameliorated" by increased charges. As to that, the future will show; or is this an oblique admission that government subsidisation is in prospect, despite the apparent safeguards in the Bill?

The Government in the course of the two weeks' hearings in committee has given a number of pledges to reconsider various points—mainly minor ones—before the Report stage. These, however, will not result in any important changes of principle in the Bill. But not until the report stage will it be possible to take a considered view of the extent of the Lords' impact upon the whole structure of the Government's plan.

Imported Films—New Tax Basis?

The Government is obviously marshalling its resources to ensure that a reduction in overseas expenditure on films is joined with cuts in imports—if and when it has the courage to impose them. On Tuesday the Chancellor of the Exchequer announced that a resolution will be embodied in the Finance Bill empowering the Treasury "to alter or add to Section 10 of the Finance Act,

1935, so as to secure that the value of exposed cinematograph film shall, for the purpose of Customs duties, be determined in such manner as may be provided by the order." Section 10 of the 1935 Act deals with valuations for charging *ad valorem* customs duties.

This new clause will not be invoked immediately it becomes effective. It merely adds to the armoury a useful device, from the Chancellor's point of view, for increasing taxation, if and when it is deemed expedient, in order to save dollars. Obviously, any increase in duty could not be discriminatory in form, but in fact would primarily affect American films. The new clause permits the Treasury to vary the valuation basis of films for duty. The existing basis, which taxes the physical value of exposed film imported, is obviously wholly inappropriate as a means of taxing or restricting Britain's expenditure on overseas films, because overwhelmingly the greater part of this represents return remittances by the overseas film companies of earnings from the exhibition of films in this country. In each of the years 1945 and 1946 imports of exposed film totalled only about £250,000, whereas the "invisible imports" of films—i.e. the remittances to foreign producers—have averaged just over £17 million a year in the period 1944-46.

From the nature of the change which the Chancellor proposes, it seems certain that if a revised duty is levied it will be based upon the estimated net rental value of imported films, including reproduction and exhibition rights. Such an arrangement would obviously be both inequitable and impracticable unless provision were made for the granting of rebates in cases in which the actual net receipts from the films fell short of the import valuation upon which duty had been paid. Presumably, the converse would also apply, so that the customs valuation would be adjusted upwards or downwards to accord with earnings experience after the expiration of some agreed or predetermined period.

The effect of a tax on such a basis as a means of economising dollars is not easy to evaluate. Whether it achieved a worthwhile reduction in film imports would obviously depend upon the elasticity of demand for foreign films in Britain. It is not simply a question of the relative quality of British and American films. Until the British film industry has expanded sufficiently to offer good films in large quantity, American films are likely to retain much of their attraction, despite an increase in cost. In such circumstances, the saving in dollars might be small. That, however, would be no argument for not including film expenditure in any general programme of import cuts. The popular argument that a reduction in British expenditure on American films might provoke retaliatory action upon British films in the American market is, in principle, rather more convincing. In the past, it is certainly an argument which has appealed to the authorities. But earnings of British films in America at present are undoubtedly very small; after distribution and advertising expenses have been met. It is perhaps significant that the Chancellor, when questioned, declined to give any estimate of the net yield. Unless there is a prospect of much more rapid expansion of British films from America than seems likely at present, the need for saving dollars now ought to be allowed to weigh rather heavily in the balance.

Increased Vehicle Export Quotas

Hard on the heels of Mr Dalton's reform of motor taxation—for vehicles registered after January, 1947—with the object of providing a broader basis for vehicle exports, has come an upward

revision of the car export quota. The Society of Motor Manufacturers and Traders has recommended to the industry an increase in the quota from 50 to 60 per cent of production. Manufacturers of heavy commercial vehicles have already agreed to raise their export quota from 33½ to 40 per cent.

The substitution of the flat-rate annual registration fee for the variable tax on cylinder capacity will take some time to yield results in terms of exports. Even on the most optimistic assumptions about the speed at which manufacturers accept and implement the increased standardisation upon medium or large horsepower models which is inherent in the scheme, the necessary retooling of factories and filling up the assembly lines with vehicles must be a fairly protracted process.

The increase in the export quota is necessarily directed mainly to the short-term problem of selling as many British cars abroad as possible while the dwindling sellers' market remains and pre-war models have a ready market. The Society of Motor Manufacturers and Traders estimates that the reduced steel allocation for the summer period will cost the industry about 1,500 cars a week. The effect of increasing the quota for export is therefore to throw the burden of reduced steel supplies even more violently on to the home market. Later in the year, better supplies of steel may be available, especially if the steel industry's coal allocation, now raised to 100 per cent of requirements, can be held at that level after the summer coal allocation period ends.

