In so doing, he has shown an enlightenment that was absent from his colleagues' decisions in the early days of the crisis. In fact the psychology of the crisis has been quite as striking as its economics, and possibly even more complex. That psychology has, moreover, economic effects which make it worth attention in an economic context. Under stress, a number of inarticulate habits of thought and feeling have become at least semi-explicit. One has heard protests against *It*, against *Them*, in which the sins of the Government and the eccentricities of the weather have been confounded in a resentment as ferocious and illogical as that of a baby hitting back at the bad, naughty table on which it has bumped its head. ("This sort of thing didn't happen when Churchill was running the country.") There has not even been lacking the suggestion that freeze-up and flood represent the Divine displeasure with the British electorate for putting in a Labour government; some such sentiment presumably strengthens the consciences of those super-patriots who switch on every piece of electrical apparatus in the house "to help bring the Government down." But the fringe of eighteen-month-old mentalities is nothing new. More striking has been the curious alliance of two strains of feeling appearing at first sight to have little or nothing in common; the defensive, exclusive, dog-in-the-manger restrictionism of the cartel or trade union and the generous spirit of fair play and *noblesse oblige*. It was evidently the latter which moved the editor of the *Tory Forum*, in a paroxysm of self-abnegation, to acclaim the ban on roneoed editions of suppressed periodicals, just as it was unmistakably the former which imposed that ban in the first place; and presumably it was some fantastic amalgam of the two which produced the Himalayan stupidity of the switch-off of hydroelectric power. Possibly one should look deeper into the collective unconscious—if there is such a thing—of the Race, to find the common root of both sentiments; a profound Puri-

tanical conviction that misery is the natural and virtuous state of man and that to minimize misery is thus both a dubiously desirable aim and, in any case, entirely secondary to the more laudable purpose of sharing whatever misery is going amongst as many people as possible.

There are, of course, times when the deliberate and unnecessary sharing of hardship may have a powerful and positive effect. When David took the water of the well of Bethlehem, which his three mighty men had brought through the host of the Philistines, and "poured it out unto the Lord," no one was any the less thirsty, but no doubt everyone fought the better; and no doubt, too, British morale stood up all the more firmly in the blitz because the Londoners could sing,

"With Mr Jones and Mr Brown
The King is still in London Town."

But this homeopathic medicine to morale is not to be dispensed in large doses, and compulsion entirely destroys its effect. Carried to its logical conclusion, the doctrine of equality of sacrifice would lead every punctual traveller on the 8.45, observing through the window the contortions and imprecations of the stragglers on the wrong side of the platform gate, to tumble headlong out again and await in manly fortitude and solidarity the arrival of the 9.15; a proceeding which, for all its moral beauty, would do nothing to ease the transport problem or win the Battle of Production. Given its head at—say—Dunkirk, that doctrine would have left the rescued 350,000 on the beaches to share the sacrifice of the unrescued; the official mind which conceived the ban on windmill generators must have shuddered at the use for large-scale cross-Channel traffic of vessels not merely grossly overloaded but actually unlicensed for the carrying of passengers.

Psychological peculiarities, like economic shortcomings, are most conspicuous in crisis but work just as effectively in "normal" times. The doctrine of equal misery, the conviction that every advantage, whether in production or in enjoyment, is an unfair advantage, the high-minded insistence that, since the wind cannot be tempered to the shorn lamb, all must be shorn alike, is nothing new. Its spirit breathes through hundreds of Trade Union regulations, Trade Association agreements, and Government controls. A beautifully clear instance of its effects, small-scale but typical, could lately be observed in the outburst

of a Surrey master builder with a local government housing contract to fulfil. Having, at one stage of that contract, a surplus of certain workers, he applied for a licence to employ them on private repair work. This licence was refused. In understandable irritation, he publicly informed the council that he was well ahead of his contract, but did not in the circumstances propose to finish the work before the agreed date; the surplus workers could stay on the council job and spin the contract out—and the Council could pay. It is easy to criticise this unpublic-spirited behaviour; but one might almost be grateful for the indiscretion which laid bare its motive springs. For every such piece of ca'canny defiantly made public, how many remain hidden, to manifest themselves only in sluggish production and inflated prices? Where is the sense in efficiency, in the saving of time, material or labour, if any advantage gained thereby is—merely because it is an advantage—regarded as unfair; when enterprise is faced not merely with heavy taxation on its profits, but with prohibitions on its use in the service of the public?

The area over which control in the interests of equal misery exerts its damping effect is wider than the legal scope of any actual regulation. The launching of any new venture, the circumventing by new methods of any difficulty, the harnessing of any freshet in the desert of scarcity, raises in the mind of whoever contemplates it the immediate query: won't some official somewhere think up a good reason for forbidding this? No regulation may actually exist, or be likely to be invoked; but the ever-present possibility blights, like a killing frost, the growing-points of enterprise. It is simpler to sit and suffer, and let the public suffer too; misery loves company, and how beautiful, after all, is Britain's ability to take it.

To make a bonfire of all controls, American fashion, would of course achieve nothing but chaos. Controls are needed until potential inflation has been mastered—an excellent reason, even were there no others, for mastering it as soon as may be. But apart from inflation, some controls must endure for a long

NOTES OF THE WEEK

Middle Game in Moscow

Each Foreign Minister has now made his opening moves in the game to determine the economic future of Germany. The pieces have been moved very much as on previous occasions and there is every prospect of a very complex, stubborn middle game to which observers in Moscow at the moment see no end. But the first exchanges have been hinted at. Mr Molotov, who at Potsdam wanted to restrict German steel production to 3½ million tons a year, seems now willing to accept between 10 and 12 million tons a year. Mr Bevin, no doubt agreeably surprised, has hinted that reparations for the Soviet Union out of current production might be possible after all, once the German economy is balanced and able to repay the external occupation costs and large advances for import payments which the British taxpayer has incurred. Such an exchange between Mr Bevin and Mr Molotov would loosen up the game considerably; but M. Bidault is ready to oppose—very firmly—a higher level of industry unless Germany is bound by treaty to export coal to France. "Why," he says, "take the ore to Germany to make steel; why not bring the coal westward and let others make the steel?" And Mr Marshall has pointed out the dangers of raising industrial production to a level at which adequate reparations from current production could be paid.

But even if French objections were overcome—and Mr Bevin has made it clear that he cannot agree to coal exports fixed by treaty—there would still be a long struggle over the size of the Soviet reparations claim. Mr Molotov has tried to fall back on an alleged Yalta agreement to talk on the basis of 20,000 million dollars spread over ten years. It has been made clear that British judgment on this claim was most emphatically reserved at Yalta, and Mr Bevin pointed out that it would mean £500,000,000 sterling a year, roughly equivalent to Germany's pre-war gross exports. On this basis the British Treasury would

time yet as tools of the social conscience. In Paris, Brussels or Rome five pounds will buy an incomparably better dinner than in London; and wealthy Greeks, Syrians and Egyptians purchase from British ex-millionaires the yachts which their former owners can no longer afford to commission. But the half-crown which will buy a square, if austere, meal in London would hardly buy a cup of coffee in Paris, and the fellaheen of Egypt live much as they have lived since the Bronze Age, on the edge of starvation and in the middle of squalor. There can hardly be any section of British public opinion which really wants economic freedom left to produce its full natural effects in inequality. The question is what price, if any, in total production should be paid for social justice. For the form of justice which is achieved by penalising the fortunate without correspondingly benefiting the unfortunate there is, of course nothing to be said except by economic masochists. But should doubt go no further than this? No other country—certainly not Russia—has placed the reduction of inequality so high on the agenda. Does it stand too high? Bread for all before cake for some is an appealing slogan, but no community has ever contrived to run for long without a little cake—and that, be it repeated, emphatically includes the USSR. One may reasonably weigh progress against the security of a national minimum, but security is meaningless if progress has actually to be reversed in order to attain it. In a hopelessly bankrupt enterprise the holders of debentures and of ordinary shares are equally impoverished. The mass of controls designed to preserve the national minimum from rising prices or from the competing demands of the wealthy, the elaborate structure of priorities, allocations and rationing, threaten to defeat their purpose. It is not much good having a first claim on a national income which is tobogganing down to Balkan levels. If the luxury of putting everyone's conscience at rest, of the ideally equalitarian distribution of misery and blessedness, can only be purchased at the price of a landslide to ever greater misery, it had better, like other and more desirable luxuries, be given a low priority.

never see a penny back. No one doubts that the Soviet claim could be proven; no one believes Germany could pay it or that large reparations from current production have not already been taken from the eastern zone. Will not the proceeds of sales and barter deals arranged at the recent Leipzig Fair eventually reach the Soviet Union?

On the administrative shape to be given to the German economy the opposed arguments are still far apart. Mr Molotov wants the fusion of the British and American Zones cancelled, yet he must know that Mr Bevin does not consent to this even if he wanted to. Mr Bevin rather impishly asked whether the Russians would share the costs of running Germany, "past, present and future." The only hopeful sign here was Mr Molotov's statement that a joint import-export programme for the whole of Germany might be worked out. But M. Bidault will not accept a central German administrative machine to run the economy until frontiers are fixed, that is to say, until the future of the Ruhr and the Saar is fixed. And if he insists on that, the burning question of Germany's eastern frontier must come up. As for the Ruhr, Mr Bevin rejected any special plan for that industrial area unless it were part of a general scheme for controlling German industry, which would of course cover eastern zone industry as well. The general impression at the moment is that certain bargains may be made, but that the general problem of providing Germany with a provisional unified economic regime will be referred to the deputies.

* * *

"Lebensraum" Again

Why exactly M. Bidault raised the problem of Germany's future population density at Moscow this week is not quite clear, but the reminder is salutary and depressing. He pointed out

that economic plans must be based on a figure of 70,000,000, with a density of 196 persons to the square kilometre, against a density in France of 75, in Poland of 62. Mr Bevin suggested a study by the occupying powers of means to redistribute those persons who had returned to Germany from outside, in other words those who had fled westward from the Soviet sphere of influence. Obviously no voluntary movement of Germans between zones will take place until their country is once more unified; and even when that is achieved there can be no certainty of the direction they will choose to take.

This brings up two burning questions: the disposal of displaced persons and the organised emigration of Germans. M. Bidault wanted to see both tackled and pointed out that France would take—is already taking—Germans for settlement and work. Mr Bevin reminded his colleagues that the British Zone was worse off than any, having increased its population of 2,500,000 above the 1939 level. General Marshall unfortunately had no suggestions to make.

Sooner or later that very effective Nazi term *Lebensraum* will appear again in German politics—effective not only in stirring Germans but in creating sympathy abroad. There are few constructive, long-term investigations that would be more worth while than a study of future emigration possibilities for Germans. Their quality as settlers is beyond dispute; the risk that they will revive National Socialism in other countries will only arise if Germany is allowed again to become aggressive and expansionist. In this as in other suggestions he has made at Moscow, M. Bidault has shown how far-seeing and sensible French policy is in the present stage. It cannot remain so if it meets much frustration, and Mr Bevin should bear this in mind.

Postscript to the Debate

There was a time when a debate on manpower in the House of Commons was of first importance. So long as the supply of men and women could be regarded in the same way as the supply of any other essential commodity, and rationed, allocated and distributed where it was most needed, the discussions of manpower policy were able to have reality and a sense of purpose. To-day, when the labour controls have disappeared, the debates have lost

that it came as an anti-climax. If it had been possible for the Government to announce any real policy for distributing manpower to the basic industries, they would have done so last week. As it is, they have no policy, and all that this week's two debates—the House of Lords has debated the Economic White Paper—have done is to underline this melancholy fact. The only real alternative to a policy of labour control would have been a wages policy, initiated before the controls were removed. But the Government has hesitated for so long that there is a danger that a wages policy, if put into effect to-day, might do no more than increase the inflationary pressure. In any case, there is to be no wages policy. On this point, Mr Ness Edwards, who replied for the Government, was quite specific; more so, perhaps, than any Minister has yet been in the House of Commons. The Government is to stand by the existing system: both sides of an industry will settle wages on the basis of

fullest economic information, that will enable it to take decisions which will not militate against the general economy while serving the industry's own interests. Thus each industry is encouraged to go on competing for manpower with its fellows. Mr Ness Edwards's statement is surely the negation of planning.

Town Planning Progress

Mr Silkin has indicated in committee that his powers to prohibit and control outdoor advertisements under the Town and Country Planning Bill will be used with moderation—perhaps too much moderation, in view of the ugly and dismal appearance which the great majority of them present. Even in rural and other places which are to be made “areas of special control,” it would clearly be wrong to prohibit election posters, Government advertisements and the individual signs of traders and craftsmen, while, as the Minister said, “nobody but a fool would wish to interfere with pub signs.” But there is force in the argument that it would be better to lay down a blanket prohibition for such areas and then specify the exemptions. As usual, the Minister's powers, wide as they are, are left by the Bill wholly permissive; there is no knowing what will be done in practice or how often policy will be changed.

Mr Silkin is proceeding in close consultation with the advertising industry. He now envisages that if a satisfactory agreement cannot be reached over the nature of the appeal tribunals that can be set up under the Bill, the Minister himself should become the court of appeal for an aggrieved advertiser. This would be most unsatisfactory. The idea of an appeal tribunal is to break the closed circle of administrative decision and enable the dispute to be examined by disinterested persons of average commonsense. It should not be beyond the Minister's wit to discover such persons and to make use of them in other contexts as well.

An important discussion has also taken place in the Committee on what kind of joint planning committees of local authorities should be permitted. The Minister has shown a healthy distaste for joint committees, together with a sane realisation that even the larger units of local government are often unsuitable for planning purposes. In some areas the problem seems insoluble within the present context of local government. The hundred odd planning authorities in Greater London will be abolished, but in their stead counties like Kent and Essex, which are half rural, half suburban, will be unwieldy partners in efforts to secure the city's orderly development. Yet the difficulties of creating a joint planning authority for the whole London region cannot be easily overcome.

Morte MacArthur

General MacArthur, in a speech to a press conference in Tokyo on March 17th, set about cutting Gordian knots with that strangely inconsistent mixture of toughness and idealism which is characteristic of his personality. He boasted that his military administration had completely demilitarised Japan, and that Japan's capacity for waging war had been “utterly destroyed”; the “mythological feudalistic conceptions” which had led the Japanese to desire to enslave the world had been uprooted, and democracy was in possession, soon to be followed, in the General's opinion, by the spread of Christianity.

On the other hand, said the General, Japan was economically exhausted, and was being “strangled” by blockade; there was no external trade except through “the bottleneck of Allied Headquarters”; soon the Japanese would either die by millions or become a charge on the bounty of the United States. No hint

more could be got out of Japan for reparations. The Allies should therefore make a peace treaty with Japan as soon as possible, withdraw all occupation troops and leave Japanese foreign trade to private enterprise. As Japan was now completely disarmed, it must be “honestly protected” by the Allies, and whatever controls were still necessary after conclusion of the peace treaty should be handled by the United Nations.

This is perhaps the first time that an eminent soldier has publicly described his own headquarters as a bottleneck; but the implied attitude is quite in keeping with a good Republican's belief in the virtues of private business enterprise, and will no doubt earn approving comment from the Grand Old Party. Indeed, General MacArthur's impatience for winding up the occupation of Japan and his insistence that he has already accomplished what he was sent to Japan to do might suggest to a suspicious observer that he is tired of governing Japan and yearns for the political arena of his own country. In his claim that no more reparations can be extracted from Japan, and that there is no point in “removing from Japan what the American taxpayer will have to pay for in two or three years' time,” the General certainly had in mind the deadlock with Russia over Japanese reparations; and his speech is in accord with the tendency of American policy on the matter, though going much further than any previous official pronouncement. But it is on the subject of withdrawal of occupation troops that his opinion is most surprising. Japan by its own recently adopted constitution is not to have any armed forces at all in future, and the strategic problem of the “power vacuum” would exist here in a specially dangerous form if there were no Allied troops in the country. It can well be understood that General MacArthur does not like the idea of being succeeded by anyone in the unique position he has held, but his optimism about the sequel seems in the present condition of the world somewhat naive.

Fission in the Security Council

The splitting of an atom produces intense light, too much heat and a discharge of poisonous rays; the splitting of the Security Council produces only gloom and chill without damaging anybody's white corpuscles. Mr Gromyko's rejection of the Atomic Energy Commission's recommended scheme for international inspection in his speech of March 5th did not cause a sensation; it was almost an expected disappointment, and received much less notice in British newspapers than the contemporary snowstorms and Shinwelleries. Formally it left matters just where they were; the whole business has been referred back to the Commission to report again by the autumn. But in reality, the situation does not stay as it is; it develops rapidly. The American move to bolster up Greece and Turkey, with its open challenge to the extension of the Russian orbit, followed almost immediately on, and in part as a consequence of, the deadlock over the atomic energy negotiations. For, if there is no agreement which can give the nations security against the new weapon, the Great Powers must look to their strategic positions and make sure of their alliances, whatever the cost to the publicity of peace. The United States continues to make atomic bombs; Russia may be making them by now; everybody is playing with rockets. With each month that passes without agreement on the international control of atomic energy, the armaments race gains momentum. Mr Gromyko's argument was that the proposed scheme would be a violation of national sovereignty, and would place the deve-

lopment of Russia's industrial life in charge of an agency on which the majority of delegates would not be well disposed towards the Soviet peoples. On the assumption that the world is permanently divided into two mutually hostile ideological camps and that one of them is in a permanent minority among the nations, Mr Gromyko's reasoning is no doubt cogent; international control of atomic energy by majority decision might be used by the capitalist world as a means of domination over the Soviet Union and its satellites. But need there be any question of domination in an inspection which is directed only to seeing that an agreement for prohibition of atomic weapons is carried out? What mankind wants is that no atomic bombs should be made. This requires inspection, and the inspection would have to go far enough to ensure that atomic material released for industrial use was not diverted to the manufacture of bombs. The original Lilienthal Report held out the hope that, by the device of “denaturing,” this security could be given without an apparatus of inspection of industry so detailed that it could be used as an instrument of pressure on general economic policy. What has happened to this suggestion, which has been lost from view? Inspection by itself raises all kinds of difficulties, but the issue would have been much clearer if the Americans had not mixed it up in their proposals with the idea of a sort of international TVA. It is to be hoped that the Atomic Energy Commission in its second thoughts will confine itself to the absolute minimum necessary for the outlawry of the atomic bomb.

Parliamentary Procedure

The Government has this week announced its views on the third report of the Select Committee on Parliamentary Procedure, whose main recommendations were summarised in *The Economist* of November 16, 1946, page 782. In brief, the Select Committee attempted to devise a procedure which would enable Parliament to deal with an ever-increasing amount of legislation and at the same time exercise more efficiently its other functions—control of policy and administration and control of taxation and expenditure.

Except on the comparatively minor proposals such as the reorganisation of supply procedure, the Government has, however, turned down the Select Committee's recommendations. It has done more than this; it is to ask the House to agree to three of its own proposals for reform which the Select Committee had examined and rejected. A full explanation of its decisions will presumably be given when the matter is debated later this session. But, inevitably, the impression given by this week's announcement is that the Government is reluctant to agree to any procedure which might interfere with the hasty progress of Government business, and that its chief concern in the reform of procedure is the removal of all existing obstacles in its way. Thus, in spite of the Select Committee's objections, the Government will propose that the consideration of a Bill should be further regimented by the establishment of a special committee with the function of sub-dividing the time allocated to the committee stage of a Bill. Again, the Select Committee pronounced strongly against the Government's suggestion that there should be no debate on the Report stage of the Budget Resolutions, because, for one thing, such a suggestion would curtail the opportunities of members to speak in one of the most important debates in the year and, for another, only fifteen days in the

most of their former effectiveness. It is utterly meaningless to talk of distributing manpower where it is most needed when there is no means of carrying it out. Hence, discussion wanders aimlessly over a range of expedients in order to attract a few thousand workers here and squeeze out a few hundreds there.

If this week's debate on manpower seemed more ineffective than most, it was because it followed so soon after the economic debate

ASSURANCE: INCORPORATED IN 1720

whole session are devoted to the control of taxation. Yet the Government is to persist with its proposal.

Its reasons for turning down the Select Committee's proposals seem no less arbitrary. It may well be that the proposed Public Expenditure Committee—an amalgamation of the Public Accounts Committee and the Select Committee on the Estimates—would be no more efficient than its parents in watching the public purse. Yet in evidence before the Select Committee, the Government's representatives seemed opposed to the idea because it might be too efficient, would make Whitehall too nervy and dithery—in Mr Morrison's words—and interfere with the smooth running of administration.

*

Most important, however, to the general public is the Government's refusal to agree to the proposed inquiry by both Houses into delegated legislation. Its reason is that an inquiry would be premature so long as such legislation is still influenced by war-time powers and before experience has been gained of last year's Statutory Instruments Act. But the objection is not to war-time powers. The point is that each new item of peacetime legislation is nothing but an enabling measure which leaves important gaps to be filled in by Whitehall after the Royal Assent has been given. If modern constitutional history is a struggle between Westminster and Whitehall, the Government's rebuff to the Select Committee is a defeat for Westminster.

* * *

One Swallow ?

Mr Barnes announced on Friday to the Standing Committee which is dealing with the Transport Bill that the Government did not propose to proceed with the clauses of the Bill that would have limited the "C" licence-holder (that is, the trader carrying only his own goods in his own motor vehicles) to a radius of 40 miles from his headquarters. This may, of course, be no more than a tactical retreat in the face of what the Minister called "increasing and growing anxiety"—a concession made, unwillingly enough, to a public opinion which the Government does not want to antagonise too far. Even if this were all, it would be a welcome and valuable amendment to a highly imperfect Bill. Apart from the gain in convenience to the traders holding "C" licences, who could not expect to find in even the best-run Government service the same flexibility and fitness to their individual needs as in a service run by themselves, the nationalised road haulage system itself is, by this deletion, given a better chance, on balance, of becoming efficient. It is true that it will now lose a large volume of traffic that would have contributed to its overheads. But there is a substantial compensation for this. The most enlightened monopoly, commanding the services of the best possible brains, using the best possible accounting system, and seraphically free from any taint of restrictionism, whether in the interests of profit or of the mental comfort of its governing hierarchy, is handicapped in its quest for efficiency by the lack of the external objective test that competition provides. In a perfectly integrated planned economy the handicap may not (according to rather rarefied theory) be fatal; but short of that theoretically perfect integration, how very much simpler to leave a pacemaker in the field—particularly when the abolition of that pacemaker, in this case, the absorption of the "C" licence business into the Government monopoly, would itself put a heavy strain on the monopoly's administrative efficiency.

But welcome in itself as is the emancipation of the "C" licence holder, it would be still more so if it indicated—as it may do—not merely a sense of tactical expediency but a real change of direction within the Government. It may not, if this interpretation is correct, be the last such change. Not merely the "C" licence provisions of the Bill, but the Bill itself—at all events in its present form and with its present time-schedule—causes "increasing and growing anxiety" to industry and commerce. Postponement of the vesting date, or even temporary shelving of the Bill pending an objective enquiry, might not be impossible. For its own sake, the overburdened Government may come to desire the former, and a long-run supra-partisan view of the national interest—aided possibly in due time by a little pressure from the House of Lords—could achieve the latter. One swallow does not make a summer. But one can always hope.

* * *

Gloom Marches on

Beer and Bible have won another famous victory. In the House of Lords on Tuesday the Government, after very properly rejecting an amendment to cut the right to apply for a licence out of the Civic Restaurants Bill altogether, surrendered half the

principle by agreeing that drinks should only be served with meals; and, further, that no licence should be granted to a restaurant attached to or used for the purposes of any church or chapel. The Chestertonian thunderbolts are no longer at hand to blast the heathen; but it is necessary, even in these days of gloom, to saddle the Church of G.K.C. with the prejudices of Little Bethel? In days long past it was the Englishman's boast that he left his neighbour alone; and the great quality of British democracy lay precisely in this, that a man was free to follow his own inclinations without fear of the imposition of an unwanted way of life. To-day, when the public inspector has become an even greater menace to freedom than the Puritan, is it too much to ask the temperance interests, not to touch the hated liquid themselves, but at least to leave one remaining avenue open to free choice and enjoyment? And has it never occurred to them that the unholy alliance of dry Christianity with brewing and catering interests and enemies of municipal reform may be even more unedifying to the general public than the sight of a glass of beer on a British Restaurant table?

There are in any case plenty of more mundane reasons why the Government's decision is regrettable. Civic restaurants have in some areas been establishing themselves as badly-needed social centres and meeting-places. Above all, they have begun to provide a form of family centre which, precisely because it catered for the family as a whole, was a definite counter-attraction to the type of public house which gives the temperance case its strongest arguments. The new clause will not prevent further development on these lines; but it will certainly not assist it. And why, in the name of Heaven, is it necessary to greet the bread shortage with legislation to promote the compulsory consumption of unwanted sandwiches?

* * *

No Bouquets for Egypt

Arab League communiques always convey an atmosphere of brotherly harmony. They are a true reflection, therefore, of the League's attitude to Palestine. But they become a mere gloss when they aim to conceal internal rifts such as that which is splitting the League's present committee deliberations about Egypt's attitude to the Sudan. Iraq, Syria, the Lebanon and Transjordan all came to independence with international blessing. They feel that if they endorse Nokrashy Pasha's claim that the Sudan shall be permanently hitched to Egypt they will be denying to the Sudanese right; that they themselves secured and prize. They also recognise (which many Egyptians do not) that there is a spontaneous independence movement in the Sudan and that here is a potential new League member. King Ibn Saud has therefore privately protested to King Farouk about Egypt's rigid attitude. Syria and the Lebanon have publicly offered to act as mediators in renewed negotiations with Britain. The gist of their comment is that if Egypt insists on carrying matters to Uno, it must think up a case that they can support; but they advise against this course because, on a long view, Egypt—and with it the Middle East—is likely to get less interference, and therefore a better bargain, from the British than from elsewhere.

This argument places King Farouk and Nokrashy Pasha in a difficulty. Their trouble is that they cannot take a long view because their hearts are set on keeping the Wafd (which boycotted the last elections) out of Parliament and office. They won a temporary respite from its pressure when they created a wave of popular fervour by announcing that they would appeal to Uno. Now they are in a quandary about what to say. Their indecision is reflected in the King's smooth acceptance of the new British nominee, Sir Robert Howe, as Governor-General of the Sudan.

If they are obliged, for lack of support, to abandon their claim to permanent sovereignty over the Sudan, their case against Great Britain becomes thin, because virtually identical with proposals already tabled by the British Government. The British Army is ready to go on terms to which they have agreed; their Nile waters are safeguarded by international agreement; their claim to greater representation in the Sudan administration encounters the snag that they are pledged to its Sudanisation, and that this is progressing apace. Eighty per cent of the civil service is already Sudanese. There are to-day 104 Sudanese in the top grade of the administration compared with 91 last year and 71 in 1945. And the process will be greatly accelerated if, as seems likely, the new constitution prepared by last year's Administration Conference, and providing for an elected Sudanese Legislative Assembly, comes into force this summer.

*

Undoubtedly, Egypt's strongest course now would be to forgo the claim to a "permanent" link—which neither Britain nor Una

nor, it seems, even their fellow-Arabs will concede. At the same time, it could suggest that, pending the day when the Sudanese decide whether to link with Egypt or no, a truer condominium should operate with an administration increasingly Sudanese but responsible to a joint Anglo-Egyptian body. But the act would involve a sacrifice of some of the catchy slogans that are so useful in home politics. In view of Wafd strength, no politician can afford to take such an initiative. The only person possessed of sufficient popularity to take the plunge is the King.

* * *

The Jews and the Terrorists

The essential problem facing all responsible persons in Palestine is how to secure the collaboration of Jew with Briton in putting an end to public insecurity. Neither party can do the job single-handed. Hagana pickets, for instance, have not been able to protect Jewish individuals against robbery with violence by needy terrorists, or Jewish school teachers against unwelcome visits from Irgun intruders who incite their pupils to do and dare. Similarly, British martial law and curfews, operated in isolation, have not curbed the attacks. Indeed, they have temporarily simplified the attackers' task, since the Jew crouching behind the oulvert can be sure that the approaching vehicle is military and a desirable target. Yet there are some signs that the two contributions to the same end are bringing the Jews to realise that they must help or they will be the worst sufferers.

The Jewish Agency, handling the matter at its current meeting in Jerusalem, has not gone so far as to offer to help the authorities, but it has said that it will not impede Jews from doing so. Naturally it takes the line that appeasement—alias a return to a generous immigration quota—would cause all Jews to act faster and more firmly. But this argument leaves out of account the fact that the terrorists have no fixed price for stopping, and tend to raise their bid with every concession.

The British authorities, for their part, give the impression that the inconveniences created by martial law in Tel Aviv and its area, and in one quarter of Jerusalem, have produced a little of the help they need with promise of more to follow. The reason why they are probably right is that the pocket of the Jewish community has been gravely hit by a fortnight's forced inactivity. Martial law directly affected one quarter of the Jewish population and cost the Jewish community £1,000,000 a day. This loss falls heavily not only upon private businesses but on the great public concerns—the co-operatives like *Tnuva* and the contracting companies, of which the biggest is *Solel Boneh*, which are directly affiliated to the General Federation of Labour (*Histadruth*). The *Histadruth* is, on account of its connection with such concerns, not an ordinary TUC. It is so closely related to the Agency that it will be bound by that body's decision not to give its help, as an organisation, to the authorities; but there is reason to think that it will—in the interest of its related industrial and commercial undertakings—encourage its members to be co-operative.

Talking Turkey

The Minister of Food's tour in Canada and the United States has resulted in a promise of American aid to build up wheat stocks in time for next winter, and the purchase of enough American beef to ensure the maintenance of the current meat rations, as well as of a few thousand turkeys. It is hoped that Britain will obtain 100,000 tons of wheat a month, or double the amount received on the last American allocation. The details of the discussions and agreements remain a close secret since, as usual, "it would be contrary to the national interest to publish them." Is there any real case for the continuance of this secrecy? If the conditions of the bargain cannot be disclosed for the sake of national interests, it clearly implies that one side has been forced to make a greater sacrifice; and past experience leaves very little doubt about which. If by a miracle it should not be Britain, cries of alarm would already be audible from the well-informed lobbyists of Washington.

But this is only part of a broader issue. State trading may in certain circumstances be efficient; its main disadvantage is that the absence of competition leaves no incentive or guarantee for efficiency. The only check existing is constructive and informed criticism both inside and outside Parliament. But the critics must be in possession of all information, including the stock position. Ever since the end of hostilities the Minister of Food has maintained that the disclosure of stocks would put Great Britain at a disadvantage in bargaining with other countries. Time has proved this argument to be specious. What country has not forced Britain to the limit, with perhaps the exception of the

Dominions, who undoubtedly are told of our position? In any case, stocks of some foodstuffs can be estimated from the data already published. The question of the purchase of turkeys is yet another case in point. Even though they could be acquired at a price which would not make them a luxury, surely Mr Strachey would not wantonly waste dollars on the purchase of a few thousand tons of poultry? Their disposal will present quite considerable administrative difficulties, even though they are destined for catering establishments. Is the answer that the United States have imposed a condition of sale—"you may buy beef so long as you also purchase our surplus turkeys"? If this is the case, the facts should be brought to the public notice immediately.

Food Horoscope—Official

Few subjects are more interesting or more speculative than the potential contribution which British agriculture might make to the saving of foreign exchange. The Government has now been so bold as to contribute its own informed guess—it cannot be put higher—on this subject.* Unfortunately, the survey on which it is based was made as long ago as the winter of 1944-45, so that the fairly optimistic forecast for 1947-48 has already been robbed of reality. But the long-term prospects are the important thing, and reality can be restored to the forecast for 1950-51, which is taken by the survey to mark the restoration of fairly normal conditions, by projecting the date a few years onwards. More unsatisfactory, though scarcely surprising in a document originally intended for internal circulation is the attenuated character of the White Paper's argument; no competent private survey would put down so many figures with so little explanation.

The Government's estimates are made in terms of pre-war prices. It concludes that the net output of British agriculture could be raised (presumably now by 1955 instead of 1950-51) to £318 million, which is about £40 million higher than in 1944-45 and £80 million higher than before the war. The bulk of the increase over pre-war would be concentrated on livestock products; a rise of 50 per cent in pigs and poultry, 25 per cent in milk output, 12½ per cent in beef cattle and 7 per cent in sheep is thought to be possible. It is assumed that imports of feeding-stuffs will be at the same level as before the war. But surely the aim should be to make them a good deal higher, since their conversion into animal products in this country can save about 60 per cent of the cost of purchasing such products overseas? The Government considers that the additional output could be secured with roughly the present labour force, but would require new capital investment of the order of £250 million (from where, incidentally, is the capital to come?). Other highly pertinent questions that need to be answered concern the effect of increased output on average farming costs and the prices or other inducements needed to call forth the increased output.

Theoretically, then, £80 million of foreign exchange might eventually be deducted from the pre-war cost of food imports. But food consumption will not remain static. The Ministry of Food, in its part of the survey, tentatively budgets for liquid milk and vegetable consumption to be some 50 per cent higher than before the war, together with a very modest increase in the consumption of meat, bacon, and milk products. This would reduce the saving of foreign exchange to virtually nil. On the assumptions the Ministry posits—that full employment and social insurance policies will be implemented and that food will be kept relatively cheap—food consumption may well rise much higher than this. The Government's forecast thus raises policy issues of the first importance. It should help to end glib talk about Britain's capacity to grow her own food; it underlines the fact that steps to boost exports and to raise the productivity of British agriculture are complementary and equally urgent; and it suggests that it may well prove impossible to keep food very cheap (thus stimulating demand at the taxpayer's expense) without a permanent continuation of rationing. Although any such intention is firmly disclaimed, it is pointed out that the maintenance of rations at the 1944 level, in conjunction with the expansion of British agriculture, might mean a saving of £116 million (again at pre-war prices) on food imports.

* * *

The Wheat Conference

The International Wheat Conference which met in London this week has before it a draft memorandum prepared in January by the International Wheat Council, bearing the imprint of the food proposals put out early this year by the Food and

* Post-War Contribution of British Agriculture to the Saving of Foreign Exchange. Cmd. 7072. 2d.

Agriculture Organisation. The wheat memorandum now under discussion contains in concrete form all the dangers to a large commercial food-importing nation such as Britain which were implicit in the FAO proposals, together with a few new dangers of its own. The first step in the proposed agreement would be the fixing of maximum and minimum world prices of wheat. This proposal is not bad in itself, although the difficulty of securing prices which are fair without being artificially high, has already been illustrated by the failure to get agreement on wheat prices to rule for the first four-year or five-year period. The majority of governments favour an initial range of 125 to 155 Canadian cents per bushel, although several exporting nations want the maximum to be as high as 180 cents. In any event, the range will be wide and 125 cents is a rather high minimum; the minimum price in the Canadian contract will fall to 100 cents in three years' time.

But the real dangers to Britain lie in the subsequent steps. The dangerous device is adopted of allocating among the main exporting nations export quotas, which may not be exceeded without subsequent heavy penalties. When, however, an exporting nation has completed its quota and piled up its permitted maximum of stocks, it may export its surplus wheat at specially low prices to needy nations for nutritional schemes approved by FAO. The assurance that these special sales will not operate to keep up the price of normal commercial exports has clearly been received with an outside pinch of salt.

At the same time, importing nations are put under several obligations. They are required to hold stocks in order to help buttress the agreed range of prices, although they may draw on their stocks if the world price rises within 5 per cent of its ceiling. They can revise upwards, but not downwards, their agreed basic import requirements. They may on no account go on importing from a nation which has exceeded its export quota, unless, presumably they are able to class themselves as "needy nations." They are given equal representation with exporting nations on the Executive Committee of the proposed International Wheat Council, but the advantage of this is rather diminished so far as Britain is concerned by the proviso that no nation may have more than one seat or one vote.

These proposals might seriously upset Britain's long-term wheat contract with Canada and might amount to a permanent acceptance

of unnecessarily high wheat prices. Coming in the same week as the Government's forecast of a permanent need for very large imports of foodstuffs, especially—incidentally—cereal imports, they make strange and gloomy reading as the basis of discussions which have been proposed and blessed by the United Kingdom Government.

Shorter Notes

In the Civil Estimates for 1947-48 the anticipated trading deficit of the Ministry of Food is put at £313 million, which compares with a final figure of £281 million for the year just ending. It seems more than likely that this figure will be revised, probably in an upward direction, during the course of the year. So far as individual items are concerned, the loss on cereals and cereal feeding stuffs (a £100 million deficit) is expected to be almost doubled, and milk products will be more costly; but the loss on eggs and egg products, owing partly to reduced supplies, is likely to diminish.

More than ten billion dollars will be needed this year for relief and reconstruction in twelve devastated countries. The Economic and Social Council had this figure before it when it decided earlier this month to form the Economic Commission of Europe. It was estimated that 6,840 million dollars could be got from the foreign-exchange and other resources of the needy countries, leaving a deficit of nearly 3,500 million dollars. It was pointed out that the International Bank could lend no more than about three-quarters of a billion dollars and, under its various rules, could not assume more than a fraction of the burden. Several hundred million dollars in gold might be available from German external assets and the return of loot; conversion of other German assets would be unlikely this year. Whatever the undevastated nations may offer in the way of relief grants and credits will still leave a colossal deficit. No one knows how it is to be met and the figures for Asia and the Far East are not yet ready. The countries affected are Belgium-Luxemburg, Czechoslovakia, Ethiopia, France, Greece, Netherlands, Poland, Yugoslavia, Austria, Finland, Hungary and Italy.

Letters to the Editor

Development or Welfare?

SIR—Your article in your issue of March 15th draws attention to the need for a far greater investment of capital in the Colonies than is contemplated in the ten year plans. You suggest that it is probably "more than a coincidence" that public corporations are now being formed to carry out development projects in the Colonies, over and above the 10-year plans under the Development and Welfare Act. It seems to me that, not only should it be "more than a coincidence" that public corporations and development and welfare plans run side by side, but it should be a matter of deliberate and proclaimed policy that these two methods of financing development are complementary to each other and need to be pursued with equal vigour. The Development and Welfare funds are too small to make any real impact on the low level of colonial productivity. All they can do is to help, together with local taxes and loans, to provide a framework of public utilities and social services on which economic enterprise must build.

Any general discussion of how much of this development and welfare money goes to "development" and how much to "welfare" seems to me both fruitless and irrelevant. All this money should be devoted to providing the general foundations of a decent economy, and individual circumstances will decide how much goes to social services, how much to roads, irrigation or agriculture. But the real economic enterprise must draw from entirely other sources. It needs scores of millions of pounds and entirely different techniques (such as the groundnuts scheme). This is where the public corporation comes in. The Treasury may not have sufficient money to finance a dozen groundnuts schemes, but money may be available through banks and the ordinary money market, or through the semi-public industrial finance corporations in this country, for colonial investment.

One is never told that the difficulty lies in a lack of investment money, either here or in the Colonies, but there appears to be inadequate machinery for channelling it in the right directions under some form of public control. At all events the possibilities of raising capital for investment in enterprise should be kept

distinct from the development and welfare planning, and should be recognised to be of at least as much importance. We are frittering away opportunities by thinking only of development and welfare and arguing how these relatively small sums should be divided, when the crux of the matter is that huge investments are needed over and above anything that may be done by the development and welfare plans.—Yours faithfully,

RITA HINDEN

Fabian Colonial Bureau, 11 Dartmouth Street, S.W.1

The Coal Target

SIR—Now that power has been restored to the factories and the immediate fuel and power crisis is over, we feel that consideration of some of the technical factors involved may help in developing plans to avoid even more severe power cuts next winter and in succeeding winters.

In this country, we depend on coal for power production. We have no native oil as an alternative fuel and there are not very many opportunities for using water-power. Nevertheless, we believe it is more important that some power stations, particularly those near oil refineries, should be fitted with the necessary equipment to make possible a switch-over to oil fuel during an acute crisis such as that we have just passed through. The necessary equipment is inexpensive and could be made available rapidly. More important is that we should make full use of those resources of water power that we do possess; the Severn Barrage would save nearly a million tons of coal a year and hydro-electric schemes in the Highlands could save as much more.

But even if such schemes are carried out coal will still be the main basis for production of power. The factors involved in increasing coal output are now well known. The miners are setting an example to the nation in the way they are contributing to increased output, but even if all interests follow their example and provide the mining industry with all it needs, an increase in output of 5 per cent, or thereabouts, is all we can hope to achieve in 1947. A much greater contribution can be made towards balancing power production against power needs by greater

efficiency of coal utilisation. On an average in this country, we only use 20 per cent of the energy available in the coal we burn, the other 80 per cent is wasted. While it is not practicable to achieve a 100 per cent efficiency of utilisation, we believe that an efficiency of 40 per cent could be reached; this has been done in Germany. Both industrial and domestic consumers can help. The main technical steps that would be involved are:—

(i) Increasing the average of steam-raising efficiency in industry to the level of the best firms. This would mean providing old-fashioned hand-stoked boilers with the much more efficient automatic stoking equipment, small firms being provided with credits where necessary. Farmers can now be dispossessed for bad husbandry; we believe a salutary effect would be achieved by penalising failure to reach certain minimum standards of fuel utilisation in industry.

(ii) The domestic open coal fire must be replaced by stoves burning processed coal (coke, coalite or gas) whatever sentimental sacrifices are involved. All housing estates should be fitted with such stoves, or, better still, district heating schemes should be developed using where possible waste heat from power stations.

Technical improvements such as these cannot be carried out without detailed planning and allocation of priorities by the Government; this is what is now needed.—Yours faithfully,

15 Half Moon St., London, W.1

Hon. Sec., London Area Committee of Association of Scientific Workers

The Case for Deflation

SIR—I fear my letter of last week failed to convey my meaning, for you comment that "the total of personal money incomes greatly exceeds the supply of goods."

My contention is that the total of incomes is *always equal to* the output of goods.

That there are "transfer" incomes which are paid for by no current services, such as the national debt, old age pensions or charitable or family gifts, does not affect the principle. The exclusion of transfer incomes from calculations of the national income is well recognised by statisticians and economists (for example in the annual White Paper which accompanies the Budget). They are best treated as portions of the taxpayers' or donors' incomes delegated to the recipients. If that is understood, all incomes are derived from production and all production generates incomes. The incomes and the production are two different aspects of the same quantity. Inflation occurs when expenditure exceeds incomes; demand then exceeds output, and prices are driven up. Incomes are increased, but are still equal to output at the higher price level.

The excess demand is made possible because people can supplement their incomes by drawing on balances. Inflationary Government finance cannot cause a disparity between incomes and production, but, by creating money out of nothing, it adds so much to the balances to be drawn on.

The misconception which I am seeking to remove is dangerous because it suggests that the problem to be solved is a matter of the hundreds of millions of current deficit, not of the thousands of millions of redundant money. The new money created merges in the existing stock. An ordinary budget surplus would make little impression on so vast a total.—Yours faithfully,

R. G. HAWTREY

29 Argyll Road, London, W.8

[It is now a commonplace of economic theory that the total of all incomes must equal the value of output. But Mr Hawtreys would surely not deny that the total of personal incomes can exceed the value of output. Suppose the State prints some additional currency and hands it over to its employees. Personal incomes have gone up, without any increase in things to spend them on. Total incomes have not, because the increase in personal incomes is offset by the deficit ("dis-income") of the State. Mr Hawtreys is talking about total incomes; we were talking about personal incomes, and we persist in the beliefs (a) that an excess of personal incomes is dangerous; (b) that the danger is not merely potential, like the (admitted) danger of spending of past hoards, but actual; and (c) that it can be corrected by fiscal policy.—EDITOR.]

Census of Distribution

SIR—As an economic statistician, I wish to place on record my deep regret that the Government have now decided, after the postponement of the Census of Distribution, to postpone the taking of a Census of Production until 1949. As a Census of Population will not be taken until 1951, and as the analysis of all these Censuses takes considerable time, it will be not until

well in the 1950's that we shall obtain an overall picture of the British economy.

In recent years many of us started empirical investigations into the structure, productivity, inter-relations, prices and costs of British industry, with the general aim of arriving at practical conclusions which would help in the advance of British industry and the raising of our standard of living. In these investigations data for the 1930's were used, in the hope that in due course up-to-date and more comprehensive statistics might be substituted. These hopes now vanish one by one. To mention one example, one cannot at the present say anything about the overall productivity of British industry compared with a pre-war date, and it is shocking to realise that this position could not be remedied before 1950.

One would have imagined that the crises through which British industry is passing, and the Government's alleged intention of planning production, would have made the taking of a Census of Production more imperative than ever before. One would also have imagined that our acute shortage of manpower, and the virtual lack of knowledge about the efficiency of distribution, would have made the taking of a Census of Distribution equally imperative. In fact, the Government will have no information on which an overall and consistent economic policy could be based until it might be too late to apply such a policy.—Yours faithfully,

T. BARNA

Houghton Street, Aldwych, London, W.C.2

Design in Industry

SIR—It is not only in the motor industry that producers must study appearance. From time immemorial the eye has played an important part in assessing qualities, and it will continue to do so. If the eye is not pleased how often no further interest is taken.

In days when Britain was the major industrial producer and machines were more crude, low prices were in themselves sufficient to ensure large markets and quality of design was not of major importance in securing sales. This situation has now been reversed. Each of the two great wars has converted importing countries to producers. Each new country so converted installs the newest machines it can buy. Each hopes to break into the export market. Most of them pay considerable attention to design to increase their chances.

The United States is design-conscious. Her great producers employ design specialists to work with technical experts as a team to satisfy the eye and hand of the consumer, through form, materials and their proper use, fitness for purpose and ease in handling, seeking to build up goodwill through pride in possession. We may not always like what they do, but it is folly to ignore and even decry methods adopted by our chief competitors which have proved successful, and still more foolish if we wish to sell more of our goods in the American market.—Yours faithfully,

The Studio Limited,

F. A. MERCER

66 Chandos Place, Strand, London, W.C.2

From The Economist of 1847

March 20, 1847

In proportion as the State charges itself with the duties of individuals, it exonerates them from the performance of their duties. If it should educate their offspring, it should also clothe and feed them. To some extent this is done, and to a larger extent it is proposed. The consequence, however, must be to reduce the bulk of the people to be mere tax-paying automatons, without any of the motives for good behaviour which nature has implanted in parents. It substitutes the State for the order of Nature. Now, as the State comes in the end to mean the one only mind which conceives the law, and the one or two persons only who carry it into execution, this contrivance really, in the end, substitutes the skill and wisdom of one or a few for the skill and wisdom of the many. But it is clear that the skill and wisdom of the few never can equal the skill and wisdom of the whole, of which they form a part. This contrivance, then, necessarily substitutes comparative ignorance for wisdom. It destroys in the many natural motives for exertion, and makes them the slaves of a system devised and carried out by a few. It never can be beneficial to substitute the State for the many parents, and not beneficial, therefore, to regulate education by public authority, instead of leaving it to individuals.

Books and Publications

Stalin—The Bad Neighbour

"The Great Globe Itself." William C. Bullitt. Macmillan and Company, Ltd. 259 pages. 8s. 6d.

MR BULLITT minces words so little in his analysis of Soviet policy that even its bitterest critics may find some of the argument hard to digest. There are 180 pages of indictment and recommendation and 70 pages of appendices. Of these appendices the first gives a list of Soviet violations of international treaties and assurances, placed side by side with charges preferred against the German war criminals at Nuremberg—the number of charges coming to 28. The second gives a series of extracts from the New York *Daily Worker* showing that paper's efforts to keep in line with changes of policy in Moscow between 1939 and 1945. These, though amusing, can be ignored and attention concentrated on the main argument, which is clearly, vigorously and fairly put.

What do people, in fact, fear in this post-war world? asks the author; the answer is given in one sentence: "The only totalitarian imperialism that threatens war in the world to-day is the Soviet Union." Part of the blame for this state of affairs is laid on President Roosevelt who, it is argued, should have got from Stalin as the price of American help assurances that no European nation should lose its independence as a result of the war, and should have laid during the war the foundations of the federation of independent democratic states in Europe proposed by Mr. Churchill. During the Teheran negotiations, it appears, President Roosevelt gave "a seminar" for Stalin's benefit, on the good neighbour policy, in the course of which Stalin gave a sweeping declaration of his desire to conciliate his neighbours in Europe. But when it came to Yalta, Mr Churchill was left alone to fight against the Soviet demand for a slice of Eastern Poland and the redrawing of the Western frontier of Poland. The opportunity then missed Mr Bullitt wants to see recreated. Force must be used to give moral ideas time to grow; in other words, the United States must state what are the tolerable limits of Soviet expansion and organise an intra-European League to preserve them.

Its purpose would be defensive; Mr Bullitt rejects outright as immoral the idea of a preventive war. Within the framework of the United Nations he would create an association of Western independent states bound together by ideology and economic interest, supported in the final ordeal by President Roosevelt's "Atlantic Doctrine." Like Wilson, he puts his ideas into 14 points, some of which overlap. The principal one are: support Uno, but recognise that it is still not a security organisation; treat the Soviet Union as a totalitarian dictatorship—but with scrupulous fairness and correctness—and give the American public more facts about its activities in Europe; maintain superiority in the air and make more atomic bombs; refuse to give atomic secrets or economic assistance until the Soviet Government gives up the Communist creed of world conquest; start conversations for a European federation of democratic states and give Congress facts to justify American support.

As part of his case Mr Bullitt gives a sketch of Russian history, which amounts to saying that the Soviet way of life and government springs directly from Russian historical experience; but this approach appears to justify the very "appeasement" of which he accuses Mr Roosevelt. Much more cogent is his analysis of Soviet foreign policy since 1917, with its six fundamental changes of direction in 30 years, and his account of the weakness of post-war Europe. He finds the mainspring of Soviet policy in the fact that Moscow is the headquarters of an international faith which, according to Lenin, cannot live side by side with other faiths. He can find no need of space, of raw materials, of trading opportunities, or security which will justify Stalin's behaviour. He does not discuss the possibility that the Soviet rulers genuinely fear an American—and British—attempts to subvert the Russian people from their allegiance to the way of life and work to which Lenin's successors are pledged, nor that Washington and London may look from Moscow like headquarters of a rival international organisation.

What is most disappointing about the book is its failure to provide, from Mr Bullitt's own experiences as Ambassador in Moscow, illustrations of the inevitability of his general conclusions. He must have seen something of the complexity of affairs; now, ten years later he makes everything look too simple.

Federalism in America

"The Fiscal Impact of Federalism in the United States." By James A. Maxwell. Harvard University Press. London Geoffrey Cumberlege. 427 pages, 28s.

THE latest volume in the Harvard Economic Studies constitutes by far the most comprehensive treatment to date of the fiscal implications of federalism in the United States. The events of the thirties created a virtual revolution in the fiscal relationships of federal and state governments, a revolution which has so far been studied only in certain aspects; thus the development of federal grants, the administration of public works, or the problems of conflicting taxation have, in isolation, all been treated with a fair degree of thoroughness. But this book is the first to bring these problems together, and to consider them in relation to each other. The author proceeds from a historical résumé of the changing fiscal relationships of state and federation to a detailed examination of each field of government action—defence, justice and police, education, public assistance, etc.—and then to a similarly detailed study of the sources of taxation—income tax, commodity taxes and so on. The result is not only an extremely thorough examination of all the main fiscal problems, but also, since fiscal control is the key to power in a federation no less than elsewhere, an unusually revealing exposure of the springs of power beneath the complicated surface of the American constitutional structure.

Mr Maxwell, to a degree not often found among authors of academic treatises on his subject, has a shrewd nose and sound judgment for the political realities which underlie legal and constitutional forms. This enables him not only to unmask the economic interest, public or private, which is swagging in the robes of states rights or national sovereignty. It also helps him to observe the far more elusive attempts of a large and diversified country to maintain both a national direction from the centre and a maximum of local control. "For some countries federalism is appropriate because only federalism is practicable." This awareness permeates the entire book, and in consequence the relation between even the most recondite fiscal problem and the social, political and economic facts of contemporary America is always kept in mind. There was a time when Dicey's dictum that "federalism is legalism" truly reflected the constitutional struggles which dominated the American scene. Today many of those struggles have been transferred from the courts to the counting-houses. But the fundamental factor of diversity in unity remains. It is perhaps the supreme merit of Mr Maxwell's excellent book that it continuously recognises, respects and illuminates that fact.

The Economists' Bookshop

(jointly owned by the London School of Economics and Political Science and by *The Economist*)

is now open for business at

11/12 CLEMENT'S INN PASSAGE,
ALDWYCH, LONDON, W.C.2.

The Economists' Bookshop specialises in books on Economics, Sociology, Psychology, History, Political Science and Current Problems, to which some carefully selected general literature is added.

Particular attention will be given to the supply of books to and from any country in the world. Postal orders are welcomed.

The difficulties of the book trade at the present day are well known and it is impossible to promise to supply any book on demand. Inquiries, however, are invited. Orders for books for which there is a reasonable chance of re-issue will be kept on file and the books supplied as soon as they become available.

AMERICAN SURVEY

The New Monroe

(From Our US Editorial Staff)

IT is true to say of the Greek crisis that only the news of it was new. But it was major news. The economic, political and military difficulties of Greece have been duly reported, through private channels and to a considerable extent in the newspapers, for months. The British compulsion to reduce overseas commitments has also been obvious over a period; the anticipated withdrawal of British troops from Egypt was announced as long ago as March 7, 1946.

But however much about the crisis might have been foretold, the fact remains that the Administration gave no forewarning. So the country has been very suddenly confronted with major commitments, and shocked by the clear inference as to who must meet them. The chronology of shock is worth listing. Bracketed between the blizzard of February 10th and the blizzard of March 7th in the British Isles, came three British announcements. On February 20th, Mr Attlee gave notice that British troops would be out of India by June, 1948. On February 25th, Mr Bevin proposed handling the Palestine problem through the United Nations. On February 28th, came news of the Greek withdrawal, with March 31st, one month off, as the financial deadline.

But it was the weather that really did it. Except for State Department experts and minority groups whose personal connections made them sensitive to particular conditions, the areas from which the British were withdrawing might have been regarded by the general public as far away countries of which they knew little. But few Americans had ever expected to see a time when they might be called upon to carry coals to Newcastle. The snowfall, by exaggerating the shape of things in Britain, revealed to a people accustomed to complain of the difficulties of life with father, what life would be like with father no longer there. The rather-too-promptly-published obituaries seemed, many of them, to take insufficient account of the likelihood of a spring thaw; and it was curious how many people, who previously had seen small merit in British imperialism, were heard to speak of the departed with delicate regret. But the assessment of the British domestic position, however inaccurate, underlined implications of the overseas situation which might otherwise have been too lightly taken, or ignored. Pax Britannica is over. Who then shall be the keeper of the peace?

The gravity of this question was made much heavier by Mr Gromyko's speech at the Security Council on March 8th. His refusal, which seemed definitely to bar the way to any international control of atomic energy, is a major item in the chronology of shock.

These facts were known, and at least partly realized during the interval before Mr Truman appeared at the joint session of Congress on March 12th. Even his financial recommendations had been forecast with assurance. For that reason, his rather rapid, unemphasized reading of his Message gave somewhat the effect of the second reading of a Bill.

The major uncertainty preceding the speech was whether it would parallel the policy of piece-meal peace-making which this Administration has followed, putting the case of Greece and Turkey as a narrow instance of crisis, or whether emergency action would be proposed in a wider context. A considerable part of the initial approval of the proposed policy may well be due to the decision—fortified, it is understood, by Mr Vandenberg—which made Mr Truman say: "I am fully aware of the broad implications involved if the United States extends assistance to Greece and Turkey," and then go on to spell them out.

For a comparable spelling out of American policy in peace-

time,—and for a startling continuity of thought—one must go back to President Monroe's message to Congress of December 2, 1823. In a period when transatlantic travel was a matter of weeks, President Monroe said:

A strong hope has long been entertained, founded on the heroic struggle of the Greeks, that they would succeed in their contest and resume their equal station among the nations of the earth. It is believed that the whole civilised world take a deep interest in their welfare.

—Then, turning to the affairs of Spain and Portugal,

The citizens of the United States cherish sentiments the most friendly in favour of the liberty and happiness of their fellow men on that side of the Atlantic. In the wars of the European powers in matters relating to themselves we have never taken any part, nor does it comport with our policy so to do. It is only when our rights are invaded or seriously menaced that we resent injuries or make preparations for our defence. With the movements in this hemisphere we are of necessity more immediately connected, and by causes which must be obvious to all enlightened and impartial observers. The political system of the allied powers is essentially different in this respect from that of America. . . . We owe it, therefore, to candour and to the amicable relations existing between the United States and those powers to declare that we should consider any attempt on their part to extend their system to any portion of this hemisphere as dangerous to our peace and safety.

The extent of action advanced by President Truman "to support free peoples who are resisting attempted mobilization by armed minorities or outside pressures" contrasts sharply with the series of steps taken against German totalitarianism in the latter 1930's. Before World War II, there was neutrality, quarantine, boxes and bales—first on a cash-and-carry basis, then on lend-lease—but not men. Until after Pearl Harbour, not men. The present proposal is for funds, commodities and personnel—both civilian and military—right away.

★

Only the first indications of reaction are yet visible. The grimness of the mood, which includes but affects much wider circles than Congress, recognizes the dark possibilities of the President's words: "This is a serious course upon which we embark. I would not recommend it except that the alternative is much more serious." Comments such as "If we fail, this aid to Greece is the lend-lease of World War III," indicate the belief that a near miss is the best alternative available.

The new policy exacerbates the problem of political bed-fellows. Senator Brooks, whose opinions often coincide with those of the *Chicago Tribune*, and Representatives Marcantonio and Powell, whose opinions often coincide with those of the *Daily Worker*, join in viewing with alarm. But shorn of extremes, substantial Republican support as well as Democratic backing is expected. The middle-of-the-road opposition will probably rely on two arguments: American strength should

"AMERICAN SURVEY" is drawn from three sources. Articles described as "From Our US Editorial Staff" are the work of a small group of regular correspondents, resident in the United States. Articles with some such attribution as "From An Industrial Correspondent" or "From A Correspondent in Ohio" are from outside contributors. Everything printed without attribution is prepared in London.

not be dissipated around the globe—let the other fellow wear himself out; and, the United Nations is the proper vehicle for handling these matters.

The present moment may, however, be the peak of popularity for the new policy. The next phase will get down to specifics, and hence to specific disagreements. What sorts of governments will actually be backed? If, as Mr Truman said, the *status quo* is not sacred, will it nevertheless be sacrosanct? How well-thought-out are the economic plans to be put into effect in April, and how competent is the staff being prepared to undertake them? How great an allocation of the nation's resources, including manpower, to military uses will the new policy require? What does it do to prospects for a tax cut? Will a policy of containing communism abroad induce witch hunts as well as

security measures at home? The next weeks' debates will see all these matters aired.

Yet there is in this policy some sense of a long-term recovery of balance. It affirms democracy as an article of export with a willing market. Since the onslaught of the 1929 depression, the self-criticism of a nation aware of wasted and wasting resources, followed by outside criticism from totalitarian regimes organized to confuse and divide, have put the country on the defensive, made it aware of the gaps between public professions of democracy and the daily practices of private life, led it to expect initiative to come from the totalitarian side. Here is an affirmation that a system which believes in the Bill of Rights is best. Here is an initiative which cannot be declared in advance to be too little and too late.

The Role of Government

(From Our US Editorial Staff)

WHILE Congress is struggling with the question of what limits it is to place on appropriations for the federal government and encountering great difficulty in doing so, local governments are rapidly discovering that they too face great problems. Indeed, discussions of the local issues have become fully as prominent as the national matters. While the citizenry is concerned with national defence, veteran care, debt service and federal bureaucracy, it is also concerned with local transportation, education, crime and care for the ill and the injured. Activities of both types are costly and the needs great.

New York City is facing its subway (i.e., Underground) problem again—in more acute form than ever. Mr O'Dwyer, the Mayor, calls the situation "chaotic." At rush hours crowding is indescribable and the local press uses such words as uncivilized, barbarous and disgraceful; subway riders use terms more vivid but unprintable. Everyone agrees that something must be done, and the cost of reasonable modernization is estimated at \$400,000,000. The city, which owns and operates the lines, already has a budget of about \$1 billion for the fiscal year 1947-48 and a debt of about \$3 billion—the next largest governmental indebtedness to the federal. The real estate interests, who provide most of the tax revenue, vigorously assert they are already overburdened and urge a rise in the subway fare from 5 cents to 10 cents. Numerous groups oppose such an increase as falling hardest on those least able to pay, and the city government, after hearings, has taken a stand against a fare increase. Its solution is to appeal to the State government for aid—but the Republicans at Albany, the State capital, seemed inclined to let the Democratic city administration find its own ways and means.

The New York subway is only the most extreme example of the problem of local transportation which exists at many places in the nation. With the return of petrol, traffic on city streets is badly congested. Local bus and trolley systems badly need much new equipment.

In education, the crisis is pronounced. An extreme shortage of teachers exists throughout the country and there is every reason to believe it will become worse next year and the year after. The *New York Times* is currently reporting on an extensive study it has just completed and the story is striking. About 6,000 schools in the country are closed for lack of teachers and 60,000 of the total of 850,000 teachers to-day have only a high school education or less, while another 100,000 have completed only one year of college. About 125,000 are teaching on emergency substandard licences issued by authorities whose only alternatives are to close the schools, to cut the already reduced curriculum, or to crowd already overcrowded classes. Twenty-five years ago 22 per cent of the country's college students were in teacher training while the present figure is 7 per cent. The average classroom teacher today gets \$37 a week and 200,000 of them receive \$25 a week or less. They can earn more in many other occupations, even including

garbage collection, truck driving and bartending. Teacher morale is very low and the *Times* says that at least 2,000,000 children are getting "impaired, inadequate education." Enrollment in primary and secondary schools is now about 26,000,000 and will rise for several years due to the large increase in births during the war. The *Times* reports that the United States spends 1.5 per cent of its national income on education, compared with 3 per cent in Great Britain and 7.5 per cent in the USSR. The teacher crisis is only more severe than the problem of school buildings. The *Times* says bluntly that a "deplorable" condition exists.

A similarly acute condition is reported in libraries. That of New York probably is more extreme than some but the condition just revealed by the President of the Public Library is indicative. The New York Public Library last year had a staff turnover of 44 per cent. Of the total staff of 868 only six are paid as much as \$4,000 a year. Service to children in hospitals, orphanages and welfare institutions has had to be eliminated, other services greatly reduced.

The condition in public hospitals is bad. Mr O'Dwyer, in his appeal for State aid to the city, revealed that by last October the city hospitals had reached a condition where there was one nurse for each 52 beds and that space and equipment shortages made it necessary for some patients to be put on the floor. Pay increases have alleviated the condition somewhat since then—but at the cost of a higher budget total. Hospital conditions elsewhere are also critical in many cases.

These conditions currently receiving publicity are only the more extreme examples. New York and many other cities have police forces inadequate to cope with the criminal tendencies which are appearing now as after the other war. Fire protection is below reasonable standards. Overcrowded slum housing breeds disease and crime and calls for rectification even more loudly now than ever before.

The way of the budget cutters is therefore hard at the local as well as at the national level. At the local as well as at the national level, the nation is struggling with the basic question of the appropriate rôle of government, or, to state it differently, with the question of the most appropriate allocation of resources. The problem is complicated by the overemployment which the nation is still experiencing. It is complicated by the impact of the inflation and rise in costs since pre-war. And it is complicated by the large shifts of population which occurred during the war.

But these are only complications. Fundamentally, much of the population still believes that that government is best which spends the least, and instinctively and emotionally opposes expansion of any expenditure for any purpose at any time. How is this attitude to be squared with the evident need for better local services, and with federal government functions compatible with the nation's international position and the requirements of urbanized society?

American Notes

Cracks in Republican Solidarity

It has taken only three months of power to show that Republican "unity" is only slightly less fictitious than that of the Democrats. True, there is no solid Mason and Dixon line running down the middle of the party, no single demarcation based on geography, economic interests, and state of progress. But the divisions are already sufficiently marked to have elicited a plea for teamwork from Mr Reece, the Chairman of the National Committee, a plea which Senator Morse, of the party's small liberal wing, has denounced as a "brazen demand for reactionary control." Sixteen "freshman" Senators, including such experienced old political hands as Senator Bricker and Senator Baldwin, have demanded a bigger voice in the forming of policy. On the far right, Senator Bushfield accuses the party of betraying the voters who put it in power—a charge with which the Democrats heartily agree, and which has cut Senator Taft to the quick.

On the most important issues before Congress, there are sharp disagreements between the leaders, or between the leaders and their followers. The Lilienthal appointment is opposed by Senator Taft and Senator White; it is supported, though not very loudly, by Senator Vandenberg. The Vandenberg-Millikin tariff compromise was received with a very ill grace by Senator Taft, who has publicly doubted whether it modifies any of the substantial objections to the Reciprocal Trade Agreements Act, but who grudgingly concedes that no legislative alterations could over-ride a Presidential veto. The House and Senate are still deadlocked on the size of the bite to be taken out of the President's budget, and how much is to go to tax reduction, how much to debt reduction. On labour questions the extreme right, strongest in the House, favours drastic measures like the abolition of the closed shop and the end of industry-wide bargaining; the Senate bill will be drawn more prudently. On aid to Greece, Senator Taft is being brought into closer touch to win over his support.

None of these divisions is likely to be, or will be allowed to become, fatal to the party fortunes, and compared with earlier Congresses, this session has not been unusually dilatory. Spade-work in committee is well advanced; the Republicans have had, in addition, to cope with the changes of the Reorganisation law. What the party are suffering from is the gap between the realities of government and the wildly improbable campaign promises they made last year. They are encumbered, as well, by too many potential leaders, and too little agreed policy. Thus there is a constant temptation to put the election of 1948 ahead of the issues of 1947—with a consequent blurring of the legislative record which candidates like Senator Taft hope will stand them in good stead eighteen months hence. Lucky the candidate, like Governor Dewey, who has no rivals in his own particular pond. And lucky President Truman, who has inherited a policy, has no formidable contenders, and whose party, according to the latest Gallup poll, has recaptured 51 per cent of the voters.

Another Round of Strikes

(From Our US Editorial Staff)—Labour relations are confused again, and the outlook has probably become somewhat more dubious in the last 30 days. The major development has been the marked increase in commodity prices which is moving through to the cost of living. The other uncertainty arises from the Supreme Court decision in the United Mine Workers' case; while this has been taken by some people as a curb on strikes, the validity of this conclusion is not yet established. Meanwhile, significant disputes are reaching the critical point of the calendar. A dispute between telephone employees and their employers has reached the point where a strike appears a definite possibility, and the present deadline is April 7th. The next critical date is April 30th in the steel industry. The Union of Financial Employees is talking of a strike, and the critical date is in April. Mr John Lewis, in deference to the recent Supreme Court ruling, has withdrawn the coal strike notice timed for April 1st. But he is by no means reconciled, and there are a great many cases of individual companies or smaller industries which are reaching the showdown stage in coming weeks.

Only a few weeks ago, the view was frequently expressed that this year's labour controversies would not reach the point of national significance and of lost production that was seen in 1946. There were several reasons for this hopeful view. With the ending of controls, it became possible to reach wage settlements at the cost of higher prices. Corporate profits in some industries are

high and could permit some adjustments. On the other hand, last year's painful experience of idleness and loss of income would restrain the workers. Pending labour legislation by Congress would also be a restraint since strikes would enhance the risk of more unfavourable measures. And prices and the cost of living had not generally been expected to be rising during the spring—indeed, a stable or even declining tendency was frequently anticipated. The new developments have raised significant questions about this hopeful point of view.

"Management's Front Line"

The first word on the right of foremen to organise was spoken this week when the Supreme Court in a 5 to 4 decision declared that they shared with other employees the protection extended by the Wagner Act. The last word undoubtedly will come from Congress. The right of foremen to organise already agitates many a Congressman, and Senator Taft has pointed out that pending legislation would free managements of the obligation to bargain collectively with organisations of foremen.

In the majority decision, Justice Jackson plainly invited Congress to write its own recipe. The case before the court was brought by the Packard Company, which insisted that its 1,100 foremen were in the "front-line of management" and refused to bargain with their union on the ground that foremen were not employees in the meaning of the Wagner Act. Mr Jackson insisted that there was no reason for believing that the Wagner Act was intended to bar foremen from the benefits of collective bargaining, but he said: "It is for Congress, not for us, to create exceptions to the plain terms of the Act" and that the Court could not base legal decisions on the "wisdom of the legislation." This is a self-denying ordinance as useful now to the majority as it was twelve years ago to a majority of a very different political hue. Justice Douglas, on the other hand, insisted in a dissenting opinion, that if foremen's unions were to be considered appropriate bargaining units, the same privileges could hardly be denied to a hypothetical union of vice-presidents.

The Packard case is more straightforward than another now working its way to the Supreme Court. In the present instance, the foremen's union is independent; in the Jones and Laughlin case the Court will have to determine whether a foremen's union may be affiliated with a union of production workers and still retain its bargaining rights.

Mr Schwellenbach, the Secretary of Labour, recently warned the House Labour Committee that industrial chaos would follow if Congress outlawed the closed shop and other union security safeguards. He said that about 77 per cent of union workers have some form of the closed shop. In passing he pointed out that when in 1943 foremen at the Maryland Dry Dock Company were not allowed to bargain collectively, there was such an increase in strikes that the Labour Board was forced to reverse its decision. He might also have reminded his hearers of the serious set-back to war production in 1944 when foremen walked out of thirteen plants in Detroit. There may be some point in refusing to allow foremen to join production unions, but to refuse to allow them to bargain on matters affecting their own interests is asking for trouble.

Three-Dollar Wheat

Three-dollar wheat is something of an achievement, even for the Chicago wheat pit in a boom year, but the price for March delivery has gone above this level during the last few days, and dealers are discussing the narrow margin between the current level and the all-time record of \$3.25 a bushel reached in 1917. The rise in farm product prices has, in general, surpassed the climb between the beginning of the first World War, and the top of the post-war commodity boom of 1919-20.

The current flurry is the more remarkable because it follows a distinctly depressing survey of farm product prices from the Bureau of Agricultural Economy at the beginning of March, a survey which is said to have been responsible in part for a bad day on Wall Street. The Bureau, after surveying the trend of national income payments and consumer purchasing power, declared that farm prices in 1947 might easily fall by 20 to 25 per cent. Washington may have timed this forecast in order to break the more speculative elements in Chicago, since it is known to be concerned by the abnormal price movement in advance of the World Wheat Conference which opened in London this week, and

it has taken steps to enforce heavier cash payments on future transactions.

Chicago itself is clearly not sure of the future, since September deliveries have been quoted around \$2.20. All recent advices suggest that the winter crop has not been seriously damaged by weather conditions, and the yield from the winter planting is expected to soar to an all-time record of 1 billion bushels, with a further 300 million from the spring crop.

The main factor in the speculative buying, of course, is the new level of 350 million bushels set for 1947 exports. If crop estimates are fulfilled, such a shipment would leave the United States with a better stock than in 1946, although that stock would be not more than one-half of the average carry-over figure in the decade before the war. An aggravating factor, in the face of recent attempts to push shipments for relief purposes, has been the shortage of railway cars for transport. Crop developments may yet enforce still higher price levels, for any serious damage to the crop would bring a serious situation throughout the world, so long as the US market remains the only material channel for relief supplies. A rise of 80 cents a bushel from the early January level, however, must surely leave the bulls vulnerable in the absence of any serious blow to crop prospects.

* * *

Conflict in Metals

An "era of dynamic demand" for the light metal industries is forecast by trade observers, at least so long as the general level of industrial activity continues to tax the capacity of all metal producing and fabricating industries. Many of the high-cost magnesium plants—scheduled for more or less immediate redundancy with the close of the war—have enjoyed a new lease of life as pre-war price relationships have become completely distorted, although it is still recognised that the specialised qualities of this metal put fairly severe limits on the possibility of expansion.

For aluminium, however, the story is very different. Before the war, with the Aluminium Company of America in undisputed control of large-scale output, the price was stabilised at near 20 cents per lb., and an effective limit on new consumption channels

was provided by the competitive merits of copper, which ranged from 1938 to 1945 between 10 cents and the war-controlled level of 11.87 cents. Within recent months, however, with aluminium ingots pegged steadily at a 15 cents level (12 cents in Canada), copper has for the first time in more than twenty years outstripped the aluminium level—it is now selling above 21 cents.

The result has been a vast increase in the demand for aluminium. Yearly domestic copper output went above the one million tons level in several war years, but output at this rate puts a maximum strain on capacities, and in future the United States will probably be fortunate to achieve it. Aluminium output, which was 148,000 short tons only in 1939, last year took second place in US metals output (the copper industry was crippled by strikes lasting for five months) with nearly 420,000 short tons. This year the industry is going for at least 500,000 short tons, and Washington wants more than 600,000.

In most consumer industries, and more especially in the electrical industry, the prestige value of copper is very high. But aluminium possesses many of the qualities essential for this work, and in many other fields this very lightweight metal, tough, durable and non-corrosive, has now become a formidable competitor, even against zinc and steel. From a tonnage basis, the steel industry, with a rated capacity of 90 million tons, has nothing to fear. But aluminium has made good gains in the shipbuilding, automobile and constructional industries, and for railway passenger cars, progress has been exceptionally rapid.

This progress coincides with a considerable change in the structure of the aluminium industry. There is no doubt that the Aluminium Company is now seeking to attain high-volume and low-cost markets, and in this work it enjoys high-grade mineral resources, very cheap power facilities, and a strategic position of enormous strength. But the competitive position is now somewhat stronger, and a nation-wide interest in the potentialities of the industry may well enforce, at some later stage, a further relaxation of ALCOA'S still very tight hold on fabrication and production. In the meantime, the present price leaves a very comfortable profit margin, and many of the new markets won by aluminium should remain despite any considerable retreat by copper from its present high level.

THE WORLD OVERSEAS

Shaping the New Italy

(From Our Rome Correspondent)

THE elections to the Constituent Assembly last June put an end to the provisional Esarchia or Six-Party Government. Three parties emerged which were based upon solid popular support, but none of them with an absolute majority in the Chamber. A Government was thereupon formed from among the leaders of the Christian-Democrats, the Socialists and the Communists, together with a couple of Mazzinian Republicans; Giannini's Quilunquisti formed the largest oppositional element, and subsequent local elections to some extent justified their pretensions to be recognised as a mass party too.

Of the three big governmental parties only the Communists were well organised and homogeneous. The Christian-Democrats represented the most divergent opinions, but were held together by the personality of De Gasperi. But in January the Socialists fell apart, Saragat and his friends and the Republicans went into opposition and the three-party Government broke down. Now, even if Saragat should succeed in creating the big non-Communist Progressive block after which Italy has been straining for so long, it is difficult to feel that he timed his secession very happily. At the moment when the new constitution had not merely to be drafted but to be realised as the political expression of the new Italian republic, De Gasperi formed his third Cabinet, a two-party Catholic-Communist coalition, with the orthodox Socialist rump under Nenni still attached to it. This Government was welcome in all conservative circles, because the Treasury and Ministry of Finance and the Ministry of Agriculture had passed from Communist into Christian-Democrat hands. Greater financial confidence was immediately manifested. But the two main Government parties carry on a running fight in the press and on the posters which seem to cover the walls of Italian cities, and they hold diametrically opposed views on the main issues now under discussion in the Assembly; never can a Cabinet's solidarity have been less convincing.

For the next few months the Italian Constituent Assembly will be discussing the draft constitution which a commission of seventy-five deputies has framed; the debate opened on March 4th and is likely to continue until the end of June. The *Progetto di Costituzione* is an interesting document. It is dominated by a determination to block the way to Fascism for ever and by an aspiration after the social and economic justice of which Italy is so sorely in need. By it Italy renounces war as an instrument of conquest, blesses the family, abolishes the death penalty, guarantees personal liberty, and private enterprise, the right to work, the right to strike, and at least eight years' schooling to every Italian child; this last, should it be fulfilled, is perhaps the most revolutionary point of all, for hitherto the working population was lucky if its children had three or four years at school.

Local Autonomy

The first week of the debate on the draft constitution has shown that some of its most controversial clauses are those according to which administrative decentralisation is to be achieved. The House of Savoy was habitually blamed for extending a French prefectorial system, not unsatisfactory for a small area like Piedmont, over the whole of Italy; the problem of the south was only aggravated by this attempt to deny its existence. In the Fascist period centralisation was carried to fantastic extremes, and in the "clandestine" days of resistance all the anti-Fascist parties, with the exception of the Communists, worked out plans for local autonomy of every kind; there were some who even wished to establish a cantonal system on the model of the Swiss Confederation. Articles 106 to 125 of the draft constitution are the fruits of this decentralising ardour. They add two to the historic Regions of Italy, thus recognising twenty-two Regions each containing its self-governing communes. The old provinces—over 90 in all—each ruled by its prefect, are ignored. For the islands, Sicily and Sardinia, and for the bi-lingual districts of the Val d'Aosta and Alto Adige special autonomy statutes are to be

worked out. As for the other eighteen regions, the draft constitution assigns a great many powers (including the right to legislate in a number of directions) to them and provides them with an elective assembly and executive body; but the thorny question of their exact relationship to the State above them and the communes below them is left more or less open. The fact is that the decentralising fervour of the Italians has cooled; partly perhaps because of the sporadic separatism manifested by the Sicilians, partly perhaps because the Peace Treaty has made slogans about national unity more popular, and partly because when it comes to working out a practical plan for a perfected local autonomy difficulties spring up like warriors from dragons' teeth.

Only two parties have now remained entirely faithful to the *decentramento*, the Christian-Democrats and the Republicans. It is said by their opponents that the Christian-Democrats take up this position because they are sure, through the priests, of carrying weight in every locality, whether large or small. The Republicans, a relatively small group of Mazzinian purists, not to be confused with the large mass of Italians who voted the Monarchy out last June, are local autonomists on principle: though Mazzini himself was centralist, his Party is untrue to him in this respect, for it has become convinced by the teaching of Cattaneo that centralisation was the instrument of monarchical tyranny and that the Republic must pursue the opposite course, since self-government requires a pyramid built up on a broad base.

Dangers of Bureaucracy

While the most clerical and the most anti-clerical parties are thus agreed in the support they give to the draft constitution with regard to the regions and communes, it is amusing to find the extreme Right and the extreme Left are at one in opposing the articles concerned. The ultra-conservative Liberals, who would like best to put the clock back by about fifty years—back to the days before Giolitti's social reforms—are naturally alarmed by the prospect before them. Nitti has protested that Cavour's life-work and the unity of Italy will be undone, while people like Professor Einaudi have pointed out more precisely that all the new local authorities spell more bureaucracy and more expense. A good many people of every political colour probably feel slightly disconcerted at the prospect of quite so many subjects as the draft constitution indicates being discussed—with the possibility of legislation—at three levels. It is also pointed out that all economic tendencies are making for larger political and administrative units and that autonomy will cut off the poorer regions from the resources of the richer ones.

The regional issue seems to divide the Constituent Assembly and even the Government as sharply as that of the relations between Church and State, the special problem of Italy. Although the Church threw all her weight into the scales against the Republic last summer, the Republic, thanks to the magnitude of the Christian-Democrat Party in the Chamber, was, it seemed, to be very much the child of the Church. Article 5 of the draft Constitution lays down that the relations between Church and State are to remain regulated according to the Lateran Pacts arrived at between Pius XI and Mussolini in 1929. Of these the Concordat greatly increased the influence of the Church over education which is now to be so widely extended in Italy; the Concordat also denied the possibility of divorce. It should not be forgotten that the framing of Article 5 has coincided with a rising tide of anti-clerical feeling and of indignation against the growing political activity of the Vatican; unfavourable comments may also be heard about the alleged economic interests of the Church.

In the first week of the debate on the Constitution it was felt that the *Progetto* would be accepted passively with little modification. Many people thought that the Communists would sup-

port it out of a cynical indifference towards an order which they intended to overturn as soon as they felt strong enough, and that the oppositional parties lacked the conviction necessary for effective resistance. This situation was dramatically transformed in the afternoon session on Tuesday, March 11th, by a speech from the Communist leader, Togliatti, which was then crowned by an appeal from no less a person than Croce himself. After a discursive oration from a Christian-Democrat speaker, who was listened to with some impatience, the Chamber seemed almost spellbound by Togliatti, leader of a Government party yet not himself a member of the Cabinet, who spoke with his accustomed lucidity and his habitual moderation. After cogently pointing out that the city or commune was the traditional Italian entity for local autonomy and that he saw no reason to interpose the Region between it and the State, and after condemning the conception of a State religion, he made clear that the Communists will oppose the draft constitution on both regional and religious issues. (It is clear that all the Socialists will do so.) Togliatti's is generally regarded as the best mind in Italian politics to-day, and there is a wistfulness in the air when he speaks as if everyone were murmuring: "If only one could take you at your word!" The venerable philosopher Croce wound up the day's discussion first with an indictment of the confused and heterogeneous character of the *Progetto*. And as Togliatti had condemned the offending articles in the name of a future workers' Italy, so Croce condemned them in the name of Machiavelli and Mazzini and the Italy of Cavour. The battle is joined, the outcome uncertain; it looks almost as if the supporters of the Catholic Church had overplayed their hand.

Russia in 1947—II.

Drive for Efficiency

[FROM A SPECIAL CORRESPONDENT]

THE current Five-Year Plan is based on a system of priorities in which the renewal and the expansion of industry's capital equipment is ruthlessly promoted to be the first and foremost objective of the national economy. Even though in 1946 the Plan was not fulfilled in many branches, the progress made in re-equipping industry was by far more rapid and energetic than the overall increase in the output of consumers' goods. The disappointingly slow increase in the gross output of civilian goods—20 per cent—is contrasted with a 50 per cent increase in machine building. In the long run the principle is certainly sound; and it is sure to pay handsome economic and political dividends. But it may be argued that in sacrificing the immediate interests of consumers to the long term objectives of its economic policy the Soviet Government has been overplaying its hand; that the half-famished consumer is a poor workman; that the chronic, and in recent years aggravated, shortage of consumers' goods results in low productivity of labour; and that a more liberal treatment of consumers' needs would in the end benefit the producers' industries as well, because it would lead to higher overall efficiency. British Governments, it has often been argued, by caring too much for the present standard of living and too little for the re-equipment of industry, have been sacrificing the nation's future standard of living.

But the argument is not new; it apparently carries no more conviction now with the Soviet planners than it did in the course of the first Five-Year Plan. The relentless drive to restore and increase the nation's capital assets is on: and no real "respite" for the mass of consumers is contemplated. In spite of all appearances to the contrary, this policy has been empirical to the last degree. Soviet planners prefer to have as many machines as possible produced now, even at a lower rate of efficiency, than to rely on the hypothetical higher efficiency that could be expected in the future from a better-fed, better-clad and better-housed working class. What one might call the anti-consumer outlook of Soviet planners has evidently been enhanced by the experiences of the war. "What would have been Russia's position now—it is often argued—if in the thirties we had given in to the pressure of consumers' interests; if we had not sacrificed our light industries to our heavy industries? Soviet Russia would have been crushed by the Third Reich." And, since nothing succeeds like success, the principle that the consumer comes last—never quite so openly avowed—has now been promoted almost to a national dogma.

By what means then does the Soviet Government intend to overcome the present crisis? The means recently adopted are

not new—they have been used and tested in previous Five-Year Plans; but they have now been carried a few long steps further. The shortage of manpower is being overcome by what looks like a real *tour de force*. The number of workers in industry was increased by three million people last year; for the current year the Plan provides for total employment amounting to 31.6 million people. This is 1.2 million more than the total employment in 1940, Russia's last year of peace. It had been planned that the average annual intake of labour in industry would be at the rate of one and a quarter million throughout the Five-Year period. The intake in the first year was thus much more than double that rate. The intake for 1946 and 1947 will amount at least to about 5,000,000. Where does this new labour come from? In the main, from the armed forces; but even the most drastic demobilisation would hardly have allowed Russia to keep her employment at a level so much higher than that of before the war, since Russia's manpower has been reduced by millions of casualties. Apparently most of the female and juvenile labour, drafted into industry during the war will be staying on.

In addition, a drastic regrouping of the available labour resources is taking place which aims at transferring great masses of people from less to more productive jobs. Thus the establishment of the economic civil service has now been cut by 730,000 posts—the personnel thus released is to be employed in actual production. (Incidentally, a few months ago the journal of the Planning Commission had suggested a reduction in the economic civil service by 20 per cent. If the figure of 730,000 corresponded to that percentage one would get some idea of the vastness of the administrative machinery in Soviet economy.) A similar redistribution of workers, especially of the skilled ones, is taking place in agriculture. The administrative staff of the collective farms had also become inflated. As Mr Andreev has stated, half of the number of agronomists and experts employed in them is redundant and will be directed to actual production. This striking swelling of bureaucracy had been stimulated by the privileged position of the administrative staffs. "The closer to production they are the less pay they get," said Mr Andreev, referring to the salaries of agriculturists. On Mr Stalin's initiative, the salaries of agriculturists employed on administrative jobs will from now on be 25 per cent less than those of "agronomers" working in the field. The whole set of measures designed to deflate economic bureaucracy is very characteristic. For many years the regime has had a vested interest in inflating the administrative cadres, since politically they have been its most reliable prop. But now that vested political interest has very obviously clashed with the demands of national efficiency, the regime has had to sacrifice a section of that social group whose privileged position it has hitherto carefully sheltered.

Strict Watch on Bonuses

However, the most important emergency measures have been taken in wages policy. Payment by results, rewards for skill and efficiency, progressive piece rates have been the guiding principles ever since the inception of Stakhanovism in 1935. The policy is now being pushed to new extremes in both its positive and negative aspects. Output above the standard norms is to be even better rewarded than hitherto; the standard norms are to be raised; and often output below the standard norms is to be penalised through decreasing scales of payment. The new collective agreements that are to be signed between the industrial trusts and the trade unions in April will embody these principles. Last year the structure of wages was still planned in connection with the then contemplated abolition of rationing. In practice, this would have amounted to abolition of the national minimum wage that had been guaranteed to the worker during the war. Meantime the drought has compelled the Government to keep rationing in being, but the national minimum wage has been virtually abolished by a fairly steep increase in the prices of rationed goods. The process is now to be completed by the raising of the standard norms of productivity. The worker will have to produce much more than hitherto, not only in order to get bonuses and special rewards, but also in order to earn his previous minimum. At the same time control over the payment of bonuses is to be tightened up. Output above the standard norm will from now on not be specially rewarded if costs of production rise together with output. Indeed, in some industries lowering of costs is to be made the condition for the payment of bonuses. Technical and administrative personnel responsible for the building of new enterprises will not be paid any bonuses at all until plants or mines are actually ready for production and taken over by the producers.

But the most sweeping and thoroughgoing change—one that affects two-thirds of the Soviet population—is being made in the structure of agricultural wages. Until now the system of payment in the collective farms was a combination of time and piece rates:

The time rate was the pay for the so-called working day. The working day and its pay was equal for all; and all collective farmers were obliged to do an equal number of "working days" during the year. From now on the uniform payment per working day is abolished, and all agricultural wages are to be calculated on the basis of efficiency—that is, in relation to harvests.

The strong bias in favour of incentive wages has in the past undoubtedly stimulated the growth of an élite of skilled workers in Russia; and to this extent it has been justified by the results. But an over-emphasis on incentive wages may also lead to undesirable consequences. The lower-paid worker becomes disgruntled and unwilling to produce. The enterprising individuals grow even more enterprising, while the "unenterprising" mass grows rather apathetic. What develops is a too deep cleavage between a well-trained, efficient and privileged labour élite and a dull, inefficient and disgruntled mass of workers, a cleavage that must seem rather unnatural under a "proletarian dictatorship." At the early stages of Stakhanovism the first symptoms of the cleavage had already led to social tension. However, the Soviet Government are now apparently determined to take the risk. They are confident that, in the short run, no social tensions can cause trouble and lead to any political opposition. What matters now is that the initial hitches and failures of the new Five-Year Plan should be overcome; that labour should be geared up for the all-out effort of reconstruction, and that the wheels of industry should turn at full speed. In the past, planned economy took initial obstacles in its stride, and there is—so it is evidently believed—no reason why it should not do so again.

[The third and final article of this series will discuss the Russian financial situation.]

France and Her Foreigners

[FROM OUR PARIS CORRESPONDENT]

NOT least among the differences between France and Britain is that the one is a country of traditional immigration and the other is not. The flow of foreigners into France since the middle of the last century has made the process seem right and natural; recent French experience may be worth consideration now that the British are seeking labour from abroad.

In the past the foreigners who came to France were landless peasants and surplus workers from Eastern and Mediterranean Europe, where high birth-rates are accompanied by low standards of living. France for them was a land of plenty, where, untroubled by public obscurantism or a dictatorial state, they could earn the decent living denied them at home. Conscious of their own falling birth-rate and finding often that hard manual labour was better left to others, the French accepted gladly these destitute immigrants. Poles, Italians, Hungarians and others became the miners, manual labourers and artisans of the toughest trades in France.

This movement of immigration, haphazard, unplanned, and often unnoticed, has greatly influenced the development of the French people. Morazé has pointed out that, while "in 1851 the immigrant population represented one per cent of the autochthonous, in 1931 it represented seven per cent, or 3,000,000 people." Landry has estimated that 5,500,000 of the present French population, or over 13 per cent, must be regarded as the direct or indirect product of comparatively recent immigration.

In 1945 the need for a new wave of immigration was clear.

For one reason or another—timely prudence, flight, deportation, or death—the number of foreign workers in France has greatly diminished since the war, perhaps by as much as a million. In 1946 there were only 2,000,000 of them (in contrast with the United States, French naturalisation is difficult, foreigners being issued with special papers and retaining their original nationality for long years and often for life). The Monnet Plan asked for an extra 1,200,000 workers by 1950; less official estimates put the necessary figure at 2,000,000 or even higher. Recruitment could no longer be left to the haphazard movement of peoples. Employers, experts and the trade unions were all agreed that it must be planned.

Trade Union Support

It was clear to those who governed France after the liberation that national recovery, in the wide sense, could be achieved only by more than making good the ravages of war—that is, by catching up on the intensive industrial development of the victorious Powers as well as by putting back what had been destroyed. France's claim to the status of a great Power would be allowed only if she could take part in international agreements on a level not far removed from equality with the Big Three. Even if this were too optimistic, as many thought, at least it might be said that France could retain the international responsibilities withheld from small Powers only by a great national effort. For that, additional labour was essential.

This conviction underlies the trade union campaign for planned immigration. The *Confédération Générale du Travail* has done more than accept the principle of immigration: it has actively encouraged and sponsored the arrival of foreign workers. The union leaders see in high production and greater prosperity a vital factor contributing to their policy of reaching socialism while (as they would say) protecting France from the penetration of American and British capital. Higher production depends upon coal and labour, and the unions have consciously rejected the temptation to concentrate on short-term benefits by conserving a scarcity of labour.

Their agreement to expand the labour force by several millions is a sign of the confidence which the unions now have in their political and economic influence. It is a long-term policy, inseparable perhaps from their Marxist view that the working-class, in the end, must prevail, and that a strong and prosperous working-class is the best guarantee for the achievement of socialism. It goes without saying that the Communist majority in the CGT has had to fight this out with the minority, which clings to the traditional ideas of syndicalism and sees the be-all and end-all of the trade union movement in the struggle by individual unions for the best immediate conditions they can obtain. The majority in the CGT is no longer content with this restricted role: it aspires to a share in the framing of national policy.

Recruitment in Germany

The decision having been taken to import an almost unlimited number of foreigners, the next problem was to know where to look for them. Poland was not only unwilling or unable to resume the post-war flow; it asked that the Polish miners in the Pas de Calais—productively one of the most important groups in the French working-class—should be given facilities for returning home if they so wished. Most of them have asked to go, and the one condition which the French could impose was to arrange their departure in gradual stages. Czechoslovakia had none to offer; nor had

Hungary, Switzerland or the Balkan countries. The Spanish Republicans now working in the Midi, a labour force of many thousands, would stay for the time being; more could not be expected from Spain.

There remained only Italy and Germany. An "experimental agreement" for the transfer of 20,000 Italians for the French coal mines was signed with the Italian Government on February 22, 1946; a much larger agreement, for the import of 200,000 workers of many kinds during 1947, was concluded on November 30th. Up to January only 6,000 had been recruited; but in the first half of February alone there was an influx of 5,500, and the rate of recruitment is said to be likely to improve. The French hope for 30,000 young men fit for training as miners, for 70,000 agricultural workers, and the remainder for building and other basic industries.

Recruiting in Germany

Recruitment in Germany is a complex problem. At present there are about 440,000 German prisoners of war engaged in civil industry and agriculture, including 55,000 in the coal mines and 200,000 in agriculture. A recent American demand for the liberation of most of these prisoners—taken by the Americans and loaned to the French—has much embarrassed the French Government. It has now been agreed to phase their release in gradual stages so as to reduce the disorganisation of economic activity. The policy-makers have already accepted the principle of inviting German labour to France, although for obvious reasons they are making no great noise about it. There are plans for the recruitment of Germans in the three western zones and in Austria; it is likely that a special "statute" for German immigrants will be framed.

Recruitment from Italy was long obstructed by the question of wage transfers. Labour needs won the day, and in the November agreement France generously conceded that all Italian immigrants with families in Italy, whether married or single, may transfer up to 40 per cent of their wages. If they have families in France, they may transfer up to 20 per cent. Another concession is that family allowances (payable under French law with effect from the second child) will also be transferable by immigrants with families in Italy.

The task of collecting recruits is a complicated routine. A French employer needing foreign labour sends his request to the labour office of his *département*. From there it goes to the Ministry of Labour in Paris, this double check ensuring that the workers in question really cannot be found in France. The Ministry countersigns the approved request and passes it to the Office National d'Immigration, which asks of the employer the sum of 6,000 francs (about £12) for each worker to cover temporary maintenance and transport.

The immigration office then transmits the request, probably as one among many, to its standing commission in Rome, where recruitment is discussed with the Italian emigration authorities. Once the worker is found, he is sent for a succession of interviews (medical, security, technical) to the French recruitment mission of the immigration office, situated in Turin (and shortly to be supplemented by another at Ventimiglia). The medical test is fairly stiff, an average of one prospective miner in two, and 10 to 15 per cent of others, being rejected. The immigrant who is accepted receives a "bilingual engagement contract," a French visa (the consular authorities being relieved of this), and his fare to one of the "reception centres" established in France. All this is done with the close co-operation of the French and Italian trade union federations.

Arrived in one of the six "reception centres," soon to be increased to ten, the immigrant is then offered the contract for the work proposed for him. This contract specifies in great detail the conditions and wages of his work, which must be equal to those of Frenchmen, and is supervised by the Ministry of Labour. The system is known as the "anonymous contract," because the employer's name is not mentioned until the immigrant arrives in France. Another form of contract is also used in which the employer and prospective immigrant confront each other in Italy; but the Italians dislike this method, as they think employers may undertake selective recruiting on their own. Of the 200,000 immigrants specified in the November agreement only 10,000 were to be recruited by means of this second type of contract. The contract which the emigrant receives in France defines the type of work in which he is to be engaged; and he may accept no other kind unless specifically authorised by the Ministry of Labour's inspectorate.

This technique of transfer, the fruit of long experience, may hold lessons for other countries seeking foreign labour. Two basic principles stand out: first, that the interests of French workers must be protected against any tendency to make French

and foreign labour mutually competitive, whether by differentiating wages or by importing foreigners into industries where no native shortages exist; secondly, that the foreigners who come to France must be restrained from swelling the ranks of the non-productive industries.

Recovery in Singapore

[FROM A CORRESPONDENT]

GEOGRAPHY designed Singapore as the commercial and financial centre of S.E. Asia. Though the development of direct trade-routes tended to divert some of its trade, the skill of its labour, the freedom and equipment of its port, the acumen of its entrepreneurs and the fact of its being the outlet for half the world's tin and rubber made it appear commercially, as well as strategically, impregnable. Yet the Japanese occupation killed its trade at a stroke and revival is taking time. New industries are slow to start; old industries are senile. Many "cottage industries," started by the Japanese, such as cigarette-making, are fading out. Only one pine-apple canning factory remains out of five; the area under pines has sunk from 50,000 acres to 5,000. Much of the heavier trade, such as that in timber and oil with the NEI, is gone.

Less disabled by war losses and political changes than its rivals in Shanghai and the N.E.I. ports, Singapore is trying to recapture its position, but the handicaps are legion. The docks suffered much capital loss; cranes have been removed; lighters, launches, junks and rolling stock are scarce and obsolescent. Rehabilitated junks and *tongkangs* are coffin ships. The turn-round of ships, though improving, may still take up to a month. Pilferage is universal. Because the local inhabitants dislike heavy work in towns, the port depended on immigrant labour from China or India. The war shut off this supply, and many of the surviving labourers want to revisit their home countries. During 1946 16,000 Indian labourers were repatriated.

The shortage of labour is so acute that wages rose without any time-lag. Even at three times pre-war rates they are unattractive, and hawking goods on behalf of black-marketeers is more profitable than dock-work. Of the labourer's wage 56 per cent is spent on food, and it is his food which has risen most in price. He can buy one-third of his rice requirement at the controlled price of 16 cents per katty (3.36 pence per pound), but the remainder has to be bought in the black market at six times that price. The People's Restaurants run by the Government are supplying meals at 8, 10 and 35 cents and help to bring square meals and the monthly wage within measurable distance of each other. So long as rice is dear, labour is dear. Strikes are incessant. A newspaper, which did not disclose the basis of its calculation, has estimated the damage caused by strikes over a three months' period at \$35 million. Traders complain that the system of quotas, permits, licences and controls adds intolerably to their work, stifles their business and favours overseas non-Malayan interests.

The short-term outlook is perplexing. The purchasing power of a large number of troops in a seller's market has inflationary effects. Supplying them absorbs precious cargo space and the warehousing of their stores has locked up 81 of the available godowns. On the other hand, the disposal of army stores, good, clothing and engineering, has lowered prices. In December canned milk, jams, vegetables, meat and butter were auctioned, and local food dealers grumbled that the consequent fall in prices had cost them \$10 million, a loss which the general public bore with exemplary fortitude.

Fear of further price reductions and lack of godown space deter merchants from carrying large stocks. Buyers hold back in the hope that goods produced on the continent, and cheaper than English manufactures, may soon arrive. Numerous mushroom firms are springing up which import goods through local merchants on payment of a 25 per cent deposit; on arrival of these goods they may default, refusing delivery and forfeiting the deposit. Legislation to expedite auction in such cases is being considered. The creditors are the importers, shippers and Customs Department. Nevertheless prices of all commodities are falling, for goods are at last arriving in quantity. This fall is not reflected yet in controlled prices, but the black market reacts quickly. White drill, for example, is controlled at \$1.10 a yard, the same material in the black market cost \$5.00 in August, but in December the price had fallen to \$3.00. Pork is controlled at \$2.25 per lb.; in September the black market charged \$3.75. The arrival of Siamese supplies in December lowered the price to \$1.20.

An early trade and industrial revival cannot be expected. Though capital is available, it can find no outlet or employment in the starting of new industries, for these must wait upon the arrival of machinery and labour.

A RECENT SURVEY in 19 countries revealed that Parker Pens were more sought after than all other makes of pen. People want them because of their dependability and satisfying performance, but they have often to wait for them, as fine workmanship cannot be hurried.

Budget Targets for 1947—II.

A Dis-inflationary Budget

THE first aim of budgetary policy, in this year of crisis, should be to restrain the inflationary pressures which are accentuating the critical lack of balance in the national economy. The problem of devising the right Budget policy in this situation is twofold. It is necessary, first, to decide how small an overall budget deficit or how large an overall surplus is needed to reduce the inflationary excess in the flow of personal incomes over the flow of available goods. Secondly, the detailed measures within this general framework must be adapted so far as possible to impose the maximum restraint at those points where the spending pressures are greatest and the specific non-essential uses of resources most wasteful and most troublesome.

Consider, first, the overall target. One test, it might be said, of a dis-inflationary or at least a non-inflationary policy would be one which stopped the creation of additional money. And since Government borrowing from the banks has been the principal cause of this creation in the past, this criterion might suggest that what is required is either to stop new Government borrowing altogether or at least to restrict it to loans direct from the public. Such a prescription would naturally relate to the Exchequer accounts as a whole: it would involve a restriction of borrowing not only for the "ordinary" account which is conventionally called the Budget, but also for the below-line items and the "extra-budgetary" accounts. Now that these extraordinary operations are becoming so large, a comprehensive and up-to-date statement of the total of these accounts—if not of each one separately—ought surely to be presented simultaneously with the conventional Budget accounts, if not more frequently. In the absence of such a statement it is becoming almost impossible to obtain a coherent picture of the national finances as a whole, and the re-classification employed in the National Income White Paper makes it for some purposes an indifferent substitute.

There is, however, a more important objection than this statistical one to the facile money-and-borrowing approach to the problem of checking inflation. War finance has driven home the truth that budgetary policy cannot be considered in isolation—a prescription for a dis-inflationary Budget cannot be found by looking solely at the Treasury accounts, however fully displayed. In certain conditions, even during full employment, the Government can run a larger deficit than is financed by borrowings from the public without producing any immediate inflationary pressure. The Government's "uncovered" expenditure may be generating a flow of income in excess of the current output of goods, but this excess will not press upon prices if the deficiency of output is being made up by importing more goods than are exported or by drawing on domestic stocks. This was the position during the early years of the war, when inflationary pressure was also being relieved by the fact that, although the Government was spending much more than its income, a large segment of industry was spending much less than its income, because normal plant maintenance and new capital works and housing had to be severely curtailed. In such circumstances, and to that extent, the Government could safely borrow from the banks because the money thus created did not increase the demand for goods but was held idle by overseas lenders or in industry's reserves.

The position now is very different. In the coming year there

will still be a net inflow of goods from abroad financed by drafts on the dollar credits, but the amount will be much less than it was in the war years, and less, too, than the amount of the dollar drafts, because a portion of British exports will in effect be employed not in paying for imports, but in repaying war-time borrowings or in making new loans. Secondly, no further relief can be obtained by drafts upon stocks. Thirdly, whereas during the war industry as a whole was spending less than its income, now increasingly it will be spending more than its income by capital outlays which will be pushed to the limits of the available physical resources. The combination of these demands for capital from non-Governmental sources will largely offset, and may more than offset, the big reduction in Governmental demands.

It is conceivable, therefore, that even a balanced budget would not be enough, and that a budgetary surplus would be necessary to remove the present inflationary pressures from the economy. On the facts, known to the public, it is impossible to say; it depends on whether the flow of domestic savings plus net borrowings from abroad is or is not enough to cover the net capital expenditure of industry plus the Government's deficit on its extra-budgetary accounts.

What is required, therefore, is not merely a Budget in the technical sense but also an overall income-and-outgo account which will reduce the Government's total borrowings from domestic sources to the point at which private capital outlays can be financed from the remaining volume of spontaneous domestic savings. What kind of Budget would this prescription for dis-inflationary fiscal policy dictate? The "Economic Survey" suggested that the minimum target for capital formation and re-equipment (including housing) should be one-fifth of the national income this year. No estimate was given in terms of money, but presumably the target outlay will be in the vicinity of £1,500 million. Only a part of this very large programme will be undertaken and financed privately, but the structure of the Governmental accounts makes it impossible to know what proportion will be financed, directly or indirectly, by the Government. Loans by the Exchequer through the Public Works Loans Board for housing, grants to Development Areas and advances to the Coal Board are obvious examples of specific governmental finance; but other governmental payments, such as EPT refunds and war damage payments (other than for chattels) have the same financial effect. Only the Treasury experts, with access to all the figures, can say what proportion of the £1,500 million target will be provided for by Exchequer outlays such as these. The search for a precise non-inflationary formula for the 1947/48 Budget must, therefore, be made with quite inadequate charts, and with little more than a general sense of direction to serve as guide.

With this proviso, these principles may now be related to last week's calculations of the Budget prospect as it looks on the basis of existing taxation and in the light of present economic policy. Those calculations suggested that the ordinary Budget would be approximately balanced, but with a tendency to tilt towards a deficit. The accounts "below-the-line," however, will show a substantial excess of expenditure. Even if no further payments are made on the post-war credits, it seems most improbable that the below-line expenditure in 1947/48

will be less than the £350 million which, on the target estimates, will on balance be borrowed abroad.

On this basis, there is a possibility that the below-line account (especially if the surplus income of the Unemployment Fund is taken into account) may be financed in such a way as not to exert any positive inflationary pressure—and, incidentally, probably without any further borrowing from the banking system. But unless the proportion of the £1,500 million investment programme which is financed by the Exchequer is very large, it seems unlikely that the flow of spontaneous private savings will suffice to finance the remainder of the programme without setting up inflationary pressures. To put the matter in more concrete terms, is it likely that new private savings out of income will suffice to finance (a) drafts on past savings by encashment of Savings Certificates, Defence Bonds etc. (b) purchases of gilt-edged and any industrial securities sold by industry to finance reconstruction (c) purchases of gilt-edged securities from the banks to offset the monetary effects of rising demands for bank advances and (d) any other excess outlays by industry and the public utilities, e.g. by reduction of their cash balances. If private savings will not suffice for this purpose, there is plainly no scope at all within a non-inflationary policy for further Government borrowings for the ordinary Budget. On the contrary, if there is a deficiency between the spontaneous flow of savings and private investment outlays, it ought to be made good by a corresponding surplus on the ordinary Budget—a surplus which would enable the Treasury to repay indebtedness and thus to release finance for private investment.

In the absence of sufficient data to make precise estimation possible it is, perhaps not necessary to assume that the capital deficiency will be large. But it would certainly be extremely rash to work on the assumption that there might be, on the contrary, any surplus available to finance a Budget deficit. In other words, Mr Dalton should now plan for an honest balancing

of his accounts—for this purpose strictly excluding from his receipts any adventitious surpluses which conceivably could be brought in from moneys already accumulated (e.g. against sales of surplus stores already completed).

Since the prospective Budget, even including some further non-recurring income, is barely balanced on the present basis of taxation, it is clear that a non-inflationary policy leaves no scope for any further overall reduction in taxation on the existing basis of expenditure. This means first, therefore, that there cannot be any overall tax reduction unless it is balanced by a reduction in expenditure already projected for the coming year and, secondly, that any further concessions in one part of the tax system must be balanced by increased taxes in another part. There is, in fact, wide and profitable scope for manoeuvre within the tax system as it now stands; but the possibilities deserve detailed discussion which will be undertaken in a separate and concluding article.

There is, however, one important block of expenditure which could profitably be re-examined, even at this late stage, without in any way upsetting the Government's main spending programme. A very large proportion of civil expenditure is now absorbed by the cost-of-living subsidies, which even in 1946-47 will have cost roughly £370 million. The subsidies were imposed with the object of restraining the wage-prices spiral. This is often described as an anti-inflationary policy, and it is true that it is an attempt to avoid the rising prices that are a symptom of inflation. But in so far as they widen the gap between the total of incomes and the total (at ruling prices) of the goods available to be bought, the subsidies tend to feed the fires of the very inflation against which they are aimed. To remove them at one blow might lead to demands for wage increases and to a consequent further rise in incomes. The important question is whether the reduction of subsidies by £100 million would or would not lead to an increase in per-

Entrepôt trade

In the days when the entrepôt trade flourished, British merchants were able to employ their expert knowledge of markets to buy goods in one country and sell them in another without handling the merchandise concerned. Glyn, Mills & Co., during years of close contact with this trade, have acquired an intimate understanding of its financial requirements. Their ample resources and personal service enable them to offer special facilities now the trade is returning. Enquiries are invited from interested merchants.

TOUGH

CUSTOMER

Those early settlers who called *Sarcophilus harrisi* the 'Tasmanian Devil' knew what they were doing: this marsupial cat is savage and untamable, forbidding in its temperament and appearance — and it is found only in Tasmania.

Australia and New Zealand are rich in matters of interest, richer still in business opportunities. The Bank of Australasia, which has been in existence for over 110 years, places at the disposal of all those who seek to cultivate these markets its intimate knowledge of local conditions; it offers to the British importer and exporter the ready help and sound advice which are essential to successful trading.

THE BANK OF AUSTRALASIA

(Incorporated by Royal Charter 1835.) Head Office: 4, Threadneedle Street, London, E.C.2. Telephone: London Wall 2951. Manager: G. C. Cowan. Numerous Branches throughout Australia and New Zealand.

sonal incomes of £100 million. If so, the removal would be an inflationary act; if not, it can properly form part of a disinflationary policy.

In any case, from the narrower budgetary standpoint, the burden of the subsidies cannot be allowed to rise indefinitely, and even last April Mr Dalton affirmed that he could not guarantee to stabilise the cost-of-living beyond the end of the calendar year. Unless something is done, the cost of the subsidies will inevitably rise further in 1947-48; the differential between the artificial pegged price level and the true price level will become even wider, and the difficulty of reducing or removing the subsidies still greater. But, if the cost-of-living is allowed to rise, a large block of wages will rise automatically, unless the sliding scale agreements can be revised.