There is every need to push car exports during the next few months. As an earlier Note emphasised, overseas markets are becoming increasingly difficult to hold. Last week, Argentina placed a temporary embargo on car imports, owing to exchange difficulties. And a London Stock Market firm, in a survey analysing the prospective demand for cars in 1948 in the South African market (one of the most important overseas markets for British cars) estimates that, after giving due weight to developments in the American car industry, the "popularity rating" of American cars will have increased by next year from 81.3 per cent of total sales in 1939 to 90.9 per cent. These are only estimates, but they reinforce the opinion that the export market for British cars urgently needs the stimulus of new models of a type to appeal to overseas customers. If export markets are to be successfully defended, much less expanded, there is urgent need for a favourable, speedy reaction from the motor car industry and its suppliers of components to the opportunity presented by the new taxation formula to reap the advantages of standardisation and large-scale production of models adapted to the overseas as well as the home market.

Anglo-Iranian Oil Surprise

A number of factors combined to produce the surprisingly good results, for the year 1946, announced by the Anglo-Iranian Oil Company early this week. During the year, there was a 14 per cent increase in production, a rising trend in oil prices, and the reduction of EPT to 60 per cent. The outcome for the company was a new high level in profits and dividend—and, this week, a jump of £1 in the price of the shares, which are now quoted at £9½, yielding about £3 6s. 9d. per cent on the dividend. This was increased from 20 to 30 per cent, and is the best ever paid on the present capital. A detailed analysis of the results must await the full accounts, but it appears that the

cellor needs to realise—which he scarcely appeared to do in the debate—that this tax, whether or not it can be “avoided” in the matter of “free” bonus issues (by the expedient of making no such issues), will usually be inescapable where a “bonus element” arises in new issues for cash. Approved borrowers must get the cash they need for expansion, and it is virtually impossible to make an issue successfully on terms which afford no “bonus,” even though the amount in some instances may be small.

Slump in Silver

In less than a fortnight the price for imported silver in New York has slumped from 70½ cents, at which it had been held steady for some previous weeks, to 59½ cents. The London price for authorised industrial users has declined from 43d. to 38d., the adjustment to the New York quotation being somewhat sluggish, and the latest price of 38d. still 2d. over the dollar parity. The underlying weakness of the New York market had been apparent for some time past. It revealed itself in the gradual accumulation of stocks, mainly of Mexican and Canadian origin. There was, however, no pressure to sell until some ten days ago. When this pressure began to manifest itself the price cracked quickly. The offtake of silver from the New York market remains very small. A few British purchases have been reported—of silver which is then sold for approved industrial purposes in the London market. The turnover in such metal is small. The market in free silver has been dormant ever since India suspended the grant of import licences. This position is likely to continue, given the extreme scarcity of current sterling and dollars with which India will be faced in the months to come. There is an abundance of potential offerings of free silver from Russia, Spain and other countries. For the time being, however, there are no takers. The silver market is beginning to feel the effects not merely of this new instillation of the Indian market, but of the loss of the coinage demand for the metal.

America's Synthetic Rubber Policy

Controversy about synthetic rubber is likely to continue until its peacetime level of output in the United States is

governed by a definite and coherent policy. From the wealth of information that has poured out from both protagonists and antagonists, some salient features emerge. But one of them, unfortunately, is that any attempt to appraise future American policy is fraught with dangers, for much depends upon the conflict of interest between the various “pressure” groups that are developing or may yet develop. One notable contribution to the discussion comes from Mr F. D. Ascoli, the former Director of Rubber Control in this country, in a letter published just as the article in last week's issue of *The Economist* went to press. He showed *inter alia* how widely US production at present exceeds the estimated needs of national defence.

The Batt Committee in the United States suggested that, to cover strategic requirements, minimum synthetic production there should be about 250,000 tons per annum, and that this amount could be secured by maintaining in production only the most efficient and lowest-cost units of the existing facilities—a principle which implied that petroleum would be the basic material. The Committee also urged that certain plants producing general purpose synthetic, and at least one using alcohol as raw material, should be maintained in an adequate stand-by condition by the Government. It was suggested that the capacity of these stand-by facilities should total 600,000 tons a year. Yet, in contrast with these figures, current US synthetic production averaged 60,000 tons a month in the first quarter of 1947, and, of this, GRS comprised almost 50,000.

There seems to be no doubt that the American public desires the tyres for its vehicles to be made wholly of natural rubber; but the war-time order (R1), stipulating the proportions of synthetic and natural material to be used, prevents them from making their preference felt. That is the position at present, but it may be significantly influenced in the early future by the attitude of the American rubber-using industries, and especially by the tyre industry. At the moment the rubber manufacturing industry appears to be favourably disposed towards the maintenance of synthetic production, in spite of the consumers' preference—although it should be noted that, in Mr Ascoli's view, it is not unanimous in its attitude. Its proposed compromise has been the synthetic-natural mixture tyre. To what extent its interests, in operating the synthetic plants on behalf of the Government, have