The only logical way to break this deadlock (as a writer in the current issue of *The Banker* points out) would be to offer the workers concerned a carefully balanced plan under which

reductions in subsidies would be balanced as nearly as possible by equivalent tax concessions to persons in the income groups which would be most affected by the withdrawal of subsidy. If the plan were carefully devised to achieve the maximum of equity, and if the underlying fiscal dilemma were clearly explained to the workers most closely concerned, it is not inconceivable that a revision of the sliding scale agreements might be conceded. If so, the way would be clear for a gradual reduction of subsidies, which would have the advantage first of restoring some measure of normality and flexibility to the price structure, and secondly of producing a means of reducing working-class taxation in the manner most calculated to promote incentive. Indeed, if monetary concessions (as distinct from real increases in the standard of living) still have any psychological force, a planned approach to the subsidies problem offers the best chance, in a non-inflationary budget, of introducing substantial incentive measures.

Oil Stocktaking

THE spectre of world shortage has never been far behind the scenes in the oil industry. In the United States, which has the world's largest output and consumption of oil products per head, the prospective shortage of domestic oil supplies underlies some of the main recommendations of the recently published final report of the Special Senate Committee on oil. American oil strategy is rapidly changing; new fields have been acquired in the Near East, and new agreements have been concluded between leading American oil concerns and Anglo-Iranian, under which the latter will supply large quantities of crude oil to the former during the next twenty years. In addition, American companies, already interested jointly with other countries in large oil-bearing areas in the Middle East, are themselves developing the potentially rich fields of Saudi Arabia. Behind the manoeuvres in the Middle East and the Senate Committee's findings lie the real questions: Where are the world's most prolific supplies? Who owns them? Are they being efficiently worked from the consumer's point of view to make the best use of every drop of oil?

There are definite signs of change in the relative importance of different oil-bearing regions. The first table opposite compares the proved world oil reserves in 1943 with those in 1946, and shows the degree of control which is exercised by a small group of countries. In Russia the oil reserves are owned by the state, and in America by the country's nationals. In other areas, including some of the most prolific in the world, foreign exploitation of oil reserves is almost universal.

The figures are, of course, only estimates and for Europe and the USSR probably very rough estimates. Scientific boring to ascertain workable reserves has been held up during the war, but the available figures clearly indicate the growing importance of Middle Eastern oil fields; last year's estimates show that these areas are now practically equal to the United States fields as potential sources of oil, and further boring over the next few years should give the Middle East a clear lead.

Table II shows the production of crude oil by main geographical areas for 1938 and 1944 to 1946, together with a division into the most important sub-areas. Preliminary calculations for 1946 suggest that US output last year was about 63 per cent of the world total. Venezuela, which almost doubled its output during the war years and is the world's second largest producer, has recorded the next largest increase in output; production in 1946 was 26 million metric tons higher than in 1938. Thus the American continent, north and south, was still the world's largest source of crude oil in 1946, accounting for over 80 per cent of estimated world output. At current rates of extraction,

America is drawing heavily upon proved reserves; but estimates of proved reserves have to be taken with great caution, for their scope, workability and value at any time depend on a large variety of technical factors and on the price of oil. The search for new reserves has, of course, been retarded during the war in order to use man-power on current production and at least a moderate expansion in proved reserves is in prospect.

Compared with these levels of output, the Middle East's production is as yet quite small. Persia, the largest wartime Asiatic producer, had an output in 1946 only one-third of the size of Venezuela. Saudi Arabian production was only 7 million metric tons, though this represented a tremendous wartime leap in output from the 67,000 metric tons produced in 1938. It is quite clear that unless there is a violent, unexpected fall in world consumption, or vast new fields are discovered in America (which is equally unlikely, though proved reserves may keep pace with extraction for a number of years to come) the world's oil supplies in twenty years' time will have to come largely from the Middle East. This concentration of interest on Middle Eastern sources of supply has already produced important political and economic consequences. Large oil groups and governments themselves are busy staking their claims in territories that are known or thought to be oil-bearing.

*

The prospective change of balance from American to Middle Eastern supplies will involve important economic consequences, and major technical changes in oil transport. A wide difference presumably exists between production costs in twentieth-century America and those in Arabian deserts. But just how much less or more the change to new sources of supply will cost the world consumer for his oil is still unknown, because Middle Eastern production costs are not disclosed and world oil prices are based on American prices. All that is certain at present is that Middle Eastern costs can only be a fraction of American costs. If there were a world oil price, fixed by the "higgling" of the market, as increasing supplies of Middle Eastern oil come on to the market, there might be a downward adjustment of oil prices with revolutionary effects on consumption and production.

Table III gives an indication of the expansion in refinery capacity in different areas. Capacity expanded greatly during that period in the United States and the Netherlands West Indies. But there were significant increases also in South America and the Middle East. Refinery capacity is now being expanded in the United States. Increased equipment is also being installed in South America, partly to overtake the arrears on construction programmes planned before the war, and partly

in line with the inevitable insistence of those countries upon the establishment of self-sufficiency in petroleum products and a full-scale petroleum technology. Refinery capacity in the Middle East has been further extended in 1946. But the ultimate structure of the Middle Eastern oil refining industry has yet to be decided. In Europe, the immediate target must be to restore capacity destroyed during the war.

Opinion differs within the industry about the most economic location for oil refineries, within given conditions of extraction and the type of market to be supplied. But even if the economic factors were not themselves a controversial issue and even if, under given circumstances, the best location for a refinery could be established beyond doubt, political factors intervene to prevent economic considerations from being given full play. Sovereign states normally wish to have at least some refinery capacity available within their own borders, especially if crude oil is extracted on their own territory. In many cases, this line of development finds favour with those large oil groups which already have large refinery installations on the oilfields.

Wartime consumption of oil products was abnormal, and it provides only a very tentative basis for estimating the trend of post-war consumption. A forecast made soon after the war of a decline in the demand for high-octane motor spirit has already been proved wrong. Present indications point to an increase in the number of vehicles on the roads and a higher mileage per vehicle than in the past, not only in the United States but also in devastated Europe and the East. The long run demand for petrol from this source may offset any fuel economies that may result from better engine design and better quality fuel.

*

A feature of the oil market during the war has been the increased demand for distillate oils, following the widespread use of the diesel engine in industry, marine engineering and agriculture. At the same time, the scarcity and rising cost of coal in many regions is creating a demand for fuel and gas oil even greater than during the war. This rising demand for all refined oil products is being accentuated by the need to replenish stocks. Estimates must necessarily be tentative but it has been calculated that the world consumption of oil products (excluding the USSR) during the five years 1946 to 1950 may rise by 9 per cent. A possible consumption trend on this basis for the main refined products is set out in Table IV.

The figures reflect neither a sudden burst of world prosperity—including a drive to industrialise the Far East and mechanise its transport system—nor a world slump, which might retard reconstruction in Europe and reduce the demand on machinery and power resources in the United States. They anticipate an increased demand for crude oil, and also a further, if slight, increase in the relative use of fuel oil and distillates in some regions. Further progress with engineering and industrial techniques successfully developed during the war, such as the kerosene consuming gas turbine engine, would help to realise this estimate and it is important that these techniques should be fully developed, for if the world's supplies of oil are limited they must be used to fullest advantage. The eventual prospect of some limitation in oil supplies enhances the need for the oil producer, the engineer, the metallurgical chemist and the economist to consult together on the best application of oil to industry.

A national oil policy involves the weighing of many factors, including available raw materials, sources of power, and dependence on international trade. In addition to the technical questions involved in relating oil consumption to the requirements of expanding chemical and engineering industries, there remains, for Western European countries, the impact of oil requirements on their balance of payments. The need to fit these considerations most carefully into a national balance-sheet of resources is not least obvious in the case of this country.

TABLE I—CRUDE OIL PROVED RESERVES AND OWNERSHIP

	1943	1946	Percentage owned in 1946 by

Saving and Dis-saving

Small savings, the public was triumphantly told last week, have passed their 1946-47 target of £520 million with three weeks to spare. This is certainly no moment to denigrate the efforts of the National Savings Movement, but it really is questionable whether these shouts of triumph are good tactics psychologically. The National Savings Committee works to gross targets, without taking account of the rising level of encashments of Savings Certificates and Defence Bonds, and always contends that any emphasis upon "dis-saving" damps down the enthusiasm of workers in the movement. If that is really so, it is time that serious efforts were made to bring home to all local organisers and canvassers the fact that an important part of the movement's functions now is to facilitate the stream of necessary encashments—for example, by those who are now restoring their homes—by encouraging additional savings by those whose domestic circumstances are less pressing. From the point of view of combating inflation, a gross target is almost meaningless: it can make sense only if properly related to realistic forecasts of the amount of dis-saving. Naturally there is no means of knowing whether in the past year this has been larger than the authorities forecast, but it has continued to rise steadily.

SMALL SAVINGS, 1946-47 (to March 8th)

	Purchases and Deposits (£ million)	Encashments and Withdrawals (£ million)	Net Cash Receipts
Savings Certificates	157.7*	129.7	28.0
Defence Bonds	202.1*	34.3	167.8
Savings Banks	689.8	587.7	102.1*
	1,049.6	751.7	297.9
Less Defence Bonds redeemed on maturity			22.2
			275.7†

†This compares with "target" savings of £520.9 million, comprising the sum of the items marked with an asterisk plus £59 million of interest accrued on savings deposits. Accrued interest on savings certificates during the period amounted to £53 million.

Thus, although "target" savings produced £520.9 million (including £59 million of accrued interest) in the first 49 weeks of the financial year, the actual net cash receipts were only £275.7 million, and even if all accrued interest is included, the total is no more than £387 million. Moreover, it is questionable whether even the trend of gross savings can be regarded as a measure of the volume of savings in future. Sales of Savings Certificates and Bonds during the 49 weeks totalled £360 million compared with £401 million in 1945-46, but this performance is much less satisfactory than at first appears—first because £22 million of Defence Bonds have been repaid on maturity, and secondly because sales have been artificially stimulated both by Mr Dalton's "last-chance" tactics and by the raising of the limits on individual holdings. Of the year's sales of Defence Bonds, probably at least a quarter represented purely anticipatory purchases stimulated last spring by the imminent withdrawal of the 3 per cent issue. No doubt the effects of these big purchases at that time have been felt in correspondingly smaller purchases since, but this influence was certainly substantially offset by the attraction of "large" savings into the small savings totals by the device of raising the limit on holdings. And since the Chancellor gave notice of the coming withdrawal of the current series of Savings Certificates, every effort has been made to ensure that as much money as possible is raked in before the turn of this financial year. Examination of the figures suggests that possibly £25 million has been secured in this way, which means that the volume of sales in the new financial year will be correspondingly less. Once again, however, the effect on actual sales will be obscured by tapping the resources of the large saver to whom, even after the substantial cut in interest, Savings Certificates will still be very attractive.

France's Dollar Needs

Ominous news about France's utilisation of her dollar credits has been given this week in Paris by the American Ambassador. He pointed out that of the total of \$1,920 million of credits arranged in the United States by France, as much as \$1,200 million had actually been disbursed by the end of October, 1946, and that orders placed after that date for delivery in 1946 and 1947 amounted to about \$900 million. This suggests that France's dollar commitments exceed available dollar credits by about \$180 million. The tale is reinforced by the figures of French short-term assets in the United States, which from a total of \$490

million at the end of 1940 had declined to \$275 million by September 30, 1946. The pressure on France's dollar resources is further apparent in the extent to which the Bank of France has had to ship gold in recent months. The last such operation occurred last month in connection with the payment of France's gold subscription to the International Monetary Fund. The French gold quota calculated at one-tenth of the French gold and dollar reserve amounted to about \$90 million. In order to provide for this payment a law was enacted authorising the transfer of Fr. 12,000 million of gold from the Bank of France to the Exchange Stabilisation Fund. This Fr. 12,000 million would be equal to approximately \$100 million, and the balance of \$10 million between this figure and the amount needed for France's IMF subscription is at the disposal of the Exchange Stabilisation Fund to provide urgently needed dollars. This transfer of gold to the Stabilisation Fund is the last of a number of such operations, the effect of which has been to reduce the Bank of France's gold reserve to little more than one-quarter of the figure at which it stood at the outbreak of the war. The change can best be expressed in terms of volume since this avoids the complications of two intervening valuations of the French currency. In September, 1939, the gold reserve at the Bank of France amounted to 2,408 tons. It had fallen to 1,778 tons by the liberation, and has since then been reduced to 628 tons or \$718 million.

The immediate balance of payments situation promises continuing strain on that somewhat exiguous reserve. The current deficit for 1947 is estimated at Fr. 188 milliard, or \$1,600 million, of which exactly half is "in hand" as a result of sales of external assets and further drafts on the Lend-Lease Export-Import Bank credits. Part of the estimated deficit for 1947 is, of course, a sterling deficit, which will be presumably met by transfers of sterling securities to the British Government. It is evident, however, that the French gold reserve may have to take an almost obliterating strain this year unless the International France comes to the rescue with the \$500 million loan for which France has been waiting so long.

Companies Bill and Disclosure

The final committee stages of the Companies Bill in the House of Lords last week produced a rather surprising concession, when the Lord Chancellor undertook to consider, before the Report stage, an amendment moved by Lord Swinton which would have the effect of adding shipping companies to banking, discount and assurance companies which, under the Bill, are specifically exempted from the need to make full disclosure of hidden reserves. Lord Swinton argued that the strategic importance of shipping gave it a special place in the national economy, and that the disclosure of its full reserves would provide welcome information for its foreign competitors. The Lord Chancellor not only admitted this case, but also suggested that it would not be wise to confine the exemption to shipping. This erosion of the principle of full disclosure is regrettable, for the grounds on which it has been conceded to shipping companies can hardly be denied to many other companies with establishments or business overseas. The concession admits a real danger that the principle of full disclosure for which the Cohen Committee so cogently argued may in the end be seriously diluted.

An amendment moved by Lord Lucas of Chilworth sought to include the amount of a company's trading turnover in its accounts. Lord Lucas, after a dig at British industrialists who in the past had told the public as little as they could, argued that the suspicion which was attracted by apparently high profits would be abated if it were related to the turnover from which the profit was secured—and, he might have added, the real capital which was required to earn it. This is a matter on which the Cohen Committee decided, after consideration, to make no specific recommendation, and it was hardly to be expected that the Government would accept a suggestion which, compared with most of the Bill, was somewhat controversial. But the Bill is in many respects based on widely accepted good practice which not so many years ago was in the pioneer stage; so, to-day, at least a handful of companies give information about turnover without encountering any of the difficulties involved in special cases like three-year contracts to build bridges, such as the Lord Chancellor put forward in rejecting the amendment.

Floating Debt Policy

Mr Dalton, as last week's Note in these columns pointed out, certainly chose a fortunate date for his claim in the economic

REPORT OF THE AUDITORS TO THE STOCKHOLDERS.
We have examined the above Balance Sheet with the books at the Head Office in London and with the Returns from the Branches open at 31st December, 1946, certified by the Branch Managers. No Returns are available as to the Assets and Liabilities at 31st December, 1946, of certain Branches which had not then been re-opened after enemy occupation, and the figures included in the Balance Sheet in respect of such Branches are those shown in the last Returns received: currency figures in such Returns have been converted into Sterling at the rates stated on the Balance Sheet. Under existing circumstances, it has not been possible to reconcile all outstanding transactions between re-opened Branches previously occupied by the Enemy and the Head Office and other Branches. Subject to these observations, in our opinion the Balance Sheet is properly drawn up so as to exhibit a true and correct view of the state of the Bank's affairs according to the best of our information and the explanations given to us and as shown by the books at the Head Office and the Returns referred to.

REPORT OF THE AUDITORS TO THE MEMBERS.
We have audited the above Balance Sheet with the Books in London and the certified Returns from the Branches. We have obtained all the information and explanations we have required. In our opinion such Balance Sheet is full and fair, containing the particulars required by the Regulations of the Company and is properly drawn up so as to exhibit a true and correct view of the state of the Company's affairs according to the best of our information and the explanations given to us and as shown by the Books of the Company.

London, 12th March, 1947.

policy debate that Treasury revenue surpluses were already producing a deflation of bank deposits. In each of the three weeks since the last clearing banks' statement there has been a deficit on the ordinary Budget. The total for these weeks amounts to over £92 million in contrast with only £38 million in the similar period of last year, so that the prospective out-turn of the 1946-47 accounts looks correspondingly less satisfactory than it did a few surpluses was marked by interesting changes in floating-debt policy. Except in 1940, when the floating debt was still carrying the main burden of war financing, the heavy tax gatherings of the first eight to ten weeks of the calendar year have always produced a contraction of the "tender" supply of Treasury bills. But this year, although the revenue surplus was unusually heavy, the supply of Treasury bills has actually expanded. Since end-1946, the outstanding total of tender bills has risen by £45 million to the new high level of £2,185 million, in contrast with a fall of £120 million in the similar period last year.

The whole of the seasonal impact upon the active portion of the floating debt has thus been concentrated upon Treasury deposit receipts, which, except for the end-1945 last-minute rush for the 3 per cent Savings Bonds, have declined more rapidly than ever before. The contraction of the outstanding total since the turn of the year amounts to £242 million, compared with £75 million in 1946. These changes seem to mark a further stage in the post-war policy of shifting the emphasis of floating-debt borrowings from TDRs to bills. The TDR issue still remains the normal fluctuating element in the debt, and in consequence the use of current revenue surpluses to reduce it is in conformity with past practice, but this is the first time that the authorities have reinforced the seasonal influence upon TDRs by actually increasing their borrowings on Treasury bills. At £1,435 million the TDR issue is now only some £65 million above the low point reached last June and is £750 million less than the outstanding issue of tender bills. When TDR borrowing was at its heaviest, the total often exceeded the bill issue by more than £500 million.

Imperial Tobacco and the CIC

Lord Dulverton's speech at the Imperial Tobacco meeting this week—his last as chairman of the company—revealed that the company's application for permission to raise new ordinary capital had been refused by the Capital Issues Committee. This refusal might indeed have been deduced from the reference in the report to the proposed increase in borrowing powers to £82½ million, for this was evidently put forward as an interim policy "pending a satisfactory adjustment of the position on a permanent basis." The group's financial problem emerged quite clearly from the recent balance sheet. Last year the value of stocks increased by almost £21 million, largely owing to the resumption of the pre-war practice of paying for purchases when made, instead of deferring payment, as happened during the war years, until tobacco had been actually imported into this country. To finance this increase in the stocks, the company (which had already created £10 million of 10-year notes) borrowed a further £10 million last year on acceptance credits, and its bank overdraft rose to £26.3 million. In all, therefore, short-term liabilities now exceed £46 million, and are within £4 million of the issued share capital.

The directors have sought to rectify this unbalanced position by an issue of ordinary capital sufficient, doubtless, to wipe out the bank overdraft. This could easily have been done by a rights issue, within the limits allowed by the CIC's policy. But the directors were not satisfied with this course, holding that the ordinary share issue should be made at such a price as would reduce the present rate of ordinary share dividend to a figure appreciably closer to the rate of earnings on the capital effectively employed in the business. In other words, they intended that although the issue price should be close to par, the element of true bonus involved would have been negligible, because cash amount of dividend would be only slightly increased and the rate proportionately reduced. Clearly the replacement of short-term funds by permanent capital would have contributed little or nothing to earning capacity, and a new share issue on the lines proposed would have merely linked the issued capital more closely with the company's earning power.

It is hardly surprising that the Capital Issues Committee has proved unresponsive to this line of argument, for it raises the question whether current share prices are too high (on which a number of industrial concerns have held different views from the CIC in putting forward the terms of their "rights" issues),

but whether directors of industrial companies are to be allowed to adjust their issued capital and dividend payments into closer accord with real capital and real earnings. Imperial Tobacco might have sought to make the capital adjustment through an increase in prior charge capital (which would have left the ordinary dividend almost unaffected), but this would not have secured the directors' aims, and would have added to the existing three classes of preference capital a new class of preferred ordinary shares.

The fact is that their proposal is inadmissible, not because it lacks logic and financial reasonableness, but because it strikes at the political basis of the bonus ban—namely, that the propaganda value of high nominal dividends is so high that any attempt to reduce its effectiveness by adjusting issued capital to earning power must be resisted. The policy of the CIC is, of course, made in the Treasury, and although the Chancellor of the Exchequer submitted the question of bonus issues to the National Investment Council last autumn he has remained quite obdurate to any change. In view of the present state of the gilt-edged market it would be unrealistic to expect any change—for the wartime policy of capital control was founded on fears of competition with the gilt-edged market, and these have not lessened during the last week or two.

* * *

Timber Prices and Supplies

The Timber Control has agreed with the trade to raise the price of imported softwood by £8 10s. a standard as from April 1st. The Control's basic price at present for European flooring, to give one example, is £44 per standard, but conversion and other charges may bring the final price to £80 or more. A levy of a similar amount is also imposed on all stocks in the hands of merchants at that date, when the new quota period opens. The increase in price, sharp though it is, has only limited significance owing to the desperate shortage of timber supplies and the curtailment of all forms of use. No doubt it can be justified on the ground that higher prices have to be paid to producers. The imposition of a levy on existing stocks is an obvious method of ensuring that all purchasers on and after April 1st pay the same price and will thus eliminate any differential prices and possible discrimination or leakage which might result from them. It will, however, present the Timber Control with a "windfall" amounting possibly to well over £1,000,000, which will help it to offset past deficits. This seems to be a further step in the Government's policy of gradually raising prices of basic raw materials and reducing its trading losses.

The dearth of timber presents a serious problem. Total stocks of softwood at the end of 1946 were just over 214,000 standards (the lowest on record), compared with 563,000 standards at the end of 1945 and nearly 700,000 standards at the end of 1940. Peace-time stocks were generally considered to average about 1,000,000 standards. Last year's consumption naturally showed a sudden jump compared with previous years, owing to the housing programme, but the drop of over 60 per cent in stocks clearly shows that home production and imported supplies lagged far behind requirements. Even with the lower allocation of 1.6 standards of softwood per house, stocks at the end of last December were only sufficient to build just over 130,000 houses, without allowing a single standard for other uses. The Ministry of Works are encouraging further economies in the use of timber, but little further saving can be secured in the construction of traditional dwelling houses—joists may be made slightly smaller, or their centre-spacing increased, but these are only marginal reliefs. Real economy in timber can only be effected by a modification of present housing designs or the introduction of permanent pre-fabricated houses. Since the suggested alternatives to timber are mainly materials such as steel, base metals and plasterboard, which themselves are already scarce, the scope for substitution is limited indeed. Most house-builders are not used to some of these materials. Steel or concrete joists call for fillets of timber or some other means by which floor boards can be nailed down. Again, builders may need special hoists to lift steel roof joists into position, and if the brickwork is slightly out of alignment, steel and concrete are not so workable as timber.

*

It is doubtful if the housing programme can be achieved unless additional timber supplies can be secured to build traditional houses. The United Kingdom last year negotiated a deal with the Soviet Union for 25,000 standards, but by the end of the year only 11,000 standards had arrived. Pre-war shipments from

Russia averaged some 350,000 standards annually. The timber areas of Northern and Central Europe are now within the Russian orbit, whilst Scandinavian countries could increase their supplies only in exchange for coal and other commodities which British cannot at present provide. It is understood that Mr Bevin will raise the question of timber supplies with the Russian authorities during his Moscow visit. Contracts have been made with Canada for 450,000 standards and it is hoped to obtain some 200,000 standards from the United States. These will give an increase in supplies of over 250,000 standards compared with last year, but if consumption this year is at the same level as 1946 stocks next December will stand little higher than 100,000 standards.

Sweden's Balance of Payments

Sweden has taken drastic measures this week to arrest a grave deterioration in her balance of international payments. Following the recent prohibition of imports of inessentials such as toys and jewellery, a general ban on imports has now been put into operation. This ban is subject to the issue of special exemption orders which are being issued only for absolute essentials such as skins, cotton, wool and oil products. The immediate reason for this drastic move is the substantial decline which has recently occurred in the Riksbank's gold and foreign currency reserves. The gold holding declined from Kr. 1,734 million at the end of 1945 to Kr. 1,371 million at the end of 1946, and to Kr. 1,114 million on March 4th last. The foreign exchange holding has fallen similarly from Kr. 930 million to Kr. 827 million and Kr. 609 million respectively.

Sweden's balance of payments problem, indeed, bears many resemblances to that of Britain. There was a current trade deficit of some Kr. 800 million last year, but the hard currency deficit was considerably larger than this. The distortion in the Swedish balance of payments has undoubtedly been increased by fairly generous grants of credits to countries like Norway, Finland, Poland and Holland—credits which have undoubtedly put a considerable strain on the Swedish balance of payments with Canada, the United States and some of the South American countries. Sweden thus provides an exact replica of the British problem of surpluses with soft currency and deficits with hard currency areas. The extent of that distortion is evident in the sharp decline of the gold and foreign currency (almost exclusively dollar) reserves. The position has no doubt been aggravated by the decision taken by the authorities last July to revalue the Swedish crown by 14 per cent in terms of gold and dollars. Taking the long view and bearing in mind the current rise in dollar prices, this may well have been a wise move but in the short run it is proving decidedly expensive.

Sweden is now faced with some of the domestic repercussions and implications of its exchange decision, namely a policy of high taxation, of conscious restriction of domestic consumption and stimulation of exports. While this policy is being worked out and a system of import licensing developed, the blanket prohibi-

tion on imports should serve to hold the position. One can but admire the vigour and ruthlessness with which the problem is being tackled, and wish that similar courage could be applied in other countries where the need for defensive measures of this kind are even more pressing than they are in Sweden.

Railwaymen's Wage Demands

The claim of the three railway unions for higher wages and shorter hours was considered at a joint meeting of the two sides of the railway industry this week, but no decision has been reached and the companies are still considering the matter. The unions are asking for an all-round increase of £1 a week, with a 40-hour week for operative grades and a 35-hour week for clerks and salaried employees. It seems out of the question that the companies will concede these demands, which would be in direct conflict with the labour and wage policy of the "Economic Survey" and would hardly be considered as a matter strictly between the men and the companies, in view of the vesting date on January 1st next year. The claim will almost certainly have to be referred to the industry's negotiating machinery.

It is only fair to say that the men's claim was formulated some time before the "Economic Survey" was published. They argue that railway workers are among the worst paid of any industrial workers—the lowest paid, a second grade porter, receives £4 7s. a week in London and £4 4s. in rural areas—and that railway wages have stood still since the end of the war, while other wage-earners have benefited by increased rates and shorter working weeks. With the withdrawal of the Essential Work Order many workers have been leaving the railways to seek higher-paid employment. And the "profit" which the State is expected to earn from railway nationalisation—so widely advertised by the Chancellor of the Exchequer—is an obvious incitement to increased wage demands.

Nevertheless, the wage increases asked for, which would affect some 600,000 employees, would represent a burden in wage costs, which the railways, under private or public ownership, could not afford in their present condition. The increased costs would assuredly be passed on to the consumer by additions to existing fares and higher freight charges for goods. There may be a case for a revision of the wages to raise the standards of the lowest paid sections, but a blanket increase of £1 a week would involve a penal increase in industrial costs, and would encourage other trade unions to follow suit.

Courtaulds' Accounting Date

The directors of Courtaulds Limited have declared a second interim dividend of 5 per cent actual for the year 1946, making with the first interim 7½ per cent. This second interim dividend is to be paid at some date, after April 5, 1947, to be determined (Continued on page 434)

SECURITY PRICES AND YIELDS

A fuller list containing 370 securities appears weekly in Records and Statistics. Notes on the following company reports also appear in the Supplement: Gallaher; Radiation; International Nickel; Rubber Plantations Investment Trust; and A. W. Gamage.

NATIONAL PROVIDENT INSTITUTION

GOOD INTEREST YIELD

The annual meeting of the National Provident Institution for Mutual Life Assurance will be held at 48, Gracechurch Street, London, E.C., on Tuesday, the 25th instant.

The following extracts are from the address which will be submitted by the chairman, Mr Vincent W. Yorke:—

The distribution of profits relating to the previous six years, which we made early in 1946, gave great satisfaction to our members, and I am glad to say that we can continue to allow interim bonuses to policies which become claims through death or maturity at the same excellent rates as we then declared.

INCREASED NEW BUSINESS

In 1946 life offices experienced a considerable revival of new business. The figures we report to you are more than double those of 1945, and the amount of new sums assured, after deduction of re-assurances, exceeded £2,600,000. These figures contain a slightly higher proportion of family protection benefit than usual. This is a death benefit in the form of a series of annual capital payments, and we welcome this increase because we know what great protective benefit this type of policy confers on the families of young men. Even if this were omitted, the 1946 new business would still be a record in our history.

The expense ratio for 1946 was £16 2s. 2d. per cent. (after deducting the special expenses in connection with the triennial valuation), compared with the figure

of £12 17s. 6d. per cent. for 1945. The increase in expenses directly attributable to additional new business represents about three-quarters of the total increase; the remaining quarter is attributable partly to items of a non-recurring nature and partly to the general rise in costs.

This year I again have the pleasure of reporting a favourable year in which mortality was lighter than we should have expected from the modern tables that we use. I am also glad that I can draw your attention to a slight but welcome increase in the rate of interest earned on our funds. The gross rate increased from £4 19s. 8d. per cent. to £5 0s. 10d. per cent., and the net rate, after deduction of tax, from £3 12s. 3d. per cent. to £3 14s. 8d. per cent.

I should like to draw your attention to the main changes in the balance-sheet during the past year. Firstly there was a reduction in the amount of Mortgage and Loans due to repayments, and we have also reduced our holding of Dominion and Foreign Government Securities. Against this, we have slightly increased our holding of Debentures, but this increase is likely to be of short duration in view of the Government's plans for nationalising certain industries.

Secondly, we had by the end of 1945 built up a solid block of British Government Securities, a larger proportion of our assets than we had ever shown before, except for a short period after the first World War. In view of this large holding and of the prospective replacement of "Nationalisation Stocks" by British Government Securities, we have somewhat reduced our gilt-edged portfolios. On the other hand we have considerably increased our holding of preference shares, but the largest increase among our different classes of investment is in Ordinary stocks and shares, since as the experience of past history points to a steady fall in the value of money over the years ahead, to that limited extent, the premiums of our members

are being invested in goods rather than in money.

There is a handsome margin between the value of the Stock Exchange assets as they appear in the balance-sheet and their market value at the end of 1946, but a time may come when the prices of securities may meet with a general setback. This margin would then serve as a useful cushion against such depreciation. I am pleased to repeat that our financial position is one of great strength.

The original purpose of Life assurance was to give protection, and in deciding what "protection" means to his family, a man should think first in terms of the income that is necessary to cover his family's needs. But it is difficult for a man to assure for a large enough capital sum to produce the necessary income on his death and in these circumstances he would be wise to add cover of the "Family Protection" type to such life policies as he could afford, especially as this is one of the cheapest forms of life assurance.

NEW PENSION INSURANCE

We have introduced a new policy which will appeal particularly to professional men and to those who have to provide their own pension—the "New Pension Insurance." This provides a series of capital sums half-yearly for 15 years after the selected age of retirement and under present regulations these capital sums are not taxable, and they continue for 15 years, whether the pensioner lives so long or not. Provision is also made for an ordinary life annuity to start after that period if he is still alive. This new policy has already proved to be popular, and we expect a large demand for it.

During the latter half of 1946 we have had our full branch staff working for us after the return of those who have been in the Services, and I am sure that members and agents appreciate the fuller services we are again able to offer them.

(Continued from page 433)

by the date of the Budget speech and by the ensuing period thereafter required for the preparation of dividend warrants. The directors have, however, decided to change the accounting period of the company from December 31st to March 31st, and the forthcoming report and accounts will therefore cover a 15 months' period to March 31, 1947. The question of a small final dividend, if any, on the ordinary stock to supplement the two interim dividends will be considered in June when the accounts have been completed.

The company has decided to make this change in accounting dates because of the difficulty of assessing accurately the income tax liability on trading profits for the calendar year—a liability which accrues in the following fiscal year commencing on April 6th. But it has been the company's practice in the past to issue the report and accounts within the first three months of the succeeding calendar year, and consequently the provision for income tax on trading profits has had to be estimated, without any precise knowledge of the rate of tax which they will attract. In pre-war years, when the standard rate of income tax was lower, and during the war years, when EPT was in force, this margin of potential error was not of major importance; in present circumstances, however, the directors feel that they should wait for full knowledge of the company's tax liability. The incidental delays, so far as the stockholders are concerned, will be limited to a mere month and some administrative advantages will accrue from synchronising the accounting period with the fiscal year, particularly in connection with PAYE.

By their decision, the directors of Courtaulds may set something of a precedent for other companies whose accounting year now ends on December 31st—though it will be noted that the tax problem which Courtaulds seek to avoid would not arise in quite the same form for other concerns which have been less expeditious than Courtaulds in preparing their final accounts. Within broad limits, there is a good deal to be said for spreading the publication of company reports more evenly through the year; at present they tend to be concentrated largely in the second quarter of the calendar year (mainly with accounting dates to the end of the preceding calendar year), and there is another secondary peak in the fourth

quarter, when many companies with accounting dates to September 30th issue their reports. The Courtaulds' change, if widely followed by British companies, might produce the odd result of accentuating the publishing peak; if so, it would render more difficult the task of investors and their advisers of dealing adequately with company reports.

Shorter Notes

The second allocation of tin metal for the first half of 1947 made by the Combined Tin Committee has been announced by the Ministry of Supply. Demands for allocations for the first six months of this year totalled almost 60,000 tons, against new supplies available for allocation from all sources of no more than 17,700 tons. As the first allocation totalled 10,915 tons, there remains only 6,785 tons for the second. The Committee will review the supply position again in May when the final allocation for the January-June 1947 period will be recommended. It is hoped that a further quantity of tin metal will be available from the remaining 4,000 tons of Japanese stocks. The deterioration in supplies results from retarded production in Malaya and Netherland East Indies due, among other things, to coal shortage, exchange difficulties with Siam and general economic and transport difficulties in China. Belgian tin output, however, is increasing.

*

It has been reported from Ceylon that the 150 million lb. of tea required by the Ministry of Food would be provided by the local tea industry from the 1947 crop. The price paid by the Ministry will be 3d. a lb. higher than last year's purchases. In addition, the purchaser has to pay the export duty of 7d. per lb. The Government is considering the extent to which the export duty on tea should be passed on to the consumer. Free auctions for tea now operating in Colombo are handling the whole of Ceylon's exportable surplus. The Mincing Lane tea auctions have not been allowed to reopen; before the war they sold nearly half of Ceylon's exports.

COUNTY OF LONDON ELECTRIC SUPPLY COMPANY, LIMITED

THE NATIONALISATION PROPOSALS

SIR ROBERT RENWICK'S SPEECH

The fifty-third ordinary general meeting of the County of London Electric Supply Company, Limited, was held on the 18th instant in London.

Sir Robert Renwick, Bt., K.B.E., the chairman, in the course of his speech, said: So far as the balance sheet is concerned I propose to be extremely brief, since if the Electricity Bill goes through, all your assets, which you will see from the accounts total no less than £45,211,000, will, I regret to say, be taken over by the proposed Central Authority.

Turning to the revenue account, our total receipts on the credit side come to £8,732,000, compared with £8,308,000 last year; receipts from sale of current are up about 4 per cent. at £8,063,000.

Under the new Electricity Bill the directors are precluded from recommending to the stockholders a dividend in excess of that paid last year. I must say that while your board were of the opinion that 1946 might prove a difficult period for us, a strong reason we had for not restoring the 1945 dividend to its pre-war rate was that the Chancellor of the Exchequer had publicly asked all companies throughout the country, during the period of transition from war to peace, not to dissipate resources by the payment of much increased dividends. The Government in fact ask us not to increase dividends substantially and when we, as patriotic citizens, carry out their request they buy our shares on the lower valuation that the shares in consequence command. If this is not a case of "rigging the market" I do not know what is.

UNFAIR COMPENSATION

I consider that the basis of compensation—namely Stock Exchange prices—is grossly unfair. On the basis of these prices compensation will total £37,239,726. In this company alone we have stockholders, including debenture holders, numbering over 40,000. Assuming the new stock yields 2½ per cent., which is about the best that can be hoped for, our stockholders will receive an income of just under £931,000 compared with their present income of £1,418,626. This represents a drop of over 34 per cent. I say that the Government are doing them an outrageous injustice, and the reason given by the Minister is in effect that to do justice would take too long.

During the year we have made reductions in our lighting flat rates in rural areas throughout the group, involving reductions up to 22 per cent. in the accounts of the consumers affected.

LOAD SHEDDING

Having dealt with the services that we have rendered to consumers, you will expect me to say something on the fact that since the war consumers who have in the past relied implicitly on our service now find that their trust in the industry has apparently been misplaced. I want to say as emphatically as I can that neither the companies nor the municipal undertakings are in any way responsible for the shedding of load or the recent emergency restrictions.

UNFAIR CRITICISM

I consider it most unfair of the Minister of Fuel and Power to attempt in the House of Commons to attribute the emergency restrictions to bad estimating by the Central Electricity Board. The Central Electricity Board's estimates had to be stepped up sharply at a late stage because the Ministry had failed consistently to live up to their

promised deliveries of coal. The crisis arose because coal deliveries due before the cold spell were short of allocated quantities, and not because of any substantial error in estimating requirements.

I also ask myself how much this blunder has cost the country. Though it is too early to estimate the cost really closely in terms of money, particularly since the dislocation will be felt in industry for many months, I shall be surprised if the figure is lower than £110 millions.

The Prime Minister has stated that the coal saved by the power stations during the three weeks of major restrictions amounted to 550,000 tons—so that one could say that this coal has cost the country at least £200 per ton. Why was not coal bought from the U.S.A. some eighteen months ago, even at £5 a ton? In reply to a question in the House the Chancellor of the Exchequer has promised to provide information on this subject in 1948. The Government is quick enough to make its calculations when it decides to expropriate the property of sections of the community. Why not the same speed when it slashes the national income as a whole?

EFFECT OF PLANT SHORTAGE

With regard to load shedding due to shortage of generating plant, far and away the biggest contributory factor is the entirely inadequate rate at which new plant has been and is being brought into commission since the war ended, owing to lack of Government priority. By the end of this year, by which time the war will have been over 2½ years, the country will be lucky if the additions to generating capacity since the war total 350,000 kilowatts. In 1948 we may, if we are lucky, get an additional 615,000 kilowatts.

Yet at this moment we are short of some 2,000,000 kilowatts. Compare our present progress with that achieved in one of the blackest years this country has ever faced—the year 1941. In 1941, when some panic restrictions on new generating plant might have been excusable, the additional capacity installed was 700,000 kilowatts, and in 1942 we got another 700,000 kilowatts.

CONSUMER UNPROTECTED

Too much power is reserved by the Central Authority, and through the Central Authority by the Minister; these vast area boards will, if the Bill goes through as at present drafted, possess less authority than the managements of small undertakings at the present time. It is with very great concern, therefore, that I find in the Bill so little protection for the consumer, whose interests in the future will be in the hands of nominees of the Minister for the time being.

The new boards to be formed are to secure the use of the best methods of generation and transmission, the cheapening of supplies—only so far as is practicable—the avoidance of undue preference and the simplification and standardisation of charges and systems. Every one of these objectives, if they can be so described, have already been performed or are in process of completion by the industry as it stands to-day.

Your board will continue to oppose the Bill, since they regard it as confiscatory, ill-considered, ill-considered, vexatious and bigoted, and most unlikely to assist in the realisation of greater prosperity and happiness for this country, which men of all political beliefs should determine to put first.

The report was adopted.

BRITISH ASSETS TRUST, LIMITED

Mr W. H. FRASER'S REVIEW

The forty-ninth annual general meeting of British Assets Trust, Limited, was held in Edinburgh on Thursday, the 20th instant.

Mr W. H. Fraser, the chairman, was unfortunately unable to be present owing to illness, and Mr H. G. Sharp presided.

The following is the Chairman's statement which had been circulated with the report and was taken as read:—

INCOME AND DIVIDENDS

Our income for the past year (excluding arrears, special bonuses and underwriting profits, the net amount of which as in the past has been applied in strengthening the resources of the company) after allowing for interest on temporary loans and Dominion and foreign taxation but before deducting British taxes, amounted to £419,369, against the previous year's figure of £385,712. After providing for taxation, management expenses, interest and Preference stock dividends, the amount available for Ordinary stockholders was £92,101, equal to 35.74 per cent. gross on the Ordinary stock, compared with £72,421 or 30.9 per cent. a year ago. Stockholders received a reduced dividend for many years, but in view of the steps taken to strengthen the company over a considerable period of years the Directors feel that the Ordinary stockholders are now entitled to expect a dividend bearing a closer relation to the available revenue. They have, therefore, resolved to recommend that the dividend of 20 per cent. paid last year be now increased to 25 per cent., on account of which 7½ per cent. has already been paid. While the directors regard the results of the past year as satisfactory, stockholders must recognise that the return on our highly-g geared Ordinary stock must to some extent fluctuate in relation to revenue. Present estimates, however, lead us to expect that income will be maintained during the current year, but in these unsettled times I hesitate to hazard a guess beyond that period.

The market value of our investments at the close of the year showed an excess over book values of 60.90 per cent., compared with 36.39 per cent. a year ago. Too much importance should not, however, be attached to valuation figures at any given date, particularly at a time when inflationary influences are in evidence. By way of illustration it may be recorded that in 1931 our total gross income was £444,780 earned on investments worth £6,043,000, which compares with the record figure of £448,144 earned on £11,020,000 this last year.

Reference has already been made in the Press to the directors' intention to redeem the company's 4 per cent. Debenture stock which it is not meantime intended to replace.

SECOND BRITISH ASSETS TRUST

I would also refer to the directors' decision to dispose of the company's holding of Ordinary shares of Second British Assets Trust, Ltd. After very full consideration they came to the conclusion that no useful purpose was being served by the retention of this large investment. The offer of these shares to our Ordinary stockholders at the price quoted on the Stock Exchange on 15th January, 1947, but ex dividend in the proportion of one share for every six 5s. Ordinary Stock Units of this company, was made on 14th February last, and the offer has been largely accepted. In the interval Second British Assets Trust, Ltd., has converted these shares into stock transferable in Units of £1.

The U.S.A. tax position, to which I referred last year, has been in part clarified by the recent Tax Convention, which will relieve us from 1945 onwards of liability to double Income Tax, but our U.S.A. tax liability for the years 1942-44 is still not determined.

The report and accounts were unanimously adopted.

NORTHMET POWER COMPANY

INADEQUATE COMPENSATION PROPOSALS

LORD ASHFIELD'S SPEECH

At the annual general meeting of the Northmet Power Company, held in London, on Tuesday, the 18th instant, Mr. K. A. Scott-Moncrieff, M.I.E.E., who presided, said:—

You will be disappointed to learn that our chairman is unwell and is therefore unable to preside at this meeting. In Lord Ashfield's absence I have been requested to take the chair this morning. I will ask the secretary to read the speech Lord Ashfield has prepared.

The secretary, Mr. Evelyn Boys, read Lord Ashfield's speech, of which the following are extracts:—

It is now some seventeen years since I first had the pleasure of addressing you at these annual meetings as your chairman, and to-day may be the last formal meeting of the company, as the Electricity Bill introduced by the Government has passed its second reading and is now before a Standing Committee of the House of Commons. Under the provisions of this Bill the assets of your company and its subsidiary will, if the Bill becomes an Act, be transferred to a central authority or one of the area boards it is proposed to set up.

At our annual general meeting in 1930 I reminded you that certain parts of your undertaking were operated under electric lighting orders and under certain conditions were liable to purchase by the local authorities concerned, and pointed out that I could not prophesy whether these rights would be exercised at the appropriate time. I then went on to say: "But of this I am firmly convinced: that your company can provide a service at least as cheap and efficient as that of any authority." At that time I was referring to local authorities and to the situation as it then was. The present situation differs in that it is proposed that the company's undertaking is to be acquired by a national authority, but whether the authority is local or national I can see no reason why the statement I made to you in 1930 is not equally true to-day. Certainly nothing has happened in the interval to lead me to modify my views.

In 1919 the area of supply covered 326 square miles; it now extends to 671 square miles. The total consumers now number 350,000, as against 22,000 in 1919. The output to meet the demands of our consumers has grown from 53 million units in 1919 to roundly 1,220 million units in 1946, whilst the total capital expenditure to meet these demands has grown from something over one million to more than thirteen million pounds, and if you include the Station Company the total capital expenditure is over nineteen million pounds. Finally, let me add that we now have a staff of well over 4,000, compared with 700 in 1919. These figures cannot but show that we have, by our enterprise over the years, made within our area a consistent contribution to productivity, comfort and safety.

BENEFITS FOR CONSUMERS

We have never deviated from the sound policy to which I have referred in past years—the maintenance of the undertaking at the highest possible level of efficiency and the supply of electricity at the lowest possible cost to the consumer. Indeed, efficiency must be reflected in the cost of supply to the consumer. The average price per unit sold in 1919 was 1.463d.; to-day it is 1.108d. In other words, the price has fallen from nearly 1½d. to just over 1d. a unit, a decrease of over 24 per cent. When you consider the increase in the cost of plant and equipment and also labour and materials, especially coal, that has taken place over this period, you can readily see that a ceaseless and successful search for efficiency is always maintained.

The Government by the Bill to which I have already referred seek to co-ordinate under public ownership the electricity supply industry in Great Britain, and to that end the Bill provides for the establishment of a Central Authority and fourteen Area Boards who, generally speaking, will respectively generate and distribute electricity.

STOCKHOLDERS' LOSS OF INCOME

Under the compensation provisions in the Bill it is proposed that holders of existing securities are to receive an amount of British Electricity Stock, the principal and interest being guaranteed by the Treasury, of a value equal to the value of the existing holdings on the basis of the average of the mean of the Stock Exchange quotations during the first week of November, 1946, or if the resulting figure would be higher, on what amounts to the average of the mean mid-monthly quotations between February and July, 1945. The value of the new stock to be issued will be based on what, in the opinion of the Treasury, is the then market value of Government securities. Neither the rate of interest on the new stock nor the terms of its issue have, as yet, been fixed, but a very substantial decrease of the annual income will be suffered by all classes of the company's stockholders under these proposed terms of compensation and on certain assumptions made by the Chancellor of the Exchequer. On this question of compensation I can, of course, speak only for our own company.

I am confident that after making due and proper allowance for all adverse factors, it must on any impartial view be conceded that the financial position of the undertaking demands more equitable treatment than that afforded by the compensation provisions of the Electricity Bill.

You will see from the net revenue account that there is a balance from working of some £695,000, compared with approximately £823,000 for the previous year.

RECORD SALE OF ELECTRICITY

Whilst there has been a record sale of electricity and consequently an increase in the revenue of the company amounting to roundly £616,000, this increase has been more than offset by the increase in operating expenses.

To the balance from working should be added the interest and dividends received during the year, amounting to just over £112,000, giving a total of nearly £808,000 to meet the payment of mortgage, debenture stock and other interest, and the provisions for redemption funds and depreciation.

DIVIDEND PROPOSALS

After charging these items, we are left with a balance of some £279,000, and with the balance from 1945 there is an amount of approximately £359,000 available for appropriation. Your directors recommend the payment of the dividends, less tax, on the 6 per cent. and 4 per cent. cumulative preference stocks, which requires nearly £76,000, and a dividend of 9 per cent., less tax, on the ordinary stock, of which 3 per cent. has already been paid. The total amount required to meet these dividends is just over £234,000, leaving a balance of approximately £125,000 to be carried forward.

I am sure you will agree with me that your company has been fortunate in being served by an efficient and loyal staff.

The necessary resolutions were unanimously adopted and the meeting terminated with a vote of thanks to Mr. K. A. Scott-Moncrieff, the chairman of the meeting, and to Lord Ashfield, the chairman of the company.

EASTERN BANK, LIMITED

SATISFACTORY RESULTS

The thirty-seventh annual general meeting of the Eastern Bank, Limited, will be held, on the 26th instant, at the office of the bank, 2 and 3, Crosby Square, London, E.C.

The following is an extract from the statement by the chairman (Sir James Leigh-Wood, K.B.E., C.B., C.M.G.), circulated with the report and accounts for the year ended December 31, 1946:—

The results shown will, I hope, be considered satisfactory having regard to the many difficult problems of trade and commerce throughout the world from which the territories in which we specially operate have not been immune.

INCREASED PROFIT AND DIVIDEND

After provision for contingencies, the net profit of £110,916 is some £8,000 greater than last year and will permit us to pay a slightly increased dividend at the rate of 3½ per cent., making 6 per cent. for the year, and to carry forward £70,834. We have further strengthened the published reserve fund by appropriating £50,000 from the profits of the year, thus bringing the fund to £850,000.

We are glad to report substantial recoveries in Singapore of assets previously written off, but these have not been brought into profit as the amount required to meet British taxation has not yet been determined.

There are no striking changes in the balance-sheet as the relative figures for 1945 are much the same, with the exception of an increase of £732,003 in advances and £115,787 in acceptances for customers. In aggregate, cash, bills receivable and Government securities are virtually the same as last year.

We have entered into a contract for the sale of our remaining interest in a freehold property in Calcutta upon satisfactory terms which, upon completion, will clear the balance-sheet of that item shown as £29,925.

Since the end of the year the situation in India has deteriorated and the Stock Exchanges in Calcutta, Bombay and Madras are closed in protest against the provisions of the new Finance Bill, which would impose a further tax of 25 per cent. on business profits of individual traders and companies in excess of Rs. 1 lac, as well as a new tax on capital gains. This comes at a time when the share markets have experienced a heavy setback to adjust the speculative position built up during the past year.

DEVELOPMENT OF IRAQ

The Iraq Government has further advanced comprehensive plans for the development of the country and contracts have been entered into calling for large capital outlays to be provided by internal public loans. I am pleased to say that British contractors will be largely concerned in this programme of construction, which is justified by the financial position of the Government and will, when completed, add to the public revenues. Business in Iraq continues to run on an even keel, and cultivators and merchants are doing well.

It is difficult to give a clear report on Singapore. There is great activity, and profits are correspondingly good. Superficially there is general prosperity among merchants and traders, who are, however, confronted with very heavily increased charges for administration. Fresh firms are opening—British and Dutch—and the Chinese, who are born traders, are steadily increasing their influence. But Singapore has been infected by the general malady throughout the world and strikes under Communist influences are of constant recurrence, accompanied by lawlessness in many directions.

In common with all banking institutions at home and abroad, our charges have greatly increased, and the trend may continue until a measure of equilibrium has been reached.

THE IMPERIAL TOBACCO COMPANY (OF GREAT BRITAIN AND IRELAND), LIMITED

SATISFACTORY RESULTS

LORD DULVERTON'S REVIEW

The forty-fifth annual general meeting of The Imperial Tobacco Company (of Great Britain and Ireland), Limited, was held in Bristol on the 18th instant. Lord Dulverton presided. The following is an extract from his speech.

The form of our accounts follows the general principles of the Cohen Committee report, and this year we have for the first time issued consolidated accounts.

WORKING CAPITAL

The first and most important item in the accounts is the very substantial disparity between working capital and issued capital, resulting from the expansion of the company's trade, the enormous increase in the tobacco duty from 9s. 6d. to 35s. 6d. per lb., and the general rise in costs, particularly leaf costs.

After weighing up all the factors, your directors came to the conclusion that there were no valid grounds for anticipating any appreciable reduction in the working capital needed by the company in the foreseeable future, and that therefore the company's permanent capital should be increased. They further felt that this should be done by increasing the issued ordinary capital rather than by creating a prior charge or issuing further preference capital. Last autumn, therefore, we applied to the capital issues committee for authority to raise a substantial amount of new capital by an issue of ordinary shares in such a way as to bring our rate of dividend into appreciably closer relation to the rate of earnings on capital employed in the business. Our proposal was designed to meet our pressing need for increased issued capital, without any element of capital bonus. Up to now the capital issues authorities have not seen their way to approve our application, but we have not given up hope. As soon as it is practicable to put your company's capital structure on a more satisfactory basis we shall advise you of our proposals. Meanwhile we propose, as a precautionary measure, that the directors' borrowing powers be increased.

TRADING PROFIT

Our trading profit for the year marked a recovery to the 1944 level and showed a substantial improvement over 1945, but, compared with 1944, the 1946 result represents a slightly lower rate of profit on an increased turnover. Our net earnings, after providing for taxation, do not on the average exceed ½d. for ten cigarettes and ½d. per ounce of Pipe tobacco.

FUTURE DIVIDENDS ON ORDINARY STOCK TO BE SUBJECT TO TAX

The directors propose that in future dividends on the ordinary stock should be declared subject to tax, so that the rate of dividend will not be affected by changes in the income tax rate.

FACTORIES AND PLANT

Partly to cope with the present expansion of our business and partly to replace factory space no longer suitable for modern manufacturing processes, we aim to build three new factories within the next two or three years. Two will be for our W.D. & H.O. Wills branch—at Newcastle-on-Tyne and at Glasgow. The third will be for our John Player & Sons branch at Larkhall, near Glasgow. Each factory will be laid out according to best modern standards.

As to plant, we are renewing and modernising as fast as we can. We also

have in hand considerable research on improvements in factory processes, layout, etc., in addition to fundamental research into the character and properties of the raw materials we handle.

By these means we hope to keep your company's factories and processes in the forefront of modern development, and to make an effective contribution towards the national need for greater production per man-hour.

GIFT TO STAFF AND WORKPEOPLE

I am sure that once again stockholders will welcome the board's decision to make a gift to the staff and workpeople of 16 per cent. their normal salary or wage.

PERSONNEL

Human relations vitally affect the spirit that animates a business; and it can, I think, be fairly claimed that from the earliest days of the company your directors have never lost sight of this simple fact.

If this country is to win the hard battle of production that lies ahead, it will only do so by the maximum effort of all engaged in industry, whatever their function, and by the maximum co-operation between management and labour. We are doing all we can to promote that co-operation within the company.

THE FUEL SITUATION

During the fuel crisis, by the use of our oil-fired stand-by plant, we maintained full production at each of our main factories and full supplies to our customers, a result of which we can be justifiably proud, and one which reflects great credit on all concerned.

FUTURE PROSPECTS

The prospects of the company's business depend on our ability to purchase adequate supplies of leaf tobacco. Our two main sources of supply are the U.S.A. and the Empire. Our company were pioneers in the development and use of Empire tobacco, and our policy is to buy all the Empire tobacco we can. But the rate of expansion in Empire tobacco production is necessarily limited, and for some considerable time ahead the greater part of the country's needs of tobacco can only be met by purchases from America.

There has been some serious misunderstanding of the figures of dollar purchases devoted to tobacco. The United Kingdom yearly purchases of American tobacco do not account for more than 12½ per cent. of the country's current annual dollar purchases, and this figure includes requirements for manufactured exports, so that the proportion to cover domestic needs is even less.

Tobacco is an important consideration in the relations between this country and the U.S.A., forming, as it does, a considerable part of U.S. agriculture.

The U.K. Government's revenue from tobacco duty is £400-450 million a year, or the equivalent of about 3s. 6d. in the £ in income tax. Tobacco is a comfort and a solace, and it has a beneficial effect on morale.

I have tried to put aside any natural bias in favour of the tobacco industry and to look at the question from the standpoint of national interest. It seems to me that the country stands to gain rather than to lose by a maintenance of reasonably adequate supplies of tobacco, and I can only hope that means may be found of ensuring this.

The report and accounts were adopted.

LEWIS'S LIMITED

INCREASED TURNOVER

The thirty-eighth annual ordinary general meeting of Lewis's, Limited, was held on the 18th instant at the company's store, Renshaw Street, Liverpool.

The Rt. Hon. Lord Woolton, P.C., C.H., D.L., LL.D. (chairman and senior managing director), in the course of his speech, said:

You will find the accounts informative and clearly set out. They are again accompanied by a consolidated balance-sheet and income statement of the parent company and its three subsidiaries—Bon Marché (Liverpool), Limited, Lewis's (Midland), Limited, and S. Reece and Sons, Limited. Owing to the entirely different nature of its business it was neither possible nor advisable to consolidate the results of Lewis's Bank with those of the other companies. In the profit and loss account the different sources of the company's revenue have, for the first time, been shown separately, and you will note that before debenture interest, depreciation and taxation, the aggregate profit of £1,822,179 shows an increase of £279,694 over the previous year.

SUBSTANTIALLY BIGGER TURNOVER

Of the total increase, £236,086 is accounted for by increased trading profits, and £39,554 by increased dividends from subsidiary companies. This result reflects the substantial increase in turnover largely brought about by the improved flow of consumer goods. This increase more than counterbalanced (a) a fall in the percentage rate of gross profit resulting from the reduction in permitted margins which operated throughout most of the year, and (b) a steep rise in the expenses of operation. The latter was mainly due to higher wage costs, but we were also able, during the year, to restore some of the services that have perforce been in abeyance during the war and which help to make the lot of the harassed housewife a little less burdensome.

From this total we have to deduct no less than £1,245,793 for debenture interest, depreciation and taxation. Our taxation provision is higher than last year because this year we have assessed our Schedule D income tax provision on the basis of the current year's profits, which are larger than last year. This leaves us with a net profit of £576,386, which is £102,985 higher than last year.

SURPLUSES EXCEED £2,400,000

You will see from the appropriations made by the directors that we have continued our established practice of making ample provision for reserves, and the consolidated balance-sheet now discloses that our surpluses under various headings are £2,418,993. With regard to dividends, you will see that we have shown them net—that is, after the deduction of tax—and I need not tell you that this makes a significant difference to the amount of the net profit we declare on the other side of the account. Finally, after all these appropriations have been made, our carry-forward to next year's accounts of £78,053 is slightly higher than last year.

If you will turn to the balance-sheet of the parent company, you will notice that our total current liabilities of £2,435,687 are some £325,000 higher than last year, but you will see that as compared with the current assets on the other side of the balance-sheet which now total £3,194,378, the liquid position has considerably im-

proved. The excess of current assets over liabilities is now £758,691, as compared with £365,207 last year.

TOTAL REVENUE OVER £2,000,000

Turning now to the consolidated income statement, there is little on which to comment, except to express satisfaction that in Lewis's group alone, and leaving out of account the associated companies that are subsidiaries of Lewis's Investment Trust, our total revenue amounts for the first time to over £2,000,000.

The consolidated balance-sheet calls for little comment except to point out that the surplus for the group is now more than two-thirds of the paid-up capital. As compared with this figure, the intangible assets total no more than £26,076, and this sum entirely consists of premiums paid on shares acquired in subsidiary companies. It gives me considerable satisfaction to tell you that we have now eliminated the goodwill item from every company in the Lewis's group. I hope these few explanations about the accounts will have satisfied you about the great financial strength that the group has built up since it became a public company in 1924. What now of the future?

We start our new financial year under the shadow of crisis. The effects on the nation and on the supplies of consumer goods no one can at present measure, but they cannot fail to be far-reaching. At least three full weeks of production have been lost, and it must be many more weeks still before the rhythm of production can be properly restored. However, during the last seven years our team of buyers has had many testing emergencies to face, and we are indebted to them for the way that they have kept our stores supplied with goods to sell. I have no doubt that, coupled with the very close and friendly relations we have long established with our suppliers, the same spirit of enterprise and determination will see us through the next year.

But of all the possible consequences of this crisis the one that I fear most is that it will provide a pretext for clamping still more restrictions and controls on the commercial life of the nation. The myriads of detailed controls with which we are already oppressed are slowly suffocating the life out of the commercial community, while our administrative machine becomes increasingly expensive as it is obliged to employ people to see that every control is rigidly observed.

VALUE OF COMPETITION

The steady increase that took place in our stocks throughout the past financial year was some evidence that production was getting into its swing again, and but for the interruption that has now occurred the position would soon have been reached when, in some directions at least, controls might have been removed. It is earnestly to be hoped that in the interests of our customers the time may not be far distant when, as a nation, we recover our lost faith in the virtues and safeguards of competition. Let it not be forgotten that in peace-time it was the big retail distributors who played the principal part in raising the level of real wages.

As a result of keen competition between themselves and of exciting competition between suppliers, it was they who helped to reduce prices and to keep them low. From the point of view of our own business, we have installed a most intricate organisation to ensure that all the many millions of different articles we sell are all properly priced in accordance with their appropriate Order. That organisation requires a skilled, but wholly unproductive, staff to operate it, at a time when the man-power situation of the country demands that such labour shall be reduced to a minimum.

The report and accounts were unanimously adopted.

THE STANDARD LIFE ASSURANCE COMPANY

TRIENNIAL INVESTIGATION

VALUATION BASIS STRENGTHENED: DECLARATION OF BONUS

The one hundred and twenty-first annual general meeting of The Standard Life Assurance Company was held, in Edinburgh, on the 18th March, with Mr. J. H. Richardson in the chair.

The chairman, in the course of his speech, said: Gentlemen, I must refer in the first place to the resignation from the board of the Right Hon. the Earl of Balfour, which was rendered necessary by his acceptance of an important post under the National Coal Board. Lord Balfour served as a director only for a short period, but during that time we fully realised how valuable a colleague he would be. It is a source of great regret to all of us that his help is no longer available.

During the year under review many of our staff have returned from the services and taken up their duties at Head Office and Branches. I cannot let this occasion pass without saying how grateful we are to all the members of the staff for the energetic and enthusiastic way they have carried out their duties.

Turning to the accounts for the year ended November 15, 1946, I feel confident that you will agree with me when I say that they make a very good showing. Our new life assurance business for the year at the figure of £8,696,333 shows, naturally perhaps, a very large increase over that for the previous year; our new pension business was also highly successful, for we undertook new pension contracts involving prospective pensions of £2,451,952 p.a. I should particularly like to comment on the remarkable expansion of our business in Canada in the field of pension schemes, where our form of contract appears to be greatly appreciated.

PREMIUM INCOME INCREASED

It is satisfactory that the premium income of the life assurance and annuity fund this year is £4,414,000, whereas last year it amounted to £3,394,000. As regards the expense ratio, you will note that it has risen to 11.1 per cent., compared with a figure of 10.0 per cent. last year. It was, of course, inevitable that the ratio would show an increase, mainly as a result of the initial expenses of the much larger new business we have just transacted. I may remark, however, that we had fully expected the ratio to rise even more than it has done, and the fact that it stands at the comparatively low figure of 11.1 per cent. is due to the rapid growth of our premium income. Actually this is the lowest expense ratio in the long history of the company with the exception of the recent war years.

The net rate of interest at £3-18s. 1d. per cent. shows a decrease of 8d. per cent. from the rate of the previous year. We may still feel content that our net rate of interest has been so well maintained.

I cannot let this occasion pass without saying how grateful we are to all the members of the staff for the energetic and enthusiastic way they have carried out their duties.

PROGRESS IN LAST TWENTY YEARS

Since the year which has ended is the first full peace-time year for eight years—I will not call it a normal year—it is perhaps appropriate that I should for a moment glance backwards. I am able to say, after a full examination of all the relevant figures, that the Company has emerged from the difficult wartime period with its strength unimpaired. Twenty years ago the published assets of the company amounted to just over £17,000,000; to-day they amount to over £48,000,000. Twenty years ago the premium income of the life assurance and annuity

fund was £1,090,000; to-day it is £4,414,000. It would be a mistake, however, to assume that the company's influence in the community has increased in direct proportion to the figures I have given. There can be little doubt that the National Income, expressed as it is in terms of currency, has at least doubled during the last twenty years and consequently a certain amount of the increase in our funds and premium income merely represents an increase proportionate to the larger financial resources of the country as a whole. The efforts which our institution and others in the insurance industry are making to stimulate saving by the public through the medium of insurance must be of great value to the country at the present time.

OVERSEAS ACTIVITIES

I should like to say a further word in regard to our activities overseas. As I have mentioned already, our business in the Dominion of Canada has, during the past year, shown a very satisfactory expansion and the same may be said of other fields abroad. For many years the name of British Insurance has been well and creditably known throughout the world and, in spite of the trials through which offices have passed, I am convinced that their reputation stands as high to-day as it has ever done. We have received official assurance that no steps will be taken to deprive us of the right of managing our own affairs, a decision which was no doubt based upon a realistic appreciation of the facts. Insurance business of all descriptions secures for this country a valuable invisible export which it is unthinkable that any government could afford to sacrifice.

BONUS DECLARATION: VALUATION STRENGTHENED

A bonus was declared as at November 15, 1943, in respect of the five-year period ending then and your directors have now decided that, in the meantime at least, the company should revert to a system of triennial investigations. Accordingly on this occasion the manager and actuary has carried out a full actuarial investigation and I am pleased to be able to report that the results have been excellent and have enabled us to make a declaration of bonus, maintaining the rate which was declared three years ago. This rate of reversionary bonus, as you will see from the report, is 30s. per cent. compounded triennially with an intermediate bonus in respect of claims by death or maturity at a similar rate and corresponding bonuses for other classes.

In addition to the achievement of declaring this rate of bonus, we have been able to strengthen our valuation basis and I may be permitted to say again, as my predecessors have been able to say in the past, that so far as I am aware our basis is one of unexcelled strength. We have maintained our stringent basis of 2½ per cent. interest for the valuation of our annuities, but for assurances we have passed from the assumption of 2½ per cent. interest to 2 per cent. interest. We have also made a special reserve in respect of expenses of management and in addition we have set aside other special reserves which should enable us to face the future with confidence and enable our members to feel that their benefits have that degree of security which is so greatly to be desired in these unsettled times.

I now move the formal adoption of the report, revenue accounts and balance sheet submitted.

Mr. W. F. M. Whitelaw W.S., seconded this motion which was carried unanimously.

GOVERNMENT RETURNS

For the week ended Mar. 15, 1947, total ordinary revenue was £70,615,000 against ordinary expenditure of £106,515,000, and issues to sinking funds £316,000. Thus, including sinking fund allocations of £16,903,197, the deficit accrued since April 1st is £433,661,520 against £2,031,943,000 for the corresponding period a year ago.

UNIVERSITY OF CAMBRIDGE

ASSISTANT IN STATISTICAL RESEARCH IN ECONOMICS

The Faculty Board of Economics and Politics in the University of Cambridge will shortly proceed to the appointment of an Assistant in Statistical Research. The appointment will be open equally to men and women. The initial appointment will be for a period of one year, which may be extended for two further periods of two years. The duties of the person appointed will be to assist the Lecturer in Statistics and other members of the teaching staff of the Faculty with their statistical work, and he may also be asked to give temporary assistance with the teaching of practical classes in statistics. He will be expected to be available during a reasonable part of each vacation as well as during University Terms. Applicants should possess either an honours degree of a university in economics with some training in statistics or appropriate statistical experience in a government office or other organisation. The salary will be between £350 and £450 per annum according to experience.—Applications, including references or copies of testimonials, should reach the Secretary of the Faculty of Economics and Politics, The Marshall Library, Downing Street, Cambridge by April 19th.

LONDON SCHOOL OF ECONOMICS AND POLITICAL SCIENCE

(UNIVERSITY OF LONDON)

The London School of Economics proposes to appoint to Lectureships and Assistant Lectureships in Economics from October 1, 1947. Salary scales £500-£850 p.a. and £400-£500 p.a. respectively, with superannuation benefits and family allowances. Candidates are invited to give in their applications the names of three referees and an indication of any special interests in the field of economics.—Applications should be received not later than May 1st by the Secretary, London School of Economics, Houghton Street, W.C.2, from whom further information may be obtained.

EXPERT shorthand-typist available evenings.—Box 443.

Printed in Great Britain by ST. CLEMENTS PRESS, LTD., Portugal St., Kingsway, London, W.C.2. Published weekly by THE ECONOMIST NEWSPAPER, LTD., at Brettenham House, Lancaster Place, Strand, London, W.C.2. U.S. Representative: R. S. Farley, 111 Broadway, New York, 6.—Saturday, March 22, 1947.

A German Constitution

IT is a pity that when Mr Molotov and Mr Bevin do see eye to eye the fact should pass almost unnoticed—especially when the Russian uses a very sound and British argument to justify part of his policy towards Germany. What the world has chiefly been told about last week-end's exchange of papers on the political future of Germany was that there was a quarrel between the Russians and the Anglo-Saxons on whether or not the future Germany should be a "federal" state. What was largely ignored was the fact that the actual proposals of all three Foreign Ministers were much more similar to each other than might have been feared. Mr Molotov, raising his voice and pointing his words for the German people to hear, warned his fellow Foreign Ministers against any attempts to postpone or frustrate German unity by "federalisation":

If we consider not only the tactical advantages for the immediate future, but look ahead, the policy of federalising Germany is not justified by the interests of the democratic countries.

In other words, it would certainly in the short run weaken Germany to "federalise" it; but in the long run its will to reassert its unity would be stronger than the determination of the Allies to resist it. The idea of a united Germany would become the "possession of the German militarists." And if unity was wrested from the Allies by the pressure and propaganda of militarist parties, they would thereby win among Germans sufficient prestige and confidence to embark on new adventures in foreign policy. It is a safe bet that the first objective would be to regain the eastern territories lost to Poland.

This is certainly a sound argument, and if the British proposals were, in fact, running the risks that Mr Molotov suggests, they would be indefensible. But Mr Molotov was really only playing to the gallery. What he means by "federalist" has to be explained. In the first place it is used, like "Fascist," as a term of abuse. Then it is meant to cover those "circles" whom the Russians allege to be plotting a dismemberment of Germany which would give the wealth and power of the Ruhr permanently to the West. Further, it is meant to suggest to the Germans that if Moscow fails and the present partition of Germany accordingly continues, the fault will not be Mr Molotov's. He proclaims himself against "federalists," even though his own proposals before the Conference provide for "ensuring the constitutional rights of the Lands comprising the German State." The margin between Mr Molotov's proposals and Mr Bevin's is, in fact, small—though it includes at least one point of real importance. Both want to have a Central Government controlling such subjects as finance, industry, foreign trade, transport and communications. Both want to have subsidiary Governments in the ten or a dozen *Länder* of which the new Germany is to be composed. But whereas Mr Bevin specifically proposes that all powers not specifically allocated to the Central Government shall be assigned to the *Länder*, Mr Molotov reverses the process and specifically provides that police and education shall come under the centre. The significance of these two items is obviously great. It is

undesirable, to say the least, that a powerful Ministry of the Interior and national police system should be built up in Berlin; what would happen to it, and in it can be guessed from the experience of Eastern Europe. It is likewise undesirable, for religious as well as political reasons, that educational policy should be dominated from Berlin. Mr Bevin had these and other points in mind when he declared that "we do not want to see a Germany re-created in which one party or authority attracts to itself all power in the same way as that which led to the recent war." It was this, presumably, that laid him open to the charge of being a "federalist." It is one thing, in Soviet eyes, to be against the domination of Germany by the Nazi Party, but quite a different thing to be against all one-party systems.

The differences between East and West over the future political shape of Germany are thus by no means negligible. But they should not obscure the encouraging fact that there is also a fair amount of agreement among the Russians, the Americans and the British—though the French are often in solitary dissent. Specifically, four points of agreement—at least in principle—seem to emerge. First, there should be a Central German Administration set up in Berlin in the immediate future. This is presumably still subject to agreement on economic policy and on reparations, since without economic unity the central administration would have little to do. Secondly, the new German Government should assist the Control Commission in drawing up a new constitution for Germany—though it is also made clear that the occupying Powers have strong views of their own on what that constitution should contain. Thirdly, it is agreed that, whether or not it is "federalist," the new constitution will provide for a number of powers being confided to the *Länder* and that Prussia shall be split up among a number of these. Fourthly, it is agreed that the new constitution shall be submitted for approval to an eventual all-German Parliament.

*

It is natural to feel considerable relief that agreement has gone as far as this. But relief should not entirely remove the necessity to stop and inquire whether the principles that are agreed upon are good ones. The short-term risks of what is proposed are obvious enough; they are the reason for French opposition. For instance, it is just as much a British as a French interest to inquire what is likely to be the political result of giving the Germans a powerful Central Government in Berlin. Some say that it will inevitably be dominated by Communists; because they are ruthless and efficient, because the thrust of Soviet policy is behind them, because they have a clear-cut authoritarian doctrine such as Germans like; that Soviet-Communist influence will penetrate to the Rhine and the Ruhr; and that German nationalism and Communism will find a common platform. All these things might happen, especially if Western Germany remained hungry, poor and idle. But there are powerful factors working against the Communists: the patriotic resentment against the eastern frontier, kept burning by Schumacher and the Social Democrats; the strong conservative religious forces arrayed behind the Christian Democrats, who will probably win the forthcoming elections in the *Länder* of the British Zone; the presence in Berlin of all four occupying Powers; the bargaining power of Ruhr coal, the North Sea ports and American dollars. The Communists evidently think they will gain by the creation of a Central German Government, even in Berlin, but it is by no means certain that they are right. Another immediate risk to be weighed is that a German Government would immediately become a centre of resistance to Allied demands, that it would sabotage reparations deliveries, evade disarmament orders, play off one occupying Power against another, and finally refuse to

sign a peace treaty. The answer is that this is much more likely to happen five or ten years hence than in the immediate future. The intact Conservative bureaucracy, the General Staff, the organised political power of the industrialists, which achieved such things in the 'twenties, no longer exist; neither Social Democrats nor Communists could at present revive them. And so long as the bulk of Germany's food has to be bought with dollars the capacity for defiance is limited.

The short-term risks of the agreed policy—it might be better to call it the almost-agreed policy—should, therefore, be taken. But there are the longer-term effects to consider. Supposing we look forward, not five years but twenty-five, will the arrangements now being made still look good then? The answer will vary with different opinions of what would constitute a good result. To the French, the decisions of 1947 will be good if by 1972 they still keep Germany divided, dominated and weak. To the Russians, they will be good if they pave the way to a Germany united in its devotion to Communism and to alliance with Russia. What should the Americans and the British regard as a good result? In spite of the Morgenthauianic nonsense that was talked in such volume, in both countries, during the war, the great majority of opinion in both countries now regards the eventual re-emergence of a self-governing Germany, reasonably prosperous and strong in all meanings of the word save only the military, as desirable. Or if it is not regarded as desirable, it is certainly regarded as inevitable. Peacemaking should therefore look forward to the re-emergence of Germany. The Allies should not impose on Germany anything that they will not be ready to uphold; and what they do put in the treaty they must be ready to insist upon.

The second risk is becoming the greater, for it is already apparent that the peace settlement will present so many weak spots in the Allied front where it will be possible for the diplomacy of a revived Germany, without needing to be very clever, to insert an effective lever. Why add to the grievances, why add to the difficulty of upholding the settlement by imposing a constitution on the Germans? It is quite certain that the Germans will some day be in the position to devise their own system of government, and equally certain that anything that has been imposed by foreigners will be anathema to them. Why should the Allies give one more defenceless hostage to the future? If the new-German republic is to last, its constitution must be made by Germans and if, by waiting a year or two, this result can be achieved, the delay would be well worth while. The Allies have a right and a duty to insist on certain minimum guarantees. But it must be a very short list if it is to have a chance of survival. Two items must be on it: the new German republic must neither possess nor manufacture weapons of war; and it must guarantee to its citizens the essential rights of human liberty, enforceable if need be by appeal to an external tribunal. These two will be difficult enough to maintain, and the difficulty will increase in geometric progression with every addition that is made to the list. The path of wisdom for the Allies is to cut their list of essential restrictions on ultimate German liberty down to the very essentials and to leave all other questions for the Germans themselves to decide when they once more become able to do so.

This argument therefore reaches much the same conclusion as that being held by M. Bidault in Moscow—that there should be no hurry to decide and that all but the bare essentials should be left to the future. But it reaches the same conclusion as the French for exactly the opposite reason. The French are afraid of their allies giving the Germans too much self-government. The object of the British and the Americans should be to ensure that the return of the Germans to self-government, when it comes—as it surely will—does not find in its way obstacles which can only be removed at the cost of another war.

Planners and Politicians

THE Government have appointed their Chief Planner, and all those who realise the magnitude of the country's economic problem will wish Sir Edwin Plowden well. There has been a considerable delay between the creation of the post and its filling, and it would be understandable if there had been some reluctance to occupy a position which Ministers' tactics have made a very invidious one. The absence from Ministers' speeches in the economic debate a fortnight ago of anything else that was in the least new made it appear that the appointment of the Chief Planner was the Government's answer to the economic crisis. Anybody who now accepts the post will have to fight against the public conception that he is a miracle man, endowed with full powers to do what he wants. The statement in which the appointment was announced on Thursday wisely went some way towards correcting that view. It is clear that Ministers remain responsible for the economic policy of the country. Sir Edwin Plowden's task is to act as a co-ordinator on what is known as "the official level"; he is not, in substance, in any different position from the existing official advisers of the Government, whose advice may or may not be accepted.

It is difficult for outside observers to be sure what new development, if any, is to be read into the appointment of a Chief Planner. Clearly his task will have to be accomplished within the framework of Government policy—which at once limits its scope quite considerably. Presumably Sir Edwin will be free to tender advice to the Government on such things as the need for a wage policy or the desirability of extending schemes for payment by results, or the need for longer rather than shorter hours of work, or the disastrous consequences of suppressed inflation. But the Government have not been short of the most authoritative advice on these and similar subjects; what they have lacked—and what the appointment of a Chief Planner does nothing to remedy—is the political ability to act on the advice. The reason why these things are not done, as everybody knows, is not that they are not necessary but because the trade unions will not have them.

Planning, in the meaning attached to it by the Labour Government, is a far humbler process than it is in Soviet Russia. Here, "planning" appears to mean doing whatever can be done without a change of policy. Whereas in Russia the chief object of a plan is to increase production, in this country the planners are compelled, in effect, to take the volume of production for granted and to devote most of their time to the problems of allocating scarce supplies. On this plane there is, indeed, a great deal of most useful work to be done. There was sufficient

evidence in the pre-history of the coal crisis of a serious lack of co-ordination between the departments to justify the appointment of a co-ordinator. Hitherto, there has really been no impartial body to decide such inter-departmental squabbles. In the Cabinet, Ministers fight for their department's views and the Permanent Secretaries do much the same in the Steering Committee; Sir Edwin Plowden and his staff will at least provide an impartial court of first instance, even though their judgments will still be liable to be upset on appeal. It would be interesting to know how many of the constituents of economic policy will come under their review. Will the Treasury, for example, concede anything of its monopoly of decision on financial matters? To do so would be a revolution in British methods of government. Yet to allow the Chief Planner no functions in relation to the allocation of dollars, which will soon be the supreme bottleneck, is to deny the first premise of the new appointment. It would also be interesting to know whether the Ministry of Labour, which defended its prerogatives against all comers during the war, has surrendered any of its responsibility for the distribution of manpower.

But it is not by the most skilful and comprehensive rationing policy (for that is what "planning" seems to come down to) that the economic crisis will be solved. On the whole, there are not many complaints about the way in which the Government are allocating the available resources of the nation. The real complaint is that the Government seem to be so powerless to increase the available resources. It is not the spending of the national income that is badly wrong but the size of the income. And that is the province not of economic planning but of economic policy.

The distinction between planning and policy is vital, but is very little understood. For example, it has often been argued in *The Economist* in recent weeks that the most crying need of the country is for a general policy that would change the whole climate of economic activity in the country. But this has been interpreted by some people as support for the concept of a "general plan," and when the Prime Minister dropped a remark the other day about a five-year plan, he was understood in some circles to mean that the Government were proposing to draw up a document laying down in precise numerical detail exactly where the country will stand in 1952.

But it ought to be obvious to everybody that nobody can possibly draw up a plan for 1952. There are far too many unknowns. To what extent will the world market then be a

sellers' market or a buyers' market? Will the terms of trade have shifted in favour of Britain, making it easier for us to pay for our imports? How much? Will output per manshift in the mines be higher than today? How much? Will there be more miners? How many? Will the psychology of the markets be tending towards inflation or towards deflation? Will there be a slump in America? How far will European production of food and raw material have recovered? All these matters vitally affect the British economy and no one can do more than guess at the answers. Any quantitative plan would have to allow such a wide margin between its alternative optimistic and pessimistic assumptions that it would be almost useless as a guide to action. A sound economic policy, on the other hand, would attempt to mobilize all the influence of the

state on the side of realising the optimistic assumption. It would assess the tendencies of the next five years and consider what could be done to encourage those that are favourable and hold back those that are likely to do harm. A plan for 1947, as the recent White Paper so clearly revealed, contents itself with analysing what will happen if people do not work harder. A policy would concern itself with how they can be made to work harder. Those who have recently been advocating dis-inflation have at least been proposing a real policy. If the Government cannot accept this particular proposal they should put forward an alternative. It is no answer to appoint Sir Edwin Plowden to the uncomfortable task of planning more efficiently the restrictions that will be necessary in the absence of a policy.

Prelude to Geneva

MONDAY'S debate in the House of Commons on import and export trade provided a useful reflection of opinion on the eve of the tariff and preference negotiations that are to open in Geneva immediately after Easter. British opinion on the subject of commercial policy has clearly not yet escaped from the dilemma in which it has been caught for several years past. On the one hand, there is the undeniable fact that the British Government are fully committed to giving their general support in principle to the American endeavour to codify the rules of the multilateral game. The pledge was given in a clause of the Atlantic Charter, in the famous Article Seven of the Lend-Lease Agreement and in the Financial Agreement. By these reiterated pledges Britain is committed to work for an international system based on the greatest degree of multilateral trade, non-discrimination and full convertibility of currencies. Nor would it be right to say that the Government are redeeming their pledges against their better judgment. There is in the Government and among their official advisers a great deal of faith that the American policy is, in fact, the best one for Britain to pursue. If all goes well, if a relatively free-trading, non-discriminating world can be created, if exchange controls are abolished and tariff barriers are reduced, if all the important nations maintain high and reasonably stable levels of demand, and balance their international accounts—if all this has any chance of happening, it would be so immensely to Britain's advantage that it is well worth while taking some risks to bring it about.

But there is the other horn of the dilemma. Suppose the attempt were to fail—then it would not simply be a case of a gallant attempt made and failed, with everything going back to the *status quo ante*, for the conditions insisted upon by the American Government require Great Britain to abandon the control that exchange restrictions provide over its crucial balance-of-payments problem, to forsake the assured markets of imperial preference and—most important of all—to forswear almost all the bargaining advantages that the world's largest buyer might, in normal times, be expected to possess. If the attempt to create the perfect multilateral world requires the paying of this price, then failure of the attempt would leave Britain far worse off than before it was made. The world also would be worse off; for though a multilateral, non-discriminating system that works well is no doubt the best that can be imagined, one that did not work well would be the worst. Such a system maximises both the good and the bad. It is admirably designed both to spread the advantages of any country's domestic prosperity across the world and also to carry the germs of instability to the furthest corners of the trading community which it serves. Not only Britain, but every trading nation, is being asked by the Americans, in return for the promise of a greater supply of dollars, to abandon

the right to try to protect itself against unemployment coming from abroad. All half-way houses—such as groups of countries joining together to protect their mutual trade against the effects of external slumps—are equally banned by the American doctrine, which does not enquire whether or not such arrangements are designed to make the volume of world trade larger than it would otherwise be, but simply condemns them as discriminatory. The nations of the world are being invited to put all their stakes on the one card. No wonder they are hesitating, the world's greatest trader among them.

Not that there is any hesitation visible in the British Government. In this week's debate Sir Stafford Cripps based his case for choosing the multilateral system on the usual and now familiar grounds. On the highest political plane there is the insanity of a policy that would antagonise the United States and obstruct the economic co-operation of the two countries. On the plane of more general self-interest is the argument that Britain, the world trader *par excellence*, must be the first to benefit from a reasonably stable system of multilateral and non-discriminatory trade. Of more immediate compelling interest is the need in which Britain stands to expand her exports for some 75 per cent above the pre-war volume if the pre-war level of consumption is to be regained and the financial obligations arising from the war are to be met. Sir Stafford Cripps argued, and with much force, that this target could only be reached within the context of a much expanded volume of world trade and that the best method of achieving this expansion would be by a general attack on tariffs and restrictive arrangements such as is contemplated in the proposed charter of the International Trade Organisation.

It is impossible to quarrel with this decision. No other course is honourable; if the attempt to create a multilateral system breaks down it must be by the default of other nations, not of one so pledged to it as Britain. Moreover, it is not yet time to abandon hope of the United States fulfilling its side of the bargain, in spite of the ominous mien of the new Republican Congress. And the sceptics can comfort themselves with the further argument that, of all times to set about the creation of a stable-trading group on the basis of the sterling area, the present must be by far the worst imaginable. What is in normal times the bargaining strength of the British market is at present—as General Peron is so busily demonstrating—the bargaining weakness of Britain's needs.

The British delegates will, therefore, be going to Geneva hoping for the best. But that is not to say that they will not have their specific objectives before them. Their first task, since the Geneva sessions have been advertised to be a "horse trading" match, is to drive as good a bargain as they can. Much unnecessary suspicion has been engendered by the refer-

ences to "reductions in tariffs and the elimination of preferences" in the various documents to which Britain is committed. The elimination of preferences can be regarded as a long term objective, but as Sir Stafford Cripps pointed out in this week's debate, Britain is under no one-sided obligation to eliminate or even to reduce Imperial Preferences in the coming negotiations.

"Our obligation is to consider reductions of preferences in return for reductions of tariffs within the scope of our negotiations. We, together with the Commonwealth countries, remain the judges as to whether the counter concessions offered to us are sufficient to induce us to modify preference margins in return."

The various delegations of the British Commonwealth have been holding preliminary discussions in London this week on this question, before going on to Geneva. Their attitudes are not identical, but it need not be assumed that there is any deep cleavage between them. The Australians are perhaps the most devoted to the principle of imperial preference. But if they could be assured of a market for their wool in the United States they might be prepared to go some way in reducing or even eliminating some of the margins of preference which now assist the marketing of their produce in other British countries and which discriminate against the entry of American goods in the Australian market. On the other hand, Canada, which on principle comes closest to supporting the Australian case, has a considerable vested interest in certain preferential margins, among them those which underlie the activities of some of the important subsidiaries of American enterprises established in Canada specifically to take advantage of Imperial preferences. The approach of the Empire delegates to the tariff talks is, therefore, likely to prove essentially realistic and practical. Nor does it seem likely, in spite of the fears expressed in the House of Commons debate this week, that certain colonial preferences will have to be sacrificed altogether, to the utter ruin of whole areas which, like the West Indian sugar islands, depend entirely on the protection of these arrangements. Britain's bargaining power in resisting demands for the abolition of such preferences will be strengthened by the fact that the United States is itself operating arrangements of the kind and has recently expanded them in its agreement with the Philippines. There is no reason to be unduly apprehensive about this particular phase of the bargaining. There is already reason to believe that the specific indication given by the British Government to the Americans of what would constitute a reduction in the American tariff substantial enough to justify a dismantling of imperial preference have caused quite as much dismay in Washington as the American demands have in London.

The second phase of the Conference—possibly deferred to another session later in the year—will be to pass from hard bargaining to a consideration of the general rules of the game and to the drafting of a Charter for the ITO. And this is where the second task of the British delegation arises. If we are to play the multilateral, non-discriminating game, let us at least be sure that the cards are not stacked. As the draft Charter emerged from the Conference in London last autumn, there are several aspects of it that might almost be specially designed to prejudice the British position. There are the most detailed provisions for preventing any discrimination when it is goods that are being traded and where Britain, the great buyer of goods, might be expected to benefit from discrimination. But when it comes to services, where Britain is a seller and America a buyer, there are no such provisions against discrimination. It is difficult to understand why British negotiators have so tamely submitted to the complete exclusion of any mention of shipping, where the application of the non-discrimination principle would be of the greatest benefit to this country. Insurance is another

British service export which, it might have been thought, the Board of Trade would have been anxious to bring within the protection of a code of good behaviour (though it is only fair to add that no accusation under this head can be brought against the United States). It is not too late to remedy these omissions. Nor is it too late to ask the Americans to abandon their practice of making "tied loans"—loans that have to be spent exclusively on American goods—which is just as discriminatory in its effects as any bilateral trading agreement.

But perhaps the major amendment of the draft Charter that the British delegates should seek is something in the nature of an escape clause for countries in Britain's present difficult position. Nearly every other country has secured itself an escape clause. In London last autumn, war-devastated countries and undeveloped countries forced the concession of far-reaching exemptions. Almost the only country in the world that is neither war devastated nor undeveloped nor possessed of a hard currency is the United Kingdom. Since the meeting in London President Truman has agreed to the insistence of the Republicans that there should also be an American escape clause, by which any tariff reduction can be cancelled if it does harm to any American producer. If this means what it appears to say, it makes the whole process of tariff reduction meaningless.

Britain thus has every right to insist on an escape clause of its own, and there can be very little doubt what its nature should be. So long as the balance-of-payments crisis lasts, there must be some exemption from the full rigour of the principle of non-discrimination. It is only slowly percolating into the public mind what the long word means. It means that if we cannot buy any article from America we must promise not to buy it from anyone else. It will not be long before the non-discrimination clause in the Financial Agreement begins to operate in a decidedly restrictionist manner. Already there have been instances of imports from sterling area countries—Australian books and publications are an example—being cut because there are no dollars to spare for similar imports from the United States. Tomorrow it may be tobacco—a strict interpretation of the principle would mean that, if imports of tobacco from the United States are reduced, so far from there being any possibility of the gap being filled from Rhodesia, imports of Rhodesian tobacco would have to be cut in the same proportion. The day after tomorrow it may be foodstuffs that have to be treated in the same way. We have recently seen Sweden curtailing all imports as a result of a dollar shortage and this week the State Department in Washington has protested against this defensive move. It is high time that Department was made more aware of the facts of economic life in Europe.

The Geneva discussions will provide an admirable opportunity for this educational work. It is fortunate that the "non-discriminatory" clause in the Anglo-American financial agreement was specifically stated to be "in an anticipation of more comprehensive arrangements by multilateral agreement." This clearly looked forward to the ITO Charter which will be hammered into its final shape at Geneva. It will rest with the Commonwealth delegates to see that the Charter makes reasonable provision for the application of discriminatory practices by countries in balance-of-payments difficulties. These exceptions to the rule would have to be subject to impartial review; but the touchstone should not be too difficult to apply. Discrimination is justified when it leads to more trade being done than would be possible under the full rigour of the rule. There would be no greater negation of the whole spirit of the Anglo-American financial agreement and of the ideals for which the International Trade Organisation is to stand than that the principle of non-discrimination should be used to restrict trade. Yet that will be the result—not in hypothetical theory but in actual practice—if the Americans continue to say "because you cannot buy from the United States you shall not buy from anywhere."

Tantalus and the Pools

BETTING statistics, notoriously hard to come by, have been vastly improved in recent years through the enterprise of the Churches' Commission on Gambling. It might even be said that they have been improved out of all recognition; for zeal in the cause is not always the best guarantee of statistical accuracy. But, taken with a suitable pinch of salt, they are near enough to the mark to yield something on the lines of the accompanying table. The net cost of gambling to the country

ESTIMATED GAMBLING RECEIPTS				
£ million				
	1938-9		1946-7	
	Gross	Net	Gross	Net
Football pools	22	4	45	9
Horse-racing:				
Bookmakers	275	20	300	25
Totalisator	9	1	15	2
Greyhound racing:				
Bookmakers	20	2	70	7
Totalisator	37	3	138	8
Sweepstakes	8	4	4	2
Gaming machines	10	2	10	2
TOTAL	381	36	582	55

RATIOS OF INCREASE			
	1938-9		1946-7
Gross receipts	100		153
Net receipts	100		153
Personal incomes before tax (1938-45) ..	100		175

for 1946-7—the charge on the national income, that is, to cover promoters' profits, capital expenditure on gambling establishments, and the pay and perquisites of the staff, variously estimated at up to half a million—a figure which apparently includes all part-time workers—seems to have been about £55 millions. This sum represents slightly over $\frac{1}{2}$ per cent of the total of personal incomes, and may be equivalent to between four and five per cent of the nation's expenditure on food and two-fifths of its expenditure on tobacco, in each case excluding the effects of indirect taxes and subsidies. The total—even when it is remembered that it is the net cost, not the gross turnover of the betting industry—seems almost startlingly small. On the other hand, an industry which, for a bare minimum, employs as many as cotton weaving is certainly not insignificant; and its social as apart from its economic importance is probably best measured, not by the net charge on the national income, but by the gross charge of £582 million—including, that is, the money returned to winners—or by the total of ten million people who are reckoned to bet regularly on the pools. To the moralist the gambling industry is a beam in the nation's eye. To the economist it is a mote, but still a potential reservoir of manpower, and still more of woman-power. To the Chancellor of the Exchequer it is fruit ripe for the plucking—though perhaps forbidden fruit. Can and should anything be done about it?

The moralist's case is simple and straightforward. Gambling is a menace and a scandal; it is sapping the national morale; it fritters away time which should have been given to work or honest recreation; it is creeping, in the peculiarly sinister form of the pools, into the very bosom of the family, and may shortly become as respectable as bridge. It should be suppressed, stamped upon, and in one way or another brought to an abrupt and unlamented end; and, as one report of the Churches' Commission quaintly adds (the cloven hoof peeping from beneath the cassock), "a little coercion would not be out of place."

Coercion, of course, is the core of the question. The moralist's case, though it might be improved by the addition of a sense of humour, is basically sound enough. No one can regard as healthy a state of affairs in which the vast majority of households in the country are involved in re-distributing half a billion pounds a year through the channels of highly organised gambling. Evidently there is something wrong with the national outlook to produce a phenomenon of this kind; but what is it, and what can actually be done to correct it? Is it some easily alterable feature of the national life; or is it nearer the truth to say, as common sense would suggest, that mass gambling is a symptom of a mass maladjustment, capable of correction only by educative methods and over a long period?

That the latter is the case appears clearly enough from the history of gambling in recent years. The great support for organised gambling once came from the bored and ill-educated aristocracy; it comes today from the bored and ill-educated proletariat. The busy and comparatively well-educated middle-class, with its settled and (from its own point of view) reasonably satisfactory social status and tradition, has taken, and continues to take, conspicuously little part. Conditions change, and the young man with nothing to do but to waste his inheritance on wine, woman and song has receded into a wistful memory in the pages of Saki; but the young man whose life and work neither stretch his brain to the full nor provide an outlet for his sense of adventure and advance is with us still by the million.

Mass gambling as practised today is in fact a function of two developments—the fact that the margin of working-class incomes available for free spending was multiplied eight times over between the two world wars, and the failure to cure the social and psychological maladjustments inherited from industry's past history. These maladjustments will not last for ever. But they are still emphatically present for the moment; and it is perhaps ironic that the chief beneficiaries of a Labour Government, committed to face the future with all the youthful verve and enthusiasm of Transport House, should hitherto have been the Stock Exchange investor and the pool promoter. Yet may there not be some hope for the future in the fact that, at a time of rising working-class incomes, greater social security, and greater concentration on a national effort, the gross expenditure on gambling should have failed as conspicuously as the table apparently shows to keep pace with the rising tide of personal incomes? The moral, at any rate, is clear. The causes of mass gambling are too deep-rooted to be removed by any mere surgical operation. The symptoms may be fought; but the result will only be to produce other symptoms, possibly of a far more unpleasant kind. The evil of gambling lies as much in the atmosphere as in the act; and the nation will not be much better off if it substitutes the clandestine methods of the street bookmaker for the fireside crossword-puzzle atmosphere of the pools.

From the economist's point of view, direction of labour from gambling to other occupations is not practical politics; and, even if it were, the question might well be asked whether it would be worth its cost when the effect on the national morale was taken into account. No doubt in the long run, when the basic social maladjustments have been corrected, the nation will be far better off without organised gambling than with it; and no doubt also that for an emergency of a week or two gambling can reasonably be shut down. But for the medium term—for the term, that is, with which practical policy is chiefly concerned—organised gambling meets a real recrea-

tional need. "No work and no play" is sound industrial psychology; and the economist may reasonably shudder at the thought of productivity in a world where gambling and, perhaps, films and tobacco had followed mid-week sport down the dollar drain. The labour which might be diverted from gambling organisations is in any case of very varying quality. A good deal of the pools labour could be of genuine value in other occupations; but the gaps in the mines are scarcely likely to be filled by the recruitment of an army of bookmaker's touts.

In days when the nation's chief industry is the manufacture of new regulations, any interest proposing further restrictions must be expected to prove its case to the hilt; and the case for anything resembling the suppression of gambling is certainly not made out. Suppression, however, is one thing, and discouragement is another. The improvement in drinking habits in the last quarter of a century, while largely due to improved education and rising standards of living, has also owed a great deal to the beneficent operations of the Chancellor of the Exchequer; and taxation, apart from its purely mercenary advantages to the revenue, might similarly help to salve the national conscience in the matter of gambling. A suitable formula for a betting tax will admittedly not be easy to find, and, should it be found, it would be optimistic to expect the tax to have much short-term effect on anything but the revenue. Betting is a habit in many ways similar to the habit of smoking or drink, and it is not at all improbable that in the short run the demand for betting facilities will prove as inelastic in the face of rising costs as has hitherto been the case with the two other classical vices. But, again as in their case, it does also seem probable that in the long run a betting tax would prove a real disincentive to a new generation which has not yet acquired the habit. It might not shake much fruit from the Littlewood tree in the next year or two, except in the purely fiscal sense; but over the next generation it would effectively assist the more

NOTES OF THE WEEK

The Cost of Living

No tears will be shed at the passing of the 33-year old index number of the cost of living, which reflects the tastes and spending habits of 1904 rather than of the 1940s. Only the war prevented the earlier demise of a measuring device which dealt in terms of candles and flannelette and excluded electricity and rayon, and the recommendation of the Ministry of Labour's advisory committee to discard the old basis therefore comes as no surprise.

The difficulties which arise when it comes to devising a new index are of two kinds, technical difficulties of statistics and issues of public policy. The Committee concern themselves only with the first category, which are interesting enough. The defects of the old index arise from the fact that it calculates month by month what would be the cost of providing a fixed list of items which is now out of date. An inquiry was made just before the war into the spending habits of working-class families, and a new fixed list of items based on the results of this inquiry would be much nearer to reality than the existing list, which was drawn up in 1904. But the new list would also get out of date and, specifically, it does not reflect the actual distribution of income to-day. On the other hand, to adopt an index whose composition and weighting varied with the actual expenditure of the public, though it is technically possible, has other disadvantages. It is difficult to explain simply how it works. And there are also theoretical disadvantages. If cauliflowers go up in price but carrots do not, housewives will switch their purchases from one to the other and accept a slightly lower standard of living. But if the index follows suit by reducing the weighting of cauliflowers and increasing that of carrots, it will not be doing what most people think it ought to do—that is, measure the cost of maintaining a standard of living which, though it may vary in composition, is unvarying in average quality. On the whole, fixed lists of commodities with frequent revisions seem to be the best. The Committee, however, are still hesitating between these two alternatives.

But they are agreed that the old index is now so bad that there should be no delay in scrapping it, and the main purpose of their interim report is to recommend that there should be a new

fundamental remedies of educational, social, and industrial reform.

But can a formula be found? Past Chancellors of the Exchequer, like Tantalus, have dipped into the betting pool with only too little success. Can Mr Dalton do better? The key seems to lie in the increasing organisation of gambling. When Mr Churchill set out on his first ill-fated adventure in this field, the collection of a betting tax was about as simple a proposition as collecting income tax on the profits of the black market in building. The fact that today some £200 million a year passes through the Tote and the pools puts a very different complexion on the matter. True, there is always the risk of over-taxing these relatively easy sources of revenue, and driving business into the hands of the socially more pernicious and fiscally less accessible street-corner bookmaker. But a turnover tax of the order of ten per cent on the more accessible forms of betting would not be unreasonable, and might well be supplemented with a heavy licence fee and possibly a supplementary income tax on private bookmakers. Mr Churchill once suggested a heavy tax on each telephone in a bookmaker's office; and, while this particular scheme might perhaps be too easy to circumvent by the use of a complaisant neighbour's number, it does not by any means exhaust the possibilities. In one way or another, a revenue of £20 or £30 million might well be raised, with an upper limit in the neighbourhood of £50 million. It is clearly impossible to ensure exact equity as between one type of betting agency and the next, and there should be no undue squemishness over charging what the traffic will bear. Betting is not the mine of money or manpower which interested propagandists tend to assert; but it could be made to provide a very acceptable contribution towards filling the national deficit, while at the same time hastening its own extinction. Virtue in this case is by no means incompatible with good housekeeping.

temporary index, based on the composition of working-class expenditure in 1937-38.

The issue of public policy is that, since any imaginable new index of the cost of living will almost certainly show a bigger rise in prices than the old index, which forms the basis of many wage and salary agreements, the improvement of the index may lead to widespread claims for higher wages—or alternatively, to still higher subsidies to bring the new index down to the level of only 32 per cent above September, 1939, at which the old index now stands. The Committee's proposed temporary index would attempt to dodge this issue by basing itself on 100 at the time it is introduced and not being calculated back to before the war. But it will hardly be possible to maintain this position. Sooner or later the interim index, and the later permanent index, will have to be calculated back, and then the fat may well be in the fire. But it would be unfair to blame this difficulty on the statisticians. Sooner or later the Government will, in any case, have to grasp the nettle of the present distorted relationships between prices, wages, costs and subsidies. Preserving antiquarian statistical fictions will not help them.

Perhaps when that time comes it will be as well to ask what purpose an index of the cost of living serves. An index of the cost of a subsistence standard of living has obvious values in fixing social security and other similar payments, and the chief virtue of the wartime policy of stabilising "the cost of living" is not that it has kept wage rates down (they have increased by 65 per cent) but that it has helped to provide an iron ration for the very poor. But an "iron ration" index should have no relevance to wage rates, and as the standard of living of those in work rises above the iron ration and becomes more and more diversified, variations in the cost of providing it become more and more difficult to measure.

The Veto Protects Albania

The Security Council's consideration of the British appeal against Albania about the mining of the two destroyers in the Corfu Strait reached its inevitable climax when a British amended

resolution stating that the mines could not have been laid without the knowledge of the Albanian Government was blocked by Mr Gromyko's veto, though a majority of the Council voted in favour of it. Britain, as a party to the dispute, had no vote, but the United States, France, China, Belgium, Australia, Colombia and Brazil gave affirmative votes, Poland joined the Soviet Union in voting against, and Syria abstained. The vote was taken after the Albanian representative, Mr Kyski Kap, had surpassed his previous performance by accusing the British of having laid the mines themselves; it remains to be seen whether anyone will follow up this promising line of attack in the House of Commons and charge the Admiralty with murdering 44 British sailors in order to frame an innocent Eastern democracy.

The ironclad indifference of Mr Gromyko and his Polish assistant, Dr Lange, to the facts in the case was only to be expected in view of the situation in Albania. The rule of the Communist ex-schoolmaster, Enver Hoxha, is none too stable and has to be energetically propped up by Marshal Tito, who is now economically under the weather himself. The Albanian regime gained strong popular support at the outset by the division of large estates in the central plain among the poorer peasants, but this policy has not been of much avail in the mountains, where there were no wealthy landlords to expropriate, and the general economic plight of the country, which has to support an army several times too large for its resources, has caused the dictator's popularity to wear thin. His chief asset is the belief that he is under the protection of the mighty Soviet Union, which will be on Albania's side in the international field, especially in the quarrel with Greece. For the Soviet Union to have joined in a unanimous condemnation of Albania by the Security Council would have been a manifest desertion and might well have brought about the fall of the Hoxha Government. As the Soviet Union certainly attaches importance to the maintenance of this regime on the shores of the Straits of Oranto, it was not possible for Mr Gromyko to act otherwise than he did, whatever the evidence set before him.

Britain can feel morally satisfied at having received a majority approval of its case, even though the use of the veto has blocked adoption of the resolution. This must now be reckoned the only outcome of any appeal to the Security Council. It provides a forum for public discussion and the hearing of cases, which is most important for the formation of public opinion in all countries where news reporting is free; this is not a factor to be ignored even by the Soviet Union, and it may be that the smaller democrats will get a warning not to make trouble for the big brother in future by hooligan behaviour. But it must be admitted that as a result of this case the Security Council's reputation as an executive organ of international order has touched an all-time low. If President Truman needed an illustration of Uno's inability to deal with Balkan dangers, Mr Gromyko has supplied it.

Moscow: Reparations Deadlock

Having stated at length their proposals about German economic unity, reparations and the future political shape of the country, the Foreign Ministers have been sitting back waiting for a committee of their experts to sort out the points of agreement and difference and report back. That committee has now been diverted from editing to arguing, largely by Mr Vyshinsky, who thereby runs the risk of sharpening the impression, gained by some observers, that the Soviet Government are no more interested in reaching agreement at these meetings than they are in the successful working of the Security Council. The impression is probably incorrect, but it will persist until the progress of real negotiation proves the opposite. The decisive stage of the conference is only just beginning. Its success seems certain to depend on finding some compromise between the Soviet and the British views on reparations, which are fantastically far apart.

Three years is the time fixed by American and British official statements for Western Germany to start paying its way on the lowest tolerable standard of living. After that an export surplus is hoped for, out of which both Governments will begin to recover the cost of occupation and of importing food and raw materials. By that time—1950—the sum to be recovered may be somewhere between \$2½ and \$3 billion. How long will the process of repayment take? Some say ten, some fifteen years. Then presumably, sometime in the 'sixties, an effort may be made to get reparations as well out of current German production. This is the picture which has been presented by Mr Bevin to Mr Molotov. In reply the Soviet Government demand a total of \$10,000 million in reparations, a large proportion of which can only come from current production, in the form of goods needed for reconstruction in devastated Russia.

Admitting that the Soviet claim could be proven and that it will be reduced by the amount already taken from the eastern zone, how can Mr Molotov reconcile it with his warm defence in recent speeches of Germany's right to live? And how could he explain to M. Thorez, for example, the disastrous effect of such a reparations policy on coal deliveries to France from the Ruhr? How can he expect the Americans—still less the impoverished British—to prime the German pump indefinitely in order to meet Soviet claims of such dimensions? Mr Molotov may seem in Western eyes short-sighted and stubborn, but so must Mr Bevin appear in Eastern eyes when he demands that the Soviet Government should share the full cost of running Germany as a whole and sacrifice for the common Allied stock all that they have been drawing—and would continue to draw—from the industries of Eastern Germany? There appears to be no way out of the deadlock except concessions from both sides. The decisive role may be played by Mr Marshall, whose Government holds the key, not only to British ability to prime the German pump, but to Soviet ability to seek outside Germany and eastern Europe the resources needed to make good the devastation of Russia.

* * *

The Truman Doctrine

By the end of this week the world will know something more about the Soviet attitude towards Mr Truman's intervention on both sides of the Straits. Mr Warren Austin's statement to the Security Council this Friday should give a more balanced and sober picture of what the Americans will do for Greece and Turkey than has so far appeared. Comment in European countries has been whittling down estimates of the power behind the "Truman doctrine," just as Mr. Acheson has been whittling down its implications in face of Congressional questioning. According to their sympathies, commentators have split up into those who question the efficacy of dollar rattling and those who read more into Mr Truman's challenge than Congress will accept.

So far Soviet policy has not visibly yielded an inch; it could hardly do so in face of a public challenge. Mr Gromyko has backed Albania in the Security Council with the veto; the Small Farmers' Party in Hungary has been forced to agree to new elections in May in which the Communists hope to improve their positions; Mr Marshall appears to have had no private conversations with Soviet Ministers in Moscow; and the disagreements within the Uno commission studying the Greek situation are on familiar lines.

Meanwhile, it is increasingly understood that the "Truman doctrine"—at any rate for the time being—resembles the Monroe Doctrine of the last century in its reliance on British strategic positions to make it effective. What is still not properly understood is the fact that the oil reserves of the Middle East are a vital interest, not only of the British Commonwealth, but of every European nation that has no oil of its own. To represent this interest as sinister or exclusively commercial is silly; it is no more sinister than was the British interest in keeping world sea routes open during the last century. Free access to Middle Eastern oil is an interest which the British Commonwealth, western Europe and the United States have in common; it is one of the conditions of the freedom which Mr Truman set out to defend in the ideological portions of his address to Congress.

* * *

The Government and the Public

Sir Stafford Cripps is to be congratulated on his decision to hold fortnightly press conferences, and thus to continue the process of keeping the public informed about the economic state of the nation, which was begun in the three-day debate in Parliament. It is true that much of what he told the press was not new and was available elsewhere to those in a position to dig it out; nevertheless, the mere fact of holding regular press conferences, where the data are assembled and where there is an opportunity for asking questions as well as receiving information, is an indication of the right approach to publicity.