influenced their attitude, it is difficult to say. Possibly more important still is the phobia of being dependent on foreign supplies, and therefore at the mercy of foreign “pressure” interests. But, as last week's article pointed out, there are two further factors to be taken into consideration, namely, the capital and knowledge already invested in the synthetic industry and the possibilities of future development. It is not easy to decide against a material which after all is still in its infancy, merely on the ground that it is at the moment uneconomic to produce. Unless and until a fall in the price of natural rubber largely reinforces the concealed pressure resulting from the preference of the US consumers, the attitude of the US manufacturers is perhaps unlikely to change significantly. If they had already any real hostility to the synthetic product, one or more of them would surely have been tempted to organise “opposition” to R1 if only by guiding public opinion or making it articulate. And the state of market is such that, had any significant move occurred, other manufacturers would have found it hard not to follow suit. It seems reasonable to suppose, however, that as soon as consumers' choice is permitted to make itself felt by buying what it wants from either domestic or overseas sources—and especially if a wide price differential emerges—the rubber goods industry will once more become sympathetic towards the natural product. Until then, or until competition on the world market forces the American industry to restrict its use of synthetic materials simply to those products for which it has an advantage, the present attitude is likely to continue.

Japanese Whaling Controversy

The decision of the American authorities in Japan to allow a Japanese expedition to participate in the next Antarctic whaling season has given rise to strong protests from the other powers concerned. Britain and Australia have protested to the US State Department, first, on principle, that the Americans have broken an obligation to consult the Allies before making such a decision. That is a question of fact. On the question of policy, the whaling nations—chiefly Britain and Norway—are better able than the Americans to judge whether Japan should

be allowed to resume whaling at all. The serious decline in the whale population before the war was due mainly to the methods employed by German and Japanese expeditions, which did not adhere to international conventions. In the 1932-33 season, seventeen factory ships secured 2,400,000 barrels of oil, but in the 1938-39 season twice as many ships produced only 11 per cent more oil. Post-war reports indicate that the rate of decline has not been arrested as much as had been hoped and that there are now sufficient non-Japanese factory ships to ensure the catch of the full quota.

There is presumably no objection from the Allies to an allocation to Japan of a share of the products, from an international pool, provided that the Japanese are not allowed to use their inefficient and wasteful methods. The southern Dominions have also strong strategic objections to the presence of Japanese ships in Antarctic waters, in view of past experience. This might be overcome by restricting the Japanese to shore-based operations only. But the unilateral action of the American authorities raises the much wider question of Allied participation in deciding the future status of the Japanese merchant navy as a whole.

Shorter Notes

This week's meeting of Cable and Wireless (Holding) confirmed the impression that the directors do not intend to recommend liquidation of the company, though they would prefer to wait until the terms of compensation for the nationalising of the operating company are known, towards the end of the year, before indicating the nature of the compromise arrangement which would be needed between the interests of the preference and ordinary stockholders. The tribunal to arrive at compensation terms has now been announced, and is being pressed by the company to hasten its proceedings.

The International Rubber Study Group is scheduled to meet in Paris from July 1st to July 10th. The original members of the group were the United States, France, Netherlands and the United Kingdom, but since the last meeting earlier this year 11 others have applied for membership.

ABRIDGED PARTICULARS.

LONDON MIDLAND ASSOCIATED PROPERTIES LIMITED

SHARE CAPITAL

Authorised	Issued and to be Issued
£300,000 in 4½% Cumulative Preference Stock	£300,000
200,000 in Ordinary Stock	200,000
500,000 in 50,000 Shares of £10 each	160,000
£1,000,000	£660,000

The List will open and close on Friday next, 4th July, for an

ISSUE OF £1,500,000 3½% First Mortgage Debenture Stock at £100 per Cent.

The prospectus shows (inter alia) that:

- HISTORY AND BUSINESS.** The Company was incorporated in 1911 as the “Investment Corporation of Canada Limited” and changed its name to its present title on 10th June, 1947. It owns (directly, or through its wholly-owned subsidiary Company) 4,461 modern residences, of which 3,588 are freehold or long leasehold (over 980 years unexpired), and 873 are leasehold (over 90 years unexpired), situate mainly in compact estates in the suburbs of London and on the outskirts of large provincial towns.
- OBJECTS OF ISSUE.** The net proceeds of the Issue (together with the net proceeds of 16,000 Shares of £10 each which are being offered at £12 10s. 0d. per Share pro rata to the existing Ordinary Stockholders) will be used by the Company in repaying mortgages, charges and other secured loans.
- PRESENT INCOME.** The present Gross Rentals from the 4,461 properties are estimated at £239,156, which, after allowing for all outgoings, Directors' and Trustees' Fees as payable in future, provision for Amortisation of Leases and Profits Tax, together with Interest on Mortgages remaining outstanding on properties held by the subsidiary Company, leaves a balance available for payment of Interest and Sinking Fund on the present issue of Debenture Stock of £122,516.

- SECURITY.** The 3½% First Mortgage Debenture Stock will be secured by a first specific charge on all the Freehold and Leasehold Properties of the Company (but excluding those of the wholly-owned subsidiary Company, N. Moss & Son, Ltd.) recently valued at £2,322,250 and by a floating charge on the undertaking and all other assets of the Company present and future.
- COVER.** The 3½% First Mortgage Debenture Stock is covered on the basis of the above-mentioned figures:—
 - as to principal by the assets to be specifically charged as security alone ... more than 1½ times
 - as to Interest and Sinking Fund ... almost twice.