Few will deny that one of this Government's weak spots is its handling of publicity. The Prime Minister himself is reported to have confessed to ignorance about public relations, and Mr Morrison, who does know something about them, has been sadly missed in recent months. It is indeed surprising that a Labour Government, which claims to be in touch with the ordinary men and women of the country, and to reflect their wishes, should be so vulnerable on this score. It was, for example, a good idea to publish a popular edition of the Economic White Paper. It would have been better, not merely to change the title and the

cover and to throw in a few charts, but to issue a really simple popularly-written pamphlet, which would set out the salient facts of the economic situation, without being overburdened with technical detail.

The Labour Party certainly suffers from not having a Churchill to fire the public enthusiasm, or a Woolton to gild the pills. Mr Attlee's broadcast, sensible and lucid though it was, was hardly calculated to infuse the Dunkirk spirit into the nation. Reports that Mr Bevin may be switched over from foreign to home affairs may be wishful thinking. But he would certainly do more than any other figure in the Cabinet to mobilise the workers and swing the trade unions into full co-operation. Sir Stafford Cripps's conferences will do something to feed the expert and semi-expert public with facts. It remains to find a means of reaching the inexpert and the hitherto uninterested. More mass publicity is as much the need as a raising of the iron curtain for the experts' benefit.

* * *

The Defence Debate

In the coming week Mr Attlee will try to prevent the threatened disunity within the Parliamentary Labour Party by winning over to the Government's point of view the rebels against its conscription policy. To judge from the large number of resolutions on manpower and the size of the Forces which are on the agenda for the Labour Party's Whitsun Conference, the rebels' view is shared by a large section of the local parties. Last week's debate on the Defence White Paper was a foretaste of the criticism from the Government's own supporters which may be expected when the new National Service Bill is given its second reading, for the most effective speeches came from Labour members. The arguments were the old ones. Mr Alexander, who opened the debate, argued that the past and present size of the armed forces is justified by the country's post-war commitments, that the Services' demands for manpower to fulfil these commitments were carefully screened and had been reduced, and that special committees were at work to see that there is the minimum of wastage of manpower within each Service. No one will want to belittle the importance of these new, partly civilian, committees. But, however ruthless they allow themselves to be, their recommendations are unlikely to result in the saving of more than tens of thousands at the very outside. What the Government's critics ask for is a reduction of hundreds of thousands, and that can only be achieved by a Cabinet decision that the Services can be allotted so many men and no more. Which method will result in a bigger reduction in the armed forces? The existing method, by which the estimates of the Chiefs of Staffs are submitted to the Government and then reduced to the lowest level agreed to by the Chiefs of Staffs and the Service Ministers? Or that the Government should submit to the Chiefs of Staffs the maximum figure for manpower that the Services can have and let them wrest a larger figure if they can—in other words, that the Service Ministers and the Chiefs of Staffs should do the bargaining?

Neither Mr Alexander nor Mr Noel-Baker, who wound up the debate, answered the most pertinent criticism that is made. All the commitments which are specified are, and have been for nearly two years, fulfilled with a constantly decreasing manpower total. If it is possible to fulfil them with a total of 1,400,000 men now, it was possible a year ago. If it will be possible to fulfil them with 1,000,000 men in a year's time, it should be possible now. And, when the maximum size of the armed forces is about 750,000 in two years' time, what proportion is likely to be devoted to commitments and what will be the effective strength of the defence forces immediately available for use in a war? Mr Alexander refused to give a clear picture of long-term defence policy, beyond saying that big reconstruction of the three Services was in hand. He and Mr Noel-Baker pleaded that the present period was transitional. Is it likely to be less so in a year's, or even two years', time—and, if so, in what respects and with what quantitative results?

* * *

Stalemate for Police

The publication of the Home Office report on the higher training of the police (Cmd. 7070, 4d.) substantiates all the adverse rumours which circulated about it in advance. It is a thoroughly unimaginative document, permeated with outworn prejudices, and designed to discourage any really promising young man from entering the police service, where such men are badly needed. Surely the senior members of the constabulary need have been less timorous about the Trenchard version of the police college,

and could have devised something which was a bolder compromise between the "old school tie" approach and the ultra trade-unionism of the scheme they have put forward. Seniority and the reward of faithful service dominate their suggestions with woeful tenacity.

One of the chief problems of the police before the war was to breed men within the service who were suitable for promotion to the highest posts, instead of recruiting them later in life from outside. The methods of selection of officers during the war, and recent experience elsewhere, underline the importance of picking promising men early and promoting them young. The Home Office Committee fly right in the face of this evidence. Under their proposals no one can come to the Police College—the gateway to promotion—under 27 years of age and, to quote the report, "some may, in the initial stages be 50 or more, and their average age might be as high as 35 or 40." It is thus improbable that, even when the new college has been going for some time, men will come to it under the age of 30 to 35. No university graduate or bright secondary-school boy is going to be content to be a speed-cop or answer inane questions in the streets for ten to fifteen years on trainee rates of pay. And the police force cannot do without these men.

* * *

Further Education

Local education authorities must have groaned on receiving the latest of the Ministry's pamphlets on "Further Education" (HMSO, 2s. No. 8). In itself it is an excellent publication dealing with all the aspects of education outside the ordinary schools and below the level of the universities, such as local, regional and national colleges, which may incorporate the compulsory day-time activities of the county colleges, full-time vocational courses, or part-time day and evening classes of a recreational and vocational character. But, however excellent the theory, the putting of it into practice demonstrates all the difficulties of the present time. The circular which accompanied the pamphlet demands that local authorities shall submit their plans for further education not later than March 31, 1948, "unless later submission has been approved exceptionally." It is, however, certain that either the exceptions will have to be numerous or many authorities will have to default on their obligations; for in many areas the development plans for the schools proper are already straining administrative resources to the limit. Compared with the schools' plans, those for further education are relatively modest; but they may yet prove to be the last straw.

The pressure is not basically that of the Ministry, but derives from the 1944 Education Act itself, which demands that compulsory part-time education should come into being three years after the raising of the school-leaving age. But the Act does not say whether county colleges should all be opened or merely begun by 1950. In present circumstances, the latter interpretation is inevitable, and even that may be impossible to realise with the competition from new school building. And if progress varies between one authority and another, will the boys and girls attend compulsorily or not according to where they live—a practice which had unfortunate results after the first world war?

There is, however, now a mitigating circumstance absent in the early nineteen-twenties. Owing partly to enlightenment, but predominantly to the shortage of juvenile labour, many firms have been competing with one another in the attractions they offer to young entrants, either in the shape of part-time education and vocational training on the premises, or leave of absence to study in continuation classes. In 1938, 41,500 were being released; the figure is now about 150,000. As the shortage is likely to grow worse, not better, ambitious youngsters will still be able to pick the "best" employers. And, more generally, the fact that in the field of further education so much reliance can and should be placed on agencies other than local authorities may well make the new policy considerably easier to apply than appears on the surface.

Setting aside the difficulties of preparing the new schemes, and finding the bricks and mortar to make them real, the new plans should teach the local authorities a great deal about their local resources, industrial, cultural and social. For they are required to make an elaborate local survey, and to draw up a plan which demands much co-operation with local educational and industrial bodies and an estimate of future employment trends. Is it too cynical to express the hope that, in working out these surveys, due attention will be given to the increasing survey activities of local authority departments not directly concerned with education? Duplication of research has some virtues, but not in the form in which it only too commonly occurs in both local and national government.

M. Ramadier wins a Round

When M. Ramadier first took office, it was a gamble whether the fissures in his coalition would show most quickly under the pressure of home or of overseas policy. In the event, he has won a short reprieve at home, largely thanks to the Trades Union Federation's decision not to press its minimum wage claims while the Government's price reduction policy is on trial until May, and thanks also to his firm refusal to be browbeaten by the Paris newspaper strikers. It is Indo-China that has given his flimsy cabinet its first bad shaking. He has survived it, and retained the Communists in his Government by a narrow margin and by dint of some unexpected compromises.

There were two practical points at issue in the debate on Indo-China. One was whether to proceed first by restoring order and then by holding peace talks, or whether to declare an immediate armistice. The second was whether to vote a military credit of 34,000,000,000 francs for the first purpose. The MRP, the parties to the right of them and perhaps two-thirds of the Socialists favoured the first of these alternatives; the Communists, together with some hesitant Radicals, wanted the second. Unfortunately for the Assembly's reputation, the debate opened with an outburst of the party explosions that nowadays are never far from the surface. Attacks from the right were showered not only upon Viet Minh personalities but on the past reputation of Communist deputies; the Communists responded with organised slamming of desk lids. Even fisticuffs ensued. When the uproar subsided and a vote was taken on the alternative courses to be pursued, the vote for military action was unanimous but for the Communists. These, including the five Ministers in the Government, abstained.

But their act was followed by some heartsearchings. Ought they to provoke a crisis that would weaken M. Bidault's position during the Moscow meetings? On the other hand, ought they to remain in a Government that is accepting American loans in view of their intense disapproval of President Truman's new Mediterranean policy? When M. Ramadier announced that he would make the second vote, that on the military credits, a vote of confidence, their Central Committee came out with an uncompromising refusal to support him. There followed the 24-hour delay that must, under the new constitution, precede a vote of confidence. It was then that the five Communist Ministers decided not to overthrow the Government. They therefore voted against their party. Reluctantly, but sensibly, M. Ramadier gave out that "cabinet solidarity" was sufficient for his purposes. The Communists are left explaining why a vote in two directions is not a party split.

On the short view, the Communists have had their cake and eaten it. They have kept M. Bidault as comfortable as may be in Moscow, but can disclaim party responsibility for a military campaign. Can they continue to face both ways for the duration of the Moscow Conference? Not if party recriminations open with equal acerbity on some domestic issue that affects every man in the street. This the Indo-China controversy does not do. It was a tug-of-war in which neither left nor right was pulling with a real will, and the Communist Party should without difficulty be able to live down last week's divided vote.

But the sight of Communists in a dilemma is bound to encourage the hopes of the extreme right—the only party, to-day, that would like to see a political upset. A refurbishing of weapons in that quarter has been noticeable lately. There are persistent rumours that General de Gaulle is planning to launch a party in anticipation of a financial debacle in the autumn.

More Trade with Finland

To expand trade with Finland is good politics as well as good economics, and the British discussions in London with the Finnish Trade Delegation, which began on March 3rd and ended last week, have had highly satisfactory results. The British Government can now place orders for 175,000 standards of sawn softwood, which is one-third of the total requirements of their housing programme for this year, on the austere basis of 1.6 standards per house. There will be far less scepticism about the fulfilment of this order than there is about Soviet or even Swedish execution. The Finns, in return, are satisfied about the prospect of receiving materials required to stabilise their economy and permit the regular payment of reparations to the Soviet Union, which, incidentally, is taking 110,000 of the 600,000 standards that the Finns expect to have available for use and export this year. Outstanding among their requirements was semi-manufactured steel, of which at first the Finns wanted

90,000 tons. This has to be compared with the 50,000 tons of iron and steel exported by Britain to Finland in 1946 and 18,000 tons exported in 1938, when Germany was the main supplier. This is a year in which British steel exports are likely to be sharply reduced; last year Finland's share of them was up from 1 per cent to 2½ per cent. But interest in Finland's recovery and in its unique position in Eastern Europe should ensure that British deliveries there are cut as little as possible.

No settlement has been reached on financial questions. The agreement of August 2, 1945, which expires in the summer, provided for the payment of 12½ per cent of the proceeds of Finland's exports to Britain into a special account earmarked for service on her sterling debt, which fell into interest and amortisation arrears during the war. As it is to be expected that there will be no arrears by the end of 1947, no specific segregation would appear to be necessary; Finland's record is thus outstanding even among Northern peoples.

The Crown's Planning Record

Fears that the independent and uncontrolled activities of other Government departments will defeat the purpose of the Town and Country Planning Bill have been expressed in Standing Committee, where members of all parties joined in urging Mr Silkin to take wider powers. Government departments will be asked to reach agreement with local authorities on their requirements for land, so that all land which is intended for compulsory acquisition over a ten year period may be designated as such in the planning schemes. This idea of designation is excellent; it will promote an orderly and unitary development of each area, and should minimise uncertainty among private owners about the future of their property. The snag is that Government departments may always sidestep this procedure and acquire land under other statutory powers of their own. In this way, a carefully thought out planning scheme could be suddenly wrecked. The planning record of some departments is indifferent or worse. The Ministry of Transport, described by Mr H. G. Strauss as "the greatest anti-planning authority in this country," was singled out by the Committee for condemnation, but the Board of Trade, the Service departments, and even the Post Office also attracted justifiable criticism. How far will these departments, armed with strong acquisitive powers, look beyond their own interests or convenience in the future?

Mr Silkin remarked that it would certainly be convenient for him if all land acquisition had to go through his Ministry; but he appeared to dismiss this as politically impracticable, and to pin his faith to the machinery of routine consultation among departments and local authorities which, however time-consuming (and it is certainly that), is equally certainly showing signs of improvement. But is it really so unthinkable to have one department in charge of land acquisition? After all, state ownership of land is rapidly on the increase, and the idea of having a Ministry of Planning is to simplify and expedite land control, not to increase the need for co-ordination. What is bad development when done by a private owner is not a whit better when done by a Ministry; and if the former is expected to put up with the delays and inconveniences of planning control, he is entitled to insist that the control be uniform and effective and his sacrifice not in vain.

Noah's Ark

The very serious damage done to agriculture by the snow, which killed large numbers of sheep and other livestock, and by the floods, which have spoilt a considerable part of the best arable land in the country, has again focused attention on the need for special measures to safeguard Britain's food supply. No estimate that is at all reliable can be given of the financial loss imposed by the weather on farmers and other sufferers, although in any case the Government will be asked to give more assistance than its initial £1,000,000 contribution to the Lord Mayor's relief fund and its increased grants to Catchment Boards in the Fens.

Mr Williams's emergency advisory committee of agricultural interests will have to work overtime to salvage as much of the damaged crops as possible. But, in the longer run, few tasks are so vital as the provision of enough, and good enough, housing to attract the requisite agricultural labour. In Tuesday's debate in the Commons, Mr Edwards, for the Government, put forward a well-reasoned argument to show that the housing problems of rural areas were not being neglected. Special zonal conferences are being held to try to overcome the shortage of building labour in certain rural areas; and 20,000 Airey houses,

needing little site labour and specially designed for rural conditions, as well as 5,000 Swedish-type houses have been exclusively earmarked for rural use and could be erected more quickly "if local country builders will overcome their fear of novelties."

These are enterprising measures, whilst the Government's action in scaling down local authorities' tenders to square with the labour and materials likely to be available deserves praise rather than the blame it has received. But two doubts remain. The Government has allocated about 17 per cent of this year's permanent housing programme to rural areas, which is about proportionate to their population. But, just and fair as this is, in view of the urgency of maintaining food production ought not the Government to award a rather larger slice of the housing cake to rural areas? In the second place, in spite of the strong representations of its own advisory committee, the Government is going to take no steps this session to allocate grants for the reconditioning of rural houses. Mr Edwards claimed that there was no building labour available which could profitably be put on to this work; but his view hardly squares with the observations of the Hobhouse Committee.

South Bank

Meanwhile, credit has to be given for a satisfactory piece of planning co-ordination in the County of London. The LCC intends to sweep away the derelict area on the south bank between Westminster and Waterloo bridges and to have erected, alongside County Hall, a major group of Government offices (designed to house upwards of 10,000 staff), the cultural centre mooted in the County Plan and the national theatre sponsored by the Shakespeare

Memorial National Theatre Committee. The Ministry of Works is co-operating on this project and has agreed to the appointment of an architectural consultant, Dr Holden, to harmonise the design and lay-out of these important buildings. The LCC has also secured agreement with the Ministry of Transport on the construction of a major traffic roundabout at the Elephant and Castle; if it can deal equally effectively with the London Transport trams and the Southern Railway viaducts, it may eventually transform the unpopular south bank area from the worst to the best part of London. It would be a fine, if costly, vindication of the effects of planning.

The Stevenage Appeal

The Court of Appeal on Monday reversed the order of Mr Justice Henn Collins under which he quashed the Stevenage New Town (Designation) Order made by the Minister of Town and Country Planning last November. The grounds on which Mr Justice Henn Collins based his decision were, very shortly, that

in his opinion the Minister had not considered the report of the local enquiry at Stevenage, with an unbiased mind, as he was bound to do under the New Towns Act, 1946. Equally shortly, the basis of the judgment of the Court of Appeal was that they did not find that there was sufficient evidence before Mr Justice Henn Collins to justify him in coming to that conclusion. The law requires an objector affirmatively to prove that there was bias. In the view of the Court of Appeal the objector had failed to discharge that onus.

As there is still the possibility of a second appeal to the House of Lords, further comment on that aspect of the case is impossible; but comment can be made generally on the unsatisfactory nature of this procedure of Ministerial Order and public enquiry. Clearly a Ministerial decision to establish a new town, with the consequential interference with private rights in the chosen locality, is a political act. The Minister must weigh the whole of the evidence, the pros and the cons, before making the first Order. He is then required by the New Towns Act to hold a public enquiry, at which objectors can be heard, and he is then supposed to reconsider his first decision in the light of the objections there raised. In other words, he is asked to think again and to decide if his first decision was hasty or ill-considered or both, all within the privacy of his own Ministry. Is it likely that nine Ministers out of ten will be sufficiently uncertain, or volatile, or honest to come to a different conclusion on second thoughts? If they do they automatically condemn themselves as responsible Ministers of the Crown. Yet the procedure of public enquiry is important and could be made of real use to the community. It gives the public the right, which they should have, of speaking their minds and offering their local knowledge. There should surely be some instances where they can convert the Minister to their point of view, but it would be the height of optimism to expect this to happen frequently or as a matter of course. It is all the more necessary, therefore, that the Minister should take pains to make public a detailed reply, and one far more specific than the generalisations Ministers are apt to produce, to all those objections which the chairman of the public enquiry finds to be relevant. Then the public will be able to judge for themselves of the capacity of the Minister and of the practicality of the particular plan. The main remedy for a bad plan must be in Parliament, not in the chance ability of one objector to show "bias" in the mind of the Minister concerned.

The Dutch-Indonesian Agreement

The Linggadjati Agreement between the Netherlands and the Indonesian Government of Dr Sjahrir, which was initiated last November, was formally signed in Batavia on March 25th. Differences of interpretation of the terms of the agreement have remained on some points unresolved, but the Netherlands Government has stated that they are not serious enough to hold up signature of the agreement. The negotiations have been prolonged, but both sides deserve much credit for having reached a compromise from such fundamentally opposed points of view and after even personal relations have been rendered so difficult by violence and bloodshed. Advice from a third party seems also, however, to have played a part; there has been no British mediation since the withdrawal of British troops from Java, but Washington is reported to have urged the Netherlands Government not to delay in reaching an agreement and to have added a warning that American supplies would not be available if the Dutch were to resume military operations. The Americans have been particularly anxious for a return to normal commercial conditions in the East Indies, and the same desire has impelled the Sjahrir Government to be as conciliatory as their fundamental nationalist programme will allow them to be. Hitherto the Dutch have been using their naval power to institute a kind of blockade of the territory outside their control, and an American ship was recently seized for loading a cargo in Java contrary to the Dutch trade regulations; such proceedings have caused considerable annoyance in Washington, where the State Department has been unwilling to challenge Dutch legal rights, but has nevertheless been impatient at the prolonged restraint of commerce in a region so important to world economy.

Dutch colonial officials and settlers of the older generation will, no doubt, feel that all is lost by the deal with Soekarno's State and bitter memories of the atrocities committed against Dutch civilians in the early days of Indonesian liberty will long remain to hamper the progress of reconciliation between the two peoples. But given the fact of successfully insurgent nationalism in Java and Sumatra, the Dutch have not done at all badly in a settlement

which still leaves them with a very large stake in their former East Indian empire. Conditions in the islands other than Java and Sumatra have changed very little from pre-war times, and Dutch interest and economic enterprise will probably from now on be concentrated on these territories which were formerly somewhat neglected in favour of the two westerly islands.

Guests of Nehru

The arrival of Lord Mountbatten in New Delhi as the Last of the Viceroys has coincided with the opening of an "Asian Relations Conference" in the same city assembling nominally unofficial delegates from nearly all the countries of Asia, including six of the Asiatic republics of the Soviet Union, and also Egypt. The most prominent Asiatic absentee was Japan, which received an invitation, but was not permitted by the Allied occupation authority to send a delegation.

The conference is in form and title an imitation of the biennial conference held by the Institute of Pacific Relations, an organisation with headquarters in New York, functioning as a federation of national bodies which include the British Royal Institute of International Affairs and the American Council of Foreign Relations. The Pacific Relations conferences, which have brought together European, American and East Asiatic delegates, have been ventures in a technique of international study and discussion of problems of common interest outside diplomatic and official channels. It is a technique which corresponds to the conditions of the Western democratic world, where public opinion exists independently of Governments or ruling parties, and where it is possible to have discussion on political subjects which preserves a certain detachment without being merely academic. This technique is inevitably modified by translation to an environment in which similar habits and conditions do not exist. Just as the Boy Scout movement, started in Britain as a purely civilian and non-political enterprise, has been transformed in certain countries into a politico-military organisation, so the Pacific Relations Institute system has been changed in its purely Asiatic form into a means of political manoeuvre and propaganda.

The Asian Relations conference has been directly promoted by Mr Nehru and the Congress Party and, although it may produce some useful contributions by experts to the study of Asiatic problems, there can be little doubt but that the main purposes of its convocation are first to win for Congress India the position of moral leadership in Asia to which Japan and China have unsuccessfully aspired, and secondly to isolate the Moslem League by means of direct contacts of Congress with the Moslem countries of Western Asia and also the Soviet Union. The Moslem League, recognising the tactic, has denounced the conference and decided to boycott it; thus the first consequence of a gathering theoretically aimed at promoting amity among Asiatics has been to add fuel to the flames of Indian civil strife.

Care of Children

Mr Attlee announced in the House of Commons this week that the Government had accepted the main administrative recommendations of the Curtis Committee on the care of children deprived of a normal home life. The Home Office has been selected as the appropriate Government department in which central responsibility for the children's general welfare will be concentrated. Secondly, local responsibility will, in every case, be exercised by a county borough or county council. Thirdly, to carry out their responsibilities local authorities will establish a special *ad hoc* committee, with its own executive officer, which will be concerned with all the home-finding functions at present exercised by one or more of the existing committees—the public assistance committee, the education committee and so on.

The choice of the Home Office to be the responsible Government department will doubtless arouse much indignation among those who pressed the claims of either the Ministry of Education or the Ministry of Health, or who considered that a special children's department should be established. But the Home Office, which has had much experience in this field, has strong claims; and it will be assisted by the creation, in accordance with the Committee's recommendation, of a new Children's Branch and of a standing advisory committee on which the other Government departments concerned, and outside persons and organisations, will be represented.

More dubious is the proposal that local authorities should establish a special Children's Committee. The Curtis Committee

was appalled at the number of local authority committees at present concerned in the welfare of deprived children. Logically, it may be the right solution to concentrate all these welfare activities in the hands of one committee. In practice, however, an increase in the number of committees means an increase in the co-ordination required, and the more the need for co-ordination, the greater the delay in getting anything settled. Moreover, individuals do not always fit into the categories assigned to them, and the more narrowly the functions of different committees are defined, the more likely are there to be "residuals"—a poor law term for those for whom other departments refuse to accept responsibility. From Mr Attlee's statement, however, it appears that the establishment of children's committees will be experimental and may be reviewed after three years. In any case, administrative changes are probably the least important factor in a deprived child's happiness. That depends more than anything else on the enlightenment of the person directly in charge of him, whether as a foster-parent or in a large Home.

Under the Guillotine

Steady improvement is being made to the Transport Bill in its passage through Standing Committee. Last Tuesday, Mr Barnes announced further amendments, involving the redrafting of an entire clause on the position of docks under the Transport Commission and giving, as he expressed it, "C" licence treatment to owners of private docks which are substantially used for the trans-shipment of their own goods. These, with oil and coal docks, will be excluded from the Bill. More important, however, than the change itself is the method by which it was secured and its consequences for other provisions in the Bill. Mr Barnes's concessions were the outcome of discussions between the Ministry of Transport and the dock and harbour authorities—a very proper and sensible procedure, of advantage to both sides. Discussion of this particular clause on which attention had been fastened occupied nearly the whole of Tuesday's sitting of the Standing Committee, and it was, with scarcely an exception, able and to the point. Then the guillotine fell; the clause was ordered to stand part after two and a quarter hours' discussion; four subsequent clauses with Government amendments were passed in a matter of minutes; and the Minister, finding himself with a few moments to spare, even made a start on the complications of Part V of the Bill, crucially important for transport costs.

Under the guillotine, it is a matter of accident whether a clause receives adequate discussion, or whether it is rail-roaded through with no consideration at all. Sir Arthur Salter was moved to protest yet again at the hasty discussion of clauses which give wide executive powers to the Government not merely to administer a clearly defined policy, but indeed to determine the policy itself by order instead of Parliamentary authority. He declared that the Committee were being asked to rubber-stamp a blank cheque. To which Mr Jay retorted that the country wanted to see legislation speeded up. But speed is not necessarily the same thing as efficient legislation. Speed is being applied to the Transport Bill, and in some respects it is being improved. Yet it will be enacted with whole expanses which have been denied any detailed consideration. It is too much to believe that, by a miracle of drafting, these are perfectly designed to achieve their object.

Shorter Notes

The membership of the Royal Commission on the Press has now been announced. Remarkably few of the members appear to have any extensive experience of the administration of newspapers—as distinct from the angle of the casual journalist—and administration, in the sense of "control, management and ownership," is nevertheless the core of the Commission's terms of reference. It may at least be hoped that impartiality has not been carried to the point where no significant result can emerge.

The report by Lord Justice Tucker into the proceedings before the Aberayron Bench, Cardiganshire, last April, when two informations against the clerk to the Bench alleging food regulation offences were dismissed, has now been published (Cmd. 7061). The incident which gave rise to the report shrinks in importance when the report is read; the impression that does remain is that the absence of any form of legal training for magistrates must be responsible for this, and many other failures of justice, and that the report of the Royal Commission on magistrates will, when it comes, be a document of considerable social importance.

Letters to the Editor

NCOs of Industry

SIR,—Your article on March 22nd raises the question: Are we really living in a past age? May we respectfully suggest that this rather applies to those who believe that the "free price" system can work in a period of almost universal shortage. The temptation is far too strong to produce either what the well-to-do are willing to pay excessive prices for, or shoddy goods sold at a high rate of profit. For home consumption it is the Government's duty to see that scarce labour and materials go mainly into quality and price-controlled goods required by the mass of the people.

Our main point, however, concerns capital goods required for the re-equipment of our basic industries. Britain needs a plan for mobilising more engineering capacity to the task of turning out mining machinery, electrical generating equipment and installations for all the basic industries such as transport, cotton, foundries, agriculture. Naturally, such a plan does not demand universal regimentation, but it does call for controls. Controls may be pointless in themselves, but they are a necessary complement to a positive plan for putting first things first.

Without such a plan at least for the obvious engineering priorities—in basic capital goods and basic consumer goods—it is useless to exhort engineering workers to work harder. At present the average worker—or even shop steward—sees no clear objective other than increased dividends for the shareholders. Even when he does put on a spurt, the result—because of the lack of planning and co-ordination—as likely as not, is that he finds himself standing about waiting for materials and components.

The joint production machinery has withered precisely because, in the absence of clear national objectives, the employer has been able to re-assert his exclusive concern with "managerial functions." If, ignoring the national interest, the employer is allowed to produce what he thinks will yield the maximum profit, he naturally resents any suggestion that the workers should have any say in

production; nor are the workers very keen to help him achieve that narrow aim. In our view, it is the Government's duty clearly to lay down priorities in a concrete plan, and create the conditions in which the shop stewards can help to carry it through.—Yours faithfully,

LES SMITH, Secretary

*Metal Worker,
5, Guildford Place, W.C.1*

[Agreed that a free price system would not at this moment secure a proper attention to consumers' preferences; it would do so, as the article last week showed, only on condition of disinflation to bring purchasing power into line with output. Disinflation, unless carried so far as to cause unemployment, would leave a number of bottlenecks; and it is true enough, as was pointed out in the article, that one such bottleneck which the Government has conspicuously failed to tackle is capital goods production. There is also much to be said for quality standards of the kinds suggested, for example, in the Furniture Working Party Report. But any general attempt to plan how much of each type of article conforming to the standards should be produced, outside a few very limited spheres, can lead only to regimentation of consumers and a spinner in the wheels of production. The decay of joint production machinery is certainly due in part to managerial obstruction; but it is also due to lack of guidance from the Government in switching the joint machinery over to the new tasks of peace, and to the extraordinary lack of fight on this issue on the part of the trade unions. And Heaven help the trade unions, including the shop stewards, if they can see no point in joint consultation in industries working for a free market.—EDITOR.]

SIR,—Surely foremen and charge hands, not shop stewards, are the NCOs of industry. NCOs have limited but definite powers and responsibilities; shop stewards have undefined powers and are completely free from responsibility. The only applicable military analogy is with the soldier representatives elected to serve on battalion, and I believe, higher staffs in the early days of the

B.O.A.C. SPEEDBIRD ROUTES ACROSS THE WORLD

BRITISH OVERSEAS AIRWAYS CORPORATION IN ASSOCIATION WITH Q.E.A., S.A.A., T.E.A.

this is **TI** to-day

A living thing has a way of growing, and TI have grown to mean much more than the name Tube Investments can convey. Yet it was the initial structure of the group which made possible, almost inevitable, the many later developments.

TI began as a free association of inter-dependent engineering companies who united their resources while maintaining the individual character of each concern. TI still adhere to this principle, but now concentrate technical knowledge and skill in many fields, to the benefit of their varied customers.

Precision tubes in steel and light alloys are an important part of TI enterprise; so are bicycles and cycle components, electrical appliances for the home and industry, light alloy sheet, strip and extruded sections; so also are such varied products as pressure vessels for ships, metal furniture, gas cylinders, golf shafts, traffic signs, fabricated light alloy goods, fishing rods, paints, cables and essential components of locomotives, cars, aeroplanes, to mention only a few.

All these activities are energised by the full resources of the group, and are subject to careful watch so that none shall fall below the jealously guarded standards set by TI at their beginning.

Tube Investments Ltd., 3 Grosvenor Square, London, W.1

Russian revolution. There is good reason to believe that the shop steward is as great a bar to industrial efficiency as the elected representative was to military efficiency. Day-to-day activities of the shop stewards are much more important than their manifesto, and the general evidence is that these activities seriously impede the drive towards increased production. This, however, is a matter which cannot be covered without undue trespass on your correspondence columns.—Yours faithfully,
57, Drayton Gardens, London, S.W.10 J. B. DUNCAN

["NCOs of Industry" was the title chosen for their manifesto by the shop stewards themselves. The implied change of attitude deserves, as our correspondent hints, more comment than it received.—EDITOR.]

Coal Target

SIR,—Mr F. B. Cope's suggestions in your issue of March 22nd as to how we can increase the efficiency of our industrial and domestic coal consumption are interesting, but I must confess to feeling sceptical as to their practicability. He recommends (1) the replacing of hand stoking of boilers by mechanical stoking, and (2) the substitution for the domestic open fire of stoves burning processed coal. These two measures are both excellent as a general principle, but surely they are essentially long-term projects? In its present state industry would be quite incapable of making the change-over quickly as well as continuing its normal production programme. In any case, although the measures are to be commended as a policy of reduction of smoke pollution and general economy, even if it were possible to make these changes in a short time, would the reduction in fuel consumption make any real contribution to the coal problem?

I should like to put forward as an alternative to the first proposal the increased use of colloidal fuel. Admittedly this needs a coal with low ash content, but I believe it has the advantages of (1) enabling crude oil with a low spark point to be used, (2) having a higher calorific value than the coal and oil separately, (3) being easy to regulate in actual use. The necessary crude oil could be supplied from fields in the sterling area and its combination with home-produced coal might reduce our demands on our tanker fleet, releasing them for more profitable cargoes.

In any case, it is not such expedients as these that will solve our problem. As Professor Robbins pointed out in his letter to *The Times* on February 14th last, "the root of the trouble is . . . deficient supply" and it is only by giving that problem priority, whether it be by introducing differential rations for the miners, the use of foreign labour, by importing coal from the USA, Poland or South Africa, or any other method, however drastic it may be, that we will make any recovery at all. As you point out in your current series of articles on the Russian economic situation, the Soviet Plan is concentrating on capital re-equipment, not the satisfaction of current consumer demands. It is doubtful whether such a policy would work here completely, but the wisdom of it is obvious, and if it comes to the choice of our getting coal or films from America then let us face the facts and cut our films.—Yours faithfully,
JOHN C. CLEWS
66 Wood Green, Wednesbury, Staffs

Census of Distribution

SIR,—It is all very well for Dr Barna to place on record his deep regret that the Government has decided to postpone the Census of Production until 1949. Dr Barna admits that he is an economic statistician; but were he to leave the academic atmosphere of the London School of Economics and talk to harassed managers and clerks in firms engaged in production I think he would find little support for his regrets.

The proposed Census of Production forms are extremely complicated. If reliable results are to be obtained from the Census, the forms must be filled in by responsible officials of the firms; that means taking them from some other work which already fully occupies their time. The result would be that production would suffer and the Census forms would be imperfectly compiled. The Government would waste time on an analysis of inaccurate returns.

The statistical material already rendered to the Government is enough for them to obtain a fairly complete picture of the national economy; and to make what plans they feel necessary. Dr Barna himself admits that were the Census taken in 1948 it would be well in the 1950s before we obtained an overall picture. Yet surely, by the 1950s the shape of our economy will already be decided for better or for worse. The delay of one year in taking the Census can make little difference in that respect; it may well be of inestimable value in increasing production this year and next.

Lord Keynes said that in the long run we are all dead. Dr Barna should realise that unless we have more production and less form-filling in the years to come we may well all be starved by the 1950s; and overall pictures of our economy will be poor substitutes for food.—Yours faithfully,

K. C. STUART

Corodale, 9 Elm Road, Sidcup, Kent

Dollars and Tobacco

SIR,—The Government has stated its intention not to ration tobacco. This means we shall continue to spend 32 per cent of the dwindling dollar loan on tobacco—until the loan is exhausted.

It is not for me to enlarge on the ways in which the loan might be better spent; it is evident that it could hardly be consumed worse than in smoke. We smoke more than is good for our health; we cannot afford it; and we must cut it down.

The obvious and fair way is to ration tobacco. Put tobacco and cigarettes on personal points, whilst doubling their value in terms of sweets, and many (particularly women) would take more sweets and cut out their smoking. This, apart from the size of the ration, would reduce the consumption of tobacco (which costs dollars), whilst the additional sugar and cocoa required by the sweet trade is available in the sterling area.

The chief reason given for the refusal to ration tobacco is the danger of a black market; but if non-smokers had the alternative of a larger sweet ration, the temptation to sell the ration to smokers would be greatly reduced.

The alternative to rationing is to have our tobacco cut off altogether (like our electricity) when the dollar loan comes to an end. Is it too much to hope that the Government will take measures to meet this contingency before it occurs?—Yours faithfully,
R. V. ALLEN

Vernell, Trinity Square, Llandudno

[The annual rate of dollar expenditure on tobacco is less than 3.2 per cent.—EDITOR.]

Exports and Inflation

SIR,—May I venture to point out that a large and increasing volume of exports is bound to have a further inflationary effect. None of the workmen who produce the goods for export can buy what they produce, but they are paid salaries and wages, and shareholders receive dividends.—Yours faithfully,

G. W. WILSON

Raceview Mills, Ballymena, Co. Antrim, N. Ireland

From *The Economist* of 1847

March 27, 1847

One of our contemporaries has started the idea, that the present ministers propose to legislate rather by the help of the privy council than by parliament. . . . Composed of aged statesmen and lawyers, of responsible ministers, of men eminent in every part of government, the privy council seems to be almost the beau ideal of a legislative body. . . . The House of Commons, however, filled with contentious, ambitious, factious men, struggling and fighting for power; at one time deferring to popular clamour, and at another, when proud of an expected life of five or six years, setting at defiance the public voice; now swayed by the landlords, and anon yielding to the pressure of the master manufacturers or the cry of the operatives; at one time pulled by bankers, and at another by those who decry the money classes—seems as little calculated to make good laws as any other mob of an equal number of persons. . . .

The element of publicity is the distinguishing difference between the parliament at present and the privy council. . . . The press connects the parliament with the public, and gives it that popularity and power of which the secret proceedings of the privy council must even deprive this body. . . . By the press, the opinions of the House of Commons are made known; and by the press public opinion is made known to the House; it thus becomes an adequate representative of the public, mutually acting on it, and by it acted on. As an instrument for at once fashioning and carrying out the public will, it is highly prized, and any attempt to supersede it by the secret deliberations of the privy council, would be intensely resented.

Books and Publications

Decline and Fall

"The Last Days of Hitler." By H. Trevor-Roper. Macmillan. 237 pages. 10s. 6d.

MR TREVOR-ROPER is a Fortuna among historians, and there must be some gnashing of teeth in Elysium. Who killed Sir Edmund Godfrey? What is the truth about Mary Queen of Scots? Ingenious brains have wrestled, centuries later, with these and other similar riddles; how often must they have hankered for just half an hour's conversation, half a minute, even, with just one eye-witness. And here is Mr Trevor-Roper faced with the makings of the biggest historical riddle yet, a riddle not merely of academic interest, but carrying the seeds of a pernicious mythology, and enabled within a few weeks of the event to cross-question with official authority, to examine original documents, inspect sites, check every item of evidence, and present what may reasonably be considered the final solution.

His extraordinary story recalls, inevitably, the Roman Byzantium of Gibbon; it recalls the seamier aspect of Machiavelli and, occasionally, the less elaborate politics of a Zulu Kraal. Nazi Germany's leading politicians, says Mr Trevor-Roper, "were not a government but a court," and here is a story of court intrigue.

The characters are introduced against a rapidly sketched background of war history. Goering, Hitler's heir, who had, by 1941, taken Hitler's word for it that the war was won and lived like an oriental satrap in his country palace; Bormann, Hess's ex-deputy, Goering's bitterest enemy, "a mole-like creature who seemed to avoid the glare of daylight"; Himmler, who "despaired of understanding" why foreigners thought him a monster, and impressed Albert Speer as "half schoolmaster, half crank"; Goebbels, the prize pupil of a Jesuit seminary; and a host of minor hangers-on. The narrative proper begins with the Generals' Plot of July, 1944. From that time on, Hitler and his Court were separate from, and in opposition to, Army Command, withdrawing further and further into unreality in an atmosphere of astrology, quack medicine, hysteria and, for contrast, crazy domestic tea-parties. Withdrawing, too, into narrower and narrower physical circles—besieged Berlin, the Chancellery, the Bunker—until the final scene when the corpses of Hitler and Eva Braun were carried out into the Chancellery garden, soaked in petrol, set alight, and left to sizzle while the survivors relaxed over their cigarettes.

The story of these last days, and of the final flight from the Bunker of the court Rump, has been pieced together from the narrative of some twenty witnesses, including three who actually saw or took part in the burning of the bodies of Hitler and Eva Braun. The wider history of the Nazi Court rests largely on the testimony of Albert Speer, who emerges as the one reasonably sane and sympathetic character in the whole gallery. It is with a judgment on Speer, the peaceable and constructive architect, the administrator of genius, the solid non-political, the essentially sound German, that Mr Trevor-Roper concludes his Epilogue. Because he saw clearly, yet did nothing; because, sitting at the centre of political power, he washed his hands of power's consequences, he is "the real criminal of Nazi Germany." The judgment is the harsher because Mr Trevor-Roper evidently, like everyone else who came in contact with Speer, rather liked him. It would have been easy for the historian of such events to overdramatise the ready-made melodrama, or, shrinking from that melodrama, to seek safety in a colourless official style. Luckily, Mr Trevor-Roper can write as well as conduct researches. It would be too much to say that he does full justice to his theme, but, considering the theme, that would be much indeed. He may not be a Gibbon, but Gibbon would have approved of him.

The British In India

"The British in India." By P. T. Griffiths, C.I.E. Robert Hale. 222 pages. 10s. 6d.

MR GRIFFITHS's short and extremely fair answer to the question, "Have the British given India a square deal?" makes a most timely appearance. The British are ready, even eager, to quit India, but the people of this country would be glad to think that two hundred years of British rule had not been detrimental to that land, and that the Indian claim (expressed in the Congress Party pledge) that "the British Government has not only deprived the

Indian people of their freedom, but has based itself on the exploitation of the masses, and has ruined India economically, politically, culturally and spiritually" is untrue. This claim has been so widely broadcast that many countries, including America, think there must be some truth in it, and even some people in this country wonder if there is not some sort of fire underneath so much smoke. So Mr Griffiths (with first-rate equipment, first as an official for fifteen years and then in non-official posts of importance for ten years) sets himself to answer the question, "Have the British been tyrants or benefactors?" In so short a book there is some inevitable over-simplification, but there can be no doubt of the author's sincerity, impartiality and competence.

The charge most often made is that of "exploitation." It is true that till 1813 the East India Company enjoyed a monopoly in some goods, and that for the next fifty years Indians showed no desire to engage in commerce; but they were always perfectly free to do so, as their later success in ruining the Lancashire cotton export trade clearly shows. Statistics also show that since 1870 the proportion of trade with Britain has steadily decreased, while the percentages of exports and imports to and from foreign countries has doubled or trebled. Can this be described as "exploitation"? Mr Griffiths admits that the Administration might have done more, during the last thirty years, to develop new industries, but as regards agriculture, the health services, irrigation, transport, internal and external security, and equality before the law, the gain to India has been immense. Mr Griffiths, in fact, makes out a convincing case for the benefactor *versus* the tyrant point of view in India's development.

Jewish Problem

"The Emergence of the Jewish Problem, 1879-1939." By James Parkes. Issued under the auspices of the Royal Institute of International Affairs. Oxford University Press. 15s.

FROM a starting point, twenty years ago, as research secretary of International Student Service, James Parkes has built himself into the greatest living gentile authority on the Jews. His new book, published under the auspices of Chatham House, is worthy of his reputation and of that Institute's good name for unbiased surveys. Implicit in his title is the assumption that a new Jewish problem emerged in 1879. Mr Parkes picks on his opening date because he sees the modern problem as one facet—a major facet—of the struggle between liberalism and authoritarianism. In the liberal heyday of the mid-nineteenth century anti-semitism was, he argues, a matter of individual prejudice born of hearsay or personal experience. Since then, it has become a weapon deliberately created and artificially fostered for a political purpose.

Politician after politician has used it to combat liberalism and to mask authoritarian practices. Thanks to an existing "background of susceptibility," each has been able by its means to harness and unite the most diverse elements in his support. The difference between Hitler and his predecessors—Bismarck, the Tsar and the men who knew that the Dreyfus *bordereau* was forged—is simply one of scale. No one until Hitler dared to flaunt humanity and extend the attack to the limit: to apply it to the very bodies of six million Jews.

Have his excesses re-awakened conscience in the gentiles, or are they still gullible because the lesson has been lost on them during the horrors and excitements of total war? Perhaps Mr Parkes will answer this question in the sequel in which he intends to cover the years since 1939. Meantime, his plea is that gentile as well as Jew should work to cure the maladjustment which renders the latter insecure and the former insensitive to the point of a morality. This essay on anti-semitism forms one-third only of the book. The other two parts are admirable historical surveys of this generation's two liberal attempts to adjust the problem—the first, the Minority treaties, the second, the British effort to found a Jewish national home in Palestine. The first Mr Parkes shows for a total failure; about the second he is not sure.

Correction

In the review of *Economics for the Exasperated* in the issue of February 15th the author was incorrectly referred to as Mr Rattray instead of Mr G. Rattray Taylor. We apologise for this oversight.

AMERICAN SURVEY

Greeks and Gifts

(From Our US Editorial Staff)

THE speech in which Mr Truman proposed on March 12th a totally new foreign policy, to go into action on March 31st, took the lid off a witches' brew of hopes, fears and prejudices. The figures that steamed out in the first days of the hearing before the Foreign Affairs Committee of the House of Representatives were mostly in the guise of question marks. Those still to be discerned in the boiling confusion seem to have at least two heads apiece, and to be geared for simultaneous motion forward, backwards and sideways. Nor has the timing helped to clarify the mixture. If the lid could have been lifted more gradually, the brew, simmering slowly, might have appeared more seemly, but the demand for haste on matters of such importance, having implications without metres or bounds, has shocked even a people conditioned to government by crisis into revelations that surprise themselves.

Not the least startling of these revelations is a sudden vision of Uncle Sam donning the tunic, shield, shin-guards and short sword of a military republic. Yet the Roman parallel haunts those who do not like their civilian diplomacy and their military philosophy to be fused. At this moment the nation's foreign policy is in the hands of the former head of the General Staff, an ex-Chief of Staff of SHAEF is ambassador in Moscow, military pro-consuls operate in Germany and Japan. Selective Service (which is the American euphemism for conscription) has been dropped, but the machinery for re-constituting it has not been dismantled, and Congress is considering universal military service for all young males. Meanwhile, two years after the ostensible end of the war, 30 per cent of the national budget is still earmarked for defence. The pre-war proportion was around 12 per cent of a much smaller budget.

From this vision in the misty mirror, Americans react with immediate distaste. Almost the first question asked Mr Acheson, the Under-Secretary of State, by the Foreign Affairs Committee was whether the new policy meant war. Americans do not want war, they are sensitive to charges of military intervention. Even when, earlier in the century, they sent marines into Latin America to help collect bad debts, they did it piously, and nothing in their history has led them to dream of parading as armed empire builders, or as schemers who arm mercenaries in a distant land to guard the outposts. Protests arising from this sensitivity have already reached Congress.

The second disturbing vision, directly allied with the first, is that of Uncle Sam, having lavished hopes and cash on the United Nations, by-passing that organisation in favour of unilateral action in an emergency of the very type for which everyone thought the United Nations was designed. Criticism along this line has been so loud and pained that Senators Vandenberg and Connally have proposed a new preamble to the Administration's Bill which expressly states that American action is contemplated in view of the fact that "the United Nations is not now in a position to furnish to Greece and Turkey the financial and economic assistance which is immediately required," and "the furnishing of such assistance to Greece and Turkey by

the United States will contribute to the freedom and independence of all members of the United Nations in conformity with the principles and purposes of the Charter..." The preamble is not subject to Russian veto.

On the other hand—and in its present phase the discussion which surrounds Mr Truman's new policy has almost as many hands as Briareus—the move to counter Russian expansion is to many Americans very welcome. In a people rapidly recovering from war weariness, and eager to get on with the business in hand, the continual Soviet policy of saying "No" has developed a degree of irritation which is almost as impelling as more profound fears. Having discovered, as a surprising number of Americans think they have, that attempts to work with the Russians result in nothing but new stone walls, the logical next step would be to explore ways of working without them. If One World is impossible, what would be the boundaries of Two Worlds? And how can those who want to work be sure that those who want to obstruct will stay at home and keep out of the way? To conceal those questions has been to exacerbate distrust, and a policy that brings them out into the light may have a merit that will counterbalance its perils.

Thus the Administration's first ally in pushing through the new policy is this attitude of apprehension and irritation toward Russia. A possible second ally, the idea that this nation, now the richest and most powerful in the world, must accept from the tired hands of Britain responsibility for a rather unsightly share of what used to be called the white man's burden, is more difficult to exploit because it meets resistance in old prejudices and disbeliefs. If too much stress is laid on the desirability of assuming British commitments, Americans begin to look at maps, to discover that Palestine lies not far to the south of Turkey, and that Saudi Arabian oil fields are not too remote. Russia has already mentioned the latter fact, and American liberals who have already said that they do not like the idea of propping up a weak king, might decide that they also do not like policing the headquarters of the Suez Canal.

No alternative to the Truman proposal has yet been seriously presented, but the Administration's bill will hardly go through without amendment. The preamble is already under revision. A suggestion has been made, and vigorously refused, that Greek aid might be separated from Turkish. The latter is tied to the stronger Greek case, perhaps in the hope that its predominantly military character might be overlooked.

Meanwhile the costs of the new policy, both in its present stage and its not impossible future development, occupy Congressional attention. Hearings on promised tax cuts are proceeding as calmly as though in sound-proof cells, but the sums already spent on Greece make it difficult even for an optimist to believe that half of the famous \$400 million will put Greece back on her feet. Since VE Day she has, according to figures recently released, had the following sums:

from UNRRA, \$345 million (of which \$254 million came from the USA);

from the USA, \$181 million (lend-lease, surplus property, Export-Import credit, maritime aid, etc.);

from Britain \$44 million (a loan which was later made a gift, plus surplus property credit).

This totals \$570 million, and averages \$185 million a year, to which should be added \$30 million flowing annually from the Greek-American colony in the form of emigrant remittances.

Other countries are also indicating other needs. Korea has

suggested that she could also use \$400 million. China changes the figures, adds more ciphers, thinks she would like \$1,600 million. Americans can hardly be blamed if they begin to wonder what will happen when all is spent.

Such considerations explain the sudden enthusiasm for such United Nations organisms as the World Bank, which might help take the contemplated load off Uncle Sam's shoulders. Few Americans have learned to contemplate with equanimity a world in which sixty other nations appear to be facing bankruptcy and are eager to borrow. Nor does it help to be told that, under present conditions, if the World Bank were prepared to grant the needed loans it would be largely for the reason that American bankers had seen fit to direct capital that way. The wriggling that goes on in an attempt to escape the implications of America's present financial strength would break the back of an agile anaconda.

Meanwhile, related uncertainties do not make the road to

Robert A. Taft

(From a Correspondent in Ohio)

THE eight years which Robert Alphonso Taft has spent in the Senate has proved his exceptional ability as a legislator. But his first ten weeks as actual majority leader have only intensified the debate over his fitness to serve as Republican Presidential candidate in 1948. There is surprisingly general agreement on the Ohio Senator's merits. The debate is over the future significance of his shortcomings.

On the affirmative side, all agree that Mr Taft is a slow, hard, deliberate worker, with an insatiable hunger for facts. He has the best mind in Congress and the largest fund of information—on domestic affairs; and he says precisely what he thinks. No one questions his honesty and integrity. He is confident that the Republican victory last November was due to the people's demand for more freedom—as individuals, in local self-government, in business, in the relations of management and labour. And he has been the most consistent defender of "free enterprise" against the encroachments of "statism."

Under the pressure of facts, however, Mr Taft has lately altered many of his earlier views. No longer can his opponents pin on him the Harding label, "Back to Normalcy." Frankly worried about the business cycle and fearful that another great depression would destroy America's relatively free economy, he is seeking a congeries of preventives without "socialistic controls." Thus, when he proposes Federal Government aid to create a "minimum standard floor under public subsistence, education, housing and medical care," he insists that administration be left entirely to the state and local governments. Taft calls himself "a liberal conservative." Since the 80th Congress convened he has been trying to steer a middle course between the more liberal wing of his party, as represented by Senator Morse of Oregon, and former Governor Stassen of Minnesota, and the more conservative wing represented by the majority whip, Senator Wherry of Nebraska, and Mr John Bricker, his junior colleague from Ohio. As chairman of the Republican Policy Committee, Mr Taft has counselled moderation in revising the Truman budget, reducing the public debt and drafting new labour controls. He has stood aside from the Republican attack on the reciprocal trade programme and recently startled a Cincinnati audience by declaring that "no one wants to go back to the making of tariffs by Congress." Finally, Mr Taft is on record as endorsing the nation's bi-partisan foreign policy. Today he stands near the centre of his party, an object of some suspicion to certain right-wing Republicans.

On the negative side, Robert A. Taft is still held to be woefully lacking in "political sex-appeal," despite the services of a full-time publicity agent. He has inherited—or at least displays in public—little of the legendary joviality of his father, the late President and Supreme Court Chief Justice, William Howard Taft. The Senator does not suffer fools gladly, even in his own party. As the arch-enemy of the Roosevelt New Deal, he was identified in the public mind with the reactionary wing of

decision any easier. If the State Department knows what Britain means to do about other European problems when she gets her troops out of Greece, that information has not reached the American people. Does this withdrawal herald a long-term shift in British policy, or is it merely the device of a Labour Government which, finding it uncooperative to deal with a particular king, decides to seek greener pastures nearer home? Is Britain dropping distant commitments in order to carve an area of vital interest in Western Europe where maintenance charges will be less and heads of government more the kind of people with whom Labour likes to deal?

The American people are learning that the concomitants of power wear many faces. The process of learning is so difficult that only the possibility of action sustains them. At the moment, Congress is showing itself aware that when Americans prepare to reverse an ancient adage, they must also exercise care in picking the messengers they will send bearing gifts to Greeks.

the Republican Party, and many of the independent voters, who swung the balance of power in the last election, would still place him there. One of his faults is a dogmatic style of utterance which irritates his opponents unnecessarily and cuts off his path of retreat, or makes it difficult, later, to persuade the public that he has really changed his mind. He opposed Bretton Woods and the British loan, and many observers believe that he will keep hands off the reciprocal trade programme only until the present Act expires, in 1948. For the present, he would leave the tariff-making power with the Tariff Commission, though opposing full use of its legal power to lower rates.

A leading isolationist before Pearl Harbour, Senator Taft voted against conscription, lend-lease, the transfer of the 50 destroyers to the Royal Navy, and the revision of the Neutrality Act. He has enraged the liberals by opposing the nomination of Mr David E. Lilienthal to the chairmanship of the Atomic Energy Commission, and before that he scandalised them by attacking the legal and moral justice of the Nuremberg trials. Like Governor Dewey of New York—and President Truman—he has not hesitated to play politics in attacking the British administration of Palestine. Recently, under the senatorial division of power, he has tended to leave foreign policy to his co-leader, Senator Vandenberg, chairman of the Foreign Relations Committee. But Mr Taft still frowns upon American commitments abroad, financial, economic and, especially, military. Although he is expected to approve the Truman programme of aid to Greece and Turkey, his traditional isolationism is seen to be cropping out again in his warning against the danger of war with Russia, and his suggestion that the Administration's policy toward Greece might be compared to Soviet intervention in Cuba. Many Republicans to-day cannot envisage Mr Taft in the White House at a time when the United States may be embarked upon a world-wide extension of the Monroe Doctrine, directed against Soviet totalitarianism.

The above is a brief outline of the kind of public debate that whirls about the head of the most powerful figure on Capitol Hill. His role of leadership in Congress has both assets and liabilities. In recent weeks the liabilities have been more evident, and Mr Taft's reputation as the "master-mind of Congress" has worn a little thin. This is due to various causes—natural reaction, party conflicts over domestic policy, covert attacks of rival '48 hopefuls and the increasing gravity of foreign affairs. Mr Taft sought to evade attack, and also to retain his independence, by permitting mild-mannered Senator Wallace White of Maine, to become majority leader, while he directed strategy from the vantage-point of the steering committee. Here he has been disappointed. The Republicans are split, more or less deeply, on the budget, labour legislation, income tax reduction, the Lilienthal appointment, and now the extent and nature of foreign commitments. What has been called "the best-organised Republican Senate in American

"AMERICAN SURVEY" is drawn from three sources. Articles described as "From Our US Editorial Staff" are the work of a small group of regular correspondents, resident in the United States. Articles with some such attribution as "From An Industrial Correspondent" or "From A Correspondent in Ohio" are from outside contributors. Everything printed without attribution is prepared in London.

history" betrays some signs of bogging down. Standing in the centre of the target, Senator Taft is blamed for the fact that after ten weeks, no major piece of legislation is near enactment. He is under attacks by Democrats, independent Republicans, nervous conservatives, and friends of rival candidates for the Republican nomination, especially of Mr Stassen and Mr Dewey. These last supplied much of the motive power behind the demand of 16 freshman Republican Senators for a greater voice in policy-making.

Mr Dewey and Mr Stassen are still ahead of Mr Taft in the public opinion polls. As Governor of New York, Mr Dewey enjoys a steady gleam of national limelight, while remaining free from national responsibility. In the American phrase, he is "sitting pretty." Mr Stassen, now on his well-advertised study-tour abroad, keeps himself on the fringe of national attention and stresses his interest in world problems. Mr Taft's fellow-Chioan, Senator Bricker, has temporarily dropped out of the campaign speculation, chiefly because he made a heavy-footed speech at the Washington Gridiron Club dinner—that proving ground for presidential ambitions. Generally, however, it is not the party rank and file, but the top national party leaders who determine the "availability" of presidential candidates—Mr Willkie was an exception. Here Mr Taft is fortunate: he has always been "regular." Although some conservatives have been eyeing him narrowly, he has not wandered far off the reservation. His great weakness is still his low standing, thanks to those isolationist leanings, with the Eastern branch of the party. To carry New York is almost indispensable to victory. Mr Taft has the hardest job, and the most vulnerable position of any Republican contender. His is the main responsibility for the success of the Republican programme, and that success is vital to his presidential hopes. He may soon find himself in the fatal position of having responsibility without influence.

American Notes

The Enemy Within

The new policy of "containing" Communism in Greece and Turkey, and later, perhaps, in Korea and South America, is paralleled, in domestic affairs, by a new determination to wipe out Communist influence inside the United States. Each feeds the other. The "Truman line" justifies the domestic Red hunt as a measure of national security as well as drawing support for stronger measures of foreign intervention from the private fears of many Americans. This is a reinforcement never enjoyed by A. Mitchell Palmer, the Red-hunting Attorney-General after the 1914-18 war.

The Civil Service will be the first to feel the brunt. A fortnight ago the Supreme Court upheld the dismissal, by the Civil Service Commission, of an employee suspected of Communist sympathies. "Reasonable doubt" of the loyalty of an employee to the United States is now enough to warrant discharge. Mr Truman has swiftly ordered a purge—to cost between \$15 and \$20 million—of over 2,000,000 Government employees. A list of all Communist, Fascist, and subversive organisations is to be compiled, and membership in any of these may be grounds for dismissal. One hopes that the standards will be more selective than the "prematurely anti-Fascist" label with which the State Department is said to have branded sympathisers with the Spanish loyalists.

There will be a tendency for liberals, both in the United States and abroad, to decry the new "witch hunt"; and it is tragically certain that many innocent people will be humiliated and perhaps victimised. The Canadian spy scare, the arrest of Gerhard Eisler, reputed "boss" of the American Communists, and the impudence with which one of his aides justified forgery and other crimes by reference to a "higher morality" have excited the professional anti-Communists to a pitch which will not be very tender with any unorthodoxy. Yet it should be borne in mind that many good liberals and labour leaders, whose devotion to the working class is unquestioned, are seriously alarmed about the disruptive tactics of the Communists. Not long ago, the Secretary of Labour, formerly a staunch New Dealer, left the Rankins and the Hobbes far behind when he proposed a legal ban upon the Communist Party. He would refuse Communists places on electoral tickets; he would ban them from labour unions, government jobs, and even from membership in Chambers of Commerce—a prohibition which would not seriously alarm the party organisers.

Anti-Communist drives are going on, with varying success, in a number of unions, particularly those affiliated with the Congress of Industrial Organisations, led by such men as Mr Philip Carey. In a new amalgam like the United States it has been a necessity of survival to reserve the most violent resentment for Americans who cherish an overriding loyalty to some outside power. It is a proof of the clumsiness of the American Communists that they have touched this most sensitive nerve.

Judgment in Georgia

When "Gene" Talmadge, Georgia's governor-elect, died before taking office, his son, with the aid of the Georgia legislature, and a loophole in the state constitution, brazenly tried to assert his right to succeed his father as governor. The Supreme Court of Georgia has now demolished this claim, and recognised Mr Thompson, the Lieutenant-Governor, as the legal heir. But ironically enough, this display of judicial stamina may not necessarily serve the cause of good government.

The Talmadge organisation, which remains in handy control of both branches of the legislature, has always stood for white supremacy and the disfranchisement of the negro. In this they expressed the dearest prejudices of their supporters, the "wool hat boys from the piney woods," the impoverished and ignorant whites of Georgia's back country. The first step of the Talmadge forces was to attempt to get round a decision of the Supreme Court of the United States, now two years old, which declared it contrary to the Federal Constitution to prevent negroes from voting in the party primaries. The primaries, which are preliminary contests inside the political parties between would-be candidates, decide the issue in the South, where the Democratic candidate has no opposition from the Republicans, and there is virtually a one-party system. The Talmadge scheme—and it is one which is favourably regarded in other Southern states desperately seeking to avoid mixed primaries—was to strike all references to the primaries from the State constitution and statutes. It was hoped that if the primaries could be made to appear a purely private function of the Democratic party, the writ of the Supreme Court would not apply.

But the defeat of Mr Herman Talmadge is not the same thing as a defeat for the white primary. The new governor is quite as strong a supporter of white supremacy, though he would use more genteel means to attain it, such as higher educational qualifications for would-be voters.

The legal and extra-legal battle between the Talmadge and Thompson forces aroused many citizens of Georgia to form a series of reform committees. One aim was to deprive the Talmadge forces of recognition as the authentic Democratic Party in Georgia. Another was to do away with the antiquated unit voting system which gives an unfair weight to rural votes as against urban votes, and is the backbone of the Talmadge power in Georgia politics. It will be a pity if these energies are dissipated by the mistaken impression that Mr Thompson's designation as Governor means that the forces of righteousness have triumphed and no further efforts at reform are needed.

Oil Prices and Output

A fresh advance in crude oil prices has given another hoist to the rising trend of commodity prices—the Moody index of spot prices is now above 423, against a high of 381 for 1946.

The industry has been debating the latest adjustment for some time, the pressure for another advance coming mainly from the smaller groups within the Independent Petroleum Association, which carries considerable influence in Washington. The basis for the demand has been the increasing cost of labour and materials, more especially in respect of development work. The argument has been that not only are absolute costs rising, but that work in established fields is gradually demanding progressively deeper drillings in order to sustain output. The larger refinery groups have also been in sympathy with the claim that prices must be adjusted in some measure for development costs. They claim that they have been forced to pay advancing premiums to "wild-cattling" operators in order to assure plentiful supplies, and that every new "discovery" in recent months has been followed by a flood of claims from rival refineries for definite sales contracts.

Until quite recently, however, pressure for another price advance was resisted on the basis that the industry has already enjoyed a considerable increase since the old Price Control ceilings were abandoned, and that any further increase at this stage would

bring considerable public resentment. Moreover, profits are good, supplies may soon show some expansion, and additional pipeline capacity is nearing completion.

Statistical factors, however, have evidently outpointed the moralists. Apart from a brief dip in 1942, the industry has continued to mark each year with a new peak in crude petroleum output, the 1946 total of 1,731 million barrels, comparing with 1,711 million in 1945, and with 1,265 million in 1939. It is worth noting, incidentally, that the value of this crude output at the wells was given at \$2.4 billion, against \$1.8 billion for coal.

For standard quality mid-continent crude, with a 1946 price range of between \$1.17 and \$1.62 per barrel, the quotation is now solid at \$1.87, and even the low 1946 quotation represents an adjustment of the earlier OPA ceilings. With demand this year running at high levels, it seems likely that only a sharp setback in the general pace of industry can reverse this trend. The independents were recently calling for a stabilised rate of \$2 a barrel for crude in the south-western and mid-continental zones.

Foreign Credits—

Apart from the supply of \$48 billion of goods and services on Lend-Lease terms, and the provision of a further \$3.4 billion on relief terms, the United States Government had total foreign credit commitments of \$9.2 billion at the close of last September, "excluding original World War I credits of \$10.4 billion."

This close parallel with the earlier war debt structure, notwithstanding the vast total of Lend-Lease and relief finance, is declared to be an "arresting though possibly irrelevant, circumstance" by Mr John Shiner of the Department of Commerce, in a detailed survey of the new credits structure which appears in the January *Bulletin*. The total of \$9.2 billion embraces loans, property credits, Lend-Lease settlements, war surplus disposal and shipping credits, and commodity advances. It covers \$3.9 billion in actual disbursements, \$2.7 billion in outstanding balances (disbursements less repayments of principal) and \$6.5 billion in credits not yet drawn upon by foreign countries.

The following table gives figures for the countries mainly concerned:—

	(Million Dollars)	Dis- bursements	Balance Outstanding	Unused Credits
American Republics	971	322	294	294
United Kingdom	1,264	1,102	3,561	120
China	180	81	120	1,218
France	733	728	263	180
Netherlands	134	132	192	
N.E.I.	20	20		
Soviet Union	159	49		
All Countries	3,903	2,679	6,551	

The survey covers a very small balance of Export Bank loans made from 1934 onwards. But on V-E Day, outstanding foreign credits, including the \$425 million Reconstruction Finance Corporation credit to Britain, and undrawn credits, were then no more than \$374 millions. By September last, Britain and France together accounted for more than two-thirds of credits outstanding and undrawn.

Apart from export bank credits still unused (and excluding relief provisions which will not affect the balance of payments in future years) the Federal Government has by now exhausted all but a residue of its direct authority for credits. Unused credits of the Export bank, however, then totalled \$850 millions (with \$500 millions earmarked for China) and RFC commitments and surplus property deals are expected to increase credit commitments to a total of \$10.4 billion "as an outside estimate."

—And Service Charges

These estimates, of course, exclude operations of the World Bank and the International Monetary Fund, institutions which are "expected to relieve the US government of the necessity of making substantial new foreign loans." Without them, however, Mr Shiner estimates that the future debt service, both for interest and amortisation, will rise from \$164 millions in 1950 to \$331 millions in 1951 (when initial payments become due on the loan to Britain) and the first amortisation balance becomes due on the war settlement credits for France). In 1952—the peak year on this estimate—service charges will be \$366 millions, falling

below \$300 millions in the early 1960s and to below \$250 millions by the late 1970s.

Mr Shiner, in fact, underestimates the total, owing to the difficulty of computing charges on certain of the Export Bank loans, and the service charges given above cover \$8 billion of credits only. Since the bulk of the remaining credits will be Export Bank loans on which charges are rather higher than in the case of special post-war credits, it is reasonable to assume that on a \$10 billion level, charges will advance by at least 25 per cent, or to between \$400 and \$450 millions in the 1950s. And to that charge must be added about \$350 millions for net receipts from pre-war assets, and \$150 millions for amortisation service on that score.

Early in 1946, the US government estimated that total service charges on all Export Bank credits, the loan to Britain, and World Bank loans would be less than \$1 billion yearly. The United States subscription to the Monetary Fund will be \$2,750 millions, and for the World Bank, \$3,175 millions; while it is not possible to give any precise figure for service charges in this respect, it is difficult not to believe that terms for World Bank loans will be rather more onerous than those on existing credits, for apart from continuing uncertainty on Wall Street, concerning the status of the World Bank bonds, that institution is required by charter to charge at least one per cent above the rate paid on its own bonds.

On the assumption that World Bank loans on the American market reach, or exceed, the amount of the US subscription as a member, the total service charge on all US commitments is likely to be quite substantially above the \$1 billion level, for there will no doubt be some outflow of private capital.

It is, of course, far too early yet to make any definite conclusions concerning the relative burden of these loan charges. In terms of an expanding world economy, the World Bank loans themselves should do a great deal to correct the position. But there are three factors which at the moment serve to be rather disconcerting. The first is the fact that the process of restoration now seems likely to be far more protracted than seemed possible at one time—the deterioration in the position of the United Kingdom is formidable evidence of that. The second is the political instability, which must create a very unfavourable atmosphere for the World Bank. The third is the continuing unwillingness of US politicians to accept the conclusion, again stressed by Mr Shiner, that "ultimate imports (including invisible items) in excess of exports would appear to be a major requisite" of American policy.

Shorter Notes

The *New York Times* lent the *Daily Worker*, the Communist newspaper, 16 tons of newsprint a fortnight ago, rather than see the *Worker* suspend publication. This is an exaggerated index of the gravity of the newsprint crisis. The United States still absorbs four-fifths of Canadian production; it has more newsprint than ever, but with the boxcar shortage, there is difficulty about transport. It is also alleged that since the lapsing of paper controls, large firms have been squeezing the small weeklies and dailies out of the market. The threat of a revival of controls has produced, on the part of 40 of the largest newspapers, a voluntary share-the-newsprint plan.

The people of Greece and half a dozen other countries may derive little benefit from proposed American loans and relief if Congress succeeds in scuttling the controls which make it possible to turn loans and appropriations into wheat and sugar and fertilisers. A Bill introduced by Senator Taft, which would retain controls only on tin and a few medical requirements, has the avowed aim of ending American participation in the International Emergency Food Council. Food allocation, export controls, and boxcar priorities—all of the greatest moment if devastated areas are to continue to live on American wheat and coal—expire with the Second War Powers Act on March 31st unless reprieved by Congress.

The Senate has adopted, by 59 votes to 23, a constitutional amendment to limit the tenure of the Presidency to a maximum of ten years. Attempts will now be made to reconcile it with the House measure, which limits a President to two terms. An amendment limiting the terms of all Federal officials, including members of Congress, to six years, was turned down with only one supporting vote—that of its author, Senator O'Daniel of Texas.

THE WORLD OVERSEAS

The Persian Elections

(By a Special Correspondent)

POLLING in Persia, which began on January 11th, is still unfinished because the provinces lately in revolt against the central government—that is, Azerbaijan in the north and Fars in the south—have yet to vote. But the results available are sufficient to show the way the wind will blow in the new Majlis. The Prime Minister, Qawam es Saltaneh, is going to retain power, backed, at least for the moment, by a heavy majority of individuals and factions. All but two of Teheran's twenty-four daily papers are backing him; many splinter parties and individuals who would have opposed him if they saw a chance of power for themselves have leapt on to his bandwagon. Only the former *Tudeh* newspaper *Rahbar*, now called *Mardom*, sticks convincingly to its old policy. Otherwise the Tudeh party is in eclipse and the old professional politicians are in the ascendant. In Persia, as elsewhere in the Orient, nothing succeeds like success.

Success Mr Qawam has undoubtedly had during his year of office. His feats, to be measured, must be looked at through Persian eyes. First, he got rid a year ago of two out of three foreign armies of occupation on the date of promise. Then, after a struggle and at the price of some bargain unspecified, he got rid of the Russian army also. As a result, several economic hard-

The widespread tendency to do so was reinforced by Russian acts which even Moscow's admirers cannot but brand as mistakes. The armies of occupation, for instance, not only lived on the country but stripped it of real property ranging from its forests to the very doors and windows of its barracks. Again, the Russians placed power in the hands of Persians whom they may have believed to be imbued with a genuine wish to better the masses, but who—almost without exception—proved to be average Persians on the make. There has been, for generations, a faction in Persia which believes in accommodation with Russia rather than with the west. But this group has, for the moment, shrunk out of sight. It is a long time since Russia's reputation stood so low. The atmosphere is such that Mr Qawam has been able to raid trade union headquarters, to remove all former Tudeh officials and to replace them with his own friends without any protest of consequence from at home or abroad.

So the outcome of Mr Qawam's tactics, coupled with Russian mistakes, is popular support for old familiar faces who are anything but left wing. Once the Majlis meets, which may not be for another month or so (depending on how long it takes the government troops to condition the recalcitrant provinces for polling day), two big questions will face it. The first is whether to accept or reject the Russian oil concessions which Mr Qawam is pledged to put before it. The second is: how far must lip-service already paid to social reform be translated into action if the landlord class is to avoid further upsets from the left?

The oil question will be the first to arise. It will be remembered that the proposed terms provided both for the exclusion of all non-Russian concerns from the north, and for the formation there of a joint Russo-Persian company in which the Soviet Government will for 25 years enjoy 51 per cent of both shares and profits. Every Persian, in his present mood, will say that the Russian interpretation of such terms will amount to reoccupation, and that the Majlis must reject them. But in his breast lurks the fear that Mr Qawam may have promised to engineer their acceptance somehow, and that if not, the Russians have some card up their sleeve or they would not have left the north so quietly. He pooh-poohs as over-sanguine the suggestion that they realised, upon seeing the rapacious and self-interested behaviour of Mr Pishvari and the Tudeh leaders, that Persia is wholly unripe for social change and that this must be sought by long-term educative methods, not by short-term shock tactics. The future of the concession is an open question that may well not be finally settled for years.

And from it the deputies must turn to home affairs. Mr Qawam and his followers have proclaimed the need for social reform. They have promised provincial autonomy, and condemned illiteracy and devised a seven-year economic plan and propounded a new labour law. But they have so far given little or no practical effect to these intentions. The provinces are still ruled from the centre. An American commercial company, the Morris Knudsen International Company, has been hired to make an economic survey and has plans for proving, in a specimen area, how much could be done by the expenditure of millions on irrigation. But the men who have commissioned it are under no obligation to put its recommendations into effect, and are not in the habit of taking foreign advice if the consequence of acceptance is taxation of their own incomes. The new labour law is being applied, but so far only to foreigners, *alias* the Anglo-Iranian Oil Company. As planners, the Persians who are now being returned to power give the impression that they know all the patter. But—to quote one former American adviser whose unpalatable advice they scorned—they cannot pull themselves up by their own bootstraps because their boots have no straps and they have no will to make the effort. This is a sweeping condemnation, and they have had a fright since he coined his remark. Landlords in the north know that they must do something to improve the lot of the peasants, who now have an inkling that the laws of the Persians are alterable. Perhaps, therefore, the new Majlis will be stirred to make some improvements, but it is bound to make a sluggish start.

ships have eased since he took over; transport, for instance, was at a premium and has now become adequate. The products of the rich Caspian provinces can move south once again. Prices have been dropping from their wartime peak. As if to bless his *aplomb* and good fortune, Allah sent an excellent wheat harvest in 1946 to all parts of the country except the Afghan frontier districts. Finally, and to crown the list, he is personally responsible for the gamble whereby he defied all advocates of caution and sent troops north in December to "recover" Azerbaijan. He is able to leave the impression that resistance of all sorts collapses at his approach.

These victories, moral and material, account easily enough for the support he has won. Supplementing them are other factors. The first is a corresponding moral collapse on the part of the Tudeh leaders. It will be remembered that those in Azerbaijan (where they were called "Democrats") decamped over the Russian frontier. In Teheran, only a few days before the elections began, Tudeh headquarters announced and executed a sweeping purge which branded the party leaders as riddled with graft and at loggerheads among themselves. A new political programme which they simultaneously issued therefore failed to attract supporters. A majority of their chief-leaders have since conformed to fashion and changed coats.

Russia in 1947—III.

Planning Finance

[BY A SPECIAL CORRESPONDENT]

A FEW days ago the Soviet Deputy Minister for Education, writing in *Pravda* about the curricula of Russian Universities, stated that the text books on political economy that had been issued in 1938 and 1939 ought to be withdrawn and new ones substituted. Before 1938 and 1939 "heretical" economists had been completely "purged" and silenced and their text books banned. What then has proved to be wrong in the orthodox theories of political economy? Those theories—stated the Deputy Minister—"denied the validity of the law of value in Soviet economy." Translated from the Marxian into a more popular idiom, the phrase means that Soviet economists were until quite recently overlooking the importance of price relationships in the Soviet economy; and that this oversight must now be corrected. The Ministry for Education has commissioned a number of professors to write new text books in which due attention should be given to costs of production and prices.

The new emphasis on these problems is of more than academic interest. Revisions of academic theories are usually undertaken in Soviet Russia under the immediate pressure of current economic or political needs. In the conversion of Soviet economy from war to peace, costs of production and prices have acquired a very great importance, certainly to the surprise of those who believed that they were of no significance in a planned economy. In the course of the recent Budget debate in the Supreme Soviet the financial aspects of the Five-year Plan were thrashed out almost as much as were the problems of manpower, higher productivity of labour, etc. Indeed, the need to bring the financial issues to the fore has been so pressing, precisely because in previous years Soviet planners could—under the compulsion of circumstances—afford to neglect them. During the war, finance was simply disregarded. The quantities of tanks, planes, guns, ammunition and provisions alone mattered. "Control by the rouble," that is, national accountancy in terms of money, was hardly possible. In the later years of the war, the Government itself worked on the basis of budget estimates, but most of the industry was still unable to resume financial book-keeping. This did not prevent industry from functioning as effectively as it could; and to this extent it was true that under the planned economy financial problems were largely irrelevant. Yet, the enforced neglect of finance did prevent industry from controlling its own technical efficiency and the productivity of labour. Such control has now become essential in the conversion from war to peace; and much attention is paid to planning costs and prices.

How great has been the legacy of wartime financial disorder can be seen from the fact that by the beginning of last year 42 per cent of newly-built plants and factories, the construction of which was financed by the Promyshlennyy Bank (Industrial Bank), were not able to produce estimates of the cost of their constructions. By the beginning of 1945, as many as 51 per cent of such enterprises had worked without financial estimates. The financial disorder is now being rectified. In 1946 the accounts of 211,400 enterprises were audited by the Ministry of Finance and the Gosbank, compared with only 153,200 in 1945.

This auditing has disclosed a general rise in the costs of production. The average rise in the cost of building materials was about 25 per cent by the end of the war; and it has become much steeper since. Last year the Ministry of Aviation, for instance, put the average rise in the cost of its building materials at 43 per cent; the rise in the cost of timber at 67, of bricks at 47, and of cement at 39 per cent. The variations probably reflect the varying degrees of scarcity of materials.

However, the most striking illustration of inflationary trend has been provided by the magnitude of the national bill of wages and salaries planned for this year. It amounts to 280 billion roubles. The last pre-war bill, that of 1940, was only 162 billion roubles. The sum total of wages and salaries has risen by 50 per cent, compared with a rise in employment by only 4 per cent. What is most striking is that this year's bill of wages and salaries is to be higher by nearly 30 billion roubles than that planned for 1950, the end of the Five-year Plan, when employment is to be by several millions higher than at present. This suggests that already after the publication last year of the new Five-year Plan wages must have unexpectedly risen to such an extent that by the end of the year the Planning Commission had to scrap

that part of the plan that dealt with wages and draw up a new one. The plan for this year incorporates a rise in wages by about 20 per cent. In part, this has been caused by deliberate governmental action, such as the flat increase in rates by 50 per cent for workers in essential industries east of the Urals, designed to attract labour to Soviet Asia. To a great extent, however, wages have soared because industrial concerns have been competing for scarce labour and paying rates higher than those fixed in Trade Union tariffs. This is an interesting phenomenon—it shows the upsetting effect that spontaneous economic processes have had upon planning.

How does the purchasing power in the hands of Soviet workers and employees compare with the mass of available consumers' goods? This year's plan provides for a total turnover in retail trade, in State-owned magazines and co-operative shops, amounting to 325 billion roubles, a sum only 45 billion higher than the national fund of wages and salaries. The 45 billion roubles represent the margin of consumers' goods available for the farming population. In reality, the margin will be somewhat wider, because the purchasing power of industrial workers and employees will be reduced through taxation. One-sixth or at the most one-fifth of the available mass of consumers' goods will be diverted to the countryside—the rest will go to the towns. One might point to this very uneven distribution of goods as to proof of an extraordinary exploitation of farmers, had it not been for the fact that food, which the countryside does not buy, forms the bulk of the retail turnover. Yet, the purchasing power of the peasantry, too, has grown enormously in recent years; and so in Russia, as elsewhere, superabundant money has been chasing scarce goods.

Objects of Wage Policy

Some of the Government's answers to the present troubles bear a strongly deflationary character. Thus, all the industrial concerns engaged in building new plants and factories have been ordered to effect a flat reduction in the estimates of their costs by 15 per cent. Since the estimates had been made in 1945 prices, the reduction ordered ought in effect to be much higher than 15 per cent. Part of the economy is to be achieved through giving up unessential building, but another part through real cuts in costs. The wages policy, described in a previous article, is designed to promote that end. It would perhaps be inaccurate to say that the wages policy, too, bears a definitely deflationary character. But it is certainly an elastic, double-edged policy; and at least one of its edges is sharply deflationary. The whole system of wages is now based on payment by results and piece-rates, and in the long-term agreements, now negotiated, the standard forms of output are being raised by as much as 20-25 per cent. Should the desired increase in productivity per man not be obtained, then the result is bound to be a fairly steep and absolute reduction in wages. On the other hand, a real rise in productivity would result in better supply of consumers' goods. If this materialises, the effect of the policy will not be deflationary. The most drastic operation in "mopping up" purchasing power has been the steep increase in all State-controlled prices of consumers' goods, including rationed goods. In other words, indirect taxation (the turnover tax) has been greatly increased—and this after and not during the war. The figures below show that the turnover tax is this year to provide nearly one-third of all the revenue of the Soviet Treasury.

SOVIET BUDGETS IN THREE YEARS
(in billions of roubles)

	1945	1946	1947 (Estimates)
Revenue.....	302	322.7	394.2
Turnover tax.....	123	190.9	254.7
Profit tax.....	16.8	16.2	18.7
Direct taxes.....	40	22.7	27.7
Expenditure.....	298	304.1	374.1
National economy.....	74.3	95.7	131.8
Social Services.....	62.1	80.4	107.0
Defence.....	128.0	72.6	67.0

Not the whole increase in the yield of the turnover tax has been due to higher taxation—part of it has been caused by the larger supply of the taxable consumers' goods. Nevertheless, this year's budget aims at a radical mopping up of the surplus of money that is in the hands of the population. Planned finance is coming back into its own as an indispensable element of planned economy.

Budget Targets for 1947—III

Incentives and Pressures

LAST week's article showed that the role of budgetary policy to meet the needs of the present crisis should be two-fold. It should exert an overall pressure to curtail the creation of a flow of spendable incomes in excess of the flow of available goods. Secondly, it should afford the maximum incentive (or minimum disincentive) to productive effort in general while imposing the maximum restraint on spending at specific points. On the first aspect, the conclusion was reached that the deficit on the "extraordinary" budget in 1947-48 will be at least as great as can be tolerated if there is to be no further stoking of the fires of inflation. In consequence, if the wasteful inflationary pressures are to be kept in check, the so-called "ordinary" budget must at least be balanced, which means that there is no scope for any overall reduction in taxation unless the projected expenditure is also reduced. One possibility of reducing expenditure, it was pointed out, would be to devise a balanced plan for reduction in the now very burdensome cost-of living subsidies; but the problem of the subsidies is largely distinct from the budgetary problem as a whole, because the fiscal concessions made possible by reduced subsidies would need to be principally restricted to the classes most burdened by the resultant rise in the cost-of-living. Apart from the subsidies, the chances of quickly securing an appreciable reduction in expenditure are small.

Upon the methods by which the second objective of budgetary policy should be sought, there is room for wide differences of opinion. Here the problem is to operate upon the economy in detail, by specific incentives and deterrents. The incentive measures are perhaps the least controversial. It is everywhere agreed that the present very heavy burden of direct taxation acts as a strong brake upon enterprise and efficiency. Given the huge scale of expenditure, it is impossible to relieve this burden without increasing recourse to indirect taxation, thus tending to restore the rough equality between the "two sisters" which at one time was regarded as a cardinal principle of budget making. Indirect taxes, because of their uncertainty in incidence, their regressive action, and their possible repercussions upon costs, have many disadvantages. But these are inescapable in present circumstances, and there is at least the mitigating consideration that it is only by use of the indirect weapon that budgetary policy can be made to operate specifically at the points of bottleneck. While the condition of acute scarcity and full employment remains, the broad pattern for the budget is plain: there must be the maximum relief from direct taxation and, of necessity therefore, a roughly corresponding increase in indirect taxation.

Among incentive measures, there is, however, one which could be implemented without loss of revenue—namely, the reform of PAYE. The present system, by producing sharp jerks in the effective rate of tax charged on additional increments quite apart from this, its complexity, and the suspicion which this has given rise to, have made it a significant deterrent for purely psychological reasons. A simplification of the system, without any actual tax reduction, could thus have significant "incentive" results. The lines upon which PAYE reform should be sought have been sketched so frequently in *The Economist* as to need no repetition now—except to say

that the objectives of simplified and smooth progression cannot be achieved without separating the system of allowances from the actual payment of tax. Though a substantial administrative effort is needed for reform, it would be well worth while to attempt it, not least as an anti-crisis measure.

Among the necessary tax reliefs, income tax of course ranks first. But it is by no means certain that the best incentive results could be achieved by the one shilling reduction in the standard rate, at a cost of about £130 million, which was being widely discussed before the fuel crisis. Any relief costing appreciably less than this would probably not be large enough to have significant effects. But a sum of this magnitude would be better employed in enlarging the children's allowances and in abating the tax on earned incomes than in a reduction of the standard rate. The increase in the earned income allowance from one-tenth to one-eighth in the current year has restored only one-quarter of the war-time cuts, at a cost of £33 million in a full year. To return to the pre-war proportion of one-fifth would therefore presumably cost rather more than £100 million, provided that the existing maximum of tax on an income of £1,500 were retained. But such a measure by itself would have no perceptible incentive effect upon those with incomes beyond this level.

To provide incentive relief for the managerial and professional classes obviously raises the whole question of taxation of property and company profits, and can scarcely be separated—in the Chancellor's mind at least—from the problem created by the termination of EPT. Last year, Mr Dalton said he would continue to consider what, if any, successor was needed to make good the resultant loss of revenue. By toying with the idea of a successor at all, and in particular by examining the field for taxation of company profits, he was apparently anxious to continue taxation of classes whom he regards as "property owners," regardless of the fact that the majority of company shareholders are men of relatively little means. If he really is determined to pursue this general objective, it would be much better achieved—even, perhaps, from his own political standpoint—by quite different methods. The Profits Tax, i.e. the rechristened NDC—has the particular disadvantage that it falls on equity earnings and therefore taxes precisely those incomes which are most nearly related to enterprise. To replace EPT simply by an increase in the Profits Tax would therefore be most undesirable—indeed, Mr Dalton's own works can be most effectively quoted against it. What is necessary now, if new taxes are to be imposed specifically upon the "property owning" classes, is to draw a line quite plainly between imposts which do and do not act as a brake upon enterprise.

This could be done, first, by leaving the Profits Tax unchanged (or, better still, by reducing it) and by seeking additional revenue from death duties and the more costly luxury goods. Even though the death duties have already been steeply increased, it is better to tax the capital of beneficiaries than to take an equivalent sum from the incomes of those in the same broad income groups. Secondly, if the effort to restore incentives is taken really seriously, there ought to be a clear differentiation between earned and unearned incomes throughout the whole range of income taxation—including surtax. For example, the earned income allowance, instead of ceasing

altogether beyond an income of £1,500, might be graduated from, say, one-fifth for the first £1,000 and one-eighth for the second, to smaller fractions for successive increments in income. Such a change would not only promote incentive but, in a negative sense, would also serve Mr Dalton's presumed desire to increase taxation of the propertied classes (because such relief would in the long run mean that the standard rate would not be reduced as much as would otherwise have been possible).

If both forms of incentive relief—the restoration of the pre-war earned income allowances and the new relief for higher incomes—were to be attempted in the coming Budget, the balancing increases in indirect taxation would probably have to go well beyond those which might be dictated by specific measures of deterrent taxation. But, with real ingenuity, the scope for additional taxation, even of a kind which would not have undue secondary repercussions upon costs, should be found to be quite wide. The Chancellor will not, in any case, have to face this year the effects of the termination of EPT. If, therefore, he were to decide to make good the eventual loss of revenue partly by increased death duties, it would be possible to tap this source in 1947-48. Unless, however, the increase were extremely drastic it could scarcely produce more than about £25 million in a full year.

In indirect taxation, much depends upon the outcome of the controversy about imports of tobacco and films. If imports of American tobacco were sufficiently reduced to yield any worthwhile saving in dollars, the effects upon the revenue would be so large as probably to rule out any possibility of "incentive" tax reliefs. The greater the reliance upon monetary and fiscal policies to correct the unbalanced state of the economy, the less the possibility of cutting tobacco imports. In present conditions, the right policy is probably to increase the tobacco duty still further without imposing any substantial specific cuts in the import programme. Much the same considerations apply to the beer duty. These two prolific taxes have so often

been expected to reach the point of diminishing returns that it is perhaps rash to prophesy; but there seems a chance that, even now, a further £40-£50 million of revenue might be squeezed from them, plus a small additional revenue from correspondingly increased duties on wines and spirits which would naturally accompany any further taxation on beer.

Elsewhere, the most promising possibilities lie in the purchase tax, which must also be the principal instrument of specific deterrent action. Since October 1945 there have been reliefs equivalent to about £26 million for a full year, calculated on rates of consumption below present levels. Some of these reliefs ought now to be withdrawn, especially upon items of critical significance such as electric fires and other domestic electrical apparatus. But, apart from such key items, is there any justification in the present emergency for taxing at lower rates than during the war such things as lawn mowers, hair-waving machines, garden furniture, cameras, radio-gramophones and certain non-essential leather goods? A careful combing of the whole field might conceivably yield up to £50 million of additional taxation, without imposing any real hardship and with positive benefit at some of the points of extreme bottleneck. Similarly, a further £10 million or so might be secured from the entertainments tax.

Among novel forms of taxation, only two possibilities look really promising. Though recent estimates of the wastage of labour in football pools may have been somewhat exaggerated, this is an obvious field for taxation both on anti-inflationary and physical grounds. Other forms of gambling equally merit attention, and for similar reasons, but it might be difficult to extend the field beyond football pools and totalisator betting without a cumbersome and expensive administrative machine. Even so, a tax upon gambling might yield up to £30 million without creating unreasonable administrative strain. The gambling industry and its fiscal possibilities are examined in an earlier article. The other new form of taxation which has been

discussed in the same context is that upon stock exchange operations. But a capital gains tax on the American model hardly seems a possibility now. It would, indeed, have been a logical counterpart of the cheaper money policy if launched in October, 1945, for then Mr Dalton would have been sweeping in a due share of the capital profits which his gilt-edged tactics produced. But now the boot seems to be on the other foot; a capital gains tax which allowed capital losses to be offset against gains (and any other system would be intolerably unjust) would be unlikely to provide any significant revenue this year and in a future year might even involve the Treasury in a loss. In any case, it would require so large an administrative apparatus as to be quite impracticable in the present overstrained condition of the tax-collecting machine. If, therefore, an attempt were to be made to devise a stock exchange tax, the simplest way would be merely to raise the existing rate of stamp duty on deeds of transfer. Alternatively, if Mr Dalton were determined to tax stock exchange activity (as the nearest approach to taxation of speculation) it would be necessary to tax stock exchange bargains as such, and thus to profit from

business which never reaches the stage of the transfer deed. Measures such as these would, of course, impair the freedom and elasticity of the market, but, if imposed specifically as temporary measures to meet the special situation, they might conceivably be justified if the rates were low. But the yield would be unlikely to exceed £10 million.

The suggestions made in this article can be summarised in tabular form:—

Suggested Reliefs.	Suggested Increases.
Increased earned income allowance for income tax.	Death duties.
Earned income allowance for surtax incomes.	Tobacco duty.
Children's allowances.	Alcoholic drinks duties.
	Purchase tax (some categories).
	Entertainments duty.
	Stamp duty on transfers.

Obviously, these examples do not exhaust the possibilities, but they suffice to show that the scope for additional indirect taxation, though not very large in terms of the standard rate of income tax, is sufficient to provide substantial incentives by means of earned income reliefs if the Chancellor is really determined to mould his budget to the needs of the time.

World Woolsack

THE wool market is characterised by surplus stocks, unsatiated demand and rising prices. Here is a paradox of serious consequence for the wool textile industry. It is more complex than a mere question of withholding supplies in order to force the market up. Current demand for wool is concentrated on the finer types, and the rises in the price of these types—that is, merino wools—have been appreciably greater than in the inferior, crossbred types. For several reasons, this is not surprising. The price of merino wool from Dominion sources has risen during the current season about 25 per cent above the controlled issue prices of last year, compared with increases in crossbreds of 5-10 per cent. But if the current price spread between merino and crossbred wool is compared with a normal average like 1934-38, it will be seen that merino prices, despite their rise, are still not exaggerated in relation to crossbred.

The wool market is in fact going through a period of transition from war to peace. The first meeting of the International Wool Study Group in London next Monday has been nicely timed. Representatives of twelve countries,* producers and consumers, will weigh the world's wool supplies against potential demand. Last November, when the International Wool Conference met, a free wool market had scarcely been reopened and the prospective trend of wool prices could obviously not be accurately discerned. An initial rise was fully expected but general opinion favoured a downward adjustment after the turn of year. This expectation has so far been falsified. The present position is governed by the operations of the government wool disposal organisations in the British Commonwealth and in the United States. An accurate picture of present and future trends of wool production and consumption, which the Study Group will doubtless seek to provide, will be a difficult task, for the statistics available are inadequate.

Wool production of the five main exporting countries, shown in the accompanying table, is expected to total some 2,133 million lb (greasy basis) in the current season. This represents a slight increase over 1945-46, but is about 5 per cent higher than the average for 1934-38. But the sub-division into types is important. The table makes an attempt to show the clip for each of the main exporters on a standard basis, with an estimate for the current season's production. Data

for South Africa and Australia have been drawn from official sources; for Argentina the break-down is based on estimates made by wool merchants in Buenos Aires; for Uruguay and New Zealand the proportions have been calculated from slender evidence—in the former case, trade reports and stock returns, and in the latter mainly on the classification of sheep population. The estimates given are subject to a variable element of error, but they are perhaps accurate enough as a general picture. There are no official data available for the current clip, but available figures and estimates suggest that production of merino wool this season should represent about 46 per cent of the total and may be about 7 per cent below the pre-war average, while fine crossbreds (56/58s), which are fine enough to be used as a possible merino substitute, form 21 per cent of the total clip. Output in Australia, the largest commercial producer of wool in the world, has shown some recovery over the two previous seasons, when the clip was severely affected by drought. In the two South American republics the clip is somewhat lower than the peak figures reached during the war years, though still above the pre-war level. In New Zealand production is more or less stationary—possibly, there may be a small decline—while reduced output in South Africa appears to mark a long-term change in the Veldt farmers' preference for cattle to sheep.

The Joint Organisation's stock of wool at the beginning of the current season amounted to nearly 6 million bales, of which approximately 60 per cent was merino; stocks at the end of the season are expected to be about 4½ million bales, of which the proportion of merino will probably be only very slightly reduced. Empire holdings of wool in the United Kingdom, however, are estimated to decline from 1,700,000 bales at the beginning of the season (of which 1,000,000 bales were merino) to 860,000 bales, including 460,000 bales of merino, by the close, unless considerable shipments of stocks from the Dominions to this country are effected. In subsequent seasons, the quality composition of the stocks is certain to deteriorate, as the only accession to stocks will comprise lower category wools which fail to reach the reserve price—mainly medium crossbred. The Joint Organisation has no easy task to dispose of its huge surplus without upsetting the market. The producer members naturally hope that the current high prices will be maintained, and they, therefore, tend to urge a conservative policy in market

* Argentina, Australia, Belgium, Canada, China, France, Italy, New Zealand, South Africa, Uruguay, United States and United Kingdom.

It is much more important to do right than not to do wrong; further, the one is possible, the other has always been and will always be impossible.

R. L. STEVENSON.

IN your personal and business affairs the commonest examples of going wrong are found in errors of omission rather than of commission.

To neglect taking precautions, such as the making of a will or provision against other vicissitudes of fortune, can bring untold trouble on yourself and others. If you are in doubt as to what is the right way to do the right thing, expert departmental services of Martins Bank are organised to advise you and take your instructions.

offerings. Consumers, on the other hand—particularly those in this country operating under a utility scheme with fixed prices and margins—desire prices to be brought down, or at least not raised above the current level.

The demand for wool is still running at a high level. The appetite of consumers can, perhaps, best be realised from the fact that during the current season the entire clip has been purchased—or will be—together with some 42 million lbs. from the Empire stocks, of which about 60 per cent is of merino type. Prices at recent sales have tended to increase still further. Three points are worth emphasis about this rise. The recovery of the continental wool textile industry has been more rapid than was anticipated, and recent purchases have been largely used in current production rather than for building up stocks. Secondly, wool is one of the few raw materials in free supply, and its price has not increased so sharply as those of many other commodities. Certain governments, finding themselves unable to purchase other materials owing to shortages, have provided liberal allotments of foreign exchange for the purchase of wool. Thirdly, there may have been a minor flight

from certain currencies into wool, whenever foreign exchange was made available—given the foreign exchange, merchants have evidently felt that wool is a better investment than cash. But demand has been selective, and buyers have insisted on the finer qualities, particularly merino types. This is understandable, because the general public are hungry for better quality tissues, and in countries where no utility clothing scheme is in operation, the consumer has been anxious to have them and to pay for them. Moreover, in the export market, even under the present favourable conditions for sellers, it is still less profitable to apply skill and craftsmanship to low grade materials.

It is, of course, difficult to estimate how far demand will be maintained. Machine activity in the French spinning industry (woollen and worsted) increased from 69 per cent of capacity

in February, 1946, to 81 per cent in November, and loom activity from 45 to 59 per cent. During the past year the output of tops was only 9 per cent lower than in 1938, of woollen and worsted yarns 22 per cent lower, and of tissues of all types 31 per cent lower. Planned production for the current year is equal to or above the pre-war level. In spite of the heavy French purchases during the season, wool stocks in France are only estimated at four months' supply, instead of the normal six months. The expansion in Belgium has followed a similar pattern, with machine activity running at about 85 per cent of the 1938 level. Output of the wool industry in the Netherlands during the past year was 108 per cent of the 1938-39 average, with a labour force of only 90 per cent of the May, 1940, level. The wool industries of Western Europe have obviously staged an impressive recovery. As for Britain, Bradford's stocks are being depleted and sooner or later they will have to be replenished. Reduced production due to the fuel crisis may have its effect upon demand for raw wool, but it will probably not be very significant; indeed Yorkshire buyers were surprisingly prominent at the recent Liverpool sales. Another new factor emerged from the February sales in London, when Russian buyers appeared for the first time. The United States has also resumed the purchase of wool direct from the Dominions and from the United Kingdom. Mill consumption of wool in America has been running at a very high level during 1946 and 84 per cent of the apparel wool consumed has been imported, compared with 31 per cent in 1940. The United States buys most of South America's wool exports, but Australian wool has also been eagerly sought. Conditions in the American wool market, however, will depend largely on the Commodity Credit Corporation's policy, for some time to come. Last September the CCC held a stock of some 560 million lb. (greasy basis) of domestic wool. At the moment, the Corporation is not allowed to sell below the parity price, and is therefore in an unfavourable position for competing with imported wool, even after allowing for the import duty of 34 cents a lb. If, however, the O'Mahoney Bill or a modified one is passed by Congress, permitting the Corporation to sell its stocks at a competitive price without any relation to parity, American consumption of domestic wool may be increased.

Clearly there is no lack of material for discussion by the International Wool Study Group. Indeed, four days would seem to be far too short. But to one task, at any rate, the Study Group might usefully give priority. An accurate assessment of the world wool position is now scarcely practicable, owing to the lack of adequate statistical material. Much has to be done in this field before wool is as well documented as other primary raw materials. Producers always reckon wool on a greasy basis; the wool textile industry on a clean basis. A system of agreed average clean yields, calculated for each country, would be invaluable. Again, production, consumption and trade statistics should be subdivided according to counts—say, 60s and above, 56s/58s, 46s/54s, 44s and under. If the statistical data are made comparable between different countries, accurate surveys of the wool market would be greatly facilitated.

Business Notes

A Partial Recovery

Monday was the worst day in the gilt-edged market since the rot began more than a month ago, and at the close of business the market was asking itself if on Tuesday morning 2½ per cent Savings Bonds would shed the full amount of their interest and fall below 99 "clean." No heavy selling was reported—indeed, the market throughout has been markedly sensitive to a relatively small volume of business—but when Savings Bonds reached par, cum interest, the natural reaction was to wonder whether this presumed resistance point also was not crumbling.

Tuesday brought an answer, though perhaps not a very convincing answer. Buying began with what was candidly described as "the worst type of punting," but it rallied some support from investment and institutional buying as trading got under way. Savings 2½'s were saved from disgrace by a sharp rise from 99 to 99½, and those who had long been expecting a technical recovery in the Funds, but lacked the courage to put it to the test, bid for War Loan, Old Consols and Treasury Stock 2½ per cent. But the emphasis remained concentrated on a "date"; the recovery, so largely technical in origin, was obviously welcome, but since it was accompanied by no sign of official support, it was left to show its staying-power before gaining general acceptance.

* Flat yields.

At this stage, therefore, the gilt-edged question mark still remains. Will Mr Dalton consolidate on the line of 2½ per cent Savings Bonds? That still seems the most realistic estimate of the possibilities, but the battle of nerves of the past few weeks, coupled with the effects of a long account with the Budget to follow, has not encouraged gilt-edged investors to take any chances. The technical condition of the market is still pointed towards further recovery, but its powers of resistance, should further selling occur, are not strong, for recent weeks have provided a fairly costly experience for jobbers, and they are not anxious to take stock. Meanwhile, competition from the back-door gilt-edged market in railway and electricity stocks remains strong—for those investors, at least, who are unmoved by rumours of postponements in the nationalisation programme.

Scope for Indirect Support?

Meanwhile, money market circles, in particular, have been questioning whether there are any purely technical devices which could be employed to relieve the pressure on gilt-edged. Suggestions that the scope for supporting operations of the 1946 pattern may now be very limited, on the grounds that the "departmental" funds concerned must already have switched the bulk of their assets from floating debt into longer term securities, should be heavily discounted. It certainly is true that the inflow of new resources available for departmental invest-

ment is tending to diminish. The Unemployment Fund in future is most unlikely to show surpluses comparable to those of the war years; natural forces, as well as the impending freeing of sterling, will check or even reverse the accumulation of overseas sterling balances (in this context it is the Colonial currency boards which are the most important, because it is here that the Whitehall influence upon investment policy is greatest); new savings bank deposits are scarcely likely to expand; and, finally, the fiduciary note issue, if not actually reduced, will at least not rise at its wartime rate. But although such influences as these are limiting and will continue to limit the authorities' scope for manoeuvre, it is quite unrealistic to suppose that departmental holdings of switchable liquid assets have been reduced to the point at which their exchange into long term securities would not suffice to produce any radical effect upon the gilt-edged market. By comparison with the huge volume of official resources—there is nearly £1,450 million in the Issue Department of the Bank of England alone—the amount required to influence the rather narrow gilt-edged market at the moment is relatively small.

But, since the authorities so far have obviously preferred not to embark upon any substantial support direct, is there any way in which they could, if they wished, relieve the pressure by indirect tactics? To a large extent, the cheaper money drive of 1945/46 was carried along by the heavy absorption of gilt-edged securities by the banks: in the 19 months from July, 1945, the investments of the clearing banks expanded by no less than £316 million. The banks would have been quite unable to plunge into gilt-edged on this scale, however much they might have wished to do so, unless they had been able simultaneously to maintain a satisfactory flexibility in their liquid assets structure. There is no doubt, therefore, that the policy of the Treasury in switching its floating debt borrowings from the relatively inflexible Treasury deposit receipts to Treasury bills played a significant part in the whole cheaper money drive. In some quarters it has been suggested that a similar expedient might be adopted now. But, desirable though it is to increase the flexibility of the banking structure, it is quite certain that this particular device could not have comparable effects upon the gilt-edged market now.

It is generally believed that there have been no significant bank purchases of gilt-edged in recent weeks. But if the banks, which in 1946 usually lost no opportunity for buying on any recession in the market, do not feel disposed to come in substantially even at present prices, it is most improbable that further expansion of their flexible "money market" assets would by itself lead them to change their minds. On the other hand, there is no reason to suppose that the present level of money market assets is acting as a brake upon investment policy. As bank advances expand further, the banks will certainly be anxious to see an increase in their bills and call money, even if they had no intention to increase their gilt-edged portfolios further; but money market assets at the moment stand at a ratio of almost 20 per cent to deposits, which is the highest figure since the early months of the war. If the authorities really wish to turn the tide in the gilt-edged market, but are unwilling to operate themselves, there is only one way in which the task might be attempted—namely by glutting the money market with newly-created central bank cash, and thereby forcing the banks' cash ratio well above the 8 per cent target level, and in effect compelling them to find employment for the surplus. Such tactics as these, which were used with success in 1932, would look not a little odd in the inflationary circumstances to-day.

Coal—"Target" and "Forecast"

The gap between the summer coal production budget and the "Economic Survey" target of 200 million tons—"the indispensable minimum"—has evoked much comment, in *The Economist* and elsewhere. At his first fortnightly press conference last week, Sir Stafford Cripps devoted much time to this point, which apparently turns on planning terminology. The 200 million tons target is "the practicable best that we believe to be obtainable in the given circumstances so as to bring supplies as near as possible to the requirements"—deducting from requirements anything above bare exports and domestic supplies. On the other hand, the summer budget was based on "a forecast of supplies

based on current prospects." The target, although described as "the indispensable minimum," is 20 million tons higher than the strictly realistic rate used in the summer budget (89 million tons for the six months, or 180 million tons during the coal year).

The crucial question is how far "current prospects" are changing to bring the 180 million ton rate closer to 200 million. Recruitment for the mines is certainly improving in what Sir Stafford called "the changed circumstances"—a rather coy synonym for nationalisation. In the first ten weeks of 1947 wage-earners on colliery books have increased from 692,200 to 701,600—an encouraging rate which, as already noted in these columns, would provide the target of 730,000 for coal mining manpower comfortably before the end of this year. Of the 9,000 increase, as many as 6,000 are face-workers. With so much underground development work to be done, there will be ample room for this increase in face-workers and for foreign labour to back the efforts of the increased British labour force.

As for summer coal supplies for industry—the budget figure is 17.6 million tons, plus extra deliveries to provide three weeks' stocks for winter use—the "estimate" is sufficient to keep industry running at two-thirds of full capacity. If the gap between the "estimate" and the "target" is filled during the summer months, industry will be able to work at full pace, at least as far as coal is concerned. But it is wise to expect industry now to be capable, by the exercise of every possible economy and ingenuity, to maintain full activity "at a pinch" on, say, 10 or 15 per cent less coal than stated requirements? It would be surprising, indeed, if most of the possibilities of fuel saving had not already been exploited by industry. There are, indeed, only two other ways of squaring the account. The first is conversion to oil-firing beyond the 2 million tons assumed in the summer budget, which is extremely doubtful because, even with the highest priorities, shortages of equipment are holding up the existing programme; the second is to import coal. South Africa may be able to provide some bunkers, and the Government is looking into all the possibilities of imports from other sources. Perhaps none can be secured, but this is at any rate a humbly realistic approach compared with Mr Shinwell's assertion that "there never was any need for importing coal into this country, and, in my judgment, provided the organisation is made available, there never will be any such need"—an admirable doctrine when coal was plentiful and a more hopeful forecast of production possibilities in the coming coal year than Sir Stafford is evidently prepared to contemplate.

Staggering Back to Normal

In his desire to avoid any over-estimation of the effects of the fuel crisis, Sir Stafford Cripps may have erred on the side of under-estimation. His figure for the peak unemployment of 15½ per cent of the insured population does not take into account the very large number of workers who did not draw unemployment benefit because they were covered by the guaranteed week. While he admitted that the February figures of production and the March exports will show a sharp decline, he barely touched on the longer-term effects of the crisis, which is difficult to measure but which will undoubtedly be extremely serious. The effects of industrial dislocation, the unbalanced flow of supplies and the loss of production through the enforced shortening of the working week will be felt long after registered unemployment has subsided to the pre-crisis level.

The experience of the Midlands, which is the crucial region from the engineering standpoint, is significant. It is true that unemployment figures dropped as spectacularly as they had risen; whereas at the height of the crisis there were half a million unemployed on the Ministry of Labour's books, the number had fallen to 50,000 by March 3rd. But about 90 per cent of the factories in the area are now working a 3- or 3½-day week, with a fuel allocation of 33½ per cent. It is hoped that by early summer, when improved weather reduces the amount of coal needed for space heating and a more adequate flow of coal supplies is forthcoming, allocations to industry generally will be about 50 per cent, as in the original Cripps' plan with proportionate increases for priority work, and that firms will be able to work four and five days a week.

The resumption of full production, however, is impeded by widespread uncertainty about future fuel supplies. The managing director of the General Electric Company has made a strong statement to the Press urging the Government to cut down supplies to less essential users and to give priority in practice, as well as on paper, to firms and sub-contractors engaged in the production of generating plant. There are no doubt practical difficulties—it is difficult to determine which are and which are not essential

users, while many components for priority work are produced by sub-contractors whose other work may be "less essential." It is obviously important that the summer coal budget for industry should be broken down into assured minimum supplies for individual plants as soon as possible. Only the Fuel Allocation Committees of the Regional Boards for Industry can hope to tackle this task, for it defies central control.

The problem of staggering working hours to relieve the electricity load is being worked out in empirical fashion. Individual firms are adopting their own arrangements as they think most appropriate. Some factories in the Midlands are in fact organising night shifts; others, for example in the Wolverhampton area, are operating a spread-over of six days. The Regional Board is not issuing any instructions, but is giving advice and approving schemes submitted to it. Industry seems to be adapting itself remarkably well to this situation, as it usually does when given a general lead and left with the responsibility of applying it in practical detail.

The Heavy Clothing Report

The report of the Heavy Clothing Working Party,* issued this week, closely follows the pattern set by most of the six Working Party Reports already published. No issues are raised which will prevent the recommendations from fitting into the broad framework of the Industrial Organisation Bill when it is enacted. Though the report is unanimous, there has been some difference of opinion within the working party on the method of financing the proposed central organisation, but this has not crystallised into a memorandum of dissent.

The report follows the now common form of recommending the establishment of a central organisation, to be called the Council of the Heavy Clothing Industry. It would consist of an independent chairman, independent members and allow equal representation of employers and workers. Its functions would include establishing an Official Inspection Centre and a Design and Exhibition Centre; the conduct of technical and market research; training, education and the establishment of a central Information Bureau; the dissemination of statistics, technical data and information on standardisation; lastly, it should study the seasonal unemployment problem. Recommendations are made on improving training methods and the enforcement of the Factories Act, 1937. As for machinery, the industry is faced with the same problems as other textile industries: that is, to reconcile clothing manufacturers' requirements in this country with the types made by the machinery manufacturers, especially of sewing machines, for export. The report emphasises the need for closer co-operation between machine makers and users and for the development of more efficient machines. In order to maintain an equitable distribution of limited clothing supplies, the Consumer Rationing Order should be continued until supplies are adequate. But new concerns should be encouraged to enter the industry as a spur to competition by the issue of a "float," or working stock, of clothing coupons, provided that they adhere from the start to the conditions of employment enforceable under the Factories Act. The utility cloth scheme should carry on through the transition period, and certain improvements are suggested. The report concludes with a number of detailed appendices, including a valuable account of the United States industry. A selection from the statistical tables will be found in this week's issue of the *Records and Statistics Supplement*.

Materials and Manpower Problems

The heavy clothing industry comprises between 50 and 60 per cent of the tailoring, dressmaking and millinery trades as defined in the 1935 Census of Production. That is, it covers the heavy end of the outerwear making-up trades and the shirt-makers and industrial overall manufacturers. The working party has been consequently hampered in preparing its statistical material, since no set of available production or manpower figures quite tallies with the scope of their enquiry. A more useful survey could have been presented if the terms of reference had coincided with the official classification of statistics and had extended to the retail tailoring trade.

In 1939, the industry employed about 300,000 workers, and the great majority of firms were concentrated in the West Riding, London and Lancashire areas. In 1937, 25 per cent of the working population of Leeds was dependent on tailoring and this

* Board of Trade Working Party Reports: Heavy Clothing. HM Stationery Office. Price 3s. 6d.

concentration may well have increased since. Clothing firms had to surrender about 37 per cent of their labour force between 1939 and 1944. Now, the return of these workers is coinciding with a shortage of materials, and is producing a lack of balance in the labour force. The industry, being highly concentrated in three areas where other industries are short of labour, is faced with a problem similar to that of the cotton and wool textile industries—even though it is able to offer superior working conditions in the larger factories—of having to compete with other industries with less chronic material shortage problems to retain its labour force. The working party estimate, very tentatively, that by the early '50s, clothing consumption may be 10 to 20 per cent above the pre-war level, but this increase would not require an expansion of the labour force above the pre-war level if seasonal unemployment could be overcome and a moderate increase of productivity secured. But even a return to the pre-war level of employment might require some 18,000 additional workers for clothing in the West Riding at a time when the wool industry is looking for 50,000. If clothing were to attract workers who might otherwise go into wool, the industry would have to go short of cloth and would be in much the same position as if both lost labour to non-textile industries. If clothing supplies are to expand beyond the levels of output registered immediately before the fuel crisis, there are good reasons for encouraging new and established firms to set up modern, mass-production factories in localities, away from the main industrial areas, where supplies of female labour are obtainable. The suggestions for encouraging competition from new firms are a laudable improvement on the restrictionist philosophies which have occasionally lurked beneath the surface of certain earlier working party reports.

But there can be no significant increase in output until there has been an initial increase in supplies of cloth. The working party insists that the clothing manufacturers' case for cloth supplies must be carefully considered against the claims of exports if the industry is not to suffer a slow process of attrition through inability to train young workers for the period of expansion which is expected a few years hence.

The Chancellor on Imperial Tobacco

Mr Dalton's answers to questions in Parliament on Tuesday, which sought the reasons for the recent refusal of the Capital Issues Committee to an application by the Imperial Tobacco Company for an issue of new ordinary capital, went all the way to confirm the interpretation placed on the CIC's decision in last week's issue of *The Economist*. Mr Dalton, who disclosed that no new instructions had been issued by the Treasury to the CIC since last August, stated that the issue had been refused because it would have been inconsistent with Government policy. The Chancellor stated that the directors proposed to make an issue of £1 ordinary shares at par when the market price was £7½, and claimed that "if companies pay out the same sum of money in dividends nominally on a larger capital the rate may be lowered and the public thereby deceived."

The implications of this statement rest on the word "nominally." At present, the nominal capital structure of Imperial Tobacco is out of line with the effective capital employed in the business and to raise the former would not mean that dividends were payable "nominally" on a larger capital but rather on an issued capital after it had been increased from its present "nominal" amount into line with the effective capital employed. Clearly, however, nothing is likely to be gained from demonstrating yet again the lack of financial logic in the present arrangements for controlling so-called bonus issues. The Chancellor has made it all too clear that he is determined to compel companies like Imperial Tobacco, whose assets have been built up out of profits, to maintain high nominal rates of dividend on their issued capital.

Modernising the Cotton Industry

The way now seems, at long last, to be clear for the implementation of Sir Stafford Cripps's scheme for modernising the cotton-spinning industry. At a special conference last Saturday the United Textile Factory Workers' Association, which represents some 300,000 spinning and weaving operatives, gave its general endorsement to the Government's proposals. These provide for the grouping of spinning firms, on a minimum spindle basis of 500,000, and for a re-equipment grant of 25 per cent of costs, which, it is estimated, will cost the Exchequer some £15 million. It is expected in Manchester that the first amalgamations will shortly be announced.

The Association's acceptance, by a majority of 91 to 51, of the proposals for double shift working is satisfactory. The unions' insistence that the grouping and re-equipment scheme should come first, is not unreasonable under the circumstances, even though it does indicate their suspicion of the employers' good intentions, which was so marked in the trade union memorandum in the working party report. Negotiations about hours and rates of pay can now be opened, although these may be prolonged and encounter many difficulties, for there is still a great deal of practical opposition to the two-shift system, particularly among spinners. It is to be hoped that the two-to-one vote of the whole Association will be reflected in the genuine co-operation of all sections of the industry in working out the details of the system as rapidly as possible.

It is now nearly a year since the working party report was issued, and the delays in coming to a decision on the Cripps offer, combined with the fuel crisis, have held up the urgently needed work of re-equipment. The report of the Evershed committee on the textile machinery industry is expected in the near future, and this should provide a practical basis on which to plan the re-equipment of the cotton industry. After so much delay in the process of modernisation, the need for speed in future is the more evident.

Shipbuilding Output and Delays

World output of new merchant ships amounted in 1946 to 747 vessels of 2,127,421 tons gross, according to statistics issued by *Lloyd's Register of Shipping*. British yards accounted for 53.3 per cent of this total, with 371 ships of 1,133,245 tons gross. Excluding the war years, this is the highest British total since 1930, although it is slightly below the average of 1923-30 and considerably below that of 1919-21. The world total was higher in 1937 and 1938, but the output of foreign yards has not been as low since 1915, apart from the years 1924 and 1940. United States output dropped from a wartime peak of 11.6 million tons to little more than half a million, while the other leading countries are Sweden (146,875), Italy (61,742), Spain (41,289) and Denmark (39,051 tons gross). All countries show a lower output than in 1938 except Britain and the Dominions, for the latter built 85,651 tons against 30,100 tons in 1938. British shipbuilding output, therefore, while considerably less than after the First World War, compares favourably with that of the rest of the world. These figures refer only to the tonnage launched during the year. Work on hand in British yards at the end of the year totalled nearly 2 million tons, an increase of about 20 per cent on the previous year.

There appear to be good grounds for recent expressions of apprehension from shipbuilders and complaints from shipowners about the slowness of delivery from the shipyards, which is certain to be reflected in current output figures. Chief among the contributory factors are the shortage of materials and the reduced output of the workers. Timber and steel are in short supply, with little prospect of improvement, but the provision of components is getting worse. Even the Clyde is now feeling the effect of the recent stoppage in England, and one £35,000 contract has been held up indefinitely for the want of an electric motor costing £100. The shorter week in the shipbuilding and engineering industries is bound to have an adverse effect on output and also upon shipbuilding costs. It is hard to persuade shipyard workers, particularly those who remember the nineteen-thirties, that they will not "work themselves out of a job" by increasing output; yet speed of delivery is a strong selling point and its absence is liable to lead to cancellation of existing contracts.

Export shipbuilding orders are very sensitive to delays in delivery. Only 10.2 per cent of the launches in 1946 were on foreign account, but more than a quarter of the total tonnage under construction and on order at present is destined for foreign fleets. Sweden, which is Britain's closest competitor in shipbuilding, can already undercut British costs, and with a 48-hour week and expanding yards, may soon beat British builders in delivery times. Meanwhile, British shipowners are handicapped by lack of tonnage. The Orient liner *Orcades*, for example, whose keel was laid in August, 1945, has not yet been launched, though her delivery was expected last month. Reconversion and repairs are taking twice as long as a year ago, and nearly 3 million out of a total of about 15 million tons gross of shipping are undergoing or awaiting repairs. The forthcoming lifting of the wartime ban on restrictive practices may considerably lead to an outbreak of demarcation disputes which have always prevailed in shipyards. If so, the situation will deteriorate still further.

World Bank's Bonds

The most important step yet taken in creating a market for the bonds of the International Bank for Reconstruction and Development is the recent approval by the New York State legislature of legislation authorising insurance companies in that State to purchase bonds issued or guaranteed by the Bank. Similar legislation has been enacted by the State of Maryland and in New Hampshire corresponding legislation has been passed making the Bank's obligations eligible for the savings banks. These are the essential preliminaries to getting the Bank under way. It has been evident from the first launching of the Bank that most of the funds it would require, other than its capital, would have to be found in the United States. Issues to the general investing public could hardly be given the whole responsibility of raising the necessary resources, given the prevailing ignorance of the public regarding the character of the new institution. A lead in this respect must, therefore, be given to the public by institutional investors. In most important States this required legislative action before the Bank's securities could be legally purchased by insurance companies or savings banks or by trustees who are restricted to investments eligible for saving banks. Preliminary investigations of this problem were begun last year but in somewhat half-hearted fashion and the delay prevented early action because most of the State legislatures went into recess in the autumn of last year and only reassembled early this year. A first step was taken by the New York State legislature last summer when it authorised savings banks in the State to purchase the Bank's securities. It is, of course, on the action of the State of New York that the approach of the Bank to the US capital market depends, for it is there that the vast bulk of the resources available for investment in the Bank's loans is to be found.

While good progress is at last being made in preparing the issuing machinery, the Bank has been working on the various applications for loans made to it and reports have been completed on the request by France for \$500 million and by Denmark for \$50 million. Reports from Washington and Paris suggest that France may have to be satisfied with a much smaller sum than that for which she asked, even though it received the implied approval of the US Government when the Export-Import Bank credit for France was negotiated last summer.

The Fund and the Money Market

There has been some tentative discussion in banking circles lately about the effects that may be exerted upon the domestic credit situation and the money market by the operations of the International Monetary Fund. If all the possibilities are considered, the question is complex and hardly lends itself to brief analysis; but it does seem that, if the mechanism of the Fund Agreement were fully and frequently operated by the various national members, the Bank of England would face new problems of credit management. They would not, however, be inherently more intractable problems than those presented by the operation of the Exchange Equalisation Account before the war, and would, indeed, bear a strong resemblance to them. So far, of course, there have been no credit repercussions at all, for the Government borrowing for the purpose of paying Britain's £322 million subscription to the Fund has not involved any recourse to the commercial banking system. Of this total, £238 million was in effect lent by the Fund itself (which accepted specially-created non-interest bearing Notes to that amount) and the remainder was lent by the Exchange Account and the Bank of England, presumably against tap Treasury bills—£51 million by the Exchange Account to employ the sterling secured by its release of gold and £32 million by the Bank against the deposit created in its books in favour of the Fund.

The operation of the Fund will not produce domestic credit repercussions until it needs to draw upon its sterling holdings. It will not do that until another member who is short of sterling and is eligible to use the Fund's resources buys sterling from it in return for its own currency. Part of the Fund's balance at the Bank of England will then be transferred to another account at the Bank in the name of the central bank of the purchasing member. While the money stays on that second account there will still be no credit effects. But if the money is temporarily invested, say, in tap or tender bills acquired from the Treasury, the immediate effect might be to raise clearing bank cash ratios and cause a credit surplus in the money market. Unless the Treasury used the cash to repay any outstanding ways and means advances from the Bank, it would reduce its borrowings from the

domestic banking system, whose money market assets or Treasury deposit receipts would fall correspondingly and whose cash would rise correspondingly. The same results would follow if the overseas central bank used the sterling to settle debts due to the British Government. To restore equilibrium, the Bank of England would therefore need to reduce its own security portfolio, in effect transferring floating debt, directly or indirectly, to the banking system and thereby cancelling the additional bank cash and restoring the *status quo*. Alternatively, if the overseas central bank used its sterling to settle commercial debts, the cash would generally reach the clearing banks through fresh deposits or repayments of advances by their own customers. If advances were repaid, the credit effects would be analogous to those produced by repayment of floating debt; but, if deposits rose, neutralising action by the Bank would require a cancellation of bank cash, not by the full amount created by the original payment, but by only eleven-twelfths, because the banks must keep one-twelfth of their deposits in cash.

There are also two principal ways in which the more extended operation of the Fund Agreement, as distinct from the Fund's operation on its own sterling balance, may have credit effects—but effects of a more familiar type. If Britain itself buys foreign exchange from the Fund, the credit effects will be precisely the same as those now produced by drafts upon the dollar loans. If another member exercises its right to require Britain to buy back part of its holding of sterling (against payment in gold or in that member's currency) the effect will be the same as when the Exchange Account sold gold or foreign exchange, except that, under the new system, the sterling which is being re-purchased is less likely to have been held in an account at one of the commercial banks, and, unless held in Treasury bills, would generally have been in an account at the Bank of England.

* * *

February Trade Figures

Exports from the United Kingdom in February showed a further decline compared with the last quarter of 1946, and were £15.2 million less than in January. The value figures were the lowest since September of last year. An important contributory factor to the decline is the fact that February is a short month. If exports for each of the last six months are recalculated on the basis of 26 working days so as to cancel out the effects of longer or shorter months, the result is as follows (actual value exports are given for comparison):

	Actual	26 Working Days		Actual	26 Working Days
	£mn.	£mn.		£mn.	£mn.
Sept., 1946....	71	74	Dec., 1946.....	83	90
Oct., 1946.....	91	87½	Jan., 1947.....	91	88
Nov., 1946.....	92	92	Feb., 1947.....	76	82½

Last month's export figures do not reflect the fall in production resulting from the fuel crisis, though they provide some evidence of dislocation arising from shortages of fuel earlier in the winter. There is necessarily a time-lag between manufacture and final shipment, which depends on the period of production for various manufactures. Direct effects of the crisis may not be evident till March and possibly April, while the indirect effects are likely to extend throughout the year. Allowing for the rise in prices since before the war, the volume of exports in February is provisionally estimated at 93 per cent of 1938 compared with 112 per cent in January. On the basis of 26 working days, last month's volume figure becomes approximately 100 per cent.

Exports of food, drink and tobacco were less, on a value basis, than a year ago, while the raw material group showed an increase, due mainly to further shipments of brass scrap. Among manufactured goods, the major increases compared with a year ago were machinery (100 per cent larger by value) and vehicles (133 per cent larger). In machinery, the tonnage shipped was greater than in February, 1946, and 38 per cent above the monthly average for 1938, but only insignificant quantities went to hard currency countries. The export of cars, lorries, motor-cycles and bicycles on a volume basis were well maintained during February, and were well over double the average monthly quantity shipped in 1938. If this rate can be maintained throughout the current year, which is unfortunately improbable, total exports would be closer to their end-year target. But if these two industries were to attempt to carry the burden of the export target unaided, their shipments would have to reach 260 per cent of last year's volume by December, 1947.

The value of imports during February was 42 per cent higher than a year ago and only £8.9 million less than in January, reflecting an increase in the daily rate of imports. Retained imports of food, drink and tobacco accounted for over half the total value, while retained imports of raw materials were the lowest since February, 1946. The quantities of timber and wool imported were considerably smaller than in the corresponding month of last year. There are large stocks of wool already in the United Kingdom, but the timber supply position is acute. Arrivals of raw cotton, although greater than those in February, 1946, were still less than the pre-war monthly average, but imports of cotton linters and waste and rubber showed a considerable increase. Imports of manufactures were only £0.5 million less than in January.

* * *

Cars for Export

Prospects for British car exports, after the Geneva Motor Show, are likely to be affected by the threat of competition from other countries, which can be expected to increase fairly soon, and by the inability of many British light-engined models to meet the requirements of foreign purchasers except in urban areas with metalled road surfaces. In February, new cars exported numbered 7,581, compared with only 2,278 in February, 1946—but were lower, significantly perhaps, than the 9,394 exported in December last.

An interesting illustration of price competition in overseas markets, is provided in the accompanying table of retail car prices in Australia, which is based on figures provided by a well known industrial concern in Melbourne. The table gives the selling prices for cars exported complete from Britain, chassis exported from Britain and assembled with bodies in Australia and car chassis exported from the United States or Canadian factories also for local assembly. The comparison shows quite clearly that 30 horse power, 6 cylinder American types are in the same price category as 10 horse power 4 or 6 cylinder British makes. The prices also indicate the competitive disadvantage for complete new cars which have to surmount the high Australian tariff:—

RETAIL CAR PRICES IN AUSTRALIA

BRITISH				UNITED STATES (except for Ford and Buick)			
Type	Horse Power	No. of Cylinders	Price	Type	Horse Power	No. of Cylinders	Price
Standard.....	7-96	4	£A. 550	Ford.....	32-5	8	£A. 668
Riley.....	12	4	1,269	Chevrolet (Skymaster)	29-4	6	661
Vauxhall "Wyvern"§	12	4	540	Chevrolet (Electramaster)	29-4	6	682
Vauxhall "Senior"§	14	6	609	Buick.....	30	8	1,011
Standard.....	14-01	4	720	Plymouth.....	25	6	743
Wolseley.....	18	6	1,073	Pontiac.....	30	6	796

* Including 10% sales tax on wholesale prices.

† Ex Canadian factories.

Direct price comparisons may be misleading, especially at present when all kinds of cars are in short supply. But price considerations are bound to become more important as supplies become easier. By then, the price advantage of the mass-produced American types and their obvious suitability for requirements in Dominion and foreign markets will offer severe competition to light-engined British models. The Chancellor's budget will be awaited with anxiety, for on it depends the prospect of any change in the method of motor car taxation which might free engine design and which would give the industry no excuse for failing to produce cars specifically for the export market. Since it is estimated that Australia could absorb 400,000 new cars by the end of 1949, the opportunities are great. But they must be promptly seized before the seller's market runs down.

* * *

Bolivia and World Tin Prices

The world shortage of tin, which is due in large measure to the failure of Malaya and the Netherlands East Indies to restore their output owing to lack of new equipment and coal, has produced an extraordinary response in tin prices. Negotiations are proceeding between the Reconstruction Finance Corporation in the United States and Bolivian tin producers which promise in effect to drive world prices still higher. It is understood that the Bolivian negotiators have asked for a price of 76 cents per pound, but that they might be prepared to agree to 74 cents per pound. Even that would be 7 cents higher than the price paid by the

American buyers in 1946. United States buyers are anxious to obtain 20,000 tons or more of tin in order to maintain the scale of production at the Texas smelter, but the Bolivian side is hopeful that recent reports suggesting that Argentina would be prepared to purchase as much as 10,000 tons of tin ore this year will be substantiated, and thus provide Bolivian producers with a seller's market beyond all their earlier expectations.

So far, the United States have secured 8,000 tons of tin and concentrates from Siam, between 8,000 and 10,000 tons of high grade ore from the Netherlands East Indies to be delivered to the Texas smelter this year, at 70 cents a pound, and have persuaded Belgian Congo producers to take 70 cents instead of the 75 cents demanded for part of this year's supply. Consequently they are in a fairly strong position and may be prepared to await events, particularly since stocks of tin ore at the end of last year amounted to 30,000 tons (tin content), which would be sufficient to maintain the Texas smelter in operation for about nine months.

Bolivian producers decided to cease shipping tin ore via Chilean ports from January 1st. This arbitrary step appears to have proved somewhat embarrassing since, for it has cut off supplies of foreign exchange to the Bolivian authorities and the Central Bank has already had to arrange temporary loans for the relief of the medium and small-sized producers, who are, together, responsible for about 40 per cent of the total output. This figure does not, of course, include the output of the Patino group, which is sold on long-term contract to British smelters. The decision to hold up shipments was obviously made with only one purpose—to force the world price higher. The motives of Argentina for appearing as a potential buyer of Bolivian tin ore are almost equally obvious. A deal with Bolivia would bring the two republics into closer economic and political relationship. Argentina has a tin smelter which is capable of producing metal of a suitable quality for soldering and is anxious to obtain tin ore for domestic smelting—alluvial tin production in Argentina has fallen from 1,136 metric tons in 1938 to 469 tons in 1945—in order to supplement the small allocation of tin metal which it is entitled to receive—a mere 100 tons for the first half of 1947.

These South American developments have more than local importance, for if a price of 74 cents per pound of Bolivian ore were to result from the present negotiations with the Americans it would mean that the British Government would have to pay about £400 per ton under the Patino contract—the present British price for tin metal is £380 10s. That, in turn, would involve the upward revision of contract prices to Malayan and Nigerian producers and increased costs for tin plate makers and other consumers. If Bolivia could provide a total output of 40,000 tons of tin this year it would indeed be useful, but on present indications it is likely that such a quantity may be obtainable only at an extortionate price.

* * *

Dutch Gold Call-Up

The Netherlands have adopted a decidedly leisurely pace in tightening up their exchange control machinery and have only just got down to calling up the gold held by their nationals. This week the Netherlands Bank issued a vesting order calling up gold coins and bullion held at home or abroad by residents. The order also calls up holdings of the following foreign currencies: US and Canadian dollars, sterling, French, Belgian and Swiss francs, Swedish, Norwegian and Danish crowns and Portuguese escudos. Delivery of the gold and foreign currencies vested under this order must be made before May 1, 1947. This move reinforces earlier orders made through foreign exchange decrees, but these, as may be gauged from this subsequent action, must have been applied with considerable leniency. The vesting of Dutch-owned securities is also proceeding methodically. The strain on the Netherlands' balance of payments is evident in the recent decline of the gold reserve and in the reported efforts that are being made to float a short-term Government loan on the New York market. Given these exchange difficulties it is surprising that the mobilisation of privately held gold, foreign balances and foreign securities should have been delayed so long.

* * *

Wool Processing in Germany

A contract has been made with the Russian authorities by which British wool can be spun in the Russian zone of Germany. The arrangements cover both woollen and worsted yarn; the latter may be spun either from tops sent from this country or from raw wool which is shipped from Britain for combing in the British zone. A proportion of the yarn produced will be passed to the

spinners as payment, and the remainder, which will be British owned, may either be re-shipped to this country or sent to the British or American zones to be woven into cloth, or exported from Germany on British account.

The advantages of this scheme, now that the Russian zone has been brought in (thus completing the arrangements described on page 429 of last week's issue of *The Economist*) are obvious. It effects a unity in the German wool industry, by which tops from the British zone can be spun into yarn in the Russian zone and possibly woven in the American zone. In addition, it appears to allow British manufacturers a certain amount of latitude, for when they have shipped wool from England to Germany they no longer come under the direction of the Wool Control and may therefore freely export the tops, yarns or tissues produced in Germany, subject to such conditions of contract or government restriction as may be in force. Such export, of course, will soon be on British account.

Colonial Banking Developments

The Standard Bank of South Africa has announced the formation of a subsidiary company, to be called the Standard Bank Finance and Development Corporation. The new company has been set up "to finance, assist and participate" in development in those African colonies where the bank already operates. With an initial issued capital of £500,000, the corporation will direct its activities to assisting agriculture, commerce, industry and transport primarily in the four East African territories of Kenya, Uganda, Tanganyika and Zanzibar. It will also be competent to handle the loan business of local authorities, to underwrite company flotations and to provide funds in bulk purchasing operations.

As the bank obviously recognises, progress at first may well be slow in these financially undeveloped communities. But this new venture, like the comparable institution—Barclays Overseas Development Corporation—set up by Barclays Bank (Dominion, Colonial and Overseas) last year, will help to fill a serious gap in the financial structure of the African dependencies.

The extent of this gap in the colonies has recently been brought out by the results of the Nigerian and Fiji internal loans. In Nigeria £300,000 of 3½ per cent stock, 1956-61, was offered locally at 98. Individual subscriptions totalled only 13 per cent of the amount issued. In Fiji, of an issue of £530,000 of 3½ per cent 25-year stock, the underwriting banks had to take up 60 per cent. Such results, in the face of the better terms which Nigeria at any rate might have commanded in London at that time, show how difficult and expensive it may be even for colonial Governments to raise funds locally. In most colonies the capital market is in a very rudimentary stage of development. The banks themselves are mainly concerned with providing deposit and current account facilities. During the war some progress was made in persuading uneducated local people to open post-office accounts and to buy National Savings Certificates, but progress is hindered by the strong hoarding instincts in backward communities. In present

circumstances, Development Corporations will provide a valuable channel for European financial support, but if capital is to be provided for the colonies on an adequate scale to develop their resources, the African and other communities must be gradually initiated into the arts of long-term investment of their own savings.

Brick Production Problems

About a year ago a brick shortage threatened to hold up the housing programme and to retard the whole process of industrial reconversion. The threat was averted, however, for the output of bricks, which was only 179 million in March, 1946, compared with a pre-war monthly output of 650 million, reached 379 million in January, 1947. The brick industry's labour force was 53,000 before the war, and now stands at 40,000, including some 4,000 prisoners of war. Various steps to increase output and restore the industry's manpower have been taken by the Ministry of Works, including the appointment of the Garrett committee on welfare and amenities (which revealed an unsatisfactory state of affairs) and the investigation of productivity by the technical committee of the Brick Advisory Council.

The technical report, which is based on a survey of 50 brickworks, shows that considerable economies in the use of manpower could be secured through the introduction of mechanical methods of clay-getting and haulage. Seventy per cent of all brickworks still win their clay by hand processes, and though these are predominantly small firms, they produce over one-third of the national output of bricks. The committee estimates that the equivalent of 6,000 to 15,000 of the pre-war labour force of 53,000 could be saved by the application of more modern methods, particularly in the extraction of clay. It therefore urges the Government to give priority to the production of excavating and conveying plant, and invites the Ministry of Works to undertake a full review of the industry's requirements and existing capacity of the engineering industry to meet it.

The report is valuable as a technical survey, though the committee was obviously limited by its terms of reference. Its conclusions, however, suggest the further question of what action is being taken to speed up the production of equipment, which is, at the moment, the chief limiting factor on the expansion of brick output. The absence of any clear-cut scheme of priorities between the competing demands for machinery by other essential industries, such as mining and agriculture, and the pressure of the export programme, is having serious effects. Nor does the report concern itself with the structural reorganisation of the brick industry, and the scope for concentrating output at the most efficient works. Concentration promises greater efficiency and production per man-hour, and important fuel savings, particularly at Flitton works; but these advantages would to some extent at least, be offset by increased transport costs. But decisions will have to be taken, sooner or later, about the future of the brick industry. It is only by the negative fact of critical shortages in timber and other materials that current brick production is

sufficient for this year's requirements. In particular, the smaller firms should be told whether any scheme for reorganisation and concentration is contemplated, and what material and financial assistance they can expect for capital re-equipment and modernisation.

Bowater Group Reorganisation

No tears will be shed at the reorganisation of the structure of the Bowater Group which was approved on March 25th, for even when decked out with consolidated accounts of the excellence of the recent report, it called for simplification. Under the scheme, Bowater's Paper Mills will become entirely a holding company—at present it combines the functions of holding and manufacturing company—and will transfer its manufacturing assets to a new subsidiary, Bowater's Thames Paper Mills. The two intermediate holding companies, Edward Lloyd Investment and Bowater-Lloyd Newfoundland (these carry on no active business, but merely hold the ordinary capitals of two of the operating companies, Edward Lloyd and Bowater's Newfoundland Pulp and Paper Mills respectively) will be liquidated. These two operating concerns, the new Thames Company, together with Bowaters & Lloyds Sales and Bowater's Mersey Paper Mills, will be directly controlled subsidiaries of the new holding company.

To achieve this reorganisation will involve the following repayments and new issues:—

Repayments.—£921,096 Bowater's Paper Mills 3½ per cent debenture stock at 102, requiring £939,518; £736,400 Bowater's Mersey 3½ per cent debenture stock at 102, requiring £751,128; £1,144,024, Bowater-Lloyd Newfoundland 4½ per cent debenture stock at 102, requiring £1,166,904; and £2,000,000 Edward Lloyd Investment 5 per cent redeemable preference stock at 25s. 6d., including 1s. premium and 4s. 6d. in lieu of dividend arrears, requiring £2,550,000. The total cost of these repayments is £5,407,550.

Issues (all Bowater's Paper Mills).—£3,250,000 3½ per cent new debenture stock at 101; 200,000 6½ per cent preference shares of £1 at 31s. (quoted at 35s. before the issue of the scheme); 500,000 7½ per cent £1 preference shares at 37s. (quoted at 42s. 3d.); and 500,000 £1 ordinary shares at 40s. (quoted at 55s.). These issues will be offered to existing shareholders, and holders of the debentures and preference shares which are to be repaid will have the right to convert.

Holders of more than half the capital sent proxies in favour of this necessarily complicated scheme, which brings the equity of Bowater's, on which a notional 50 per cent was earned in 1946, in sight of dividends.

Shorter Notes

The price of virgin aluminium in ingots or notch bars has been increased from £72 15s. to £80 per long ton delivered consumers' works. The increase in price will enable the Ministry of Supply to average out the cost of metal purchased at home and abroad.

Mr H. L. Urling Clark has been elected the chairman of the Stock Exchange Council in succession to Sir Robert Pearson. Mr F. H. Doran is to join Mr John Braithwaite as a deputy-chairman of the Council.

The response to the circular sent out to members of the Stock Exchange on March 3, 1947, which gave particulars of the proposed scheme of reorganisation, has proved favourable. About 57½ per cent of the present membership of the Stock Exchange expressed their views on the scheme, and of the replies received, 1,810 were favourable and 406 opposed it. The Council have felt fortified by this result, and are now to prepare the necessary resolutions for altering the deed of settlement and the legal documents for carrying the scheme into effect.

The Rand gold mines made a working loss of almost £300,000 in February owing to the "unofficial" white miners strike. The January profit was £2 million. Working costs rose to 184s. 10d. per ounce of gold produced, resulting in a loss of 2s. per ton milled.

By a typographical error, certain oil production statistics in the leading article, "Oil Stocktaking," in last week's issue were attributed to the "Palatine Press Service." This should have read the *Petroleum Press Service*.

SECURITY PRICES AND YIELDS

A fuller list containing 370 securities appears weekly in *Records and Statistics*. Notes on the following company reports also appear in the Supplement: De Beers; British Aluminium; Swan Hunter; British Xylonite.

ABRIDGED PARTICULARS

POOL, LORRIMER & TABBERER, LIMITED.

(Incorporated under the Companies Act, 1908 to 1917)

Worsted Spinners & Hosiery Manufacturers, Leicester

CAPITAL		Issued and Fully Paid Up
Authorised	£160,000 in 6 per cent. Cumulative Preference Stock (transferable in Units of 10s. each) ...	£160,000
	£100,000 in Ordinary Stock (transferable in Units of 4s. each) ...	£100,000
	£40,000 in 200,000 Ordinary Shares of 4s. each ...	—
£300,000		£260,000

There are no Debentures, Mortgages or Loan Capital.

The Application Lists opened and closed

On FRIDAY the 28th MARCH 1947

for an OFFER FOR SALE by

THE CHARTERHOUSE FINANCE CORPORATION LIMITED

OF

350,000 ORDINARY STOCK UNITS OF 4s. AT 31s. EACH.

The "Offer for Sale" showed *inter alia* that:—

The Company specialises in Machine Yarns, Hand Knitting Yarns, all types of Babies' and Children's Wear, Ladies' Outerwear and Underwear, Ladies' Hosiery and Men's Half-Hose, Infants' Shawls, Pram Rugs and Sleeping Bags, and also has a profitable trade in Hand Knitting and Mending Wools which are spun in its own mill.

Profits before E.P.T., N.D.C. and income tax were as follows for the 16 years ended 31st December 1946:—

£				£											
1931	...	...	38,653	1935	...	...	19,984	1939	...	...	53,549	1943	...	...	76,962
1932	...	...	47,022	1936	...	...	33,749	1940	...	...	124,097	1944	...	...	81,212
1933	...	...	42,591	1937	...	...	28,096	1941	...	...	88,801	1945	...	...	87,119
1934	...	...	23,714	1938	...	...	7,046	1942	...	...	77,079	1946	...	...	126,344

Turnover in the first two months of the current year exceeds that of the corresponding period last year by £23,581 despite the partial closing of the Leicester Factory for fourteen days as the result of the ban on the use of electricity during that period. Full production was resumed on the lifting of the ban.

The Directors estimate that profits for the years 1947 and 1948 will be not less than £70,000 (subject to taxation) in each year, and they consider that the Company should, unless unforeseen difficulties arise and allowing for the vagaries of trading, continue to earn average annual profits at least equal to this figure. Such profits, subject only to taxation, would be equivalent, after providing for the dividend on the Preference Stock to 60.4 per cent. on the issued Ordinary Stock, out of which the Directors would feel justified in recommending an Ordinary dividend of 35 per cent. equivalent to £4 10s. 3d. on the price of 31s. at which the Stock is offered.

NATIONAL BANK OF INDIA, LIMITED

ANOTHER SATISFACTORY YEAR

The ordinary general meeting of this bank was held at 24, Bishopsgate, London, E.C., on the 25th instant.

The following is an extract from the statement by the chairman, Mr. J. K. Michie, circulated with the report and accounts:—

It is a pleasure to me to be able to put before you the results of another satisfactory year's work. As you will see, despite unsettled conditions in India and Burma, net profits after necessary reservations and due provision for taxation and other charges are slightly higher than for the year 1945.

EXPANSION OF FIGURES

The total of the balance sheet is again higher by a little more than £1,000,000, the bulk of this increase appearing under the heading current, fixed deposit and other accounts. This increase is the more satisfactory when we take into account that during the closing months of the year many manufacturers and exporters required much larger sums to finance their business.

Cash on hand, at call and at bankers amounting to £16,111,000 is about £451,000 lower than last year. Despite the reduction and the fact that our portfolio of Treasury bills was much reduced, we still maintained a very satisfactory liquid position, holding about 30 per cent. of the total of our demand liabilities in cash and Treasury bills. During the year our investments increased by over £2,000,000, mostly represented by "dated" securities maturing within the next five years. Bills of exchange show a considerable reduction of approximately £6,700,000—entirely accounted for by the fall in our holdings of Treasury bills. Discounts, loans receivable, etc., increased by about £6,000,000. The bulk of these borrowings took place in the late months of the year, when prices of certain of India's exports advanced and when increasing imports also required financing.

IMPORTANCE OF SOUND BANKING

Throughout 1946 and throughout the world each country in its own way was struggling to adapt its economy to conditions fundamentally altered by war and its aftermath, and, as we have recently been sharply reminded, this adjustment is only in its early stages and the process is likely to be slow and painful.

The only generalisation I feel justified in making is that sound and progressive banking will be one of the absolute essentials to a sound and lasting world recovery and it is our policy to ensure that the National Bank of India will be in a position to take its full share in that service in the difficult times ahead of us.

The countries in which the bank operates could not expect to escape this problem of readjustment and, indeed, recent happenings in India, Ceylon and Burma have already given illustrations of the forms it can take and the dangers that are a consequence.

In East Africa and Aden so far I am glad to say the manifestations are fewer and less marked. India and Burma are faced with the added major complication of working out new political patterns for themselves and as an institution which has served the public in these countries for the better part of a century, we wish them wisdom in their counsels and success in resolving the many difficult and thorny problems which this supreme task entails.

As Mr Langford James has repeatedly told you, a sufficiency of food is the first economic necessity for India, and as it happens, its attainment is partly tied up with the recovery of Burma's agriculture. This fortunately has made a promising beginning; but India's population does not stand still

and the problem will remain one of urgency for many years.

India's produce has continued to command good prices in world markets and her trade balance for 1946 has been favourable, but unfortunately much invaluable production and effort has been lost through strikes and disturbances, and these in turn have led to a considerable recession in Stock Exchange values.

Preliminary talks between the Government of India and His Majesty's Government have recently been concluded in India on the question of the "sterling balances." In the present circumstances it is unlikely that these conversations have produced anything more than an interim plan, although it is of the utmost importance to both countries that a fair and workable solution should be reached at the earliest possible moment.

Ceylon's principal export trades in tea and rubber are embarking on the experiment of free marketing: rubber as the result of an international decision, but tea at the instance of the Government of Ceylon.

DEVELOPMENT IN EAST AFRICA

I have already mentioned that in East Africa conditions have been relatively settled.

Special mention, however, must be made of the very large scheme of agricultural development now being launched under the aegis of His Majesty's Government by the Governments of Tanganyika, Kenya and Northern Rhodesia in conjunction with the United Africa Co., Limited, who will in the development stages act as Government agents. By this scheme it is hoped to bring 3½ million acres under crop with the principal object of producing groundnuts, and the eventual programme will entail the employment of a labour force of 25,000. This and other developments in East African territories cannot but lead to a great expansion of their whole economy and to a general rise in the standard of living of the population.

BRITISH HOME STORES, LIMITED

INCREASED PROFITS

The nineteenth annual general meeting of British Home Stores, Limited, was held, on the 19th instant, in London, Mr Horace Moore (the chairman) presiding.

The following is an extract from the Chairman's statement:—Profits for the year showed a satisfactory increase at £292,331, against £216,671. An interim dividend was paid in September, 1946, of 16½ per cent. A final dividend of 50 per cent. is now recommended, which will leave a slightly increased carry-forward of £25,144.

During last year our sales increased substantially, but costs of operation also rose considerably. In drapery goods, which form an important part of our business, we find as yet only a small improvement in supplies. It is to be hoped that the supply position will become easier because we know just how depleted the wardrobes of the public generally have become.

Our satisfactory results have been in no small measure due to the support of our regular suppliers. Many have told us of the stabilising effect on their business that a close manufacturer-distributor relationship has brought to them, and how by the policy of selling a portion of their production to our guaranteed regular outlet they have been able to operate with greatly improved efficiency and results.

As a result of the fuel crisis it is difficult to make a forecast for the current year. In the past our business has proved resilient to difficulties, and we will all use our utmost endeavours to produce once again a satisfactory result.

The report was adopted.

NORTH-EASTERN ELECTRIC SUPPLY COMPANY, LIMITED

THE RIGHT HON. VISCOUNT RIDLEY'S REVIEW

The fifty-ninth ordinary general meeting of this company was held, on the 26th instant, at Newcastle-upon-Tyne.

The chairman (The Rt. Hon. Viscount Ridley) in the course of his speech, stated that the amount of electricity supplied to consumers in 1946—exceeding 1,834 million units—established a record in the history of the company, but the gross profit, amounting to £1,986,517, showed a decrease compared with the previous year. After payment of the proposed dividends for the year 1946, the balance remaining will be £112,812 to carry forward to the present year.

NATIONALISATION

On the subject of nationalisation the chairman said that, whether the industry were owned by the nation in the name of an electricity authority, or by a large number of individuals in the form of stockholders and ratepayers, the essential thing was that it should be efficiently and economically run in the interests of the consumers and of the owners. The Bill failed in over-centralisation of control, the separation in any area of generation and distribution, and the lack of financial autonomy for the Area Electricity Boards. It seemed that no area would be able to stand on its own and reflect its efficiency of operation, or otherwise, in the satisfactory service to consumers at an economical cost; nor could it, under the proposed system of finance and accountancy, clearly show what had been the result of its operation in any one year. These were grave defects, but it was not too late to hope that the Bill could still be modified and improved.

The chairman then reviewed the various ways in which the company had, during the course of its career, been first in the field with technical developments affecting the electricity supply industry, including the adoption of 66,000-volt transmission for the inter-connection of power stations—the forerunner of the present national grid system.

PRIDE IN ACHIEVEMENTS

Continuing, he said: We can rightly claim to have achieved, throughout the life of the company, what is stated in the Government's Electricity Bill as its first object, namely, "the use of all economical methods of generating, transmitting and distributing electricity." Indeed our area of supply of 5,640 square miles, with total connections of 1,414,526 kilowatts and 302,443 consumers, is a large and balanced area containing a variety of industrial and domestic consumers, both urban and rural, such as is in the minds of those who advocate reorganisation of the industry. We claim moreover that we have already achieved that degree of co-ordination which makes nationalisation superfluous.

In conclusion, as this will probably be our last annual meeting if the Bill passes in its present form, I think we can honestly say that our undertaking will be handed over in a sound condition when the time comes, and, though regretting the policy which enforces this change, we can only hope that the industry will, in spite of it, continue to give good service to the public.

DECLARED DIVIDENDS

The directors' report and statement of accounts were adopted, and confirmation was given to the payment of full dividends on the 7 per cent. and 5 per cent. Preference Stocks and 7 per cent. on the Ordinary Stock, less income tax.

The retiring directors were re-elected, and Messrs Price Waterhouse and Co. were reappointed auditors.

GOSSARD LIMITED

CORSET TRADE PROBLEMS

MR B. M. LINDSAY FYNN'S REVIEW

The 12th ordinary general meeting of Gossard, Limited, was held, on the 20th instant, at the registered offices, 168, Regent Street, London, W., Mr B. M. Lindsay Fynn, F.C.A., the chairman, presiding.

The secretary, Mr W. A. Dormer, read the notice convening the meeting and the report of the auditors.

The following is the chairman's statement circulated with the report and accounts for the year 1946:—During the year we were almost entirely engaged on civilian production—our Government production having declined to very small proportions—but conditions have by no means reverted to those of before the war. Our greatest difficulty, and indeed that of the corset industry in general, remains the shortage of female labour. Despite our excellent canteen facilities, our social and welfare club, our five-day week, our training schemes and high average earnings, our labour force at our main factory at Leighton Buzzard remains stationary. Bedford factory, opened last Spring, is fully staffed, and has made a welcome contribution to output, which contribution will continue to increase for some months as our girls become more highly trained.

We applied for permission to extend the Bedford factory, as more girls apply to us for employment than our small works can accommodate, but we have been refused official sanction and we are therefore negotiating in other areas.

RAW MATERIAL SHORTAGE

Our other great difficulty, which is a special difficulty of Gossards more than of the trade in general, is the shortage of raw materials suitable for the high quality merchandise for which we are known. We are the highest grade manufacturers in Britain and it is precisely the high grade materials that are in shortest supply. In addition the production of garments from them is restricted and the restriction affects us, of course, to an exceptional degree.

The Board of Trade last autumn decided to admit a quota of American and foreign corsets. The garments imported (and we were given an allocation) are comparatively expensive, and I suggest that the precious dollar exchange could have been used better had it been diverted to increase the purchase of the high-grade raw materials we need so badly for our home trade and of specialised plant and machinery which we need to maintain and further improve our high output per operative.

EXPORT TRADE DOUBLED

Our export trade has developed considerably during the year being nearly double that of 1945, and considerably more than in the last pre-war year. This has been helped by the grant of import licences to enable us to purchase high-grade materials abroad, provided the resultant finished product is wholly exported. We believe that to-day we are one of the largest exporters of British corsets. Our exports are almost entirely of the highest quality product, requiring operatives highly skilled and accustomed to fine work and fabrics. This is why we need more high-grade materials and greater freedom to concentrate our production on high-class models, both for home and export, as it is very difficult to make both high-grade and utility merchandise in the same factory and with the same operatives.

There are still certain valuable corset fabrics made in Britain which are not available to the corset trade, even for export corsets, but which are exported in the piece to the markets we supplied with corsets before the war. I hope the Board of Trade will make those available to us also—otherwise we shall be compelled by local competition and American exports to consider the erection of local factories in our overseas

markets and so to lose for ever much valuable export trade.

HIGHER OUTPUT PER OPERATIVE

Now I have told you the gloomier problems—restrictions, shortage of fine materials and labour, etc. There is also a brighter side. Our output per operative is substantially higher than before the war, and is equal to the best American standards. Our volume of civilian production in 1946 was 50 per cent. higher than our volume in the last pre-war year (while that of the industry as a whole is 40 per cent. lower), and yet we are selling on the average at less than our pre-war prices. We are justly proud of our achievement and yet dissatisfied with it. The demand for our products has risen so largely that they are almost unobtainable and are sold immediately they reach the stores. I want to tell our customers how much we regret what we consider the wholly inadequate deliveries we continue to make to them and how much we appreciate their forbearance in the matter. We anticipate that our output in 1947 will show an increase over that for 1946, although unfortunately the fuel crisis led to the temporary compulsory closure of our Leighton Buzzard and Bedford factories.

During the year we appointed Miss Cassy an executive director. Miss Cassy came to us from our good friends Harrods, Ltd., and is well known to the trade. I am satisfied that the appointment was a wise one, and that it will enable us still further to improve our quality and service.

VISITS TO USA

We like, from time to time, to renew our American contacts, and with this in view, I paid two visits by air to the U.S.A.—the second time being accompanied by Mr Sambrook, our works director, and Miss Cassy, our stylist. We received the greatest kindness and assistance from our friends in the American Gossard Company, with whom we were able to discuss our many problems and from whom we could learn the latest developments in American manufacturing technique and fashion trends. Most of the time was spent in factories or in the corset departments of the big American stores or in informal talks with buyers from all parts of the States, and we were made to feel that the magnificent organisation of the H. W. Gossard Company was entirely at our service and to realise that it is still the leading high-grade corset business in America. Indeed, it goes from strength to strength.

Our subsidiary and associated companies have made marked progress during the year, their output and profits in total being a record, and we anticipate that they will make still further progress this year. One factory that received a direct hit from a medium bomb is closed for reconstruction, but should reopen next summer, while an associated company has obtained permission to build a small new factory to replace production space destroyed in the war, and this should be available in about six months' time.

LIQUID POSITION STRENGTHENED

During the year the directors obtained permission to place 50,000 5½ per cent. Preference shares of £1 each at 23s. 6d., less 6d. commission, and, as a result, our liquid position has been greatly strengthened. We also realised a part of our trade investments at a substantial profit.

In view of the Cohen Committee recommendations, we publish this year a consolidated balance sheet. To achieve this it was necessary to alter our balance sheet date to December 31st, and alter similarly the dates in the case of our subsidiary companies as their accounts terminated on differing dates.

The report and accounts were unanimously adopted. The retiring directors, Mr R. W. G. Mackay, Mr W. A. Dormer and Miss M. V. Cassy, were re-elected, and the auditors, Messrs. J. Dix Lewis, Caesar, Duncan and Co., were re-appointed.

MIDLAND ELECTRIC CORPORATION FOR POWER DISTRIBUTION, LIMITED

THE NATIONALISATION THREAT

The forty-ninth ordinary general meeting of this company was held, on the 27th instant, in London.

Sir Alexander Roger, K.C.I.E. (the chairman), said that their unit sales at 309 millions had risen 6 per cent. over the 1945 level and the equivalent revenue from sales of electricity showed the substantial increase of £97,226, of which approximately £68,000 was obtained from lighting and domestic supplies and the balance from industrial sales. The balance carried from revenue account showed an increase of £39,731. That, however, was largely liquidated by an increase of £36,516 in provisions for taxation. The directors recommended a final dividend of 6 per cent. actual, less income tax on the ordinary share capital, making a total distribution of 9 per cent. for the year.

50 YEARS' SERVICE

The Midland Electric Corporation for Power Distribution, Limited, was incorporated on June 23, 1897. It was registered by far-seeing enterprising individuals who were among the first, if not the first, to realise that the future of electricity supply, outside the large boroughs, would require wider boundaries than single municipal units. They, therefore, negotiated with a number of local authorities, whose areas were contiguous, and eventually secured the transfer of 25 provisional orders to form a compact area of over 100 square miles, largely comprising the area of South Staffordshire known as the Black Country.

The company had made a great and lasting contribution to the area it served—in the accelerated development of the area, due to the provision of cheap and abundant electric power, resulting in the removal of smoke from the one-time Black Country, due to the installation of some 450,000 h.p. of electrical plant and the wholesale replacement of coal-burning apparatus. Their friendly and happy relationships with the local authorities and their officials had contributed in no small degree to wider opportunities for service to the community.

It should also be remembered that the company had combined with the boroughs of Wolverhampton, Walsall and West Bromwich in establishing the West Midlands Joint Electricity Authority for the joint generation of their electricity requirements and the development of a large rural area. For a period of 21 years they had worked harmoniously with representatives of those boroughs and those of other undertakings who had subsequently joined them.

Their Jubilee Year might see great changes in the electricity supply industry, but they very much doubted whether the pioneering spirit, the progress and the service they had contributed to the district would be equalled under the new control.

THE ELECTRICITY BILL

The Electricity Bill for the nationalisation of electricity supply undertakings was now before a "Standing Committee" of the House of Commons, and the continued existence of the company depended on its progress. He had written to stockholders pointing out the arbitrary, unjust and entirely unnecessary nature of the proposals it contained, especially the inadequate compensation it proposed to impose on stockholders in return for their investments in the company, which would reduce their income by 35 per cent. If stockholders disapproved of the proposals to dispossess them, he hoped they were taking every opportunity of registering their views.

He was entirely at a loss to know in what manner that transfer of ownership would

benefit the community. Personally, he was certain it would be to the detriment of the consumers and to the stockholders—the owners of the undertaking. At a time of grave economic crisis, while the Government was exhorting the country to bend all its energies in a joint and universal effort to achieve maximum production, it was incredible and amazing to see the same Government forcing further upheaval, unrest, dissension and frustration on industry and the taxpayer investor by nationalising the electricity supply industry, which had a record for success and development second to none in the country.

The change of stock certificates from holdings in a public company to a public or national board, brought no added sense of responsibility for the development of electricity supply, nor any added interest in the problems of management, neither would it assist in producing more units at a reduced price. In fact, the statutory obligation to provide a cheap and abundant supply had been omitted from the Bill, presumably on the realisation that under national operation electricity would neither be abundant nor cheap.

The splendid record of the company had only been possible by close co-operation between management, operatives, consumers and local authorities, and it should be remembered the company had distributed larger sums in wages than in dividends. The spirit in which the industry was operated was of greater importance than the form of ownership, and he was concerned to note that in the Electricity Bill, the relationship between the central controlling authority, the regional boards, the consumers and the general public, was defined by declarations, rather than by specific statutory obligations. There appeared to be no body competent to insist upon the controlling authority carrying out its duties, performing its functions, or giving effect to its policy.

The report was adopted.

RUBBER PLANTATIONS INVESTMENT TRUST, LIMITED

DIVIDENDS RESUMED

The thirty-eighth ordinary general meeting of this company was held, on the 26th instant, in London, Mr H. J. Welch (the chairman) presiding.

The following is an extract from his circulated statement:—

The proposal to pay a dividend of 3½ per cent. for the past year and the changes resulting from continuance of our war-time policy of moving a portion of our invested funds from rubber into tea are the salient features of the directors' report and accounts. We commenced the year with a carry-forward of £176,649: after adding to it the surplus revenue for 1946 and deducting taxation and the proposed appropriations, we carry into the present year a surplus of £154,123—and retain intact the dividend equalisation reserve of £50,000.

Gross revenue was up by £20,260 and net revenue by practically the same amount, before deducting taxation, which increased by £11,017.

Throughout 1946 we continued our search for improved revenue yields consistent with reasonable safety of capital; funds invested within the British Empire were to the extent of just over 4 per cent. of our total investments transferred from Malaya to India and Ceylon and at the end of the year were equally divided between those countries. Transfer of funds from rubber into tea were made to the extent of about 5 per cent. of our total investments.

Quoted securities had a market value of £2,091,911, whilst the unquoted securities were valued at £84,812, making a total valuation of £2,176,723.

The report was adopted.

TELEPHONE AND GENERAL TRUST, LIMITED

SIR ALEXANDER ROGER ON NATIONALISATION

The annual general meeting of this company will be held on April 2nd in London.

The following is an extract from the statement of the chairman, Sir Alexander Roger, K.C.I.E., circulated with the report and accounts:—

Profit amounts to £126,345, an increase of £4,854. Dividends and interest received at £181,049 increased by £8,516, and sundry receipts were less by £2,396. Management expenses and directors' fees are up by £1,145. Interest paid on loans and deposits remains practically unchanged at £7,695.

Income tax absorbs £60,000, and after providing for the preference and ordinary dividends of 7 per cent. and 8 per cent. respectively, less income tax, £96,252 is carried forward, as against £83,070 brought in, an increase of £13,182.

BALANCE SHEET

General investments have decreased by £353,747 and shares in telephone operating companies by £23,969. An active movement in loans both to and from the telephone operating companies took place during 1946, and at £371,734 loans to these companies show a net increase of £301,375, while at £181,270 loans from the companies were reduced by £284,836, showing that at long last deferred capital expenditure programmes are going ahead.

The valuation shows an appreciation of over 29 per cent. The total investments stand at £2,805,482, of which quoted investments amounting to £1,730,982 are valued at middle prices on December 31, 1946. Unquoted investments and loans at £1,074,500, mainly in telephone operating companies in British West Indies, Portugal and Venezuela, are considered by the directors to be valued on a fair and reasonable basis.

Geographically, 76.03 per cent. of total investments and loans are in the British Empire and 23.97 per cent. in foreign countries, of which Government stocks, debentures and loans amount to 18.3 per cent., preference stocks (including subsidiaries) to 14.6 per cent., ordinary to 39.3 per cent. and subsidiary ordinary to 27.9 per cent.

PROBLEMS FACING EXPORT

Last year I again laid emphasis on the vital importance of overseas investment to export trade as an essential feature of economic recovery plans. Now it has been forced afresh upon the nation by the coal and electricity crisis which brought the country to an industrial standstill, in turn leading to a more rapid exhaustion of our American loan and bringing all too near our supreme crisis, that of insufficient and unattractive food for the nation.

We still have many hundred millions of investments abroad bringing us steady orders for goods, but every step taken here extending nationalisation sets a clear example to our foreign customers on whom we depend utterly and absolutely for our foreign business.

I have often said that if Britain possessed sufficient natural resources to be a self-contained nation, like Russia and the United States, neither of whom are essentially dependent on exports and imports, the Government could go on turning business and industry upside down as they are doing at present without the world doing more than shrug its shoulders. Britain, however, while lacking these natural resources, yet remains the real nerve centre of the most complex international business and industrial machine the world has ever seen. Its mobilised and successful experience, ability and knowledge of international business, banking, finance, insurance, transport and trading is still unequalled, and to discard or interrupt this

wonderful machine for political and ideological reasons, or to proclaim that the machine is inefficient or incompetent, is nothing short of suicidal and has the most serious adverse repercussions all over the globe on our trade, our prestige and our foreign commercial influence.

Our trading Empire is the world, and all our great business since the days of Queen Elizabeth has been built on the profit motive which is ingrained in the British people and their descendants throughout the world. It may be ideologically wrong in theory, but it can't be broken in practice in the life of a Parliament or 20 Parliaments, and fecklessly to enforce a change of practice and a change of outlook in times like these is courting disaster.

CONTROLS AND FRUSTRATIONS

Even if nationalisation were the best scheme in the world, we cannot now afford the dislocation and frustration and shock to confidence which the pursuit of it entails. We all want to be engaged in a single aim. We all want to close the ranks and fight for recovery as we fought for victory in the war. But when Government says that "First things must come first," they merely mean nationalisation with further restrictions, controls and frustrations, whether you like it or whether you don't.

Karl Marx did not know the first thing about international trade, neither do some of his intellectual followers in Parliament, but they show no sign of willingness to learn from the vast experience gathered successfully over a century and more. Though available in this country right in our midst, this experience is being politically ignored and foolishly despised.

Cabinet Ministers have not been educated in the intricacies of manufacture and international trade, of production and distribution, the tempo of salesmanship and competition, and yet at a time when the dire and desperate need is for speed and action in every phase of production and trade the business of the nation is being geared to the slow movements of a partisan political machine.

TOTALITARIAN PLANNING

It is interesting to note that in the view of our democratic Government totalitarian planning differs from their kind of democratic planning. They somewhat naively state that totalitarianism subordinates all individual desires and preferences to the demands of the State, but what else are they doing?

Over 50 per cent. of the people in this country detest nationalisation, and yet they are asked—and this includes all classes, whether directors, managers, superintendents, charge-hands, clerical, factory or shop workers—to subordinate their beliefs born of practical successful experience and embark on an uncharted economic sea. In fact, the Government's only plan is to force the extension of a system on the people which must, by its very nature, defeat any hope of a united effort.

They hamstringing industry, cotton markets, metal markets and produce markets, cut out middle men who know how to sell, pack, ship and deliver anywhere in the world. These men have created the trade marks, know the quality that is needed and the price that should be charged; they know all about insurance, freights, import and export duties, and a thousand and one other things that go to make an expert and sell an export. Literally there are thousands of experts in this country who are eating their hearts out because they are not allowed to use their experience and knowledge.

GOVERNMENT RETURNS

For the week ended Mar. 22, 1947, total ordinary revenue was £90,889,000 against ordinary expenditure of £133,303,000, and issues to sinking funds £100,000. Thus, including sinking fund allocations of £17,003,197, the deficit accrued since April 1st is £476,175,264 against £2,080,090,000 for the corresponding period a year ago.

Members and Electors

AFTER several weeks of economics, politics is once more in the ascendant. The two subjects are not nowadays easily distinguished, since political issues mainly turn on economic facts, while economic trends in their turn depend on political decisions. But whereas for two months the attention of the Government, of Parliament and the public has been directed to the economic elements of the state of the nation, this week's headlines have been mainly concerned with the domestic concerns of the Labour Party. Several things have combined to produce this result. In the first place, the debate on the second reading of the National Service Bill has revealed more, or at least more open, opposition to the Government within the ranks of their own party than at any time since the General Election. Secondly, it is becoming apparent that the Labour movement in the country is not so solidly in support of the Government's handling of the economic crisis as is the Parliamentary Party. Members visiting their constituencies bring back reports which, if not yet alarming to them, are equally not very reassuring, and the Trades Union Congress has let it be known that it is by no means satisfied with the trend of the Government's policy. Important changes in the personnel of the Government are rumoured, the most sensational being that Mr Bevin is about to forsake foreign affairs for economic policy. And finally, the central offices of all parties have been flustered in recent weeks by insistent reports that the Prime Minister is considering the possibility of a General Election in the autumn.

It is very difficult to know how much credence, if any, should be attached to any of these reports. On the one hand, it is abundantly clear that the honeymoon period of the Labour Government is long since over. It can no longer blame anything on its predecessors; it can no longer count on beginner's luck; and, above all, it must find something to bind its supporters to it more durable than the initial flush of enthusiasm that comes after an unexpected victory. But, on the other hand, it would be a very great mistake to exaggerate the extent of the discontent within the Labour Party. There are, it is true, several groups that are discontented with specific aspects of the Government's policy and it happens that the National Service Bill brings several of them together in opposition. There is the large element of conscientious objection to conscription, which by long tradition enjoys much respect in the Labour Party and to which several members of the Government have belonged in the not very distant past. There is another body of members who, while not objecting to conscription in principle, nevertheless have suspicions—fortified by recent experience in the armed forces—that the Service Departments are being allowed a far greater share of the national manpower than they deserve or can use economically. And finally there is the persistent band of critics whose chief objection is to Mr Bevin's foreign policy—though Mr Crossman, who led the "rebellion" last autumn, voted and spoke on this occasion for the Bill.

These elements of dissent, it will be seen, have very various motives. But opposition to the National Service Bill is by no means the only thing that unites them; they are also united in not wishing the Government any

real harm. None of them is within a hundred miles of wishing to split their party or bring the Government down. Indeed, it was only because, on this Bill, the Government was quite sure of a majority that so much skirmishing against it was indulged in. It was not out of sheer benevolence that Mr Churchill, so openly and so early in the debate, promised the Government the support of the Opposition. To promise support was, on this occasion, the surest way of embarrassing Mr Attlee and Mr Alexander, because it made it quite safe for any Labour member to exercise his conscience or his spleen. It would be a misreading of the situation to think that Tuesday's vote, when some 70 Labour members voted against their front bench, threatens the continuance of the Government. Had the Government been in danger, the Labour battalions would have been on parade almost to the last man. The effects of the current discontent inside the party will not be seen in any insecurity of the Government. Where these effects may, in the course of time, be visible is in the policy and personnel of the Government. Ministers may think it advisable, if not to alter their course, at least to tack. The Prime Minister may think it wise to remove some of the objects of criticism, or to silence some of the critics by appointing them to office. And the final effect will not be seen until the next General Election reveals whether the dissensions within the party have subtracted anything from the votes it can poll.

*

To say that the present Ministerial team is not perfect is to carry understatement to the point of satire. Many Ministers are tired, some are ill, and quite a number have been proved inadequate. Yet Mr Attlee may find it very difficult to make changes. Every Prime Minister starts out with the warning that his original team is an experiment and that failures will be removed from office; but every Prime Minister also finds it very difficult to change his team once chosen. He never again has even the limited freedom of choice that he has at the start. For example, there is a strong case for a transfer of Mr Bevin from the Foreign Office to domestic economic policy, which badly needs both the impulsion that he could give it and the influence that he can uniquely exercise over the trade unions. It may even be that Mr Bevin wants to make the change—though of that there is no evidence. But who could succeed him at the Foreign Office? Not Mr Morrison, who is in no fit state of health to undertake the rigours of modern diplomacy. Mr Dalton would naturally be a strong candidate but, apart from the difficulty of moving him in Budget season, could he be counted on to pursue the foreign policy in which not only Mr Bevin but also Mr Attlee himself believe, and not to go off on a chase after the will o' the wisp of a "Socialist" foreign policy? The Prime Minister is no doubt conscious of the failures in his team. But could he replace them with better men and still maintain the trade union quota?

A sitting Government, for reasons such as these, always finds it difficult to change its character in mid-course, and the present Government, so far from being an exception to the rule, seems to the outside observer to be more firmly caught in its own inhibitions than most. The probability is that it will go on much as it has been going, and with much the same personalities. But how long will it go on? This is where the rumours of an election become relevant. From the strictly party point of view, there are some arguments for a dissolution this year. By the end of the present session, the Government will have passed into law a very large part of the programme they put before the electorate in 1945; they must either mark time for three more years, or exceed their "mandate," or seek a new one. They have not yet lost a by-election (though it is only fair to add that they have only fought one—and that in a mining

district—since the severity of the economic crisis became apparent). They might, by dissolving now, get five more years of office, whereas to wait until later is to run all the risks of deepening economic crisis and spreading disappointment. Moreover, there would be a purely tactical advantage for the Labour Party in fighting before the re-arrangement of electoral boundaries, which will probably work to Labour's disadvantage, is complete.

And yet there would equally be grave disadvantages, again from the strictly party point of view. Most of the Labour Ministers and members are dependent on their salaries for their livings, and there will be many who will be nervous about endangering them before it is necessary. Moreover, to have an election requires an election issue. The Opposition, with their command of the House of Lords, could create an issue at any time; moreover, if it were to take the form, not of a rejection but of postponement of the unpopular Transport Bill, the cry "the peers versus the people" might backfire among the middle sections of the electorate whose votes are needed for victory. But the Tories will not issue a challenge unless the trend of events gives them a chance of winning—in which case the argument in the Labour Party for letting well enough alone will be all the stronger. And if the issue is created, there must also be a programme. That also would create difficulty, for Ministers, who see all the problems from very close, and their followers, who are inevitably somewhat removed from reality, might have very different views. While those behind cried "Forward," some at least of those before would cry "Back."

On a balance of probabilities, therefore, the odds are that this Parliament will live out its normal life and that the General Election is still two or three years off. But the odds might change. It is often forgotten that the balance in the country is not very far from being even. The following figures of the last four General Elections are worth recalling:

	1929	1931	1935	1945
Labour	8,380,000 37.0%	6,648,000 30.7%	8,465,000 38.6%	12,051,000 48.1%
Conservative and allies	8,659,000 38.2%	13,059,000 60.4%	11,792,000 53.7%	9,978,000 39.7%
All other	5,595,000 24.8%	1,932,000 8.9%	1,688,000 7.7%	3,066,000 12.2%

Both the major parties can apparently count on a minimum of almost 40 per cent of the vote (save in such exceptional circumstances as 1931), while the Liberals and the other smaller parties have never fallen much below 8 per cent. This means that General Elections are decided by about 12 to 15 per cent of the voters, some 3,000,000 people, of whom, in 1945, two-thirds voted for the Labour Party and gave it its Parliamentary majority. If one million of these—less than 3,000 in each seat now held by Labour—were to transfer their votes to the Conservatives, the electoral vote would be equal. If two million, without voting Tory, were to withdraw their votes from Labour the result would be the same. These are small margins. When it is remembered how many electors voted Labour last time purely as a protest, how little the Labour Government has done to please those who do not consider themselves to be members of the working class, and how much more general economic trouble is to be anticipated before 1949 or 1950—when these things are remembered, it is difficult to share the confidence of many Labour supporters that they will win another easy victory next time, even if they once again have Mr Churchill's assistance. The next few by-elections will be watched very closely. If they show Labour as strong as ever, the temptation to dissolve this year will be very powerful. But if they show, for the first time, any significant fall in the Labour vote—and a fall would not have to be large to be significant—then it will be the Opposition that will begin to talk of an election and whose tactics, in both Houses of Parliament, will be shaped to that end.

Asia and the Truman Doctrine

BETWEEN the wars a book was published with the title of "Europe, the World's Banker." It was, in fact, an analysis of capital export before 1914 from Britain, France and Germany, including their lending to, and investment in, other European countries. To-day, nobody would dispute that the title of "the World's Banker" should be assigned to the United States of America; no amount of talk about a World Bank or financial assistance by the United Nations can alter the fact that the United States is the only country at present with the capacity for really large-scale foreign investment, whether with private or national funds. It is also a fact that the greater part of the world is crying out for the economic aid which America is able to provide, and this demand comes not only from countries devastated or impoverished by the war, but from the vast region of lands classified as "backward" and eager for the rapid economic development without which they cannot take their place among the nations of the modern world.

Even if there had been no war, the problem of the economic development of the countries of Asia to the south of the Soviet Union, from the Mediterranean to the Pacific, would confront the world with many delicate issues in international relations. In the whole of this region only Japan had achieved a modernised economy before the war and even in Japan the process had been a very uneven one. Elsewhere, Asia had remained in a condition of relatively primitive economy with scattered installations of modern industry or transport, mainly of foreign origin; politically it had been divided between dependencies of Western nations and countries formally independent, but subject either to definite restrictions of sovereignty or to various degrees of foreign "influence." The Western nations exporting capital to these countries had not, generally speaking, aimed at their industrialisation, but at their development as sources of primary products for the world market and at the promotion of commerce in these commodities. On the other hand, the emerging nationalist movements everywhere aimed at industrialisation, both as a means to the increase of national wealth and as an essential condition of national power and independence. These movements were faced with the dilemma that their projects in every case involved large-scale borrowing from abroad, yet their political principles forbade them to submit to any of the political or administrative controls which had previously been associated with foreign loans, credits and large business enterprises. Asiatic nationalism, therefore, and the growing anti-imperialist conscience of the West alike set the problem of how to induce capital to move as required from more advanced to less advanced countries with sufficient security for the lender, but without "strings attached" of a kind unacceptable to the borrower.

For the new era of international investment in Asia the United States has started with two great advantages. In the first place, the gospel of industrialisation of backward countries has taken hold of the American mind earlier and more strongly than of the Western European; partly because the American economy has so much more self-supply of foodstuffs and raw materials and is, therefore, less inclined to assume a lasting division between industrial and primary-producing countries; partly because faith in industrialisation as a way of general human salvation has been more widely prevalent in America. A second advantage for America in Asia is the fact that the United States has never acquired territorial sovereignty anywhere in Asia except in the Philippines, where it was taken from another European nation and subsequently renounced by the grant of sovereign national independence to the Filipinos. The Americans have thus enjoyed in Asia a certain reputation for disinterestedness and benevolence which has enabled them to start well in relations with the new nationalist forces bent on liquidating all traces of colonial rule and foreign privilege.

*

As against this, the very isolationism and anti-colonialism which have kept America out of the past interventions, conquests and partition arrangements of the European Powers in Asia are now acting as a barrier to capital export. The private investor, in fact, is showing himself very wary indeed. Theoretically, in a system of private capitalism, money for investment abroad, whether in State loans or business enterprises, comes from private capital accumulation on the same calculations of profit and risk as in domestic investment, the decisive factor being a judgment on the credit-worthiness of the country concerned or on its capacity to provide suitable conditions for the operation of a business enterprise. But in practice there has normally been in the past a reliance on the government of the lending country to provide security for the investor by means varying from direct control, as in colonial territories, to diplomatic pressure and influence. If there is no such protection from his government, or if it is insufficient, the investor is left to cope with all the dangers of lending money to a foreign government which may squander it and fall into bankruptcy or of putting money into a company whose operations may be frustrated by official extortion, brigandage or civil war. These risks have been increased by the spread of xenophobic and anti-imperialist doctrines, which represent the foreign investor as an enemy and justify any measure of default, confiscation, freezing or squeezing that a poor nation can get away with. Thus it has come about that the export of private capital from America before the proclamation of the Truman

Doctrine was quite inadequate for the needs of a number of countries crying out for financial aid.

The alternative is for Uncle Sam to go into the foreign investment business himself. This means first of all the Export-Import Bank, which provides funds not forthcoming from private financial institutions, but must justify its operations commercially according to strict regulations; and secondly, it means loans which are granted by the United States Government, subject to the approval of Congress in each case. This removal of foreign investment from Wall Street to Washington inevitably brings it into the sphere of politics and, as far as Asia is concerned, links it directly with foreign policy. The State Department has certainly grasped, what the American public as a whole has only half realised, that American foreign investment is insecure without support by American political power and that this power in the world cannot be effective

unless sustained by dollars. The US Government, indeed, has motives for investment in Asia over and above the private investor's desire to make a profit by lending his money. There is, first of all, the wish to develop markets, especially for capital goods, and thus bring about a new prosperity for American industry. But even surpassing this motive—which by itself would justify a strong support for foreign investment expansion—is the purely political purpose of sustaining the independence of a number of nations which, in Washington's official opinion, would otherwise lose it.

*

This is the design which has been exposed with the frankest emphasis to the American people in President Truman's appeal for assistance to Greece and Turkey. It is clearly not the whole of the scheme. It is openly declared that the threat to Greek and Turkish independence comes from the Soviet Union or from Soviet satellites using internal revolutionary elements as auxiliaries. But to the east of Turkey, Persia, Afghanistan and China have common frontiers with the Soviet Union, and in the extreme east of the continent is newly "liberated" Korea, divided between Soviet and American occupation zones. Lacking direct contact with the Soviet Union, but divided from it only by narrow tracts of intervening territory, are the Arab countries of South-west Asia and India, which is due to start its career as an independent nation (or nations) in

the middle of next year. All these countries will need external economic aid, if they are to achieve national strength and stability and make orderly progress in the near future. It is not logical that American bounty should stop at Mount Ararat. Already Teheran and Nanking are hopefully awaiting the golden rain.

The idea that America ought to protect China against the pressure of land power from the interior of Asia is not in fact a new one; it is much older than the Soviet Union. As early as 1855 Humphrey Marshall, the United States Commissioner in China, urged the State Department that "almost any sacrifice should be made by the United States to keep Russia from spreading her Pacific boundary or coming directly to interference in Chinese domestic affairs." But that was prophetic rather than actual; when Russia at last reached the Yellow Sea, it was not the United States, but Japan which gave battle. Later on, Russia and America were to be drawn together by a common interest against Japanese aggression, but tension began almost immediately after Japan's surrender. The main issue on which policies at once seriously clashed was the disposal of the important Japanese-installed industrial equipment of Manchuria, which had been earmarked in Washington for China's initial post-war industrialisation. The systematic removal of this plant to the Soviet Union as "war booty" gave a greater shock to the American Government than any other Soviet act, and the consequences were manifest not only in the Far East; at the other end of Asia the United States challenged Soviet policy in Persia and brought the matter before the Security Council. More recently, the move for aid to Turkey—a country part Asiatic and part European—has linked together the European-Mediterranean and the Asiatic-Pacific policies of the United States.

The Americans have involved themselves deeply in Asia, almost without knowing it, and they are now having to face the implications of the protective rôle which they have so rapidly assumed over so vast an area of the Earth's surface. The Communist spokesmen, both in Moscow and New York, assert that no country is in any danger from Soviet power and that it is simply American imperialism which is invading China, Persia and Turkey. There is no end to argument about this; it is a historical fact that empires have frequently grown from protecting weak nations against other empires and that weak nations rarely retain real independence unless all stronger nations observe a self-denying ordinance to keep their hands off them. If the United States sustains the Rimland countries of Asia against the Heartland, it will certainly assume certain rights of guidance and advice in relation to these countries. But it will not annex territory or establish formal protectorates—all that is, in any case, out of date—and it will seek to combine its protective function with the programme of industrialisation which has already been projected on purely economic grounds.

The principle of financing, however, will now be no longer purely economic; if the American nation's money is to be lent in Asia for political as well as economic purposes, the loans cannot be viewed merely as business propositions. They may serve their political purpose even if the financial outlay is never recovered. However, the political commitments will in fact improve the economic prospects; without them the economic case for large-scale investments in Asia is not good enough. Neither private nor public American funds are well invested without some kind of political guarantee in countries torn by civil war or capable of such waste as befell Unrra goods in China. It will be no use saying there are no strings to American lending; it is the strings which alone will make the lending worth while from an American point of view. Money talks, but it only talks with confidence when there is someone around to take care of it.

April School's Day?

FROM last Tuesday, April 1st, all children under the age of fourteen will be required to stay on at school for an extra year. The die is now cast, and the argument over whether to raise the leaving date this year, next year or sometime later is now decided. But if the fate of every Dick and Mary is thereby settled from an administrative point of view, their situation from a more personal angle is not, for no one yet knows whether the classrooms, desks, chairs and teachers will be ready for them. It is the purpose of this article to examine the prospects for fulfilling the targets for staff, accommodation and equipment, to consider the plans of what will be taught during the extra year, and to estimate whether in the immediate future and on balance the school children will gain or lose.

In all the following discussion two points should be kept in mind, two points which are the life line to salvation for the local authorities. The first is the fall in the birth-rate that took place in the early 1930's: in 1946 there were (in England and Wales) 575,000 fewer children in primary and secondary schools than there were in 1938. The raising of the school leaving age will entail an increase over the 1946 figure of some 390,000. Thus the education authorities, even with the extra age group, will have fewer children to deal with than before the war. The second point is that the effects of raising the leaving age will come by stages during the first 18 months. There will be no extra children until September, 1947, when only an extra 130,000 will stay on, and the full impact will not be felt until September, 1948; this will, therefore, give the local authorities a breathing space. Without these two reliefs it would be quite impossible to deal with the increase in numbers, for the losses in teachers and in school buildings during the war were very serious.

Perhaps the most surprising feature of the situation is the official expectation that the supply of teachers will be comparatively comfortable. So much has been heard about delays in selecting teachers for the emergency training scheme, in placing them in colleges, and in paying them allowances, that it has not generally been realised how large an improvement has taken place recently. The opening of the new training colleges, which was badly delayed in the early stages, has been greatly speeded up. The target was originally 42 emergency colleges giving a year's course: the target has now risen to 60, and there are 47 already open. As the result, only 2,000 teachers recently emerged from the first year's course, but there are now 11,000 in training, who will be ready for action before the summer of 1948. As it was estimated that 13,000 teachers were required to deal with the extra age group, and additional teachers are also forthcoming from the regular training colleges, it is safe to assume that the numbers of new teachers will be able to cover minimum demands, even when allowance is made for retirements.

The position, is, in fact much more favourable than the Ministry of Education had expected. In 1945 certain estimates were made of the number of ex-teachers who would return to teaching from the Forces and of the number of women who would retire from teaching, when the emergency was over. In the event far fewer married women have given up, and more ex-service men have returned to teaching than was budgeted for. There should accordingly be 8,000 teachers, over the requirements for the extra age-group, available by September, 1948, to make their contribution to the reduction in the size of classes; the number is not large but at least it is on the right side of

the balance sheet. The general picture does, however, mask shortages in certain areas and in certain categories. There is, for example, a shortage of women teachers compared with men—only one woman to every five men has applied for emergency training—and this is really acute for the infant classes. For various reasons, young women who are ready to go into the more picturesque surroundings of the nursery schools for under-fives or into the secondary schools for the over-elevens will not go into the infant and junior schools. This difficulty will become even more severe in a year or two, when the high wartime birth-rate shows its effects in the figures for school entries. The education authorities are very disturbed about the prospects.

Apart from this difficulty of sex distribution and shortages of certain specialist teachers, the response to the emergency scheme as a whole has been very satisfactory, so much so that a closing date for applications from men has now been fixed. So far there have been 90,000 applications, of whom 30,000 have been accepted for training, and applications are still coming in at the rate of 500 a week. Owing to the difficulties of finding living quarters at the present time, those Local Education Authorities which have a non-residential college within their boundaries have a big advantage in recruitment.

*

For school accommodation the future is more problematical, owing partly to the recent crisis and partly to the general difficulties of the building industry. Fortunately, owing to the fall in the birth-rate in the 1930's, a large number of the places can be found in existing schools: for example, Birmingham can find 50 per cent of the additional places in its existing schools and another 20 per cent in other buildings, so that huts are required for only 30 per cent of the extra age group. In London no temporary huts are being built, and the whole expansion is to be engineered on a shock-absorbing programme of 12 or 13 large new schools in semi-permanent buildings, erected in areas where complete new schools are required. The relative proportions of huts and existing accommodation vary between one authority and another according to local conditions—bomb damage, movements of population and so on—but the total of extra huts required for meeting the raising of the school-leaving age is only some 6,000, of which 3,700 are required by September, 1947. Up to about six weeks ago progress on these huts was very bad and the Ministry of Works, which supplies them, estimated that only 50 per cent of the target would be fulfilled. The position was so serious that the priorities were drastically altered, and it is now hoped to achieve 80 to 90 per cent of the target for September, 1947; whether this will be attained remains to be seen, but there are reasons for thinking that local authorities have over-estimated their needs and that the gap is smaller than it appears.

In addition to the huts, permanent buildings on sites where huts are not suitable are to be provided for some 70,000 to 75,000 places. But there is little prospect of any quantity of this work being ready by September, 1947, though it should be complete by September, 1948. When the two schemes are combined, the building programmes will employ 1.0 to 1.5 per cent of the country's total building labour force, 0.25 per cent of its supplies of steel and 0.5 per cent of its supplies of timber. It cannot, therefore, be claimed that the resources of the country employed in building work for the extra age group are large. When it comes to replacing old schools with new, providing for smaller classes and all the extra space and building involved in

carrying out the full programme of the 1944 Act, the picture will be very different. The London County Council's School Plan, costing £187 million over eighteen years, gives a foretaste of what the burden of the complete plan is likely to be.

The basic equipment for the new huts—desks, chairs, shelves, cupboards and benches—is being supplied centrally from standardised patterns. In terms of the total output of the school-furniture industry, the requirements are very small: it is reckoned that the whole programme would demand only 4½ weeks' work from the firms making school furniture, and as the resources of the furniture trade are underemployed, timber is the only shortage. But the allocation is so small compared with demands from other sources, for houses, factories and the like, that there are reasonable grounds for hoping that it will be delivered in time.

The question of what the fourteen-year-olds are going to learn in their extra school year raises very different questions. In many areas the problems of bricks and mortar and the pressure upon overworked staff have been so acute that very little thought has been given to this problem. And yet it is the paramount one, for neither huts, nor desks, nor inexperienced teachers can make the extra year worth while. The new experiment will meet only opposition and resentment from both parents and children if the extra year is felt to be wasted.

The most forward-looking authorities visualise a complete re-organisation of the course on a four-year basis, to take in the whole period from 11 to 15, rather than to tack an extra year's course on to the existing one. This is clearly the only satisfactory solution, provided that enough latitude is given in the fourth year to allow the child to follow some of his special interests, that the methods of teaching are permitted to be less formal and allow more scope for individual work, and that the child's natural orientation towards his future career and the outside world is encouraged and made use of by means of visits, and contacts with extra-school bodies. In some ways the difficulties of the first year may assist this process, for the absence of the normal books and facilities and the presence of teachers unaccustomed to the old routine, and with more experience of

the outside world, will help to break down old barriers, and to set up less orthodox practices. By universal consent, the generation of teachers now passing through the emergency training colleges is outstandingly good by pre-war standards and possesses a keenness and sense of initiative which should work wonders.

What does this all add up to? How far does this April mark an upward step? How will the children caught in the first year's experiment benefit? There can be no doubt that beyond the immediate future the raising of the leaving age will be wholly beneficial: the question is really whether in the short period, say the next five years, the pressure of the extra age group will serve to depress standards and cause a greater loss than gain. There can be no categorical answer owing to the variations in local conditions. In rural areas the pressure in individual schools is relatively small, and wherever the local authority, in unreorganised areas, has made special temporary arrangements for the extra age-group, as for instance in the Isle of Wight where the fourteen-year-olds are being collected together in special schools, there will be an undoubted benefit and the extra year will not be wasted. But where such arrangements are not planned and in those towns where pressure is greatest and improvisation most necessary, the first batch of children will benefit very little, if at all, from the extra year's confinement and their presence will delay improvements, such as a reduction in the size of classes, which might otherwise have been given to all the other children. It is irrefutable that if the extra teachers and huts had been provided while the raising of the age had been postponed until April, 1948, all the children between 5 and 14 would have benefited more than they will now do, and there would have been much less danger of a depression of standards. On the other hand, party pressure and the fear of an indefinite postponement of the date made it politically impossible to reverse the earlier decision. In the light of the estimates of progress it looks as if a fair proportion of the extra age group might benefit, and only a small proportion will seriously lose. Whether the gains of the first will outweigh the possible losses to the bulk of under fourteens is anybody's guess.

NOTES OF THE WEEK

Turning Point in Moscow

On April 1st the Foreign Ministers cut down their delegations to a score of persons and retired behind closed doors. This at least removed the temptation to make speeches for reproduction in the German press, where some vigorous wooing of parties is going on, with claims that Germany must be represented at the peace conference and that the bi-zonal arrangements in the west are already breaking down. Otherwise the conference has made negligible progress. In fact on Wednesday the Foreign Ministers turned away from reparations—the crucial matter—to a debate on the political structure of Germany, which is in the long run primarily the concern of the Germans themselves.

None the less, observers at the conference note a growing realisation among the Russians that only a very long-term arrangement for paying reparations out of production is possible. The estimate made in *The Economist* last week that there would be no surplus for such reparations until the 'sixties now has the support of M. Rueff, chairman of the Inter-Allied Reparations Agency. The French suggestion—an obvious gesture to the Russians in return for their support over the Ruhr—that there might be a surplus for reparations by 1949 if economic unity were attained this year is ludicrous. Any attempt to exact them at that date, combined with the French insistence on a low level of industrial production and high coal exports from the Ruhr, would merely perpetuate the burdens of the British taxpayer.

Mr Marshall, who has been as obstinate as Mr Molotov, has now made it clear that he expects only very limited results from this meeting. He obviously believes that conditions in the Russian Zone will get worse while those in the western zones get better. He may even believe he can get the French to join their zone to the British and US zones, so at least giving western Germany

economic unity. The inducement would be exports of coal from America. Mr Bevin, who has also allowed no nibbling at his case, may find some hope in the general tendency to admit that the level of industry must be raised and that free movement of goods and persons between the zones should begin as soon as possible. Why he—as well as Mr Marshall—has raised the question of the eastern frontier at this juncture is not clear. If even the most exiguous bargain is to result from this meeting it will have to be on reparations; for the Russian claim that these should come out of current production is the rock on which their whole case is founded and on which the conference still looks like splitting.

Austria—Free or Satellite?

The Moscow debates on Austria have been a good deal less important, but no less instructive, than those on Germany. Ostensibly the Foreign Ministers have been arguing about the disposal of German assets in eastern Austria, which the Soviet Government are entitled under the Potsdam Agreement to take as reparations from Germany; in fact they have been fighting for and against the eventual independence of the Austrian state. On the surface, the British and the Americans—supported by the French—have appeared very disinterested and European-minded with their insistence that Austria will be ruined if the Russians are left to interpret Potsdam as they wish; underneath there is deep concern lest the Russians should retain a permanent hold on vital Austrian industries and financial assets which would enable them to dictate policy in Vienna.

Mr Marshall produced an irrefutable argument when he reminded his Russian colleague that the title to German assets remains for the time being vested in the four Powers; although

he may find in practice that the title has in one or two important cases been already jumped, notably in the Zistersdorf oil fields. M. Bidault protested that the four Powers could not be "beneficiaries of spoliation," in other words sharers of swag. So M. Molotov has given way to the point of admitting the need for some definition of these assets to appear in the treaty. What it will be and how it will be enforced remains to be seen. If the Russians are allowed to take everything that, in the years before the war, passed from Austrian to German ownership, except only those properties that were taken by the threat of force, the consequences will be serious, if not disastrous. For German penetration of Austrian industry began before the Anschluss of 1938. I. G. Farben, for instance, had a decisive voice in the Austrian chemical industry long before the Nazis used the occupation to gain virtually complete control. It will take a clever accountant to unravel the threads. And the Vereinigte Stahlwerke of Duesseldorf held over half the shares in the Alpin Montangesellschaft iron-ore concern before the Hermann Goering combine absorbed the lot. As for the Zistersdorf oil fields, now one of the most valuable in Europe and producing over 750,000 tons a year, the prospecting rights are British and Dutch and the amount of German capital involved must be small.

There is no doubt at all that in this controversy the Austrian interest and British and American interests coincide. The Austrians are living on loans and gifts of food from the West; they will go on living a hungry and bankrupt existence until the four zones work together. Their industry, raw materials and agriculture are complementary. If agreement is not reached in Moscow they will be held apart indefinitely and Allied troops will stay; and the reluctant House of Representatives and the hard-pressed British Treasury will be asked for further loans—another example of the way in which the threat of economic catastrophe is being used to squeeze the Anglo-Saxons from the Baltic to the Aegean. If this reparations quarrel is settled the rest of the Austrian Treaty should give no serious difficulty.

Francisco the Eighth

"Spain and Russia," General Franco recently remarked, "are the only two countries in the world to-day that know exactly where they are going." But apparently his most vociferous supporters do not share this certitude. A few days before the Caudillo finally reaffirmed that Spain is a Catholic Kingdom Falangist busybodies were castigating Monarchist sympathisers in the streets of Madrid. He would have spoken more accurately, if less effectively, had he said that Spain knew exactly where it did not want to go. Ever since 1939 Franco and his notably small group of political advisers and executors have been cannily waiting on the up-and-down of events beyond the Pyrenees to decide their commitments. The friction between Russia and her wartime Allies, sharpening into President Truman's manifestation of time interest in the strategic outposts of Europe, has done more than any indignant resolution of the United Nations to persuade them to pledge a restoration of the Monarchy—*mañana*. In return for the spoken promise of orderly evolution towards a more liberal régime, and for the unspoken promise of the historic strategic advantages of the Peninsula in time of trouble, Franco is counting on urgently needed economic help from overseas.

There is to be no haste in his policy. In Spanish homes Franco has long been dubbed Francisco the Eighth by virtue of the meagre weekly ration of an eighth of a litre of olive oil. The reign of the healthy 54-year-old *Generalissimo* is to continue until his death or incapacity. In the background, preparing for the least changeable change-over, will be the newly-nominated Regency Council, composed of the President of the Cortes, the Primate (the Cardinal-Archbishop of Toledo), the Chief of the General Staff, the President of the Supreme Court of Justice, the President of the Institute of Spain, and four Councillors representing the Syndicates, the Universities, the local authorities, and the professional organisations. When the time comes this Council will offer the throne to whom it considers the most satisfactory candidate of Royal blood. If none is deemed satisfactory—the Pretender, Don Juan, has hitherto proclaimed policies unwelcome to the Church and Army—a Regent will be appointed.

Franco tacitly assumes these arrangements will be ratified by the necessary two-thirds of the Cortes, which is little more of a debating Chamber than was Hitler's Reichstag. There are no dissenting Republican or Communist Deputies to voice approval or dissent. Nor is the Press free to discuss the pros and cons of a restoration. What, then, do the unconsulted Spaniards think? The majority, including the Army, are ready for peaceful change; but only a small and at times seemingly quixotic minority are

still moved by personal loyalty to the Royal House. Many former Republicans would now choose a restoration as the lesser of two evils, for the Spanish Government-in-Exile has lost the confidence and interest of most of its supporters at home where no new leaders have been allowed to arise. Positively opposed to a restoration are only a small faction of Communists, Republican diehards, and such *Falangistas* as are likely to lose their jobs and perquisites in a more open market. Having learnt their lesson of civil war and observed the violent end of contemporary dictatorships, Spaniards are probably more qualified to-day than they have ever been before for an experiment in constitutional monarchy, and it will be a pity if they are kept waiting overlong.

The Conscription Debate

The political implications of the National Service Bill influenced the whole tone of the debate on the Second Reading. Members, that is, were anxious to establish or reject the principle of conscription itself, and little attention was paid, except by Mr Isaacs, who opened the debate, to the provisions of the Bill imposing it. As the Bill will be considered in a Committee of the whole House, there will be further opportunity for members to give it more detailed attention, and it is hoped that they will then take up some of the points raised by Mr Isaacs's speech.

Notice has already been given that an amendment will be put down to reduce the period of conscription from eighteen months to twelve. This indeed would be the biggest improvement that could be made, but it again raises the question of why conscription is necessary. *The Economist* has always maintained that the real purpose of conscription is the need to have a large reserve of trained men who can immediately be mobilised in the event of war. This has at last been admitted by the Government; but both Mr Isaacs and Mr Alexander made it quite clear that the conscripts will also be used to help to fulfil the country's commitments. They will be fully trained in ten to twelve months, and they may then be used to do such service as garrison work overseas. What, however, neither Minister made clear was how many men will be needed to fulfil each of the individual commitments, from garrison duty in Hongkong to anti-aircraft defence at home. If the total were totted up, it would surely be apparent that the contribution of an extra six months' conscription towards it would be very small—certainly not large enough to justify the social and economic dislocation that it will cause.

On lesser points, members should take up a remark by Mr Isaacs to the effect that doctors and dentists when called up will serve as doctors and dentists—and therefore in the officer class and not in the ranks. From a strictly military point of view, this may be justifiable, since they would serve as doctors and dentists in a war. But this is a Bill in which equity must be paramount, and at all costs the principle of equal service must be maintained. Young men should not be attracted into the medical and dental professions by the bait of less unpleasant military service.

A third point, which received small attention in the debate, is the conscription of women. On grounds of equity, there is no justification for totally exempting them. On the other hand, there may be practical reasons for doing so. The armed forces could not take them all, and to direct them to other work would introduce the principle of industrial conscription, which is politically impossible. But the Government should at least be asked to state its reasons for excluding them from the Bill.

The FBI and the TUC

The similarity between the proposals for tackling the economic situation which have been put forward within three days of each other by the Federation of British Industries and the Trades Union Congress is remarkable, but not surprising. It is certainly encouraging to find organised employers and organised labour thinking, to some extent, on parallel—and, to some extent, constructive—lines; many of their recommendations are, however, largely a matter of commonsense, and are neither illuminating nor imaginative. For instance, both bodies call for more definite and speedier planning, the TUC laying particular emphasis on the need to fix industrial targets, the FBI insisting that planning should not be confused with controls. The FBI points out that the Government has undertaken too much, with too few resources, and urges it to soft-pedal on controversial issues, such as nationalisation, a view to which the TUC can hardly be expected to subscribe. Both organisations have arrived at the same target—220 million tons—

for coal production in 1947, though neither really suggests how this revised target can be achieved. Both urge the need for giving priority in supplies of fuel and steel for the production of mining machinery, generating plant and railway wagons and locomotives, and both recommend the Government to adjust its export policy accordingly. The Federation pays rather more attention to the dangers of inflation than the TUC does, but makes no recommendations whatsoever on manpower or wages. This omission, explained by the fact that the British Employers' Confederation is the appropriate body for dealing with these matters, makes its document curiously lopsided.

If the constructive parts of the two documents are flat and uninspiring—through no fault of the bodies concerned, but because they have been rehearsed so often, and to such little effect—the omissions are frankly disappointing. The TUC is silent on a policy for wages, and refuses to depart from the principle of a shorter working week. The references in the Economic Survey to the need for abandoning restrictive practices on the part of both sides of industry are ignored, as if by mutual consent. So far as the TUC is concerned, this may be because it has no guarantee that any good advice it puts forward will be adopted by the individual unions—the builders' opposition to payment by results is a good example. Yet it seems that the Government is relying, to compensate for its own lack of an economic policy, on both sides of industry to find their own cure, now that the diagnosis has been made clear to them. If the views of the FBI and the TUC are really representative of the attitude of the individual employer and worker, which by no means follows, then the prognosis is indeed poor.

* * *

Small Savings

With the passing of the much-advertised deadline of March 31st, the rate of interest payable on National Savings Certificates drops from £3 3s. 5d. per cent to £2 13s. 2d. per cent, tax free. Possibly this stiffening of terms, planned in the heyday of the cheap money policy, will prove a deterrent too strong for the National Savings Committee's purposes, and may be maintained only by penalising still further the alternative outlets for private saving. The Budget may show. Certainly there is no evidence of any strong pressure by small savers such as would, on old-fashioned economic grounds, justify the cut in yield.

On the other hand, certain long-run forces may be working in Mr Dalton's favour. Savings, after all, have a double purpose, only part of which, and to the small saver the less important part, is the provision of a permanent income. They are income—income spread over a lifetime to fit a pattern of needs which rarely corresponds to the pattern of earnings. The position of the man who can without anxiety overspend his current earnings during the years when his family responsibilities are heaviest, because he has for that specific purpose deferred his spending when they were low, is enviable enough to be imitated regardless of the rate of interest which he gets as an extra advantage. Nor is it only the comparatively large holding whose advantage is obvious. Even a small nest-egg makes possible a freedom and an efficiency in purchasing unknown to those who bump along the bottom from pay-day to pay-day, deviating now to the pawnshop and now to the tally-man. It is in itself as much an ingredient of a higher standard of living as a second suit or pair of shoes, and the interest payable is neither here nor there. For these day-to-day elasticities, of course, the Post Office account rather than the Savings Certificate is the thing; but the savings habit, once established, is not likely to be given up in a hurry, because one of its advantages, and that the less important, has been fractionally diminished, any more than the practice of keeping an extra pair of shoes would be given up because the price of shoelaces had risen.

In so far as Certificates are held in blocks of the maximum size by comparatively large investors, for the sake of their yield, the cut may damp down demand. But of the 17 million holders, only about 10 per cent hold the maximum, and the great majority hold under £100 worth. It is a fairly safe guess that for these smallest investors it is the nest-egg itself, rather than the yield derived from it, which counts.

The Ruhr on the March

Mass demonstrations in Duesseldorf and other Ruhr towns, a march of 10,000 with banners in Krefeld—which is not a coal town—and the threat of a strike to be called by the miners' union delegates at their Bochum conference this week have made the

British authorities nervous. A general strike in the mines would cost 250,000 tons of coal daily, and already time spent in discussing grievances has brought production down from its peak figure of 238,000 tons on March 21. The repercussions of such an event would be endless: cutting down of the coal exports from Germany to Europe planned for the next quarter and disappointment to such sensitive customers as the French and the Belgians; further delay in increasing German production; and a mortal blow at the efforts of the newly-fused British and American zones to get Germans on the path towards paying their own way. If anyone wished to cause confusion in the ranks behind Mr Bevin in his struggle for the British case in Moscow, the Ruhr is the place to strike. Correspondents on the spot have hinted that the demonstrations have Communist inspiration; this has yet to be proved as a valid explanation of events which arise out of genuine grievances and intolerable living conditions. The grievances are partly human, partly political. Food supplies for the Ruhr area are precarious; time and again full rations have not been honoured and the contrast between the rations of heavy workers and normal consumers is particularly striking there. The farms of the British zone have not delivered their quotas. Their target for January was 190,000 tons and delivery only 133,000 tons; the target for February was 170,000 tons and delivery only 87,000. Meat and other produce also fell short and potato stocks are almost exhausted.

*

The demonstrators included among their political grievances demands for the dismissal of Dr Schlange-Schoeninger, formerly head of the Food Department in the British zone and now deputy head of the new bi-zonal Food Office in Stuttgart. Why he should be blamed for the faults of a clumsy and incomplete administrative machine is not clear. It is virtually the old *Reichsnaehrstand* without the old Nazi inducements and ruthlessness. The rigid cultivation plans and delivery quotas remain, but without adequate supplies of fertilisers, machinery and consumer goods to keep production costs down and incentives alive. In the absence of these inducements only strict policing of the farms could ensure deliveries, but there are no special police for the purpose.

Add to this the curious administrative set-up and it is not surprising that German farmers should not be making their full contribution. The new bi-zonal organisation set up on January 1st is not yet a working machine. German responsibility is still only regional and lies with the governments of the *Länder*. Each of them is showing a curious revival of federal selfishness; the interest of each *Land* is put before the interests of the two zones. The *Länder* of the American zone, for example, whose requirements of imported cereals is a third of those of the British zone, refuse to take their quota of maize for bread grain. The need for real unification of authority and administration in German hands is urgent; federalism is showing its faults.

Eleven Good Men and True

The Security Council's first birthday has passed quietly. At its first meeting on March 25th last year Mr Byrnes declared: "If disputes cannot be settled by friendly negotiations, they must be brought before the Security Council. That is why the Council must at all times be prepared to act promptly; that is why it must be prepared to function continuously."

In its first year's record it can indeed be claimed on behalf of the Council that it has been prompt in its consideration of cases and that it has not refused to "function continuously." Whether it can be said to have "acted" is another matter. The Council has worked as a kind of loosely regulated tribunal with the spotlight of world publicity upon it; eminent counsel for prosecution and defence contend in verbal duel, and in this dramatic form some inkling of what the dispute is about is conveyed to the infinite multitude of normally uninterested human beings who compose "world opinion." The verdict does not matter so much, for everyone knows that eleven good men and true cannot decide anything if the Great Power Veto is invoked. It is now fairly well understood that the Security Council cannot provide security by any kind of military enforcement, for a Great Power can veto any action by the Council against the aggression of itself or its satellites. In this respect the Security Council cannot even accomplish as much as the old League of Nations; under the Uno Charter the League would never have been able to get as far as putting sanctions on Italy in 1935.

But the Security Council has been prompt; it has avoided the League's tendency to postpone or conceal issues in the hope that they would somehow be settled off stage. The Security Council has been a ring for straightforward fights with no pulling of punches, and the chief reason for this has been the American

determination to have it so. It started off with the American appeal on behalf of Persia; Russia countered with charges against Britain over Greece and Indonesia, which raised plenty of dust but not enough to obscure the fact that Russian troops were remaining in Persia after the date when they were due to be withdrawn. In the end they were withdrawn, and though it cannot be proved that the debates in the Security Council had anything to do with the withdrawal, it seems unlikely that they could have been got out of Persia by normal diplomatic means; at any rate, the ignominious collapse of the Pishvari régime in Azerbaijan has shown that the presence was necessary to sustain the Russian-sponsored "autonomy." The Security Council has likewise served as a sounding board for the vital discussions on atomic energy; the world now knows where the Great Powers stand on the issue. Tennyson's "fierce light that beats upon a throne" now beats on the eleven men who represent the world in conclave; it may yet be a gain for humanity that they cannot get away from the glare of the arc lamps.

Freeze-out of Houses

The February returns (Cmd. 7079 and 7080) for housing are every bit as catastrophic as had been expected. The appalling weather has reduced the number of permanent houses completed during the month from 8,500 in January to 3,800 in February and of temporary houses from 4,800 in January to 2,400 in February. (The full details will be found in the *Records and Statistics Supplement*.) Although the cold weather broke in March, it was succeeded by a record rainfall which is as detrimental to housing progress as frost, so that no recovery of lost progress can be expected in the next returns. The gods have been extremely unkind.

The target for the year 1947 was 240,000 new permanent houses, which demands an average of 20,000 houses completed a month. It might have been possible to make up for the losses of the first quarter if there had been nothing but bad building weather to counteract. But unfortunately the fuel crisis has also played havoc with the output of building materials, and the results of this will last for many months to come. For example, the output of cement during the five weeks of January was 550,000 tons and only 192,000 during the four weeks of February, and brick output fell from 379 million to 247 million in the same period.

University Scholarships

The creaming of the intellectual talent of the country by Oxford and Cambridge universities has for long been a problem to those who desire to see a balanced expansion and a more even distribution of ability round the civic universities. The announcement that the allocation of state scholarships is now to be controlled is a welcome step in the right direction. In the past Oxford and Cambridge could accept as many as they desired of the state scholars, for the majority made these two universities their first choice. In future, with the increase of state scholarships from 360 to 750 announced last week, only 50 per cent will be allowed to go to Oxford, Cambridge and London, on a ration of about 120 each, and the rest will be distributed round the other universities in proportion to their size. This still leaves to Oxford and Cambridge a larger proportion than their numbers should strictly entitle them, but it was not thought possible to restrict the numbers below what they have had in the past.

The new denying ordinance continues to permit these two universities to take the cream off the 750 scholars, for intending students will still hanker for their prestige and hallowed precincts, but at least they will not receive a still larger share than in the past. And the other universities are now attempting to create their own counter attractions, for the development plans of every university include a large expansion of halls of residence, and other buildings designed to improve amenities. It may even be that the imitation is being taken too far, in view of the cost.

In addition to the normal scholarships there are to be 100 new Technical State Scholarships for students who go into industry and commerce from school and take part-time classes. These will be offered to students under the age of twenty on the recommendation of the Colleges of Further Education and on the advice of a Selection Committee, and like the other scholarships they will cover fees and maintenance based on an income scale. Thirdly there are to be twenty scholarships for older men and women who have missed the opportunity in earlier life—a very small number, but at least a beginning.

These three schemes show that the Ministry of Education have appreciated that there cannot be a large expansion in university numbers without a considerable increase in state grants to cover the students' expenses. But even now with 65,000 university students there are only 6,000 regular awards annually given or supplemented from public funds covering fees and maintenance—1,500-2,000 major awards given by the local education authorities, 1,200-1,500 open scholarships awarded by the universities and 1,800 awards given to intending teachers and the 870 announced under the new schemes. The 32,000 awards so far given to ex-service men and women will not continue indefinitely, and without some provision to fill this gap later there may be difficulties.

The Lords Debate Divorce

Last week the House of Lords, on a motion by Lord Reading, debated the Final Report of the Denning Committee on Matrimonial Causes Procedure, and once again the Lords demonstrated the public value that their deliberations can have. The immediate interest of the debate lies in the positive announcements made by the Lord Chancellor in his reply. First, he stated definitely that the Government will follow the recommendation of the Denning Committee by giving financial aid to existing voluntary organisations offering marriage guidance in one form or another. The second point concerns the proposal in the Denning Report that "marriage welfare officers" should be appointed both in the Divorce Court and in the magistrates' courts. This, the Lord Chancellor said, he was not prepared to follow at the moment, for two reasons. One was the practical difficulty in finding enough trained and suitable people—already the number of probation officers attached to magistrates' courts is below what is required. The other was based on his desire to see this proposal fitted into the larger machine for State assisted litigation envisaged by the Rushcliffe Committee's report and likely to be the subject of legislation next session.

No one can quarrel with those two reasons but there is a great deal that can be done in the meantime. This problem is, *par excellence*, a case where the interests of all would be served by the publication of early and full details of the pattern which this proposed legislation will follow. The problems tackled by the Rushcliffe and the Denning Committees are closely linked, for at the moment some four-fifths of all assisted litigation is litigation over matrimonial disputes. Whatever machinery is proposed will require the willing and intelligent co-operation of a very large number of individuals and organisations, ranging from the social worker to the whole of the legal profession. It is imperative that they should be given as long as possible to study and comment upon the actual details which the Government intends to put into its Bill.

Palestine: Waiting Without Seeing

Is no one ready to make any concrete proposal, or to take any firm step, to deal with Palestine? Each party concerned is now seeking, by inaction, to avoid prejudicing its position when the United Nations Assembly debates the case. The British are

The Economist Budget Supplement

Statistical material relating to the National Finances and the Budget, which replaces the Budget Supplement published by *The Economist* for many years, will be issued as part of a forthcoming number of the *Records and Statistics Supplement*.

The date of publication, dependent upon the issue of the National Income estimates for 1946, will be either April 19th or April 26th.

A limited number of copies will be available, price 6d. post free, for readers who are not subscribers to *Records and Statistics*. Orders should be sent to:—

The Publisher

THE ECONOMIST, BRETTENHAM HOUSE,
Lancaster Place, London, W.C.2.

going forward with a historical document on pros and cons, but without a policy. The Zionists are equally negative. The result of their recent Agency Executive meeting reflects the division within the movement as between the partitionists and the "whole loaf" school. It was decided not to present the Assembly with any firm statement of its aims, but to leave all doors open to the best bargain obtainable subject to three conditions. These are, as was only to be expected, no prejudice to the independence of the Jewish national home; no bars to immigration and no restriction on land sales. These conditions do not exclude partition. But, in deference to the extremists on the Executive, they do not recommend it. The United States is the third haverer. The American Government, fearful of the problem's implications in home politics, prefers not to sit on any preliminary Uno committee of study. So there is to be no preliminary committee. A full Assembly, meeting either in special session or in September, will deal with the matter. The American Government also prefers not to put forward any solution of its own. Who, then, except the Arabs, is going to speak out?

This job clearly falls to the British Government. No one else possesses the relevant experience or data. Either it must get the American Government to join it in advancing a proposal, or else, failing this, it must say what situation it is itself prepared to guarantee, given the consent of other states members. The first possibility—that of a joint Anglo-American proposal—has become vastly more likely since President Truman stepped into the Levant. A president who has guaranteed Turkey can no longer afford to suggest that Jewish newcomers in unwanted quantities shall be planted upon Turkey's Arab friends. He becomes as interested as is Britain in striking a balance that will work in the Middle East.

Until some concrete proposal emerges, terrorism is in the ascendant. It breeds freely in an atmosphere of stalemate. The terrorists have the whip hand both of the British, who, in letting the Dov Gruner appeals mount up, have subordinated government to security. They also have the whip hand of their own people. Jew is now murdering Jew and, by tampering with water supplies, is penalising whole villages simply upon suspicion of collaboration with the Government.

Nothing can stop this process except Jewish public co-operation. Jewish public temper, although anti-British, is rising, as the recent *Vaad Leumi* resolution against terrorism showed. If, indeed, there is to be no stage at which exasperation produces the missing element of Jewish effort, any future Jewish state will start with a heavy handicap in the shape of chronic saboteurs.

* * *

Lord Winster and the Cypriots

The determination with which the Cypriots have come to grips with Lord Winster must not pass unnoticed. He arrived to take up his governorship on March 22nd. He came full of the political and material improvements that were described in *The Economist* of October 26th. But the local church authorities and political parties ordained that the presentations to him should be boycotted. Some important Cypriots, including four members of his Advisory Council, obeyed the injunction. He, seeing in this lapse of courtesy an insult to the Crown, preferred not to receive them in Council. It is to be hoped that the brush will not be allowed to develop into a rug-of-war.

For the Cypriots are disposed to pull with a will. If asked, by plebiscite to-day, what future they would prefer for themselves, a very considerable majority (excluding the one-fifth of the population that is Turkish and Moslem) would unhesitatingly answer: "Union with Greece." What is the force that moves them to wish to leave the British Empire, within which they are economically fairly secure, and unconditionally to join a state that is politically in chaos and a prey to inflation? They say, almost unanimously, that the motive is not hostility to Britain. Is it the notion that a British decline has set in in the Eastern Mediterranean? Or is it due to past British imprudence, or to Communist influence, or merely to Greek sentimentality?

The last is the major part of the explanation. Greeks, for all their individual success in commerce, are not collectively a nation of shopkeepers because as soon as two or three of them are gathered together their Mediterranean emotions take charge. No other explanation can account for the Cypriots' readiness to plunge into Greece's chaos without thought of safeguarding their tranquillity and economy by claiming at least some measure of local autonomy. Is Greek sovereignty, for instance, incompatible with retention of a place in the sterling area?