Prospectuses, on the terms of which alone applications will be considered, and Forms of Application, will be available on Monday from:

BARCLAYS BANK LIMITED, New Issue Department, 54, Lombard Street, London, E.C.3, or any of its Branches.
HAMBROS BANK LIMITED, 41, Bishopsgate, London, E.C.2.
ROWE, SWANN & CO., 24, Old Broad Street, London, E.C.2.
THE OFFICE OF THE COMPANY, 3, Mandeville Place, London, W.1.

COMPANY MEETINGS

TAYLOR WOODROW, LIMITED

A DIFFICULT YEAR

The twelfth annual meeting of this company was held on the 27th instant, in London.

Mr Francis Taylor, chairman, in his statement, referred to the change of the end of the company's year from October 31 to December 31.

He regretted that the company had not been able to benefit by the reduction in the rate of Excess Profits Tax, owing to a deficiency for E.P.T. purposes during the first year of the imposition of the tax being applied against the excess for the year 1946.

Drawing attention to the balance-sheet, Mr Taylor said that no account had been taken of the E.P.T. refund, estimated at £18,000 of the E.P.T. refund, estimated at £18,000 net, which would be due to the company, and which would be used upon development and re-equipment. He said that the figure for work in progress stood at £7,184,098, and that the new issue of 600,000 shares had been successful.

Mr Taylor referred to the shortage of supplies and to the restrictions and controls. The building of permanent houses had been adversely affected by these difficulties. He said, however, that in the temporary housing programme the company had played a leading part.

He spoke of the successful year enjoyed by the subsidiary companies in this country and the company's expansion in Africa. A subsidiary company had been formed in South Africa, and negotiations were almost complete for the formation of another in East Africa. Taylor Woodrow (West Africa), Ltd., had been formed in conjunction with the United Africa Company, Limited.

The report and accounts were adopted.

BARRY AND STAINES LINOLEUM LIMITED

YEAR OF FRUSTRATION

The ordinary general meeting of Barry and Staines Linoleum Limited, was held in London on the 25th instant.

Sir John N. Barran, Bt., the chairman, in the course of his speech, said: Our conversion to peace-time production has been completed. Consumer demand has been abnormally keen from all markets.

On the equipment side, a start has been made on large schemes for the extension, improvement and remodelling of capital assets at both our works. A new laboratory is on the way at Kirkcaldy (the old was partly destroyed during the war). The Runnymede Rubber Company has begun to produce again, with an enviable degree of freedom from control on the site occupied for four years by the Admiralty. Our technical research section has got through a heavy programme of work.

This brief recital of facts should not lead stockholders to suppose that the past year has been a period of smoothly developing work and output. The case is the very reverse.

We are expected to make a good export showing with a 35 per cent. allowance of pre-war oil doled out at about eight times pre-war price. Government has appealed to management and labour throughout the country for higher efficiency and greater effort; and both are, in our experience, more than ready to meet it. But we find few signs of mutual and co-operative effort from the Government side; and the interests of the consumer appear in their view to come a bad third. It has been a year of almost complete frustration. If such are the results of control in a sellers' market, what may we look for when competition must be faced?

The report was adopted.

FORSTER'S GLASS COMPANY LIMITED

DISTRIBUTION AGAIN 16½ PER CENT

The 28th annual general meeting of Forster's Glass Company, Limited, was held on the 26th instant, in London, Col. Charles E. Ponsonby, T.D., D.L., M.P. (chairman) presiding.

The following is an extract from the chairman's statement circulated with the report:

The profit for the year amounts to £68,554, against £68,516 for last year, this after providing an increased amount for depreciation of £22,729 as against £20,237. I am sure you will consider it satisfactory that the profit earned, after taxation, has been maintained at last year's level despite the increased and heavy expenditure. The net profit is £40,408. This, with the balance brought forward from last year of £29,977 and the over-provision for E.P.T. of £23,300, gives a total available for distribution of £93,685. The directors recommend a dividend of 10 per cent. and a cash bonus of 6½ per cent. on the Ordinary shares—that is a total distribution of 16½ per cent. (the same as last year). This will absorb £27,930, and leave a balance of £30,755 to be carried forward.

During the year we had to contend with many difficulties, including rising costs, shortage of raw materials, and lastly, but by no means least, the fuel crisis. The effects of the latter might well have turned out to be more disastrous than was the case but for the effective action taken by the management to reduce working costs. Nevertheless it is satisfactory to note that production and sales attained new record levels, indicating that we are beginning to feel the benefits from the heavy expenditure on plant improvements, additions, renewals and repairs which we have undertaken during the past two years.

The report was adopted.

DAILY NEWS LIMITED

GROWTH OF CIRCULATION

MR L. J. CADBURY ON THE PRESS COMMISSION

The annual general meeting of the Daily News Limited, was held, on the 18th instant, at 12, Bouverie Street, London, E.C., Mr L. J. Cadbury (the chairman) presiding.