Only the moment for their present display of feeling is prompted by outside events. Of these, far the most potent is a siren call

from Greece. On February 28th, just before rising for two months, the Greek National Assembly dealt with two similar resolutions on Cyprus, one from the Sophoulis Liberals and the other from the Government parties. The Government seized on a topic productive of unity and expressed its unshakable confidence in Britain's capacity to apply the principles of self-determination. Here was a filip to the Cypriots compared with which the British exodus from Egypt or the careless American disclosure that the State Department favours a Greek Cyprus carry small weight.

* * *

Channel Islands Constitutions

Last week saw the publication of the Report of the Committee of the Privy Council set up to consider the proposed reforms in the constitutions and legal systems of the Channel Islands (Command 7074). The Home Secretary was chairman of this Committee, and its members included Viscount Samuel and Mr R. A. Butler. Its origin lies in the proposals for reform put forward by the governing bodies of Jersey and Guernsey last year, and the task of the Committee was to advise the Government on what action it should take on the Channel Islanders' own proposals.

In substance the Committee approves the original plans. The constitutions of the two islands are in outline similar, and both are completely mediæval in form, having existed, with no more than modifications, since the 13th century when continental Normandy was lost to the British Crown. The plans considered in this Report leave that structure largely intact, but the alterations, if carried out, will extend the franchise, give universal adult suffrage (generally speaking, women have little voice in Channel Island affairs at present), and will revoke the provision that gives the Dean and the Rectors *ex-officio* membership of the assemblies. The Committee seem to have discharged their task well. They gave considerable facilities to everyone interested to bring forward their views. They visited the Islands last year and held public sittings. So far as possible they have tried to find out the majority opinion in the Islands and to give effect to it in their recommendations. And they have shown scrupulous regard for the Islanders' own attachment to their history and customs. The Report gives every appearance of being a document that will assist in carrying out sweeping reforms to two separate constitutions with the minimum of public disturbance, itself a notable achievement in such a year as this.

There is, however, one comment that should be made. The Report deals with the question of appeals from the Islands' courts, and recommends the setting up of a court of appeal common to both Islands. In this section of the Report there is an extract from the evidence of the Stipendiary of Guernsey on the state of the criminal law in the island: "The punishment is not defined and the law is not defined . . ." he says. No one can possibly consider that to be a satisfactory state of affairs. It is a basic condition of criminal law that it should be fixed, unambiguous and understandable by each citizen. It is to be hoped that the Privy Council will in their advice to His Majesty suggest that steps should immediately be taken to remedy that state of affairs.

* * *

Part-time Nursing

In the autumn of 1945, when the Ministry of Health launched its latest campaign for nursing recruits the national shortage of nurses was estimated to be over 30,000. To-day, the shortage is still 30,000, but one county at least, not only has a full staff for its public assistance infirmaries, which are notoriously difficult to staff, but has a waiting list of volunteers and was able to provide the entire staff for a hospital of a neighbouring county out of its reserve. The county which has thus won distinction is Gloucestershire, and it has done so through the employment of part-time nurses.

There is nothing new in a scheme for part-time nursing. But it is certainly new to find one that has been so completely successful as in Gloucestershire, and the secret of Gloucestershire's success lies in the new approach that was adopted. Hitherto, part-time nursing has been regarded as a stop-gap, as a means of filling vacancies caused by a shortage of full-time workers. In Gloucestershire, where at the beginning of 1946 the position in the county infirmaries was so serious that the whole service was on the verge of breaking down, the part-time nurses are regarded as the main part of the nursing staff and the full-time nurses as supplementary. Of the 301 part-time nurses engaged, 72 are trained nurses, 32 enrolled assistant nurses, 92 nursing attendants and 105 nursing orderlies. Other interesting figures are

that their average age is $38\frac{1}{2}$; $86\frac{1}{2}$ per cent are married, and there is an average of 1.8 children per worker. In spite of this division of loyalties, absenteeism has been negligible and can be fully compensated by the reserves or "casuals." It is also worth noting that the full-time staff do not resent the part-timers but welcome them, and are themselves working under better conditions than they have ever known.

Gloucestershire's example is being followed in other areas, and the campaign which has been running in the London area has so far produced about 1,800 volunteers of whom about 90 are midwives and 700 either state-registered nurses or enrolled assistant nurses. Further campaigns are planned for the other regions, and will be launched shortly. Some controversy has arisen about pay. Gloucestershire pays its part-time staff on a scale varying from 1s. 6d. an hour for a nursing orderly to 2s. 6d. for a fully-trained nurse. But the Ministry of Health is in favour of the Rushcliffe scales being rigidly adhered to, which means that a trained staff nurse in London will only get 2s. 1d. an hour, whereas the London charwoman receives at least 2s., and a nursing attendant (a woman who is untrained but with previous nursing experience) only 1s. 5d., which is only a penny an hour more than the minimum wage of a ward cleaner. Payment for part-time nursing should not be so high that it induces full-time workers to become part-time, but anomalies like this should be rectified.

Perhaps the most encouraging aspect of the part-time nursing scheme, at least in Gloucestershire, is that its sponsors were able to break down the traditional rigid organisation of the hospitals to inaugurate it (as illustration—the patients now sleep till 7 or 8 a.m.). Trade unions and managements, please note.

Scottish Nationalism

The Scots have been meeting in Glasgow in solemn conclave to create a National Assembly as an instrument for obtaining greater independence—chiefly in the form of a devolution of legislative powers. The pre-occupation of the House of Commons at Westminster with English affairs has long been a grievance, and as the pace of legislation and the demands on private members' time have increased so has the sense of grievance. Not only can little time be devoted to the discussion of Scottish affairs, but when an important Scottish bill is in progress through Committee, as with the Scottish Health Bill at present, the Scottish members have, for practical purposes, to choose between this and the discussion of other matters of importance to the nation as a whole.

The recent gathering was attended by 400 delegates from all parts of Scotland and from a wide range of public bodies, political parties, local authorities, trade unions and Church organisations. No doubt, those who were unsympathetic to the general aim stayed away, but those who came represented a broad cross-section of the country, and were not noticeably dominated by any political colour. The general temper of the meeting was moderate and reasonable; very little invective was hurled against the

The Economists' Bookshop

(jointly owned by the London School of Economics and Political Science and by *The Economist*)

is now open for business at

11/12 CLEMENT'S INN PASSAGE,
ALDWYCH, LONDON, W.C.2.

The Economists' Bookshop specialises in books on Economics, Sociology, Psychology, History, Political Science and Current Problems, to which some carefully selected general literature is added.

Particular attention will be given to the supply of books to and from any country in the world. Postal orders are welcomed.

The difficulties of the book trade at the present day are well known and it is impossible to promise to supply any book on demand. Inquiries, however, are invited. Orders for books for which there is a reasonable chance of re-issue will be kept on file and the books supplied as soon as they become available.

English, and the main resolution which was passed by a large majority asked for a legislative committee for Scotland "with power to initiate and carry through legislation affecting Scotland's domestic affairs" subject if necessary to some control by the House of Commons, and a Commission of inquiry to consider how reforms in procedure could be carried out.

While there are strong arguments against a proposal of this sort, a meeting of this kind is of considerable significance. Little has been heard of it in the English press, and most Englishmen are either blissfully unconscious or wilfully blind to the independence movement. It may result in them receiving an unwelcome surprise later on, whereas it would be far better to be forewarned—and if necessary forearmed.

Shorter Notes

Of the five Africans sentenced to death in December, 1944, for a ritual murder in the Gold Coast in 1943, whose case was commented on in *The Economist* of March 8th (page 322), three were executed last week. The execution of the remaining two was postponed for an eighth time, on this occasion because a writ of *habeas corpus* was applied for. The Governor has now decided to commute their sentence to life imprisonment. His statement announcing this decision declared that on the previous occasions when an application for postponement was made, the condemned men were fully aware of the defence's intentions to avert the execution at the last minute and therefore suffered none of the mental torture alleged. After three of them had actually been executed, however, the position of the remaining two was different, for they were aware that the tactics of the defence had failed as regards their accomplices. It was because of these circumstances that the Governor decided to exercise his prerogative.

*

Replying to a parliamentary question last week, Mr Attlee defended the lucidity of the Economic Survey for 1947, and the general level of intelligence in the nation, by pointing out that the combined sales of the Economic Survey and its popular version had reached nearly 300,000. It is worth pointing out that the combined sales of the Beveridge Report and its popular version reached about 665,000. The moral does not lie in the comparative lucidity of the two publications, nor in the national IQ now and then, but in people's apparently far greater interest in what they can get out of the national income than in what they can contribute towards it.

*

The Registrar-General's quarterly return shows that 221,891 live births were registered in the last quarter of 1946, representing a birth-rate of 20.5 per 1,000, the highest birth-rate for a December quarter since 1941. For the whole of 1946 the birth-rate was 19.1 per 1,000, the highest since 1923, and infant mortality at 43 per 1,000 was 2 per 1,000 below the previous low record. But the most interesting figure of this bumper return from the Registrar-General is that the net reproduction rate for the year was 1.102, the first time it has reached replacement level since 1922. Whether this has any long-term significance, or merely reflects large-scale demobilisation, remains to be seen.

*

The 1951 Exhibition is definitely off as far as anything really spectacular is concerned, although a token commemoration may be staged on the "Britain Can Make It" scale. Sir Stafford Cripps announced this last week, and gave as the reason the demands which a really large exhibition would make on the building resources of the country. The decision is certainly right, though it is a sad commentary on the pace of recovery.

*

The National Farmers' Union has opened an Agricultural Disaster Fund to mitigate financial losses resulting from the disastrous weather, which the Union estimates to be around £20 million. This figure is, inevitably, a very rough guess indeed, and, serious as it is, the weather has given grounds for much gloomier prognostications. It is said that 1,300,000 sheep and lambs died in the snowdrifts, and, whatever the position elsewhere, there can be no doubting that very many hill farmers are financially crippled and require generous and speedy assistance.

*

The Attorney-General announced in the Commons on March 27th that it was the intention of the Government (at a time not yet settled) to introduce legislation to abolish Special Juries, with the exception of City of London Special Juries, which are only ordered by the Court for trials in cases of considerable commercial complexity. It is unlikely that there will be any general regret at the passing of this unnecessary survival of class distinction.

Letters to the Editor

Misery Loves Company

SIR,—Your article on March 15th is unfortunately liable to confuse the reader's mind on two wholly separate issues. One is the question of the re-distribution of goods in the interest of social justice—as evidenced, for example, by our policy of food rationing combined with subsidies. The other is the operation of controls and restrictions in a mistaken and corrupt interpretation of the notion of "fair play"—so as to avoid any discrimination between the efficient and the inefficient, the necessary and the unnecessary, the desirable and the undesirable. The uniform ban on all periodicals, the uniform restriction of coal allocation to all claimants, the uniform ban on the use of electric power, irrespective of whether it was generated by coal or water power, are all examples of "fairness" which have nothing to do with the needs of social justice, but only with a blind desire to preserve the *status quo*. So is, for that matter, the rumoured opposition of the General Council of the T.U.C. to an increase in miners' wages, if it is not accompanied by similar increases in other industries; and the opposition of industry to any policy of re-organisation that does not compensate adequately for the loss of profits of inefficient units.

Equalitarianism of this latter type is thus not confined to the Left, or to the Civil Service; innumerable examples could be quoted from the actions of pre-war Governments, and of unofficial bodies like trade associations who are not conspicuous for their desire for social equality. And it is this latter kind of equalitarianism, and not the former, which threatens to destroy initiative, prevent essential adjustments and ossify our economic structure.

Your article also argues that "apart from inflation, some controls must endure for a long time yet as tools of the social conscience"—meaning that in a world of scarcities and of unequal distribution of wealth, the allocation of goods cannot be left solely to the hazards of a free market. This is undoubtedly true; but it would be wrong to suppose that it is *only* the social injustice of a free-market-distribution that makes controls necessary at the present time. Even if wealth and income were distributed equally, we should still need controls to ensure, e.g., that sufficient resources were devoted to exports, or that the composition of our imports was such as to provide for the long-term necessities of the community, and not only the immediate preferences of individuals.—Yours faithfully,

NICHOLAS KALDOR

Houghton Street, W.C.2

The Coal Target

SIR,—May I be permitted to make a brief but stern protest against a statement of Mr F. B. Cope, writing as the secretary of a scientific workers' committee, in your issue of March 22nd? He says that "the domestic open coal fire must be replaced by stoves burning processed coal (coke, coalite or gas) whatever sentimental sacrifices are involved." What right has he to say "must"?

The open coal fire is exceedingly valuable as a stimulant to individual reflection and to interesting conversations, and is also dearly loved by many of us for its own sake. It may be an extravagance. Mr Cope's wording implies that he is not thinking mainly of the critical two years ahead, but of a longer period ("succeeding winters")—in which we hope that as output per man rises progressively, amenities of various kinds will be steadily increased and more widely diffused. Why then "must" we sacrifice an age-old and highly prized amenity? It must be added that even now neither the open coal fire nor, for that matter, intelligent discussion are luxuries confined to the rich. They are, however, peculiarly symbolic of what may be called civilisation, from the decay of which "science" has not yet demonstrably shown that it can save us.

Yet I write as a passionate believer in the value of science to man, and it is largely for this reason that I wish to protest against the detriment done to science by the reference to it under the signature to a letter containing the quoted statement. I pursue a study, which unhappily has not yet graduated as a science—economics. This is concerned with analysing the extent to which procedure and behaviour in a complicated society succeed or fail in providing men and women with the things that *please* them. This is a different kind of problem from that of how to raise a given cubic space to a certain temperature with the minimum ex-

penditure of fuel. Modest though the achievements of economics are, yet they are quite good enough for economists to claim that all technological proposals of this kind be submitted to economic criteria and, if necessary, rejected.

Without pausing to consider these matters, Mr Cope most unscientifically rushes forward and urges the Government to "allocate" a "priority" to his proposals. When these kinds of things are said, it is incumbent on economists to be most vigilant.—Yours faithfully,

R. F. HARROD

Christ Church, Oxford

Fission in the Security Council

SIR,—The following quotations from the report of the Atomic Energy Commission to the Security Council provide at least a partial answer to the query in your Note of March 22nd as to what has happened to the suggestion that atomic fuel should be "denatured" in such a way as to make it unsuitable for making bombs.

"Whereas concentrated nuclear fuel is required for bombs, a less concentrated material is sufficient for peaceful applications. This has led to the suggestion that material be added which may make the fuel less suitable for bomb production, while maintaining its suitability for use in a controlled reactor. Such materials, which are called 'denaturants,' must be chosen so that they are extremely difficult to remove from the fuel material proper.

"It has been suggested that secondary reactors for electric power or industrial heating, designed so as not to regenerate explosive material, might operate on 'denatured' fuel. If so, and to the extent that this proves to be technically feasible and effective, diverted material would not be usable for weapons without further processing, involving large plants and appreciable time."

I would like to add an analogy that may help in understanding the position. The use of methylated spirit requires less strict supervision by the Excise authorities than does the use of the pure alcohol that can be obtained from methylated spirit by the possessor of a still; but these authorities still require wide powers to prevent the illicit distillation of alcohol from methylated spirit.

From *The Economist* of 1847

April 3, 1847

SHALL THE STATE EDUCATE THE PEOPLE?

We are . . . perfectly convinced that our present system of school education is as bad as possible. But we are also convinced that our system of cookery is far from good in England. It is extremely wasteful. The people generally speaking are ignorant of the chemical properties of food, and ignorant of the art of making it at once tasteful and nutritious. We are of opinion, too, in common we believe with many other persons, that the means of subsistence are unfairly distributed. While some of the population are fed in the most scanty manner, others waste great quantities of food in riot and extravagance. We are sensible of the existence of many evils in other parts of the country as in education, but as we do not conclude that the Government should equalise the means of subsistence, and reform the national cookery; neither can we agree with those who affirm that it should provide education for the people. We reprobate its interference with education, because we do not see how it can then object to equalising the means of subsistence and reforming our cookery. Nay, we are convinced, that from calling on the State to educate the people, to calling on it to equalise property, the stages are few and short. . . .

Education is, with much parade, provided by one class for another; after many years of schooling, the children have learnt little more than their catechism, and, perhaps, some little contempt for their less-instructed parents. After leaving school, it is a chance whether they ever find any use or advantage from what they have been taught. Were education left untouched by the State, its own beauties and inherent advantages are so great that the people would be as naturally attracted to it as they are to high wages, and would be as eager to obtain it as they are to get plenty of fine clothing and wholesome food.

Similarly, "denatured" atomic fuel would ease the task of inspection but would not greatly lessen the powers that must be given to the inspectors if they are to prevent its improper use.—Yours faithfully,
P. B. MOON

Atomic Scientists' Association, Birmingham University

Smuts Puts the Clock Back

SIR,—I was very alarmed by the arguments put forward in favour of General Smuts's policy towards Indians in South Africa by Mr Meulen in your issue of March 8th. His argument that "drastic measures" were justified against the prospect of a race different in culture and tradition swamping the white population very much reminds me of the Nazi arguments for their policy towards the Jews. I see no profound difference, as both arguments dismiss the principle of "equality of man." I believe it to be most essential that this principle should be applied exactly there, where it implies inconvenience, whilst I find no particular merit in applying it where it does not.

The difference between Mr Meulen's attitude and Fascism is to be found only in the measures he is prepared to agree to, i.e., a difference of degree, which is not based on principle but on practice.

I had hoped that Germany's deterrent example would suffice not only for us but for everyone to perceive, that the only way to safeguard humanity is to safeguard one's mind against inhuman conceptions, alike the one of Mr Meulen.—Yours faithfully,
Hamburg 23, Hagenau 5, Germany

RICHARD DEGWITZ

Budget Targets

SIR,—How about a tax on advertisements? Vast sums of money from accumulated and undistributed profits are being spent in boosting goods that are in any case unobtainable. These sums, being allowed as trade expenses, represent a form of tax evasion. If a tax on advertisements cuts down the demand for newspaper space the press would probably not suffer any loss

of revenue, as the demand for space is at present much in excess of supply. And a tax on hoardings and placards might have a beneficial effect on streets and countryside now suffering ghastly disfigurement. Administration should not be difficult—in most European countries every placard has to carry a revenue stamp, and we cannot afford to be too proud to take a lesson from the foreigner. Collection from the press could be on a basis of space and circulation.

There would still be a loophole—the sandwich man. But even he should not defeat the great brains now in charge of our affairs. And if they could concentrate their attention on the real problem, they would find it a rich source of revenue.—Yours faithfully,
GERARD TALLACK

44 Pine Avenue, Gravesend.

Intellectual Relief for Germany

SIR,—May I ask for a little space to bring to the notice of your readers a request I have just received from the Committee of Former Political Prisoners in Germany begging for English papers and periodicals?

The intellectual and spiritual isolation of Germany bears very hard on the tried and proven anti-Nazis who are engaged in the most difficult task of re-educating Germany, a task in which they do not always receive full encouragement from officials.

The secretary of the Inter-Zone office writes: "Since our organisation is pursuing the aim of developing the spirit of true democracy in Germany we are almost entirely dependent on publications abroad. . . German democracy is still a very feeble shoot, and it requires assistance from abroad if it is to grow."

Anyone able to send either regularly or occasionally, any or all, of the publications listed below should send them direct to: Hans Schwartz, Inter-Zone Sekretariat, Komitee ehemaliger politischer Gefangener, Maria-Louisen-Strasse 132, Hamburg 39.

The papers are: *The Times*, *The Manchester Guardian*, *News Chronicle*, *The New Statesman and Nation*, *The Economist*, *The Spectator*, *The Tribune*, *Time and Tide*, *Reynolds' News*.—Yours faithfully,
BEATRICE KING

28, Aldbourne Road, London, W. 12

Books and Publications

American Business

"Big Business." By Peter F. Drucker. Heinemann. 302 pages. 10s. 6d.

MR DRUCKER has set out to examine the large business corporation, not in its economic, but in its social functioning, inspired by the belief that it "has become America's representative social institution"—representative that is not of the average, but of the norm to which the other economic units of a modern industrial state inspire. He reports his findings in two parts: a study of its internal structure, "the corporation as human effort," and a study of its relationship to the rest of society, "the corporation as a social institution."

The expectations aroused by the freshness and importance of the theme are disappointed by the treatment. It is not merely that Mr Drucker's material appears to have been gathered too exclusively from one field, that of General Motors, to whom he served as consultant for eighteen months. It is rather that there is lacking the basis of detailed and direct observation, of hard facts and precise figures, without which his remarkable powers of analysis and exposition seem to be operating in a vacuum. A study of the large corporation as a social institution remains to be made which will capture something of the actuality of life in the factory and in the office and examine their principles of organisation and administration in terms of the human beings who compose them: it would do for industrial society what Bryce's *American Commonwealth* did for the United States of its time. *Big Business*, from which all sense of life as it is lived in an industrial establishment is wholly lacking; in which even the organisational chart of General Motors is described only by loose analogies to "federalism" and the structures of the Prussian Army and the Catholic Church, is, unfortunately, almost wholly lacking in even the raw material for such a study. This gives the book a curious air of unreality—an impression hardly diminished by recollecting that the corporation which it principally studies (and, in its main features, warmly

endorses) was involved, just as the book was completed, in one of the largest, longest and most crippling labour disputes in American history.

That is not to deny that Mr Drucker's book renders certain valuable services. It presents its problems—of the accommodation of big business internally and externally to the social and political claims of modern society—in a clear and pungent form, breaking them up into their logical and manageable components. It presents certain criticisms and makes certain recommendations. More disputably, it relates its conclusions (no small feat this) to the philosophy of the author of *The End of Economic Man*. This is all very stimulating, but it is not very rewarding. It is an elegant intellectual exercise; it does not carry conviction.

East and West

"The Meeting of East and West." An Inquiry concerning World Understanding. By F. S. C. Northrop. Macmillan: New York. 531 pages. \$6.00.

THE author of this formidable book is Professor of Philosophy in Yale University. His ultimate aim is to expound his own philosophy which emerges in the last two chapters. But the greater part of the book is taken up with the study and criticism of historic philosophical doctrines of both West and East, viewing them in a broad perspective as constituents of different forms of civilisation, as "ideologies." In the course of his investigation the author ranges widely over science, art, sociology and politics, and the variety of his topics is reflected in his style, which relieves tracts of somewhat indigestible philosophical jargon with passages of lively impressionistic journalism.

Professor Northrop starts from the fact that in the world to-day "ideological conflicts are present everywhere." He refers at the outset to the ideological conflict between the Western democracies and Russian Communism, and in Chapter VI provides a very competent and interesting critique of Marxism as a philosophical system. But he claims that this is not the most important ideo-

logical difference—an eminence which he assigns to the older contrast of Eastern and Western civilisation. He claims that his own philosophy reconciles the basic world-views of East and West. His account of the matter, however, involves him in a curious definition of "Eastern"; he first of all excludes Islam and then equates Chinese to Indian thought by an extremely fanciful and unjustifiable interpretation of Confucianism. It is clear that what really interests Professor Northrop as a philosopher is Indian thought. On the other hand, his force is attracted by things Chinese, and seems anxious to group China and India together in a way that cannot be done without violence to cultural facts.

It is symptomatic of the author's approach to the contemporary world that he starts his survey with Mexico. His geographical angle of vision is American, not European, and this also accounts in part for the preoccupation with China, which comes so naturally to many Americans imbued with the enthusiasms of the "Pacific Era." The book is indeed significant of a specifically American endeavour to attain "a more inclusive, truly international, cultural ideal which provides scientifically grounded intellectual and emotional foundations for a partial world sovereignty." In its tendency to seek spiritual refreshment in Asia the book is often reminiscent of Koestler's *The Yogi and the Commissar* and Aldous Huxley's *The Perennial Philosophy*, but it strikes a more robust and optimistic note than either of these; it is the work of an American who is at ease with engineers as well as with yogis, even though not enamoured of commissars. This philosophy may not be perennial, but it is good twentieth-century American, and its catholicity of interest comes from strength and not weakness.

European Population

"European Population Transfers, 1939-45." By Joseph E. Schechtman, Geoffrey Cumberlege. Oxford University Press. 532 pages. 21s.

MR SCHECHTMAN's book is one of a series on the reconstruction of Europe which is being published in America under the auspices of the Institute of World Affairs. It contains a great deal of valuable information about certain of the changes that have taken place in the ethnic geography of Europe during the war; it is copiously and painstakingly documented, efficiently indexed, and objectively presented. But unfortunately it is not the book suggested by its title. At the most, it can only claim to be an unfinished study.

In his introduction the author confesses that his picture is incomplete, and that the bulk of his data is taken from newspaper reports, mostly German. The result is a sadly lopsided survey. Over two-thirds of the book's 500 pages are devoted to Hitler's programme for the repatriation of *Auslandsdeutsche* from Eastern Europe. This section includes brief references to the Jewish and Polish populations which were evacuated to make room for the resettlement of these Germans, but gives only a few clues as to their ultimate fate. Mr Schechtman then turns to the transfers of Soviet, Finnish and Balkan minorities carried out by German, Soviet and other authorities during the war years. It is understandable that the absence of reliable information has compelled him to dismiss many of these movements rather summarily. But it is difficult to understand why there is no reference at all to some of the most interesting transfers. Mr Schechtman describes the Soviet evacuation of Volga Germans into the Asiatic hinterland, but does not mention the similar evacuation of Poles from the area east of the Curzon Line. The only detailed information about the deportation of Jews is confined to those taken from north-western Poland. Nothing is said about the Germanisation of such areas as Alsace-Lorraine. And the enormous transfers which began in 1945 are not even mentioned.

In a final chapter Mr Schechtman outlines the lessons of past experience. But he wisely concludes that there can be no hard-and-fast rules governing either the necessity for, or the chances of success of, any given transfer. However that may be, it is unfortunate that fuller information about wartime transfers is not yet available, and that the most important transfers involved in the post-war settlement have already been carried out with very little respect for the lessons of the past.

Power of the Cinema

"Sociology of Films." By J. P. Mayer. Faber and Faber. 328 pages. 15s. net.

MR MAYER is a crusader. No one who reads this book can doubt the sincerity of his conviction that the cinema has a profound influence on its audiences and that it is in the main a bad in-

fluence. In fact, his belief in his cause is so passionate that it transcends his clumsy literary style—the book abounds in such phrases as "value patterns" and "sensation-perception mechanisms"—and almost persuades the reader that he must always be right. Almost—but the query persists: is this real evidence? As Mr Mayer shows in two interesting chapters which summarise some American investigations in the early 'thirties, the subject is not one that can readily be investigated by the statistical method. What he does, therefore, is to give what amount to his clinical impressions, which is all very well provided he is aware of the drawbacks of the evidence and warns his readers of its dangers. Instead, he defiantly states, after describing one child's reactions, "There must exist tens of thousands of Hazels in this country. . . The social conditions of her case allow strict and valid generalisations, though I am unable to say whether 100,000 Hazels are similarly affected or merely 99,999."

But why, the reader asks, should Hazel be regarded as representative? Or the secondary schoolgirls of Hampstead, whose essays on the films they like and dislike are given and discussed in detail? Why, especially, should the people who wrote to him through the *Picturegoer* (prizes being offered for the best letters) describing their reactions to films be considered representative of the adult cinema audience of this country? One has the feeling that Mr Mayer is too convinced of the rightness of his cause to have troubled to test sufficiently the efficacy of his weapons.

Most people probably have the clinical impression that the cinema's influence is very important, especially on children, who, as Mr Mayer very pertinently remarks, often cannot see isolated scenes in the context of the whole story and therefore lose the moral that it tries to present. Few, too, will dispute the absurdity of the present method of classifying films as A, U and H. But just how permanent the cinema's influence is, and how strongly it affects people's lives and actions, one is still left guessing even after reading all the clinical data Mr Mayer has so industriously collected and presented in this sometimes infuriating, but nevertheless interesting, book.

Local Government

"A History of Local Government." By K. B. Smellie. Allen and Unwin. 172 pages. 7s. 6d.

THIS is a valuable short history. The first chapter, which in many ways is the most interesting, deals with the genesis of local government prior to 1832 and from then onwards the main developments—the creation of new types of authority, the extension of functions, the periodic reorganisations of finance, the modern extension of central control—are faithfully and briefly recorded. The emphasis is descriptive rather than critical, although judgments are offered on some points, such as the undesirability of confusing health functions with those of public assistance. Current problems, such as the issue of regionalism, are not ignored but their treatment is too perfunctory to be satisfactory, even in a book of this size. Indeed the weakest part of the book is the comparatively short section dealing with the period from 1929 to the present day, when the swift march of administrative changes seems to have defeated the attempt to hold it in perspective. It is a pity that there is not a specific chapter on the post-war problems in local government that have now to be faced. Reform in local government, as Mr Smellie's own historical account demonstrates, has always been forced upon it by the external logic of administrative necessity. Once created, a local body, whether elected or appointed, is difficult to abolish; but, if it becomes unsuitable, it will be progressively by-passed until the accumulation of separate authorities compels some drastic measure of reorganisation. Mr Smellie rather ignores the steady growth of new administrative pressures, which may soon force some such crisis on the present system of local government. The result is a certain tendency for his history to be backward-looking rather than forward-looking, although this does not alter the fact that, within the limits which he sets himself, his book is both fair and informative.

Shorter Notice

"The Furnished Houses (Rent Control) Act, 1946." By L. G. H. Horton-Smith. Justices of the Peace Limited. 47 pages. 4s.

MR L. G. H. HORTON-SMITH, barrister, is chairman of a London Furnished Houses Rent Control Tribunal. The book consists of a number of questions arising on the Act with their answers and should be of considerable practical value to those concerned in the administration, and with the effects, of the Act.

AMERICAN SURVEY

Farm Surpluses

(From a Correspondent in Iowa)

IN a hungry world, American farmers are still haunted by the spectre of unsaleable farm surpluses. Ruinous gluts of the 1930s are fresh in mind; recent experiences with cotton and potatoes bring the spectre home. Cotton remained surplus throughout the war, with a full year's supply in storage in the United States on the eve of each harvest. It took poor crops in both 1945 and 1946 to reduce the carryover to one-third of a year's supply. Last autumn's potato yield was sold, given away, used to capacity by distillers, and even exported—and still quantities were left to rot in the ground or be crushed by government bulldozers.

"It's hard to believe, here in the land of plenty," chats the Corn Belt monthly, *Successful Farming*, "but the experts in the US Department of Agriculture say the world will be hungry again this year." An Iowa farmer wrote to another paper, "Farmers never in history have had so much to be thankful for. I only hope that farm prices do not get any more out of line so as to cause anybody in this country to go hungry." This blind spot toward hunger beyond the national border is the rule; the exception is the frequency with which people call on newspapers, radio stations, and prosperous immigrants to translate letters of thanks from European recipients of food packages. Yet the record income of United States farmers in 1946 is due to coincidence of the end of price control, famine in Europe and Asia, and bumper crops in America.

President Truman's official proclamation of the "end of hostilities" limits to 1947 and 1948 the Government's promise to maintain prices of farm products at 90 per cent of "parity." So this Congress, not its successor, must write a legislative programme for postwar agriculture. Politicians had hoped to postpone it until after the 1948 election. There is still no very broad consensus on how to deal with possible surpluses. Policy could be directed towards export of farm products; or towards government limitation of production to the size of the domestic market; or towards government-encouraged expansion of the domestic market, either through better diets or more non-food uses. The New Deal tried all of these in some degree.

"Parity" is that devious calculation, designed to give farm products the same relative purchasing power they had in American agriculture's Golden Age—1910-14. Without production control it makes little sense, and the 1910-14 base becomes more and more absurd as time goes on. Even farmers' organisations agree it must be altered. To take its place a committee of the New Dealish National Farmers' Union, which met this March in Topeka, Kansas, endorsed a "forward pricing" plan, proposed by Professor Theodore W. Schultz, of the University of Chicago. This was the lure which won the big wartime increases in oil-producing crops: announcing in advance of a crop year (or livestock cycle) a price the government will guarantee at its end, setting the price high (or low) enough to bring out the desired production.

The three large conservative farm associations have not gone as far as that towards undermining the idol of parity pricing. But at a joint meeting in Buffalo, N.Y., last autumn, the American Farm Bureau Federation, the National Grange, and the National Council of Farm Co-operatives agreed that the parity formula should be revised, "giving, among other things, careful consideration to a ten-year moving average adjusted to the 1910-14 overall parity relationship, and to inclusion of farm labour costs in the parity index." For the two years of postwar price supports, however, these associations would retain the existing formula to calculate parity for wheat, maize, cotton, tobacco,

rice, and peanuts, the "basic crops" of the Agricultural Adjustment Act. On other crops the Farm Bureau is willing to see government price guarantees paid only to those who stay within production quotas—a proviso since announced by the Department of Agriculture for potatoes. But in general, farmers dislike government limitation of farm production.

The lost export market for American farm products reappeared with war and postwar conditions, but in spite of the additional demand likely as a result of this winter's weather in Europe and the British Isles, few expect it to last more than another year or so. The swift ending of lend-lease and Unrra were in part over-hasty anticipations of returning economic self-sufficiency in the Eastern Hemisphere. True, the Farm Bureau now champions Reciprocal Trade Agreements and gradual "adjustment" of international trade barriers, but slips weasel words into its resolutions of support—while midwest congressmen continue to take belligerently protectionist stands. So do a few of the state Commissioners of Agriculture in the South, once the great free trade area.

Farm and small town conservatism stands in the way of most of the New Deal devices for attacking surpluses by increasing domestic consumption of agricultural products through subsidies to consumers and the poor. However, the school lunch programme seems likely to become permanent and general. This involves federal grants-in-aid to help local groups provide well-balanced hot midday meals at cost to all children in school, and free to those whose parents cannot afford payment. Re-appearance of surpluses might revive other such devices.

Meanwhile, one of the white hopes of the nineteen-thirties for absorbing farm surpluses seems more blurred than ever: finding industrial uses so that the farm market would no longer be limited to the capacity of man's stomach and the length of his shirt. "Farm chemurgy," its more fanatical proponents call it. The National Farm Chemurgic Council held its annual meeting this March in Oklahoma City to hear chemists tell of such marvels as making nylon out of corn cobs. But the Ford Motor Company recently discontinued manufacture of moulded parts from soybean plastics. Wartime efforts to make alcohol and butadiene for synthetic rubber from grain proved uneconomic under peacetime conditions.

New industrial uses for agricultural products, byproducts, and wastes are constantly being found, but so are new chemical substitutes for agricultural products. The synthetic fibres rayon and nylon first hit an imported natural fibre, silk, but the effects of chemical research do not stop at the edge of the Water or the Farm Belt. Already cotton as well as silk is staggering under the pressure—of nylon tyre cords for example. Numbers of new synthetic fibres are entering the competition. Wool and leather are insecure; coal, petroleum, other minerals, air and even water, vie with farm products as the raw materials of new chemical industries. In time, food may follow fibre out of the farmer's monopoly.

At best, the chemurgic farm loses the combination of independence and steady demand that has been the boon of staple farming. The essence of the chemical industry is constant research, constant change: soybeans today, bagasse tomorrow, petroleum on Friday week. Even without chemurgic trimmings, American commercial farmers are having to adjust to unstable prices, unstable demand, ever-changing techniques, pests, grades, and markets. That is part of the price of industrial civilisation. It explains the farmer's emphasis in his politics, on the search for factors of stability.

Anti-Trust Activity

(From a Correspondent in Chicago)

WHEN the United States entered the recent war, its anti-trust laws were being enforced upon a scale, to judge by the number of presentations, four times larger than ever before in their history. During the war, in spite of a series of dramatic prosecutions of international cartels, enforced competition gave way temporarily to control of the economy by various war agencies. Today, as the last of the wartime controls are being liquidated, the primacy of the competitive policy is being restored.

The end of the war found control of American industry more highly concentrated than ever before. The 250 largest manufacturing corporations, which owned 65 per cent of the nation's productive facilities in 1939, operated 79 per cent of the new war facilities built with Federal funds and in September, 1944, held 75 per cent of the prime war supply contracts.

An effort is being made to sell about \$11½ billion worth of Government-owned war plants in such a way as to reduce industrial concentration. The Surplus Property Act provides that such sales shall be designed to strengthen free and independent enterprise and discourage monopolies. When a plant worth more than \$5 million is sold, the Attorney General reviews the sale and reports whether it is consistent with this purpose. In the aluminium industry, leases of Government plants to Reynolds Metals Company and Permanente Metals Corporation have gone some way towards loosening the control formerly enjoyed by the Aluminium Company of America. In 1944 this company controlled productive capacity for alumina, primary aluminium, and sheet, strip, and plate which ranged from 86 per cent to 96 per cent of the total American capacity. At the end of 1946 it controlled from 44 to 54 per cent of the nation's capacity for the same products. A similar diffusion of control has been accomplished in the sale of Government-owned nitrogen plants. However, these cases are exceptional. Nearly 70 per cent of all sales and leases of Government-owned war plants prior to 1947 were made to about 60 concerns, which are among the largest 250 manufacturing enterprises in the country. A striking example is the steel plant at Geneva, Utah, largest in the Far West, which was sold, with the approval of the Attorney General, to a subsidiary of the country's largest steel producer, the United States Steel Corporation.

The growth of economic concentration has aroused some political protest. Last year a Senate committee made public a report by the Smaller War Plants Corporation which said that the war had enhanced industrial concentration and predicted that concentration would remain higher in the post war years. Just before the Democrats lost their committee chairmanships, the Senate Small Business Committee published a report on the future of independent business which treated the concentration of economic power as the principal problem of the day and offered a variety of remedial recommendations, including the establishment of a new Department of Small Business, increased appropriations to enforce the anti-trust laws, new laws against mergers of competing corporations and against use of basing-point systems of pricing, reorganization of the patent system, registration of trade associations, and requirement that corporations engaged in interstate commerce operate under Federal rather than state charters.

Use of the anti-trust laws to dissolve large corporations is also beginning. A Federal court has declared that the country's largest grocery chain is an illegal combination in restraint of trade, and the Supreme Court has sustained an anti-trust decision which requires divorcement of the manufacture of sleeping cars from their operation by the Pullman Company, which formerly monopolized both kinds of business. These cases were initiated several years ago, but they are now regarded as merely the first skirmishes of a campaign by the Department of Justice to break up some of the larger and more powerful enterprises. The Federal Trade Commission has renewed its

long-standing recommendation that the law be amended to make mergers difficult.

The attack upon bigness is the most recent development in a broad revival of anti-trust prosecutions. More than twenty cases, many of which involve international cartel activity, were postponed to allow the defendants to concentrate upon war work. These are now on their way through the courts. A test case to determine whether the use of basing-point formulas is illegal price-fixing is being carried to the Supreme Court by the Federal Trade Commission, which failed to establish this doctrine in a lower court. However, prosecutions of new price-fixing agreements are still relatively few, since there is little incentive to make such arrangements while goods are scarce and prices are rising.

Control of Congress by the Republican Party is not likely to diminish the importance of the anti-trust laws. True, this party contains a group which is tender of the interests of big business, but it also contains Western agrarian radicals devoted to the enforcement of competition. In spite of protests by the Department of Justice, an effort is being made to pass a law under which rate conferences organized by railways and road haulage lines may be registered with the Interstate Commerce Commission and may operate under its approval. A similar bill was favourably reported from committee in the last Congress, but failed to pass. Among the many labour bills now under consideration are several which propose to make the anti-trust laws applicable to restrictive practices by labour unions, as was the case until unions were granted immunity by the Court's interpretation of some of the New Deal labour laws. Off-setting these proposals from the conservative side is a bill by a Republican Senator from Oregon which seeks to tighten the anti-trust laws. It would specifically prohibit participation in international cartels. It would require registration of patent licence agreements and would prevent them from containing restrictions about price, quantity, or field of business activity. It would increase appropriations for enforcement of the anti-trust laws and would impose heavier penalties upon those who violate these laws. It would also provide for annual public reports by the President about the extent of monopolistic practices, for directives by him designed to coordinate the attack upon monopoly throughout the Federal Government, and for supplementary devices, such as easier credit for small business and modification of freight rate structures, which might foster competition.

That such divergent tendencies express no serious disagreement about the basic philosophy of the anti-trust laws is evident in the fact that there is general agreement in support of the portions of the draft charter of the International Trade Organization which are designed to curb international cartels. Both parties take this part of the charter for granted. Leading business groups have endorsed the proposal, though some of them apparently hope that a way can be found to use the looser provisions of the international charter as a means of relaxing the domestic anti-trust laws. Newspaper and political comment has been generally favourable, with occasional criticism on the ground that the charter is not strong enough.

Questions and Answers on Greece

March 31st—the date by which President Truman had hoped Congress would have acted on the Greek and Turkish loans—has now come and gone, with the hearings before the Senate Committee still incomplete. The full Senate debate will not start until April 7, and that in the House will follow. Questions and projected amendments are legion; Senator Vandenberg has collected 400 questions and sifted them down to 100; the list of amendments already number 23. The debate is unlikely to be either short or sweet.

From this barrage it is already clear that the Administration is most vulnerable on the score of by-passing the United Nations; and this omission is being hastily repaired, Mr Austin has explained at Lake Success that the American initiative was merely of “temporary and emergency” character until Uno could take over, and that it complemented, rather than undermined, the activities of Uno in the Balkans. The new preamble to the bill, written by Senators Vandenberg and Connally, serves the same purpose; and Senator Vandenberg now proposes an amendment which would give the United Nations a veto power over the extension of American funds to Greece and Turkey. Some of this new devotion to the prestige of the United Nations is simply good strategy on the part of the opponents of the bill; in part the United Nations may merely be a handy excuse for inaction. But it is significant that second thoughts on Greece have all ruled out the appearance of unilateral action.

The opposition on the left has another string to its bow: the high proportion of military, as opposed to civilian, aid in the plan. Mr Clayton's tentative outline of how the money would be spent is hotly disputed by Senators Pepper and Taylor. The scheme is for the \$100 millions to Turkey to be spent exclusively on defence; the \$300 millions for Greece would be divided, half for defence, half for relief and rehabilitation. Senator Pepper's resolution would deny any aid to Turkey, and would extend only funds for relief to Greece, and those only through the United Nations.

There is as yet no suggestion that Congress will repudiate the President's plan, whatever conditions may be attached. But in answering the questions of Congress, the Administration is steering a nervous course between playing up and playing down the Russian bogey. What a tight-rope has to be walked is illustrated, at the other extreme, by the suggestion that if the United States is going to be tough, it had better go all the way: that General Marshall, and the heads of the Army and Navy, should take over the control of atomic energy from the Lillenthal Commission, and that the new Secretary of State should, metaphorically, tuck the atom bomb under his arm when he pays his diplomatic calls. This is a genie which may be hard to put back in the bottle as the debate continues.

Mr Truman on Prices

The fresh burst of speculative activity in the commodity markets over the last few weeks is now engaging the constant attention of Mr Truman's economic advisers. At a Press conference held last week, the President declared that the price level had reached a point where it was quite easy for industry to “see the writing on the wall,” while Mr John W. Snyder, for the Treasury, said that prices were “altogether out of line” and that the government had been discussing the position continuously with representatives of the basic industries. Both praised the price reduction policy announced quite recently by such undertakings as Ford and International Harvester, and both hinted that further price revisions of this type may accrue in other basic industries. It is suggested that Washington spokesmen have been pressing US Steel to give a new impetus to price reduction.

Last week, however, US Steel denied that any general price revision was in prospect, and other manufacturers, while they are admittedly reluctant to raise prices again, are very cautious in admitting that downward adjustments are possible. Wage rates are still rising. A few weeks ago, the oil refinery workers got 20 cents an hour, an advance of about 15 per cent. The rubber workers got 8-10 per cent, the steel workers may settle for a similar amount this month, while automobile workers are still demanding 23.5 cents an hour—though they will probably settle at a substantial discount on this bid. Telephone and rail wage negotiations have also reached awkward stages. Organised labour, generally, does not want to strike, but it is determined to cash in to some extent on the present prosperity. In spite of all predictions of impending collapse, therefore, industry does not believe

that the present climate is suitable for downward price adjustments.

Meanwhile, the government cannot do very much to reverse the price trend in the present political set-up. It can set its face against tax reductions, and it can put up a few more barriers against speculators in the commodity markets. But even on Budget policy it will be forced to compromise with the majority party, and the most that it can do will amount to very little against the powerful forces now exerting their pressure on price-levels. On Truman estimates, the 1947-48 Budget might leave as much as \$5 billion to \$6 billion for debt redemption, while the cash surplus of the Treasury over the first six months of 1947 might be as much as \$3 to \$4 billion. In so far as this debt is held by the Federal Reserve system, redemption could exercise a sharply deflationary effect on member bank reserves. The other line of approach for the government is the long-discussed “defrosting” of short-term money rates, though this move, if and when it occurs, will not be intended as a sharply deflationary move, but as a barrier against possible new inflationary pressure arising from the so-called “monetisation” of debt.

* * *

The Controls Behind the Loans

An observer said last week, “Congress must be a very great body, it moves so slowly.” March 31st was a deadline, not only for the Greek and Turkish loans, but for that last handful of controls which even the free enterprisers cannot lightly discard. They were reprieved at the eleventh hour. In February, President Truman asked Congress to extend certain of the authorities granted by the Second War Powers Act, which was due to expire on March 31st. The controls involved work two ways: they regulate domestic distribution of sugar, rice, certain drugs, and imported industrial commodities which are short in the United States; they also make possible American participation in the world food pool, which lays down international “fair shares” and authorises allocations and priorities which make a proportion of American production available for relief exports. Allocations are necessary for wheat and fats, for example, and priorities on the railroads are essential if wheat, coal and fats are to reach the ports despite a box-car shortage worse than anything experienced during the war. Without these controls the dollar could outbid the poorer and hungrier countries; in the ensuing scramble prices would rise and the needy go without.

Congress balked at renewing these powers *en bloc*. Separate measures have been enacted for sugar and rubber, but for the rest a hasty extension of the War Powers Act until June 30th has had to suffice. The debate over sugar controls was bitter, and in the end a compromise had to be arranged between those who wished to abolish controls altogether and those who, like Senator Tobey, wished them extended for a year and heatedly attacked members of his own party for opening the door to the sugar speculator. The pressure on the Senate stemmed partly from housewives, who will now get 35 instead of 25 pounds a year, but chiefly from the industrial users of sugar, who are chafing at the limits on their production and profits imposed by the sugar restrictions.

Between now and June 30th Congress will go over the controls individually; it will also have to act on the extension of the Export Control Act, which President Truman has requested to protect domestic supplies of short commodities and to enable the Administration to direct exports to countries which need them most.

To retain controls, even for export, goes against the grain of a Congress which has triumphantly liquidated them at home. Evidently there will be a bitter struggle inside the Republican party between the followers of Senator Taft, who has no use for “interference” in the domestic distribution of wheat and fats, or for American co-operation in international allocations, and those who like Senator Aiken believe that no foreign loan can offset the damage done by letting allocations and export controls lapse. The loans themselves will become illusory if they cannot be turned into goods, and distribution is to be by scramble. This decision on controls lies at the very core of a consistent foreign economic policy.

Return of the Tourist ?

(From our US Editorial Staff.)—The recent burning of the liner “John Ericsson” at her Hudson River pier removed one more vessel from the scanty North Atlantic passenger fleet, and dimmed the golden dream of summer tourism by just that much. Mr John Strachey, making his way through smoke to the “Queen Elizabeth” berthed next door, assured reporters that England

would welcome, feed and lodge, sixty to seventy thousand visitors next summer. Meanwhile, possible carrying space going up in smoke on the other side of the pier was throwing more soot than light on the problem of how these thousands could be taken over and brought back again.

Travel hopes burgeon on both sides of the Atlantic, but with different ends. Britain and the continent want American dollars (which used to come from tourists at the rate of \$300 million a year), and are apparently preparing to furnish a modicum of food, lodging and transportation in exchange. Americans want charm, ruins, horror, history, family reunions, the simple sensation of going abroad. They are prepared to find that the food, the beds and the train service which they buy in the process of satisfying less tangible desires are good or bad—in either event they will talk about them. They know that steamship fares have gone up 15 to 30 per cent. They are being warned that the kind of travel facilities which they used to buy on an inclusive basis at \$21 a day will now cost \$25, and that the simpler type for which their poorer cousins paid \$12 a day will now cost \$17. These higher rates are not surprising, but those who plan to pay them have not yet had a chance to measure quality against price.

All kinds of people are planning to go to all kinds of places, without much knowledge of what the going will entail. Two thousand Scandinavian servants who have been saving fat wages during the war years will take them home and come back again for more. The Northern and Southern Baptists will sample international affairs by means of a conference in Copenhagen. The Czechs in Iowa are preparing gymnastic displays for the first post-war reunion of the famous Sokol groups in Prague, apparently confident that the Army will find ways of routing their trains through Germany. As for the unclassified travel-hungry, their applications for space are already exceeding the demand, and two thousand of them want to take their motor-cars with them into lands which still ration petrol.

In all this, the core of the problem is not so much how to get them over as how to bring them back. Of the pre-war transatlantic fleet, only about 20 per cent remains—eight ships out of 40 or 50, and of major tonnage only the Queens. During the summer months those eight ships would have room for 155,000 people, while the seven air lines could carry 200,000 more. But unless the piled-up demand for western passage which has crowded all available space since the war's end were somehow blocked off, only a fraction of this 355,000 could come home again. The

government is, therefore, issuing tourist visas only to those who have guaranteed passage back.

It is not surprising that the representatives of fifteen international steamship lines meeting in Paris on the day the “John Ericsson” burned found it unwise to set agreed scales of steamship fares until October. Steamship and travel offices are expecting to look like the nylon stocking queues last spring, and if stockings could be sold under the counter, steamship tickets may also move by devious and not unprofitable ways.

Shorter Notes

Mr John L. Lewis, the United Mineworkers' leader, recently decided to withdraw the coal strike notice timed for April 1st. This week, Mr Lewis decreed that beginning from that date, the bituminous coal workers should suspend labour for one week “as a memorial to miners killed in the recent Illinois pit explosion.” By the withdrawal of formal notice, Mr Lewis saved his union \$2,700,000 in court fines, gave fresh notice to the private mine operators that the struggle is not over, and demonstrated once again his personal mastery of the mineworkers. Charges of “criminal negligence” in terms of mine administration may not be without foundation (if directed at the right quarters) but they carry less conviction when timed to coincide so precisely with the personal ambitions of Mr Lewis.

*

A wage dispute with one firm of brokers threatens a general strike on Wall Street later this month, according to leaders of United Financial Employees, the Labour Federation body covering workers both on the Stock and Curb Exchanges. If mediation fails to avert a strike, the dispute may last for some time since the union has claims against several other firms and asserts that it has been unable to obtain any satisfaction through the usual negotiating bodies.

*

The Civil Aeronautics Boards has approved an advance of 10 per cent in airline passenger fares, to slightly more than 5 cents a mile. This will leave airline rates at levels comparing favourably with those for Pullman car travel, and in the opinion of the industry's leaders, will put the airlines back on to a solvent basis, though it may well slow down the earlier rate of expansion.

THE WORLD OVERSEAS

Ghosts of Vichy

(From Our Paris Correspondent)

THE crisis which hovered over M. Ramadier's Cabinet last week was both more and less serious than the periodical deadlock so familiar to French politics. It was less serious because none of the main parties wanted the Government to fall, and were therefore willing to clutch at any compromise they could find; until their tactics change—perhaps in another few months—M. Ramadier is safe. It was more serious because it brought to a head, in certain of its aspects, a threat to French parliamentary institutions that goes far beyond the scope of party strategy.

Policy in Indo-China, it is true, was more than a mere vehicle for dispute. There has been a genuine difference of opinion on the best way to handle the Annamese independence movement. Formally, the Government parties are all agreed on the desirability of establishing “a free association of peoples within the framework of the French Union”; in fact, of course, this kind of formula, so dear to the French mind, is open to a number of varying and even contradictory interpretations. The Right and Centre Right translate it into terms of more or less charitable trusteeship, allowing that the “natives” may have some voice in managing their own affairs, but making sure, at the same time, that French dividends in rubber, cotton and rice are amply guaranteed by the presence of French soldiers and administrators. It is a fact which may seem remarkable enough in English eyes that only the Communists have tackled the Indo-China problem in terms comparable with the latest British approach to Burma. The Socialists have paid lip-service to the same imaginative policy;

but their actions have not kept pace with their words. The issue has lain between a “colonial” and a “dominion” policy.

The root issue in last week's crisis, however, was not so much Indo-China as the continued development of the Fourth Republic. This may sound strange with an Assembly in which even the extreme Right labels itself “Moderate Republican”; but labels are nowhere more misleading than in modern France. The extreme Right is neither Moderate nor Republican; and how far it is from being reconciled to the Constitution of 1946 can be gauged by the sad confusion of loyalties in which the French *bourgeoisie* lives to-day. What is little less than outright sedition on the extreme Right tones down to self-destructive criticism in the Centre, but of this there is an outpouring as impressive by its dazzling brilliance as by its unflinching abundance.

The foreigner who takes up any of the “intellectual dailies”—with *Figaro* and *Combat* at their head—can only conclude that many thoughtful Frenchmen live in an atmosphere of acute mental discomfort and moral instability, while nothing in France amounts to more than negation and despair. If he goes farther to the Right and reads *Aurore* and *Epoque*, he will be packing his bags by lunch-time and taking the first train home. The impression is perhaps exaggerated: yet these are states of mind not difficult to run across in France. It may be hard to kick against the constitutional pricks: thousands, it seems, are doing it every day.

This almost Gadarene pessimism cannot be explained by the

basic facts of the French political and economic position. A bare summary of things achieved by the coalition governments of the last two years would provide impressive evidence of the far-reaching degree to which a shattered society had been pulled to its feet and pieced together again. Important structural reforms backed alike by Socialists, Christian-Democrats and Communists have brought the ownership and direction of wide sections of the French economy into line with the aspirations of those who, during the years of occupation, planned a new and rejuvenated France. A reform of the civil service that is not far from a revolution has been framed and placed upon the statute book. Young and enthusiastic military leaders have begun the rebuilding of the armed forces.

French industry has made long strides towards recovery; a strong and vigorous trade union movement has accepted the challenge to higher production and the national planning of wages. The association of the working-class in the management of industry has made reassuringly good progress; and, with few exceptions, peace has reigned between workers and employers. Large sums of money have been borrowed on advantageous terms from America and Britain, and much of this has been turned to good account. In spite of astronomical figures and dizzy balance sheets the financial position is far from catastrophic, the note circulation not much in excess of what is justified by existing price levels. The manpower shortage has been faced with realism and—at last week's agreement for the import of 200,000 Italian workers in 1947 showed—with initial success. Even admitting that much is still done badly and even dishonestly, and that some aspects of French life have yet to recover from the demoralisation of defeat, it is nevertheless clear that there are also solid grounds for encouragement.

Scandals on the Right

Yet the Fourth Republic, clearly, is still a frail creation. It is too easily forgotten, perhaps, that the struggle between Vichy and the Resistance was a civil war which split deeply along the grain of traditional loyalties. The ghost of Vichy still walks in France; and the chain of complicities which linked so many *bien-pensants* to Pétain has now begun to rattle. Within the last few weeks a dozen "scandals" have dazzled the public with tales of ill-gotten gold and triple betrayals—and not one of these *affaires* has failed to strike a political note. Their complexities defy coherent description. It is found, two years after the end of the war, that an ex-colonel of the Resistance, a supposed hero, was by his own admission the man who betrayed several members of the National Council of Resistance in June, 1943.

These *affaires*, it may be argued, are nothing but the inevitable repercussions of invasion and occupation. Perhaps: but the evil of them lies in their persistence. They have served to lift the lid on a number of French consciences; and what goes on inside seems far from pleasant. The *affaires* may affect only a small minority of Frenchmen: The alarming thing is that so many of them are explicable only in terms of political affiliations. One by one, with unhappy regularity, they reveal their hidden springs of action in terms of a blind and violent anti-communism. Far from being reconciled to the existence of a strong and constructive working-class movement in France, the Right and all who cleave to the Right are steering obstinately towards a renewal of the battle which the men of Vichy opened seven years ago.

It may be melodramatic to talk of plots against the Republic. It is never as simple as that. Yet, deliberately or not, the publicists of the Centre and Right continue to nag away at old scores that were better forgotten, to harp on all the reasons that exist for despondency and alarm, to illuminate what is dark and obscure, what is hopeful. If the French economy is out of balance, this is at least in large part the fault of those who hoard food and consumers' goods. There is the daily chorus of Cassandras, who, consciously or not, appear to long for the disaster which should relieve them by a miracle from circumstances they find increasingly unbearable. Perhaps there is no plot against the Republic: what is certain is that there is no lack of plotters.

Crucial Months Ahead

At the bottom of their mental revolt, no doubt, lies the knowledge that the Constitution of 1947 was the fruit of new and dynamic growths in French society. The old landmarks of the Third Republic have been swept away; new forms of social integration lie ahead. Whatever exact direction these new forms may take it seems quite sure that the working-class—that is, the

Communists—must have their leading place: the conviction of the Communists, indeed, that the present order of things in France is a necessary if lengthy prelude to Socialism, goes far to explain their conciliatory attitude. Those who foretell a coming Communist *coup d'état* are giving themselves away. Conflicts within the party may well exist (no one outside the inner councils can really measure their importance); but the weekly rumours that the rank and file is divided between Thorez, who wants to work the parliamentary machine, and Marty, who would throw up barricades to-morrow if Moscow were less afraid of American intervention, are mere wishful thinking. A Communist insurrection would be too incredibly convenient: people do not hand their sworn enemies a loaded pistol.

These are crucial months. If the three main parties combined to uphold M. Ramadier last week it was not simply from their several reluctance to leave office. The crisis was more serious than that. To have brought down the Government would have risked severing the last links between Left and Centre and to have opened the doors of the Palais Bourbon to the wide world of adventure.

The ceremony at Bruneval last Sunday was not only a typical De Gaullist occasion, with the emphasis on the General rather than on those who made the raid of 1942; it also marked a long step forward towards an alliance of all right-wing elements under the General's banner. The speech made was not only a characteristically obscure pronouncement *urbi et orbi* but also the opening of a new political campaign which is causing some anxiety to the Cabinet. Henceforward those who regret the Fourth Republic will not lack a leader.

Jewish Camps in Cyprus

[FROM A CORRESPONDENT]

ACCORDING to official figures 13,724 Jewish illegal immigrants bound for Palestine have already arrived in Cyprus, of which 3,942 have been sent to Palestine camps to await the quota. With a further six hundred expected, there will soon be nearly over the 10,000 provided for by the immigration detention law still in the two camps.

No one knows how long the camps will be maintained in Cyprus, and one can only speculate on the possible results of the recent arrests of American crews for aiding and abetting illegal immigration; but according to reports received in the camps here from relatives in Europe, the movement is increasing rather than diminishing. The permanence of the Xylotymbou camp, together with the fact that work has now started on the first of the Caralios camps, which is being similarly provided with Nissen huts, suggests that the authorities expect immigrants in Cyprus for a long time to come.

Immigrants are recruited from almost all countries in Europe (as well as Moroccan Jews speaking only Arabic) and vary from unskilled and rough types to prosperous business men and professional men. This makes it difficult to treat them as a community, but the problem of camp administration is helped by the fact that they usually join the ships bound for Palestine in well organised religious or political groups, varying from 20 to 30 in a group. On arrival leaders of these groups immediately contact leaders of "allied" groups, and the group is treated as a unit for the distribution of food and clothing, and for administrative purposes. A central committee of group leaders deals with the administration of the camp, which is a purely military concern. There is no lack of good will on the part of the military, a fact which seems to be appreciated by the immigrants, but proceedings were undoubtedly held up at first by lack of co-ordination between the military and civil authorities, added to the difficulties to be expected where officers trained to deal with disciplined men are faced with the entirely different problems of civilians. The fact that there have been no serious clashes is due perhaps more than anything else to the Joint Distribution Committee (an American Jewish Organisation with some fifty million dollars behind it), which has not only supplied the camps with extra food, clothing, comforts, and medical supplies, but whose trained welfare workers, speaking Hebrew and Yiddish, act as unofficial liaison officers between the authorities and the Jews.

Some idea of conditions in the camps was given during a Press visit at the beginning of this year to the Xylotymbou camp near Larnaca. It appeared clean and orderly, but Major Macdonald, senior British Medical Officer, stated that of the 1,777 inmates of Xylotymbou, between four and five hundred were being treated for skin diseases. No adequate arrangements for heating water

existed when they arrived, and lack of medicaments due to shipping difficulties had contributed to the spread of disease. However, "facilities for cleanliness were considerably better here than at Caralios." Major Macdonald attributed the lack of more serious illnesses principally to the remarkable stamina of the immigrants, for which he could only account by the theory that only the physically fittest could have survived the past years in Europe. Military authorities confiscated pictures of medical cases taken by Palestine journalists in the camp.

Hasty Preparations

The history of the camps and of the authorities' handling of the press has been an unfortunate one. The plan to use Cyprus for detention camps for illegal immigrants was at least discussed as far back as the beginning of 1946, but when they began to arrive in August the local military authorities had received very short notice, and were not entirely prepared. The first intimation the press received was on August 4th, when Caralios, a military camp outside Famagusta, which in 1918 had been used to house White Russian refugees, was hastily reinforced by a double fencing of barbed wire. Military and civil authorities refused all information, and it was not until August 8th that correspondents learned from Washington that the expected arrivals were indeed illegal immigrants and not Palestine terrorists as one newspaper had suggested. The atmosphere of strictest secrecy was maintained. At dawn on August 14th, when the Liberty ships "Empire Heywood" and "Empire Rival" were escorted into Famagusta by H.M.S. "Ajax," the press, warned away from the port and the foreshore, were forced to meet them in a small sailing boat as owners of all larger vessels had been intimidated by the naval authorities. Even this was only made possible by the refusal of the Cypriot harbourmaster to comply with the quite improper request of the senior naval officer to impound all fishing vessels in the bay.

The first batch of 1,200 immigrants consisted mostly of young married couples, with a fair sprinkling of students of both sexes, and 177 children. The precautions taken by the military, who lined the road to the camp with Bren gun-carriers and troops armed with Tommy-guns, were caustically commented upon by the press. Officers stated afterwards that they had received no information regarding the type of persons being sent and had no idea what to expect. On August 18th, when the second batch of 784 arrived, there was a complete lack of these warlike precautions. The same day the press were allowed to visit the camp.

A great deal has been written about the so called riot on that day, but an eyewitness account may not be out of place. After considerable pressure had been exercised, journalists were informed on August 17th that they would be allowed to visit the camp on the following day, provided that they did not speak to the immigrants personally but submitted written questions to the authorities in advance. Under protest against the conditions laid down, correspondents arrived at Caralios on the day fixed, only to be informed by the military authorities that even written questions would not be allowed, and that all conversation with the immigrants was strictly forbidden. The immigrants had arranged to hold meetings to state their case. When they realised that they were not to be allowed to speak to the press, a determined but perfectly orderly procession marched down to the main gate. It was not until an attempt was made to get the press out through a side entrance that the trouble began. The immigrants rushed the main gate and tore down the barbed wire fences. British soldiers, who behaved admirably throughout the whole proceedings, fired over their heads without stopping the rush.

It is impossible to judge how serious developments might have been (an amendment of the illegal immigrant law providing for the use of firearms to quell disturbances was published the following day), but a Palestine journalist climbed the wire fence at some personal risk and calmed the crowd by promising a press hearing. As soon as the immigrants dispersed the press were informed that they must leave. They replied by ignoring the authorities and marching into the camp. Since then, apart from one or two visits by "selected" individuals, Caralios has been closed to the press.

The visit showed that the camp was far from ideal for the accommodation of the number of men, women and children contemplated. Major Houry, who had been in charge of the camp when it housed only one thousand troops during the war, had admitted then that sanitation was a serious problem. With ten times the number of undisciplined civilians it was insoluble. Local authorities hinted that the insanitary state of the camp threatened the health of the surrounding district. Camp officers unofficially state that they are doing their best, but the immigrants refuse to co-operate, and there is little likelihood that conditions will improve.

Early in November press reports stated that a new camp was being prepared at Xylotymbou, near Larnaca, for the reception of a further 10,000 immigrants. The policy of secrecy was maintained by the authorities, and it was not until December 5th that they admitted that five new camps equipped with Nissen huts and all possible facilities had been erected as winter quarters for the immigrants who would be transferred from Caralios. A press communiqué stated: "The completed camp has been photographed with all its amenities, for record purposes, should the immigrants endeavour to reduce it to the shambles they have made of the camp at Caralios."

The first batch was transferred to Xylotymbou on December 9th, but after that no other transfer was made. Immigrants stated that they preferred to stay at Caralios where they had "settled in" and refused to be moved. The reason seemed to be that they had formed friends and attachments and were afraid of being separated in the new camps.

So things remain, with the authorities worried about the disposal and management if new arrivals are to be expected. The Jewish illegal immigrant problem is a costly one. Xylotymbou cost £500,000, and in addition there are clothing, medical supplies, welfare and civilian labour for running the camps to be paid for. For transport alone, three Liberty ships have been kept permanently in commission.

The Chancellor of the Exchequer, answering a question in the House of Commons in February, stated that the costs of the Cyprus camps would be a charge on the Government of Palestine, but gave no details of the costs.

Spitsbergen

[FROM A CORRESPONDENT]

WHEN William Barents discovered Spitsbergen in 1596 he, like the bold seamen of the previous fifty years, starting with Sir Hugh Willoughby's ill-fated expedition from Deptford in 1553, was in search of the North-East Passage. His orders were to sail into the North Seas to discover the kingdoms of Cathay and China. He hoped to voyage along the northern route already shown on contemporary maps and thus to nullify Spanish and Portuguese control of the Indies trade-route. There still is no such Passage, but the strategic importance of Spitsbergen on the northern sea route to Russia gives it an increased significance of which recent events have been reminders.

On January 10th it was reported in London that the Soviet Government were negotiating with Norway for military bases in Spitsbergen. Later that same day the Norwegian Foreign Ministry issued a statement that negotiations had been going on since the autumn of 1944, when the Russians broached to the Norwegian Government in London the revision of the Spitsbergen (Svalbard) Treaty of February 9, 1920. The Norwegians had replied that there could be no revision without reference to the other Signatory Powers (Britain, the United States, France, Sweden, Denmark, Holland, Italy and Japan—the last two being now excluded as enemy Powers), and to the Norwegian Parliament when it met again in Norway. On January 17th a further statement revealed that the Norwegian and Russian Foreign Ministers had discussed the suggestion in New York in November, 1946, and that the Norwegian Parliament was considering the problem raised. The results of its deliberations were announced early in March. In a secret session on February 15th it had voted by 101 votes to 11 (the Communist members) to revise the Soviet-Norwegian Agreement of 1945, which stated that the defence of Spitsbergen was the joint concern of the Soviet Union and Norway. The reason was that the international situation had changed, Uno had been established, and "the opening of negotiations of a military character with any single foreign Power concerning the defence of a region under Norwegian sovereignty would be contrary to the foreign policy which the Government . . . has pursued since the liberation." Nevertheless, having in mind the particular economic interests of Russia in Spitsbergen the *Storting* was in favour of continuing negotiations to make the 1920 Treaty "more satisfactory." The next move is thus with the Russians, and the Soviet Ambassador to Oslo recently went to Moscow—presumably to ascertain his Government's definition of "more satisfactory."

There are thus clearly two sets of interests involved, the political and the economic. The 1920 Treaty recognises 40 claims in Spitsbergen, of which 32, or 87 per cent of the claimed areas, are owned either by the Norwegian Government or by private Norwegian firms. The Scottish Spitsbergen Syndicate owns 4 claims, but has never seriously operated them. The Russian Arctic

Ugö also owns 4 claims of slightly less area; these are Barentsberg, Grumant, Pyramiden and Bohemanneset. The most important of these are Barentsberg and Grumant, which were acquired from Dutch interests in the 'twenties. Barentsberg in the 'thirties produced about 400,000 tons of coal yearly but just before the war production was declining, largely because of the amount of slate mined. The coal from Grumant was of better quality, but its exploitation was more difficult, since wharves could not be built nearby. Small-scale experiments had also been made at Pyramiden. Barentsberg and Grumant were destroyed in the British Commando raid in autumn, 1941, but Pyramiden was untouched. Reconstruction, which was foreshadowed by a small Russian reconnaissance party in the summer of 1945, did not really start until November, 1946—a curious time to send an expedition to the Arctic, although last winter was unusually mild in Spitsbergen.

Two companies operate the Norwegian claims. These are the Store Norske Spitsbergen Coal Co., which has mines at Longyear bought from the Americans in 1916 and at Svea—their total production in the coming year is estimated to be about 500,000 tons; and the Kings Bay Coal Co., with an estimated production in 1947 of 50,000 tons. Reserves at Longyear are estimated at 1.5 billion tons and the Store Norske Co. has been lent over 24 million kroner in the last few years by the Norwegian Government. Although lavish support has also been provided for the Russian company by its Government, geological surveys indicate that, unlike the

Norwegian companies, it has little prospect of ever operating economically.

The vigour and persistence of Soviet interest has thus caused some speculation in Norway. Most Norwegians consider that since the Soviet Government under the 1920 Treaty can do anything it likes except establish military bases, the demand for bases is primarily a reply to American interest in Icelandic airfields. The locations proposed are interesting. A base at the entrance of Isfjord, however, would be tactically valuable. Green Harbour is the best anchorage in Spitsbergen, has good bunker-coal at hand, and controls the bulk of coal shipments from the island. But Soviet bases in Spitsbergen could not be maintained without control of sea and air communications with Murmansk.

If the Soviet Government still press for a revision of the 1920 Treaty, two courses seem open. They may either agree to the Norwegian proposal and negotiate with all the signatories—in which case it is unlikely they would get exclusive use of bases. Or they may drop diplomatic action and concentrate on economic penetration. But they must know that no land on Spitsbergen may be sold without the consent of the Norwegian Government and that Norwegian owners are not likely to sell.

Garrison Prosperity in Palestine

[BY A CORRESPONDENT RECENTLY IN PALESTINE]

POLITICAL difficulties have so far not had a permanent adverse effect on the economy of Palestine. On the contrary, there are very clear indications of further economic expansion during the past year. Foreign trade increased, imports in the first six months of 1946 amounting to nearly £13 million, compared with just over £9 million for the same period of 1945, and exports were worth nearly £29 million, as against just over £20 million. The building of houses and factory premises, the replacement of industrial equipment, agricultural production and industrial activity showed a steady upward tendency. There were no signs of unemployment, wages are high and cost of living is still rising.

These outward signs of the country's prosperity do not, however, give a clear picture of the actual situation. Experts agree that Palestine has not yet entered into the phase of post-war reconstruction and has not started to deal with the immense problems which will have to be faced in the near future. On the contrary, it is still living under a wartime economy in "garrison prosperity." The expenditure of British forces is one of the main sources of national income. According to the Chief Government Statistician it rose from £2,841,000 in 1939 to £25,229,000 in 1944 and 1945, and will most probably reach the figure of £30 million in 1946. This represents about 20 per cent of the total national income, which is estimated at about £123 million. Of this £30 million are derived from agriculture, fisheries and forests; £70 million from industry (including building), trade and transport; and the balance from the Government and local authorities, hotels and domestic service, and so forth.

It is obvious that as long as the military absorbs about a fifth of the national output, and pays for it, not from current taxation, but from funds provided by Great Britain, Palestine will be prosperous.

Jews and Arabs are, however, well aware that present prosperity is mainly the result of "pumping" in of funds by the military, and ask what will happen when political problems are settled, the military establishment is reduced to normal size, and the source of income from military expenditure dries up. The Economic Department of the Jewish Agency seems to realise fully the great advantages Palestine is receiving from being the garrison of the Middle East. Even the extremists are also aware of the financial benefits the country is deriving from the military. Accordingly statements have been made on various occasions by Jewish leaders, as well as by leaders of the underground organisations, that the political struggle and terrorist activities do not aim at driving the British military forces out of Palestine. On the contrary, as soon as the Jewish state was achieved, Jews would be prepared to grant Britain military bases in Palestine.

Although in terms of Palestine pounds the national income has quadrupled since 1939, the real output expressed in goods and services has increased by only 50 per cent. The cost of living index has risen to 260 (1939=100). The war has caused a great change in the economic structure. There has been an important shift from agriculture to industry, and in agriculture itself from citrus fruits to dairy produce, vegetables and cereals. The growth of a large number of industries such as textiles, chemicals, light engineering and the recently extended diamond industry, are also important in the plans for peacetime reconstruction.

To carry any programme of reconstruction through a sound plan will be necessary. Investment would have to be strictly controlled. There is at present no shortage of capital in the country, and there are considerable funds in the form of various reserves for building and replacing machinery and industrial equipment. There also exist a great housing shortage and an enormous demand for factory space. Building costs are extremely high—the shortage of skilled builders and the lack of any wage control have resulted in wages of all building operatives increasing greatly during recent months. But it would be impossible to house large numbers of immigrants without a new building programme. Imports and exports would also have to be more strictly controlled to give preference to local industries and the import of vital machinery.

A vast amount of economic preparation will thus be necessary to save the country from a great depression, which will most probably occur at the moment when the military expenditure in Palestine is to be reduced. It is obvious, however, that in any country such as Palestine it will be very difficult to introduce and carry out large-scale plans. But most difficult will be the attainment of the political harmony necessary for their success.

Market Currents

The approach of Spring heralded by our display of colourful necksquares and ties is said to be responsible for the general feeling of optimism in the City. Our Fenchurch Street branch is making an issue of Spring suits. And both there and at our Cheapside branch investors are urgently demanding socks, underwear and pullovers—all in short supply. Early application for all items of clothes is strongly advised while the situation remains tight.

Meanwhile, of course, we are doing everything possible to make things easier.

Decca Navigator coverage in

Western Europe to be **750,000 square miles**

The Decca Navigator System has now been officially adopted by the Danish Government after giving careful consideration to the merits of all known radio aids to marine navigation. A Decca chain of transmitters will be erected in Denmark during this year. When this chain is in operation, together with the existing English chain, and the projected one for Scotland, the service area of the three chains of transmitters in Western Europe will be 750,000 square miles, the first major steps to world coverage.

THE BUSINESS WORLD

When the Dollars Run Out

UNDERLYING the "Economic Survey" estimates for 1947 and the longer-term objectives of which they are the forerunner is the problem of the British balance of payments. It is on what Britain can afford to import that the standard of well-being in this country must ultimately depend. The British accounts with the rest of the world were precariously balanced in the immediate pre-war period. The admittedly rough and unsatisfactory estimates of the Board of Trade showed a deficit of £70 million for 1938, and an average deficit of £43 million for the three years immediately before the war. To that extent the country appeared not to be balancing its current payments and to be drawing on external reserves. Fortunately, the cushion of reserves was a substantial one. Moreover, many of the Board of Trade estimates were of a hit-or-miss character and in the light of subsequent refinement in the mechanism for calculating invisible items of external payments, it might well be true that this country was not in fact balancing its account in the immediate pre-war period.

At best, however, the balance was a precarious one, and with the advent of war this approximate equilibrium was completely shattered. While Britain fought a war "without counting the cost," it lived on imports provided by realising its external capital assets to the extent of about £1,200 million, by increasing its external debts to the amount of about £3,000 million, by lend-lease aid from the United States, which totalled more than £5,000 million, and by gifts and mutual-aid from Canada which totalled about £900 million. The vast total of over £10,000

EXTERNAL PAYMENTS ACCOUNT ESTIMATES
(£ Mn.)

	1946	1947
Imports (f.o.b.)	1,100	1,450
Government Expenditure overseas	300	175
Total Payments	1,400	1,625
Exports	900	1,200
Invisibles (net)	50	75
Total Receipts	950	1,275
Deficit	450	350

million made up by these items has little bearing on the present problem, since it includes the provision of military aid as well as the flow of goods required to keep the British people fed and supplied with essential imports and materials. But the magnitudes involved are some measure of the shattering dislocation to which the British balance of payments was subjected, and from which it has been trying to recover since the war.

It was quite evident that the re-establishment of equilibrium would take time and that after the war-time distortion of the national economy a transition period of perhaps three or four years would have to elapse before Britain's current payments and receipts could be balanced. That was the justification for the American and Canadian lines of credit of \$5,000 million and for further increases in sterling debts which raised sterling balances from a figure of just over £3,000 million on June 30, 1945, to £3,500 million in March, 1946, and to a peak that must have carried the total over £3,600 million in the Autumn of last year. When the dollar credits were obtained, it was the general assumption that the balance of payments deficit for

1946 to 1948 inclusive would total £1,500 million, and that half of this would be incurred in 1946. The actual results for last year and the estimates for 1947, which are shown in the table in preceding column, reveal an appreciable improvement on these original assumptions.

At the end of 1946, £955 million of the American and Canadian lines of credit remained unused and this fact, taken in conjunction with the prospective deficit for 1947, would appear to indicate a reasonably comfortable position. Any reassurance on this score must, however, require a number of reservations.

In the first place, imports in 1946 were kept down, not by exchange shortages, but on supply grounds, and in meeting current requirements a considerable draft on stocks of foodstuffs and raw materials had to be made. In order merely to maintain consumption this year it will therefore be necessary to increase imports above the 1946 level, and in fact the increase, shown in the above table reflects no more than a modest rise in import prices and a margin representing the extent to which Britain lived on stocks in 1946. The 1947 target for imports still represents no more than 80-85 per cent of the 1938 volume, and makes no allowance for building up depleted stocks. Merely to restore the volume of imports to its 1938 level would require at least another £200 million. Even this would not mean a restoration of the pre-war level of imports entering into consumption in Britain, since the need to raise exports to 40 per cent above 1938, which is the target for the end of 1947, and to 75 per cent. above 1938, which is the post-transition period goal, must involve a proportionately heavier import of raw materials destined for the production of export goods. The second reservation that must be entered concerns the difficulty of reaching the stated export target.

Thirdly, there is the distinction to be made between the global deficit and that which is incurred in trade with hard currency countries. The "Economic Survey" for 1947, identifying the hard currency countries with the Western Hemisphere and the soft with the rest of the world, pointed out that Britain was now drawing some 42 per cent of its imports from the former and sending to it only 14 per cent of its exports. Sir Stafford Cripps, in his opening speech in the economic debate, pointed out that the proportion of British exports to hard currency countries had been increasing by one per cent a quarter throughout 1946 and that discussions with exporters were now going on to encourage a further acceleration of this trend. The President of the Board of Trade also emphasised that no occasion was being lost when negotiating trade and financial agreements with other countries to obtain as large a proportion as possible of imports from the soft currency area. But the near future is unlikely to ease the compulsion, in which this country and a great many others stand, of having to purchase a substantial proportion of the most urgently needed imports from countries whose currencies are the most difficult to acquire. If the ratios of hard currency imports and exports given above are taken as applicable to the prospective trade figures for 1947, they suggest a deficit in trade with the Western Hemisphere of about £440 million, to which should be added the small deficit with European hard currency countries, chiefly Sweden and Switzerland. The somewhat ominous result of that cal-

culatation must, however, be tempered by one important reservation, namely the extent to which the British deficit with hard currency countries is offset by the surplus with South Africa, usually ranked among the soft, because sterling, countries, but in fact the hardest of them all. Last year imports of South African gold into the United Kingdom must have neared the £100 million mark and the British current trade surplus with South Africa—some £60 million—was thus available in a form that could be converted into dollars or, if so desired (as it apparently was), to strengthen the British gold reserve. After making due allowance for these factors it would seem probable that the real hard currency deficit this year will be no greater than the global deficit of £350 million to £400 million and that current payments with other countries will be in approximate equilibrium.

*

This has a bearing on the next reservation to which the requirements of dollars should be subjected, namely the cost of the "convertibility" of sterling which becomes effective, under the terms of the Anglo-American financial agreement, on July 15th next. This is the point on which both apprehensions, and misapprehensions appear to exist. One prevalent idea that should be strongly rejected is that convertibility will apply to all the sterling arising from current transactions—that India, for example, will be free to convert into dollars the whole of its export proceeds to Britain. That, of course, is not so. Steps will no doubt be taken before July 15th to define exactly how much of its requirements from Britain India will be able to finance by drawing on accumulated sterling, and it will probably be a very small sum. For the rest, India's imports from Britain will have to be paid for by her exports and all indications suggest that this current trade will be running heavily against India for some time, giving that country no real claim to convertibility. It is the net balance with each country and not the total debit side of the sterling trading account that must be considered in terms of convertibility. When they are broken down, these net balances will be seen to be relatively unimportant as a threat to the British dollar resources. The main debit balances are those incurred in trade with the Western Hemisphere. These have already to be paid for in hard currency, which has been duly allowed for in calculating the hard-currency deficit for 1947. One must beware of making the error of double counting by providing, for example, for the cost of convertibility of Argentina's accumulation of sterling this year. The entry into force on July 15th of the promise to make current sterling thereafter convertible could lead to an additional drain on British dollar resources only in cases where there is a net deficit which does not now have to be met in dollars, and Britain's principal deficits with soft currency countries this year will be with Australia and New Zealand and some of the colonial territories. It may be assumed that any sterling accumulating in these hands will not be unduly pressed for conversion and that the countries concerned will continue to exercise the wise and honourable restraint they have hitherto shown in drawing on the sterling area dollar pool. If the promise of convertibility costs Britain as much as £50 million in hard currencies this year, we shall have to deem ourselves very unfortunate.

On these estimates, allowing for a shortfall of £50 million in the 1947 export target and for £50 million as the cost of "convertibility," the drain on gold and dollar resources this year would be of the order of £500 million, a figure which may be compared with the annual rate of £420 million at which the US and Canadian dollar credits have been drawn on during the past three months. This, allowing for a gradual improvement in the balance-of-payments position in the second half of 1947

and thereafter, would shift the point of exhaustion of the dollar credits well into 1949.

The dollar crisis is, therefore, not imminent. But what really matters is not the exact timing of the exhaustion of the dollar credits, but whether when they are exhausted the British balance of payments will be in reasonable equilibrium. This means looking forward two or three years or, to see the position in all its grimness, to 1951, the first year when the service on the dollars now sustaining Britain has to be paid. The problem which will then face Britain will depend on a number of factors that cannot yet be estimated: the changes in terms of trade, the arrangements that will be made with sterling area creditors, the amount of Government external expenditure, above all the effect of such steps as may be taken to import manpower and increase productivity. Where so much is conjectural it may seem pointless to hazard any estimate. But certain commitments and probabilities are easier to estimate than others. By assembling these, it is possible to assess the broad order of magnitude of the task that has to be accomplished to make the accounts balance without external help.

*

If export and import prices are roughly stable, an import volume equal to that for the current year would amount to £1,450 million. This must be regarded as a bare minimum. Allowing for the fact that larger imports would be required to produce the larger exports, it would represent rather less than 80 per cent of the domestic consumption of imports of 1938, and rather less than is being consumed now. To this sum should be added a minimum estimate of £100 million for external Government expenditure, and another £100 million for the service of the dollar credits and releases of sterling balances. Against total disbursements of £1,650 million, it should be possible to count on an appreciable expansion in the invisible income, which yielded a net sum of £50 million last year and is expected to provide £75 million in 1947. As much as £100 million may be added to this as a result of higher shipping income, a better balance of the film account and the development of the tourist trade. But even on this somewhat optimistic basis of receipts and an austere basis for imports, exports would have to produce £1,475 million or £275 million more than the highly optimistic target for 1947 in order to make current payments and receipts balance. The ultimate figure of £1,475 million does, in effect, represent a close approximation to the target of 75 per cent increase in the volume of exports over and above that for 1938. To reach that figure will call for prodigies either of productivity or of austerity. Indeed, contemplation of these figures leads inexorably to the conclusion that a satisfactory escape from the problem that the balance of payments poses will be very difficult without some fall in the prices of the foodstuffs and raw materials that Britain buys. Fortunately, some such fall can be anticipated with confidence, though it would take a bold prophet to predict either its extent or its timing. If more moderate prices for what Britain buys can be combined with high economic efficiency in the exporting industries, so as to make selling prices competitive while still covering the high British standard of wages, then the problem is soluble.

The first half of the equation is beyond Britain's control; there is little that can be done but wait for more normal conditions to return to world markets. The second half, however, should be well within the control of the British nation. What is needed is not merely effort put into the export campaign of which there is already plenty—but also economic efficiency, the determination to pay a high wage and still sell cheaply. And of this latter there is, as yet, far too little. But it is the only alternative to perpetual short commons for the British people.

Base Metal Boom

IN rapid succession last week-end, the prices of tin, copper and lead were raised to record post-war levels. By these increases, the prices of copper and lead have been doubled in a twelvemonth, and tin is as high as it has ever stood in this century. Nor can it be said that the series of precipitous rises in the prices of base metals since the end of the war has been exhausted. The contrast between to-day's conditions and the stability of prices throughout the war illustrates the degree of strain that the resumption of peacetime demand has imposed on metal supplies.

The magnitude of post-war price changes is important, but even more significant is the rate at which they have occurred. The accompanying chart gives a vivid impression of the trend.

These sharp increases reflect rising metal prices on the world market—for practical purposes, the United States, where the end of price ceilings has produced a major boom in all primary industrial materials. Against the urgency of American demand, bulk purchasing methods have been quite ineffectual. Base metal producers have not been anxious to sign contracts for future supplies at fixed prices; they have preferred to count, so far with complete success, on rising American demand and rising world prices. Since the Ministry of Supply is forced to charge consumers a price which covers its average replacement costs, the whole *raison d'être* of bulk buying comes into question. In food there may be arguments for the artificial maintenance of a low level of prices for the "iron ration." But in metals the case for bulk purchase now seems dubious. If Government buying secured better supplies and more stable prices than the open market, it would be different, but experience in the past 18 months shows that neither of these two conditions has been satisfied. The Government has been trying, always anxiously, and sometimes pathetically, to provide the bare minimum of base metal requirements for British industry, and prices have passed right beyond its control.

Indeed, they are open market prices, for the Ministry has been chasing after the world market, lacking any power to impose its will upon it. Under free market conditions, changes in base metal prices during the last 18 months would have been more frequent, but industrial consumers would at least have been able to form their own judgments about future supplies, and given an organised market would have been in a position to buy spot or cover their forward requirements as they wished. Admittedly, under present conditions of world-wide inflation and a ubiquitous seller's market, the manufacturer may not be greatly worried about this risk, since he usually passes on to the buyer the full costs of the metals and

wages. But these conditions will not be permanent, and, even under bulk purchase, price changes are sudden and arbitrary. They have to be announced only a few hours before they take effect. By watching certain free markets, such as the New York quotation for export copper, and by following in detail the negotiations for supplies between producing and consuming countries, consumers can sometimes get an inkling of price changes—for example, the increase in tin at the end of last week was fully anticipated from the discussions between the Bolivian producers and the American smelters, as described in last week's issue of *The Economist*. But no consumer can tell exactly when the Government may decide to alter its domestic selling prices and the changes of recent months have undoubtedly disturbed industry.

It would, of course, be unreasonable to blame the Ministry of Supply for what has been happening to base metal prices during recent months. After their initial mistake about the prospective demand for copper towards the end of 1945, their room for manoeuvre was small and when American ceiling prices were lifted last November, it disappeared. At the moment the only practical policy may be to follow, perhaps almost helplessly, in the American wake, paying American prices for such supplies as are available. An aggressive buying policy might produce a little more metal for the British consumer, but it would certainly force the price up further against him. This follows from the major change in the American base metal economy. A study of the table below shows that, with the single exception of tin, the United States is now far more dependent than it was in pre-war days upon imported metal supplies, and less dependent upon home production. Corresponding changes are now afoot in the world market, and these have to be recognised if adequate supplies of base metals are to be provided for British industry.

The present situation is little short of desperate. All the base metals are in the most urgent demand for industrial re-equipment and housing. There is a positive merry-go-round of substitution between the different metals, by which those in extreme scarcity are replaced on the margin by others which are hardly less scarce. Copper has been used to replace lead, aluminium to replace copper and cadmium as a partial substitute for tin; but these substitutions have a reflex effect on the demand for the substitutes and the supply of none of them is adequate to afford useful relief. The peacetime pipelines of all base metals in all countries are drained almost dry and they

must be replenished before more stable market conditions can be secured. Present prospects suggest that the current high level of consumption of copper, lead and tin will continue and that the rise in prices is not yet exhausted. The major factor is the search of the United States for metals outside its own frontiers, and since America alone has the needed dollars, it has a long start in the race for world supplies. The race may even be heightened this year, for prospective American consumption of copper has been put at between 1½ and 1¾ million short tons, lead at more than 1 million short tons and tin at 85,000-90,000 long tons.

Despite the rapid rise in prices and the vigorous character of demand, world production of copper, lead and tin has made a disappointing response. This may reflect doubt about the permanence of the present high level of American consumption; American domestic base metal production is still sheltered behind a high tariff and although the present rate of base metal imports into the United States is in sharp contrast with the 'thirties when the American tariff operated with devastating effect to keep out imports from abroad, producers still seem uncertain of its continuance and sensitive to the possibility of a setback in American demand. By all appearances they have not been very active in expanding their production facilities to meet a permanent increase in American imports. Moreover they are operating—or trying to restart operations—under severe physical handicaps. In the Belgian Congo, copper output has been restricted through lack of water; in Rhodesia there have been labour troubles, lack of coal and shortage of transport. In Chile there is the affliction of perennial labour disturbances; in the United States itself, mine output is declining, particularly in lead, where production has been falling steadily despite the subsidy. Lead supplies have been affected by the cessation of production in Burma and Germany owing to the war, and only small quantities are available at the moment in Yugoslavia. Persistent labour shortage in Australia has led to a steady decline in lead output since 1940 and considerable arrears of development work must be overtaken before output can be increased. Rehabilitation in the Malayan and Dutch tin industries have been far slower than was originally expected. From Malaya comes the familiar story of the urgent need for coal and new equipment and the state of labour is not as satisfactory as it should be. In the Netherlands East Indies slightly greater progress appears to have been made in re-equipment but coal is desperately short. Accurate production forecasts for 1947 are hardly possible, but it would be optimistic to suppose that a rapid recovery in the output of copper, lead and tin

is likely, particularly while the present scarcities of equipment and coal continue.

The conclusion of this analysis for the United Kingdom is that in base metals, as in other matters, this country now has to pay the piper without much chance of calling the tune. The rise in base metal prices and the exiguous supplies which are forthcoming at these prices show all too clearly what may happen to Britain's external payments account when the attempt is made to build up stocks of primary materials to a level appropriate for full employment and prosperity. It is difficult to make the attempt or to prescribe any remedy so long as the level demand for base metals in the United States continues at such a high pitch. But it would seem premature, at any rate, to suppose that any major and immediate change is likely to take place. The voices which were prophesying a slump in the United States six months ago have been conspicuously silent for many weeks past. Present conditions are certainly not ideal for reopening the London Metal Market,

which would find it extremely difficult to conduct its business on the basis of such limited supplies of metals as are now being offered. But despite these difficulties it must be seriously asked whether the London Metal Exchange would involve any greater cost or any greater restriction of supplies for the British consumer than the present system. Its functions are being increasingly challenged by New York, and its expertise is gathering together relatively small parcels of metals which, though not large in size, would greatly ease the bottlenecks for British consumers, is being drained away. Is not the onus upon the advocates of bulk purchase now to prove their case for base metals?

Gilt-edged—Prescription as before

The recovery in the gilt-edged market has been quite well consolidated in the past week, with gains ranging up to a full point in the volatile irredeemables and correspondingly smaller movements elsewhere. But hardly anybody expects the further large advance which would be needed to carry prices near to their pre-crisis levels, and already the recovery movement seems to have lost momentum. Meanwhile, the Chancellor has faced the first of a series of dilemmas which his own aggressive tactics have prepared for him. During the fuel crisis he lost ground heavily simply through failure to defend what he had won—doubtless well knowing that the position was either untenable or could be held only at very great cost. He chose to stand aside and pretend that nothing was happening. But now he has been forced into positive action, through the fact that two more corporation issues—and, moreover, 5 per cent issues—were due to be called for redemption. To postpone decision or to pitch the terms for conversion more or less in line with the current market level would have meant an overt admission that ground had been lost and was presumed to be irretrievable. The only alternative was to show a quite brazen indifference to all that has happened in the past seven weeks. And that is what Mr Dalton has done.

The 5 per cent Derby and Newcastle stocks are being duly called for redemption, and offered conversion into new stock on precisely the terms that were being established as standard before the fuel crisis knocked prices down by anything up to six points. They are offered 2½ per cent stock, 1970-75, at par, regardless of the fact that even the earlier series of issues left substantial amounts of stock to be taken up by the official underwriters. When these terms were last offered the Treasury 2½ per cent stock was standing almost at par, and the 2½ per cent Savings Bonds 1964-67—the nearest comparable Government stock—were standing more than four points above par, showing a yield differential, in favour of the longer-dated corporation scrips, of fully ¼ per cent. When these new conversions were announced, the Savings Bonds had only just recovered above par—and that fractionally. And the “Dalton” 2½ per cent stock was fully five points below par. Obviously, the National Debt Commissioners will have to work hard if this prescription is long maintained.

The market had grown so accustomed to the shock tactics of 1946 that even this bluff had its psychological effect and helped to stiffen the recovery movement, but obviously the market is not disposed to conclude that the Chancellor expects to be able to make good his lost ground. The inner defence line of par for a twenty-year 2½ per cent dated stock, in contrast with the forsaken advanced position of the same terms for an undated stock, is now tolerably well held, and perhaps can be maintained without money-creating official support. The Chancellor, if he is wise, will make that the limit of his ambitions—except perhaps for occasional sallies into no man's land for the purpose of testing the strength of the opposition.

Coal for Industry

Beyond the statement that domestic and non-industrial consumers of coal would have to aim at saving 2½ million tons of coal to close the gap between supplies and consumption this summer, the Prime Minister's statement on the coal shortage last Thursday week was virtually a replica of the Cripps coal budget, which was given in detail in *The Economist* of March 15th. Further consideration of the budget even when it is conceived, in Sir Stafford Cripps's words, as “a forecast of supplies based on current prospects” suggests that it is framed so cautiously as to be pessimistic. There are overwhelming arguments for realism in coal budgeting—for that reason the raising of the coal “target” from 200 million tons to 220 million tons, which has been recommended by both the TUC and the FBI, can only be described as optimistic arithmetic, removed from practical possibility.

But it is less certain that “current prospects” will involve an actual fall of output, during the six summer months, from 94½ million tons—the amount produced in the six corresponding months of 1946—to 89 million tons in May to October this year.

The great unknown is the effect of the five-day week in May. For surface workers, who have recently been working 5½ shifts a week, this will involve a loss of output; but for face workers who have been putting in 4½ shifts or a little more, a full five shifts would make a great difference. Moreover, the industry is still attracting ex-miners back to the pits, and more than half of the total men recruited in February were either ex-miners or had received training. Sir Stafford Cripps has himself admitted that the “Economic Survey” target of 730,000 workers in the coal mining industry should be reached, on the recent rate of recruitment, by October. Will that produce a fall in output?

Admittedly it will be difficult to reach the 200 million ton target in the coming coal year. But the current trend of production is improving and to budget for a further fall in output during the first six months seems to be carrying caution too far. Great arrears of underground development work may have to be overtaken before the increased labour force becomes fully effective. Yet the austerity coal supplies now budgeted for industry this summer will involve the direst consequences for the nation. The Government's anxiety to avoid any repetition of the calamity of February by building up stocks before next winter by 10 million tons is very proper. But it involves a continued and almost equally heavy calamity this summer; industry's requirements are to be cut by one-third; invidious—indeed impossible—choices will be made between “essential” and “inessential” industries; there will be loss of steel output, loss of cotton supplies, and loss of exports. Such is the price which must be paid to build coal stocks by 10 million tons during the summer, on the assumption of a more meagre coal output than last year. Yet the signs of improvement in coal manpower and output are apparent—they do not indeed point to a final solution of the coal problem, but they offer sufficient encouragement to justify a re-examination of the basis on which the summer coal budget was prepared under crisis conditions a month ago. If, as now seems agreed, it is technically possible to discharge American coal ships in British ports, and coal can be bought in the United States this year, the argument would be reinforced. If the results of such a re-examination are promising, it would only be realistic, in the present industrial crisis, to let industry have the benefit this summer of a rising trend of output in the form of increased coal supplies, even if that course involves risks which are always inherent in an act of faith. Complete security is an illusion which can be too dearly purchased.

The Fiscal Year

The out-turn of the first complete fiscal year since the end of hostilities proves to be a good deal more favourable than either Mr Dalton or the unofficial estimators foresaw at the time of the last Budget, but very much less so than seemed possible a few months ago. Through the first nine months of the year, ordinary expenditure fell appreciably faster, and at an accelerating rate, below 1945-46 than the Budget estimates contemplated. But thereafter the decline became steadily smaller, until in the final month fully £50 million more was spent than in March last year. The closing weeks of the year, notoriously difficult to forecast, have therefore changed the picture much more radically than usual. Three months ago it seemed that the ordinary deficit might be no more than £200 million. As at March 1st (as *The Economist* showed on March 15th, in the first of a series of Budget surveys), it promised to be £400 million or more. It is actually £569 million compared with an original Budget estimate of £726 million and a revised estimate (including supplementary votes for Supply) of £940 million.

This “ordinary” deficit is not, of course, a measure of the true excess of Exchequer disbursements over receipts, nor is it even a measure of the net out-turn of those items which might be regarded as having “inflationary” significance, as distinct from such nominal or capital items as, for example, the payments of subscriptions to the Bretton Woods institutions. “Below-line” expenditure ranges from repayment of post-war credits, which plainly have an inflationary character, to advances to the Civil Contingencies Fund which may be required simply to provide

working capital for the trading controls. The major below-line items other than Bretton Woods have been as follows:

	£ mn.
EPT refunds	184
Housing Acts	91
Coal Nationalisation Act	41
Local Authorities Loans Act	48
War Damage	107
Civil Contingencies Fund	64
Post-war credits	58
	593

Including these items, the overall deficit thus amounts to about £1,160 million—and it should be added that £118 million of the year's apparent revenue was never actually received in cash but represented the net repayment of Tax Reserve Certificates purchased by taxpayers in earlier years in anticipation of tax liabilities. On this basis, therefore, the Exchequer had to find roughly £1,280 million of finance, to which “small” savers contributed about £300 million, £428 million was borrowed under the dollar credits, and the remainder was financed by floating debt. The floating debt actually increased during the year by £467 million, but the movement would have been almost £150 million larger than this had it not been for a purely internal operation—the National Debt Commissioners took up on behalf of the Savings Banks a substantially larger sum in Terminable Annuities than was actually received on balance from small savers.

* * *

Buoyant Revenue

The contraction of the “ordinary” deficit compared with the revised estimate was attributable almost equally to the performance of revenue and expenditure. Ordinary revenue had been expected to fall by £123 million, owing to the tax remissions; expected to fall by £123 million, and thus bettered the estimate it actually rose by £56.8 million, and thus bettered the estimate by almost £180 million. Ordinary expenditure had been expected, on the original estimate, to fall by £1,597 million or, on the revised estimate, by £1,382 million; it actually fell by £1,574 million to £3,910 million—£192 million less than the final estimate. As the table on page 519 shows, the buoyancy of the revenue spread almost right through the list. Only two items fell short of the estimate—surtax and Excise. Over-estimation of surtax receipts has been a notable feature of the budgets for some years past, but this time the shortfall is only £4 million and the total yield, even so, is £7 million more than in 1945-46. The shortage in Excise is wholly due to the cut in beer production, which was estimated to involve a revenue loss of about £48 million; yet the total yield of Excise is only £28 million below estimate, and £23 million more than in 1945-46.

It is noteworthy, however, that of the £180 million gain in revenue, no less than £83 million is attributable to items whose size in any particular year depends to a large extent upon internal financial policy. Miscellaneous receipts, which are habitually under-estimated, brought in £56 million more than the Chancellor chose to assume last April; sundry loans brought in £12 million more; and receipts from sales of surplus stores and from trading operations provided £215 million—£15 million above estimates. In view of this, there is perhaps no reason to revise, in the light of this more favourable revenue out-turn than seemed likely a month ago, the estimates of the 1947-48 prospect given in these columns three weeks ago. But if the Chancellor wants to present his budget in a rosy light, the performance of these “policy” items will certainly serve his purpose. They could be used to support the really striking achievement of the inland revenue duties—with income-tax bettering the estimate by £45 million and profits tax and EPT by £32 million. For the future, this EPT gain is of relatively little significance, but the good income-tax yield plainly reflects the buoyancy of the national income in terms of money. So, too, does the gain of £25 million in Customs—a surprising result in view of the enforced curtailment of the 1946 import programme through sheer shortage of supplies, and one which also speaks of inflationary pressures. But even the evidence of such pressures affords no clue to Mr Dalton's intentions in a fortnight's time. The situation calls for a more purist, anti-inflationary budget; but it is far from certain that this is the Chancellor's view.

* * *

ICI Bonus Implications

Between 1938 and 1945 the directors of Imperial Chemical Industries stabilised the ordinary stock distribution at 8 per cent. This payment had become, in the view of some investors, almost a tradition; ICI, together with some other leading industrial con-

cerns like Courtaulds and Turner and Newall, were credited with the policy of putting the stockholders well down the list for any share in increased profits. This line of argument has been weakened recently by the admission that some increase in the Turner and Newall dividend might be possible for the current year (though this was made before the fuel crisis) and by the allowance in the new Courtaulds dividend arrangements for the possibility of a small final payment. Now the ICI directors themselves have gone far to explode it by declaring a 2 per cent bonus to supplement the annual 8 per cent dividend.

That the increased 10 per cent distribution makes only modest inroads into available profits is evident enough from the past year's earnings figures, which are analysed in detail in the *Records and Statistics Supplement*. Income for last year has been revised to a “net” basis—in other words, it has been struck after provision for the total amount of income tax to be borne on the profits and not, as in earlier years, after income tax on the company's reserved profits only. On this new basis net revenue, after providing for all taxation and £3 million for obsolescence and depreciation, compared with £2,500,000 in 1945, amounts to £7,171,109 compared with £4,770,062 in 1945. The latest year's income has had the benefit of a credit of £1,692,000 from previous over-provision for taxation, compared with £1,100,000 from the same source in 1945. Excluding the special credit, it would appear that net income after all taxation in respect of 1946 amounted to little short of £5½ million. Making allowance for the further provision for obsolescence and depreciation of £1½ million and the net dividend on the preference stock, the resulting earnings for the issued ordinary stock on an approximately “true” basis for the past year would appear to be slightly over 11 per cent. This calculation, it should be emphasised, omits the special taxation credits, but takes full account of the increase in the obsolescence provision. When the figures are viewed on this austere basis, it is evident that the directors of Imperial Chemical Industries are mixing their generosity with caution. Their decision to supplement the 8 per cent dividend with a 2 per cent bonus has naturally given pleasure and satisfaction, but it is wholly consistent with adequate provisions for obsolescence. These will raise the group's reserves under this head by £4,500,000; at December, 1945, they stood at £17.6 million, against fixed assets at cost, less amounts written off, of £66.2 million. The wisdom of a generous obsolescence policy in an industry which is subject to rapid technical change needs no emphasis. Imperial Chemical Industries is faced moreover with a provisional eight-year programme of capital expenditure, involving over £40 million.

In these circumstances the modest satisfaction which is reflected in the advance of the £1 stock units of ICI from 43s. 3d. before the announcement to 47s. seems quite appropriate. The yield of £4 7s. 6d. at this price would be reckoned attractive if the future repetition of the 2 per cent bonus could be taken as read. The question mark for the current year, however, is the extent to which the fuel crisis may have affected the turnover and profits of the group, and in consequence tarnished the prospect that ICI distributions in future might be stabilised at a new level of 10 per cent.

* * *

The Role of ICFC

The broad question of the relations between the two finance corporations (Finance Corporation for Industry and the Industrial and Commercial Finance Corporation, which caters for smaller needs) and the normal new issue market has been raised this week in connection with two new issues sponsored by ICFC. In the first, the National Gas and Oil Engine Company placed 159,993 £1 preference shares with the Corporation; in the second, the Corporation has subscribed for £135,000 of new debenture stock of Viscose Development Company, and has underwritten for a commission of 1 per cent an issue of 344,000 5s. ordinary shares at 7s. 6d. to be offered in the first instance to existing holders of preference and ordinary shares.

Both operations have at first sight a rather remote connection with the function of closing the “Macmillan gap” for which the ICFC was set up. The National Gas and Oil Engine Company is a well-known concern, with an established profits record and a long Stock Exchange history. Viscose Development again is an established company whose ordinary shares are dealt in on the Stock Exchange and have received regular dividends. In size, perhaps, the two operations come within the class of “small finance” which the Corporation was intended to undertake. But it is doubtful whether either operation can be described as assistance to undertakings which would have had difficulty in raising

money through the usual market channels. In reply to questions on Wednesday, the Chancellor of the Exchequer suggested that even if that were the intention when the two finance corporations were created in 1945, he reserved the right to change any arrangement which had then been made—adding, somewhat irrelevantly to this particular question, that his concern was to see that money goes into useful and productive enterprises. The point is whether “useful and productive enterprises”—a description which certainly applies to both these companies—are to make use of the Corporations’ facilities in any circumstances, or only when they cannot for technical reasons obtain finance on the open market.

In these two instances, clearly, the ICFC approached, if it did not cross, the frontier between its intended function of filling a void in the capital market and the existing facilities for providing new capital in the market. It may be that a certain common area between the two is desirable, but obviously it should be kept as small as possible. If, as Mr Dalton appeared to suggest, the original functions of the Corporation are in process of change, that fact and its attendant details should be made clear at the earliest moment.

Industry's Problems

In his candid review of the position of the English Electric Company, Sir George Nelson last week illustrated many of the problems which are facing British industry—particularly in the heavy sections—to-day. English Electric, like many others, has made a full and successful contribution to the export drive; its uncompleted order book, measured not merely in value but in volume too, is higher than it has ever been, not excluding the war period; and it has embarked on important extensions and has raised new capital to pay for them, on the assurance that additional labour and a balanced flow of materials would be forthcoming. In addition the company has concentrated production in specialised factories of efficient size. It has extended its long established training schools for technical staffs and has removed wholesale certain departments manufacturing small products from one works to another in order to release labour for the manufacture of a greater volume of heavy electrical equipment.

After all these efforts, Sir George could only describe the results as “bitterly disappointing.” In the last 12 months the company succeeded in obtaining an increase of less than 300 men to its labour force, whereas it could employ several thousands more on increasing the output of heavy machinery alone. The supply of materials was out of balance long before the coal and power crisis broke. There was particular difficulty in obtaining more than a partial allocation of the special electrical sheet steel which the company requires, though other standard materials were also insufficient for balanced production, and supplies have become even more disrupted during the past two months. The resulting dis-economy of production is revealed in a rise in the burden of overheads, which were projected for a bigger output than is now possible. Working capital tied up in work in progress is out of proportion to output. Output per man of direct labour is sub-normal, not because of lack of effort, but because of disjointed production created by shortage of labour and materials. Finally, output per square foot of manufacturing area is abnormally low because work in progress which cannot be completed is cluttering up the factory floor space.

Sir George concluded that it is necessary to compress and organise the national effort before it can be expanded—as the long-term need requires that it should be expanded—because the nation has oversold its production capacity and must now face the task of bringing its commitments more into line with its available resources. He deplored the proposal to work a double day in two shifts of 3½ hours instead of night and day shifts, describing it as a “fantastic proposal,” when a full 44 hours per shift is a minimum need which itself should be increased for the next two years at least by as many additional hours as can reasonably be arranged.

American Ships for Britain

The United States Government has agreed to sell to Britain 137 of the 271 cargo ships at present on bareboat charter to the Ministry of Transport, at an estimated cost of about £18 million in dollars. British shipowners will be allowed to purchase 106 of the 10,000-ton Liberty ships and one of the short-sea types while the Government itself will buy thirty of the smaller types which are especially suitable for use in the Baltic timber trade. The remainder are to be returned to the United States,

delivery to start immediately and to be completed by this time next year. The Liberty ships are all oil-burning steamships (except for one coal-burner), built during the war in American yards when British yards were concentrating on warship construction. They are not regarded by British shipowners as ideal replacements for peacetime commercial purposes, but are accepted, at the cost of dollars, as a temporary measure to make up for war losses.

This transaction will increase the tonnage on the UK register by some 1,150,000 tons deadweight. On the other hand, the return of the remaining ships will deprive Britain of some 1,300,000 tons carrying capacity within the next twelve months and British output of dry cargo ships is unlikely to reach such a figure in the period. This lends some urgency to an American reply to the bids of British shipowners for 40 surplus Victory ships, for which a further £8 million or so would be involved. This was a private offer made some months ago, but the Americans have shown no great hurry to accept, even though Italy, Greece, China and many others have been awarded ships. In the British Government's opinion the purchase is regarded as a fair settlement of the problem, but many private observers—not all of them in the shipping industry—hold the view that no problem would have arisen had not the Administration been faced with acute pressure from American shipping interests. When the ships are returned they will merely be added to the vast tonnage laid up in reserve. Meanwhile, Russia has so far declined to discuss at all the question of returning 95 ships chartered on similar arrangements.