The Chairman said: Gentlemen,—As chairman of the company which controls the News Chronicle and The Star, I am well aware that the production of newspapers is something more than an industry, but it is as true of the press as of any other industry that competition is essential to preserve its vitality and ensure its progress. Thus the outstanding event for us in 1946 was the raising of the restriction on sale following the increase in the supply of newsprint granted towards the end of September. That meant that for the first time since 1941 all readers were able to buy the paper of their choice. Competition has once more begun to operate, and the wishes of the reading public now exert their influence over the nation's newspapers. This is an important social fact as well as a welcome return to free enterprise.

It cannot be said of the national press today, however, that competition is causing wasteful practices. The sizes of newspapers remain controlled; circulation-raising devices such as canvassing with free gifts and free insurance are still prohibited. No free copies are allowed, and it is not permissible for distributors to send back any surplus copies. In other words, "Returns" are banned.

STAR'S RECORD SALE INCREASE

With this freedom of sale, there have, of course, been considerable changes in circulation. Our London evening newspaper, The Star, has shown a most gratifying increase, and is now selling over a million copies a day, while the News Chronicle sales are in the region of 1,600,000. The increase in The Star sale is now nearly 50 per cent. above its sale for last September, and is a record percentage increase for any London evening newspaper. It continues to progress.

In addition to the lifting of the restriction on circulation, newsprint supplies were increased in September to allow the greater part of the press, previously limited to four pages, to increase to five. That is to say, four pages for three days each week, and six for the other three. This still leaves far too little space in which to record the news of the day, particularly in these times of intense Parliamentary activity and stirring events both at home and abroad.

SHORTAGE OF NEWSPRINT

Despite this modest increase in its raw material, the British press is still restricted to a lower figure than that of any other industry in the country. We look forward to the day when it may be relieved. Unfortunately, we cannot be very optimistic. From 40 to 50 per cent. of our present supplies come from overseas, almost entirely from dollar sources, and our shortage of dollars is obviously going to be a matter of grave embarrassment for some time to come.

The rest of our newsprint comes from the home paper mills. Here we are confronted with the double shortage of coal and wood pulp. As it takes about a ton of coal to produce a ton of newsprint, it is not surprising that newsprint production was severely hit by the coal crisis. The wood pulp all comes either from Canada or from hard currency Scandinavian countries. Our hopes are, therefore, not bright for an increased output of newsprint from the home mills. Their production at the present moment is limited to 35 per cent. of their

pre-war capacity, and even this figure will be slightly reduced after next month.

We must face the fact that a return to newspapers of a size more suited to the needs of one of the world's great democracies is postponed to a distant future. This is a national misfortune.

SMALL NEWSPAPERS

We have had four- and six-page papers for so many years in this country that they no longer appear to us as unusual. They do, however, in fact, reflect what is almost a revolution in newspaper editorial technique. The editorial staffs have displayed great adaptability in compressing news of the day into the meagre space at their disposal. Overseas journalists, accustomed to almost unlimited pages, have been greatly impressed with the results.

A few weeks ago, in the News Chronicle, Mr A. J. Cummings recorded the following views of some distinguished American visitors on the British press:—"They were astonished at the journalistic efficiency which manages to give a clear and comprehensive picture of the world's news in four or six pages. They were astonished also at the amount of space allotted to Parliamentary reports, without serious detriment to the attractiveness of the make-up."

RISING COSTS

Rising costs and prices with the danger of runaway inflation have been under continuous review by the Government. It is very right that this question should be a subject of public concern. The value of sterling must be maintained and the cost of living, with its immediate reaction on wage rates, must be kept under control. In this connection the newspaper industry has a remarkable record. Newsprint, which before the war could be purchased for £10 or £11 a ton, has risen during the year from £30 to £32 a ton. The cost of rail carriage over pre-war has risen by 33½. Wages and social security charges have gone up. Reduced hours of work have caused a further rise in costs.

To meet war conditions a great many of the provincial papers raised their price from 1d. to 1½d., but the national penny papers still maintain their pre-war price. They have been able to do this because of the enforced reduction in the size of papers, by eliminating wasteful competitive practices and by charging higher rates per column inch to the advertiser. It is significant that the ratio of advertising to reading matter has been substantially reduced in the national morning papers. On the average about 23 per cent. of space is now devoted in the penny press to advertising purposes, compared with something over 40 per cent. before the war.

THE ROYAL COMMISSION

After some delay in choosing its chairman and personnel, the Royal Commission on the press has been set up. I welcome the statement in its terms of reference that it has been appointed "with the object of furthering the free expression of opinion through the press." More than ever we see that a free press is an essential condition of democratic government.

It is interesting to observe that the unofficial Commission on the press that has recently sat in the United States concluded, according to its chairman, Dr. Hutchins, "that it did not want to have the press controlled or regulated by the Government."

We hope the Royal Commission will be able to give publicity to the handicaps under which the press in this country labours. In addition to the newsprint shortage to which I have already alluded, there is, for instance, the incalculable nature of the existing law of libel. As Mr Brendan Bracken said recently in the Companies Bill debate, "It is no exaggeration to say that our present law of libel greatly advantages financial sharks and their underworld lawyers."