Record Bank Advances

The seasonal impetus of bank advances in March has carried them past another milestone. In February they exceeded £1,000 million for the first time since 1940; they have since risen by a further £17 million to £1,022 million, which comfortably surpasses the record level of £1,013 million reached in October, 1939. The thousand-million mark has been attained only about half-a-dozen times altogether—in 1929, 1939-40, and now. But the differences between these occasions are more marked than their similarities. In the hey-day of commercial financing by the banks, a figure approaching £1,000 million used to be regarded as the “proper” level for times of activity, and a certain nostalgic interest still attaches to it. But in 1929, when it was first achieved, bank deposits stood at under £1,800 million, or less than one-third of their present volume, with the advances’ ratio at 55-56 per cent. In the 1939-40 phase, the ratio was running at about 44 per cent. Now it is no more than 18.4 per cent which, although above the worst, is actually below the ratio of end-1943 when the advances total touched its wartime low point at £724 million.

These contrasts measure the real deterioration of the importance of advances in the business of the banks: though their total is back to its 1939 level, the real volume of trade and industry which they support, allowing for the change in prices, is probably barely half what it was. Even so, the expansion since VE-day—it amounts to £273 million—has been rather more rapid than many bankers expected. Recently, however, it has slackened somewhat. Despite the effects of the fuel crisis in putting strain upon industry's liquid resources for overheads and payments under guaranteed weeks, the expansion in February and March—especially February—has been no more than seasonal. But the further effects of the crisis, in causing accumulations of stocks of unfinished goods awaiting components, may possibly offset the normal tendency towards a contraction of bank advances in April. And, on a slightly longer view, it is perhaps to be expected that the expansion will accelerate, because EPT refunds and other capital disbursements by the Government, which in the past twelve months have augmented industry's own reserves, are now tailing off.

The other changes shown in the March statement present no surprises—not even, perhaps, to Mr Dalton, who, when seizing upon February's big fall in deposits in order to defend cheap money, must have known that the pace was too hot to last. Indeed, the main cause of the decline—the seasonal revenue surplus—had disappeared even before he spoke. The deficit in the four weeks covered by the March bank statement was so large that even the heavy drafts upon the dollar credits have failed to prevent it from affecting the banking position. Thus “true” deposits have risen by £32½ million, and still stand at £786 million above their comparable 1946 level. The immediate counterpart of this movement is the rise in advances and a £16 million expansion of the investment portfolio, which shows that the banks have supported the gilt-edged market somewhat more substantially than had been generally supposed. The banks’ floating debt assets have changed significantly, as was to be expected. Treasury

deposit receipts have declined by £119 million and money market assets (bills and call money) have risen by £113 million, to the new high level of £1,194 million, with a ratio to deposits of 21.5 per cent.

Another Australian Banking Merger

A further Australian banking amalgamation was announced at the end of last week. The National Bank of Australasia and the Queensland National Bank are to join forces by a share exchange, and the combined business will be carried on under the name of the former institution. The proposals are conditional upon the assent by holders of 75 per cent of the capital of the Queensland Bank, whose shares have been valued for the purpose of the merger (including cash purchase for shareholders who are precluded from exchanging) at appreciably above their market price on the eve of the announcement. The scheme has been approved by the Commonwealth Treasurer, one condition being that there should be no displacement of staff.

The full potential economies of the fusion will not, therefore, be reaped in the immediate future, but there is no doubt that eventually the two businesses, and especially their head office administrations, will be fully integrated, and presumably there will be closings of overlapping branches and agencies. Both are exclusively Australian banks, locally registered; but whereas the National Bank, with deposits of nearly £A.90 million, has a nationwide organisation, the Queensland Bank, with deposits of £A.25 million, has principally confined its activities within that state. Until the 1920's the larger institution did not operate in Queensland, but then obtained a solid footing there through absorption of the Bank of Queensland and now has 58 offices there compared with the Queensland National Bank's 124. Quite apart, therefore, from the economies to be reaped through rationalisation of the branch organisations in Queensland, the two undertakings are in important respects complementary—the one with its wide sweep and the other with its intensive connections.

The fact that this merger follows so closely upon that of the Bank of Australasia with the Union Bank of Australia has naturally given rise to suggestions that an amalgamation movement might have been inspired by the now strongly dominant banking authorities. But in fact a tendency of this kind would run directly counter to the whole drift of politics in Australian banking; the

Commonwealth Bank was originally founded as a state-sponsored institution with the specific object of competing with the trading banks and thus of avoiding the supposed danger of the creation of a “money trust.” It can safely be assumed that the authorities have approved these mergers on their specific merits, and do not desire integration for its own sake. There obviously is an indirect connection, however, between official policy and this phase of amalgamation. The wartime principle of control, now adapted to a permanent peacetime form, has put the authorities in a position to dictate the disposition of bank assets even more directly and closely than in countries where the systems are highly organised. And the Australian authorities, by means of the special deposits which the trading banks must maintain with them and through their control of advances policy, do in fact direct the banking system with the object, among others, of restraining any rise in bank profits. The knowledge that profits are thus limited must obviously operate as a strong incentive to the banks to seek economies and strengthen their organisations wherever and whenever opportunity presents itself.

German Yarn for Britain

The Allied Control Commission in Germany has officially confirmed that negotiations are in progress to enable Lancashire firms to get cotton yarn from German mills. It is understood that one deal covering 500,000 lb. of twofold 32's yarn for the lace and net trade has already been commissioned from German mills. Lancashire does not appear to have taken too kindly to this arrangement for reasons which are understandable. Before the war, Germany was an important customer for fine Lancashire yarn for the fabric glove trade. But recently raw cotton has been sent from Alexandria to Germany to be spun into fine yarns suitable for the Midlands trade.

Such a reversal of the direction of trade may well be a blow to Lancashire pride, as well as its pocket, but under present conditions the arrangements appear to be justified from a broad national point of view. So far, no details of the scheme have been published—it is not known, for instance, whether trade will be done on Government account or on a factory-to-factory basis. The fuel crisis in February caused a drop in deliveries of yarn for that month to the home market to only 9 million lb., or some 40 per

cent of the allocation of 22.9 million lb. Deliveries to all users—including home trade, export trade, industrial groups and Government Departments—totalled only 30.1 million lb., compared with the allocation of 60.5 million lb. Weavers could still use more yarn, for both domestic consumption and overseas markets, even if the spinners obtained all the fuel they needed. Indeed the Cotton Board's plan for developing the weaving section is being held over until the spinning modernisation scheme has been fully launched. Meanwhile, yarn made in Germany is surely preferable, if it keeps the Midlands industry going, to no yarn from Lancashire.

Output of cotton, rayon and mixture cloth was also seriously affected during February, though the fall was not so severe as in yarn. Average weekly production totalled 24 million yards, compared with 36.4 million yards in January and 43.5 million yards last November, when production reached its highest post-war level.

The Federal Reserve in Germany

The *Federal Reserve Bulletin* for February gives full details of the legislation under which a new central banking system has been established in the American zone of Germany. For administrative purposes, this zone has been divided into three Laender districts, in the United States, each Land has been given a Land Central Bank. The system set up in Germany copies not only the general decentralised structure of the Federal Reserve System, it also follows in very considerable detail the American legislation regulating central banking operations in the United States. The three Laender Banks have taken over the offices of the former Reichsbank in their respective territories. Their capital has at the outset been furnished by the Governments of the three Laender, but it is provided that within two years the shares are to be sold to the credit institutions (member banks), which are required to maintain minimum reserves with the Laender Banks. The legislation provides in considerable detail for the organisation and administration of these three banks. The constitution of the boards of directors requires the representation of official, banking and commercial interests comparable to that obtained through the three classes of directors in the Federal Reserve System. The permissible business activities of the Laender Banks are defined with considerable precision. Pending the establishment of a uniform system of issuing bank notes throughout Germany each Land Bank will regulate the circulation of currency and the supply of credit in its district; it will execute the cash transactions of the State; it will keep the cash reserves which credit institutions are compelled to maintain with it; it will buy and sell three-name bills of exchange of not more than six months' maturity; it will buy and sell securities in the open market; it will deal in gold and foreign exchange; in

general, it will transact the orthodox business of a central bank. Unless these permissive clauses are operated with considerable elasticity—with the kind of elasticity that had to be infused into the Federal Reserve System at the time of the US banking crisis of the 1930's—the Laender Banks may find themselves armed with such an impressive statute that they cannot transact any business at all in the chaos that fills Germany to-day.

Italy's Sterling

Mild astonishment has been caused in London by the extremely bullish interpretation of the Anglo-Italian agreement given by Signor Mechinella, the principal Italian delegate in the discussions that led to the agreement. According to his claims, Italy's sterling balance of £50 million will be available for conversion into dollars up to an amount of £32 million. This claim may have admirable propaganda value in Rome, where it was made, but it will not bear unduly close investigation. In the first place, Italy's sterling balances amount to no more than £34 million, and the figure of £50 million is merely a hopeful estimate of the figure at which they may stand by next July. Of the actual figure of £34 million, some £10 million is reserved as a basic balance for the purpose of the payments agreement between the two countries. A further £8 million has already been earmarked for the purchase of British surplus stores in Italy. According to present plans, Italy will require between £9 million and £10 million to finance urgently needed imports from sterling area countries. That leaves about £6 million of the accumulated balances which Italy will be free to dispose of as she wishes. If the total balances increase to £50 million, the excess will be available to meet expenditure in any part of the world—but that is not a privilege to which the Italians can lay exclusive claim.

Poorer Diet for Stags

Recent signs suggest that speculative investors are becoming more selective in their appetite for new issues. Their flow has been particularly brisk during the last week or two, for many issues were held up by the printing restrictions during the fuel crisis, and an attempt has been made to clear the decks before Easter and the Budget.

The public have been invited to take an interest in a number of established concerns in recent months. In the best of these issues the proportion of capital retained by "insiders" has generally been high enough to create confidence; preferential treatment to customers and to employees has also been a noticeable feature. A number of concerns, however, have revealed some remarkable profits records, with handsome figures for the past year or two but with pre-war figures showing a pale shadow of recent results. This is particularly true of certain of the recent clothing issues. Perhaps the less aggressive appetite for new issues, which is

* Placing price. † Underwriters took up 60 per cent. § 86 1/2 per cent left with underwriters.

But the failure this week of the Charterhouse Finance Corporation's marketing of Pool, Lorrimer and Tabberer on a £4 10s. 3d. per cent dividend yield basis is more surprising. Although 40,000 4s. units were applied for by those connected with the company, 60 per cent of the 350,000 units offered to the public had to be taken by the underwriters; the public interest thus seems to have reached no more than 100,000 units. The service agreements gave the directors an inducement to maintain a satisfactory rate of profit. Whatever the reason may have been in this particular case—not in itself an exception, for certain fixed-interest issues have not succeeded in attracting full support recently—it seems that the chances of automatic new issue profits are diminishing. The stag has recently had some lush grazing. Now he may have to put up with a more austere diet—including an occasional thistle.

One Buyer For Silver

The New York price for imported silver has been creeping up again as a result of modest but persistent demand from London and the sterling price has been adjusted to this movement, rising to 46d. this week. The market remains highly sensitive to the interaction of demand and supply in a very modest turnover. The silver position is, for the time being, clouded in uncertainty by the Indian Government's decision to suspend the grant of import

licences. The importance of this move is emphasised by the authoritative estimates of imports of silver into India made in the quarterly bullion letter published this week by Messrs Mocatta and Goldsmid. This suggests that since last August shipments of silver from London to Bombay amounted to approximately £7,485,000. In addition it is estimated that about half as much was exported direct from Hongkong to India. Exports from the United States to India are not estimated by Messrs Mocatta and Goldsmid but it will be recalled that the Chancellor of the Exchequer recently stated that the amount of silver arbitrated from New York to India by Belgian operators amounted to about 11 1/2 million ounces, which would represent close on £3,000,000. At present rates, Messrs Mocatta and Goldsmid estimate the absorptive capacity of India at about 60,000,000 ounces a year. They add that there is virtually no other buyer for any large quantities and point out that the main problem of the silver producers of the western world is to discover on what terms India can be induced to buy from them.

As a postscript to the Belgian arbitrage operations, it should be pointed out that since the sterling which accrued to the operators as a result of sales of silver in Bombay was ultimately canalised in transferable accounts, this sterling could be converted back into US dollars at the official rate of 4.02 1/2. Since the transaction made it possible for the Belgian arbitrageurs to convert their dollars into sterling at a rate of around \$3 to the pound, the resulting profit, earned in dollars, was considerable. This fact, moreover, throws some doubt on the Chancellor of the Exchequer's assurance that these transactions had involved Britain in no loss of dollars.

Shorter Notes

The Ministry of Transport has disposed of 49 out of the 59 ships, which were formerly German owned, for £3,526,850. Since November 26, 1946, when the third tender opened, one vessel was withdrawn. Britain received as reparations from Germany 89 ships of a total gross tonnage of 350,000.

The British Government is to pay the Netherlands Government £8,500,000 in final settlement of the bulk of obligations arising out of the use in wartime of Dutch ships. About half the sum is to cover reconditioning of passenger liners used as troopships.

IS FLOUR SELF RAISING?

"A bag of self-raising flour" is, nowadays, a regular item on the housewife's shopping list. But flour is not actually self-raising until certain other ingredients are added. Important among these are the food phosphates, such as Monocalcium Orthophosphate—a mouthful of a name for an aerating material which, through many years of technical research and manufacturing skill, has—so far anonymously—come to the aid of the overworked housewife, and made ordinary flour self-raising.

EQUITY AND LAW LIFE ASSURANCE SOCIETY

TRIENNIAL VALUATION RESULTS

SIR GEOFFREY ELLIS'S REVIEW

The annual general meeting of the Equity and Law Life Assurance Society was held, on the 27th ultimo, in London, Lord Kennet, P.C., G.B.E., D.S.O., presiding in the absence of the chairman, Sir Geoffrey Ellis, Bt.

The chairman read the speech prepared by Sir Geoffrey Ellis, of which the following are extracts:

My first very pleasant duty is to welcome Sir Richard Hopkins, who has joined the Board of the Society since our last annual general meeting. Sir Richard with his keen mind and wide knowledge of affairs will, I am sure, be a great source of strength to the board.

I propose today to devote my remarks mainly to the position of the Society as disclosed by the triennial valuation made as at December 31, 1946; I feel sure that you will find the results most satisfactory. The directors have given full consideration to the basis upon which both the assets and the liabilities should be valued on this occasion. I would remind you of the fall that has occurred in the general level of interest rates and the consequent rise that has occurred in the market values of Stock Exchange securities. Bearing this in mind your directors have decided that credit should be taken in the accounts for the sum of £2,085,000 in respect of profit on securities and transfer from reserve, and that this sum should be applied wholly to strengthen the valuation reserves set against the liabilities under the Society's contracts.

RATES OF INTEREST—VALUABLE MARGIN

We are satisfied that even after transferring the sum which I have just mentioned there remain ample margins between the values at which the assets appear in the balance sheet and their market values. Besides considering the assets from the point of view of their capital value an investigation has been made into the future income which we may expect to receive. After making full allowance for the loss of income likely to be suffered on all securities at present the subject of legislation, it appears that we may expect to receive a return of slightly more than 4 per cent. gross on the written up balance sheet values of the assets.

As regards the other side of the balance sheet, I would draw your attention to the summary of the actuarial valuation basis appended to the director's report. Even measured by the low rates of interest now obtainable on the investment of new money this is a strong actuarial valuation basis—a very strong basis indeed—and involves over all the earning of a gross rate of interest of slightly less than 3½ per cent. gross. This rate of interest is strictly comparable with the gross rate of interest of slightly more than 4 per cent. that I have just indicated as the rate which we expect to earn on our balance sheet values. You will see, therefore, that there is here a very valuable margin of ½ per cent., which should prove in the years to come both a source of strength and a source of profit to the Society.

Besides the strong actuarial basis used there is a contingencies reserve of £500,000; that within this contingencies reserve there are free sums more than sufficient to strengthen the valuation basis of our life assurance business still further to a 1½ per cent. net premium valuation.

We have tried to pursue a principle of "uniform stringency." On the liabilities side we have a margin of ½ per cent. in the gross rate of interest and a contingencies reserve of half a million pounds; on the

assets side we have very ample margins in the values at which our securities appear in the balance sheet and in addition a free investment reserve of half a million pounds.

SURPLUS AND ALLOCATIONS

You will see from the report that your directors have declared the divisible surplus to be £1,062,928, and that it has been decided to allocate bonuses for the last six years in terms of the table appended to the report. In view of the fact that no bonus was declared at December 31, 1943 the sum of £122,889 to be transferred to the Proprietors' Fund is the product of six years profits. In very round terms it may be said to arise as to £50,000 from the period 1941-43 and as to £70,000 from the period 1944-46. Bearing this in mind, and bearing in mind a further consideration to which I shall refer shortly, your directors recommend that the sum of £50,000 should be used to pay up a further 5s. per share of our uncalled capital and that a dividend of 4s. 6d. gross per share should be declared; this dividend is one which I think the Society may reasonably hope to maintain.

BUILDING UP PAID-UP CAPITAL OF THE SOCIETY

Now as to the further consideration which I have just mentioned, it is this. A life assurance office requires to keep a balance between the amount of with-profit assurance business on its books and the amount of its non-profit contracts—both for life assurance and annuity. The existence of the shareholders capital—called up and uncalled—of £1,000,000 gives to your directors a great degree of flexibility in framing policy as to the extent to which they are justified in encouraging non-profit contracts for life assurance and annuity business; this can ensure to the great benefit of our with-profit policyholders, who, I would remind you, receive 90 per cent. of the profits on all our non-profit contracts. It is against the background that I have just sketched that your directors consider it wise on this occasion to apply £50,000 of profits to building up the paid up capital of the Society.

I do not think I need to commend to you the rates of bonus now declared on our with-profit policies; for the current year interim bonus at the same rates as those declared for 1944-46 will be paid on claims arising.

ATTRACTIVE WITH-PROFIT POLICIES

I think that the Society's with-profit policies will stand comparison with those of any other office. This is particularly true when the strength of the Society as disclosed by the triennial investigation is borne in mind. We look to our new business getting staff and to our agents to secure an ever growing amount of with-profit life assurance business.

I would remind you of what I said last year, namely, that just as the expenses of the Society are increasing owing to the need for paying salaries in accordance with modern conditions, so should the man or woman requiring life assurance insure for a larger sum assured. As this happens the old relationships between sums assured, annuities, and premiums, on the one hand, and expenses on the other hand will tend to be restored.

The success of the Society's "Capital Annuity" Scheme continues and the Staff Pension Schemes department is now a well established part of our organisation.

The Chairman closed by referring to the coming departure of Mr. Haynes, to Mr. Whyte's coming election to the Board, and by expressing his thanks to the staff.

THE HALIFAX BUILDING SOCIETY

MR ALGERNON DENHAM'S REVIEW

The ninety-fourth annual general meeting of this society was held, on the 31st ultimo, in Halifax, Mr Algernon Denham, J.P., presiding.

The chairman, in the course of his speech, said:—The balance sheet as at January 31st, discloses assets totalling £136,897,007—an increase of £1,411,094 over the previous record year.

The apportionment of assets shows that 65.9 per cent. represented loans on mortgage, 30.6 per cent. represented investments in Government issues and with local authorities, the balance of 3.4 per cent. being cash in hand and office premises.

On the liabilities side, the amounts due to shareholders and depositors have increased by £1,002,141 to £128,735,955.

STRONG POSITION

Reserves and carry forward, after allocations to which I will refer later, have increased from £6,835,321 to £7,064,423, the addition of £229,102 representing a further strengthening of your society's financial position as a result of the year's operations.

The amount loaned on mortgage establishes a record in the history of the society.

Management expenses are again higher at £789,608 compared with £615,710—an increase of £173,898. The substantial increase this year is due mainly to the return of our staff from the Forces.

You will note that we have placed £50,000 to taxation reserve and once more set aside the sum of £50,000 for depreciation on premises—a prudent course which I know you will approve.

Having regard to the reduced yield from investments of the staff superannuation fund, £100,000 has been allocated to the fund as an addition to the normal annual grant.

I ask your approval of the allocation of a bonus of 5s. 0d. per cent. to the paid-up shareholders, class 1, and to the monthly investing shareholders amounting to £53,654.

HOUSING AND INCREASED COSTS

Among the many disappointments suffered by the nation during the last year, none has been more severe than the failure to produce permanent houses in reasonable numbers. I have never felt any doubts about houses being eventually so provided, but I would again call attention to the continuing rise in costs, which is now much nearer 200 per cent. over pre-war than something less than 50 per cent. prophesied in 1945.

To have in front of us a programme of erecting millions of Government sponsored houses at the prevailing price of approximately £1,500 per house, is almost too fantastic to need comment. I am indeed sorry to say that in the building trades it is beyond dispute that there is organised restriction of output—an exploiting of the needs of the people for which there can be no excuse. The sooner costs and wages are strictly related to output the better it will be for the nation as a whole.

I have still an abiding faith in the ultimate common sense of the British people, but to bring about the state of affairs all would like to see, recriminations, excuses, wishful thinking and platitudes must be replaced and superseded by resolute action and a very real determination on the part of all to face up to unpleasant facts.

Inflationary tendencies can only be arrested by balancing our Budget, paying our way and relating wages to output, which at once would reduce prices and increase the supply of consumer goods. In other words, the alternatives before the nation are greater production and reduced costs or a lower standard of life.

ABBEY NATIONAL BUILDING SOCIETY

ALL ROUND PROGRESS

SIR HAROLD BELLMAN'S REVIEW

The Annual Meeting of the Abbey National Building Society was held at the Wigmore Hall, Wigmore Street, W.1 on the 28th ultimo. Sir Harold Bellman, D.L., J.P., LL.D., Chairman of the Society, presided and in the course of moving the adoption of the Report and Accounts said:

The Society during 1946 showed a considerable measure of progress all round. This will be sufficiently evident from a perusal of our accounts.

BALANCE SHEET ITEMS

The Balance Sheet shows an expansion in total assets from £80,026,000 in 1945 to £83,981,000 in 1946. Our mortgage asset has increased from £56,916,000 to £60,221,000. The Society's financial position remains very liquid. Our investments, together with cash at bank and in hand, total £22,948,000, as compared with £22,289,000. In particular, it is satisfactory to note that the market value of our investments at December 31, 1946, showed noteworthy appreciation when compared with the value in the Society's books. On the other side of the balance sheet, perhaps I need only refer to the combined total of the reserve funds and the balance carried forward, which has increased to £5,856,000, as against £5,583,000, in 1945.

ADVANCES

Our principal activity is best reflected in the amount advanced, which last year reached no less than £14,042,000, which shows more than a three-fold increase, as compared with 1945. This is indeed a gratifying figure and is an earnest of the degree of assistance which a Society of our magnitude can render in furthering home ownership, once freer opportunities exist. As it is, however, it may be considered sufficiently satisfactory. I need hardly add, perhaps, that the volume of mortgage business could have been appreciably increased had the Society not adhered to a policy of prudent discrimination in selecting from the business offered.

It is significant that the average amount outstanding in connection with all the Society's advances amounts only to £480. During the past year the Society continued to charge 4 per cent. as its rate for ordinary advances, while paying 2½ per cent., income tax borne by the Society, on shares, with 1½ per cent., again with income tax borne by the Society, on deposits.

THRIFT AN URGENT NECESSITY

We should all realise now, in the light of the most recent events, the nature of the economic problem which confronts us as a nation. It is evident that a great deal of reconstruction is imperative if we are to maintain a tolerable, not to mention an improved, standard of living. This will necessarily entail the expenditure of vast capital sums, which over the next ten years are being currently estimated at certainly not less than £10,000 million. This money must be found, and it must come from saving of one kind or another. No honest analysis of the existing situation can promise that all this money will actually be forthcoming on the basis of present trends. In coming on the basis of present trends, these circumstances, a new emphasis is placed on the value of individual thrift. This also is closely linked to the need for incentives. In other words, there must first be the capacity to save, and then the disposition to save.

It is clear that a building society is in a unique position to render outstanding service in this matter. It is the focal point at which two of the great needs of our day meet; thus, on the one hand, it promotes

saving, while on the other it utilises those savings in promoting the building of homes for personal ownership, which accounts for one of the important items in the programme of reconstruction which the nation will have to undertake. In these circumstances a building society clearly has a redoubled justification in the economic conditions which the country is now entering.

THE NEW TOWN AND COUNTRY PLANNING BILL

The new Town and Country Planning Bill, is the most fundamental measure of planning so far produced by any of our Governments. The necessity for a framework of this kind can hardly be gainsaid. There will, however, be much less agreement regarding the details of the Bill.

In this Bill there should be two predominant considerations: first, to give it an ethical basis, in view of its exceptional range and importance for the future, which places it beyond legitimate criticism; and secondly, to infuse an administrative flexibility to secure the generally agreed objectives of planning without undue detriment to the satisfaction of the urgent housing needs of the day.

THE FUTURE

The Abbey National Building Society will be ready, with other units of the movement, to take its place in the great work which we hope the future will provide. We claim to offer a nation-wide mortgage service, and this is indeed true. We are steadily expanding our network of branch offices, apart from other offices, and during the past year have opened, in fact, no fewer than 21 new branch offices. At the same time we are sparing no pains to provide a mortgage service which bears the hall-marks of economy, efficiency and simplicity.

Mr Stanley C. Ramsey, F.R.I.B.A., deputy chairman of the Society, in the course of seconding the adoption of the report and accounts, said:

Whatever form of State direction and control obtains here, there must be within the framework of such direction and control the fullest opportunity for initiative and enterprise. The building societies are apt illustrations of this argument. Their activities are controlled by Acts of Parliament and by rules binding both members and directors. These rules have to be framed to the approval of a Government official—namely, the Chief Registrar of Friendly Societies; the balance sheets must be in the form prescribed by Parliament. The Chief Registrar keeps a watchful eye over the activities of the societies, but if his surveillance is strict, it is also friendly and the whole framework of the machinery, including his direction, is such that it does allow of the maximum of initiative on the part of individual societies. In saying this, I would ask you to believe that I am not speaking with undue complacency, but in all modesty, fully aware, as are the majority of those concerned with the direction of building societies, how useful constructive criticism can be.

BUILDING SOCIETIES IN NATION'S FUTURE

What part the building societies will play in the national life of the future, I cannot pretend to say, but that they will have a very important part is my earnest and constant belief. Their primary object is to encourage home ownership and thrift. Now, unfortunately, at the present time comparatively few new homes are being built, and those which are, are for the lower-paid workers who require houses to rent. The problem of producing an ample number of houses in the immediate future is a very complex one.

The provision of houses cannot be regarded as an isolated operation; it is an integral part of the whole economic structure. It has been said that "the English always do the right thing in the end; unfortunately they try all the wrong ways first." I believe that we shall in the end surmount all our difficulties in a manner that will confute both our doubting friends and our scornful enemies.

The report and accounts were adopted.

The Society's auditors, Mr Harold Lake-man, F.C.A., Lt.-Col. W. C. Smith, D.S.O., M.C., F.C.A., and Mr H. P. Walters, F.C.A., were re-elected. The chairman announced that Messrs William Cash, Junr., M.A., Arthur Collins, F.S.A.A., and Herbert N. E. West were duly re-elected to the board.

Mr R. Bruce Wycherley, M.C., F.C.I.S., joint managing director, speaking on behalf of the directors re-elected to the board, expressed their appreciation of the further opportunity to serve the Society. The Abbey National, refusing to be daunted by difficulties or disenchantments, would continue to pursue its chosen path, confident of the worthwhileness of its work and of its own inherent strength.

THE NATIONAL MUTUAL LIFE ASSURANCE SOCIETY

MR KENNETH A. E. MOORE'S REVIEW

The one hundred and seventeenth annual general meeting of The National Mutual Life Assurance Society, was held, on the 26th ultimo, in London, Mr Kenneth A. E. Moore, F.C.A. (the chairman), presiding.

The chairman, in his speech to the members, reviewed the results shown by the Society's first post-war actuarial stocktaking covering the three years 1944, 1945 and 1946.

After strengthening the valuation basis to accord with current and prospective interest rates, a surplus of total assets over liabilities of nearly two million pounds is disclosed, which is represented in the accounts by a reserve fund of £1,420,000, a carry forward of £130,000 and a distribution of substantial bonuses costing £410,000.

RATE OF INTEREST IMPROVED

The balance sheet reveals certain major movements in the Society's investments. There has been a reduction in the holdings of British Government securities by about £1,000,000, while increases are shown under the heads of debentures (near £500,000), preference and guaranteed stocks (£670,000), ordinary stocks and shares (£500,000). This has had the effect of improving the rate of interest earned on the invested funds.

The Society's new business for 1946 was almost double that for the previous year, while the mortality experience continues to be better than expected and a mortality profit was shown for the year at a record high level.

Together the valuation report and the accounts for the year 1946 disclose a satisfactory position, and the Society's affairs, from a domestic standpoint, are in excellent shape.

DANGER OF INFLATION

Mr Moore went on to say that, although the Society's domestic affairs are in such good shape, there are matters outside the directors' control which are justifiably causing great misgiving. The process of monetary inflation which has been in evidence in recent years and the risk of its gathering pace are causing concern. If the purchasing power of the people's savings, be they represented by National Savings Certificates, Government or other fixed interest securities, pension funds, life assurance policies, trade union funds, bank deposits and the rest, is allowed to dwindle in the months and years to come through Government action or inaction, then the Government of the day, whatever its political shade, will be guilty of the most heartless swindle in the history of mankind.

BRITISH POWER AND LIGHT CORPORATION, LIMITED

REVENUE MORE THAN MAINTAINED

The eighteenth ordinary general meeting of this company was held, on the 27th ultimo, in London, Air-Commodore C. E. Benson, C.B.E., D.S.O. (chairman of the company), presiding.

The following is an extract from the chairman's statement circulated with the report and accounts.

Last year was a period of transition from war-time to peace-time conditions, and it is satisfactory that, as shown by the consolidated profit and loss account, our revenue from sale of energy was more than maintained. In spite of a small increase in revenue our cost of energy decreased by approximately £40,000, due partly to improved water conditions at our Dolgarrog generating station and partly to an improvement in the bulk supply costs of one of the larger of our subsidiary companies. The result is an increase in gross profit of £64,785.

EFFECT OF GOVERNMENT ACTION

After adding sundry receipts, which have increased from £44,752 to £103,917, and deducting reserves for depreciation, the trading profit is £519,272 compared with £482,069 for the previous year. Provision for taxation is £254,884 against £273,082, due to the reduction in the rate of excess profits tax, and the result is that the net balance after payment of preference dividends is some £55,500 higher at £181,275.

This increase in the net balance is not reflected in the corporation's own profit and loss account since, although it is not yet on the Statute Book, we are precluded by the retroactive terms of the Electricity Bill, recently published, from drawing, from those of our subsidiary companies whose profits have increased, dividends at rates higher than those which were paid for 1945.

With regard to the corporation's own accounts, I think that the only item which calls for comment is the reduction of some £15,400 in interest dividends and sundry receipts due to the fact that the profits of two of our subsidiary companies were slightly lower than in the previous year. The net profit for the year, after provision for taxation, is £154,111, against £163,203, of which preference dividends, less tax, take £47,100, and interim ordinary dividend £33,495. It is proposed to pay a final dividend on the ordinary stock of 5 per cent., maintaining the total dividend at 8 per cent., leaving £17,691 to be added to the amount carried forward.

I have already referred to the fact that the rate at which we were able to proceed with the normal development of our undertakings during the past year fell far short of that of pre-war years, as is the case with all undertakers in the industry, owing to shortage of materials. In the areas served by our subsidiary companies we estimate that it will be necessary to expend something like £3,000,000 in order to bring our normal development up to date.

THE ELECTRICITY BILL

Stockholders will no doubt be familiar generally with the provisions of the Electricity Bill which was issued in January and which sets out the Government's intentions with regard to the nationalisation of the electricity supply industry. The proposals include the taking over by the Electricity Authority, to be set up under the Bill, of certain holding companies, of which your corporation is one, and the setting up of area boards for the local administration of the industry, and although the vesting-date has not been fixed, I regret that it may well

be that this is the last occasion on which ELLI shall meet at an ordinary general meeting.

It appears that the amount of British Electricity stock which will be issued in exchange for the stocks of this corporation will be for each £1 unit of ordinary stock 37s. 10d., of 6 per cent. preference stock 29s. 10d., and of 4½ per cent. preference stock 24s. On the assumption that the British Electricity stock will carry interest at the rate of 2½ per cent. per annum those figures indicate a considerable reduction in income for our stockholders. Criticisms have been made from time to time by Government spokesmen of the large profits made by electricity supply companies. In this connection it is interesting to note that the average dividend paid on the ordinary stock of this corporation since its inception has been rather less than 5½ per cent. per annum on the issue price.

RURAL DEVELOPMENT

During the years from 1930 to 1939, when we were free to develop our undertakings, our subsidiary companies expended over £2,300,000 on capital works, this being spent in the development of predominantly rural areas, and in so doing performed a very real public service. There is to-day an insistent demand for electricity in rural areas. It must be remembered, however, that the attitude towards supplies of electricity in these areas has changed considerably during the last eight years, stimulated, I believe, by the shortage throughout the country of hard fuel for domestic purposes.

Unfortunately this demand has arisen at a time when the provision of supplies is fraught with difficulties. I have already referred to the shortage of materials for construction work, but in addition to that there is the fact that war production was given priority over the manufacture of generating plant. While this was undoubtedly the correct policy at the time, it has resulted in a serious shortage of plant capacity and it will be some years before the plant available will be sufficient to supply all the electricity required. Glowing accounts have been given of the benefits to be derived from the nationalisation of the electricity supply industry, but nothing has been said which would indicate that electricity will be more abundant or cheaper in price or that the staff and workpeople will enjoy any better conditions than those under which they are working at present.

THE RECENT COAL CRISIS

The country generally has recently been passing through a crisis involving severe cuts in electricity supplies due to the shortage of coal at the generating stations. As stockholders will remember, North Wales Power Company has expended a considerable amount of time and money in the investigation of the possibility of developing further the water-power resources in North Wales for the generation of electricity, and caused a report thereon to be prepared by two eminent engineers.

It is a great disappointment to your directors to have to report that the amount of thought and labour expended in this connection, not only by the engineers who prepared the report but also by the company's own staff, have so far borne no results, as it is felt that the shortage of coal supplies makes it more than ever essential that the fullest possible use should be made of the water-power resources of the country, as is being done in Scotland under the Scottish Hydro-Electric Board.

The report was adopted.

CO-OPERATIVE PERMANENT BUILDING SOCIETY

DR MANSBRIDGE'S ADDRESS

The sixty-third annual meeting of the Co-operative Permanent Building Society was held in London on the 29th ultimo.

The president, Dr Mansbridge, in the course of his speech said:—

At the close of the sixty-third year of the society it stands in a position of strength unparalleled in its history.

During the year its mortgage assets increased by four and a-half million pounds and its shares and deposits by two millions. This speaks for itself, in a time of national difficulty and perplexity concerning housing.

The spirit of the society expresses itself in social purpose. The housing of the people is its concern. It is keen to assist individuals. Although it must have adequate reserves, now approaching two million pounds, yet it is not out to make excessive profits. It has, for example, over a period of years allowed rebates on mortgage interest amounting to over a million pounds. In its close alliance with the Co-operative movement, the society expects to extend its beneficent power in years to come.

LOW INTEREST RATES

At my time of life I feel the temptation to make a broad survey of social tendencies and, in the light of my experience, to discourse upon the trend of social legislation. I must, however, resist that temptation. But I may at least venture to submit three general observations. The first is that I rejoice in the effort of the Government to maintain interest rates as low as is humanly possible. It is our endeavour to make conditions for our borrowers as easy as possible. Those conditions are determined, in the last resort, by the rate of interest that the Government is able to maintain. I therefore wish the Government all success in its present endeavour.

My second observation is that it is the duty of the building society movement to co-operate to the fullest possible extent with the Government in its effort to build new houses as quickly as possible.

NEED FOR BUILDING SOCIETIES

My final observation is that the need for building societies will continue so long as the desire for home ownership remains and the opportunity to build urgently needed houses exists.

Some voluntary social institutions work for their own extinction; they engage in pioneer work and draw attention to needs that are eventually met by state action. But I do not regard the Building Society movement as self-extinguishing in that way; for as long in the future as we need to contemplate, and for as long as the desire for home ownership remains in the heart of the people, there will be need for the movement of which we form part.

Building societies have a greater housing potential to-day than at any time in their history. The society is doing all that it can to help.

It has given support to housing societies, which were given statutory recognition in the Housing Act, 1936, and have been commended by the Minister of Health in so far as they work in co-operation with local authorities. Co-operative housing societies have been and are being formed, but the progress of their work has been slow; 1947 should see a forward move.

CURRENT ADVANCES

We can take pride in the fact that at the present time roughly one-fifth of our business is in relationship to newly constructed houses built at controlled prices.

Interest rates, both on investments and loans, are considered carefully with regularity. So far we have led the way in the movement by making rates more equitable.

The report and accounts were adopted.

BRITANNIC ASSURANCE COMPANY, LIMITED

TOTAL INCOME OVER £10,000,000

LARGER ALLOCATIONS TO POLICYHOLDERS

Mr J. A. Jefferson, F.I.A., presiding at the 81st ordinary general meeting, said:—

Several factors have contributed to the year's excellent results, among them being the return of our Servicemen, the return to civilian life of so many men who had not for some years had an opportunity of effecting any life assurance, the larger volume of money in circulation, and a growing desire for life assurance.

The total income increased by £657,000 to £10,126,000. The funds amounted to £53,751,000—an increase of £3,680,000, and the claims paid in the year amounted to £3,629,000, bringing the total paid since the formation of the company to £75,000,000.

ORDINARY BRANCH

The new business at £6,908,000 was almost double that completed in 1945, and the average sum assured per policy was £327, against £214 in the last pre-war year. The annual premium income increased by £246,000 to £2,455,000. The fund amounted to £18,948,000—an increase of £1,448,000, and the net rate of interest earned has slightly increased to £3 4s. 10d. per cent. Death claims at £255,000 were a little less than in 1945, and payments under maturing policies were £796,000. The expense ratio at 12½ per cent., although showing an increase of just over 2 per cent., is still very moderate. The rise in the ratio was due to the record volume of new business.

INDUSTRIAL BRANCH

The premium income amounted to £5,559,000, being £225,000 greater than in 1945. The fund at the end of the year amounted to £29,531,000—an increase of £1,972,000. The net rate of interest earned was £3 19s. 0d. per cent., which was 5s. 6d. per cent. in excess of the rate earned in 1945. The main factors contributing to this increase were a rise of 1s. 10d. per cent. in the gross rate of interest, and a reduction in the standard rate of tax.

Death claims totalled £1,389,000. Maturing Endowment Assurance claims amounted to £1,187,000, the increase of £141,000 reflecting the growing popularity of this type of business.

The expense ratio was 27.69 per cent.—an increase of 2.10 per cent. The increase was not unexpected and reflected the record amount of new business. Our present rate shows that the business is conducted cheaply and efficiently; on only two occasions have we achieved a lower figure.

THE ASSETS

Towards the end of last year, we considerably slowed down our investing as it seemed to us that the artificial stimulation of cheap money had created an inflationary condition, out of gear with the country's present level of production. Cheap money pushed to excess means valueless money. The credit of a nation is not to be measured solely by the rate of interest it has to pay on its internal loans, but in the final result by the productivity of its soil and hands and brains. Too high taxation with too low interest has brought us perilously near the point at which spending is more attractive to the individual than saving. Add to this a shortage of consumer goods, and at once you have a vicious condition of inflation, with "too much money chasing too few goods."

BRITISH ALUMINIUM COMPANY LIMITED

SATISFACTORY RESULTS

At the annual general meeting of The British Aluminium Company, Limited, held, on the 28th ultimo, the chairman, Mr R. W. Cooper, M.C., said that the profit for the year was £1,368,095, which was more satisfactory than the previous year. Production at their Alumina Works was at 60 per cent. of maximum capacity. In effecting economies they had unfortunately had to close down their works in Northern Ireland after fifty years of operation. All three Reduction Works in Scotland had operated at full output and the company's total production in this country passed the half million ton mark during the year. At their three rolling mills a record output was obtained and their output of semi-fabricated material was almost four times greater than in 1938.

The company had purchased from the Government certain plant at the Warrington and Milton mills as well as the new rolling mill at Falkirk, an acquisition that would make them well placed to meet demand and competition. Works purchased at Latchford, Warrington, were designed for the remelting of scrap and blowing of aluminium powder. The company and its subsidiaries now employed over 10,000 people in this country.

EXPANSION OF EXPORTS

Export business had continued to expand during the year; but this did not constitute a large proportion of their total because supplies of semi-fabricated material to makers of finished products formed the main part of their material which found its way abroad, exported by manufacturers rather than by themselves direct.

The Government was still the sole purchaser and seller of virgin aluminium ingot and the company's position was causing grave concern. It had been reported in the Press that the Government was able to reduce the price of aluminium owing to a very large and favourable contract made with Canada. The price paid to their company had been in excess of that paid to Canada, whose costs of production were well below any other country in the world for a number of reasons, not the least of which was power cost. The Government seemed to regard the price obtainable in that market as a yardstick and to ignore the fact that costs of production in this country are at least as low as anywhere in the world outside North America.

MODERNISATION AND RE-EQUIPMENT

Stockholders would agree that they must face the risk of heavy capital expenditure on modernisation and re-equipment. British industry must remain virile if it was to survive. The position of their French and Norwegian assets was still obscure. They had a scheme for special production in Norway which would greatly benefit the fabricating industry in this country; but, although, owing to lack of power it was impossible to carry out the process in England they had been refused a licence to send £70,000 to Norway for this purpose.

Turning to the balance sheet, the principal difference was the increase in fixed assets from £4,996,693 to £6,127,751, towards which a refund of £341,946 E.P.T. contributed. The sum of £200,000 to general reserve as compared with £125,000 last year was advisable in view of considerable deferred repairs, and £140,000 was allocated to depreciation as compared with £75,000. A final dividend of 8 per cent. on the ordinary stock made 10 per cent. for the year, leaving the accumulated balance to credit of profit and loss at £308,361.

The report was adopted.

ENGLISH ELECTRIC COMPANY, LIMITED

EXPANSION POLICY

Sir George H. Nelson (the chairman), presiding at the twenty-eighth annual general meeting held, on the 27th ultimo, said that through the purchase of the share capital of Marconi's Wireless Telegraph Company, Limited, the E.E. Co.'s activity and facilities had been considerably extended by embracing that branch of the electrical industry known as the micro current field. With regard to the present economic state of the country, no one could read the recent Government White Paper without feeling the immense responsibility imposed on the Government, industry and the community. It established the facts that we were dangerously impoverished and faced with a lower standard of living, unless by enterprise and hard work, efficiently directed, we could create a new wealth and fresh resources. Important Works' extensions had been commenced, but despite special efforts by the company to obtain labour, the disappointing result was that the last twelve months had produced 300 men only, whereas several thousands were needed to increase the output of heavy machinery. The engineering industry had introduced the 44-hours week in the faith and promise that the work people would produce as much in that time as in a 47½-hours week. In the light of the present shortage of labour, the proposal to work a double day in two 37½-hours shifts was deplored. What was needed, for the next 2 years at least, was a full 44-hours for each shift with no absenteeism, with as many additional hours as could be reasonably arranged.

The Report was adopted and the final dividend of 6 per cent. (making 10 per cent. for the year) declared on the Ordinary stock.

BOVRIL, LIMITED

SATISFACTORY RESULTS

The fiftieth annual general meeting of Bovril Limited, was held, in London, on the 24th instant. The following is an extract of the statement by Lord Luke (chairman) circulated with the report and accounts:—

I propose this year to present the chairman's statement in a rather different manner, which I hope will be acceptable and of some assistance to shareholders.

The accounts before you are generally satisfactory. Net profit is £573,919 (£641,007), taxation absorbs £350,000 (£448,750), leaving a balance of £223,919 (£192,257).

Your directors recommend the same final dividend on the deferred stock of 7½ per cent., making 10 per cent. for the year 1946, and a bonus of 2½ per cent.

Bovril sales have kept pace with production and have not been affected by the unfortunate but necessary raising of prices, which was caused by the continually rising cost of production and in particular the cost of raw materials.

We have been more fortunate than some concerns in that our war and peace-time production has been the same—apart from the extra work we did for Government Departments.

Therefore, our transition has been easy and we are making the most of our time and energy to keep pace with demand.

We hope that costs have reached the top of their spiral, for it ought not to have escaped any thoughtful person's notice that in present circumstances this can only lead to further inflation.

Bovril, in spite of the recent price increase, is still a good and cheap alternative to beef, quite apart from its health-giving qualities. Public opinion has testified to this by its continued demand.

MARCONI'S WIRELESS TELEGRAPH COMPANY, LIMITED

MANY IMPROVEMENTS

The forty-ninth ordinary general meeting of Marconi's Wireless Telegraph Company, Limited, was held, on the 27th ultimo, in London.

Sir George H. Nelson, F.C.G.I., M.I.Mech.E., M.I.E.E., the chairman, in the course of his speech said: This is the first opportunity I have had of addressing you as chairman of the company. In August, 1946, the English Electric Company purchased from Cable and Wireless (Holding), Limited, their share holding in your company, and the board was reconstituted so as to ensure the maximum of co-operation and mutual support between this company and the other members of the English Electric Group.

It is satisfactory to report that 60 per cent. in value of our orders during the year has been for export. In the Marine field we have marketed a completely new range of transmitters and are already supplying these sets in large numbers to the Marconi International Marine Company and foreign customers for the re-equipment of merchant ships. Our marine radar, which will give a performance fully in keeping with the high standard expected of the name "Marconi," has undergone most successful trials and will shortly be coming into production. Our company continues to play a prominent part in the application of radio to aviation.

In the broadcasting field many detailed improvements have been made in our standard equipments, and we have recently been entrusted by the B.B.C. with their order for the first high-power Frequency Modulated Broadcast Transmitter to be established in this country.

The report was adopted.

MARCONI INTERNATIONAL MARINE COMMUNICATION COMPANY, LIMITED

VALUABLE NEW EQUIPMENT

The forty-seventh ordinary general meeting of this company, was held on the 27th ultimo, in London.

Sir George H. Nelson, F.C.G.I., M.I.Mech.E., M.I.E.E., the chairman, in the course of his speech, said: With the enormous war-time advances at the disposal of our technical staff a completely new range of Marine Radio Communication and Navigational Aids equipment have been designed, and these equipments are now being fitted as quickly as possible to fulfil the very large number of contracts we have received during the past year.

The Direction Finder is a particularly valuable Navigational Aid to seafarers, for not only does it enable the Navigating Officer himself to plot his position wherever he may be sailing but it also enables him to locate the position of any vessel in difficulty which is able to send out a distress signal.

For some time past we have had our latest experimental Marine Radar Equipment on one of the regular cross-Channel steamers, and by the courtesy and kindness of the owners we have been able to carry out extensive and far-reaching tests. The apparatus is now giving first-class results. It is simple in character, easy to handle, and gives the Master or Navigating Officer of the vessel a true picture of any objects upon the sea and the approaching coast line.

Our sea-going staff has returned to peace-time conditions, and is providing a Communications service for ships' personnel and passengers which is second to none with the modern and super-efficient apparatus with which so many vessels have been fitted by your company.

The report was adopted.

METROPOLITAN ELECTRIC SUPPLY COMPANY, LIMITED

NATIONALISATION A RISK

The sixtieth ordinary general meeting of this company was held, on the 1st instant, in London.

Major H. Richardson, M.C., T.D., J.P., M.I.E.E., chairman and managing director, said that the year under review was the first full year's trading since the cessation of hostilities and he thought it would be agreed that the results were satisfactory. The total units supplied to their customers and to those of their subsidiary companies amounted to 590 millions, to which must be added a further 230 millions supplied to other undertakings, an increase of 86 millions. The substantial progress made in the London areas had enabled them to give some alleviation of the unavoidable increases in charges made during the war.

The balance on revenue account had increased by £159,770 compared with 1945 and amounted to £828,682. The directors recommended a final dividend of 6 per cent. on the ordinary stock, making 9 per cent., less tax, for the year.

With regard to the Government's intentions, in view of the great problems which beset them and the solution of which were so vital to the economic recovery of the country, it was indeed difficult to understand why any Government should at such a time risk experimenting on an industry which was part of the very foundation of the industrial life of the nation, an industry which had amply demonstrated its efficiency and reliability.

He was convinced that the proposed form of national management could only result in the elimination of reasonably healthy competition, initiative and incentive.

The report was adopted.

BRITISH ROPES, LIMITED

INCREASED DIVIDEND

The annual general meeting of British Ropes, Limited, was held, on the 2nd instant, in London.

Mr Herbert Smith (chairman and managing director), in the course of his speech, said: The reconstruction of plant and machinery is being pressed forward with great diligence, but the progress we would wish has not been made; the universal shortage of materials, the vexatious controls which damp down enthusiastic work, appear to increase rather than to diminish. Large scale schemes for future development are in hand, especially in regard to the quality of our products, which schemes are being held back owing to the difficulty of obtaining the means of production.

The year's trading could have been better if more materials had been available. Labour shortage and difficulties have been continuous, but increased mechanical efficiency has maintained output, and, moreover, the company's three main products are essential requirements for the maintenance of industry.

Your directors have pursued a consistent policy during the years that have elapsed since the drastic reconstruction of the company in 1934, the main purpose being to strengthen and consolidate the financial structure of your company. The small increase in the trading profit before providing for income tax to £494,025, as compared with £461,506 for the previous year, is mainly accounted for by the increase for the year in the E.P.T. standard profit.

The directors recommend the payment of a final dividend of 15 per cent., less tax, on the issued ordinary stock, making with the interim dividend a total distribution for the year of 20 per cent., less tax, compared with a total dividend last year of 17½ per cent., less tax.

The report was adopted.

GOVERNMENT RETURNS

The full returns for the year's figures are given in this week's issue of "Records and Statistics."

For the nine days ended Mar. 31, 1947, total ordinary revenue was £121,047,335 against ordinary expenditure of £230,997,564, and issues to sinking funds £37,557. Thus, including sinking fund allocations of £17,040,754, the deficit accrued since April 1st is £586,163,351 against £2,206,826,000 for the corresponding period a year ago.

shattered such hopes. So far, Mr Marshall had been an unknown quantity; his brief was known, but not his method of advocacy. It suddenly became clear that the American line was to be the tough line—that the Americans would publicly raise their grievances about Soviet policy in the Middle East, Eastern Europe, even the Far East, and conduct a public campaign to rally Congress behind a thrustful foreign policy. Since then Mr Truman has rubbed salt in the wounds by reaffirming Jefferson's oath:

I have sworn eternal hostility against every form of tyranny over the mind of man, which is tantamount to a declaration of ideological warfare.

Whatever the eventual outcome, there would be no immediate Soviet retreat. So, during the critical phases of the Moscow meetings, Soviet statesmen remained silent.

In this situation Mr Bevin could do little more in Moscow than sit and watch. The manner and timing of the Truman declaration were decided without consultation with London; any British mediation or counsel could only complicate the arguments in Congress about the loans to Greece and Turkey, which Mr Bevin wants as much as Mr Marshall. The debate on Germany, in which Britain has a more vital interest than the United States, became unreal.

Is it then fair to say that Mr Bevin has failed in any important respect? Clearly it is not. Before he left for Moscow he pledged himself in the House of Commons to accept nothing that would increase the burden on the British taxpayer arising out of the occupation of Germany. Having given that pledge he could not yield an inch to the Soviet claims for ten billion dollars in reparations from the German production that is being stimulated to provide exports. For it is not just a question of saving or spending money; it is a question whether the interest of a particular nation or the

general welfare of Europe comes first. Mr Marshall stated the principle clearly in his speech on the Polish frontier question:

The final action should be in the interest of Europe as a whole. Let us start to apply the conception that European matters that are of general concern should be dealt with in the general interest. We at this table have a duty to try and rebuild a Europe better than it replaces.

If Soviet Ministers were not so inept in some of their arguments one might hope that Mr Molotov would reply that the reconstruction of the Soviet economy is an interest of Europe as a whole. If he could say such a thing and demonstrate that his policy in eastern Europe aims at something more than the creation of a strong, self-sufficient Soviet-dominated bloc then the arguments now being used against the Truman doctrine by Mr Wallace and others would begin to carry weight. But on present information there is no sign that this is the Soviet policy.

Mr Bevin's support of the tough line is therefore to be applauded—but with a vital qualification, which cannot be repeated too often: the object of the tough line must be to attain general agreement, in the first place between the United States and the Soviet Union, in the second place between Britain and the Soviet Union. If it cannot be found in Germany it must be sought elsewhere, either in the political or the economic sphere. In both spheres the initiative lies almost entirely with the Americans. So long as the Truman doctrine can be regarded as the starting point for an eventual understanding between the Russians and the Americans, it should have British support. But if it is to lead to a kind of indefinite phoney war with dollars and words, then Mr Bevin, with the British people deeply divided, will have to find a way to security and prosperity within the Empire and Western Europe.

The Road to Paris

ECHOES of the Truman doctrine have been rumbling across France in the last ten days, from Bruneval on the Channel to Strasbourg on the Rhine. The French Right has taken up its challenge to Communism and General de Gaulle has come out of retirement to stump the country. He has started on a journey which will take him via Marseilles, Bordeaux and Rouen to Paris. By the time he reaches the capital—probably on June 18—his opponents should be in full cry, too; and there may well come out of France a confused noise of challenges and counter-challenges which will do nothing to improve and much to damage international and national relations between Right and Left.

The General is in Fighting French form: that is to say his mood is intensely nationalist, impatient, uncompromising and emotional. He made last Sunday in Strasbourg a speech that would have gone down equally well in Metz; a speech which must have stirred in many hearers memories of the ardent and romantic traditionalism with which Frenchmen have written and spoken about the border provinces of Alsace and Lorraine. He asked for a coalition (*rassemblement*) of the French people and a government which could rebuild a State "capable of leading France with impartiality, authority and continuity." He denounced the paralysis of the machinery of government and laid the blame on the "disturbing and exceptional ambitions, tactics and methods" of the Communists. These, he argued, had forced other parties to similar behaviour, and the suspicion rife between them had made it necessary to divide the reins of government. With its new constitution, which he had already denounced last year, the Fourth Republic was in danger of dictatorship by a party. He implied, but did not say, that personal leadership could alone guide France firmly towards

a future of prosperity, strength and independence, and give the Republic "efficiency, harmony and liberty."

The question is, of course, how all this is to be brought about. Will the General form a new party? If he does, it might well have no representatives in the Assembly until 1951. If he does not, how is he to campaign and work against the Constitution "within the framework of the laws," as he promised? Will he try to rally all deputies from the Centre to the Right behind him? If he does, down comes M. Ramadier's government and the policy of co-operation with and appeasement of the Communists, hitherto pursued by the Popular Republicans and the Socialists, collapses. And if that happens, what is to prevent M. Thorez and his colleagues from wielding their dreaded weapon of the general strike and non-cooperation by the workers? At that point the shadow of civil war must appear. Is General de Gaulle ready even for that? If so, he should think of the probable consequences for Europe: the inevitable partisanship of America for the Right and the divided sympathies all over Europe, greatest of all in Britain. He should think, too, of the inevitable collapse of those hopes of co-operation between employers and workers on which the Monnet Plan of reconstruction is founded, bringing with it an end to all chances of beating Germany in the race for industrial recovery.

It is not unfair to ask whether the General in his present mood has thought of these things; for when his temper is roused he puts blinkers to his eyes and refuses to see the wider consequences of his actions. Some of those listening to him at Strasbourg last Sunday must have recalled how he refused to sacrifice the city in January, 1945, so that the greatest possible Allied strength could be thrown against Hitler's offen-

sive in the Ardennes. As it turned out, he was right; but his attitude was not dictated by a military judgment that the Germans would fail in the Ardennes, but by a determination that they should not succeed in Alsace. He might have been wrong. Foresight in the General cannot be taken for granted. He sometimes recalls that other soldier, President of the French Republic seventy years ago, who in May, 1877, refused to resign when the Deputies voted in favour of parliamentary government, and about whom the text-books say: "McMahon was a fine, tall, soldierly man, universally esteemed as generous and honourable; as a politician he was patriotic and well-intentioned, but with no real statecraft."

The next speeches on the road to Paris should throw light on General de Gaulle's tactics. They are unlikely to reveal much more of his programme. What he outlined at Strasbourg on Sunday was a list of aspirations, not an inventory of measures: reform of the constitution which only nine million electors accepted last year; stabilisation of the currency and a reduction of State expenditure—which means a cutting down of "State activities"; increases in production, man-power and coal exports; a return to *laissez faire* in economic life and a new relationship between capital and labour. What he actually said on these last two great themes is worth quotation, for it illustrates vividly the embarrassment which is felt by men of the Right all over Europe when they try to put into words the doctrine with which they hope to challenge Socialism and Communism. He offered as an economic policy

the encouragement and rewarding of the spirit of enterprise, initiative and emulation, and in principle the restoration of a freedom in each branch of economic activity, as soon as a possible balance can be found between supply and demand,

and as a social policy

the dignified and fruitful association of those who put in the common, in the same enterprise, their labour, their technical skill, or their wealth, and who should participate openly and like honest shareholders in the profits and the risks.

There could hardly be a more impeccable statement of sound Catholic doctrine; but it has no relation whatsoever to a France still inflamed by the memories of Vichy and Pétainism, in which Marxism has an intellectual as well as an emotional appeal, and in which Communist-dominated trade unions form an estate all to themselves. It is a policy which might be carried out by a benevolent despot, operating through an enlightened élite; but there are too many Frenchmen who will not take General de Gaulle's benevolence for granted and who regard the French élite as contaminated by the era of Pétain.

Such a statement of policy must provoke the suspicion among their enemies that the Catholic and progressive-conservative MRP (*Mouvement Républicain Populaire*) are behind General de Gaulle in his new campaign. In fact it is unlikely that they are; they have violently disagreed with him in the past and there is little future for them if they show any reactionary tendencies. It is far more likely that his backers lie further still to the Right, and time will doubtless show who they are. His foreign policy alone would divide the MRP from him, at any rate on the basis laid down in the Strasbourg speech, and symbolised by the telegrams sent to President Truman and General Eisenhower. The General asked for French leadership in "so remaking Europe that, besides the two great world Powers of Russia and the United States, there may be an element of balance." He would support any international security organisation, but on condition that France remained faithful to her western traditions. Which means in fact that he would aim, through personal leadership as head of State, at freeing French policy from its present dependence on the French Communist Party, and at forming a western European political and economic association which might keep a balance of power between the United States and the Soviet Union, bound to neither and hostile to neither. That is a not unattractive idea,

which will warm many British hearts otherwise unfriendly to General de Gaulle. Similar things have been said in very high quarters, not only by Mr Churchill. Did not Mr Attlee, for example, say that "Europe must federate or perish"? But the Gaullistes state things rather too crudely and simply; and they have not the excuse which Mr Churchill offers for his indiscretions, that he is an elder statesman. The General and his advisers are younger statesmen—that is half the trouble.

It has, of course, to be remembered that General de Gaulle has been orating, and will probably continue to orate. Orations in France habitually go far beyond the protocol, so that audiences may delight in broad principles and go home with clear propositions and strong emotions to argue about. He is doubtless chiefly concerned to create a mood, to start Frenchmen thinking along new lines, to test the temper of the people. And to do this it is legitimate to recall to the French their periodical strivings to attain unity and order under strong men, the great tradition of authority and central control which runs through their history. For many of the questions now vexing France are old questions, issues of 1789 and 1792, of 1848 and 1870. But there is this difference, that one powerful party—the Communist Party—is believed by its opponents to have ceased thinking as Frenchmen. That is the suspicion which General de Gaulle's speeches are calculated to strengthen, and which has already been heard more clearly in France since President Truman said what he thought of Communism and its activity in liberty-loving countries. Many are afraid to voice the thought because to do so is to bring themselves into strange company, with the Quislings, the Pétains and the Francos. But General de Gaulle is respectable and his flagrant simplifications will probably relieve tensions in many French minds and lead to a clearer-cut division between Left and Right.

From such a process the worst sufferers will be the Socialists, the followers of M. Ramadier and M. Blum, who are keeping the Fourth Republic a going concern and who presumably are the men whom a British Labour Government like to see in charge of French affairs. The Ramadier Government have just survived a crisis by conniving at extraordinary behaviour by their Communist partners in the coalition. They will only survive further crises if they continue to appease the Communists; and they can only do that on the assumption that M. Thorez and his followers want France to become strong, prosperous and contented. That assumption was—and will remain—practically tenable so long as the Communists continue their long-term, moderate policy of cooperation in politics and industry, designed to lead eventually to a peaceful and respectable accession to power. But they will certainly not continue that policy if challenged in the way that General de Gaulle threatens to challenge them.

Clearly the Gaullistes have timed their campaign badly. The Ramadier Government has not had a fair trial; credit has not been given for the remarkable recovery that France has already made; time has not been given for the Monnet plan and financial reforms to be brought into action—or to have decisively failed. True, there has been paralysis of some functions of government; but the causes of this are known and the cure must take time and patience and skill. General de Gaulle seems to fancy himself in the part of the osteopath, who promises a violent, painful but quick manipulation.

It is possible, of course, that on a long view he is right, as he was in January, 1945. But it is no more certain now that he is right than it was then. And if he were right now, it would be, as it was then, by accident. Sooner or later it may be necessary to test to what extent M. Thorez's followers are Frenchmen first and Communists afterwards. The test would be watched with the most intense interest all over Europe. But now is not the time, and General de Gaulle must not be surprised if the Left gains, rather than loses, in the storm that may follow this thunder from the Right.

Food Policy and Subsidies

THE only way by which any substantial reductions in taxation in the forthcoming Budget can be reconciled with a policy in accordance with the economic needs of the country is by reductions in the total of expenditure below the aggregate of the Estimates already published. And the only place in the Estimates where a large reduction could be contemplated is in the food subsidies. The Ministry of Food's trading deficit for the year just ended was originally put at £232 million; it has turned out to be £281 million. The estimate for the coming year is £313 million; what the final figure will be is anyone's guess, but only a confirmed optimist will expect it to be below and not above the estimate. Thus, within a year, the anticipated rate of deficit has increased by £80 million. But these figures do not represent a complete guide to the cost to the taxpayer of supplying the nation's demand for food. The Ministry of Food makes certain direct payments to wholesalers, and the Ministry of Agriculture pays over £15 million a year in acreage payments, which are a direct subsidy to current production. Defined so as to exclude only long-term schemes of agricultural improvement (and it is doubtful if these should, in fact, be excluded), the total cost of food subsidies for the financial year just ended was estimated at £364 million and it would not be far wrong to assume that the cost is now running at an annual rate of £400 million. This is an enormous item of expenditure, whose complete abolition would be the equivalent of a reduction in the standard rate of income-tax of over 3s. in the £.

This is the budgetary argument for reconsidering the food subsidies. But the question can and should also be considered within the framework of food policy. The general arguments for subsidising the cost of food are pungent and familiar. Food is the first necessity of life and a major constituent of the cost of living. It is unthinkable that, so long as there is a serious food shortage combined with the existence of a large reservoir of unexpended purchasing power, food prices should be permitted to skyrocket to the levels they would reach on a free market. Therefore, some measure of control and assistance is unavoidable. The question is how great this should be and how long it should last; and on this issue, considerations of political expediency and of social policy are combining to insist that the retail price of food should permanently be kept at a very low level. On the political side, it is argued that any appreciable increase in food prices would set off a chain of wage demands that would make the net effect on the problem of inflation an adverse one. On the social side, it is urged that the great advance in the nutritional standards of the poor that wartime policy has brought about should be consolidated; and that the provision of cheap food for all should be regarded as a vital social service.

The advocates of a cheap food policy have a powerful case. There can be no doubting the essential rightness and desirability of the social goals which they propound. Indeed, it is possible, in a visionary mood, to go further and envisage a time when the full provision by the state to its citizens of the essential minimum of certain basic foodstuffs will seem no more remarkable than the free provision of the essential minimum of education does today—though, as is shown by the extracts from *The Economist* of 1847 which have recently been appearing, it seemed to be a very shocking idea a hundred years ago. But one of the Labour Party's greatest weaknesses is an insistence on introducing the right idea at the wrong time. All social advances depend upon there being a sufficient national income to provide them. It is too much to expect Britain's distorted, war-shattered, debt-encumbered economy to bear the

strain of implementing every scheme of social amelioration the minute that anyone thinks of it.

The Government's food policy raises two issues—an immediate one, applicable to this year's Budget, and a long-term one. There is an immediate case for pruning the food subsidies fairly drastically in order to bring the flow of income into closer accord with the flow of consumer's goods. The cost of basic foodstuffs has risen far less than has the average level of wages or earnings. Retail food prices entering into the Cost of Living Index have risen by only 22 per cent since 1939. Admittedly, the reason for this is that prices have been based on the index and not the index on prices; but the enormous burden that this has entailed for the taxpayer indicates the absurdity of such artificial contriving to keep down the cost of the principal rationed foods. The discrepancy between the controlled price and the economic price is altogether too great. Even the food consumer bears a considerable burden in the shape of the enormous inflation in the prices of commodities outside the controlled sphere, such as certain fruits and vegetables. As reconversion proceeds, the two markets—the "controlled" and the "uncontrolled"—should move together; instead they are moving further apart.

To take £100 or £150 million off the cost of food subsidies this year would leave very few people worse off, in respect of the power of their incomes to purchase food, than they were in 1939. Most of them would still be better off, and the few who would be prejudiced—pensioners and the like—could be relieved at a very much lower cost than the saving on the subsidies. To argue that any beneficial result would be at once negated by a rising spiral of wage increases is to assume that the co-operation between Government, industry, and the unions, for which a clarion call went out in the Economic White Paper, is foredoomed to failure on the simplest and easiest of tests. The nation's surplus of money will never be digested unless the unions can be persuaded to swallow some part of it.

The contention that the provision of food should be permanently subsidised as a vital social service runs up against one powerful practical objection. This is that, so far as Britain is concerned, the demand for food looks like outdistancing the possibility of ever meeting it in full. All the Government's internal measures—its steps to maintain full employment, its all-in scheme of social security, its introduction of family allowances, its welfare schemes and its publicising of nutritional values—all of them have the effect of creating a large unsatisfied demand for food; yet Britain's precarious trading status makes it harder than at any time in this nation's history to afford imports of food on an adequate scale. The moral can be drawn from the survey of the possibilities of British agriculture in saving foreign exchange, undertaken by the Coalition Government in 1944-45 but only recently published (Cmd. 7072. 2d.), which points out that the rising demand for food may be expected to absorb virtually the whole of the increased output which it is practicable to require of British agriculture and which has still to take place. Once rationing is removed, Britain's outlay on food imports looks like being even larger than it was before the war. So far from the expansion of domestic agriculture being able to make a contribution towards the solution of the balance-of-payments problem, it looks like being inadequate—given a combination of full employment with food subsidies—to meet the increase in the demand for food.

There is thus a real risk that it will be impossible for food

policy to make both ends meet and that rationing will be permanent. If this comes about, it will be a very great calamity. Not only is food rationing inherently distasteful to a nation that has never known it in time of peace and extremely injurious to popular morale, but it moulds demand into an artificial pattern, obliterating the subtler preferences of consumers, and it absorbs into administrative controls a noticeable proportion of the nation's manpower that can ill be spared. The moral is obvious. If rationing is ever to be brought to an end, the Government should not go out of its way further to stimulate a demand for food, which it will be difficult to satisfy in any event, through cheapening it at the taxpayers' expense. Let it rest content, for the time being, with the other large social reforms that it is promoting to the advantage of every food consumer in the lower income groups. It is taking the horse to the water and advising him where to drink; to insist on actually pouring the water down his throat as well is to court disaster by emptying the trough.

*

There is equally little to be said for the permanent maintenance of Government price control over the principal range of foodstuffs. The control of retail prices entails Government supervision over the procurement of all controlled foods and over the channels of their marketing and distribution. This responsibility was assumed by the Ministry of Food at the outset of the war, and on balance it has been carried out extremely conscientiously and fairly, and with care to ensure that the principle of equality of sacrifice is applied—however inappropriately—as rigidly among wholesalers and importers as it has to be among consumers. The result is widespread stagnation among private enterprise without any compensating tightening of efficiency. The Ministry's control has seriously weakened the normal incentives springing from competition; but, partly because of its composition out of leading elements in the trades affected, the Ministry has shown neither the inclination nor the courage to rationalise distribution and eliminate the firms that would become redundant. Ministerial control has been a passable device during wartime, when it was necessary to have a minimum of fuss both in dealings with the distributive trade and in the supplying of consumers' needs. But it will not do much longer. The time has come for the Government to go either forward or back; and since no one has any real faith in the state's capacity to operate food distribution itself (nor has the Government a mandate for doing so), the best course is to restore free competition and a free market as quickly as possible.

One of the evils of Government price-fixing is that it obscures both the natural outlets of consumers' demand and the real costs of production. There has been some pointless argument about how far the present food subsidies represent assistance to consumers and how far to producers. The answer is that

it is impossible to tell. The Government fixes both the price that the farmer receives and the price that the consumer pays, and it bears any resulting deficit on both home-produced and imported food. By juggling with prices, and by adjusting the volume of imports, the Government can make any branch of British food production appear as profitable—or, for that matter, as unprofitable—as it pleases. It can turn black into red or red into black; for there is no economic criterion available to reveal what is the real cost of producing any particular food in this country or what its production is costing the taxpayer.

This system is unavoidable so long as rationing is in force, but it is too pernicious in its effects to be worth keeping permanently. A Government department is a poor, inflexible instrument for supplying the normal demands of food consumers with either skill or economy; and it is far better to give British agriculture enough direct aid to compete successfully in the domestic market than to disguise its real position by the complete manipulation of imports and prices.

This year it is impracticable to do more than prune the food subsidies. But this pruning ought to be regarded as no more than a highly necessary preliminary to the eventual abolition of the whole system of Ministerial purchase, price control, and rationing. This policy does not in the least mean a return to pre-war conditions of widespread malnutrition. The Ministry of Food would remain in being to publicise nutritional values and to operate its existing welfare schemes, which should be retained and perhaps extended; in addition, public money might well continue to be available for cheapening one or two foods of high nutritional value, such as milk, though there again it would be wasteful to subsidise the whole supply when the special nutritional needs refer to only part. But the greatest guarantee of a permanent improvement in diet lies in the acceptance of the principle that every citizen should at all times receive an adequate minimum income. The soundest way to raise nutrition is to end poverty once and for all.

Poverty will never be ended by cheeseparing restrictions and controls, which waste the manpower of the nation, the time and temper of the consumer, and the income of the taxpayer. The real long-term issue over food policy is whether and when rationing will end; for with the end of rationing will go the only acceptable justification for Ministerial control of food supplies and food prices. But it is now beginning to be whispered that rationing may never be ended and that the Ministry of Food can never relax its hold. This will never do. Even austerity-ridden Ministers should realise that a time will come when the maintenance of that strict egalitarianism on which they have set their hearts cannot justify the inconveniences and the inefficiencies—the former of which are palpable, the latter of which are not a whit the better for being so easily disguised—that spring from too detailed and distorting an interference by the state with the food supply of the people.

Bonus Distribution

TRIENNIAL VALUATION 1944-46

Reversionary bonuses on With-Profit policies have now been allotted at rates per annum ranging from £1. 10s. to over £2. 10s. per £100 of sum assured—and, 10/- % on all existing bonus additions.

The Tobacco Standard

(By a Correspondent)

IT is certainly too early to attempt any complete evaluation of the changes introduced into European economic affairs by the system of exchange that may for convenience be termed the tobacco standard, but at least it is a suitable occasion at which to comment on its existence and on its implications. The £50 million that Britain pays each year to the United States for tobacco, and the £60 million that Britain has lost in occupied Europe through failure to understand the working of the system in its initial stages are expensive tuition fees—viciously expensive if the lessons are not learnt.

The economic historian of the future will probably regard the period between the two wars as a time when mankind groped hesitantly for a new international currency. The precious metals had failed. For gold, the ritual remained. At the cost of considerable effort in money and labour, gold was laboriously extracted from the rocks of South Africa, refined, shipped to the United States of America and there re-interred, this time in circumstances that demand an additional economic wastage in the shape of armed guards. In the case of silver, hardly even a pretence was observed. The so-called silver coinage in large areas of the world ceased to contain any valuable content of silver, or of any other metal. It was conveniently simple for a state regime to extract the silver formerly used in its coinage and issue in lieu, at a considerable profit to itself, metal discs without intrinsic value. The last gold coin of practical use in Britain was the half-sovereign, and those who can remember it will agree that its size was about the smallest that could be tolerated in a coinage in general use. By the end of the 1914 war, coins of gold of the denominations in most general use could no longer be made, even if there had been enough metal available. Diamonds had some advantages as a currency for large-scale or illicit operations, but there again no coinage could be built up on a substance where the pound sterling would be represented by a stone the size of the head of a pin. At one time, postage stamps were favoured and the historian may devote an interesting footnote on the place of philately in the international monetary system. But the fact remained that for twenty-five years mankind was compelled to rely on valueless tokens.

This was clearly unsatisfactory, if not to the theorists then to the man in the street. The theorists were unable to devise a token coinage, of paper or any other substance, that would have an international acceptance. The man in the street, who needed such a currency far more than the theorists, was unable to find one. The interrelation between this fact and the economic disturbances of that era has yet to be explored in full but it is clear, from the eagerness with which the Tobacco Standard was later adopted, that the two are not disconnected. Confidence in a currency is not only a matter of exchange rates on an official bourse. The malaise induced in an individual by the possession of paper as his sole token of wealth can result in far-reaching reactions. But, fascinating as the field is, exploration must wait.

The early history of the cigarette currency is obscure and will only be extracted from contemporary records by considerable research in both occupied Europe and in Britain. The cigarette was beginning to establish itself in this new role not later than 1941. From then onwards its development in each area is similar but not identical. In Britain it never, even at the height of the American occupation, went so far as to replace the existing metal or paper coinages. In occupied Europe it

did. Starting from modest beginnings in Germany and the occupied countries, it reached its full flower during 1944 as Europe was liberated. As the armies with seemingly unlimited supplies of cigarettes available behind them replaced those with more meagre resources, so did the acceptance of the currency spread. In terms of goods it probably reached its peak value in the second quarter of 1945, although that date was not constant all over Europe. During the first days of the liberation of Holland, for example, a single cigarette there was equivalent to an English pound, while simultaneously its value in France was perhaps no more than sixpence. Such unfortunate variations are inevitable where the introduction of a new currency is left largely to chance.

What are the peculiarities of the tobacco standard? Perhaps the most outstanding is its self-liquidating quality. In the period before the wars there were many attempts made to attach to the token currencies of the day some device which would make them self-liquidating. The ostensible reason for that was the view then held by many that production and distribution needed some stimulus additional to that provided by the economic machinery of the day. This was accompanied by the belief that the national currency could be made to play some part in this process. There were, for example, plans for the creation of dollars (the plans were largely confined to the dollar countries) which lost a proportion of their face value after each month in the same ownership. (Not unnaturally such plans were never put into operation.) It was almost by accident that the cigarette was found to have this useful quality. How often did not the cry go up, in 1945, that what Europe needs is an indestructible cigarette—a reverse, and perhaps a perverse, tribute to the practical utility of the cigarette as currency. The whole secret of the cigarette was that it could in fact be smoked.

It had, of course, other advantages. It was reasonably small in size and conveniently packed. It was generally available in such supply that the single unit had a value not too different from that of the standard national metal currency. It did not perish if properly stored. It was light in weight. It could not easily be forged or counterfeited and by the happy chance of history its dimensions were very largely internationally standardised. In short, the practical genius of mankind as a trading being saw it as a heaven-sent currency medium and used it accordingly.

*

Undoubtedly one of the most interesting sections in any history of the cigarette will be that examining the amazing inability of the authorities to appreciate what was happening before their very eyes. To future generations it will be inconceivable that no Government made even the most tentative plan to fit this new currency into its proper place in the economic life. It was not as though they had ignored its existence. In many countries its manufacture had been made into a profitable state monopoly. In others, Britain, for example, it had been utilised as a valuable instrument of taxation. Yet not one Government made any attempt to regularise its use as currency. On the contrary, many went out of their way to free it from all control whatsoever. Some governments did limit the number of fresh cigarettes that any one individual could acquire each month. Others went to the other extreme and made it easy for an individual to buy as many as he wished

and as cheaply as possible. (There is a school of thought that considers this policy in fact to have been deliberately designed to assist the citizens of that country, and so the country itself, to establish general economic control, or at least to acquire considerable economic benefits, in occupied Europe, but no evidence has, as yet, been adduced to support this theory.)

Yet a good deal could have been done to turn this new development to desirable economic ends. It would have been perfectly possible to convert cigarettes into the only currency available to the occupying armies and to prohibit their sale fresh throughout the whole of the territories of the defeated powers. By this means the supply of currency could have been regulated in the areas where regulation was a crying need. Fresh cigarettes returned into stock could have been withdrawn from circulation (the person returning them drawing an equivalent credit on national currency in his country of origin) and the market in commodities as a result kept under some control. Further, since some cigarettes would have inevitably been smoked, the demand for fresh stocks would have left the manufacturers no real cause for complaint. However, nothing of the kind was done. Ignorance, lack of imagination or the obstinate regard for outworn traditions (as, for example, the tradition, strong, if comparatively recent, that soldiers must always be paid in cash) involved the states supplying the cigar-

NOTES OF THE WEEK

From Eighteen to Twelve

On Monday, March 31st, the Minister of Labour defended the period of eighteen months' full-time service imposed by the National Service Bill, explaining that it was necessary, first, so that the period of training would be adequate, and, secondly, so that the conscripts, when trained, could supplement the regular forces in fulfilling the country's commitments. On April 1st this explanation was endorsed by the Minister of Defence. On April 3rd, however, the Government tabled an amendment to the National Service Bill reducing the maximum period of full-time conscription from eighteen months to twelve. Obviously, the reason for this major reversal of policy was the adverse vote of many Labour back-benchers on the second reading. But it places the Government in a very unfavourable light. On one day they are convinced by the arguments of the Chiefs of Staff that such-and-such a number of men are needed for the armed forces; on the next day they give way to political pressure. They have attempted to carry it off by claiming that the Services agreed to the shorter period, after a fresh examination of its effects, based on the arguments raised in the debate. But this will convince nobody. The arguments were those that have been put forward many times; it was the fact that they were supported by a large adverse Labour vote that prompted the urgent appeal to the Chiefs of Staff. The incident, in fact, is characteristic of the history of demobilisation ever since the war ended. The Service Departments have been fighting a losing battle over man-power with public opinion, and the Government has been an uneasy neutral, crossing first from one side to the other and then back again.

But if the Government has made a political blunder by announcing this amendment after the debate instead of before it, the Conservatives' reaction, as illustrated by Mr Churchill's pronouncement from his country house at the week-end, is equally inept politically. To accuse the Government of needless vacillation and of scuttling is one thing. But to threaten to withdraw Conservative support from the Bill is likely merely to help the Government out of the very awkward position it has got itself into and to rally all the Labour rebels, many of whom might otherwise be unmoved by the reduction in the period of conscription, to the Government's support. Surely, too, Mr Churchill does not think that advocacy of eighteen months' conscription will add to the popularity of Conservatism in the country?

But the political blunders of the leaders of both parties are their own concern. Let them stew in their own juice. The essential thing is that the period of full-time service has been reduced. This makes conscription, still a distasteful necessity, very much more tolerable both socially and economically.

ettes in very considerable losses. Only our future historian will be able to tell how quickly, if at all, these lessons were learnt, or what effective steps were ultimately taken to counter-act the dangers of such an unregulated currency.

But, however much it may distress our vanity to-day, there is one comment that the future generations of economists and sociologists will inevitably make. It is in the change of concepts illustrated by the discard of gold as an international medium and by the adoption of tobacco in its place. Gold, after all, had its heroic qualities. In more primitive days, the man who possessed it did not hide it all away. He used it. It graced his woman, it decorated his table and his home. By wearing it himself he added dignity to his carriage and, given as an act of charity or piety, it brought beauty and light into his places of worship. A fortune was not represented by pieces of paper lacking even artistic merit. It shone for all to see. What can one say of the cigarette? It is the symbol of idleness and forgetfulness. Where gold stimulates, a cigarette soothes. Where silver gives back to the sun some of its splendour, tobacco sets up a cloud between mankind and the sky.

The contrast is all too pointed. The Elizabethans set out to find the treasures of the New World. The one discovery of theirs to last longest is a weed. If our future historian wishes to moralise, as well he may, what a theme awaits his pen.

The Next Sitings

Parliament's brief recess ends next week, when members will reassemble to hear the Chancellor's Budget statement. If the Government is still determined not to prolong the session after the end of July, financial business—that is, the Budget debate, the Finance Bill proceedings, and the allotted supply days—should account for roughly half of the remaining parliamentary time. Yet there is still a considerable amount of legislation to be completed. Of the ten major measures of the session, only one—the Exchange Control Bill—has received the Royal Assent. The Agriculture Bill, the Electricity Bill and the Industrial Organisation Bill are still in standing committee. The Cotton (Centralised Buying) Bill, the Statistics of Trade Bill, the Town and Country Planning Bill and the Transport Bill have to go through the report stage and receive a third reading. The Companies Bill, which was initiated in the House of Lords, has not yet had its second reading in the Commons. The National Service Bill has been committed to a Committee of the whole House, and the Government can hardly rush through its remaining stages. There are also one or two comparatively minor measures, such as the Fire Service Bill, the Scottish Health Service Bill, and the Crown Proceedings Bill, which are still far from being completed.

If it were not that the Government had so frequently and so passionately affirmed their intention to complete their legislative programme, it would be tempting to say that the task before both Houses in the next three and a-half months is impossible. It is certainly impossible for them to fulfil it adequately. The effect of the guillotine on the two most important Bills of the session—Transport and Town and Country Planning—has been that the purpose of the committee stage, to enable the text to be considered clause by clause and even word by word if need be, has been largely flouted. Thus, a special responsibility will rest on the House of Lords in respect of these two measures. But if the House of Lords does its duty properly, it will almost certainly want to make some important amendments to them. Consideration of these amendments will then have to be squeezed into the House of Commons' time-table.

On top of the financial business and the remaining legislative programme, the House of Commons will have to be able to devote some time at least to matters of general public importance. The Moscow Conference, the international trade discussions at Geneva and the hardy perennials, such as fuel supplies and Palestine, are all matters that are likely to come up for debate between now and August. The Government has also given notice that it will introduce a motion for the reform of parliamentary procedure. It is presumably asking too much that this should be designed to prevent a recurrence of the "hurried scampering"—Mr W. S. Morrison's phrase for the committee stage of the Town and Country Planning Bill—that has characterised this session.

Coal Output and Miners' Hours

Some remarks made by Mr Shinwell in the debate on the fuel situation just before Easter deserve to be lifted into prominence:

We have to face certain adverse factors in relation to coal output, and it is no use trying to conceal them. One of them is that we are not certain whether the five-day week . . . which is to come into operation at the beginning of May, will have an adverse effect on production. . . . If we were to base our calculations exclusively on the statistical information available, then the outlook is far from favourable as to its effect on production. I put it to the right honourable Gentleman, if he were in my place, responsible for the administration of the mining industry, and in particular—I emphasise this—for creating a favourable atmosphere in that industry, would he, in face of the quite proper demands made by the National Union of Mineworkers, having regard to the arduous nature of their occupation, have denied them this privilege in such circumstances? Moreover, if we sought to deny the miners this long-awaited and long-demanded reform, it might have an adverse effect on production on a six-day basis.

In short, what the Minister was saying was "I know the five-day week will cost me output. But what could I do? Arthur Horner told me if I did not agree, it would cost me still more output."

It has always been said that one of the greatest weaknesses of nationalisation would turn out to be that issues would no longer be settled according to the merits of the case, the situation of the industry or the needs of the country, but by political pressure exerted on Ministers. It should go on the record that only three months after the start of the National Coal Board, the Minister of Fuel and Power was already confessing himself the victim of precisely such blackmailing tactics. The fact that his concession to the miners means a still further increase in the price of coal was apparently considered to be so unimportant that it was not even mentioned. Are political decisions, paid for by the consumer, to be the normal operating method of nationalised industries?

* * *

Back to the Atom

The working committee of Uno's Atomic Energy Commission, ordered by the Security Council to forget about Mr Gromyko's staggering blow delivered early in March to the prospect of international supervision and controls, is back at work behind closed doors. The task that it has been set is to produce, between now and the General Assembly, a blue print for a system of controls from mine to plant bench. It is said that, in committee, the Russian representative is discussing this matter as readily as the rest, subject, of course, to giving priority to the destruction of existing bombs. How is this fact to be reconciled with Mr Gromyko's earlier declaration on interference with sovereignty?

The explanation that suggests itself also fits his speech made this week in reply to Mr Warren Austin in the Security Council on the subject of aid to Greece and Turkey. He has instructions to take, wherever possible, a line that will appear eminently reasonable to the many American opponents of President Truman's plan for aid to Greece. He is therefore ready to rediscuss atomic controls. It is difficult to interpret his complaisance in any other way. For why should one of the most secretive people in the world have changed, overnight, their attitude to the admission of Paul Prys?

This week's happenings in the Uno committee on conventional armaments—as opposed to unconventional, or mass destruction, weapons—merely serve to underline the fact that the major deadlock on atomic weapons continues unaltered. There the Russians and the French, alone of the Big Five, have voted in favour of a Colombian resolution that places the onus for disarmament proposals upon the Big Five, without reference to the atomic deadlock. Briefly, the deadlock can be likened to that between two fighting cocks who are both anxious to retire from the profession but who cannot agree on how to do so because one has on metal spurs and the other has not. Says the first: "I'll remove my spurs when we have settled how to provide that no one shall have spurs." Says the second: "To settle in that way is to settle under duress. You take off your spurs, and then we can talk." It is difficult to imagine that Mr Gromyko will talk seriously in any other conditions. And, at the present meetings, they do not exist. It is a depressing thought that they may not do so until everyone has got an atom bomb.

* * *

The Eastern Frontier

On Wednesday, Mr Marshall at length grasped the nettle of the Polish-German frontier; but unfortunately neither he nor Mr Bevin grasped it very firmly. Admittedly, it is a very prickly

nettle. Soviet troops conquered Eastern Germany, and the Soviets want to give the whole area up to the Oder-Neisse line to Poland; Poland has had to cede a large area in the east to Russia and was promised compensation at Yalta and Potsdam; any attempt to question the frontier "provisionally" fixed at Potsdam will be met with uncompromising negatives from Moscow and by a frenzy of passion from Warsaw; and with every month that passes the expulsion of Germany and the settlement of Poles makes the Oder-Neisse line more of a *fait accompli*.

For all that, Mr Marshall and Mr Bevin are undoubtedly right to try to submit the question, even at this late hour, to the tests of justice and of long-range European statesmanship. The pity is that they did it so half-heartedly, suggesting no more than the retrocession of a few agricultural areas to Germany. By the test of justice, of ethnography, of the self-determination of peoples, there was nothing wrong—except perhaps in minor detail, here and there—with the German-Polish frontier of 1939. The fact that Poland has lost territory in the east—territory not indisputably Polish, but probably more Polish than Russian—has, in a context of justice, nothing whatever to do with the matter. The theory of "compensation"—that he who is robbed by his stronger neighbour can put matters right by robbing someone still weaker than himself—is familiar in politics, but not in morality or jurisprudence.

*

The test of statesmanship gives the same answer. It cannot be for Europe's good that the Germans should be compressed within frontiers where they cannot support themselves or that they should be given a grievance of a size without parallel in European history. Are the Poles quite incapable of learning any lesson from their own history? More than any other people they should know that the dismemberment of defeated nations is not a settlement but an unsettlement. Cannot they see that, in their unlucky position between two countries far stronger than themselves, their only hope of safety is to occupy no lands but those that are indisputably their own? Do not they see that their new "Western Lands" are destined to be, one day, the price of a new German-Russian alliance—a price that Russia can easily pay and for which any German Government will always be prepared to give anything? After all they have been through, do they really see their future in terms of being a semi-great Power for a few years and partitioned the rest of the time?

The Russian and Polish reaction to Mr Marshall's and Mr Bevin's moderation has already shown that they have gained nothing by it. Their re-opening of the question will not alter the Oder-Neisse frontier, over which Russian troops stand guard. Why, then, be diplomatic about it? Why not speak the whole truth?

* * *

Opening Rounds at Geneva

The "horse trading" at Geneva has begun. Delegates of seventeen nations are getting down to the bargaining which will determine just how much the United States has to offer in return for their help in getting international trade on to a multi-lateral and non-discriminatory basis. The sessions will be arduous, secret and prolonged; the Geneva hotels are booked up for three months ahead. Out of them may come decisions and bargains decisive for British and Dominion trade, since the British Government—whatever other governments may say and do—is pledged three times over to support in principle the American attempt to codify new rules of international trade. And other governments are tempted by the offer of more dollars to lend their support, too.

This Geneva conference was arranged at the meeting of the preparatory committee of the International Trade Conference in London last autumn. Since then disturbing things have happened. In order to get Republican support for his idea of making economic as well as diplomatic policy bilateral, President Truman agreed that tariff arrangements with other countries should contain an escape clause, by which a tariff reduction can be cancelled if it harms an American producer. In other words, the Americans are still not sure that they want to import more, although they are quite sure they want to export more. Moreover, several countries have got into even worse difficulties with their balances of payments than they were in last autumn. Sweden, for example, has been severely rebuked by the State Department for curtailing its imports to meet a shortage of dollars. And then there are governments in eastern Europe, anxious for their share in increased world trade, but puzzled about how to play the American game so long as their

recovery programmes depend on bilateral barter arrangements with neighbours and special commitments to the Soviet Union, which has shown no interest at all in the ITO project.

The test of all policies and measures proposed at Geneva will be whether they will in fact increase trade. Not all the American proposals can survive this test, particularly if applied to British trade. But it may be that the American delegates will see the advantage of making special concessions for transitional periods to countries that have urgent reconstruction policies demanding special and restrictive methods of planning. Among those countries is Britain, and Sir Stafford Cripps should take the lead in explaining the facts of economic life in contemporary Europe to his American colleagues.

* * *

Planning and Public Relations

Sir Stafford Cripps threw some more light on the functions and powers of the chief planner at a press conference last week. From his explanation it is clear that the new arrangements fill a serious gap in the present machinery at the centre of the administration, but they do not provide that administration with any powerful new force. The engine may run more smoothly, but the horse-power remains the same.

The Government have made the new planner a civil servant, not a politician, and the initiative or lack of it remains in the hands of the existing Ministers. Unless the rumour of impending Government changes results in a re-orientation of policy far more drastic than any reasonable forecasts would justify, Sir Edwin Plowden will have to work within the old triangle bounded on the one side by the TUC's objections to interference, on the second by the preoccupation of the socialist wing of the Government with politically dictated legislation, and on the third by the instinctive unwillingness of Government departments to hand over any of their authority to an "outsider." Only on the third side has the new planner any hope of extending his territory.

One new point of interest was made by Sir Stafford. It appears that a small but highly powered information section is to be set up side by side with the new planning organisation—to keep the public in touch with the general economic situation. The position of the new organisation is not at all clear, for there already exists an Adviser on Public Relations at Number 10 Downing Street, the Central Office of Information under the direct jurisdiction of the Lord President and public relations officers in most departments. There is something very wrong with the public relations of the Government at present—owing chiefly to their lack of sensitiveness to public opinion, which is not limited to economic affairs, as witness their handling of conscription. But if they succeeded in bringing the economic situation home to the people this would be nine-tenths of the battle. Can the unions be converted from the bottom upwards, since the reverse process has been such a dismal failure?

* * *

Agriculture's Disaster

The Government has announced the steps that it will take to assuage the disasters that the weather has inflicted on agriculture. It will double the voluntary contributions to the Agricultural Disaster Fund, set up by the National Farmers' Union. This will ease, although it cannot be expected to obviate, the financial losses of individual farmers. It will also adapt the hill sheep subsidy scheme in such a way as to make funds available for the many hill sheep farmers who have lost a large part of their flocks; since the Minister estimates that a third of hill sheep have been lost, the subsidy is likely to require early enlargement. Finally, special acreage payments are to be made to farmers sowing land this spring which will be related to the anticipated reduction of yield that will result from the damaged condition of the soil and the lateness of sowing. This is an ingenious way of stimulating production in the face of adverse conditions. It is badly needed, since it is estimated that some 270,000 acres of corn, mostly wheat, have already been destroyed by frost and floods, and this year's wheat acreage will in any event be far below its original target. The Government's promises of aid have been prompt, various and ingenious. They will not, however, enable the farmers' losses to be recompensed in full, but it is not reasonable to expect this. Indeed it is something new for the Government to have accepted the principle that exceptional seasonal losses carry a claim to any public assistance. It is now worth asking whether the payment of

guaranteed prices to farmers should not be related in some way to the total annual quantities produced, which vary very widely from year to year. In a poor year the price could be raised and in a bumper year lowered. At the moment it might be unwise to make any arrangement which would not put the full premium on maximum output, but in normal times it is not satisfactory that the farmer's income should fluctuate too widely with seasonal conditions.

* * *

Planning Bill Debates

The standing committee stage of the Town and Country Planning Bill was completed last week after twenty-five sittings. The bad effect of the guillotine was seen in recent sittings, not only in the large number of clauses and several schedules that had to be passed without being considered, but in the number of important discussions that were terminated abruptly and inconclusively.

There was a very important debate on Exchequer grants to local authorities. To the many critics who accused the Government of ungenerosity, Mr Silkin could reply with some force that (unlike the provisions of the 1944 Act) the grants were payable for the full loan period of sixty years and that they were extended for the first time to "blighted" areas and to land acquired for planning purposes. Taken in conjunction with the lifting of the whole burden of compensation for planning off the backs of local authorities, the Government's policy amounts to the first real attempt to rebuild the whole central areas of the principal cities. Just because this aim is so ambitious, it is open to question whether the means proposed will suffice. The maximum grants specified in the Bill are generous, but the minimum grants are very much lower, amounting, for instance, in the case of "blighted" areas to 30 per cent for the first period, tapering off to 20 per cent and finally 10 per cent. Grants for "blitzed" areas start in all cases at 90 per cent for the first five or eight years, and thereafter fall off to minimum grants of 30 per cent and finally 20 per cent.

It is reasonable to vary the grants according to the financial status and obligations of each local authority, but the schedule of grants that has been tentatively circulated leaves many cities, which by no stretch of the imagination could be described as "rich," with grants much closer to the minimum than to the maximum. This is partly the result of anomalies which arise from using its rateable value as an index of an authority's financial strength; in common equity, some better basis must be found. But apart from this fact, it is doubtful whether the grants will be enough to remove the financial caution which is restraining many local authorities from bold development schemes. It is anything but wise to urge the Treasury to increase its financial obligations at the present time. There is much to be said, however, for increasing the Exchequer grants while keeping down the scale of the local redevelopment plans to which they contribute. Sad as it may be, the old adage that Rome was not built in a day much needs to be remembered in post-war Britain.

*

The Committee had its liveliest debate on the clause which transfers the planning powers of the City of London to the London County Council. The City exists for its daytime influx of some million workers, and it is naturally fighting ferociously to retain

The Economist Budget Supplement

Statistical material relating to the National Finances and the Budget, which replaces the Budget Supplement published by *The Economist* for many years, will be issued as part of the *Records and Statistics* Supplement on April 26th.

A limited number of copies will be available, price 6d. post free, for readers who are not subscribers to *Records and Statistics*. Orders should be sent to:—

The Publisher

THE ECONOMIST, BRETTENHAM HOUSE,
Lancaster Place, London, W.C.2.

its most important function. Mr Silkin argued that the close economic interdependence between the small square mile of the City and the enormous London that has engulfed it rendered the Government's proposal essential. It is true that many vital decisions—on transport and the amount of office accommodation to be provided, for instance—depend on considerations well outside the City's purview and which the LCC, *faute de mieux*, is best qualified to judge. On rational planning lines, Mr Silkin is right; but there is cause to regret the passing of an authority which had the City's special historical needs and anomalies well in mind. Thus truncated of its powers, has the City much of an administrative future left to it?

What Next for DPs?

It is perhaps as well that Major-General Lowell Rooks, of Unrra, was this week misreported as saying that, unless a miracle occurred, the DPs might, on the expiry of Unrra in June, have to be repatriated willy nilly, and regardless of the rods that some Governments have in pickle for them. What General Rooks in fact said was that Unrra had only eighty days of life before it, and that, unless the International Refugee Organisation were to come into being in that period, it might "have to turn these unfortunate people back into the hands of the Governments of the countries in which they find themselves, whether civil or military." But might not this course turn out, at second remove, to amount to forcible repatriation? How are the Governments in question to finance the upkeep and resettlement of unwanted thousands?

What are the alternatives to forcible repatriation? Only two possibilities emerge. The first is that the International Refugee Organisation should be born between now and June 30th. But the prospect is remote. The *sine qua non* of its creation is that 15 nations should guarantee 75 per cent of its budget. So far, 12 Governments, representing 70 per cent only of the total quota of contributions, have signed its constitution, and no other signatures seem to be impending.

The alternative possibility is that national Governments, either conscience-stricken or else alive to the ultimate advantages of increasing the working population, will come forward with offers of room for resettlement. This is happening, but only in dribbles.

The key to the conundrum lies in the application to it of a sense of proportion. This most nations are not applying. They view it as if each were threatened with inundation by floods of foreigners. This is not so. There are now only 750,000 DPs. The trickle of firm offers for 1947 already made amounts to a total of 150,000, of which about half come from Western Europe and half from Latin America and Canada. The right proportions in which to view the problem have been sketched by Mr Earl Harrison, lately United States Commissioner for Migration and now campaigning as chairman of a new American "Citizens' Committee on Displaced Persons." He points out how quickly the total would be absorbed were States to fill their existing immigration quotas. In the United States alone only 15 per cent of the quota was used throughout the war years; "in other words, the United States was prepared to receive 914,762 people who could have entered legally and did not do so." For the British taxpayer the cheapest course is to admit the small quota that would fall to Britain's share. The second cheapest course is to hope for the creation of IRO. The cruellest and most expensive is to let the problem and the expense devolve upon the British military governments in Germany and Austria.

* * *

Missing Prisoners

In his recent Note to the Soviet Union on the withdrawal of American forces from China, Mr Marshall mentioned that, whereas the Americans had repatriated to Japan the Japanese whose surrender was taken in China south of the Great Wall, he still had no information about an estimated 700,000 Japanese captured by Russian forces in Manchuria and not repatriated. This item of news may be compared with the recent Soviet declaration at the Foreign Ministers' Conference that the number of German prisoners now held by the Soviet Union was less than 900,000; also with the appeal made by the German Social Democrat leader, Dr Schumacher, to German families to send particulars of all missing relatives, military or civilian, in order to build up a register of missing persons; and with the Italian Government's official statement that of the Italian soldiers taken prisoner in the campaign in Russia over 80 per cent had perished there.

The Allies in general bear the responsibility for holding great numbers of enemy prisoners for a period after the end of hostilities far exceeding, in the spirit if not in the letter, the period allowed by the Geneva Convention, and for using them for forced labour for the benefit of the victors. International law formerly assumed that a war would be ended by an armistice and an early peace treaty, which between them would provide for a rapid repatriation of prisoners on both sides. The Allies have avoided this restriction by substituting unconditional surrender for an armistice and postponing indefinitely for Germany and Japan the conclusion of a state of war; they have also endorsed the principle that reparations may be taken in the form of labour. Nevertheless, the Western democracies have felt certain qualms about the exploitation of prisoner labour, which have caused them to adopt repatriation schemes of various degrees of celerity; and they also regard themselves as bound by the Geneva Convention in their treatment of the prisoners they hold.

The question of the retention of prisoners of war has in fact two aspects: the duration of their imprisonment and its conditions. A man held in captivity, doing virtually unpaid work and separated from his family for several years suffers thereby in any case, yet his life may be physically a healthy one and his chances of dying may be no greater in a prison camp than they would be in his own country. It is the mortality figures of imprisonment which are of crucial importance; in so far as what may be reckoned as a normal death rate is increased by avoidable starvation, disease and ill-treatment, a "crime against humanity" is being committed. The Soviet Union unfortunately has never accepted the Geneva Convention and allows no protection to its prisoners from the International Red Cross. It is widely believed in Germany and Japan that the majority of those who were captured by the Russian forces will never return home and the Italian evidence seems to justify these fears.

* * *

Franco Meets His Match

It is a strange turn of the wheel which brings General Franco into collision with the divine right of kings. He has found that he can disregard opponents who attack him in the name of democracy and the rights of man, but now he meets in the Pretender Don Juan an opponent who claims the "sacred, imprescriptible right of sovereignty" which "by the will of God" lies in his person. Don Juan describes the Cortes which is to approve the new succession law as a "Government-appointed assembly" and denounces the General's regime as arbitrary and its claims as precarious. Uno could not put it better.

All this was said last Monday by Don Juan in a message to the Spanish people issued from Lisbon. The note of authority and the appeal to tradition may be just what is needed to rally men of diverse views to a movement to substitute constitutional monarchy for the present dictatorship. Franco's plan to continue his own personal rule and leave the choice of a successor to a Regency Council, dominated by Church and Army influences, obviously offers no solution to Spain's difficulties. Nor does the policy of the quarrelsome and much discredited republican government in exile. Within the country itself there can be no real discussion, public or private, of alternatives, and Don Juan's offer to become a law-abiding sovereign offers a way out.

The bridges between the Dictator and the Pretender are now burnt and it is difficult to see where Franco will find an alternative successor. His embarrassment will be evident and may convince some Spaniards that his position is far weaker than they believed. If there is to be a restoration the first move will have to be made in Spain; not only has Franco to be got rid of, but the way has to be prepared for the Pretender. There will have to be preliminary political negotiation and party discussion of a kind which is impossible under the present régime. And it is too much to expect anything like a referendum or free elections. Memories of the civil war are still poignant and exacerbating; until they are deadened, the kind of democracy which the Uno Assembly seems to want for Spain will not work.

* * *

Burma in Transition

The Burmese elections took place on April 10th. With 210 seats to be filled, Aung San's Anti-Fascist People's Independence League (the AFPIL) had nearly 90 uncontested, and nobody doubted its overwhelming victory. The "White Flag" Communists were expected to win a few seats. The "Red Flag" Communists and the ultra-nationalist factions led by U Saw, Ba Maw and Thakin Ba Sein all boycotted the elections and

threatened to attack the polling booths. First reports indicated that, whether because of intimidation, indifference or the certainty of the outcome, polling was very light, though there was little actual violence, at any rate in the towns. British and Indian troops helped to keep order.

It is taken for granted that the AFPIL will win a heavy majority and will form the first government of independent Burma. This preponderance of one party is due to the concentration of Burmese political feeling for many years on the single issue of national independence; the AFPIL corresponds in this way to the Congress Party in India, the Kuomintang in China, the Viet Minh in Indo-China and Quezon's Nationalist Party of former days in the Philippines. Such parties tend to rally to themselves under a single leadership the popular forces responsive to the agitation for independence; provided the nationality is sufficiently homogeneous and is not split on ethnic or religious communal lines as in India, the nationalist movement retains its cohesion until the main question of independence or "rights recovery" is settled and then begins to break up—unless held together dictatorially—into a normal parliamentary party system on social and economic issues. Another feature of this type of political evolution is that the nationalist movement in its oppositional or revolutionary days combines its nationalist propaganda with a radical social programme, arising partly from the genuine enthusiasms of some of the leaders and partly from the need to gain mass support, but once in power becomes more conservative in social outlook, leaving the cause of the Left to Communist and near-Communist parties, which start as auxiliaries of nationalism, but soon go into opposition. These tendencies are already manifest in Burma, where the AFPIL has indulged in much radical talk—the young Burmese intellectuals have not sat at the feet of Professor Laski for nothing—but is unlikely to be much more advanced in its actual social policies than the Kuomintang in China, which once used similar language. The Communists, however, have already begun to make plenty of trouble for them, and the war has left Burma full of hidden arms. Order has never really been re-established since the war and the AFPIL will face a difficult task in taking over its inheritance, even in the plains. In the mountains, where the people do not yet fully understand the meaning of Anti-Fascism, there has recently been a revival of the ancient pastime of head-hunting.

* * *

Reparations from Japan

The United States Government has directed General MacArthur to make immediately available as reparations 30 per cent of all Japanese industrial equipment listed for removal. China is to get 15 per cent, the Philippines 5 per cent, and Britain and the Netherlands 5 per cent each for their Far Eastern territories. The United States has thus by-passed the Far Eastern Commission, which according to a spokesman of the State Department "can review the directive, but not reverse it." The decision is defended on the ground that the four nations concerned are in extreme need of industrial equipment for war-ravaged areas, and that prolonged delay in taking reparations from Japan is not only causing hardship to these countries but also causing deterioration of the assets available.

The American proposal was opposed on the Far Eastern Commission by the Soviet Union, France, Australia and India, and Britain was reported to be "not pleased" with it. It is a matter for regret that the action has been unilateral and not a result of a general inter-Allied agreement. The deadlock over reparations from Japan has differed from that over German reparations because the respective relations of the Allied Powers to the two wars have been different. In Europe nobody has ever questioned the basic thesis that the Soviet Union and the East European Allies have the largest claim to reparations from Germany. But in the Far East it is the Western Powers, China and the Philippines who have the valid reparation claims on behalf of war-devastated territories. Soviet territory was never invaded by Japan, and the Soviet-Japanese war only lasted a few days. Yet the cream of Japanese reparations assets, the industrial plant installed by Japan in Chinese Manchuria, was scooped up and removed to the Soviet Union as "war booty."

The Americans have always held that these assets should have been included in the reparations pool, and fundamental disagreement on this issue has prevented any common Allied approach to the Japanese reparations question; there have also been disagreements on claims by other Allies. Hitherto removals from Japan itself, which is entirely under American occupational control, have been held up in the hope of inter-Allied agreement, but now the Americans have decided to distribute at their own discretion to the principal claimants.

Quite apart from disputes between the Allies over their shares there have been misgivings about large-scale removals from Japan itself on account of the precarious economic situation of that country, which appears to be getting worse rather than better. General MacArthur, who is ordered to carry out the removals, recently urged that nothing more should be taken from Japan for reparations or a starving Japan would become a burden on the American taxpayer. But from the point of view of the Administration in Washington this may be less alarming than the alternative. By a remarkable paradox the United States cannot give economic aid to Allied nations without going to Congress and raising a political storm in every case, but expenditure in ex-enemy countries under American occupation, which is just an item in the military budget, does not expose the executive so much to the kicks of the Congressional mule.

* * *

Free Speech in the Civil Service

The continued growth in the size of the Civil Service, shown in the latest quarterly returns for January 1, 1947, gives an added point to the argument which is going on between the Treasury and the Staff Side about the freedom of civil servants to take part in political activities. The matter has been under discussion for some time, so that there was a considerable flurry of excitement when Mr Hall, Financial Secretary to the Treasury, stated in reply to a parliamentary question on March 27th:—

"I should regard as improper any public criticism by a civil servant of policy for which a Minister, whether of his own or some other department, is responsible."

As there is almost no important sphere of the nation's life for which a Minister of the Crown is not at least partially responsible, the area of free comment, on Mr Hall's definition, is reduced to an insignificant size. Such a restriction on the individual liberty of nearly three-quarters of a million civil servants would be quite unjustified, and would be most unhealthy for the country. Civil servants are already quite remote enough from the ordinary stream of the nation's life to need every reasonable encouragement to wade into it whenever they can.

It is on the definition of what is reasonable that the difficulty arises. While most people would agree that a postman should have almost unlimited freedom of speech and the permanent head of a department none, there is a broad belt between the two which defies specific definition. The civil service trade unions are pressing for release and reinstatement for service in Parliament, time off with pay for service in local government and complete freedom of expression of political opinion for all grades, subject to disciplinary action for indiscreet conduct. These demands go too far in the very definite form in which they have been put forward, but it is certainly better to err on the side of more, not less, liberty, and to leave departments a free hand to say when an individual has gone too far. Senior officials certainly ought not to be allowed an unrestricted two-way traffic between the Palace of Westminster and Whitehall, but the single journey outwards might be made easier; and part-time release might well be permitted to the executive and clerical grades, outside particular departments, for service in local government.