QUESTION OF OWNERSHIP

One of the other objects of the Royal Commission is to inquire into the ownership of the press. Here our position is clear. My father first became interested in the Daily News in 1900 and, some years later, in 1911, he handed over a majority of the Ordinary shares in the Daily News Limited, to trustees. Control of the Daily News Limited, and its subsidiary companies, the News Chronicle, Limited, and Star Newspaper Company, Limited, continue under the deed of trust then established.

We are not tied to any political party and can therefore bring an independent judgment to bear on the problems of the day. Our general outlook is, however, Liberal and vigorously progressive. We are equally opposed to doctrinaire Socialism and reactionary Conservatism.

We have supported the Government in the measures which, in our view, are in the public interest, but in some directions have not been able to follow them. We have no liking for nationalisation merely for nationalisation's sake.

PRESS AS WATCH-DOG

The Government is forcing through Parliament a volume of legislation at unprecedented speed, so much so that the usual processes of Parliamentary discussion and criticism have not sufficient opportunity to be effective. Upon the press, therefore, devolves the function of being more than ever the watch-dog of the ordinary citizen. The readers of our newspapers are drawn from all sections of the community. It is therefore fitting that we should represent the interests of all groups, including those who have no powerful industrial or political organisation to back them.

I have already mentioned the return to competition of the press, although its chief raw material is still in short supply and is subject to control. In this matter the newspapers have given a valuable lead to the numerous industries that still have their outposts regulated by rationed raw material supplies.

Individual firms in these industries have their turnover pegged to that of the early war period, or even in some cases to a period before the war. They cannot progress, but they are saved from any danger of losing ground to more energetic rivals. An enervating atmosphere is created, enterprise receives little encouragement, and in too many instances firms or industries are showing reluctance to emerge once more into the hazards of competition with its rewards, but with its risks.

WIDE AREA OF PRIVATE ENTERPRISE

The methods by which at least some element of competition has been introduced into the newspaper industry may not be exactly applicable elsewhere. I hope, however, that they will encourage other controlled industries to seek out methods suitable to their own circumstances.

Despite the Government's nationalisation projects it must not be forgotten that the area of private enterprise in this country is still very wide. If the nation is to return to economic health, incentives must be restored and the spirit of vigorous competition and initiative must be recovered in all branches of industry.

The report and accounts were adopted.

ANGLO-PORTUGUESE TELEPHONE COMPANY, LIMITED

SIR ALEXANDER ROGER ON HIS VISIT

The sixtieth annual general meeting of the Anglo-Portuguese Telephone Company, Limited, will be held at Donington House, Norfolk Street, London, W.C., on the 30th instant.

The following is an extract from the statement by the chairman, Sir Alexander Roger, K.C.I.E., circulated with the report and accounts for the year 1946:—

Net profit is £59,521 as against £55,517. Dividends of 8 per cent., less tax, on the ordinary stock and "A" ordinary shares absorb £57,172, leaving £42,092 against £39,743 brought in.

I am glad to report that during 1946 shipments of British plant and supplies to the value of £366,000 went to your company and the value of £138,000 to the telephone department of the Portuguese Government. This achievement has been made possible only through the valuable assistance from our manufacturing associates to whom we are greatly indebted. In addition, your company purchased in Lisbon and Oporto over 9,400 contos (£94,000) of miscellaneous telephone and ancillary supplies from Portuguese traders.

These are handsome contributions towards war-time arrears and are a measure of the promises which I was able to make to the Portuguese authorities in 1945, when discussing our comprehensive post-war five-year plan for development and expansion.

PLANT ADDITIONS

The heavy technical work of installation kept pace with deliveries of material and all the main projects of the programme were completed. In Lisbon the outstanding event was the opening of the new Campo Pequeno Automatic Exchange, designed for 20,000 lines capacity, by His Excellency General Carmona, the President of the Republic, attended by the Minister of Public Works and many other high officials. The British community, led by the British Ambassador, was well represented and we record our deep appreciation and express our thanks to them and all who attended. Trindade Exchange is the oldest and largest of our change is the oldest and largest of our automatic exchanges. A further unit has been added and the number of lines in operation is 11,600.

The cable department of the engineering division was no less active than the installation section, and chief among the works carried out were the laying of new toll cables to Estoril and the south of the Tagus, which brought much-needed relief to those areas. In Oporto an entirely new exchange was almost completed and increases in exchange capacity were effected in several of the satellite exchanges, while cable distribution schemes were also completed.

TELEPHONES—STATION GROWTH

Altogether, stations added numbered 6,980, which represents 10.7 per cent. increase over 1945, bringing the total to 72,185. In looking back over the past 20 years of my chairmanship, which began on 19th May 1927, I find that as a result of continuing capital investment based on experienced expert planning, the systems in Lisbon and Oporto have been built up from approximately 20,000 stations to the present-day number of over 72,000.

Considering all the vicissitudes, particularly the difficult war years, the progress of your company in terms of station growth over the past two decades can be regarded with satisfaction.

PERSONAL VISIT

A few weeks ago I returned from another visit with Mr. Hollier to Portugal. We found that the demand for service shows no abatement, and the waiting list of applicants approximately 17,000. Our programme

planned to be undertaken this year involves gross expenditure of approximately £400,000, and our Portuguese friends know that we shall not rest until we have completed it, and proceeded to meet all further demands.

The world shortage of basic materials is one of the main reasons which prevent the orders for telephone plant and equipment being fulfilled more promptly. Every country is short of telephones and the aggregate shortage involves many hundreds of millions of pounds of expenditure which can only be met by manufacturers over years. Our company and the Portuguese community generally are aware that relatively Portugal is getting a good share of the available supplies and I hope this will continue.

PROGRESS OF PORTUGAL

I had the honour of a lengthy meeting with His Excellency Doctor Oliveira Salazar, the Prime Minister, and exchanging views with him on many subjects. I had the privilege, too, of meeting several Government Ministers and Chiefs of Government and Municipal Department. I have been a frequent visitor to Portugal for many years in connection with our telecommunications business and a variety of interests directly concerned with Anglo-Portuguese commerce and trade. Each time, particularly in the later years, I become more impressed with the advancement of the country. Huge blocks of flats and large numbers of houses and factories continue to rise in Lisbon and Oporto and elsewhere. I was agreeably surprised to see the rapidity with which the new harbour, dock and warehouse accommodation at Leixões, Oporto, have been completed, and the work which has already commenced both in Oporto and in Lisbon for further expansion to meet the needs of shipping. New industries are being developed and extended in many places with the result that there is practically no unemployment, leading to much competition for labour, especially as regards skilled artisans.

Many schemes are in hand and include hydro-electricification plant for supplying electric current throughout the country. Electrification of the railways, additions to the mercantile fleet, and the reconstruction of basic industries are all in progress. It is estimated that the various post-war measures will mean the expenditure of approximately 9,000,000 contos (£90,000,000). The development and progress of Portugal is being actively led by the Government, and it is realised that the country will continue to need foreign technique, capital and supplies for many years. We hope that our British Government departments will afford every assistance possible to enable all British interests, which are exporters of plant, equipment and materials to Portugal, to fulfil the demands of that country, and at the same time increase British export trade, particularly bearing in mind the statement made in the White Paper—Economic Survey for 1947—to the effect that British exports to Portugal earn dollars or the equivalent of dollars.

AN ANGLO-PORTUGUESE ENTERPRISE

To all British shareholders of the company visiting Portugal at any time, and to all Portuguese and other shareholders resident there, I extend a hearty invitation to visit one of our main exchanges in Lisbon or Oporto. They will see in operation a great business, built up over a period of 60 years, which is providing a fine telephone service and which it has been, and will continue to be, our constant aim to develop and expand. Portugal knows well how to encourage enterprises which recognise their duties and responsibilities to the Government and the community,

and for our part we can fairly claim that our obligations are being honourably fulfilled, and that this Anglo-Portuguese enterprise is of great mutual benefit to the social and commercial relationships of Portugal and Great Britain.

Interchange of visits—Since the last general meeting, Mr. Rye has made two valuable visits to Portugal and Senhor Antonio Branco Cabral, the chairman of the board in Portugal, was able to make an equally valuable visit to London. The interchange of visits between executives of the organisation in Portugal and London is regular and there is no adequate substitute for these personal contacts which eliminate delays and promote good feeling and mutual understanding.

Your company serves the cities and suburbs of Lisbon and Oporto, and the rest of the country is served telephonically by the Government, the two systems being inter-linked. Capital and revenue expenses have now reached such a level that both the state system and our own require some adjustment in the telephone rate structure. This is under sympathetic review by the Portuguese Telephone Administration and we expect to be called into consultation very soon.

ANGLO-NEWFOUNDLAND DEVELOPMENT COMPANY, LIMITED

SOUND FINANCIAL POSITION

MR. ELLIOTT LITTLE ON THE NEWSPRINT SITUATION

The ordinary general meeting of Anglo-Newfoundland Development Company, Limited, was held, on the 24th instant, at the offices of the company, Grand Falls, Newfoundland, Mr. Elliott M. Little (president) in the chair.

The following is the president's statement, which was circulated with the report and accounts for the year ended December 31, 1946:—

Before giving you a résumé of the year's operations, I should like to draw your attention to the fact that for comparison the figures of the previous year are shown on the accounts now submitted. Certain other changes have been made in the form of these accounts to add to their clarity. You will observe from the accounts that the result of the year's operations, after all charges including taxation, is only slightly lower than the previous year, in which year \$400,000 in dividends was received from our shipping company. During the year there was some improvement in the price of newsprint and pulps; but the benefits that would normally accrue from those increases were offset by increased costs for labour and materials and higher taxation.