*

The full figures (Cmd 7086) for the increase in numbers over October, 1946, are given in the *Records and Statistics Supplement*. They show a rise of 8,000 to a total of 722,000, with the biggest increases in the Post Office and Inland Revenue, but with smaller increases in almost every department except the service and supply departments and the Ministry of Food. Socialism and the apparatus of regulation continue to keep step.

* * *

The Law Lords on Desertion

The House of Lords recently delivered a judgment in a divorce suit that is of wide social interest. The point at issue was simple. The parties were married in May, 1941, and until the November

THE ECONOMIST BY AIR

Express Service to U.S.A. and Canada

of that year lived normally as man and wife. In the November the wife refused the husband marital intercourse. The husband was then on active service. Her refusal persisted but they continued to occupy the same flat on his periods of leave, until May, 1943, when they separated. The husband petitioned for divorce on the ground of desertion on the part of his wife, her desertion being simply her refusal of marital intercourse. The petition was finally dismissed by the House of Lords.

The major interest in the case lies in the survey of the relevant state of English law by the Lord Chancellor in his judgment. Desertion is nowhere defined by statute and the Courts have at all times been reluctant to make their own definition, and so voluntarily to impose limits on their future freedom. It is, therefore, a question of fact in each case. In the Court of Appeal, Lord Justice Scott, in a dissenting judgment, would have granted the husband the divorce he claimed on the ground that a Christian marriage necessarily implied that both parties had accepted the obligation that their union was intended, among other things, for the procreation of children. The Lord Chancellor was not prepared to base the legal consequences of marriage, and of acts relating to marriage on the marriage service in the Book of Common Prayer. The law, he stated, is concerned with marriages that are made in registry offices, that are made between peoples of all religions and of no religion. The legal consequences of each must be the same, and must be derived from the statutes governing divorce, not from the rubrics governing Christian marriage. And the Acts regulating matrimonial disputes do not support the claim that a wife's refusal of marital intercourse, once a marriage had been consummated, was the desertion that the Statutes intended should be the foundation of a successful claim for divorce. It is clear that if the rights and duties of the married are to be changed, it will need an Act of Parliament to do it.

* * *

Civil and Military Research

The publication of the Estimates for the year 1947-48 reveals some very interesting comparisons between the level of Government expenditure on civil and military research. When the country is at peace and drastically reducing its armed forces it

is startling to find that government expenditure on military research is about six times the expenditure on research for peaceful purposes.

On March 19th Mr A. V. Alexander announced that during the coming year £60 million would be spent by the Admiralty and the Ministry of Supply in scientific research and development. Other government grants for purposes of research may be summarised as follows:—

ESTIMATES FOR 1947-48 FOR GOVERNMENT GRANTS FOR RESEARCH

Agricultural Research Council	402,000
Agricultural Research financed direct by Departments of Agriculture*	1,289,000
Fishery research	222,000
Medical Research Council	698,000
Department for Scientific and Industrial Research	3,118,000
Colonial Research	1,000,000
Social Survey	50,000
Universities—total recurrent grant	12,000,000
	18,779,000

* Includes capital grants and grants in aid of annual expenditure to Colleges and Institutes.

As part of the expenditure allocated to the Department of Scientific and Industrial Research is for military purposes, and the grants to the universities and agricultural colleges and institutes includes large sums for ordinary maintenance and teaching costs and the usual apparatus of student life, it is probably nearer the truth to reckon that ten out of the nineteen million pounds is used for research proper. This figure for civilian research contrasts strikingly with the sixty million pounds for military research.

The expenditure of private industry on applied scientific research is not included in these figures. The total must be considerable, but it is not known. And at a time when the future of the country is bound up as much in its economic as its military future more positive steps to assist research in fields more related to industrial developments is badly needed from the Exchequer.

Letters to the Editor

Census of Production

SIR,—If Mr Stuart entertains the belief that "the statistical material already rendered to the Government is enough for them to obtain a fairly complete picture of the national economy," I recommend to him that he read Chapter vi of *Employment Policy* (Cmd. 6527), where the Government's requirements are set out, and compare this with what is available. Or, if he is too harassed to do that, he might find frequent references to lack of information in *The Economist*. I for one cannot see how an intelligent discussion of, for instance, inflation can take place, and the official estimates of the money national income made use of, without knowing at least the volume of production. Neither do I think that our need for information will be less in 1950 than to-day.

I also hope, Sir, that your readers will not be taken in by "the practical man's" plea that filling in Census of Production forms is a Herculean task. I cannot find a single item mentioned in the *Report of the Census of Production Committee* (Cmd. 6687, 1945) which should not be already in the files of the accountant of any efficiently run firm; and it would be of great educational value for other firms to keep similar records (see para. 4, Cmd. 6687). I have myself initiated such records in a factory during the war with no great difficulty.—Yours faithfully,

Houghton Street, Aldwych, London, W.C. 2 T. BARNA

Budget Target 1947

SIR,—Are you really sensible when you say in your issue dated March 29th that the Chancellor should seek additional revenue from death duties? England became great by honest thrift. The high rates of income and surtax have destroyed honesty; the high rate of death duties has destroyed thrift. People used to be thrifty mainly for two reasons; either to provide for themselves a reserve on which they could live in bad times, or in old age, or to give their children a good start in life. The desire of parents to give their children a good start arises from the Christian

outlook on life based upon the unity of the family. Now, alas! all is changed, and increasing numbers are adopting the pagan conception that someone else can look after them or their children.

Both the Chancellor and other members of the Government have said that, as individuals, we must save, and in our businesses we must plough back profits. Why should we save or plough back profits if the results of our efforts are confiscated when we die? Moreover, new developments in business require several years to reach fruition. How can the Chancellor expect us to plough back profits in risky enterprise when an untimely death may mean that a large sum of money suddenly has to be raised out of the business, thereby causing disaster to the business and financial embarrassment to the family?

Sir Stafford Cripps has appointed a number of working parties because he believes that British industry is out of date. I wonder whether anyone has ever bothered to discover to what extent this unfortunate state of affairs is due to death duties. One need only travel through the English countryside in order to perceive the lamentable state of the land and farm buildings which has resulted from confiscation of capital. The same applies to industry, particularly the small industries which provide employment for the vast majority of our people.

In this country nearly all of us are capitalists. If England is going to regain its former greatness, we must all strive to become bigger capitalists. We shall only do so if there is a simultaneous reduction in death duties as well as in other forms of direct taxation.—Yours faithfully,

10 Southwick Place, London, W. 2

WILLIAM FOSTER

Income Tax and the Budget

SIR,—Is it any good pointing out that the chief troubles about Income Tax and PAYE spring from the absurdly high points of total exemption? One need not go so far as J. S. Mill, who thought £50 high enough for a man with a family, or as Harold Cox, who thought that everyone with an income ought to pay some tax on it. But the mere fact that Income and Surtax rising to 19s. 6d. in the £, only bring in £1,232 million, out of a national

income estimated at well over £8,000 million, shows that a large amount of income escapes tax altogether.

Therefore I suggest that the point of total exemption for single persons should be reduced to £80 a year. This would bring in many millions of voters who ought to bear some direct responsibility for the policy which their votes have endorsed. At the same time, I would reduce the rate on the first £200 of "taxable income" to 2s.

One desirable reform is the inclusion of "board and lodging" in the assessment of income. The Treasury finds no difficulty in valuing this item when it wants to prove that a soldier's remuneration is a great deal more than his pay.—Yours faithfully,

2 St. Peter's Terrace, Cambridge

J. E. ALLEN

Let us Face the Future

SIR,—I was rather startled by your editorial article of January 25, 1947. Startled by what was left unsaid.

The editorial notes the current labour shortage in Great Britain, as set forth in the Government's White Paper. It adds: "Moreover, so long as £7,000 million of incomes (after tax) face only £6,000 million of consumer goods and services the threat of inflation remains." Then it proposes a four-point programme to increase production. The four points are: (1) "Enlarge the total labour force" (2) "Revise the whole system of direct taxation"; (3) "Formulation of a consistent wages policy"; (4) "Overhaul the whole apparatus of economic control."

Although the editorial covers almost two printed pages it does not even touch upon raising productivity by increased mechanisation. In 1931, eight years before the war, *Automobile Engineer* expressed the view that "high production machines that are being developed in America cannot be economically used in this country . . . because existing British plants can already produce more rapidly than the products can be disposed of." (Quoted by R. Palme Dutt, *Fascism and Social Revolution* (1934), p. 1.)

The war brought to America astonished reports by returning personnel about the lack of modern machinery in England. From the opposite standpoint many *Punch* cartoons seemed to express surprise at the extent of mechanisation in the American Army.

The fact that buying power now exceeds available goods in a 7-6 ratio shows that the present situation is the direct opposite from that when existing machines could "produce more rapidly than the products can be disposed of." The same considerations which induced limitation of mechanisation then, seem to call for more high production machinery at this time. It is no answer that there may be obstacles: in your editorial this recourse was ignored, not rejected. According to accounts in American newspapers, the Government has begun such a programme in the coal mines, but expects it to take twenty years.—Yours faithfully,

GEORGE G. OLSHAUSEN

797, Bay Street, San Francisco, California

Deflation

SIR,—The attention which has been paid by *The Economist* and other financial papers to the increase in the volume of bank deposits has, I fear, led some people to conceive of this vast quantity of money as liable at any moment to be spent on goods, so constituting an alarming inflationary threat. Surely whatever excess of bank deposits may exist over the volume that would exist in the absence of the Chancellor's cheap money policy is held instead of low interest bearing securities, and is no more likely to be spent than such holdings of securities.

The case against the cheap money policy should be directed solely to the low interest rates to secure which this creation of bank credit was necessary. Those who object to the Chancellor's cheap money policy do so on presumably two grounds: (a) that investment is over-stimulated by excessively low interest rates; (b) that in the process of driving rates down security prices are forced up, and capital gains result which may add to effective demand for goods.

As regards (a), surely the control of capital issues has replaced the interest rate mechanism as a means of keeping down the rate of investment? There is no need to deflate credit if you wish to reduce investment activity; and if you don't wish to reduce investment activity, how can dearer money help you?

As regards (b), this period of rising security prices should now be over, since it seems unlikely the Chancellor intends to force

interest rates down lower still. (Nevertheless, to maintain them where they are, which is probably below the equilibrium rate that would secure no more than full employment, he may well have to continue creating money to be held by those who won't lend at 2½ per cent.)

A considerable part of the national debt matures over the next few years. I cannot believe that *The Economist*, which is continually calling for a balanced budget and also if possible lower taxation, really wishes the debt charge to be allowed to grow heavier. The cheap money policy is a plain budgetary necessity.

In your leading article of March 15th you say the Government "cannot adopt a realistic financial policy, partly because that would involve abandoning Mr Dalton's policy of over-cheap money, and partly because they could not face the odium of deliberately setting out to reduce the money incomes of the wage-earners." I hope deflation is not *The Economist's* idea of a realistic financial policy. It is the most irresponsible and unrealistic policy imaginable.—Yours faithfully,

F. J. ATKINSON

Experts and Inflation

SIR,—None of the workmen who produce goods for export can buy what they produce, as your correspondent, Mr G. W. Wilson says in his letter of March 29th, but surely they can, and do, buy the goods imported which are the counterpart of those exports.—Yours faithfully,

CHAS. H. BATES

34 Flanders Mansions, Bedford Park, W.4

Design in Industry

SIR,—Your correspondent, Mr. H. A. Fieldhouse, would not meet with universal agreement in his suggestion that American technical design is invariably of neater appearance and layout than corresponding British products. Other experience, especially in aircraft engineering, would point to the contrary where British design, on a sounder fundamental basis, provides a more closely integrated design solution than the "Christmas Tree" effect caused by after-thoughts arising from empirical solutions.

To understand "neatness," or even beauty in design is essential.

From *The Economist* of 1847

April 10, 1847

... What is our present position, and what are our future prospects? . . . we find ourselves committed to a public expenditure in Ireland of eight million during the remainder of the present year, which must chiefly be expended in importing foreign provisions. . . . Then, independent of this large sum, a large amount will be required to import food to make up the consumption of other parts of the United Kingdom. . . . Then, again, with respect to all the leading articles of raw material, cotton, wool, hemp, flax, tallow, and most articles of colonial and foreign produce, the stocks are much below their usual amount. . . .

But against these increased importations, what probability is there of any material increase of exports? Of foreign and colonial produce, our stocks do not admit of it. Of manufactured goods, the high price of the raw materials will operate materially against such an increase. . . . On the whole . . . taking a careful survey of all our markets, the most favourable view that we can take of our export trade, is that the additional demand for some, may compensate for the falling-off to others; and that the entire amount of our exports will, in 1847, be equal to those of 1846; we say this is the most favourable view we can take of the matter. . . .

We regret that it is not in our power to give a more cheering prospect for the immediate future; but it is a state of matters which . . . we have urged upon our readers as certain to happen, sooner or later, from the railway undertakings; and it will now be most easily met, and its effects most mitigated, by clearly understanding the extent of the difficulty. . . .

We have great confidence in the enormous energy which this country can display in such periods of difficulty as we are inevitably approaching; in the increased facilities and economies which such necessities introduce into production, and of the individual privations which our countrymen will suffer, and the efforts they will make in order to retrieve a misfortune; and it is to these, and these alone, that we now look for a mitigation of pending calamities and a restoration to a condition of prosperity.

This is not truly achieved by camouflaging the Christmas Tree under the tinsel of a so-called "streamlined" case, complete with chromium plated fittings, often with no real purpose, though there is no objection to enclosure as such, provided it is part of the fundamental design and not "decoration." A design is only satisfying to the discerning eye when it approaches functional perfection.

It is true that American equipment was invariably better finished externally by plating, enamelling and other methods, which is a measure rather of the extent to which resources were stretched in the respective countries. Finishing processes not essential to functional performance were not countenanced in this country. No one would deny that in this country we must pay more attention to industrial design which is again often another matter. It is, however, rather unfair to the motor industry to complain that motor car manufacturers have not, generally speaking, changed since before the war. I do not know the motor trade personally, but would imagine they would doubtless like to. Unlike their American contemporaries, the war started for them in 1939, and they have been at it ever since.—Yours faithfully,

Conflicting Claims for Emigrants

SIR,—I was very much interested in the note published in your paper of January 25th. I read there that the Dominions, especially Canada, Australia and South Africa, have a very acute lack of manpower, and that the United Kingdom cannot answer this

urgent claim by sending people abroad. May I draw your attention to the fact that there are in Germany a considerable number of persons, skilled workers of all professions—artisans, farmers, engineers and scientists—who would be quite willing to go abroad and to start a new life. Some countries have already started to profit by these offers, and the first to come forward will have the selection of the best workers. These people, working in different parts of the world, without any close contact with one another, will not be a political danger. Moreover, experience in the United States proves that German emigrants may very quickly become good citizens of their new country, and that in the second generation they differ little from the old inhabitants.

Settling some millions of Germans in the vast areas of Canada, Australia, etc., would automatically solve a number of serious problems. Instead of sending vast amounts of food to Germany it would mean a saving of cargo tonnage and at the same time would give the different countries the manpower they need. Considering the present living conditions in Germany, these settlers would not mind the hardships and difficulties that emigration brings with it—for example, housing shortages, etc. Perhaps it would be best to send carpenters and masons first, so that they could build new houses both for the old inhabitants and the new settlers.

Radio Melbourne is said to have broadcast a report saying that the immigration of scientists from Germany would be the best way of paying reparations. This could certainly be the case for skilled artisans also if special schools were established in Germany, e.g., Canadian or Australian Institutes, which could make young Germans of both sexes acquainted with the conditions of life in their possible new homes and teach the language.—Yours faithfully,

HELMAR STRANCH

Books and Publications

Empire Trade

"Imperial Preference." By Ronald S. Russell. Empire Economic Union. 168 pages. 5s.

WITH the meeting of the International Trade Organisation at Geneva this week, where undoubtedly imperial preference will be one of the major topics of discussion, the publication of this book has been most opportune. It is intended to be a factual study and indeed contains many statistics and much useful information. According to Mr L. S. Amery, in his foreword, the book provides material which justifies the claim that Britain has sought to overcome her immediate post-war difficulties by abjuring the right to co-operate in any exclusive sense with the members of the Commonwealth.

No factual study, however, can give a completely objective survey, least of all on such a complicated problem as imperial preference. The correlation of facts and figures is seldom simple, and Mr Russell would have done better had he attempted an objective analysis. To show that the proportion of Empire trade either with the United Kingdom or within the Empire itself has risen between 1930 and 1938, has little significance in itself; nor do facts and figures on their own necessarily prove the case for or against imperial preference. The fundamental questions are whether the Empire can supply Britain with the goods she wants, and whether England can supply manufactures in return. The year of the greatest expansion of Empire trade, as far as the United Kingdom was concerned, was 1931 to 1932—before the Ottawa Agreement, and was mainly due to the creation of the sterling bloc. Even in 1938, Empire sources supplied only 40 per cent of the total of United Kingdom's imports and took 50 per cent of her exports. In the same year trade within the Empire accounted for only one third of the total of trade conducted by the Empire, which shows the foolishness of any assumption that the Empire could be a self-contained economic unit.

But these arguments do not necessarily vitiate the case for imperial preference. Although the economic reasons are not overwhelming, the political ones may be. This, however, cannot be proved or even stated by facts and figures of trade. If the case for imperial preference is to be made convincing it must be argued on much broader grounds, and this is precisely what Mr Russell's book fails to do. Moreover, the bald statement of facts can be very misleading to a reader who does not fully understand their implications. The unilateral application of imperial

preference by the Dominions at the end of the nineteenth and the beginning of the twentieth centuries was not done out of altruism. The Empire countries needed British manufactures as much as England required foreign raw materials. But Great Britain was still more important to the Dominions as a buyer of their produce than as a seller of manufactured goods, and Canada was the first to realise that by granting unilateral preference to British goods, she increased her share of the British market for her own exports.

Perhaps the most useful part of the book starts at chapter 6 where it deals with commodities. But here, too, it is too brief for the more serious reader and too factual and unpalatable for the casual one. The author set himself an impossible task; his efforts would have been better rewarded had he written either an easily digested explanation for the general reader, or better still, an objective and critical analysis of the whole question of imperial preference for those who are more seriously interested. As it is, this book should be considered as a factual *aide-memoire* for the student of Empire policy.

Indo-British Treaty

"The Basis of an Indo-British Treaty." By K. M. Panikkar. Indian Council of World Affairs. Oxford University Press. 52 pages. 2s. 6d.

MR PANIKKAR, already well known to those interested in Eastern affairs by his book, *The Future of South-East Asia*, is an exceptional figure among contemporary Indian writers. Although a Hindu, he is quite tolerant of the idea of Pakistan; as a native of Travancore in the extreme south of India, he has an interest in overseas and naval questions very unusual in the sub-continent; and as a competent historian with a broad and realistic view of international relations, he has an awareness of problems of external defence to which most Indian nationalists seem to be quite blind. These exceptional qualities render it impossible to regard Mr Panikkar as representative of Indian opinion; he is nevertheless a prophet not entirely without political influence—he is Prime Minister of the State of Bikanir and his ideas may in the future become practical politics.

Briefly, his theory is that India's future prosperity and safety are bound up with the peace and security of the Indian Ocean and the countries on its shores, for which a permanent alliance with

Britain after India's attainment of full independence offers the best guarantee. He conceives the future special relation of Britain and India not as British protection of India, but as a complementary association of equals which will be in Britain's interest as much as India's. Both Britain and India, he argues, must seek to maintain a Eurasian balance of power, which is now threatened by "the organisation of the heart of the Eurasian continent in an unprecedented unity and strength, covering the area from the Pacific to the Adriatic and Baltic and from the Arctic Ocean to the Himalayas." The countries of the "Rimland" extending from Britain to Indonesia—the traditional sphere of British naval ascendancy and imperial policy—can only survive in independence by defensive association, for which Britain is the key for the western or Atlantic, and India for the eastern or Indian Ocean, sector. "The Indian Ocean region extending from Aden to Java," writes Mr Panikkar, "is strategically one, and is dominated by the geographical position of India." He believes that the alliance would not only assure Britain's maritime life-lines but also "create a great industrial and trade revival in Britain," for it will require an intensive industrialisation of India, if only as a basis for defence, and "the old-fashioned idea that it is an undeveloped agricultural country that provides the best market for an industrial nation has been completely disproved by the experience of the last half century."

Industry in Latin America

"Industrialisation of Latin America." Edited by Lloyd J. Hughlett. McGraw-Hill. 508 pages. 5s.

THE war-time activities of various United States financial and technical agencies stimulated the industrialisation of Latin America and the interest of North American businessmen in the region. The present position of their main trading rivals—Britain and Germany—and the possession by the Republics of some \$4 million balances give a great advantage to the United States. It is thus not surprising that in recent years a number of books on trading conditions and prospects in Latin America have been issued by American publishers. While there is no need for these books to be highly specialist or theoretical, there is no doubt that the majority are naïve, pretentious and over-optimistic. This book, by contrast, provides a critical and well-informed general study of the industrialisation of Latin America.

The book's approach is severely practical. Even the introductory chapter, in which the editor sets out the problem of industrialising South America against its economic background, is factual rather than theoretical. The seeker after El Dorado will be rather discouraged by the list of handicaps to industrial development—the extremely low purchasing power of the people, the vast distances and inadequate transport facilities, illiteracy and the legacy of "colonial" economics. But the shrewd entrepreneur will be grateful for this indication of his difficulties—and his opportunities. Seventeen industries are then dealt with in detail, each being treated to a short general introduction, a factual survey of the main enterprises, arranged country by country, and, finally, but not invariably, a few pages of general conclusions. This treatment results in a book that is more suitable for reference than for reading, and there is fortunately an adequate index. The text is illustrated by many maps, diagrams and tables, some of which are rather old and quoted without their source, and by over 120 photographs, which are not on the whole very well selected, or well reproduced.

The book contains a wealth of useful information, but the emphasis on fact tends to produce some rather tedious lists of names of firms given apparently for their own sake rather than to illustrate any particular point, while other facts having a greater bearing on industrial enterprise are given too slight a treatment. Unless it is assumed that the practical businessman will read some of the more speculative books which treat of these topics, they could well have been included—possibly at the expense of Mr Braden's dutiful but platitudinous last chapter.

Socialist History

"Years of Crisis." An Outline of International History, 1919-45. Kenneth Ingram. Allen and Unwin. 21s.

ALTHOUGH the sub-title of this book describes it as covering the years from 1919 to 1945, less than 200 of the 475 pages of text deal with the twenty years between the two wars. Mr Ingram has really attempted to combine an outline narrative of the war

with a fairly long historical introduction. The narrative is clearly and sensibly written; the main facts are sorted out and arranged with considerable skill, but the general level of treatment is superficial. Few authorities are quoted, and those chosen tend to be of light weight.

The chapters on the pre-war years are open to most serious criticism. Here also indeed Mr Ingram is lucid and business-like when he is dealing with facts and dates. Unfortunately he tries to interpret as well as to describe, yet he makes this attempt without realising that the first duty of an historian is not to praise or condemn but to understand. Mr Ingram's method of interpretation is of a "left-wing" kind which has become as familiar to this generation as were representations of the Last Judgment to our medieval forefathers. There are the Righteous and the Damned; the Socialists and the Conservatives. The Righteous, and in particular the Righteous Russians, are never wrong. Those Damned can never get things square. Even if they behave properly, they do so for sinister reasons. Thus in 1940 the English Conservatives, or financier-industrialists, went on fighting because they were faced with "the threat to British imperial-commercial interests."

How does Mr Ingram know all this? What careful sifting of thousands of individual cases has convinced him that while English Socialists fought for democratic liberty, English Conservatives fought for property and stocks and shares? And if Mr Ingram has not spent month after month in careful examination of the evidence bearing upon the point, by what right does he insult the propertied classes? Obviously Mr Ingram did not intend those insults. The fact that they are implicit in his rash and unnecessary generalisations shows the danger of writing history under the impression that everyone who is not a Socialist is, or must become, a Fascist.

Shorter Notices

"Economic Research and the Keynesian Thinking of Our Times." By Arthur F. Burns. 26th Annual Report of the National Bureau of Economic Research Inc., New York.

IN this short but valuable essay the author examines the assumptions of Keynesian Theory, and finds them, for all their logical coherence, as imperfectly based in real facts as were those of Ricardo, with whom he draws a suggestive parallel. He outlines the factual and statistical researches which should provide a test for these assumptions and a guide to cycle policy, fortifying his text by several tables which indicate that the Keynesian picture is oversimplified. Aggregates of savings, investment, employment and spending are illusory and should be broken down into industry; the shape and permanence or otherwise of the "consumption junction" should be studied. The giving of realistic content to economic ideas, always desirable, becomes urgently necessary where those ideas are likely to provide the basis of Government policy.

"Argentina." By Norman Mackenzie. Gollancz, 1947. 6s.

IN February, 1946, the United States Government issued a *Blue Book* on Argentina. This, though in some respects a partial document, was, in its main indictment, impossible to refute. Mr Mackenzie leans heavily upon it. Though he does not acknowledge the fact, the *Blue Book* has provided him with the core of his own book. He has prefaced its indictment, however, with an introductory chapter, based almost entirely, and also without acknowledgment, on the works of Isabel, Rennie and Felix Weil, and in forty pages or so at the end he brings it up to date. The introduction is not altogether happy. It contains a number of dubious generalisations and a gross misrepresentation of the Roca-Runciman Agreement. But the succeeding chapters are worthy of attention. It is not necessary to believe, with Mr Mackenzie, that President Perón is a "Nazi agent" or to accept all Mr Mackenzie's other opinions. But his main attack on the Argentine régime, like that of the *Blue Book*, which the United States Government now finds it more convenient to forget, stands. It is the indictment of a near-Fascist régime which has thrived by the familiar technique of exploiting one section of society against another.

"The University of Birmingham." E. W. Vincent and P. Hinton. Cornish Bros. 238 pages. 25s.

THIS is a handsome and attractive production, very different from the usual modest volumes which describe the history of British Universities. It deals with the development of Birmingham University from 1900 to 1945, but unfortunately stops short of the plans for post-war development. It is generously illustrated, and strictly accurate, but there is a certain unacademic simplicity about the treatment which derives from the author's background. This is no history written by dons, but by Birmingham citizens who have a great pride in their young university, and few qualms about the fundamental purposes for which a university exists.

AMERICAN SURVEY

Coal Hazards and Politics

(From Our US Editorial Staff)

ON March 25th, in Centralia, Illinois, 111 miners lost their lives. They died slowly, from the gas, after writing farewell notes to their families in the dark, on leaves torn from a time-book. Per million man-hours worked, theirs is the most hazardous American occupation: in 1946, a year of no major disaster, 974 men lost their lives, and only lumbering exceeds mining in the frequency of accidents.

Centralia was an accident, but it is now becoming both a political and an economic act. It had the timing essential to tragedy: it came two weeks before Easter, and shortly before John Mitchell Day (April 11th), when miners normally celebrate the man who righted ancient wrongs by building them a strong union. It also came in the week before March 31st, the date at which a walk-out had been threatened by Mr Lewis last December, and withdrawn by him only on March 19th in conformity with the Supreme Court decision. On April 1st, moreover, the Solid Fuels Administration, which had authority to allocate coal supplies, ceased to exist with the expiry of the Second War Powers Act.

The establishment of a health and welfare fund, to be administered by the union, was a major factor in the unsuccessful contract negotiations between Mr Lewis and the operators a year ago, following which the government took over the mines. Now Mr Lewis becomes the champion of safety. The six day "mourning period," which he decreed to start on the hour that the strike would have started, is to continue, mine by mine, until all mines are safe. Mr Lewis has a letter from Dr Sayers, Director of the Federal Bureau of Mines, saying that only two of the country's mines are entirely in compliance with the Federal Mine Safety Code which became effective on July 29, 1946. Since "mourning periods" are recognised as legitimate in the miners' basic agreement, the Bureau of Labour Statistics will not record the present stoppage as a labour-management dispute, and the unemployment compensation thereby made payable will reduce the loss of income of the miners, whose wages now average \$70 a week.

But Mr Krug, Secretary of the Interior, administrator of the government-operated mines, and strategist of the Government policy pursued with regard to Mr Lewis last winter, is also out for safety. He has made an order to shut 518 mines and to reinspect the 2,531 others, with those shut not to be reopened until the union mine safety committees say they are safe. And to avoid another argument, Dr Sayers, whom Mr Lewis has made it clear he trusts, has been persuaded to stay on for the present as head of the Bureau of Mines.

Mr Lewis's effort to pin the entire responsibility on to Mr Krug, in asking for a Congressional joint resolution requesting the President to oust him, falters on the point of these mine safety committees. Under the diffused exercise of responsibility that accompanies states rights, the states traditionally have been responsible for safety under their various safety laws, their own inspection procedure, and their own power to deal with violations. The Federal Bureau of Mines has had authority only to make recommendations to the operator of a mine; his compliance was entirely discretionally. But the safety code adopted

last July for the period of government operation required copies of inspectors' reports to be filed also with the district and national offices of the union. So the non-compliance of the operator of the Centralia mine, noted in November, and again in March, was known both to the government and to the United Mine Workers' officials. Mr Lewis's alibi is that the recent court procedure cowed his people into inaction.

Mr Krug's order, issued after the disaster, by-passes entirely the governments of the nineteen states in which mines are closed. Mr Lewis was in the midst of theatrical testimony before the House Labour Welfare Sub-committee when the order came out: he was asking for a law giving to Federal inspectors the power they do not now have to close mines found to be in violation. (Mr Krug's special powers as administrator will run out at the latest on June 30th, when the mines go back to the private operators.) The retrospective interest in mine safety which is thus being shown on the national level is doubled on the state level in Illinois where the disaster occurred. Mr Green, the Republican Governor of the State, has announced the resignation of Robert Medill, head of the State Department of Mines, "for the good of the service."

The economic impact of the initial "mourning period" was estimated by the National Coal Association, on the basis of production during previous Easter weeks when the miners worked, at a minimum of 8,000,000 tons of bituminous coal. The output of the 518 mines that were ordered to be closed by Mr Krug is estimated at about 600,000 tons a day, or some 26 per cent of the country's daily output. Some of the violations of the code at these mines can be remedied in a brief period; others would require drastic changes. Particularly with the Solid Fuels Administration out of business, the economic impact of continued non-operation may be considerable.

Its political impact also will be substantial. Mr Lewis, in trying to pin the blame on a Democratic Cabinet member, in instructing men to go back only to mines that are safe, and in asking Congress to direct the Treasury to refund the \$750,000 fine levied on the UMW for contempt of court, so that it may be used as an endowment for the families of the victims, has somewhat the air of an undertaker laying a mat of artificial green grass over the raw earth beside a grave. Mr Lewis, who at the moment is a good Republican, has doubtless noted the Gallup poll which gives Mr Truman a rating of 60 now, and gave him a rating of 32 at the time of the last election. Few doubt that the upward rise began with Mr Truman's handling of the coal situation. Mr Lewis would not inconceivably like to get some of his own back.

On the Republican side, the intricate balance among many leaders may also be affected. Nobody knows for certain that Governor Dewey is Mr Lewis's favourite for the Republican Presidential nomination; but his behaviour in testifying before the House Labour Committee did not indicate a desire to make things easy for Senator Taft. Mr Taft is also weakened by the double blow to the Republican state machine in Illinois, who are his natural allies. Having just lost the Chicago mayoralty election, they are now accused of corruption and inefficiency. They are doing what they can to cover up. It was the Illinois Republican, Senator Brooks, who moved the resolution in the Senate to set up a committee of investigation. But the evidence may be difficult for the Republicans. The State inspector of mines in the Centralia district has already alleged that the State inspectors—all political appointees of course—were required by the party machine to raise a campaign fund of \$25,000 from mine operators "satisfied with the inspection service." This is expected to be part of the evidence that will have to be handled by this Committee.

Henry Ford

THERE is a tremendous fascination in the record of the economic empire-builders—at least for the non-Marxist student of American history. Gould, Rockefeller, Carnegie, J. P. Morgan, "The Commodore," the Harrimans, the McCormicks, and the Guggenheims—the list is no more than a random selection from the list of adventurers, inventors and organisers who dominated the industrial scene in the United States during the last thirty years of the nineteenth century. They knew the power bestowed by the outsize business organisation, with its centralised control and administration, its links with the financiers, and its grip on every instrument of production, from the individual labourer to the local, or the Federal, politician. When they began, the United States was scarcely more than a land of farmers and handicraft industries, with many of its communities almost isolated, and almost self-sufficient. Often, they operated with reckless prodigality in terms of national resources; they made the legal profession and the politicians their docile instruments of power. Frequently, they were not averse from violence, and they had, in general, little vision beyond the confines of their power. But, by the turn of the century, they had laid the foundations of the industrial wealth and machine power of the United States. They had unified a continent, and in the eyes of Andrew Carnegie, democracy was both "triumphant and complete."

Against this background, through the closing years of the nineteenth century, Henry Ford began the career that was to place within his hands an accumulation of personal wealth and industrial power unequalled by any other individual within, or beyond, the continental boundaries of the United States. But there would be something less than justice for Henry Ford in a record that sought to assess his life and work solely in terms of personal wealth and power. By any comparison, there are as many divergences as there are similarities in the romance of the Ford Empire and the record established by the earlier pioneers whose ruthless energies subdued the material resources of North America.

Henry Ford, it is clear, was not averse from wealth or power. He believed, indeed, with so many of his predecessors and contemporaries, that power accrues from the possession of individual talent. And he could be ruthless enough when circumstances warranted such a course. The record of the La Follette Committee on Civil Liberties showed clearly enough that violence on the part of industry was by no means the prerogative solely of the nineteenth century. There are, even today, whole areas of the United States in which the Bill of Rights enjoys no more than a nominal authority. The Ford Motor Company did not shrink from the most ruthless methods to assert the sanctity of property.

For Mr Ford, however, the assumption of extra-legal authority in defence of property was no more than an incident in the record of enterprise. He could not believe that industry—unmolested by the agitation of subversive elements—might fail to provide the answer for every material problem of human life. But he did not seek violence because he might thereby advance his personal possessions, or assuage any thirst for personal power and privilege. He was never embroiled in the frenzy of speculation that brought so many of his industrial colleagues to disaster, and he no doubt despised the efforts of the lesser fry who, after the turn of depression in the nineteenth-thirties, writhed beneath the probe of the Senate Committee investigating the Wall Street preliminaries to the collapse.

The secret of the satisfaction that Mr Ford derived from life, and of the respect in which he was held by the American community, lay in his entire pre-occupation with productive effort. He did not claim the credit for the first automobile, but he never tired of asserting his role as the founder of the modern industry. He did not claim credit as inventor of the machine-belt and the assembly line, but he never forgot that the Ford works first showed their mighty potentialities.

Altogether, Henry Ford believed, as resolutely as did Maynard Keynes, that "consumption is the sole object and end of all economic activity." And he was at one with every economist in his passionate assertion that in the lowest possible cost of production, and the maximum possible division of labour, could be found the key to wealth for the consumer.

In these qualities, and in his equally passionate conviction that the horizons of opportunity were still unbounded, Mr Ford was at one with popular opinion in the United States. At recurrent intervals, the American worker, the farmer, the professional and intellectual classes have challenged the power of Big Business. The Jacksonian legends and Bryanism are still powerful forces, and Wilson's New Freedom, no less than Roosevelt's New Deal, will sooner or later emerge from present neglect. But, aside from rare moments, the challenge has never assumed a collectivist tinge. A very brief incursion by Mr Reuther in 1945 took the ranks of organised labour beyond the preoccupation with hours and wages which forms their normal boundary. But the effort was not sustained, and it will probably not be repeated unless the industrial scene becomes very much darker than in 1947.

This general respect for Mr Ford's qualities, however, could not for one moment avert the hostility of the unions more directly concerned with the vast Ford plant. Ford's Jolly Roger flew boldly against the Blue Eagle of the Roosevelt Administration in the days of the National Recovery Act, and not until the entry of the United States as an active belligerent in World War II did Mr Ford—whose grip on the Ford Empire seemed as secure as ever—make a final peace deal with the United Automobile Workers, and thus with the labour legislation of the Roosevelt era.

The struggles with labour, more especially from 1933 onwards, indeed, are not the least remarkable evidence of the naive and egotistic beliefs by which Henry Ford lost so much of the credit that accrued from his productive and mechanical genius. They are too well known to need any full recapitulation in these columns. They sprang from the simple view that machine technology could simultaneously produce an always-rising living standard, and sustain the essential simplicity of life as Mr Ford recalled it on the home farm in Michigan. The verdict that history was "bunk" did not save him from a belief in the essential validity of the Protocols of Zion, and the resentment which sprang from "bureaucratic interference" with the virtue of the producer (he held no less fervently than did Calvin Coolidge that business is the business of the US Government) embraced the entire works of the New Deal.

Perhaps the most striking feature in assessing Henry Ford's life, however, is the realisation that over the last decade or so, the era of personal dominance in the big American corporation has given place steadily and relentlessly to the co-operative efforts of the machine managers. With Mr Ford at the peak of his life, and with his personal hold unchallenged, the Ford works dominated the American motor world. In 1929, Ford held pride of place in the "Big Three" which still dominate the industry. By 1932 that place had been taken by General Motors, and less than a decade later the Chrysler company took second place and has held it, the Ford share of the "Big Three's" output falling in the last pre-war year to no more than twenty per cent.

In the annals of American achievement the name of Ford must always command a very special place. He resisted to the utmost every effort to keep industry away from the mass consumer. He took the largest personal part in building an industry which, though assailed by the anti-monopolists and the Federal Trade Commission, has a remarkable record for productive efficiency. He left an industry which normally leads all others, in terms of value added by manufacture, materials consumed, and value of goods produced. It would be going very far to say that technology cannot again produce such an era of industrial expansion. But it is probably true to say that Mr Ford will

"AMERICAN SURVEY" is drawn from three sources. Articles described as "From Our US Editorial Staff" are the work of a small group of regular correspondents, resident in the United States. Articles with some such attribution as "From An Industrial Correspondent" or "From A Correspondent in Ohio" are from outside contributors. Everything printed without attribution is prepared in London.

know no later rival in terms of personal power and dominance. The inventive capacity and flair for organisation that built the Ford Motor Empire today find their channels for expression in the research departments and the production divisions of corporations that have grown beyond the capacity of entirely personal supervision. We are in the age of Mr Burnham's managerial revolution, and it is not wholly without significance that when so astute an observer as Mr Peter Drucker turned to survey the social functions of the representative American corporation, he should go, not to Ford, but to General Motors, whose ascendancy was based, not on the personal leadership of its founder William Durant, but on the group efforts of many of Ford's earlier lieutenants.

We shall not, therefore, in all probability, look upon his like again. But the loneliness of his eminence only increases his stature. Ford made an age. He created modern industry. He found automobiles expensive because there were so few of them, and so few of them because they were so expensive. He made his hundreds of millions by one simple act of faith—that if he produced cars in sufficient numbers for them to be cheap, people would buy them. In economic terms, he discovered the elasticity of demand for the products of industry. In retrospect it sounds simple, just as simple as the original invention of the wheel, which exists nowhere in nature. But it was hardly less fundamental, and though the workers of Detroit and of many cities in many lands, who are tied to the assembly line, may sometimes curse his name, nevertheless, when they knock off work after their short hours and are carried by public or private transport to homes whose high standard of living rests entirely on the mass production of manufactures, they owe a tribute of respect, as he passes to his grave, to the man who made it all possible.

American Notes

The Telephone Strike

The telephone strike, and the transparency of the mourning band worn by Mr John L. Lewis, are badly timed for their effect upon labour legislation. After brooding for nearly two months upon the problem of labour law, the Senate and House Committees are by all accounts, ready to lay a very small egg. These two bills are due to be reported out in the next fortnight. At this crucial moment the telephone strikers have forcibly reminded Congress of its impotence in the face of a national utility strike, and Mr Lewis's mourning period is a rude reminder that even the Supreme Court may be flouted by indirection.

Mr Hartley, the chairman of the House Labour Committee, has rushed into the breach with a bill authorising the government to employ the injunction to halt strikes in transport, utilities and communications. This bill, although it was approved by 16 to 3 in the House Committee, is unlikely to secure Senate assent. But a more formidable figure, Senator Taft, has let it be known that the bill he has submitted to the Senate Labour Committee contains a "national emergency" section which would give the government special powers in critical strikes. Legislators will observe with interest that the telephone strike stops short of the borders of Indiana and Virginia where there are state laws, with teeth, prohibiting utility stoppages. A similar law in New Jersey, without direct penalties for strikers, has now been reinforced by a new measure authorising fines and imprisonment for strikers in the telephone service.

The telephone strike is mainly for a wage increase of \$12 weekly to operators now earning an average of \$43. Hopes have not materialised of peaceful settlements on the pattern of the rubber industry when the workers accepted an increase of 11½ cents an hour. One of the obstacles is the insistence of the telephone companies that wage rates should not be determined nationally, but by the districts in which rates are fixed. This issue may revive interest in a legal prohibition on industry-wide bargaining which, according to reports, had been shelved. Another point on which opinion may harden is that of the closed shop. A complete ban has been opposed in the past, not only by labour's friends, but by some employers who find it a source of order in their industries. Now Congress may be tempted to go further, perhaps in the direction of encouraging state bans, of which there are already seven, with bills pending in many Southern and Western States.

The labour picture would not be complete without some

reference to the blind cuts in the appropriations for the Department of Labour made in the interests of economy. If not rescinded, these will not only cripple the protective and conciliatory functions of the Department, but may eliminate much of its statistical work valuable both to labour and industry.

* * *

US and UN

The Eaton bill providing \$400 million for aid to Greece and Turkey has been approved unanimously by the Senate Foreign Relations Committee. As introduced on to the floor of the Senate, the bill contains only three significant changes: the Lodge amendment providing that American funds may not be used to discharge prior obligation of the Greeks and Turks—an oblique reference to earlier British loans; the Connally-Vandenberg preamble, expressing the belief that the bill is in harmony with the aims of the United Nations; and a more momentous amendment proposed by Senator Vandenberg which provides that the President may withdraw aid to the two countries upon their own application or if the Security Council finds (with respect to which finding the United States waives the exercise of the veto) or the General Assembly finds, that action taken or assistance furnished by the United Nations makes the continuance of such assistance unnecessary or undesirable. The Senator who now proposes a United Nations veto on American action—however remote—is hard to identify with the man of the same name who, at San Francisco, had to be persuaded that the American veto on the United Nations would adequately safeguard American sovereignty.

The amendment unquestionably makes the whole programme more palatable to Congress. It dispels the misgivings of the sincere defenders of the United Nations, while it cuts the ground from under those who are less concerned with strengthening Uno than with thwarting the Truman Doctrine. It also deprives the Russians of any pretext of a precedent for future unilateral actions of their own.

The amendment had, at its inception, neither the support of the Administration nor of Senator Connally; and there is some speculation in Washington whether this unilateralism on Senator Vandenberg's part is a symptom of a falling away in bi-partisan co-operation over foreign policy, which might be traced partly to the break-up of the Byrnes-Connally-Vandenberg team; partly to the Republican desire for an independent line; and partly to Mr Truman's unexpected recovery of popularity. Whatever the motives, Senator Vandenberg's initiative fills a glaring gap in the Administration's proposals. Once more the gentleman from Michigan has contrived to find a compromise to neutralise the opposition and on the Senate floor he is proving a pillar of strength. As time goes on, he looms larger and larger among the Republican Big Four.

In the Senate debate more may be heard of certain strings on Greek and Turkish aid which were cut away in committee. These include the creation of a Congressional committee to act as a watch-dog; proposals to earmark certain funds for specific purposes; and a proposal to require the setting up in Greece and Turkey of self-help schemes of taxation, price stabilisation, and export and import control. It will be a remarkable achievement if a Republican Congress allows a Democratic President the latitude now permitted by the bill.

Report of the Press Commission

Members of the Royal Commission on the Press may be interested in the report on a "Free and Responsible Press" just published in the United States. This private four-year study, financed by the Encyclopædia Britannica, Inc. (\$15,000) and Time, Inc. (\$200,000) was carried out by Dr Robert M. Hutchins, president of the University of Chicago, and twelve other eminent Americans, chiefly professors, with no special experience of the press. For the purpose of the investigation the "press" was taken to mean not only the newspapers, but magazines, book publishing, radio and the cinema. Much of the report is sufficiently generalised to apply to the communications of any industrialised and non-totalitarian society. Thus, the Commission argues that the freedom of the press is indeed in danger, but not because of any threat from the government or the iniquities of pressure groups, but because it does not fully discharge its responsibilities to the community of accurate, informed reporting, providing a forum for diverse views and using its educational opportunities to the full. These opportunities are made almost boundless by growing civic responsibilities, the failure of

Much more than you think! 66 lb. is the free baggage allowance on all Speedbird routes, plus what you carry—overcoat, magazines and books. Here is how your 66 lb. might be made up. A big lightweight case (weighing about 6½ lb.) in which you can pack, say, the following 39½ lb. of clothing: lounge suit—tweeds and flannels or dinner jacket—2 tropical suits—3 pairs of shoes—16 shirts—and all you need in the way of pyjamas, underclothes and etceteras. This leaves about 20 lb. for toilet kit and extras in a small nightstop case. In fact, for you, sir, 66 lb. means all you want for a month's world air travel. For you, madam, because of your much lighter clothing, more than enough of everything.

ABRIDGED REPORT

CANADIAN PACIFIC RAILWAY COMPANY

(Incorporated in Canada with limited liability)
SIXTY-SIXTH ANNUAL REPORT OF THE DIRECTORS
FOR THE YEAR ENDED DECEMBER 31, 1946

TO THE SHAREHOLDERS:
The year 1946 provided welcome opportunities for the re-establishment by your Company of services which were suspended during the war, and for introducing further improvements in the field of transportation. The difficulties which the transition period presented were largely surmounted. The Dominion enjoyed general prosperity and the demand for rail transportation was well sustained.

Canadian freight rates, lower than those charged in any other country in the Commonwealth, in Europe or in America, have remained virtually unchanged for more than two decades. Throughout this long period freight revenues earned by your Company have averaged less than one cent per ton of freight hauled one mile. On the other hand, progressive increases have occurred in wage rates and material prices. As a result of such increases since 1939, the costs of operation in 1946 were \$57 million greater than they would have been had prices and wages remained at their 1939 levels. Because this situation imperils the ability of the railway industry to continue to provide modern and efficient transportation service, your Company in association with the other railways in Canada has filed with the appropriate regulatory bodies an application for authority to make a general increase of 30 per cent. in freight rates, with some exceptions.

INCOME ACCOUNT	
Gross Earnings ...	\$292,495,828
Working Expenses (including taxes) ...	271,652,778
Net Earnings ...	\$20,843,050

2% paid October 1, 1946 ...	6,700,000
	11,257,682

PROFIT AND LOSS ACCOUNT	
Balance transferred to Profit and Loss Account ...	\$13,877,049
Profit and Loss Balance December 31, 1945 ...	\$262,772,828
Final dividend of 3 per cent. on the Ordinary Stock, declared from the earnings of the year 1945, paid March 30, 1946 ...	10,050,000
	\$252,722,828

Balance of Income Account for the year ended December 31, 1946 ...	\$13,877,049
Portion of steamship insurance recoveries representing compensation for increased cost of tonnage replacement ...	2,016,572
Net exchange credit in respect of expenditures for new steamships and steamship insurance recoveries ...	708,746
	\$16,602,367
Deduct:	
Miscellaneous—Net Debit ...	198,223
	16,404,144

Profit and Loss Balance December 31, 1946, as per Balance Sheet ... \$269,126,972
(The final dividend of 3 per cent. on the Ordinary Stock for the year 1946 which was declared subsequent to the end of the year and is payable March 31, 1947, amounting to \$10,050,000, is not deducted from the Profit and Loss balance shown above.)

RAILWAY OPERATIONS
Gross Earnings in 1946 decreased \$23,613,530 or 7.5% from 1945. The year's gross earnings have been exceeded only three times, in 1943, 1944 and 1945.
The ratio of working expenses to gross earnings was the highest on record, with expenses absorbing 93 cents of every dollar earned for railway service.
Net Earnings amounted to \$20,843,050, a decrease of \$15,211,284, or 42.2% from 1945. They represented only 7% of gross earnings compared with 11% in 1945, 14% in 1944 and an average of 16% in the decade prior to the war.

other institutions like the schools, and a technological revolution still in its infancy; but the performance of the press does not equal either its power or its technical resources. If the standard is not raised, regulation may become inevitable. Freedom must be "accountable."

Accompanying a technological revolution, there has come the concentration of power characteristic of other industries. National newspaper chains have receded slightly from their peak of power, but local monopoly is growing. Only about one out of twelve cities with any daily paper now has more than one. On the air, the concentration of control enjoyed by the main networks is carried further by the advertisers who pay the bills. Fewer than 150 advertisers provide more than 95 per cent of the networks' income, and many of these channel their contracts through a handful of advertising firms. Food, drugs and tobacco decree what Americans may hear.

The report is critical of the newspapers' sensationalism (though editors will be chary of following the Commission's academic recommendations of giving prominence to such themes as "less intolerance, more schooling, fewer men tending machines"); of Hollywood's spineless accommodation to the pressures of its mass audience; of the big business mentality of the editorial page, and the pernicious effect of advertising on radio programmes; and it is pained by the self-restraint with which papers keep each other's errors and falsifications out of the news. The Commission would like to see a little more of dog eat dog.

But what of specifics for the malady? Dr Hutchins admits ruefully that the most surprising thing about the recommendations is that nothing more surprising could be recommended than a higher standard of professional conduct on the part of the press itself, and certain changes in the law of libel, taxation and anti-trust procedure. The power of the press has increased, is still increasing, and ought to be directed to higher ends—but the sovereign remedy eludes the physicians.

Pulp and Paper

The newsprint shortage in the United States has now reached quite alarming proportions. As reported earlier, the New York Daily Worker was faced quite recently with the complete collapse of its gospel mission, and was saved only by a timely piece of knight-errantry whereby the New York Times made a substantial newsprint loan—presumably on something like Lend-lease terms. In Washington, the Small Business Committee of the Senate was told that small publishers were paying up to \$250 a ton for job lots of newsprint, against a general level of about \$84. Senator Wherry, who ranks as chairman of this committee and is one of the most aggressive spokesmen for the majority party, so far forgot his earlier fight against controls as to threaten the industry with a new bundle of orders, and repentant publishers promised Congressmen that in future they would share out supplies on more equitable lines.

By British standards, however, the distress and despondency which mark the American publishing trade, look more than a little unreal. There is a shortage of immediate supplies, due very largely to the lack of rail freight cars, but the publishing trade scarcely looks as though it is threatened with extinction. In 1946 the overall circulation of newspapers reached an all-time record of nearly 51 million copies daily, with advertising lineage reaching new peaks. And for the second successive year there was an increase in the number of daily newspapers, although the growth of chain groups has brought the total down from 2,500 to 1,760 over thirty years.

In fact, the United States is using more paper than at any previous period:—

	NEWSPRINT AND WOODPULP	
	Imports	Domestic output
	(Million tons)	
1929	4.3	11.1
1932	3.3	8.0
1939	4.6	13.5
1943	3.9	17.0
1945	4.4	17.4
1946	5.3	19.0

Canadian supplies have more than outbalanced the loss of European suppliers, although it is true that the large publishing groups have greatly extended their hold on the newsprint mills, and have thus brought about rather disturbing conditions for some

smaller producers. In the process, the newsprint industry has emerged from a condition of chronic over-capacity to a period of sustained prosperity. It is now engaged in a programme of expansion which is calculated to raise annual domestic capacity by at least three million tons, and to a level which would almost certainly leave it vulnerable to sizeable losses in the event of any marked downturn in the level of industrial activity. For the time being, however, the shortage of essential equipment will probably keep the newsprint industry operating at near capacity.

* * *

The Teacher's Right to Strike

What is to be done when teacher breaks the rules? In Buffalo, a month ago, 2,400 city school teachers walked out, giving nearly 72,000 pupils an unexpected holiday. They won their point, although the city of Buffalo had declared it had no funds. In New York City there is talk of a protest strike against "inadequate" wage increases. Nowhere is there much doubt that on the average teachers' salaries are too low, in terms of current purchasing power, and in relation to the wages of factory workers, janitors and garbage collectors, to maintain the existing corps of teachers, let alone attract competent new recruits. But the teacher's right to remedy the situation by taking a leaf out of the book of organised labour is hotly contested. In New York City, Governor Dewey, over Democratic opposition, has struck back with the Condon-Wadkin Law, which prohibits strikes by public workers and provides very severe penalties for strikers who, if they are reinstated, may not return to work at a higher salary than they received before they struck, may not receive any wage increase for three years, and for five years are to be deprived of any security of tenure and must serve on probation.

The Supreme Court decision in the Lewis case is also being discussed in connection with the right to strike of nearly three million Government employees. In conservative circles it is hoped that the ruling empowers not only the Federal Government but states and municipalities to employ the injunction against their workers.

It is plainly undesirable that essential services like teaching, sanitation, transport and nursing should be subject to strikes. In the schools another effect would be to widen the difference which already exists between the ill-paid, over-worked rural teacher and the more highly organised city groups. But to prohibit strikes by public workers without removing the cause of strikes is to deprive the teachers and others of rights enjoyed by labour in general without providing any compensation. It is hardly calculated to make teaching, already the least dignified or well-paid of the professions, more attractive. Part of the drive behind the new law unquestionably arises from the fear of Communists and labour agitators seeping into the schools. This is a fear which may well prove even more compelling in less liberal states than New York.

Governor Dewey has also espoused a measure which would allow cities and other subdivisions to tap additional tax resources to meet the rising cost of local government. If the new funds are used for education, this will do more to stop teachers' strikes than any prohibition which reduces the teacher to a second-class citizen. But it provides no solution to the problem of poverty-stricken cities and counties in the south and west which have few resources to draw upon.

Shorter Notes

Another stage was reached in Mr Lillenthal's long and painful progress toward Senate confirmation as head of the Atomic Energy Commission when Senator Bricker's motion to recommit the nomination was defeated by 52 to 38. The purpose of the motion was to allow time for further investigation of Mr Lillenthal and his colleagues by the Federal Bureau of Investigation and scrutiny of the records of all employees hired by the Commission. The occasion widened the split between Senator Taft and Senator Vandenberg.

*

The "irresistible Republican tide" which the party professes to see suffered a minor check in Chicago last week when the Democratic candidate for Mayor, Mr Kennelly, was overwhelmingly returned. There is some dispute as to just how significant a straw in the wind this reversal of last November is. The only moral completely tenable seems to be that both parties will find an attractive candidate, with a solid record of business and civic achievement, more profitable than any party wheel-horse.

THE WORLD OVERSEAS

Reparations and the Russian People

(By a Correspondent)

WHAT does the Russian "man in the street" feel about the international situation, and quite especially about the tension between his country and the Western Powers? Does any public opinion exist in Russia? And, if so, does it exert any influence on the Government's foreign policy? Under the single party system that has existed in Russia for several decades now there are obviously no direct clues to what the popular mind is thinking; and such trends of thought as exist among the politically minded must remain latent and cannot crystallise into distinct viewpoints and formulae. It is, for instance, inconceivable that a Soviet Mr Wallace should appear in Moscow, denounce Mr Molotov's conduct of foreign policy and propose an alternative line. This much is obvious—but it is very little indeed. Yet, to assume for this reason that Russian public opinion does not weigh at all in the formulation of Russian foreign policy would be erroneous.

In his "Prelude to the Russian Campaign" M. G. Gafencu, a former Roumanian Ambassador in Moscow, has given an interesting account of how, between 1939 and 1941, popular discontent with the Russo-German pact of non-aggression showed itself in all sorts of subtle ways; and of how this made the foreign observer aware that the usual official claim that the Soviet people were united behind the Government's foreign policy was a mere pretence. There have been several other important instances in which it was not so difficult to see either that a cleavage between official policy and the popular mood was impending or that a particular line in the Government's policy had an exceptionally strong popular appeal.

The Moscow conference of the Foreign Ministers undoubtedly stands in the centre of the Russian public's interest, just as did the previous diplomatic gatherings; and it seems that it is not even overshadowed by the many economic difficulties that have been hindering Russia's reconstruction. Gone are the days when foreign affairs were reported by the national newspapers in short dispatches at the bottom of the last page, so that in the public's eyes they dwindled into insignificance compared with the latest record of a Stakhanovite in the Donetz Basin, or with the increase in the yield of milk of one collectivised cow in a farm of the Altai Province. In recent months, the conferences of Foreign Ministers and the debates of the Security Council have occupied perhaps 50 per cent—or even more—of the space in the national newspapers, which is considerably more than in the press of any western country. The law of diminishing news returns from a protracted diplomatic conference that has been overwhelming news editors all over the world has had no influence at all on the Russian press. The Press and Propaganda Departments of Party and Government have been determined to make the diplomatic battles loom before the eyes of the Russian people as large as possible; and in this they have undoubtedly succeeded.

Mood of Expectation

The public that has had its gaze fixed on the diplomatic scene has not yet overcome its own very acute post-war *malaise*. Victory had evoked great hopes, most of which have been dashed. The standard of living has not greatly improved since the war; and in many areas it has gravely deteriorated. The magnitude of the price that Russia has paid for victory has really impressed itself on the minds of rulers and ruled alike only since the first flush of victory passed. Amid the holocaust of war, national unity had been achieved to an extent unknown before. In making their prodigious sacrifices the mass of the Russian people had taken it for granted that they had now deserved the trust of their own Government as well as of their western Allies; that after victory the rigours of the régime would be so relaxed by the Government as to allow them some taste of freedom; and that they would be helped back to their feet by sympathetic and grateful allies. The *malaise* has been aggravated by the experiences of millions of Russians beyond their own

frontiers who have had their eyes opened to the higher standards of living and the greater freedom that even the vanquished peoples have been enjoying.

The expectations of greater freedom at home could not be altogether ignored by the Government, even though they have been firmly determined not to give in on any essential point. Thus, the Supreme Soviet at its recent session promised to promulgate something like a statute of *habeas corpus*; and to carry out a revision of the criminal code that would at least protect the Soviet citizen against lawless and arbitrary exercise of authority. Only time can show whether, or to what extent, this promise will be made good. The dilemma that confronts the rulers is not unfamiliar—can an autocracy of its own accord evolve towards some degree of liberalism? The answer that historical precedent offers is in some ways inconclusive. But at present the issue is more symptomatic than actual: it reflects the desire of the Government to free itself up to a point from blame for the oppressive conditions under which the Russian people has still to live. The oppression of economic misery is, after all, the worst of all. It has, of course, been made graver by last year's drought, the *force majeure* for which even the most sullen malcontent cannot blame the Government, and to which official propaganda has therefore been most ready to give the greatest possible publicity.

Molotov's Master Stroke

And now has come the other *force majeure*—the conspiracy of the western Powers against Russia's reconstruction. It is in this light that the Russian public is shown and sees the debates of the Foreign Ministers. From the Russian domestic angle, it has probably been a master stroke on Mr Molotov's part—a master stroke in which he was greatly assisted by the other Ministers—to be able to demonstrate to the Russian public that the real deadlock between the Allies has arisen over the issue of reparations. A serious controversy over, say, Germany's future constitution would leave the Russian public lukewarm, if not altogether cold. Trouble between Russia and the western Allies over federalism or centralism would most probably have provoked resentment inside Russia—resentment, that is, against the Soviet Government for spoiling the chances of agreement and co-operation with the West by obstinacy over irrelevant matters of constitutional doctrine. But Mr Molotov is sure to be sincerely applauded by every Russian whenever he comes to blows with Mr Bevin and Mr Marshall over the Russian claim for reparations. The concessions that he has made in the debate, his agreement to raise German steel output to 10-12 million tons a year and to extend the term for the payment of reparations to 20 years, have only strengthened his case. The arguments of the Western Ministers have, on the whole, been fairly and extensively reported in the Russian Press and Radio, but they can carry no conviction with the Russian public. The British and the American taxpayers whom Mr Bevin and Mr Marshall have brought to the front, and on whose behalf they have refuted the Russian demands, cut no attractive characters in Russian eyes. Compared with the astronomical figures of Russia's war losses, the burden that the British and American taxpayers have to carry in order to feed Germany appears to the Russians even lighter than that proverbial straw that might break the camel's back, especially the back of the American camel. And why—this is the unsophisticated Russian query—should the feeding of Germany be a higher priority than the feeding of Russia? Mr Molotov's disclosure of the secret Yalta protocol on reparations must have given an additional and powerful filip to popular Russian indignation—"is this how the Anglo-Saxon gentlemen honour their bonds, not merely words?"

It has often been said that Russian diplomacy has squandered the good will that Russia had accumulated in the western countries during the war. This is all too true. It is perhaps as well to realise that something similar is now happening the other

way round. Whatever the merits or demerits of the British and American attitude over reparations, Mr Bevin and Mr Marshall have now certainly been squandering the enormous moral credit that the western democracies had acquired with the Russian people in recent years, a moral credit that until quite recently was still greater than has ever been realised in the west, and certainly great enough to cause serious embarrassment to the Soviet Government and to outlast those ups and downs of post-war diplomacy. It might be said that in refusing so categorically reparations to the Russian people, the western statesmen have paid enormous moral reparations to their rulers. Unco-operative isolationism, which until recently was rather unpopular in Russia itself, is now almost certain to get powerful popular backing. In this mood, even such an outrageous and bizarre act of truly Oriental isolationism as the recent ban on marriages between Russian and foreign nationals, may be accepted by Russian opinion as a justifiable expression of the national bad temper against the outside world.

Czechoslovakia's Export Trade

[FROM OUR PRAGUE CORRESPONDENT]

THE second post-war Prague Fair has given Czechoslovak industry quite a lot to think about. The first shock was the comparatively small number of would-be buyers from "hard" currency countries. But when a large proportion of the foreign visitors went home again without placing orders, it was realised by many people that a drastic overhaul of prices and possibly of the whole system of foreign trade controls might be necessary. Czechoslovakia no less—perhaps indeed more—than Great Britain depends on exports for the foreign exchange with which to finance the importation of the raw material needed for industry. The Two-Year Plan, which contemplates raising the industrial output of the country to 10 per cent above the pre-war level with perhaps 30 per cent less workers, is doomed to failure if the export programme cannot be carried out—unless, of course, foreign countries are prepared to do business on credit. But Czechoslovakia is unfortunately finding—to use biblical language—that: Only to him that hath goods which will sell, shall credit be given. Exports in February, valued at Kcs 1,708 million, were less than in January when they were worth Kcs 1,938 million. This decrease, however, is officially said to be seasonal and due especially to the very hard frosts. Whereas the most important customers were Switzerland, Sweden and Belgium, the most important suppliers are the United States, Holland and Britain.

One of the reasons Czechoslovakia finds it difficult to sell just now is, of course, the poverty of those who would like to buy. But there is no doubt that in many industries Czechoslovak prices are well above world prices. In passing, it is worth adding that export prices are generally much lower than internal prices; for example, a new type of washing machine shown at the Fair, for which Kcs 12,500 was asked for export, was priced at Kcs 30,000 for delivery in Prague. Many classes of goods, however, notably in the textile group, are being produced only for export, and can only be obtained inside the country through the rather extensive black market.

Whereas internal prices of most goods were fixed by the Government in December, 1945, export prices are more or less uncontrolled, though in some cases there is a fixed minimum price. It is not clear on what basis these minimum prices are calculated, but it can be said that in so far as internal prices are concerned, some of the more efficient manufacturers are making huge profits while others in the same line of business are producing at a heavy loss. As wages are on a fixed scale, as well as prices, it is clear that the reasons for this must either be mis-management or out-of-date machinery, or both. In regard to external trade, both these reasons contribute to the high prices. So does the low output of the workers. But this is improving and is possibly not so marked in Czechoslovakia as in many other countries. In the coal-mines, for example, the output per head is now higher than pre-war. And it should be added that in a few cases the prices of goods shown at the Fair compared very favourably with those ruling in other countries. There was, for instance, a motor saw which was said to be less than half the price of its nearest foreign competitor.

In general, however, all prices—internal as well as external—are admittedly too high and during the past few months members of all parties of the National Front have been urging the Government to reduce them. After much delay and deliberation, a

new scale for most foodstuffs and a few other items such as petrol, agricultural machinery and workers' clothes, was actually published in March and came into operation on April 1st. According, however, to Dr Ripka, Minister for Foreign Trade, the reductions are "largely artificial." Apparently, they are to be financed by a special turnover tax instead of being the result of a real reduction in costs. In other words, they will come out of the pockets either of the taxpayer, the consumer, the producer or the middleman. It is likely in the circumstances to take some time to find out which pays which and with what and to whom, though one is tempted to assume that the consumer always pays in the end.

Juggling with Taxes

Whatever the answer to this somewhat hoary question, the expedient the Government has adopted cannot easily be used for any length of time to improve Czechoslovakia's chances of competing in foreign markets. The present disparity between internal and external prices would seem to indicate that the home consumer is already having to pay more so that the foreigner can be asked to pay less. When both home and foreign consumers are kicking against the pricks of the high prices, juggling with taxes may fool all the people some of the time, but is unlikely to provide a permanent solution of the problem of increasing, not merely the turnover tax, but the real trade turnover.

Prices, of course, are not the only hindrance to the development of Czechoslovakia's export trade. Another is the extremely involved method of State control, due no doubt partly to the complicated nature of Czechoslovakia's post-war trade treaties, but also to the fact that the Ministry of Trade naturally has a finger in the pie as well as the Ministries of Foreign Trade and Finance. The fact that the Minister of Foreign Trade belongs to a different political party from the other two Ministers is, perhaps, an added complication. So far as the nationalised industries are concerned there seems to be comparatively little bumbledom. But the private exporter is not always so lucky. According to the strict letter of the law, as expounded in the commercial colleges, he may have to have his signature to a contract with a foreign firm attested by a public notary and then go to the commercial department of the District Court to get a certificate that he is a fit and proper person to sign such a contract. It may also be necessary for him to have his certificates and the contract translated by an official translator into the language of the country to which the goods are to be exported and, if so, the District Court has to be asked for a further certificate that the official translator is a proper person to draft an international agreement. There are even said to be occasions when the Ministry of Justice must attest the right of the District Court to attest the *bona fides* of the translator. Add the stamps of the Ministry of Foreign Trade and of the Consulate of the importing country and it is not surprising that the fees have been known to total Kcs 2,000—£10 in English money.

No Place for the Middleman

Czechoslovak export trade also has to contend with the fact that the change-over from private to nationalised enterprise in the great exporting houses is not yet complete. The grouping of the various concerns is practically finished, but their sales organisations are still being rebuilt. In most cases, the nationalised enterprises seem to be in favour of establishing their own sales offices in all the countries with which they hope to do big business. Some of them have already done so. This is in line with the Government's policy on internal trade, which aims at cutting out the middleman as much as possible and developing a system of direct sales from factory to retailer. One of the reasons for frowning on the wholesaler is that the existing network of big wholesale firms is largely a legacy from the Protectorate and there is, therefore, a widespread desire to get rid of it. What the Government intends to put in its place is not yet clear, but seeing that three of the four parties are avowedly Socialist, it is unlikely that a major role will be given to private enterprise. A pointer can, perhaps, be seen in the plans the Minister of Food, Mr Majer, announced at the end of March for the food industry. Speaking to the appropriate committee of the National Assembly, Mr Majer said there would be three central societies to handle respectively grain, fruit and vegetables, animals and animal products. Each society, he said, would deal not only with internal distribution, but with import and export as well. The plan aroused considerable criticism from private members, speaking mainly on behalf of private enterprise, and it is too early to judge what its ultimate fate will be.

Sweden's Dalton

[FROM OUR STOCKHOLM CORRESPONDENT]

THE demand for levelling out the income and capital structure is as old as liberalism. And in Sweden, too, strivings in this direction have made themselves felt for many decades. Yet there is no doubt that inequalities of income and capital are much less pronounced in Sweden than, for instance, in Great Britain and the United States, and the tendency is definitely for these inequalities to be less and less evident. In Sweden a millionaire is a very rare phenomenon—less than 1,000 persons out of a total population of 6,600,000 own more than 1,000,000 kronor and the average of their capital is about 2,000,000 kronor. The number of small capital-owners and the average value of their property has become greater, to some extent due to saving through insurance. The wage policy of the trade unions has meant not only the transference of income from shareholders to labour, but also a levelling out of income inequalities within the workers' own ranks through a wage policy of "solidarity." This policy has aimed at raising the wage level primarily of those workers that belong to the lowest-paid groups. The main factor in this process, however, has been the continued expansion of the social security system which has been financed by progressive taxation.

It has been pointed out many times in Swedish economic discussion that the limit for taxing the higher income groups will soon be reached. An illustration of this is that total confiscation of all taxable incomes above 12,000 kronor would mean a net increase in Government revenue by only 175 million kronor, as compared with a total budget of about 4,000 million kronor. It has also been stressed that too high a taxation runs the risk of hampering economic progress by stifling incentive. Execution of the new taxation scheme presented by a committee which has been working under the chairmanship of the Minister of Finance is definitely pushing Swedish taxation nearer that limit, if not across it, as the Opposition claims.

The new taxation proposals have a threefold purpose. First, they aim at realising the long-promised reductions in wartime taxation. These abatements in the burden of taxation are, however, primarily reserved for the lower income groups; in fact the reductions do not extend beyond the 15,000 kronor-bracket as regards families or the 7,000 kronor-bracket as regards single persons. The second motive of the new taxation proposal is to lay down a plan to finance the big social reforms that are going to be carried through during the next five years. This means that the decrease in Government revenues that is caused by the removal of the general sales tax and the above-mentioned reductions in taxation of the lower income groups will have to be covered. This compensation is reached, partly by raising income taxes for the higher income groups, partly by an increased capital tax and the introduction of an estate duty, and partly by raising taxes on joint-stock companies from 32 to 40 per cent of taxable income.

Short Cuts to Equality

The third aim of the proposal is not openly stated in the memorandum, but is evident when studying the actual consequences of the suggested taxation rates. It is to reach rapidly a far more pronounced equality of income and capital than now exists. In public discussions this aspect has also been stressed by the Minister of Finance. As can be expected, it is the possessors of capital who are hit hardest in the new scheme. The Opposition has especially pointed out the unreasonable consequences of the proposals as regards those persons whose only means of support are the yield from owned capital. If the yield is calculated at 3½ per cent, the capital owner can, in fact, never retain more than 6,000 kronor after paying Government taxes. This maximum is reached when his capital amounts to 600,000 kronor and the yield accordingly is about 20,000 kronor. If the sum of the capital owned increases, the retained income after taxes decreases and finally gets negative. If the capital is 3,000,000 kronor, for example, and the yield about 100,000 kronor, Government taxes alone amount to 103,000 kronor, i.e., 3,000 kronor more than the actual income. The capital owner has to pay not only income tax on the yield, but also a special tax on his capital.

One of the main criticisms directed against the committee's memorandum is its total lack of interest in the economic and social consequences of the proposed changes in the present taxation structure. The only exception is the part defending the suggested rise in taxation of joint-stock companies. This does contain some reflections on the possibility of unfavourable effects

on economic progress of such a measure. The committee will not admit that increased taxation of enterprises will stifle investment initiative and refers to the fact that during wartime the level of investment in Sweden was exceptionally high in spite of heavy taxation. As has been stressed in public discussions, the committee here fails to see that special circumstances—the blockade and the subsequent shutting out of foreign competition, the increased armaments output, the need for substitute production, Government price policies, etc.—account for these wartime experiences.

Estates and Confiscation

The main point of the Opposition's attack has been the proposed estate tax, which is to be paid out of the undivided estate. The only aim of this tax is changing the distribution of property. Its importance from a fiscal point of view is insignificant as the Government receipts from this tax are estimated at only some 40 million kronor annually. In fact this tax will probably in the long run diminish Government revenue, as the bigger fortunes are thus reduced. The proposed estate tax is about 7,000 kronor on an estate of 100,000 kronor and increases progressively, so that it amounts to almost 50 per cent of a 10-million-kronor estate. On top of this come the ordinary death duties, which every heir pays according, firstly, to the amount inherited and, secondly, to his relationship with the deceased.

The question of the estate tax has been much debated, not least due to the statement by the three circuit courts of appeal, which important judicial bodies expressly declare the proposal incompatible with the Swedish constitution, as it implies confiscation of property for no other purpose than changing the distribution of property in society. The same conclusion has, by the way, been drawn also by the Social Democratic Governor of Stockholm.

From an economic point of view there is, however, no doubt that the estate tax is less dangerous to progressive forces than the proposed increases in the taxation of higher incomes and joint-stock companies. The last-mentioned measures will definitely hamper the establishment of new firms and the development of small business and thus work in favour of the big corporations already in existence. It is true that the estate tax will mean a change in the ownership of "family firms"—the heirs are allowed to pay the duty by transferring shares, mortgages, etc., to the state—but, on the other hand, it will not directly affect the dynamics of small business.

It is hard to say if any committee memorandum ever has met with more unanimous criticism. All the Government agencies asked have rejected the proposal in its present form. The Co-operatives, which are a very potent group in Sweden, representing 800,000, or more than 40 per cent of Swedish families, have strongly criticised the memorandum, as have also all the private organisations. The main exception and a very important one, however, is the Trade Union Organisation, which has given the proposal its general approval. This body, however, makes two important qualifications. First, the Trade Unions voice some doubts about the suggested increase in the corporation taxes. The second qualification is of a positive nature, the Trade Unions demanding a general capital levy. As the Social Democratic Party gets its main voting and financial strength from the trade unions, quite naturally their views will have great weight. Thus it was no unexpected development when the Minister of Finance recently put forward a Bill in the *Riksdag*, which only showed minor changes from the committee's proposals.

Outbidding The Communists

The Minister of Finance—the Social Democratic Party's spiritual leader—has additional reasons for trying to squeeze through the original proposal without heeding the criticism put forward. First, it is well known that his ideology calls for eliminating higher incomes and bigger private fortunes. The second reason is of a strategic nature, and may weigh even stronger. Mr Wigforss has seen the political strength of the Social Democratic Parties decline all over Europe, and the Communists gaining more and more in importance. His way of stopping this development in Sweden is to try to behave more radically than the Communists. The hurried forcing through of the great social reforms no doubt has this explanation. But the Social Democrats have in some way also to meet the Communist demand for a complete "economic democracy," that is, socialisation. Experience during the inter-war period and the war years has shown Wigforss that socialisation is a very slow process demanding thorough investigations and involving many technical difficulties. From this point of view a radical taxation scheme might seem the logical solution.

THE BUSINESS WORLD

Transport Bill Amended

ON Wednesday last week, Standing Committee B sat for the thirty-first time, to complete its labours on the Transport Bill. It was a characteristic session, in which twelve Schedules were added to the Bill, seven of them without any discussion whatsoever. For more than half of its sittings, the Committee has been working under the guillotine; in seventeen sessions, 116 clauses have been despatched, of which 37 have been automatically added, with Government amendments. The Government demanded speed in the transit of the Bill through Committee, and it has certainly got it. It may also claim that it has a better Bill, which would be true enough in part. But it also has a Bill of which entire stretches have been given no detailed discussion, where the words originally employed by the Parliamentary draftsmen, occasionally modified by the second thoughts of the Minister, seem at present destined to become law by the automatic operation of a Parliamentary majority.

How does the Bill emerge? In its essential features it is the same Bill. The structure of the Commission, its Executives, and the relations of the Minister towards both remain unaltered. The Commission still seems dangerously small for the performance of its duties; a large secretariat will certainly be required behind the scenes to assist the Commission to carry on all its business "as one undertaking"; and it will lack the practical and personal convenience of being able to break off into sub-committee for the handling of particular problems. The Commission, it seems, is fated to spend its time perpetually in august session—or else it will have to allot specific duties to each of the five members, which would introduce the questionable element of specialisation of function which the Executives themselves seem to carry unduly far. As for the Minister's power, it begins with the power of appointment to both bodies, which is clearly right so far as the Commission is concerned, but seems more questionable for the Executives. Mr Barnes has jealously guarded this power, though it threatens to weaken from the very outset the authority which the Commission can wield over the Executives. The Railway Executive alone will itself be an enormous repository of power, responsible for the four main line undertakings. The "Big Five" will have to feel very big indeed to control its policy and to secure its compliance, and the separate appointment of each body by even a Ministerial third party is not the surest way of securing what the soldiers call "the chain of command."

Such broad policy issues have indeed been discussed in Committee, but even the more spacious discussions of the early clauses of the Bill, which govern them, hardly suggested that either side had produced much conclusive thinking about them. This is a realm of experiment preceded by guesswork—a realm in which it may be possible to assert that a small Commission is preferable to a large one, without knowing with certainty what "the right size" is. Thus it is quite clear that five is better than fifty; but there are no bio-economic principles which can enable the Minister, or his advisers, to say in advance and with complete assurance, that five is better than seven or nine. A somewhat larger Commission would have had many practical advantages, without losing any of the merits of compactness. A Commission as small as five runs the risk of being overloaded with responsibility, or of becoming a tool of the Executives. If

a mistake has been made in the size of the Commission, the successful fusion of transport will be the more difficult.

There is, indeed, all too much open-mindedness about these questions of organisation and major policy. The Minister has not been completely unequivocal about the fusion of transport; regional transport schemes (which obviously provide the best ultimate assurance of co-ordination between all forms of transport) "cannot proceed on any uniform pattern"; there are to be "at the outset only a small number of Executives"—the rest can be left until they have work to do. In all this, it is possible to discern some underlying anxiety about the smoothness of the transition period, and in particular of the successful transfer of the railway undertakings on January 1st next. Such diffidence is wise, for the condition of railway transport by the end of this year may well be more critical than it is to-day, and the risk of inadequate transport may conceivably be added to the fact of inadequate coal and generating capacity. But it means that although the Bill is being enacted now, the policy has to wait.

In two respects, the Bill now provides for more equitable compensation. The Government guarantee of interest and principal on London Transport 3 per cent stock is to be recognised, though only *ex gratia*, for even now the Government will not admit any legal obligation. Secondly, the scrap-heap basis of compensation for railway wagons has been replaced by a schedule of purchase prices according to type and date of construction. But no improvement has been conceded for the railway stocks. The old ground has been re-trodden, but no common meeting place has emerged between the outright condemnation of the terms by the railway boards and the obvious satisfaction of the Government at the prospect of a "profit" of £17½ million a year from the deal. The "profit" is the clearest proof in itself that the compensation terms are in part expropriatory, for it is based on the postulate that the railways will in future be capable of earning £40 million a year—which is roughly speaking what they are entitled to receive under the wartime rental agreement. The £17½ million represents the extent to which the Government have departed from their own original principle of basing compensation on "net maintainable revenue."

To earn £40 million a year, however, will involve alterations in charges to meet the rising trend of operating costs. Indeed, an increase for 1947 is still apparently under consideration by the Minister, who has been waiting until the end of March to see whether it will be necessary, or whether the optimistic forecasts of traffics put forward at the charges enquiry last autumn are, after all, likely to be fulfilled. What is competent for the Minister now, or will be within the power of the Transport Commission and the Transport Tribunal, in the fixing of charges, would have been equally open to the railways had they reverted to their pre-war status, for the rental agreement specifically provided for a review of charges before independent operation was resumed. The compensation terms remain a denial of reasonable rights to future railway income, and the difference in the income that the railway stockholders will receive is far greater than can be justified, in spite of the Chancellor of the Exchequer's assertions to the contrary, by any superior element of security in the British Transport Commis-

sion's stock—at least as compared with the high-grade railway stocks which have always been fully covered by earnings, and were always likely to be so covered unless some future Government were to change the charges machinery for the British railways and plunge them into insolvency.

One of the outstanding gaps in the Second Reading discussion was the question of future transport charges. The Committee stage has brought this question no nearer solution; there is no charges policy in the Bill, nor has one been outlined. For the first two years of the Commission's life (or longer if the Minister so determines) there will be a breathing space in which charges schemes can be worked out by the Commission, on the advice of the Executives, and which will then be submitted to the Transport Tribunal for consideration, together with any directions which the Minister may wish to give. That is the machinery, but it gives no hint of policy. Government spokesmen have urged that, on this point at least, there should be a detailed enquiry before decisions are taken. "We are proposing," argued Mr Strauss, "the establishment of a charges system on some entirely new principles." What are these principles? Let Mr Strauss answer: "For the first time we shall have a central planning body charged with establishing a charges system within the general framework of making all their services pay; with establishing a charges system, not based on what the traffic will bear, or on a profit on a particular service, but on the principle of what will be the greatest benefit to the community as a whole, and the trading community in particular. . . . It is an exceedingly fascinating problem."

It is, indeed. The Commission's task will be to cover its total costs for all inland transport, and so to distribute its charges between the various forms of service and traffic that it will encourage users of different forms of transport to obtain the maximum advantage from each form for particular purposes. The distribution of traffic could be done theoretically by compulsion; or it could be achieved more harmoniously by differential rates in favour of the best form of transport for particular loads; or it might be possible to increase the load factor on the railways very greatly (with a marked reduction in unit costs) by using road transport primarily as a feeder service; or, most simple of all, there might be common freight scales and passenger fares for all transport, with rebated rates for optimum loads and hauls. These are some of the possible approaches to the problem of charges; they have their merits and demerits, but on none of them has the Government thought fit to express even a general opinion. It has offered no views on the relations which should subsist between the Com-

mission's fixed and variable operating costs, on the one hand, and the charges imposed on the public, on the other hand.

Part V of the Bill, which deals with charges, is the crux of the nationalisation issue, and it cannot be said that, after less than seven hours' discussion, the transport-using public will be much the wiser about the future character of the charging schemes for which the Bill provides. The guillotine has also ruled out the effective examination of the mileage limits under which "A" and "B" licence holders can operate their vehicles. The one major concession—surprising and altogether welcome—has been the freeing of "C" licensed vehicles, in deference, as Mr Barnes put it, to the "increasing anxiety among the vast number of merchants in the community." The concession is accompanied by threats—if the "C" licence holder abuses his "privilege," the Government will come down heavily upon him. But the consequence of the withdrawal of these restrictions on the freedom of the "C" licence holder must be entirely salutary for the Commission; it will be the best guarantee—or at least the best that the Government is prepared to concede—that the Commission will be spurred and prodded into enterprise, and not enabled to lapse into monopolistic sloth.

It is, then, a better Transport Bill that emerges from Standing Committee. But it is also a Bill on which a lot of work has still to be done, first on the Report stage, then in the House of Lords, and if it is finally passed, by the Commission and Executives and the Minister. It is a framework which may offer scope for effective co-ordination of transport, even though Government spokesmen are still chary of defining with any precision what they mean by co-ordination. In some ways, it has been re-styled for practical needs—for example, the comparatively simple expedient for continuing the railway stock registers and avoiding the wholesale confusion of an exchange of securities for a million accounts on Vesting Day might have been foreseen and arranged by any draftsman who had the slightest practical knowledge of the working of these matters, instead of having to be hurriedly devised long after the Bill had been introduced. Doubtless there are other matters in which the Bill would have benefited from a more immediate and a less remote approach to transport problems. It remains to be seen whether its concluding stages will yet afford an opportunity for more careful consideration of the Commission's organisation, its operations, and its charges, or whether an attempt will be made to enact the Bill with the same frantic and dangerous rush that has characterised the Committee stage.

India's Economic Transition

IT is perhaps inevitable that the problems of India's future should be discussed exclusively—or almost exclusively—in a political setting. But the neglect, if long continued, of the economic aspects of the impending constitutional changes may bring eventually a sorry retribution. Inevitably, they will add a heavy burden of new responsibilities to economic problems which are already oppressive. The war has so changed the shape of India's economy, and, even more important, has generated so marked an impetus to further change, that the process of post-war transition and reconstruction was bound to be particularly difficult even without the superimposed and as yet imponderable economic complications from political change.

It is obviously too soon, and might in any case be politically unwise, to try to discern the nature of these complications; but the problems inherent in the post-war transition itself merit closer attention than they have yet received. On the wider

issue, one guess alone seems permissible. Upon external economic policy, which is naturally the aspect that most closely concerns Britain, it seems that India's government of 1948 will certainly take care to demonstrate its complete autonomy in all matters, even to the extent of severing traditional (and entirely voluntary) links. But much that may be done will be for the sake of appearances only; India's interests, as responsible opinion is well aware, require that any changes in the pattern of commercial and financial relationships, at all events in the short run, shall be more apparent than real. Two straws recently show the direction of the wind. India's new Exchange Regulation Act, which closely resembles and serves broadly the same purpose as Mr Dalton's Exchange Control Act, puts sterling formally in the same position as any other "foreign" exchange: but executive orders under the Act will ensure in fact the virtual maintenance of the mechanics of the present system—subject to such modification as result from the eventual

settlement of the sterling balances and the "freeing" of sterling under the Anglo-American Loan agreement. Secondly, a Government Bill passed through the Legislative Assembly this week, in connection with India's adherence to Bretton Woods, withdraws the legal anchorage of the rupee to sterling, and, in conformity with the International Monetary Fund Agreement, anchors it instead to gold, with the Reserve Bank empowered to hold other currencies than sterling. This means that, if sterling's IMF parity were to be altered, there would be no automatic, and legally obligatory, similar movement of the rupee; but the legal change will not alter the strength of the natural links.

*

What, now, of the problems of the post-war transition? Some of them have already passed from the plane of discussion to that of policy: problems of exchange rates, sterling balances and international trade have all become issues on which policy must be framed and decisions taken. They must be visualised against the wartime background. The principal legacies of war in India's economy are now fairly well known. First, a huge governmental expenditure, especially British government expenditure, generated a large rise in the national income in an economy starved of imported consumers' goods and lacking any highly organised tax system or fiscal discipline. The result was a substantial inflation, the extent of which may be gauged from the fact that between 1939 and 1945, as Table I shows,

TABLE I—WAR-TIME INFLATION: MONETARY INDICATORS

wholesale prices rose by 150 per cent while the note issue showed almost a sixfold increase. Moreover, even since the end of the war, despite the rapid reduction in governmental outlays, inflationary conditions have persisted: prices, note issues, and bank clearings all tended to rise further during 1946. On the external side, one of the most striking results of the war was the translation of India from a debtor to a creditor country—a creditor with upwards of £1,200 million of sterling assets, despite the repatriation of some £300 million (almost the whole) of its external debt. Thirdly, large-scale war production and defence works greatly hastened the process of industrialisation. Table II gives some indication of the effects of this movement upon purely civil supplies and basic industrial materials. These three major developments condition future economic policy, which, to fill the void created by the cessation of war orders and to meet the aspirations which war-time activity generated, is largely based on an extensive programme of reconstruction and further industrialisation designed to effect far-reaching changes in the Indian economy.

The war-time inflation naturally gave rise to discussion of a possible devaluation of the rupee. Indian prices and incomes, it has been argued, are now out of line with those abroad and must be readjusted, but readjustment through deflation would involve hardship. On this view, which still finds much support in Congress circles, devaluation would be the only practicable means of achieving the realignment, because deflation would

cut into the profit margins of industry and agriculture. Given the desirability of fixing exchange rates now at a level justified by current economic conditions so that disturbing changes may not later become necessary, the case for devaluation has no doubt a certain force. But the argument minimises some factors of great importance in the present situation. First is the likelihood that devaluation might cause further inflation, mainly, but not wholly, for psychological reasons. As there already exists a massive inflationary potential, largely in the form of hoarded notes, it would be at least imprudent to take any action which might energise it. It can hardly be doubted that devaluation now would have this effect, stimulating the inflationary forces already in existence and transmitting to the Indian economy in an intensified form the rising trend of world prices. At a time of hunger for goods, the mere threat of an increase in rupee import prices might have sharp repercussions. Secondly, as so many other countries have lately discovered, the argument for devaluation is in any case somewhat academic. It disregards the facts of worldwide scarcity, by assuming that imports and exports will readily respond to alterations of exchange rates. Under present conditions, the course of trade is governed hardly at all by such changes: the volume of imports and exports is limited by supply factors while demand is so urgent as to be highly inelastic. Thus if India needs food imports (as it does) they must be procured—up to the limits of what can be spared by producing areas or allotted under allocation machinery—under Government arrangements or otherwise, more or less irrespective of price. If Indian textile factories require to be re-equipped (as they do), their re-equipment will be determined mainly by the pace at which Britain or America can produce the plant. Similarly, on the export side, it cannot be said that there is at present any restriction of overseas markets which calls for a reduction of export prices. To take only three examples, the demand for Indian products such as jute, tea and oilseeds is even now largely unsatisfied.

The question as an issue in practical politics appears to have been settled, at least for the present, by the decision to retain the former parity which has been duly notified to the IMF. In the light of this decision an attempt may be made to consider the probable future trend of the balance of payments. During the middle years of the war the favourable trade balance increased considerably, largely owing to restriction of imports, but since 1944 it has been much smaller. The extent to which

imports and exports have been controlled under war regulations and distorted by movements of war supplies makes the figures of little direct value for assessing future trends. Any quantitative estimate of trade during the next few years must necessarily be speculative, but the probable developments can be indicated

in general terms. On the one hand, while export prices may fall below present levels, it is not likely that the volume of exports will increase. If the domestic programme is even moderately successful, the export surplus will continue to be limited by the needs of a growing population for food, clothing and other articles, while industrialisation on the scale contemplated should not only raise the standard of living—that, of course, is its primary object—but will also absorb goods formerly exported. Another factor which may become important in this connection is the future of India's competitive position in some of the markets opened up during the war. On the other hand, when the supply position permits, a larger volume of imports is probable in order to meet demands for consumption goods and much heavier requirements than formerly of capital goods and raw materials. A recent unofficial but detailed estimate anticipates a large increase in all these classes of imports during the next few years and a substantial deficit in the balance of trade. If, in addition, imports of gold and silver were resumed on a large scale, the adverse trade balance would be even greater; but that consideration may dictate retention of the recently-imposed ban on such imports.

As against this, some assistance may come from the invisible items in the balance of payments. Though the nature of the eventual settlement of the sterling balances is still uncertain, it can reasonably be assumed that it will provide for some release of balances to meet India's needs for imports (not all of which the United Kingdom may be able to supply) and for the establishment of a residual balance on which interest will be payable during an extended period of amortisation. More doubt attaches to other possible terms such as funding Indian Government pensions charges payable overseas and the purchase of British investments in India. (As regards the latter, it may be noted that although the liquidation of the Argentine sterling balances by taking over the railways offers a natural parallel, there is in India no such conveniently homogeneous block of investments available for offsetting purposes, and in any case the Indian balances far exceed those held by Argentina.) An agreement might therefore permit a certain increase in imports and provide a modest annual invisible credit in interest and amortisation. On the whole, it appears likely that the total of invisible debit items still payable in the immediate future and for the next few years will exceed the invisible credits.

If these estimates are realised and there is a deficit on both the visible and invisible account, it will be necessary to draw on available overseas assets and perhaps also to have recourse to the International Monetary Fund. The Governor of the Reserve Bank possibly envisaged such developments when he referred last year to the desirability of aiming at an import

surplus as helping to liquidate sterling balances, and to the advantage of being able to obtain assistance from the International Monetary Fund "during periods of adjustment." And Mr Joshi, India's executive director on the IMF, has already given warning to his co-directors that India's quota of \$400 million may be inadequate for its requirements, and has reserved the right to ask for an increase. A good deal, in this context, will obviously depend on the nature of the sterling balances settlement.

Much will depend, too, on the shape of India's trade policy still to be precisely defined. Participation in the proposed International Trade Organisation is considered expedient since India, as a creditor nation with claims to liquidate, may benefit from multilateralism and an expansion of world trade. But there is less enthusiasm for proposals aiming at a reduction in tariffs. On this aspect of trade policy, the Indian view is that an undeveloped country with a programme of industrialisation cannot be ranked with fully industrialised nations, that tariff negotiations must take account of this fact, and that protective measures are necessary for industrial development and the prevention of dumping. The task of reconciling these views with the United States proposals will not be easy, especially as the Indian Government is not only committed to a policy of economic nationalism but derives much support from Indian industrialists likely to oppose tariff reductions. As the United States is keenly interested in the future of the Indian market, this may give rise to a certain conflict of interests, the outcome of which is hard to see.

No details of any comprehensive policy to meet the complexities of these many conflicting interests have yet been revealed, perhaps have not yet been decided. The difficulties involved are formidable, and it will need more than dexterity to solve them. But in one fundamental sense the long-run interests of Britain and India are complementary, and therein the way to solution may be found when the mists of politics clear sufficiently to enable India's future rulers to perceive it. It is demonstrably impossible for Britain to release any large proportion of the accumulated sterling for expenditure in dollars, and it is only in America that large supplies are now prospectively available. But India, even given political tranquility, will find that, for sheer administrative reasons, it is almost equally impossible for her to industrialise very rapidly. To finance the necessary capital imports, it must in any case rely upon accumulated reserves rather than upon hopes of a large current export surplus. Hence India's best course will be to try to keep the pace of industrialisation more or less in step with the pace at which Britain can produce a surplus of capital goods for export—which is, in turn, the pace at which the residual sterling balances might be released.

Business Notes

Before the Budget

It would be unfair, and perhaps unwise, to take too seriously the further reaction in gilt-edged prices and many industrial equity shares which has occurred this week. The combination of the Budget, the Easter holiday and the tail-end of the long account is sufficient to explain the manifest lack of support in most sections of the market. But this has meant, as in recent weeks, that a relatively small volume of stock pressed for sale has exerted a disproportionate effect on prices. Such a reaction was particularly evident in the gilt-edged market, where the slow convalescence of the last week or two has given way to the March malaise. Indeed, on Wednesday the prices of the undated securities fell by as much as $\frac{1}{2}$, and Treasury 2½s were again down to 95 and further falls of a quarter of a point occurred on the following day. The relatively limited capacity of the market is, however, now stretched to the point at which it has virtually no resilience—and its elasticity has been further impaired this week by the fact that some significant selling of the shorts took up most of the immediately available slack in the discount market.

The review of the cheap money policy which Mr Dalton has promised in his Budget speech will have to be convincing if it is to put an end to the persistent weakness of gilt-edged stocks. His proclaimed 2½ per cent basis for long-term issues is being preserved on 2½ per cent Savings Bonds, 1964-67, but not with any display of conviction. And Budget uncertainties, coupled with the doubts about industrial recovery and the parsimonious summer coal allocation continue to unsettle the industrial equity list. Tobacco and brewery shares have discounted the possibility of increased indirect taxation—in some cases possibly to excess, unless the Chancellor decides to impose such swingeing increases in taxation that demand will be curtailed; if his policy is relatively moderate—which seems more likely—it may well be that the consequences of increased taxation on beer and tobacco will be less serious, in terms of producers' profits, than the market is at present disposed to think.

Sir Stafford's Easter Offering

At his second press conference before Easter, Sir Stafford Cripps had three main topics—the functions of the Chief Planner; the coal target; and the review of the export programme to draw off manufactured goods which are urgently needed for industrial recovery at home. One swallow does not make a summer, and a recovery in the trend of coal employment and output is not conclusive evidence at this stage that the coal crisis is solving itself. The number in the industry had grown to 705,640 by March 22nd—an increase of 14,000 since the beginning of the year, of which nearly half are ex-miners returning from other industries. These figures include no Poles. As for juveniles, the recent rate of recruitment has been double that of a year ago, but the raising of the school-leaving age will reduce the intake for at least a year.

Sir Stafford was entitled to claim that the outlook on the coal front is continuing to improve. He should, therefore, be the reader to make a quick improvement in industry's summer coal budget on the lines discussed on page 508 of last week's issue of *The Economist*. Given a weekly output per man of 5.2 tons (the February figure) the present manpower would produce approximately 190 million tons of coal, so that a further increase in manpower and in productivity is required if the "indispensable minimum" of 200 million tons is to be reached this year. But these are the astronomical targets; industry's present concern is with its dole of coal under the revised austerity allocations. The Government, understandably crisis-minded still, are distributing an additional 100,000 tons of coal to industry each week up to the end of May. The plans for this new allocation have yet to be announced, and there is, as yet, no detailed knowledge at the factories about how much coal can be expected as a minimum guarantee under the summer budget.

Sir Stafford disclosed that the Government have reviewed "the whole situation in the field of generating plant" with the manufacturers. Standardisation, high priority for steel, and the smoother provision of components and supplies were presumably some of the questions under review. The export programme is being re-examined "to see if anything useful can be done

there to help the home situation"—a wide phrase which opens the door to Sir Stafford's wrong-headed critics and may react on the success of the export drive. Taking agricultural machinery, on which a six-weeks' stop of exports has been imposed, as an example, it is surely inevitable that machinery for seed-sowing—which is urgently needed at this moment—is unlikely to get to the British farmer in time. If it did, he would still require more labour to use it to the best advantage. As it is, British agriculture is already one of the most highly mechanised in the world, and the farmer will prefer to get through this belated seed-time by his own energy and resource, without waiting for machinery diverted from the export trade, which might be invaluable within a matter of days, but is more likely to be a matter of weeks in delivery. A similar examination of the locomotive and rolling stock position might also help, if it is carried out in good time before the winter transport crisis is upon the country. Here again, it would be dubious policy to divert any great proportion of output from the export trade so long as a single austerity locomotive or freight wagon remains unrepaired.

Coals from America

In 1938 total exports of coal, anthracite and coke from the United States amounted to 11.7 million tons, of which Europe took a mere 27,349 tons; last year total exports amounted to 43.9 million tons, despite coal and transport strikes, of which Europe absorbed nearly 17 million tons. These figures graphically illustrate the far-reaching changes which have occurred in the world coal situation as a result of the war. Indeed, they underestimate the recent rate of exports, which since last summer have averaged 2,000,000 tons a month, and last July, reached 2,400,000 tons. The United States has raised the sights on coal exports to Europe to 2,601,000 tons for each month of the second quarter of this year, and will attempt to ship 3,000,000 tons a month in the third quarter.

These figures have relevance to arguments that Britain should seek to obtain coal supplies from the United States. According to American sources, Britain has asked the European Coal Commission to increase the third quarter shipping allocation of United States coal to Europe to 3,000,000 tons per month so that part of the British requirements can be filled from the United States. According to Mr Shinwell, in last week's debate on the adjournment, there is little likelihood that this third quarter increase in American shipments will be secured, owing to shortage of wagons in the United States. If additional supplies are provided to Europe, their allocation will be a matter for the European Coal Organisation, made by mutual agreement between the coal-importing countries under American supervision. There is no prospect that Britain would be able to obtain direct supplies. In an elusive phrase, Mr Shinwell suggested that the Government "were not unmindful of the possibility of other arrangements being made if there were new developments," but he refused to enlarge on this cryptic statement.

Even assuming that an amount of 400,000 tons a month is made available to Britain through the ECO during the third quarter of this year—and at the moment this is far from certain—it would provide a useful addition to winter stocks, rather than a comfortable safety margin. One and a quarter million tons would have saved the situation in February, but the Cripps coal budget proposes that Britain should make next winter's coal supplies safe through its own exertions, coupled with a savage reduction in industrial supplies this summer. These supplies, particularly in the light of Mr Shinwell's admission that the Government does not know whether the five-day week, which begins next month, will have an adverse effect on production, are the urgent element in the coal problem. Plainly, it would be folly to gamble on the chance of any substantial import of coal from the United States this year. But equally it would be folly to prevent industry from restoring its full rate of output as soon as coal output permits, even if that does entail some element of risk for next winter.

The Canadian Dollar

Canada's re-imposition, as from the beginning of this week, of war-time controls on the use of US dollars, has naturally brought into sharper focus the recent rumours that last summer's appreciation of the Canadian dollar to parity with the US

dollar may need to be reversed. It would be unwise at this stage to try to forecast whether a change will in fact be made, though there is little doubt that devaluation must be among the various possibilities which the Canadian authorities are now studying as a means of meeting the immediate exchange problem. Certainly, it is an intractable problem, which in important respects resembles that of Britain—namely, the problem created by buying in terms of hard currencies and selling mainly in soft. Canada's upward revaluation of her currency last summer was made rather in spite of, than because of, her exchange situation. It was primarily a means of protecting the successful war-time policy of internal price stabilisation from the menace of rapidly rising US prices, and was presumably based on the assumption that the large war-time accumulation of gold and US dollar reserves would comfortably suffice to meet the strain of heavy imports from America until exports once again began to produce an adequate revenue in hard currency. But informed opinion had all along feared that maintenance of a high level of domestic employment would impose a heavy strain upon the balance of payments. Evidently the stresses of the past twelve months have been at least as great as had been feared; and they have naturally been accentuated by the high level of American prices. In addition, the widespread belief that the appreciation of the exchange last summer was a rather rash move has produced a perceptible and growing speculative pressure. Though no recent figures are available, there is no doubt that US dollar reserves are now far below the \$1,508 million peak reached end-1945.

The new regulations, it seems, are designed rather to check the speculative movement and to prevent any seepage of Canadian capital than to impose any restraint upon current business or upon the normal movement of Canadians to and from the United States. In future, exchange permits must be sought even for travel remittances of less than US \$100 which formerly could be obtained without any application to the Control; the US dollars unexpended at the end of each trip must be resold to the Control. In view of the speculative pressures, it may be impossible for the Canadian authorities to determine their policy solely by reference to current economic factors. So long as the two dollars remain at parity, there may always be some who envisage a depreciation of the Canadian. But, this consideration apart, it is very questionable whether depreciation would provide any perceptible relief—just as it is questionable whether the appreciation of last summer has, speculation apart, intensified the strain. Obviously, depreciation at this stage would do little or nothing to stimulate Canadian exports; and, similarly, in conditions of scarcity and a high level of employment, it would be unreasonable to expect the inflow of American goods to be significantly diminished simply by making them 10 per cent dearer. Whether the Canadian dollar is devalued or not, the fundamental dilemma will remain. Canada obviously could not, even if she wished, quickly re-orientate her economy so as to concentrate her purchases in the areas where she sells. She must therefore face a continued strain so long as domestic employment is well maintained; and, like Britain, can only hope that her dollar resources will hold out until the hoped-for stream of US lendings to the soft currency areas makes export proceeds once more convertible into hard currency.

Anglo-Spanish Money Pact

The Anglo-Spanish Monetary Agreement which came into force last Tuesday adds a final link to the chain of monetary agreements which Britain forged with the countries of Western Europe in 1945-46. The Agreement follows closely the pattern of its predecessors, the only noteworthy differences being that it is to run for a period of two years (instead of the three- and five-year terms arranged previously), and that the basic reciprocal limit up to which each country is willing to hold the other's currency is fixed at £2,000,000. Though the Agreement is in the customary reciprocal form, it is in fact Spain which will be the creditor; and, as in the Swiss Agreement, it is provided that the basic limit to the accumulation of sterling will be increased by an additional sum "determined in the light of the estimated balance of payments between the sterling area and the Spanish monetary area." The total which may thus be accumulated will depend very largely upon the extent to which Britain is able to release supplies for export; but, in any case, the net balance will be subject to considerable seasonal variations. During the peak of the fruit moving season it may well amount to £10 to £12 million, even if British exports reach expectations, but the net balance on the full year's trading is likely to be substantially less than this. But, whether the balance is large or small, the Agree-

ment means that Britain's important supplies of potash, iron ore and pyrites, quite apart from oranges, bananas, tomatoes, dried fruit and fruit pulp, will be assured even if British exports should be depressed below current expectations.

The Agreement supersedes both the Anglo-Spanish Clearing Agreement of January, 1936, and the wartime Payments Agreement with Spain, both of which have fulfilled the purposes for which they were designed. The sterling which Spain accumulated during the war in payment for a continued export of iron ore, potash and pyrites, and also in consequence of certain British pre-emption purchases, enabled it to liquidate the £8,000,000 of commercial debts previously accumulated on the clearing and also to repay the loan advances of £4½ million made to Spain by the British Government in the early phase of the war. In consequence, no arrears of commercial debts are now outstanding and the Clearing will be wound up.

From the wider standpoint, the significant feature of this Agreement lies in its similarity with earlier agreements, for zero hour for making sterling freely "expendable" under the terms of the Anglo-American Loan Agreement is now only a little more than three months distant. Hence the arrangement with Spain confirms that the main structure of the monetary agreements with Western Europe will endure after July 15th. It will be necessary, however, to make supplementary agreements to provide for the "expendability" obligations. By "expendability" is meant the right of a holder of sterling accruing from a net balance of new current business to spend it for current purposes in any currency area in the world. "Expendability" is thus distinguished from "convertibility" in the sense implied in the Bretton Woods Agreement, whereby a holder of sterling resulting from current trade would have the right to require its conversion into gold or into his own currency. Supplementary agreements of this kind have already been made with Belgium, Holland and Portugal.

Have You Any Wool?

The Wool Study Group which met in London last week appears to have achieved less than had been hoped. The lack of definite proposals will perhaps even relieve the minds of some member countries, and in that respect the Conference will in all probability be considered a signal success. Representatives of some 25 countries, with observers from the United Nations and Food and Agriculture Organisations, conferred for four days and decided nothing. They estimated world production of wool for the current season at 2,905 million lbs. (greasy basis), compared with a total estimated consumption of 3,395 million lbs. This will mean a reduction in world stocks from 5,000 million on June 30, 1946, to about 4,500 million on June 30, 1947. This stock is still alarming in its size, for it represents about a year and a half's normal supply. But the total stock is less important than the composition of its qualities, and in fact it is believed that the larger part consists of poorer types. The decline is stated to have taken place in government held stocks, which at the beginning of the season accounted for 50 per cent of the total. At the end of the season it is estimated that they will be 2,000 million lbs., or 45 per cent. If these figures are correct, it would follow that commercial stocks will remain unchanged throughout the current period, having merely changed in their geographical location. On the face of it, this seems a little difficult to accept. Surely it did not require an international conference to formulate such estimates as these.

The Study Group has invited the participating Governments to consider further the question of special studies on the co-ordination of national wool policies. This massive but innocuous phrase must have pleased the *rapporteurs* considerably. But if problems such as these are in effect to be repeatedly shelved for further consideration, international co-ordination in wool will be no nearer than before, although the Study Group rightly appreciates that the disposal of the world's large stocks of wool presents a formidable problem.

A further complicating factor, however, is the recent Senate Agriculture Committee's approval of the Robertson Wool Bill, by which the Commodity Credit Corporation in the United States will be able to dispose of its wool stockpile of 432 million lbs. at prices in competition with imported wool instead of at parity. But the sales must be handled so as to avoid "disruption of the domestic market." The Bill further directs the CCC to support wool production in the United States in 1947 and 1948 at not less than 90 per cent of the comparable price in January of the year when it is produced, or at the CCC's 1946 support price, whichever is higher. The need for such a measure had, of course,

The Needs of Industry

In every section of industry careful planning will be necessary in order to re-establish and develop home and export markets. Financial problems of great magnitude will have to be tackled. The Three Banks with their accumulated store of knowledge of commercial and general industrial banking are well equipped to assist. They command wide resources which are at the service of their customers.

April

This year Easter falls in April, and Spring brings many inquiries of a happy and eventful nature.

"I am delighted to tell you that I am to be married at Easter"—so begins a letter to one of our branch managers. It continues "My solicitors are preparing a marriage settlement and they tell me that I shall need to make a new will, as marriage revokes the existing one. I wonder whether your Trustee Company will act?" Of course the Company will act, as executor or trustee or both. Its officers, while giving the benefits of a specialized service, preserve friendly relations with all those for whom they act.

MIDLAND BANK
EXECUTOR AND TRUSTEE COMPANY LIMITED

TRADE WITH THE EAST

THE CHARTERED BANK OF INDIA, AUSTRALIA AND CHINA provides a complete banking service, backed by practically a century's first-hand experience of Asiatic economic conditions, for every financial operation connected with TRADE, INVESTMENT AND TRAVEL IN THE EAST. The Bank's branch system, under British management directed from London, extends throughout

INDIA • BURMA • CEYLON
MALAYAN UNION • STRAITS SETTLEMENTS
BRITISH NORTH BORNEO AND SARAWAK
FRENCH INDO-CHINA • SIAM • INDONESIA
CHINA • THE PHILIPPINE COMMONWEALTH

Merchants and Manufacturers planning to establish, renew or extend business relations with the East would be well advised to consult the Managers in London or Manchester.

been expected for some time, and it is disappointing to find that such measures were not considered by the Study Group, as they are indeed full of international implications.

Much was originally expected of the Study Groups in wool and other raw materials when they were set up last year. Last week's Wool Conference suggests that, faced with real issues of policy, they tend to develop frustrating inhibitions, even to the point of failing to produce information and facts, which is their primary purpose. Or is information on proposals and policies already agreed upon being withheld from public scrutiny?

British Aluminium Problems

An important section of Mr R. W. Cooper's speech at the recent meeting of British Aluminium was occupied by a discussion of the company's trading relations with the Government, which is the sole purchaser and seller of aluminium ingots. The position, said Mr Cooper, is obscure, and it causes the company grave concern. It has, of course, been widely recognised that British Aluminium is receiving a price for its output in excess of that paid by the British Government for Canadian aluminium, under the very large and favourable contract which was made last year. The difference in price is not due to any technical deficiency on the part of British Aluminium—indeed, the chairman claimed that the company's furnace technique is in advance of that in any other part of the world—but largely due to lower costs of power.