The mill operated practically at capacity during the year 1946. The production during the year under review was some 7,000 tons greater than in 1945. The increased production was due to the speeding up of machines and improvements made in the physical condition of the plant. In this latter respect considerable expenditures have yet to be made over the next few years as materials and supplies become available. Similarly, expenditures on townsite and transportation facilities to maintain them in efficient state of repair will be necessary for a few years ahead.

LONG-RANGE PROGRAMME

I do not intend to dwell upon the balance sheet changes item by item, but should like to say in passing that the increases which are shown under our towns, railways, etc., are part of the long-range programme which must be carried out to modernise plant and improve operations. Likewise, the pulp wood cut has been the largest in our history and the stocks of newsprint and pulp are at the lowest.

The report and accounts were adopted.

APPOINTMENT OF CENTRAL STATISTICAL OFFICER

APPLICATIONS are invited for the appointment in the office of the Town Clerk of a competent STATISTICIAN at a commencing salary of £1,000 per annum plus war bonus as may be determined—at present £59 19s. per annum.

Candidates must have organising ability and administrative experience and be competent to advise upon the setting up as part of the Corporation service of a Central Statistical Office, and to have charge of such office if and when established. Experience in Local Government Service, whilst not essential, will be an advantage.

The appointment will be terminable at any time by three months' notice on either side.

Applications endorsed "Central Statistical Officer," with copies of not more than three testimonials of recent date, should be addressed to the Town Clerk, Room 30B, Council House, Birmingham 1, and delivered on or before July 31, 1947. Applications should contain the following information: age; whether married or single; where educated; whether the holder of any degrees, diplomas, etc.; range of experience in various occupations, including details of experience and training in the analysis, interpretation and use of statistics as a guide to policy, and a statement of disqualification.

F. C. MINSHULL, Town Clerk
Town Clerk's Office, Council House, Birmingham 1. June 7, 1947.

MINISTRY OF EDUCATION: Applications are invited from men and women between 23 and 40 years of age, who served in H.M. Forces or were employed full-time in other work of national importance during the war, for admission to courses of training as full-time Teachers of Technical or Commercial Subjects in Colleges of Further Education or in Secondary Technical Schools.

or applicants should have good qualifications of the order of Higher National Certificate or Final Examination of the City and Guilds of London Institute in any of the following: Building, Commerce, Engineering, Offices, Textiles, Transport, and Baking and Confectionery. Candidates must also have experience in one of the following: Carpentry, General management, Catering, Housecraft, Needle Trades or Crafts. A candidate who desires to teach a trade which is not the subject of a generally recognised examination should have had 5 years' post-apprenticeship experience while a candidate with two years should have been in a responsible position. Candidates may be required to undergo written and practical tests.

Training will be given in the principles and practice of teaching and in the methods of teaching special subjects. The courses will be of six-nine months' duration. There will be no fees, and students will be eligible for maintenance grants for the period of the course.

Application should be made on Form 203 R.E., which may be obtained from the Secretary (Teachers R.E. 1), Ministry of Education, 14-22, Lennox Gardens, London, S.W.1.

(Incorporated in Turkey With Limited Liability)

NOTICE IS HEREBY GIVEN that, in accordance with Article 25 of the Statute of the annual General Meeting of shareholders to be held on Wednesday, July 16, 1947, at Winchester House, Old Broad Street, London, E.C.2, at 12.30 p.m., to receive a Report from the Committee with the Accounts for the year ending December 31, 1946, to propose a Dividend and to replace the retiring Members of the General Committee.

By the 27th Article of the Statutes, the General Meeting is composed of Shareholders possessing at least thirty shares, who, to be entitled to form part of the Meeting, must deposit their shares at the Chief Office of the Company, in London, or at either of the several Branches or Agencies abroad (in London at 20/22, Abchurch Lane, E.C.4, and in Paris at 7, Rue Meyerbeer, 9me) ten days at least before the day fixed for the Meeting.

THE Appointments Committee of the Faculty of Economics in the University of Cambridge will shortly meet for the appointment of a University Lecturer in Economics who will be providing teaching in the Economics required by the Colonial Service Committee in the provision of courses for Colonial Service Officers and Colonial Service Officers. The appointment will be made in accordance with the Statutes and Ordinances of the University. The initial stipend of a University Lecturer is at present £250 and in 1917-48 there will be paid a non-pensionable bonus of £250 and a stipend of £75, or £50 if the Lecturer is a Fellow of a College, or £50 for each dependent child will also be paid. A stipend allowance of £250. An additional pensionable payment may be granted to a Fellow of a College may be granted a further allowance of £250. An additional pensionable payment may be made for additional duties in conducting classes for Colonial Service Probationers and Officers.

Candidates are required to send their applications to the Secretary of the Faculty of Economics and Statistics, Gonville and Caius College, Cambridge, by July 26, 1954. The application should be sent by post. Candidates should send testimonials but may submit the names of not more than three persons to whom reference may be made, and may send a copy of any publications.

UNIVERSITY OF LONDON.—The Senate invite applications for a Readership in Economics (Banking and Currency) in the School of Economics (salary £800-£1,000-£1,200) must be received not later than September 4, 1947.