Mr Cooper revealed that last year the company had considerable difficulty in negotiating a satisfactory contract, but this year, apparently, the difficulty is even greater, and no contract has yet been completed. The provisional price which is at present paid to the company is below cost of production and "well below the price at which metal can be purchased in any part of the world to-day." Recently, the Government has made an offer which is slightly below the estimated cost of production for this year, but with a string attached by which the company will have to undertake heavy expenditure on a programme of modernisation and re-equipment. In a counter offer, the company has put forward an arrangement which would provide "an extremely low return on the ingot side of the business" and

would involve heavy capital expenditure on assets with an uncertain future.

Neither the exact price of the Canadian contract nor of last year's British Aluminium contract has been disclosed. But it is possible to get some impression of the range between the two figures. The Statistical Digest gives figures of home ingot production, imports, and consumption, and it is known that the price of virgin aluminium was recently increased from £72 15s. to £80 per ton (delivered) to average out the costs of metal purchased at home and abroad. During the second half of last year (that is, after the revaluation of the Canadian dollar) the average import price of aluminium was £66 per ton c.i.f. Imports during the seven months to January last totalled 88,700 tons; home production was 17,920 tons; and home consumption 84,300 tons. Since no stock figures are available, it is necessary to make arbitrary assumption about the cost of the supplies which were made available to consumers at £72 15s. per ton during the seven months. On the visible supplies accruing during that period, it can be calculated that the cost of British ingots was probably of the order of £100 per ton—a little more on the figures above, but possibly a little less if allowance is made for metal purchased at lower prices at earlier dates.

It is therefore important for British Aluminium and its shareholders that the fabricating branches of the concern are at present so well placed. In particular the new rolling mill at Falkirk has been steadily coming into fuller and more efficient operation. As was suggested in a Company Note on the British Aluminium accounts in the *Records and Statistics* supplement of March 29th, it is on this side of the business that favourable profits wholly depend.

Industry's Gilt-Edged Sales

So little information is available about the liquidity habits of the public that the evidence, slender though it is, afforded by the half-yearly analysis of the distribution of bank deposits always merits scrutiny. The latest figures, as at December 31st last, are indeed particularly suggestive. They reveal a violent reversal of the trend of the previous eighteen months, and virtually restore the pattern of the war-time period. Except in the early period of the war the greater part of the increase in "net"

bank deposits accumulated on non-personal accounts, and in the years 1942 to 1944 a quite consistent pattern was established, as the accompanying table shows. Personal deposits rose in each successive half-year, but business deposits declined moderately in the first half of each year and rose strongly in each second half, when they accounted for between 70 and 73 per cent of the aggregate growth. In 1945, however, the pattern was radically altered: "personal deposits" absorbed nearly three-quarters of the year's aggregate increase and business deposits only one-quarter. In the first half of last year the contrast with the war period was slightly less marked; even so, personal deposits absorbed more than half. But now, in the second half

Half-Years	DISTRIBUTION OF "NET" BANK DEPOSITS*	
	Personal Accounts	Non-Personal Accounts
1940; Second.....	7.6	92.4
1941; First.....	7.1	92.9
1941; Second.....	29.5	70.5
1942; First.....	38.4	61.6
1942; Second.....	29.5	70.5
1943; First.....	35.1	64.9
1943; Second.....	28.0	72.0
1944; First.....	37.1	62.9
1944; Second.....	27.4	72.6
1945; First.....	51.3	48.7
1945; Second.....	52.7	47.3
1946; First.....	24.7	75.3
1946; Second.....	24.7	75.3

* After deducting bank advances.

of 1946, personal deposits have dropped even below their war-time proportion and business deposits have absorbed more than three-quarters of the aggregate expansion.

The preponderance of business deposits in the war years obviously reflects the rapid rate of accumulation of liquid reserves in industry as stocks were liquidated, depreciation funds piled up and tax liabilities accrued. Then, in 1945, industry faced not only reconversion outlays as generally understood but also had to carry the burden of overheads as Government contracts were tapered off. As such transitional outlays must have continued throughout 1946, it might have been expected that the pattern of deposits movements would have been similar to that of 1945, for there is certainly no reason to suppose that industry's liquid reserves as a whole have been rising rapidly since the war—and they certainly cannot have been rising at their war-time rate. In the circumstances it seems reasonable to deduce that cash balances have been expanded at the expense of gilt-edged holdings, which suggests that the resistance to the cheaper money drive was by no means confined to the personal investor. In recent weeks, too, there has been a good deal of evidence to suggest that most of the selling of gilt-edged securities has come from industrial holdings. Certainly, the fuel shutdown produced a much smaller demand for bank advances than might have been expected—presumably because the necessary finance was provided by a reduction in investment portfolios.

Colonial Mining Policy

The Government memorandum on colonial mining policy which was reviewed in *The Economist* on November 23rd and December 21st, 1946, has brought a rejoinder from the British Overseas Mining Association to the Colonial Secretary. The Association finds much for praise in the Government memorandum, but, as was to be expected, it puts forward a counter view based on arguments in favour of private exploitation of colonial mining resources.

The Association controverts the statement in the Colonial Secretary's paper that development of minerals in colonial conditions frequently requires considerable Government expenditure by pointing to the extensive surveys and transport facilities provided by private enterprise. This is an argument about past fact; so far as future policy is concerned, it would be quite logical to argue that surveys and transport development should be matters for colonial governments, without any reflection on the part which private enterprise has played in these respects in the past. The Association proceeds to argue that the implication of the Colonial Secretary's memorandum that limited groups of private individuals enjoy too large a share of the proceeds of colonial mining is disproved by the average gross profit of 13 per cent (that is, 13 per cent of gross mining proceeds) on Nigerian, Gold Coast and Northern Rhodesian mining is no more than a reasonable reward for a risky investment in a wasting asset.

The Association appears to support the principle that indigenous populations should be fitted for the higher posts in colonial mining, it asserts that the principle is opposed by local white Trade Unions. But it goes on to say that "it is questionable whether it is wise to train the indigenous population to fit the higher posts in mining if no such posts will be available to them after the mineral in the territory is exhausted." This is surely to assume that the working life of a profitable mine must be short and to take a limited view of future mining prospects in the colonial territories. Are colonial mineral resources likely to experience sudden exhaustion? If not, it is difficult to discern logic in an argument that the training of native technicians might be a waste of time. Again, it may be possible to say in 1947 that "the aim of all mining enterprise which is carried on efficiently is to obtain the largest output of mineral at the minimum cost," but the consumer's experience of restriction schemes before the war would scarcely have borne out this claim. Further, the Association argues that the rights of the British South Africa Company could not be acquired against the will of the Company without committing a clear breach of faith. Yet at one point it criticises royalty payments as an undesirable form of taxation of mining enterprise. Does this argument apply, for example, to the Northern Rhodesian copper companies, which make substantial payments on account of royalties to the Chartered Company? Again, is it quite fair to assume, in the attempt to prove that a large proportion of the gross sale proceeds from minerals is retained in the colonies, that payments for stores and services made are largely retained in the Colonies? The Association agrees with much of the memorandum and has assured the Colonial Secretary of its whole-hearted co-operation with the Colonial Governments. No doubt there are features in the Colonial Secretary's memorandum, particularly in connection with the adventuring of public money and skill in such a risky enterprise as mining, that call for careful examination. On the other side, it must be said that the British Overseas Mining Association does not provide a final answer to some of the points in the memorandum, in particular those dealing with native labour.

Insurance in Argentina

In May last year the Argentine Government promulgated a decree under which a Reinsurance Institute was to be set up. To this Institute all insurance companies operating in Argentina, whether indigenous or foreign owned, were called upon to cede a share of their business. The decree (of which a summary was provided in *The Economist* of June 22nd and June 29th last year) also introduced a sharp increase in the discrimination between Argentine and foreign companies, particularly in taxation; this discrimination was carried to its final conclusion by restricting the transaction of marine insurance on Argentine risks to Argentine companies.

In the ensuing period, the original decree has been substituted by a second draft decree, issued last December, which contains substantially the same provisions and was submitted by the Government to the recent extraordinary session of Congress. But a development has recently occurred which seems to be of particular significance. It is now known that a petition has been submitted to the President of the Chamber of Deputies by a number of independent Argentine insurance companies; these companies, which are free from any form of control by foreign companies, have asked for a postponement of the consideration of the decree, so that they can have an opportunity of submitting to the Chamber of Deputies their reasons for asking for a modification of the proposals. The exact shape of the modifications which the Argentine companies have in mind has not been revealed, nor have they given even a general indication of the reasons which lead them to argue that modifications are necessary. Yet the fact that they have submitted a petition at all may be taken to indicate that the Argentine insurance companies have concluded that the Government's decree may not produce satisfactory results for Argentine companies—nor perhaps for Argentine assured. If this inference is correct, the further developments of the Argentine companies' step will deserve watching with close attention by British insurance offices.

Facts for Budget Eve

It is a pity, however inevitable, that the information given in the annual reports of the Commissioners of Inland Revenue is always published so long in arrears. The latest data in the most recent report, issued a week or so ago, relate to the year

DURING a term of existence extending over more than a century, the Westminster Bank has built up a banking system elastic enough to meet rapidly changing conditions, strong enough to withstand the impact of more than one major national emergency. Today, a wealth of experience in every sphere of banking activity underlies the service which, at over 1,000 branch offices, the Bank places at the disposal of all its customers, whether their accounts be large or small.

WESTMINSTER BANK
LIMITED

The Union of South Africa produces large quantities of gold, wool and diamonds, and it is with these commodities that the prosperity of the country is generally associated. There are, however, many other valuable industries, although in some instances their relative importance in the economy of the Union underwent considerable change during the war years. The export of sugar, for example, declined sharply until 1942 when an upward trend developed. Coal exports also rose steeply, as did the export value of wines and spirits, while maize and fruit showed a marked decrease in comparison with the 1939 figures.

As conditions return to normal throughout the world, fresh demands may well cause changes in the relative importance of the industries of the Union. Full and up-to-date information, backed by an intimate knowledge of the country, is available to merchants and manufacturers interested in trade with the Union of South Africa.

HEAD OFFICE: 54 LOMBARD STREET, LONDON, E.C.3

1945-46. But there is here such a wealth of fact for the statistician-minded, and for all who seek to probe the underlying arithmetic of the Chancellor's problems, that a few excerpts are appropriate for Budget eve. Especially intriguing, in view of recent discussion of the possibility of stimulating incentive by distinguishing more sharply between earned and unearned income, is a new table showing the distribution of earned income among surtax-payers in 1944-45. From this the striking fact emerges that nearly one-quarter of all such tax-payers—that is, persons with total taxable incomes exceeding £2,000—earned 90 per cent or more of their incomes; at the other extreme, a similar proportion (actually, 23.7 per cent, compared with 22.9 per cent) earned less than 10 per cent. Of surtax payers with incomes up to £3,000, almost two-thirds earn at least half their incomes, and even if the line is drawn at £10,000 the proportion of taxpayers earning half or more drops only to 57½ per cent. On the other hand, roughly one-third of all surtax paid appears to come from persons with incomes over £20,000, but the amount of income retained net by this group is so small that the scope for differential taxation of high unearned incomes would be insignificant from the revenue-producing standpoint.

In the field of income-tax, the most striking new fact is that in each of the first two years of PAYE roughly 43 per cent of the total yield of income-tax was collected by this means. The more detailed income-tax analyses are not yet available for any later year than 1942-43, but even by that year the yield from a penny in the standard rate had risen to the phenomenal figure of £9,230,000: in 1938-39 it was £5,013,000. By 1945-46—just before Mr Dalton's concessions greatly narrowed the field—the income-tax "region" had grown to 18½ million persons with incomes above the exemption limit, of whom 5 million escaped tax through allowances; the 13½ million actually chargeable with tax contrasted with 3.8 million in 1938-39, when the "region" was 9.8 million.

Among the stamp duty statistics, those relating to transfers of stock exchange securities and stockbrokers' contract notes are of particular interest in the light of recent suggestions of a possible Stock Exchange tax. The yield from transfer duties in 1945-46 was £7,975,000, compared with £5,623,000 in the previous year, with a low point of £2,369,000 in 1940-41, with £4,686,000 in 1938-39, and with £10,359,000 during the rearmament boom activity of 1936-37. Fluctuations in the yield from contract stamps are even more revealing, reflecting as they do the contrast between war-time "cash" dealings and pre-war "Account" and carry-over business. In 1936-37, contract notes yielded £549,000, but had dropped to only £78,000 by 1940-41. By 1945-46, however, the yield had recovered to the level of the last pre-war year, at £246,000.

* * *

Building Wages and Incentives

The Building Unions' claim for an extra sixpence an hour was not granted by the National Joint Council and has gone to arbitration. It is a claim which leaves on one side the controversial issue whether it is desirable and, if so, possible to institute a form of wage payment in the building industry which gives greater recognition to the need for incentive. The tradition of the National Joint Council for the building industry, which has worked successfully since the end of the first world war, has been a flat hourly rate for building tradesmen, and this has assumed almost sanctified recognition in the National Wages Agreement. That is not to say that the national minimum was never exceeded in peacetime. On many pre-war housing estates some form of incentive payment was made, whether by recognition pay, bonus schemes or even the less desirable "grip" system. The objections to piece-work payment cannot be lightly dismissed, for in building quality of output is at least as important as quantity and the unions retain a proper regard for the maintenance of their craft standards. Again, even where in pre-war days it was possible to organise building labour on the site so that additional effort could be recognised by payment related in some way to output, the fairness and attractiveness of such schemes depended on a well-organised flow of materials and competent management.

During the war, however, and since, builders have been required by Defence Regulation 56 AB to pay neither more nor less than the prescribed wage rates. This has meant the end of incentives in peacetime, however much it may have been necessary in wartime to prevent poaching of limited building manpower. The nice calculation of neither more nor less applies

with complete rigidity to local authority building, though it is far less effective in private building. At present, therefore, the unions are eager to maintain the principle of the hourly wage rate and to insist on its application in particular to local authority building. Builders on local authority contracts have of necessity to conform to the standard wage; but there is an increasing fringe of builders and building workers (who are less keen on DR 56 AB than their union officials) who are conniving in its open breach, draining manpower from local authority building and providing a positive encouragement to black market building.

*

The resistance of the building unions, some employers and not a few civil servants to any change in DR 56 AB is the more difficult to understand now that the contracting owners for most of the present house construction are the local authorities. These are in a good position to maintain day-to-day supervision of work on the sites (and thereby prevent any scamping of quality of work), and their total outlay on building schemes is subject to strict scrutiny (thereby preventing any reckless rise in costs).

The objection to local schemes of payment by results, which can be worked out with greater or lesser degree of formality on particular jobs and in particular areas, is therefore greatly weakened by the character of the present housing task. The local authority building programme is now hampered by shortages of materials and by the late start to the building season, and the chance of achieving the target of 240,000 permanent houses this year is certainly dim. There is all the more reason for setting up a common financial interest between the local authorities, contractors and building workers. In other words, Defence Regulation 56 AB, which has long ceased to serve its purpose and is now a positive handicap, should be withdrawn, and flexible systems of payment which offer greater incentive to conscientious effort should be introduced.

* * *

The Significance of Rising Profits

Figures of industrial profits and their distribution between dividends and reserves for the fourth quarter of 1946 are published in this week's issue of the *Records and Statistics* supplement. They show a further increase in gross profits (that is, profits available for interest, dividends and reserves before deduction of Income Tax) for 527 companies whose reports appeared in the last quarter of 1946 to £76,968,000 compared with £69,403,000 in the preceding financial years of the same companies and £62,989,000 three years earlier. Taking the last figure as a datum—it corresponds roughly to profits earned by these companies in 1942-43—the trend has risen steadily from 100 in that year to 110.2 two years later and 122.2 in the latest year. It is clear that some degree of profits inflation is now in train, though it seems moderate enough in extent compared with the inflation of production costs of both raw materials and wages.

At a moment when the ordinary share investor's eyes are fastened on the Budget next Tuesday, to see whether Mr Dalton will impose increased taxation on company profits, it may be pointed out once again that, despite the rising tendency of industrial profits, the increase in ordinary dividends has been kept within very moderate bounds. Whether this degree of moderation will be sufficient to satisfy the Chancellor—who has repeatedly put industry on its good behaviour to stabilise dividends and threatened it with the possible punishment of increased taxation on profits if it fails—is another question. But it should be recorded that while the fourth-quarter companies last year increased their distributable gross profits by over £7½ million, they increased their ordinary dividends by little over £4½ million, and the share of last year's increased profits set aside for free reserves and other forms of savings was raised from 29.2 per cent to 30.3 per cent. Taking a view for the whole of last year, free reserves were credited with 25.6 per cent of distributable profits compared with 24.7 per cent for 1945, while the share going to ordinary dividends was scarcely changed, at 56.6 per cent. The corpus of profits from which these dividends were paid itself increased, and enabled the average rate of ordinary dividend to be modestly raised from 11.2 per cent in 1945 to 12.4 per cent in 1946 on the issued ordinary capital of the companies concerned. This average rate of dividend, of course, takes no account of the effective, as distinct from the issued, capital which produced last year's profits.

There is nothing better than BRITISH LAW For JUSTICE

and "THE BRITISH LAW" For INSURANCE

REFUGE Assurance Company Limited.

Chief Office: Oxford Street, Manchester, 1.

In 1946 representatives of the Company provided service, usually at the homes of the policyholders, in respect of **NINE MILLION POLICIES**, making **190,000** maturity payments totalling **£5,200,000** and paying **£3,000,000** in death claims. In addition, **1,400,000** calls were made to pay National Health Insurance benefits.

Ordinary Branch: A reversionary bonus of **£1%** for each year's premium due and paid in 1946 is declared on with-profit policies.

Industrial Branch: **£850,000** is allocated to increase the benefits of the majority of existing premium-paying policies.

HONGKONG AND SHANGHAI BANKING CORPORATION

(Incorporated in the Colony of Hongkong.)

ONE HUNDRED AND THIRTIETH REPORT OF THE BOARD OF DIRECTORS,
SUBMITTED to the Ordinary Yearly General Meeting of Shareholders held at the Offices of the Hongkong & Shanghai Banking Corporation, 1, Queen's Road Central, Hongkong, on Friday, 22nd March, 1947.

To the Shareholders of the HONGKONG AND SHANGHAI BANKING CORPORATION.
The Directors have pleasure in submitting the Profit and Loss Account for the year ended 31st December, 1946, together with the Balance Sheet at that date. The net profit for the year, after making transfers to Provisions for Contingencies out of which accounts provision has been made for Bad and Doubtful Debts and (the estimated amount of the losses arising as a result of war, amounting to £9,092,381. From this sum the Directors recommend the payment of a dividend of 2½ per cent on the paid-up capital, the rate of the day, will amount to £7,760,842, leaving a balance of £1,841,861 to be carried forward to next year.

The Directors have considered it necessary to transfer a sum of £1,126,000 from Reserve Fund to add to Provisions for Contingencies in respect of War Losses. The Hongkong Dollar figures shown on the Balance Sheet have been converted into Sterling at 1/2 27/32d., the rate ruling on the last day of the year. The Hongkong Dollar figures shown on the Balance Sheet have been converted into Sterling at 1/2 27/32d., the rate ruling on the last day of the year. The Hongkong Dollar figures shown on the Balance Sheet have been converted into Sterling at 1/2 27/32d., the rate ruling on the last day of the year.

NOTES: 1. There are contingent liabilities in respect of bills re-discounted, confirmed credits, guarantees given and forward contracts for the purchase and sale of foreign exchange.
2. Balances in currencies in respect of which an official rate of exchange existed at 31st December, 1946, have been converted at approximately the official rate; balances in currencies in respect of which no official rate of exchange existed have been converted at approximately the bank rate ruling at 31st December, 1946, or the rate officially quoted prior to that date.

REPORT OF THE AUDITORS TO THE MEMBERS OF THE HONGKONG AND SHANGHAI BANKING CORPORATION.
We have examined the above Balance Sheet with the Books of the Corporation kept in Hongkong, with the audited accounts of the London Office and with the returns received from the other Offices which have been certified by the Branch Managers. In the case of certain offices, which have not yet been re-opened, the figures included in the above Balance Sheet are as shown by the last returns received in Hongkong. Subject to the above observations we have obtained all the information and explanations we have required and in our opinion such Balance Sheet is properly drawn up so as to exhibit a true and correct view of the state of the Corporation's affairs according to the best of our information and the explanations given to us and as shown by the books kept in Hongkong and by the returns from the other Offices.

Metropolitan Assented

The position of Metropolitan Assented Stock under the Transport Bill has now been clarified by an announcement by Glyn Mills and Company, the trustees appointed by the Minister of Transport under the London Passenger Transport Act, 1933. The present security for the outstanding £6,540,474 Metropolitan Assented stock consists of £4,414,819 London Passenger Transport "C" stock. Under the Bill, this "C" stock is due to be replaced by British Transport stock worth £2,966,206 at the time of issue. Metropolitan Assented stockholders are entitled to interest at the rate of 3½ per cent until December 31, 1948, and thereafter until December 31, 1958, at 3 per cent. To the extent that the income on the "C" stock might be insufficient to meet these rates, the four main line railways were originally liable to provide the difference out of the receipts of the London Passenger Pool—a liability which after December, 1939, was borne by the pooled revenues of the controlled undertakings. This liability after the Bill is enacted will fall on the British Transport Commission. Unless the underlying British Transport stock is redeemed before December 3, 1958—a remote contingency—the Trustees will then distribute *pro rata* to Metropolitan Assented stockholders, the only difference being that instead of £67 ros. of London Transport "C" stock a holder of £100 Metropolitan Assented will receive approximately £47 7s. British Transport stock, assuming for the calculation that this stock is issued at par.

Ceylon and the Tea Ration

The Minister of Food issued a warning last week concerning the maintenance of the tea ration. The contract for 150 million lb. of tea which was offered to Ceylon producers has not been fully taken up. The last published figures gave total acceptances so far as just over 91 million lb., leaving a deficit of nearly 60 million lb. Total tea imports for 1946 amounted to 396 million lb., of which 142 million lb. came from Ceylon. Consumption, on the other hand, totalled almost 460 million lb., leaving a deficit which must have been made up from stocks. If Ceylon producers do not agree to send more than 100 million lb. this year, and assuming that supplies from other sources (mainly India) are at last year's level, then, if the tea ration is to be maintained, a total drawing on stocks of some 100 million lb. will be unavoidable.

The present level of stocks must be fairly low, if the dock strike in Calcutta which is holding up tea shipments is sufficient to cause concern to Mr Strachey. It is possible that they represent less than six months' supply and may even be nearer four months'. With such a narrow margin few chances can be taken. But even if this short-term danger is averted and shipments are made good, the long-term position, with its prospective decline of 100 million lb. in stocks during the year, would still be uncomfortable.

The difficulty for Britain is that both Ceylon and India are keen to exploit their position of monopoly sellers. They have recently raised prices and imposed an export duty and they are reluctant to

sell tea under bulk contract to the Ministry of Food when they hope to obtain higher prices at the auctions. Experience in the recent Colombo sales provides no firm evidence as yet whether the Ceylon Government is pursuing the right tactics from its own point of view. But neither Ceylon nor India should complain if after exploiting their sellers' position now, as they have every right to do, the tables are later turned and Britain seeks its own advantage. Their position when the food situation improves and Britain becomes their sole market may not be so agreeable. And it is in their long-term interest to encourage greater consumption of tea by methods wholly opposed to the present technique of consumers' ransom.

Rubber in New York and London

Although the United States Administration will control the "end use" of natural and synthetic rubber until March 31, 1948, in order to ensure the position of the synthetic rubber industry, the private import of natural rubber into the United States has now been permitted as from April 1st. The Special Exchange Board has decided, as expected, that the date for re-opening the New York rubber market is to be May 1st. The resumption of private dealing in New York should broaden the London and Singapore futures markets; London dealers, under Bank of England authority, will be able to carry on arbitrage operations with both centres.

In London, rubber prices are on balance a little firmer, partly in sympathy with the effect of modest private purchases on American account in Singapore. Shortage of spot rubber persists, and the quotation of 1s. 2½d. to 1s. 2½d. per lb. is somewhat nominal. The Board of Trade continues to ask 1s. 3½d. per lb. for its small stocks. In order to free the market the minimum deposit for non-members of the London Rubber Exchange has been reduced from £15 per ton to £5; the fortnightly settlement is providing an effective check on the creation of any undesirable speculative position.

US Consumption of Textile Fibres

Total consumption of textile fibres (cotton, wool, rayon and silk) in the United States reached a very high level during 1946 and according to *Rayon Organon* amounted to 6,475 million lb. This shows an increase of over 500 million lb. on 1945 and about 100 million lb. above the five-year average of 1941-45. Consumption last year was some 50 per cent above the pre-war level and reflected the urgency of civilian demand and the replenishment of stocks. Furthermore, it reveals the speed at which the American textile industry has been able to re-adjust itself to peacetime requirements. Cotton is still the major textile fibre with a consumption of 4,845 million lb., but its position is weakening

(Continued on page 557)

(Continued from page 556)

compared with pre-war as it accounted for only 75 per cent of the total as against over 80 per cent in 1936-40.

Rayon, with an annual consumption of 875 million lb., improved its position as the second most important fibre and accounted for 13½ per cent of total consumption. Continuous filament yarn showed a proportionately greater increase on 1945 than staple fibre and totalled 666 million lb. The consumption of cellulose by the US rayon industry in 1946 amounted to 426,000 short tons compared with 400,000 short tons in the previous year; of this total, wood pulp provided 321,000 short tons of 75 per cent. According to the US Pulp Producers' Association, the available supply of dissolving pulp in 1946 was estimated at slightly over 490,000 tons; thus the American rayon industry took two-thirds of available supplies, leaving only 169,000

US TEXTILE FIBRE CONSUMPTION
(in millions of lbs.)

	Cotton	Rayon	Wool	Silk	Total
1936-40 Average...	5,525.9	379.5	375.8	49.2	6,330.4
1941-45	5,078.7	668.7	633.2	6.2	6,386.8
1945	4,508.2	769.9	648.2	0.5	5,926.8
1946	4,844.9	875.4	748.4	6.3	6,475.0

tons for the manufacture of such goods as plastics and cellophane. The rayon industry's consumption of 105,000 short tons of cotton linters has been estimated to represent one half of the total linter supplies.

American wool consumption in 1946 reached a new high level of 748 million lb. (scoured basis). This figure is almost double the pre-war average. Apparel wool consumption totalled 620 million lb. (scoured basis), which broke all previous records, but 82 per cent of this total was provided by foreign wools and only 18 per cent by wools of US origin. The consumption of carpet wool reached 128 million lb., the second highest on record. Imports of raw wool into the United States during 1946 also broke all records, amounting to 1,074 million lb. (actual weight). Supplies came mainly from Argentina, Australia, New Zealand, United Kingdom (Joint Organisation's stock) and Uruguay. End-of-year commercial stocks of raw wool are estimated at 540 million

lb. (scoured basis), of which 438 million lb. were apparel type (274 million lb. domestic origin and 164 million lb. foreign).

During 1946 raw silk returned to the American civilian market for the first time since 1941, but consumption which totalled some 6 million lb. was well below the pre-war level. With the resumption of trade with the Far East, however, a more rapid expansion of silk consumption is expected this year.

Shorter Notes

Priorities for steel supplies in 1947 have been fixed for six classes: electricity generating plant for suppliers of current; machinery for coal production; plant for gas undertakings; equipment for conversion of plants from coal to oil-firing; railway equipment, including goods locomotives, coal wagons and rails; and atomic energy development. No individual or total steel consumption targets have been fixed for these priority groups. Priority for exports is under discussion.

What may prove to be the last dividend on Stock Exchange shares has been declared this week. The payment is £5, making £8 for the year to March 25th, which is the highest total since £12 ros. was paid for 1938-39 and compares with £5 paid for 1945-46. Profits have risen by £175,147 to £359,783. The £8 rate is equivalent to that which would be drawn from the proposed 4 per cent annuities, which are to be allotted in the proportion of two annuities for each share of £36 paid when the financial reconstruction scheme, which has already been given general approval, is completed.

According to London metal dealers, the Dutch domestic selling price of tin has been raised from 410 guilders to 472 guilders per 100 kilos delivered from works. This is equivalent to just under £450 per ton. In the United States, the Reconstruction Finance Corporation raised the price of tin by 10 cents to 80 cents a lb. for April delivery. This is due to the new contract price recently agreed with the Bolivian producers. The new American price is equivalent to about £445 per ton, compared with the British price of £437 per ton.

SECURITY PRICES AND YIELDS

A fuller list containing 370 securities appears weekly in the *Records and Statistics Supplement*. Notes on the following company reports also appear in the Supplement: Harrods; Cammell Laird; Colvilles; Godfrey Phillips; Hadfields; Cunard.

SAFETY... No. 1 Priority

Designed and constructed to provide a wide margin of safety, the "Bristol" Wayfarer has a rugged appearance which creates passenger confidence. It looks dependable and is as dependable as it looks. The Wayfarer offers saloon comfort for up to 36 passengers and can be operated at rates low enough to attract many of those people who have never before travelled by air.

THE BRISTOL AEROPLANE COMPANY LIMITED

"If you ask me,
shortages hit hardest
at the man
who wants the best"

When you find WHITE HORSE WHISKY hard to come by, reflect that its fine-liqueur quality was never finer than it is today.

MAXIMUM PRICES:—Bot. 25/9, 1-Bot. 13/6 as fixed by the Scotch Whisky Association

BANK OF SCOTLAND

POSITION OF LIQUIDITY AND STRENGTH

LORD ELPHINSTONE'S SPEECH

The annual general meeting of the Proprietors of the Bank of Scotland was held within the head office, Edinburgh, on the 1st instant. The Rt. Honourable Lord Elphinstone, K.T., Governor of the bank, presided.

In submitting the directors' report, the chairman said:—For the first time in our long history our balance sheet takes account of liabilities and assets in excess of £100 millions. The expansion of £10 millions in our deposits is in accord with the general experience and is a reflection of the Government's policy of deficit financing. There has been a satisfactory increase in our advances and loans. They are now slightly higher than before the outbreak of war. The figures have been arrived at after making full allowance for bad and doubtful debts—these having been provided for as usual by specific reserves.

With increased funds at our disposal we would welcome applications by credit worthy borrowers and we trust that the latent enterprise in industry and commerce will enable us to utilise a larger proportion of our resources in direct lending for trading purposes.

There has been a relatively small fluctuation in our note circulation which is still more than three times the pre-war total.

As a counterpart to the expansion in available funds investments have been increased by £5,000,000 during the year. The market value of these is substantially in excess of the figure at which they appear in the balance sheet.

BRANCHES REOPENED

The return of staff has enabled us to re-open several branches and sub-branches which were closed temporarily during the war. The amount shown in our books against bank premises represents much less than real value, but we shall have to face considerable expenditure when controls permit of our overtaking arrears of maintenance and reconstruction. Funds have been set aside to cover these potential outlays.

The total of cash, bank balances, documents in transit, and money at call and short notice is 26 per cent. of our liabilities to the public. Adding bills discounted (including Treasury bills), Treasury deposit receipts and investments, we have an aggregate of £92,900,000, which represents 89 per cent. of current liabilities. This you will agree shows a position of liquidity and strength.

The directors have thought it desirable to transfer to the published reserve fund £250,000 from reserves set aside for contingencies during the war which are now no longer required. With a further allocation of £100,000 from the current year's profits, our reserve fund now stands at £2,600,000.

RESULTS FOR THE YEAR

The increase of £35,585 in our net profits—after account is taken of the reduction in income-tax—is modest in relation to the expansion that has taken place in our resources. Operating costs have again increased substantially while on a large proportion of our funds a very low rate of interest is being earned.

The net profits are	£303,215
Add the balance from last year ...	161,133
	464,348

Deduct:—	
To reserve fund	£100,000
Transferred to trustees for officers' pension fund ...	30,000
Transferred to Bank of Scotland widows' fund	10,000
Dividend at 12 per cent. per annum, less income tax	158,400
	298,400

Leaving to be carried forward £165,948

The past year has been one of difficulties and disappointments for all, but it was only to be expected that the process of reversion and rehabilitation would present serious problems and that, in the nature of things, many of the controls and restrictions imposed by the necessities of war-time would have to be continued. The acute shortage in man-power and raw materials rendered that inevitable. This country, having sacrificed most of its vast overseas investments and expended its material resources in prosecuting the war, has been impoverished. It was and still is in an extremely debilitated condition. America and Canada have come to our assistance with large dollar credits, on terms that must, in our present state, be regarded as generous. But even with that assistance—and assuming it is wisely and prudently expended—our financial position in the family of nations is precarious. Not only is our standard of living in jeopardy, our status as a first-class Power is at stake. Unless the true position is realised by our people and all our energies and resources are harnessed to the task that faces us the outlook cannot be other than bleak.

PRESENT SITUATION

In some aspects our present situation is as desperate as that which faced us at the worst period of the war, and if we are to regain our lost position it must be tackled in the same spirit as prevailed then. Honest hard work in all grades of employment, coupled with maximum efficiency in management and direction, are called for, and indeed, should be demanded. A favourable response from all classes would go far towards easing and ultimately resolving our difficulties. Owing to high taxation and the ill effects of scarcity and inflation the temptation to many to give of less than their best is perhaps greater now than ever before. A fundamental need of progress and welfare is a restoration of that high moral standard which in days gone by actuated the majority of the people of this country, but which I regret to think is now less in evidence. A recovery of the pride in doing a good job and in the faithful performance of duties would be of immense value to our nation materially and spiritually.

At this critical juncture the responsibilities and tasks of government are perhaps heavier than at any time in our country's history. Inspired leadership and high statesmanship could, I believe, recreate in our people these qualities and virtues which they seem temporarily to have lost. It is surely not too much to hope that even yet these may be forthcoming!

TRIBUTE TO STAFF

I would take this opportunity to express the thanks of the directors to the executive, management and staff of the bank at head office and branches. Their labours have contributed in no small degree to the highly satisfactory results of the past year.

The report and accounts were adopted.

WILLIAM HOLLINS AND COMPANY, LIMITED

SATISFACTORY RESULTS

The 39th annual ordinary general meeting of William Hollins and Company Limited, was held, on the 28th ultimo, at Nottingham.

Mr Douglas Hamilton (the chairman), in the course of his speech, said: A year ago the British textile industry was looking forward with confidence to a steady emergence from war-time restrictions. To a limited extent our expectations have been justified. Raw wool markets have been freed from control, thus enabling us to replenish our stocks and ensure the maintenance of the high standard of "Viyella," "Clydella," "Dayella," and our other famous brands. In conformity with Government policy as well as in our own long-term interests we have applied all possible effort to the restoration of our export trade, in which we have made considerable progress.

SHORTAGE OF LABOUR

Despite our most strenuous efforts to attract labour and notwithstanding the improved working conditions and hours and higher pay that have been introduced throughout the industry, our total number of operatives is still greatly below our 1939 level. It appears to be usual nowadays to look upon shortage of manpower as an accepted fact; whether that be the case or no, surely it should be the duty of the Government to ensure that whatever manpower is available should be employed to the best possible advantage of the nation as a whole. At the same time, the Government, faced with the gravest economic problems that have ever confronted the nation, should realise that anything which impedes the progress of the basic industries is to be avoided at all costs.

PROFIT AND DIVIDEND

The trading profit amounts to £248,347, compared with £225,006 for the previous year.

I regret that the lion's share of our profits again goes to the Exchequer, £155,000 being required to cover our taxation liability. Now that Excess Profits Tax has come to an end, you will be interested to know that your company, during the years 1939 to 1946 has contributed by way of income tax and E.P.T. no less a sum than £1,453,000.

After providing for taxation, £5,000 for war damage loss and £2,475 in respect of the preference dividend, there remains a balance of £85,872 which, with the amount brought forward, of £20,291, makes a total available balance of £106,163, out of which your board have transferred £15,000 to general reserve, which now stands at £80,000. The board recommends a dividend of 7½ per cent. on the ordinary shares, which will absorb a sum of £52,388, leaving a balance of £38,875 to be carried forward.

The only changes in the balance sheet calling for special comment are:

On the assets side: An increase of some £350,000 in our stocks is attributable largely to the replenishment of our raw wool stocks; an increase of approximately £50,000 in sundry debtors, due mainly to increased turnover in the latter part of the year; and a reduction of approximately £230,000 in the tax reserve certificates held, accounted for by the surrender of certificates in payment of taxation liabilities and the reduction in the provision necessary at the year end, by reason of the reduced rate of E.P.T.

On the liabilities side: We have carried to a suspense account £91,362, representing the net amount of the E.P.T. post-war refund, to which we were entitled at December 31, 1946, and the increase of just over £100,000 in trade creditors and accrued charges, mainly due to the increase in raw material purchases.

The report was adopted.

THE PRUDENTIAL ASSURANCE COMPANY, LIMITED

RECORD VOLUME OF NEW BUSINESS

SIR GEORGE BARSTOW'S REVIEW

The ninety-eighth annual general meeting of The Prudential Assurance Company, Limited, was held, on the 2nd instant, in London.

Sir George L. Lewis Barstow, K.C.B., Chairman of the Company, in the course of his remarks, said:—

With your permission, and in accordance with our usual practice, I will take the report as read.

In my remarks this afternoon I propose for convenience to quote round figures where appropriate.

NEW BUSINESS IN THE LIFE BRANCHES

In the ordinary branch the number of policies issued during the year, including group life and overseas business, but not group pension business, was 145,000, compared with 70,500 in 1945, assuring sums of £73,200,000, compared with £30,800,000. The highest previous total of new ordinary branch sums assured was £32,500,000 in 1937. Of the total new sums assured in 1946, the home business produced £53,200,000, compared with £17,200,000 in 1945, and the overseas business produced £20,000,000, compared with £13,600,000.

In the industrial branch the number of policies issued during the year was 2,231,000, compared with 1,336,000 in 1945, assuring sums of £101,900,000, compared with £52,900,000. The highest previous total of new industrial branch sums assured was £69,700,000 in 1938.

CHEAP MONEY AND ITS EFFECTS

The consequences of the current low yields are of fundamental significance to an institution such as ours, whose contracts are in the main based on the principle of accumulation of money over long terms of years.

Thus the financial adjustments set out in the valuation report, and briefly outlined in the directors' report, are of particular importance in that they reflect the new conditions to which I have referred. Firstly, it has been necessary to increase the rates of premium at which we are prepared to write new business. Secondly, it has become necessary to strengthen the valuation bases of our home assurance business by reducing the future net rates of interest assumed. Although it was impracticable to make detailed valuations on appropriately revised bases as at December 31st last, there have been included in the liabilities additional sums which are estimated to be sufficient to enable the valuation rate of interest to be reduced from 2½ per cent. to 2 per cent. for ordinary branch assurances issued in the United Kingdom and Eire, and from 2½ per cent. to 2½ per cent. for industrial branch assurances. The provision for a reduction to a lower valuation rate of interest in the ordinary branch, as compared with the industrial branch, reflects the difference in the weight of taxation in the two branches.

The cost of this additional provision is substantial. It will be seen from the directors' report that, while there are available for this purpose two non-recurrent items which appear in the 1946 accounts of the life branches as a result of changes in accountancy practice, the major part of the cost has been met in the industrial branch by utilising the investment reserve fund of £5,750,000, and in the ordinary branch by utilising the investment reserve fund of £3,850,000, together with £3,000,000 from profit on investments account.

INVESTMENTS

The other main factor affecting institutional investors in the past year has been the development of the Government's nationalisation programme.

The net yield earned on the ordinary branch fund during the year was £3 7s. 1d. per cent., and on the industrial branch fund was £3 10s. 11d. per cent. We have again received substantial payments of arrears of interest from investments in enemy and formerly enemy-occupied territories and these are shown under separate headings in the accounts.

ORDINARY BRANCH

In the ordinary branch the premiums were £20,900,000, an increase of £3,100,000. The total sums assured in force, including bonuses, exceeded £400,000,000; the corresponding liabilities, as increased by the provision made for strengthening the basis of valuation, exceeded £160,000,000. The death claims amounted to £2,900,000 and claims by maturity of endowment were £9,300,000.

The surplus in the ordinary branch, including £213,318 brought forward from the previous year, is £2,592,954. The allocation of this amount is set out in the directors' report. The directors have declared a reversionary bonus of £1 per £100 sum assured for participating policies in force on December 31, 1946.

OVERSEAS LIFE BUSINESS

During 1946 the sums assured, including bonuses, in force in our overseas life branches passed the £100,000,000 level. Most of the branches commenced operations in the years 1930 to 1932, and at the outbreak of war the sums assured in force, including bonuses, amounted to about £45,000,000. During the war years most branches consolidated their position and recorded healthy expansion, and the business in force at the end of 1946 was £107,000,000, the annual premium income being £4,100,000.

INDUSTRIAL BRANCH

In the industrial branch the premiums were £32,100,000, an increase of £1,800,000. The total sums assured in force, including bonuses, exceeded £800,000,000; the corresponding liabilities, as increased by the provision made for strengthening the basis of valuation, exceeded £277,000,000. The death claims amounted to £9,000,000 and claims by maturity of endowment were £8,600,000.

The surplus of the industrial branch, including £1,078,170 brought forward from the previous year, is £6,041,107. The allocation of this sum is set out in the directors' report.

The directors have declared a reversionary bonus at the rate of 16s. per £100 sum assured on participating policies issued by the Prudential, which were premium-paying policies on December 31, 1946. This bonus is subject to completion of payment of one year's premiums.

GENERAL BRANCH

In my speech a year ago I stated that with the change from war to peace we could look for more vigorous growth in our general branch premium income. The increase of £963,000 for the year 1946 is the largest we have ever recorded and the total premiums amounted to £4,448,000.

The surplus for the year before the inclusion of the sum brought forward from the previous year is £216,661, compared with £262,803 for the year 1945. Included in the surplus for 1946, moreover, is a non-recurrent item of accrued interest of £42,591.

Details of the disposal of the surplus in the general branch are given in the directors' report. In view of the expansion in this branch, the reserves have again been increased by transferring £100,000 from the surplus to the additional reserve fund.

MONSANTO CHEMICALS LIMITED

A RECORD YEAR

The thirteenth annual general meeting of Monsanto Chemicals Limited, was held, on the 25th ultimo, at the company's registered office, Victoria Station House, S.W. 1.

Dr L. F. Nickell (the chairman), who presided, reviewed the company's activities during the year. Many difficulties in the matter of shortages of fuel and raw materials, supplies and equipment have been encountered, and constant attention and sustained effort, far greater than anything ever experienced, have been required to meet these problems. Particularly distressing have been the difficulties with packages and coal. The chemical business is one in which packages are especially important, and the range of packages required is a wide one. A number of makeshifts have had to be used during the year, and these have not always succeeded in getting goods to the customers in proper condition.

At present the situation is extremely difficult, and is not becoming easier, but everything within the company's compass has been done, and is being done, to meet it. Like all industry, the activities of the company have been adversely affected by the fuel shortage. This is a serious and basic problem that faces not only this company but the entire country. It is inconceivable that this problem of adequate production of coal cannot be solved. It must be. The only alternative is chaos. But time is the essence; not only must it be solved, but in the shortest possible time. Yet, in spite of all these handicaps, the year has been a record one thanks to the efforts and spirit shown throughout the company's organisation from top to bottom.

INCREASED BUSINESS

At the last annual meeting reference was made to two plans for the expansion and development of the company's activities—a short-term and a long-term one. In spite of the difficulties already referred to, marked progress was made with the short-term plan throughout the year. Much of this plan still remains to be done, but the progress already made is the factor chiefly responsible for the satisfactory increase (35.5 per cent.) in the company's business, and an important factor in the increase (80 per cent.) in trading profit. It is gratifying to note that with this increase in business 33 per cent. was direct export business, and a further important percentage of domestic sales is known to have been exported in the form of customers' products.

With respect to the long-term plan, long delivery periods for equipment and the general shortages of building materials are proving a great handicap. But plans have been completed, and construction is on the point of starting, and will proceed with all the despatch that the country's economic plight will permit. We are all faced with grave and serious problems, and this company will have to share in these, but that should not deter the company from any reasonable expansion or development. There are always problems, and there always will be, and it is company policy to go forward as expeditiously and rapidly as possible.

PROFIT AND DIVIDEND

After depreciation of £69,343 and provision for taxation of £572,859, the accounts for the year ended December 31, 1946, show a profit of £237,878 (£94,337), surplus and reserves of £1,503,284 (£1,046,034), current liabilities and provisions of £846,662 (£811,168), and current assets of £1,765,368 (£1,490,101). A tax-free final dividend of £70,000 on the ordinary shares is recommended by the directors.

The report and accounts were adopted.

REFUGE ASSURANCE COMPANY, LIMITED

INCREASED NEW BUSINESS

Mr. J. WILCOCK HOLGATE'S REVIEW

Mr J. Wilcock Holgate, the chairman, presiding at the eighty-third annual ordinary general meeting of the Refuge Assurance Company, Limited, held at the Chief Office, Oxford Street, Manchester, in the course of his speech, said:—

The report I now submit for your approval is distinctive in that for the first time since 1938 it refers to a period throughout which our work was carried out under peace-time conditions. That is not, of course, to say that there do not still remain many difficulties resulting from six years of war; we are all, I fear, uncomfortably aware of these in our private lives as well as in our business. As far as this company is concerned, we have been called upon to face a continued fall in the rate of interest on new investments and also an increase in the costs of goods, materials and services, with a consequent adverse effect on our expense ratios. On the other hand, our investment position is very strong, and we are able to record a greatly increased new business as compared with 1945, together with a most satisfactory rate of collection of premiums.

LIFE ASSURANCE AND SAVING

During the year the total amount assured under our policies increased by over £16,000,000 to £246,369,471. The total life assurance funds now amount to £90,444,998—which are, of course, the property of our policyholders—in addition to which we hold investments reserve and other funds amounting to over £6,500,000; and the magnitude of these figures indicates the importance of the contribution the company makes towards the national object of increased saving. Money laid out in the payment of life assurance premiums is not money spent, but money saved.

During the year the amount of our new business increased in remarkable fashion. This was due in part no doubt to the absence of many things which the public would otherwise purchase; but it was due also in very large measure to the return of so many individuals to their normal civilian life and their assumption or re-assumption of domestic responsibilities. It is widely recognised that the value of £100 to-day is not what it was ten years ago; as a consequence existing assurances are being very generally increased in order to compensate for this fact, and indeed in the ordinary branch the average yearly premium in our new business has almost doubled since 1935. In the industrial branch we have moved far from our original position as providers of whole life assurance at 1d. a week, and we have fully justified the opinion expressed in 1853 by a Committee of the House of Commons to the effect that the application of life assurance was "capable of a great extension, not only in the higher and middle classes of society, but also among the humbler classes, to whom it has recently been very considerably applied." Policies may still be taken at 1d. a week, but the average new business premium is very considerably higher, having increased from 3.7d. in 1918 to 9d. last year. This increase is due to the growing appreciation of the value of policies incorporating an endowment benefit, premiums under which now form 73 per cent. of our new business.

VALUATIONS

In the ordinary branch the life assurances valued were as follows:—

Policies	Amounts assured	Premiums
541,466	£97,047,136	£5,039,887

The number of new policies effected was 42,831, assuring the total sum of £11,516,078, as against comparable figures of 27,550 and £5,996,391 in the previous year. The premium income increased by £252,760 to £5,419,207 and the net interest amounted to £1,483,462. The expense ratio was 12.91,

as against 10.74 in 1945, and the life assurance fund now amounts to £45,564,724, in addition to which there is an investments reserve fund of £2,250,000.

In the industrial branch the policies valued were as follows:—

Policies	Amounts assured	Premiums
8,830,096	£149,322,335	£8,032,770

The premium income was £7,654,318, showing an increase over that of the previous year of £88,836; and in this connection I should point out that this increase is affected by the fact that in 1945 there were 53 weekly accounts as compared with 52 in 1946. The life assurance fund now amounts to £44,880,274, having increased by over £2,500,000 during the year, in addition to which there is an investments reserve fund which now amounts to £3,100,000. The expense ratio was 27.78, as against 26.73 in respect of 1945.

ALLOCATION OF PROFITS TO POLICYHOLDERS

After a careful review, not only of the present circumstances, but also of the future effects upon our interest income of the present policy of cheap money, your board recommends the declaration of a reversionary bonus in respect of ordinary branch with profit policies at the rate of £1 per cent. on the sum assured in respect of each full year's premium due and paid in 1946. It is recommended also that until further notice an interim bonus be allowed on policies becoming claims by death or survival at the rate of £1 per cent. on the sum assured.

In the industrial branch the policies are in form non-profit: but an amount of profit has been allocated to policyholders and out of this sum it is proposed to grant the following additional benefits:—

As regards existing premium paying policies (with certain exceptions) dated prior to January 1, 1942, and all "age 90" paid up policies, the amounts payable in respect of deaths or survivals of endowment terms which occur within the twelve months commencing March 20, 1947, will be increased by amounts varying from 6d. to 1s. 7d. in the £.

I regret that circumstances have at last made it necessary for us to prepare new rates of premium which will come into force at an early date. These new rates will in general show increases as compared with those at present in force; but I need not remind you that they will apply only to new policies, and that those now in force will be unaffected. It is the first time in the history of the company that the whole of the prospectus has been revised in an upward direction. I deplore the circumstance: but facts must be faced.

INVESTMENTS

Perhaps the aspect of our work during the year that has caused us the most concern is the matter of our investments. The rate of interest in long-term Government borrowing fell appreciably during the year. It is true that as a result the margin between the book values of our investments and the corresponding market values, which was already very large, has been further increased, but at the cost of rendering extremely difficult the task of investing our growing funds at remunerative rates.

The position will be further worsened by the loss of income we shall have to suffer if our investments in railway securities are replaced by Government stock at 2½ per cent.; which would involve the company in a reduction in gross income of some £90,000 a year. It occurs to me to reflect that the present unattractive investment outlook affords little encouragement to the thrifty man who wishes to save money for his family or against his old age.

The report and accounts were adopted.

MERCANTILE BANK OF INDIA, LIMITED

FURTHER EXPANSION

SIR CHARLES A. INNES'S STATEMENT

The annual general meeting of the Mercantile Bank of India, Limited, will be held, on the 22nd instant, in London.

The following is an extract from the statement of the chairman (Sir Charles A. Innes, K.C.S.I., C.I.E.), which has been circulated with the report and accounts for the year ended December 31, 1946:—

The business of the bank has continued to expand. In spite of the termination of the war and the big drop in military expenditure, especially in India, there has been a further large increase in deposits while on the assets side the most noteworthy features are an increase of more than £4 millions in cash and of more than £6 millions in bills, loans and advances. Our holdings of Government securities are down by £3 millions, and the proportion of our deposits applied to the financing of industry and commerce has risen to 41 per cent. Our profits at £180,837 show an improvement on those of last year, and we have been able to increase the dividend from 6 per cent. to 8 per cent. As regards allocations, there is only one point to which I need draw your attention. We propose to repeat last year's allocation of £50,000 to premises account. Our project for rebuilding our Bombay office which has been held up by the war has now become urgent, and we cannot postpone it any longer with safety.

CONDITIONS IN INDIA

In India the year witnessed a deterioration of the political situation. It began with riots first in Bombay and then in Calcutta. The arrival in March of the Cabinet Mission had a quietening effect, and the announcement in the Budget for 1946-47 of the abolition of the Excess Profits Tax led to buoyancy in the Stock Exchanges, and prices were driven up to very high levels. In August, however, fierce communal riots broke out in Calcutta and later spread to eastern Bengal and Bihar. They caused a setback to the Stock Exchanges, a further break in prices occurred in November with the failure of the London talks with the Indian political leaders, and prices continued to sag for the rest of the year. The food situation, though not so serious as in the previous year, remained difficult, and the high prices of food grains caused much distress among the poorer classes. This is one cause of the widespread epidemic of strikes which afflicted India throughout the year.

Nevertheless, in spite of this unfavourable background, business activity remained at a high level, and the bank had a busy year.

THE FUTURE

As regards the future, the Prime Minister's announcement must be fresh in your minds, and I am sure that it is the hope of every one in this country that in the short space of time still left to them the Indian leaders will be able to compose their differences and work together to set up a strong and stable Government. If they are successful, a long period of peace and prosperity should open up for India, but it depends on themselves whether they are successful, and one can only hope for the best. In the meantime, I note that there are signs of increasing communist activity in India, so much so that the

Government of Madras has recently had to arm itself with special powers to deal with the menace.

The new taxes announced by the Finance Minister in the Budget, particularly the new business tax, caused concern and further depressed share values. It was feared that the new business tax would act as a deterrent to that industrial development which is so necessary for India's economy, and it is satisfactory that the Finance Minister has since agreed to make it less severe. As regards the future of this bank in the new India, I will only say that we have the confidence and good will of many Indian clients and that we have a long record of useful service to Indian trade and industry. I believe myself that the opportunity of continuing that service will remain.

OTHER COUNTRIES

Ceylon was given large powers of self-government in the new constitution announced last May and also a pledge that it would attain the full status of a Dominion in a comparatively short space of time, and politically the year was a peaceful one. On the economic side, trade statistics give an encouraging picture.

Burma was ravaged by war more than any other country in the Far East, and though some progress in rehabilitation has been made, basically the country is still in a bad way. The emphasis is still on politics rather than on economics and the physical restoration of the country. In Siam the difficulties are mainly economic. Mauritius had a good sugar crop and is showing signs of recovery from disasters of the previous year, when the sugar crop on which it depends was badly damaged by cyclones. Reports from Malaya are generally favourable. Recovery in Hong Kong has been remarkable, and the colony did an immense trade in the year, though the export of local manufactures has not yet started to any great extent.

GENERAL INVESTORS AND TRUSTEES, LIMITED

A GRIM OUTLOOK

The fortieth ordinary general meeting of this company was held, on the 27th ultimo, in London, Mr Sidney S. Lamert (the chairman) presiding.

The following is an extract from his circulated statement:—

A valuation of our securities shows that there has been an appreciation of rather more than a quarter of a million pounds in the year. The obvious comment is that it would be a poorly chosen portfolio which did not show substantial appreciation in the buoyant markets which have prevailed until recently. This Trust, with substantial reserves formed from accumulated revenue undistributed in the past and with a well-balanced portfolio of investments, widely distributed and carefully selected, is in a strong position.

Net revenue has expanded by £7,000 in round figures, which justifies us in recommending to you an increase of 1 per cent. in the distribution on our ordinary stock, making a round 10 per cent. for the year. We suggest this increase should be by way of bonus.

I shall make no attempt to assess the future. We shall lose a substantial amount of income when our railway and other stocks are, in the euphemistic phrase of the moment, "taken over" under the plan of nationalisation. To offset this, we have considerable interests in the rubber industry which may reasonably be expected to come back into the paying list. Further, we have a number of equities in thriving industrial companies which have not yet reached their full stature. Industry can only thrive if it can command the three essentials—man-power, raw materials and coal. The outlook in all these three respects is admittedly grim.

The report was adopted.

WESLEYAN AND GENERAL ASSURANCE SOCIETY

A RECORD YEAR

The one hundred and sixth annual general meeting of this society was held, on the 1st instant, Mr Arthur L. Hunt, F.S.S., F.C.I.I., the society's chairman and managing director, in the chair.

The chairman, in moving the adoption of the reports said: In these days of shortages of commodities of all kinds, there is, nevertheless, no shortage, limitation or restriction affecting life assurance, which remains freely available to all in normal health, who wisely seek its protection.

During 1946 the society issued 9,018 policies in the ordinary life department assuring £3,164,437; this was more than double the figure for the previous year and is a record for the society.

The premium income of the ordinary life department at £1,018,693 exceeds the million pound mark for the first time, while that of the industrial life department has reached £1,799,586. The premium income of the fire, accident, motor vehicle and employers' liability departments increased by 30 per cent. to the record figure of £86,976 compared with £66,663 for the previous year. The premium income of the society as a whole is £2,880,841, being an increase of £164,081 in the year.

The society's assets have reached £22,674,290, having increased by £1,244,117 in the year.

The valuation of liabilities discloses a surplus in each department. The surplus in the ordinary department was sufficient to enable the directors to declare a reversionary bonus at the rate of £1 per £100 sum assured at a cost of £104,765.

The surplus in the industrial department was sufficient to enable the directors to allocate £40,000 for the benefit of industrial department policyholders. Additions, up to a maximum of 10 per cent. will be made to the sums payable on claims arising either by death or maturity on or before April 5, 1948.

The directors have increased the general reserve to £250,000 by a transfer of £15,000 from the ordinary department. The general and investments reserves together now exceed £1,000,000.

The amount advanced to house purchasers for the year 1946 was the highest for the last twenty years, notwithstanding that the society does not encourage the purchase of houses at excessive prices.

NEW FORM OF ANNUITY

In November last the society obtained a favourable decision against the Inland Revenue in the Court of Appeal concerning a new form of annuity policy issued by the society. The society had issued an annuity policy to Mr Charles Hart in 1944 providing for two benefits to be paid, namely, benefit (1) an annuity during Mr Hart's lifetime, and benefit (2) a capital sum at his death computed, as follows:—should he die upon reaching his expectation of life by the mortality table used by the society, the sum then becoming payable was to be equal to the money which Mr Hart had paid for the Annuity Policy; should he die earlier a smaller amount was to be payable and should he die later a larger amount was to be payable.

Mr Hart was given the right to anticipate the capital sum which became due on his death by means of loans on which the society did not require interest to be paid. Repayment of the loan was to be effected at Mr Hart's death by setting off any loans advanced to Mr Hart against the capital sum then becoming payable.

The society had succeeded in dividing a purchased annuity into its two components—capital and income. The Inland Revenue, quite rightly, decided to test whether the

policy was sound at law, and in 1945 the question was submitted to the Special Commissioners of Inland Revenue who awarded Judgment in favour of the society. In July, 1946, the matter was referred to a Judge of the High Court, Mr Justice Macnaghten, who reversed the Special Commissioners' decision. In November, 1946, Lord Justice Greene (the Master of the Rolls), Lord Justice Cohen and Lord Justice Asquith of the Court of Appeal quashed the Judgment of the High Court. In view of the wide importance of the case an Appeal by the Inland Revenue to the House of Lords was permitted, but I do not yet know whether the Inland Revenue intend to carry the matter further. I would have been glad to be able to announce that the society was able to commence issuing these attractive annuity policies on a large scale, but you will realise that whilst an appeal to the House of Lords is pending there are difficulties in doing this. When Mr Justice Macnaghten delivered his Judgment against the society certain sections of the press were not very kind to us and many people were left with the impression that the society had been attempting to do something which was not quite proper. Nothing is further from the truth. There is no disgrace in trying to change the existing situation, if it is a bad situation, by any lawful means, provided proper respect is paid to the justifiable rights of all parties. The society was very careful, when designing its annuity policy, to respect the rights of the Inland Revenue to be able to tax as income everything which was properly income.

The taxation of purchased life annuities is a glaring example of an injustice which has not been put right notwithstanding many protests by individuals and organisations such as the Institute of Actuaries, the Life Offices' Association, and the Associated Scottish Life Offices. This injustice is particularly harsh on those people who after a life-time of hard work have saved a capital sum on which they have to depend for the rest of their lives. The cheap money policy of the present administration makes it almost impossible for a man to live on the interest deriving from his capital and he has no alternative but to live on his capital, generally by purchasing a life annuity. It is, therefore, consistent with the present policy of the Government that the unfair rule which bears so grievously upon an annuitant should be obviated or circumvented.

It seems to me that there are three possible courses of action for the Inland Revenue to follow. Firstly, the Inland Revenue could bring in legislation to stop the effects of the policy, if their appeal to the House of Lords were to prove unsuccessful. I, however, do not believe that the Inland Revenue will do so, because the financial effect to the Treasury of the issue of the policy would be very much less than most people believe, and, moreover, any preventive legislation would bear such a stamp of injustice upon it that Parliament might well refuse to ratify it. Secondly, the Inland Revenue might amend the law so as to allow a proper proportion of purchased life annuities to be free of tax, in which event the society's policy would become unnecessary. In doing this the Inland Revenue would only be following an example set by some of the Dominions. Thirdly, the Inland Revenue could accept the position as determined by the Judgment of the Court of Appeal, which would mean that from now on by perfectly legal and proper means all new annuitants would be able to ensure that tax was charged only on the interest element of their contracts. Thus a hardship would be removed within the existing law and without the need of any special legislation.

The report and accounts were adopted.

ROWNTREE AND COMPANY, LIMITED

SATISFACTORY RESULTS

MR G. J. HARRIS'S REVIEW

Speaking at the 50th annual meeting at York, held on the 1st instant, the chairman, Mr G. J. Harris, said:

The profit earned in the year, after charging all expenses, and after providing for amounts payable to direction and labour under the company's profit sharing scheme, for all Government taxation, and for directors' fees, is £317,544, compared with £269,589 in 1945. You will see from the account that this increase of £47,955 in the balance of profit reflects an improved trading profit, a substantial reduction in the income tax charge, and a larger provision for the depreciation of fixed assets. The reduced charge for income tax arises mainly from the reduction in the standard rate from 10s. to 9s., and the reduced amount required to cover the 1947/48 liability. The larger provision for depreciation represents depreciation of new assets acquired during the year, and the writing down of older plant and machinery.

DIVIDENDS AND ALLOCATIONS

The addition of the year's profit to the amount brought forward from 1945, together with a transfer of £8,965 from investment reserve, to which I will refer later, gives a total of £607,734. Preference dividends for 1946 already paid absorb £169,800, and £12,500 has been distributed already to ordinary shareholders as an interim dividend at the rate of 2½ per cent. free of tax, leaving a balance of £425,434 now to be dealt with.

The directors recommend that out of this balance £65,000 be transferred to contingencies reserve, and that a final dividend at the rate of 7½ per cent. free of tax be paid to the ordinary shareholders, which will require £37,500. This final dividend, with the interim already paid, will bring the distribution to ordinary shareholders for the year up to 10 per cent. free of tax, compared with 8½ per cent. free of tax in 1945. If you approve these recommendations there will remain a balance of £322,934 to be carried forward to 1947, compared with £281,225 brought in from 1945—an increase of £41,709.

The proposed transfer of £65,000 to contingencies reserve includes £25,000 to bring the reserve for unemployment benefits under the company's scheme to an amount sufficient to cover the maximum commitment for one year under the terms of the scheme, which is being amended to provide improved benefits, to which I will refer later. The remaining £40,000 of the £65,000 proposed transfer, is for an obsolescence reserve to facilitate re-equipment.

PROBLEMS OF INTEGRATING GOVERNMENT AND INDUSTRIAL POLICY

After dealing with various items in the balance sheet, the chairman continued: The Government has referred to the need for management (by better organisation, layout, and equipment) and for labour (by greater effort) increasing materially the output per man hour. The Government is entitled to whole-hearted support from management and labour to achieve this purpose.

Important though that issue is, however, in the case of this industry, it is not the most important item in determining consumer prices and values. A 2 oz. block of plain chocolate had, in 1939, an ingredient cost of 38.7s. per cwt. The new 1947 ingredient price will be 135s. per cwt., an increase of 96.3s. per cwt. All other costs, including wages, salaries, packing materials, delivering, selling, and administration, were 51.9s. per cwt. in 1939, and 54.7s. per cwt. in 1947, an increase of only 2.8s. per cwt. That

small increase includes the effect of considerable reductions in distribution cost.

The sensational increase in the price of cocoa and the great increase in the price of sugar will cause the 2 oz. block of chocolate to be sold later this year at fully 100 per cent above the pre-war price.

The object of export is to be able to import equipment, raw materials, and food; I am giving these facts to underline the great importance in this connection of the price we pay for imports, and because of a conviction that the ultimate price to the consumer is always a matter of capital importance.

Substantially eight years of sellers' market conditions have made the Government, industry, and the unions alike under-rate the devastating silent power of the consumer to ease off buying, even with shortages, when prices get beyond reason.

As was recently announced, £7,000 million cash is available for £6,000 million of goods and services. This dangerous situation will assuredly bring its own nemesis and none of us can expect to escape its ultimate result.

TENDENCY OF PERPETUATING CONTROLS

No government in power after the war could escape being faced with the gravest political and economic problems that have faced this country in this century. Even so, there are trends in policy in tackling post-war problems that would appear to some of us likely to worsen rather than improve our economic condition. While shortages and consequent controls last, it is an administrative necessity of the Government to deal with industrial problems at industry level rather than company level, but there are signs, such as the powers taken in the Industrial Organisation Bill, of perpetuating controls over a wide field which (whether intended to do so or not) lead in the direction of the corporate state. Trade associations, either as such or acting as wartime associations, have greatly extended their membership during the war, because Government departments have settled policy at industry level; and therefore membership of the employers' negotiating body was practically a necessity, if only to keep informed on matters of supply and price of the industries' products. The basic principle of operation was to allocate ingredients according to usage during the year preceding the outbreak of war, and equity between manufacturers was thus maintained in a rough and ready way. Similarly, prices were on a basis that at least retained all the manufacturers in membership.

PRESENT POLICY NO SOLUTION

As regards consumer goods, I confess an ignorance of how it is possible to secure full employment at rates satisfactory to the unions with, at the same time, profits satisfactory to all trade association members, and margins satisfactory to all distributors, without the grave risk of arriving at a quality and price for products unacceptable to the mass of consumers. This condition can be masked for a time by overall shortages making a sellers' market, by Government subsidies on food amounting to £364 million, and by living on the U.S.A./Canadian Loan, but these devices only defer a settlement and do not provide a solution of our problem.

The chairman concluded with an exhaustive analysis of the Government's policy for tackling the nation's problems.

The report and accounts were adopted.

LANCASHIRE ELECTRIC LIGHT AND POWER COMPANY, LIMITED

SIR JOSEPH NALL ON THE BILL

The ordinary general meeting of this Company was held, on the 9th instant, in London.

Sir Joseph Nall, the chairman, after dealing with the accounts, said that with regard to the shortage of generating capacity in the country, one must go back over 20 years to the real beginning of that menace. He had been one of that small group of members in the House of Commons who had endeavoured to expose the fallacies underlying the Electricity Act of 1926, which was founded on the Weir Report, which he and others had endeavoured to show was a factually fallacious and fundamentally futile document. The underlying theory of that Report and the Act was that an alleged redundancy of generating capacity existed due to municipalities and companies building too much plant ahead of requirements.

In fact, they had only been exercising common business prudence in an industry which they knew was in its early stages and was bound to experience a vast and increasing expansion as the years progressed. So far as spare plant was created by the policy of expanding generating capacity, it had enabled unforeseen demands for new business or breakdowns to be met without any disturbance to consumers, and the policy of inter-linking between the various authorities for co-operation and mutual aid had been well advanced before the Weir Report.

He was in no way criticising the Central Electricity Board, but they had been required to work within the obligations of a statutory scheme always fundamentally unsound because it tended to decrease the percentage of spare plant available and merely diverted capital expenditure from the building of generating plant, the lack of which they now bewailed, and put the money into a huge and costly transmission system which produced nothing and merely increased over-all costs.

A VAST UPHEAVAL

The Electricity Bill now before Parliament sought still further to impose the process of rigid centralisation in the direction and management of generation by transferring the whole ownership and daily management of the huge stations to an entirely new and as yet unconstituted body of persons, who according to the Bill need not know anything whatever about electricity supply or production. To make matters worse for the consumer, it would hand over the distribution system from the present experienced local organisations—municipalities or companies—to a series of unknown and probably unqualified boards yet to be appointed, who would be responsible for the administration and management of utterly unwieldy, unwanted and unworkable areas of distribution.

The vast upheaval was bound to retard development and check progress towards increased efficiency and divert the activities of experts and executives from immediate and practical problems now requiring their urgent and concentrated attention. Of vital importance to consumers, and particularly industrial consumers, was the proposed abolition of the Electricity Commissioners. It was useless window-dressing to suggest that consultative or advisory councils with absolutely no executive or judicial authority could fulfil their role.

The financial proposals in the Bill had already been widely condemned. What the thrifty investing public must realise was that the policy of summarily exchanging stockholders' securities for new securities at prices arbitrarily fixed without reference to real or potential values was only part of a wider intention to enforce a Marxian policy.

The report was adopted.

THE CLYDE VALLEY ELECTRICAL POWER COMPANY

NATIONALISATION NO BENEFIT TO COMMUNITY

RAW DEAL FOR SCOTLAND

The annual general meeting of this company was held, on the 1st instant, in Glasgow, Mr Robert Robertson, LL.D., the chairman, presiding.

In the course of his speech when moving the adoption of the report and accounts for the past year, the chairman said:—

The Electricity Bill having passed its second reading I need no longer expand on the objections to the nationalisation proposals. Like you I regret the passing of this great undertaking, built up entirely by the foresight, ability, perseverance and energy of its founders and their successors, who have controlled it since its inception.

I am still strongly of the opinion that the disappearance of this company will not be to the benefit of the community.

COMPENSATION TERMS UNFAIR

Dealing with the provisions of the Bill I agree with the view expressed in many quarters that the compensation terms to be afforded to the stockholders are entirely unfair. To determine the value of an undertaking on Stock Exchange quotations is altogether unsound because various factors enter into the make up of the price. To fix the purchase price on a present day quotation would be wrong because the shadow of nationalisation has had serious depressing effect on the value of the shares. On the other hand, to take the market quotation of almost two years ago is again fallacious because no consideration is taken of the change in circumstances since that date. Clyde Valley stocks were always looked upon as gilt edged, but it is easy to-day to make a selection in market quotations of stock of companies which were not regarded as being more safe than ours and where the quotations are very much in excess of the prices now proposed to be paid to our stockholders. Further, the market value is to some extent fixed by the yield and stockholders of the prudently managed company whose directors preferred to apply a considerable amount of the profit to the development of the undertaking instead of paying it in dividend are being penalised compared with undertakings which preferred to pay a larger proportion of their profit to their stockholders. Where the profits have been ploughed back into the business, thus providing capital without interest charges, as is the case with this company, the stockholders are entitled to more consideration than that now being afforded to them. Apart from the loss in the capital value of the shares, the stockholders are severely penalised by loss of income. At the present rate of interest afforded by Government securities, taken as 2½ per cent., there will be a substantial loss in income to the stockholders amounting to 33.68 per cent. on the first preference stock, 35.94 per cent. on the second preference stock and 27.5 per cent. on the ordinary stock.

The provisions in the Bill regarding Scotland cannot be viewed with equanimity. Apparently for some reason which has not yet been adequately explained, the North of Scotland is to be denied the alleged benefits of nationalisation, while Southern Scotland, which includes practically the whole of the industrial areas, is to be tacked on to England, and will constitute two of the fourteen areas which are to be administered to all intents and purposes from the central control in London, so that so far at least as electricity is concerned, Southern Scotland really becomes a part of provincial England. The characteristics of Southern

Scotland are to be ignored to the detriment of the consumers. Again Southern Scotland is divided into two areas. The proper method of development is to have a combination of urban and rural demand so as to obtain a proper diversity of load, but two-thirds of the electrical consumption and 50 per cent. of the population is centred in the artificial south-west area. Obviously, the south-east area must be under a very considerable handicap in further development.

CHEAP ENERGY FOR ENGLAND

If we must have nationalisation, then Scotland should be separated from England and administered as one entity. Industrial Scotland's chief asset in the past has been cheap power which, with the exhaustion of the Lanarkshire coalfields is in danger. A cheap supply of electricity could be maintained by forming Scotland into one entity, obtaining the benefit of cheap hydro-electric energy produced both in the Highlands and South Scotland, and this could be accomplished without disturbing the plans of the Hydro-Electric Board for the development of the Highlands. Under the Bill the benefit of this cheap energy will go mainly to England. Scotland again is getting a raw deal.

There is another matter to which I must refer. In the Second Reading of the Bill, the Minister of Fuel and Power saw fit to make some observations on our last issue of capital in 1938, and stated categorically that the stockholders had made a profit of £750,000 on the issue. The Minister's statement was misleading and untrue. The facts are that the shareholder made no capital appreciation at all. The Minister also stated that the Electricity Commission protested against the issue. That also is incorrect; no protest was made.

Again, the Minister's statement infers that the consumer was prejudiced, but from the date of the new capital issue, the average selling price per unit per annum fell steadily, and did not rise above the 1937 price until 1943, when the tremendous rise in the cost of coal began to affect the charge to the power consumer. The company did not increase the charges current at the time of the issue to the consumer, which remained at the same tariff until January, 1947.

NEW PLANT DIFFICULTIES

During the present winter the company was directed to make considerable interruptions of supply to many of our consumers, which we did with regret. These interruptions in supply arose from two causes—national shortage of generating plant and shortage and poor quality of coal. One important cause which has not received the prominence which it deserves is the vastly increased number of consents which require to be obtained before new plant can be installed.

As an example, on July 31, 1939, the company was directed by the Central Board to instal an additional 30,000-kw. generating set at our Clyde's Mill power station. The consent of the Electricity Commission was received on August 16, 1939, and work was commenced immediately, the set going into commercial use in December, 1941. On July 5, 1946, the company was directed by the Central Board to instal two generating sets of similar capacity at Clyde's Mill power station. Application was made for the consent of the Commissioners on July 24th, but to-day—nine months later—the consent has not yet been received from the Commissioners because of the new procedure.

The report and accounts were adopted.

KING LINE, LIMITED

ENCOURAGING RESULTS

OUTLOOK FOR TRAMP SHIPPING

SIR VERNON THOMSON'S VIEWS

The 58th annual meeting of King Line, Limited, was held, on the 21st ultimo, in London.

Sir F. Vernon Thomson, Bt., G.B.E., who presided, said: Gentlemen,—The directors' report, with the accounts for the year 1946, having been circulated a few days ago, I assume it will be your pleasure, as usual, to take them as read. It was with deep regret that the directors had to record the death, on January 12, 1947, of their esteemed friend and colleague, Mr Percy Cross.

For the first year's trading since the company's tonnage was released from direct Government service, the directors are glad to be able to submit results so encouraging.

DISTRIBUTION AGAIN

After providing for all taxation on the year's profits, also providing for depreciation of the fleet as set out in the profit and loss account, the net profit for the year was £180,611, to which has to be added the amount brought forward from 1945. The company's reserve account has been augmented by £100,000, and the directors recommend a total distribution of 15 per cent. for the year 1946, less income tax (the same as for the previous year), carrying forward the balance of £178,853.

The initial income tax allowance on capital expenditure on new tonnage acquired since 1944 has been debited in the profit and loss account and applied as additional depreciation on the vessels concerned, thus utilising this helpful concession under the Finance Act. The investments are worth substantially more than the £819,386 at which they stand in the company's books.

ABNORMALLY HIGH COSTS

The company owns six motor vessels and one steamship as set out in the report. The vessels are of an average age of 10 years and stand in the company's books at the moderate figure of £6 12s. 4d. per ton d.w. To a tramp shipping company, dependent as it is upon the volume of the trade of the world, and the seas being open to the competition of all flags, it is of cardinal importance that it should have efficient tonnage at competitive costs.

Shareholders will appreciate that ship-building costs are at present abnormally high, being more than twice pre-war cost; repairs and running costs also are similarly in excess of pre-war. This is a period of transition. The immediate outlook for British tramp shipping for the next few months continues good; beyond that no one can say definitely. It is prudent ship management policy to write down as soon as possible high cost of expensive tonnage while current remunerative freights permit. From past experience of tramp shipping approximately three years out of ten are good years.

IMPORTANCE OF EXPORTS

To enable Britain to import its vital supplies of food and raw materials at this time, exports are of the utmost importance. This is emphasised in the Government White Paper Economic Survey for 1947. British shipping services overseas rank as U.K. invisible exports; they are higher than any other single industry exports. The importance of British shipping in the national economy is thus in peace-time second only to its services to the country during the war.

In 1939 the King Line fleet aggregated 107,370 tons d.w. To-day it has a total d.w. of 64,320 tons. Eleven vessels were lost during the war; four have been replaced so far. If this old-established tramp ship-

ping company is to replace the major portion of the tonnage lost and so play its part in maintaining an adequate and efficient British Mercantile Marine, it is obviously advisable to retain in the business more than would otherwise be necessary. This policy is in the best interest of the continuing shareholder and of our country.

IMPROVED PAY AND CONDITIONS

Following the seafarers' outstanding service to the country in the cause of freedom and right, to which your directors paid tribute throughout the war, shareholders will be glad to know that after long negotiations by the National Maritime Board, which is composed of representatives of seafarers and shipowners, agreement has been achieved voluntarily which will ensure as compared with pre-war greatly improved pay and conditions of employment in British ships, with security of tenure. I trust this will be of lasting benefit to British shipping and its personnel.

The accounts were approved and the retiring directors re-elected.

LONDON & LOMOND INVESTMENT TRUST, LIMITED

INCREASED NET REVENUE

THE HON. W. B. L. BARRINGTON'S STATEMENT

The sixteenth ordinary general meeting of London & Lomond Investment Trust, Limited, will be held, on the 16th instant, at 116 Old Broad Street, London, E.C. 2.

The following are extracts from the statement of the chairman, the Hon. W. B. L. Barrington, circulated with the report and accounts:—

The net revenue exceeded that of last year by £9,747. After providing for the dividends on the preference stocks, £28,704 was available for the ordinary stockholders, which is equivalent to 21.75 per cent. on the ordinary stock before deduction of income-tax, as compared with last year's figures of £19,609, or 16.1 per cent.

The sum of £5,000 has again been transferred from profit and loss account to general reserve, which now amounts to £115,000.

The directors are recommending the payment of a final dividend on the ordinary stock of 8½ per cent., which will make the total distribution 12½ per cent., as against 11 per cent. last year.

VALUE OF INVESTMENTS

The market value of the investments was £2,347,585, as noted on the balance-sheet, a figure which is £731,845 more than their total book value as stated in the balance-sheet. The position may be summarised as follows:—

Appreciation in value of investments	£731,845
Capital reserve	281,006
General reserve	115,000
Profit and loss appropriation account	15,317

£1,143,168

each £100 of ordinary stock being thus represented at January 31, 1947, by net assets of approximately £576 (after provision for the final dividend).

ISSUE OF ORDINARY SHARES FORESHADOWED

The directors propose to make an issue of ordinary shares at an early date.

With this end in view the 15,000 shares of £10 each created but not yet issued must be divided into 150,000 shares of £1 each; 20,000 of these £1 shares will then be offered in the form of ordinary shares pro rata to the ordinary stockholders at £2 10s. per share. This represents one share in respect of every £12 ordinary stock. These shares, when fully paid, will be converted into ordinary stock and will rank pari passu with the existing ordinary capital.

GUY MOTORS, LIMITED

SATISFACTORY FINANCIAL POSITION

MR SYDNEY S. GUY'S SPEECH

The adjourned thirtieth and thirty-first annual general meetings of Guy Motors, Limited, were held on March 4th at Wolverhampton. Mr Sydney S. Guy, M.I.Mech.E., M.I.A.E., A.M.I.E.E. (chairman and managing director), presided.

The following is the chairman's statement circulated with the report and accounts:— With your permission as both the 1945 and 1946 accounts are published together, I will deal with the earlier year first and subsequently draw your attention to matters which concern both years.

The only difference between the 1945 and the previous year's figures which requires explanation is the large increase in the stock. This apparent increase was due to the fact that towards the close of the 1945 financial year we were completing contracts for military vehicles and Government payments on account of work in progress had largely ceased, so that we were then financing ourselves.

Referring to the 1946 accounts these show the effect of increased capital subscribed in October, 1945, and the increased reserve account by the premium obtained on the share issue less its cost. Another appreciable alteration will be seen in the items "Fixed assets." I should explain that if we were to adopt the latest practice in the arrangement of the accounts we could not present a proper picture in regard to the amount written off and reserves created thereby on buildings, plant and machinery, unless we obtained a valuation of these assets. Your directors also felt this course was desirable because, as pointed out at our annual meeting in December, 1944, the figure at which these items stood in our books did not "in any respect adequately represent the extent of our organisation." "the result of the heavy depreciation which had been written off over the years."

THE WORKS AND PLANT

Since the war ended we have received many visits from customers who had not previously seen our works and we have also exchanged visits with all the important British heavy commercial vehicle manufacturers. In practically every case the visitors have expressed their astonishment at the size of the factory, the excellence of its layout, the quantity and quality of its modern equipment, and were surprised to find we manufactured practically every component for one model or another.

It would be no exaggeration to say that no heavy commercial vehicle manufacturer has a higher percentage of modern plant and equipment than your company and employing some 1,400 to 1,500 the management is able to keep that personal touch which tends towards the greatest efficiency and harmonious working which is so necessary today.

DEVELOPMENT AND PRODUCTION

You will also notice in the balance sheet the provision for development of new models and reorganisation of production, also for obsolescence and deferred repairs, totalling £33,500. I would point out that since the war we have spent far more money under these headings than the figures mentioned, nevertheless we propose to retain these reserves for the time being as further expenditure under these headings continues to be made.

The reduction in the amount of staff bonus was due to the elimination of A.R.P., N.F.S. and other special war-time personnel. The actual bonus paid to each individual was unchanged. The dividend paid on the ordinary stock was 15 per cent. for the tenth year in

succession. The increased amount absorbed was due, of course, to the increase of capital.

It should be noted that as the accounts are now arranged the appropriations are shown in the profit and loss account, and are also incorporated in the figures given in the balance sheet.

The 1946 year was a difficult one, and although we were able to change over from the manufacture of military vehicles to civilian types with surprising speed, we were soon confronted with shortage of supplies and delays in delivery, both of which increased in severity as the year rolled on, and for these reasons production fell short of the programme we had planned. Coupled with this we regret to say we have not so far been successful in obtaining a settlement of our claims by the Government departments, to which I referred at our previous meeting, and, of course, no credit has been taken in the accounts for the amount involved. Through these causes the profit did not reach our pre-war standard, which explains the small amount we shall recover from previous excess profit payments referred to in the profit and loss account.

Before leaving the accounts, I would point out that the current assets are more than double the current liabilities, and the reserve, at approximately £600,000, is over twice the amount of the issued capital, which, you will agree, discloses a very satisfactory position.

ORDER POSITION

I reported in December that the company was well supplied with orders, and speaking generally the output of both goods and passenger vehicles has been sold for 1947, that many orders had been booked for both classes of vehicle for 1948, and I can now add others for delivery in 1949.

During the last year approximately 40 per cent. of our vehicles have been exported and we are very gratified by the large percentage of repeat orders we continue to receive both from home and abroad, but we are much concerned with the ever increasing difficulties of shipping.

Seven years of war has given some of the British heavy commercial vehicle manufacturers an exceptional opportunity of proving the quality of their products. During the war it was impossible to obtain new vehicles and the operators continued to run the old ones, but experience has shown that the mass-produced vehicle has a limited life, whereas the British vehicles continued to operate satisfactorily. There are to-day many hundreds of Guy vehicles at home and abroad that are giving satisfaction in spite of their 15 to 20 years' life. This experience justifies your company's policy of producing individually-built vehicles for "long life and low running costs." Nevertheless, we must have regard to the present high cost of production if we are to be in a position to meet competition in the world's market when the present abnormal demands have been met—already I notice some American manufacturers have reduced their prices.

PLEA FOR A UNITED EFFORT

Your Board is not despondent of the future; your factory is efficient; there exists an excellent team spirit, and we believe that this nation's common sense must again triumph. Industry and commerce made this country great and can again restore its prosperity. But time is the essence of the problem, we must sink our political differences, "cut the cackle," and by a united effort get down to the job of supply and production.

The report and accounts were unanimously adopted.

MIDLAND COUNTIES ELECTRIC SUPPLY COMPANY, LIMITED

INJUSTICES OF ELECTRICITY BILL

The thirty-fourth ordinary general meeting of the Midland Counties Electric Supply Company, Limited, was held, on the 28th ultimo, in London. Mr William Shearer, in the course of his speech said:— Dealing with the company side of electricity supply generally, I know of no other industry that has ploughed back such a large proportion of its earnings over a number of years into the operating properties. In consequence, while the equity securities may not have had the same specific attraction as many industrial ordinary shares, they have enjoyed a very high investment rating.

In examining the proposed financial arrangements for the new Government Boards further, we find that the door is left wide open to possible political abuses. It is intended that the Central Authority should exercise complete control over the finances of the Area Boards, including the amounts to be paid by these Area Boards to the Central Board for Electricity Supplies, and the finances of the Central Board are placed under the control of the Minister. I find it difficult to follow the mental process which, starting from the premise that all monopolies are vicious, assumes that when they become State monopolies, and beyond competition, they immediately acquire all the sovereign virtues.

COMPENSATION CLAUSES

Let us now examine the proposed compensation clauses. The Minister stated that in his opinion the terms of compensation to stockholders are "fair and even generous." In the beginning of my remarks I made some observations which indicated my view regarding this opinion, which I fear must have been formed without a proper appreciation of the meaning of these terms. I have already touched on the high investment rating which preference and ordinary stock of electricity supply companies have enjoyed. Since, however, the threat of nationalisation emerged neither the preference nor ordinary stocks of supply companies have appreciated to anything like the same extent as other investment securities. This is due to the fact that there was a widespread fear that if nationalisation materialised holders would not receive fair, let alone generous, treatment from a Socialist Government.

I should like to give you an illustration of the manner in which Supply securities such as ours have lagged behind in Stock Exchange quotations, and in doing so I might mention our own 6 per cent. Cumulative Preference stock as compared with 2½ per cent. Consols, Distillers Company 6 per cent. Cumulative Preference stock and Imperial Tobacco 6 per cent. Non-Cumulative Preference stock. The mean price of our Midland Counties 6 per cent. stock in 1938 was 28s. 7½d., but the take over price under the Bill is computed to be 31s. 6d., or a rise of only 10 per cent.

The mean price of 2½ per cent. Consols for 1938 was 71½, but their average price on the dates taken as the basis for computation under the Electricity Bill was 99½, or a rise of 39 per cent. Similarly, Distillers 6 per cent. Cumulative Preference had a mean price in 1938 of 30s. 4½d., and an average price on dates mentioned of 39s. 7d., a rise of 30 per cent. Imperial Tobacco 6 per cent. Non-Cumulative Preference had a mean price in 1938 of 29s. 3½d., and an average price on dates mentioned of 38s. 2d., or a rise of 30 per cent.

EFFECT OF CHEAP MONEY POLICY

It will thus be seen that while the Chancellor's cheap money policy has caused very considerable rises in the price of both 2½ per

cent. Consols and the two Industrial shares mentioned, the threat of nationalisation has kept the 6 per cent. Preference stock of our company far from a corresponding upward movement. The same argument applies with equal force to our other classes of stock and to that of electricity supply companies generally throughout the country.

While the holders of Argentine railway stocks may not feel particularly happy over the price which has been agreed for their properties, they may consider themselves fortunate that the Argentine Finance Minister has not adopted the same questionable tactics as appear to have been followed in the Electricity Bill.

If the actual terms proposed are examined in relation to the earning capacity on the present rate of dividends being paid, a clear picture can be obtained of the confiscatory nature of the Government's proposals. Assuming that in payment for the various issues of the Company a 2½ per cent. Government loan is issued, our 4½ per cent. Preference stockholders will lose £1 5s. 7d. per cent. per annum, our 6 per cent. Preference stockholders will lose £2 1s. 4d. per cent. per annum, and our Ordinary stockholders will lose at least £4 1s. 5d. per cent. per annum. On the assumption that the Government will issue a 2½ per cent. stock for compensation, the annual cost to them, before deduction of tax, will be under £400,000 per annum, whereas we earned in the year 1946 profits, after providing for depreciation and before tax, of approximately £950,000, with every prospect of increasing this year by year. Moreover, the Government stock will, we gather, be a redeemable one, whereas by far the larger part of our business has been given to us by Parliament in perpetuity and stockholders had every reason to believe their investment not only progressive but permanent. These figures and facts surely prove the monstrous injustice which the British Government propose to perpetrate.

TRACTION BUSINESS

Now you will expect me to say something about our traction business. Under the Transport Bill, which was first presented to Parliament, these undertakings might fall to be expropriated or dealt with in some other way as the Minister of Transport might direct, under a scheme for passenger road transport as may be permitted by the Transport Bill. That, in itself, is objectionable enough, but under the terms of the Electricity Bill which has since been introduced, this company's entire assets will be taken over and, by a somewhat strange anomaly, the Minister of Fuel and Power thus becomes the owner of our three passenger traction companies.

I understand there are other instances where road passenger transport companies may be summarily taken over by the Minister of Fuel and Power because they happen to have some minor or even derelict powers for the supply of electricity, and thus the Government, if it succeeds in passing both Bills into law, will be taking over vital road passenger services under two different codes of expropriation and compensation by two different Departments of State, presumably leaving the respective Ministers to argue between themselves as to who shall continue to operate businesses which have been successfully built up as complete entities and of whose operating conditions at least the Minister of Fuel and Power can have no knowledge at all.

The report and accounts were adopted and a final dividend of 4 per cent. (making 8 per cent. for the year) together with a bonus of 2½ per cent. on the ordinary stock, were declared.

GOLD COAST BANKET AREAS, LIMITED

PROGRESS OF DEVELOPMENTS

The thirteenth ordinary general meeting of Gold Coast Banket Areas, Ltd., was held, on the 24th ultimo, in London, Mr C. E. Jobling, M.Inst.M.M., M.I.M.E. (the chairman), presiding.

The following are extracts from his statement circulated with the report and accounts and from his speech at the meeting.

The year under review is noteworthy chiefly on account of the increase in the company's authorised share capital from £500,000 to £1,000,000. You will remember that in February, 1946, an issue of 3,200,000 shares at 2s. 6d. per share was made.

During the current month our associated company, South Banket Areas, Ltd., have made their issue of fresh capital, of which we have taken up sufficient shares to maintain our 40 per cent. interest in the capital of that company. The whole amount of the indebtedness to us has been paid off, and, their bank overdraft having been liquidated, our guarantee, referred to in Note 1 on the balance-sheet, has been cancelled. Our associated company are now free of all indebtedness; they have an issued capital of £773,398, while their net cash resources amount to approximately £500,000. They are thus in a position to proceed with their intensive development programme, and we feel fully justified in regarding with confidence our holding, which now amounts to 6,187,186 shares.

PROFIT AND LOSS ACCOUNT

The profit and loss account does not require much comment. The concentration scheme terminated at the end of February last, but payments in respect of care and maintenance under the Government scheme, based on the average monthly costs over the period of three years, continued to be paid up to the end of August. The expenditure in West Africa and London, £6,010, represents outgoings over and above these payments. The loss for the year amounting to £1,266, reduced the credit to profit and loss account in the balance-sheet to £24,108, which it is proposed to carry forward.

Our energies at the mine were confined to development, with a view to increasing our ore reserves, estimated to be, at the end of June, 1946, 383,933 tons, with an average value of 4.98 dwts. over 38.30 ins., compared with the previous estimate of 330,136 tons, value 5.03 dwts. over 38.41 ins., and to preparing for an early resumption of milling.

INTERESTING DEVELOPMENTS IN NORTHERN SECTION

Since the close of the financial year we have published the results of some very interesting developments encountered towards the northern section of the mine. With regard to further operations at our mine, information additional to the published results confirmed the continuation of the good values exposed in the new north section of the mine, though a fault has now been encountered. A short crosscut to the footwall of the reef has again shown good values. In the south shaft section development on both the main and west reefs have shown satisfactory improvement.

These developments on the newly discovered reef in the northern-most section of our workings are promising, and further progress will be watched with interest.

The report was adopted.

HARRODS LIMITED

RECORD PROFIT

SIR RICHARD BURBIDGE'S STATEMENT

The fifty-seventh annual general meeting of the above company was held, on the 11th instant, in London, Sir Richard Burbidge, Bart, C.B.E., presiding.

The following are extracts from the chairman's statement, which had been circulated with the report and accounts:—

The trading for the year has resulted in a net profit of £1,130,128, a record figure for the company. The increase in net profit of £212,321 is due entirely to greatly increased sales, as the gross profit earned is at a lower rate and the expenses have increased considerably. The net profit has been arrived at after charging all expenses, and after adding substantially to our reserves for possible stock losses, deferred repairs and renewals and other contingencies. Altogether our reserves for these purposes now exceed £700,000.

The directors recommend that a final dividend of 10 per cent. be paid on the ordinary stock, making a total of 15 per cent. for the year, and in addition recommend the payment of a bonus dividend of 5 per cent., making a total distribution of 20 per cent., against 14 per cent. last year.

After providing £646,000 for taxation covering the liability due next year on the profits now under review and providing £50,000 for freehold buildings reserve, bringing this up to £307,556, the carry forward will be increased from £243,455 to £268,912.

LIQUID RESOURCES

After the purchase of John Walsh, Limited, for £459,508 our cash and gilt-edged investments amount to £2,507,579, against £2,969,426 last year, while D. H. Evans and Dickens and Jones hold £1,379,781, against £1,270,119 last year.

You will notice that stock, debtors, etc., at £2,990,139 show an increase of £939,638 over last year, reflecting the increased trade. We can expect the necessity for further increases in this direction, and in addition we hope to be able to make a start on some of the repairs and renewals that are needed so urgently. It will be realised that while our cash resources would appear to be ample, the calls on them will be considerable owing to the increased day-to-day costs of doing business and our commitments in Sheffield.

STOCK

I have referred already to the fact that stocks are higher than last year. The general position, although easier in certain directions, has been very difficult all through the year. We are always hoping that there will be an improvement, but recent troubles have set back our expectations, and the prospects of obtaining merchandise of the type and quality

our customers prefer cannot yet be considered to show much improvement.

CONTROLS

I referred last year to the need for more goods in the shops at home and for better-quality goods for export, the former, if not for any other reason, as an incentive to produce the latter, which are vital if the country is to prosper. Britain has built up its great and world-wide reputation on goods of quality, and I am convinced that any loss of quality in our exports will rapidly and dangerously affect the quantity for which we shall be able to find buyers. Some controls and restrictions are necessary as long as shortages exist, but I do appeal for more latitude for the manufacturers to allow them to use their experience, their brains and their material in the way they think best, instead of being told how to use them, for it is the manufacturers through the retailers, rather than the Government officials at Whitehall, who are in touch with the real needs of the people.

PROSPECTS

The prospects for the coming year are very much a matter of conjecture, and, as far as we are concerned, depend mainly on three factors. (1) The quantity of goods that will be produced. (2) The gross margin of profit we shall be allowed; and (3) The rate of expenses.

The first factor is entirely out of our control, and while we can control expenses to a certain extent we cannot prevent a further increase in this direction, as, apart from the fact that the cost of doing business is rising constantly, there are certain directions, deliveries, for instance, in which our customers are entitled to expect better service than we have been able to render in the past. The deciding factor will be the gross margins we are allowed, as these, which used to depend on the skill of a good merchant, are now more or less arbitrarily fixed by the Board of Trade at a level which in their opinion will allow a reasonable net profit on the trade they estimate for the period ahead. These margins have been cut already to such an extent that any falling-off from the Board of Trade's estimate of increased trade in the coming year must result in numbers of small traders being unable to operate at a profit, and any further cuts would prove disastrous to them. The present method of fixing margins is not sufficiently flexible, and it is time that it was realised that retailing is not just handing out merchandise, but a technique that is subject to quick changes of fortune. The general body of retailers only ask that they should receive a reasonable reward for the services they render to the community, but they are entitled to insist that their advice and experience should be respected, for while it is true that traders are consulted in a more or less formal manner, very little, if any, attention is

paid to their views, particularly to the need for a larger margin for high fashion goods. For example, the recent cut was vigorously contested by all sections of the retail trade and was not justified on the figures discussed, even before the coal crisis with its consequent effect on deliveries of consumer goods, the imminence of which crisis must surely have been known to the Government statisticians. Moreover, this cut was imposed on January 31st, a most inconvenient date for retailers, again in spite of protests from the trade associations, who were refused an extension of even a few days.

In such circumstances accurate forecasting to-day is difficult, and it is for this reason that we recommend that part of the present distribution should be by way of a bonus dividend. But in spite of all our difficulties I hope that next year, given reasonable trading conditions, we shall be able to produce results as satisfactory as those now before you. I have every confidence in our management, buyers and staff, and our conservative policy of the last few years has considerably strengthened the company in every respect, so that we should be able to overcome any obstacles with which we may be faced. More proudly than ever I declare, "There is only one Harrods."

JEREMIAH ROTHERHAM AND COMPANY, LIMITED

INCREASED TURNOVER

The forty-ninth annual general meeting of Jeremiah Rotherham & Company, Limited, was held, on the 2nd instant, in London, Mr Joseph Hockley (chairman and managing director) presiding.

The following is an extract from the chairman's statement, circulated with the report: Profit margins are still controlled by the Board of Trade. The increased profit which we are able to show is the result of increased turnover. During the year there has been an improvement in the production of certain consumer goods, but some sections are still desperately short.

Addressing the meeting, the Chairman said: I hope that the result of the year's trading which we are able to place before you is considered satisfactory. Future prospects will depend entirely upon the supplies we are able to obtain. Our buyers are not lacking in searching the markets for what is obtainable.

You may rest assured that we shall continue to do our part in securing all we can in the way of supplies to keep up our turnover, which for the first two months this year shows a nice increase.

I shall presently ask you to confirm the payment of a dividend of 6 per cent. and a bonus of 2½ per cent. for the year. We shall then be carrying forward £10,229, which with last year's amount brought forward of £41,892, makes a total of £52,121. This may, perhaps, seem a large amount to carry forward, but we cannot tell what the future is going to be—if it happens to be more favourable than we might expect, we shall have something in hand for distribution. Next year will be the company's Jubilee. The report and accounts were adopted.

PRIVATE SECRETARY required for Managing Director merchant business. Must be well educated, efficient in shorthand and typing, thoroughly experienced and qualified in all other secretarial duties. Preference given to applicants willing to do a spell of duty in Malaya. Apply, giving age and all particulars, to Box 478, Dorland Advertising Ltd., 18, Regent Street, S.W.1.

GOING ABROAD.—We achieve the impossible in securing passages waste it. Write instead to Anna Claire, 107a, Grosvenor Road, London, S.W.1. Vic. 5901.

Applications invited for the post of Research and Publicity Officer at Headquarters of The National Union of Bank Employees, 28, Old Queen Street, Westminster, S.W.1.

Duties entail those usually associated with research work, preparation of propaganda material and general publicity. Salary £500/£600, according to qualifications.

GOVERNMENT RETURNS

For the five days ended April 5, 1947, total ordinary revenue was £44,510,485 against ordinary expenditure of £79,252,250 and issues to sinking funds £109,015. Thus, including sinking fund allocations of £109,015, the deficit accrued since April 1st is £34,850,780 against £55,709,000 for the corresponding period a year ago.

NEW BUSINESS CONTACTS IN CANADA

We are prepared to give practical help and guidance to British business men in establishing new trade connections in Canada

ENQUIRIES WELCOMED

THE
CANADIAN BANK OF COMMERCE
(Incorporated in Canada in 1867 with Limited Liability)

2, LOMBARD STREET, LONDON, E.C.3.

Head Office: TORONTO, CANADA

UNIVERSITY OF BIRMINGHAM

FACULTY OF COMMERCE AND SOCIAL SCIENCE

Applications are invited for the post of Lecturer (Grade IIA) in Industrial Economics at a stipend of £750-850, according to qualifications and experience.

Duties will include the organisation of students' visits of observation, and practical work in industrial establishments, and contacts with the industrial community generally.

Applications (3 copies) with copies of not more than three testimonials and the names of two referees should reach the undersigned (from whom further particulars may be obtained) not later than May 17, 1947. No special application form is issued.

C. G. BURTON, Secretary
The University, Edmund Street, Birmingham, 3. March, 1947.

NATIONAL COAL BOARD

The National Coal Board invites applications for appointment as Organising Accountant in the Finance Department at the Headquarters in London. The person appointed will be required to initiate and develop accounting schemes, including mechanisation, for the Board's activities and it will be necessary to travel extensively in the coal-fields. Applicants should have a wide experience in accounting and mechanical accounting methods. The commencing salary will be commensurate with qualifications and experience, in accordance with a scale which commences at £1,500 per annum.

Applications, giving full particulars of career, education, degrees, etc. (with dates) should be made before May 30, 1947, and addressed to the Appointments Officer, Ministry of Labour and National Service, 1-6, Tavistock Square, W.C.1, quoting reference number T.T./18 B.H.67. In no circumstances should original testimonials be provided. Only candidates selected for interview will be advised.

NATIONAL SAVINGS COMMITTEE—ASSISTANT COMMISSIONERS

The Civil Service Commissioners announce that the Reconstruction Competition for these posts has been extended, in order to fill a further 20 vacancies. Applications are invited for these vacancies which will be filled by competitive interview before a Selection Board in London. Candidates must have attained the age of 21 by January 1st in the year in which they compete and must not have attained the age of 41 on August 1, 1945.

A University training and knowledge of economic subjects are desirable but not obligatory. Service in any part of England or Wales may be required. Salary (for men) £275 rising by annual increments of £18 to £525, then by annual increments of £25 to a maximum of £650, and (for women) £275 rising by annual increments of £18 to a maximum of £525. Starting pay will be adjusted according to age, subject to a maximum of £383. A War Bonus consolidation addition varying from £78 to £90 per annum (for men) and £63 to £72 (for women) is also payable for the time being, pending the application of new scales.

Requests for copies of the regulations and forms of application should be made by postcard to:—

The Director of Establishments, National Savings Committee, 11/12, Cornhill, E.C.3.
Persons overseas can also obtain particulars from the Chief Officer, Civil Service Commission, at the following addresses:
(India)—10, Underhill Lane, Delhi.
(Egypt)—8, Sharia Tolumbat, Garden City, Cairo.
(Germany)—c/o, 2nd Echelon, G.H.Q., B.A.O.R.

Completed forms of application must be returned by May 31, 1947, or—in the case of persons serving with the Forces—by July 31, 1947. All candidates are, however, asked to apply as soon as possible.

ROYAL BANK OF CANADA

DIVIDEND No. 239

NOTICE IS HEREBY GIVEN that a DIVIDEND of 2 per cent, being at the rate of 8 per cent per annum upon the paid-up Capital Stock of the Bank, has been DECLARED for the three months ending May 31, 1947, and will be PAYABLE at the bank and its branches on and after June 2, 1947, to shareholders of record April 30, 1947.

By Order of the Board,
E. B. McINERNEY, London Manager
6 Lothbury, London, E.C.2. April 9, 1947

THE ALEXANDRIA WATER COMPANY, LIMITED

PAYMENT OF DIVIDEND

Notice is hereby given that a dividend of ten shillings per £5 share on coupon No. 117 will be paid without deduction of British Income Tax but less Egyptian Government and Alexandria Municipal Taxes, amounting to 1s. 2.76d., making 8s. 9.24d. net, on and after April 15, 1947, at the National Bank of Egypt in Alexandria, at Rue Toussouin, or in London at 6, King William Street, E.C.4.

Net profits for the year ended December 31, 1946, £151,200 (last year, £147,000).

Dated, Alexandria, Egypt, April 3, 1947.
By order of the board,
ROBERT WALTON, Manager.

CHARTERED ACCOUNTANT, with long experience of management and administrative problems, and an expert in costing systems, budgetary control and financial matters, is open for engagement, temporary or permanent. Holds references of the highest order.—Box 448.

EXPORT.—The recently retired Managing Director (aged 60) of an internationally-known Export Company will assist, on a directional or advisory level, any British concern genuinely intent on expanding its Export trade. Since his primary object is to render a service for which his twenty years' practical experience has equipped him, and he is of independent means, the personal financial aspect is not of any great importance.—Box 456.

QUEEN'S College, London. Required in September, a part-time Lecturer in Economics.—Apply to the Principal, 43-47, Harley Street, W.1.

FOR SALE.—The Economist 1938 to 1944 incl.—Box 451.

THE COUNCIL OF INDUSTRIAL DESIGN requires an Assistant Administrative Officer with experience in placing contracts and controlling permanent and temporary staff. Knowledge of dealing with Architects, Building Contractors, Interior Decorators, etc., desirable. Salary £750-£950, according to experience. Applications, giving full particulars, including posts held, should be sent in writing to The Establishment Officer, The Council of Industrial Design, Tilbury House, Petty France, London, S.W.1.

WANTED by Student. "The Pound Sterling." A. E. Feavearyear. Box 452.

CHARTERED Accountants (London) require competent Senior Audit Clerk (Chartered or Incorporated). Good prospects. Salary according to experience, from £600 per annum.—Write, Box PA, 363, Deacons Advertising, 36, Leadenhall Street, E.C.3.

An Acceptable Budget

MR DALTON'S third Budget is an acceptable, almost a good one. With his passion for cloaking even the most innocent actions in a prejudicial form, he tried hard, in the course of a long and lucid speech, to make it sound as if he were doing adventurous and controversial things. But in fact the proposals he made were, with one exception, based on principles of finance that all authorities would approve, and they were also, again with one courageous exception, pedestrian rather than adventurous. The exception to the soundness of the Budget is the new penalisation of dividends; the act of courage is the decision to increase the duty on tobacco, already heavy, by no less than half. Politics is as apparent in the first decision as it is commendably absent from the second. But it is very doubtful whether any credit the Chancellor may earn among the faithful by his dividend tax will go very far to offset the dismay he will have caused by an increase in the tobacco duty which, however desirable in the public interest, will inevitably fall more heavily on small incomes than on large. Of this balance of popular reaction, Mr Dalton, who is a politician before everything, was undoubtedly aware; he deserves the credit for having made his choice.

From the accounting point of view, the chief surprise of the Budget was that the Chancellor was able to estimate for a receipt of no less than £292 million from Miscellaneous Receipts, mainly from the re-claiming of unspent balances and the like. The Chancellor described these items as rabbits out of a hat. They are, indeed, a curious collection of rabbits—not least curious in being non-recurring. Nevertheless, they enabled Mr Dalton, within the rules of the game, to produce a prospective surplus, on the basis of existing taxation, of no less than £248 million. He might have dissipated this surplus in reductions of taxation. But he decided, very wisely and properly, not to do so, but rather to fortify it by changes in taxation which provide, on balance, a small net increase of revenue. His reasons for this were twofold—partly the ground of high economic principle that "this is a year when we ought, in any case, to have a Budget surplus," and partly the lower, but no less commendable, ground of expediency that the surplus may be needed next year, when there will be lower receipts from income tax, no EPT and fewer, if any, rabbits.

Unquestionably, this decision, in the present circumstances of the country, is the right one. There was, in the speech, some very strong language directed against those writers in the financial press who advocate deflation and dear money—"baleful Bourbons" he called them, "who sit in office chairs in the City of London" (a description which, it will be noted, acquits *The Economist*). But if, in fact, any voices have been raised in favour of "dear money... depressed trade... mass unemployment... cuts in wages and social services and indiscriminate short-sighted economy campaigns of every sort," they have escaped general notice. Mr Dalton's noisy assaults upon this collection of Aunt Salies were designed to disguise the fact that he is proposing to move in exactly the direction that his "deflationist" critics have urged upon him. The immediate danger, he admitted, was of "an inflation going beyond bounds" and he proposed to take steps to reduce the inflationary pressure.

It is true that his conversion to a disinflationary policy might have been more whole-hearted as well as more gracious. He might have done much more. He might, for example, have really balanced his Budget. The surplus of £270 million with which he balanced the accounts of "ordinary" revenue and expenditure is, of course, a very partial figure. The Chancellor is proposing to spend much more than this on items that are printed in the Exchequer return "below the line" and are accordingly not counted as ordinary expenditure. It would, in any case, be a curious accounting procedure to pile up a surplus above the line and a deficit below it. But, in fact, though some of the items below the line, such as the redemption of maturing debt and the purchase of real assets, are properly excluded, there are others which ought to be treated as expenditure. Payments of Post-War Income Tax Credits, for example, are direct repayments of sums that were, when they came in, credited to ordinary revenue. The same is true of EPT refunds. Yet these two items alone will amount to £130 million, or nearly half the surplus "above the line," without allowing for the only slightly less clear case of War Damage payments amounting to £330 million. It would have been a better employment of his "surplus" if the Chancellor had used it to improve the logic and honesty of the Exchequer accounts. And if he had done so, he would have had to confess that he was in fact proposing, not a substantial surplus, but a deficit. That policy might well be a defensible one, in view of the surpluses that can be expected on the accounts of the national insurance funds and the local authorities. But defensible or not, it would have been more candid.

Mr Dalton might also have gone further in the process of reversing the upward trend of food subsidies. As he said, "this element, alone in all the total of our public expenditure, might seem to be passing out of our own control." It is something that the food subsidies are not—apparently (the Chancellor was not very specific)—to be allowed to increase further after the introduction of the new cost-of-living index. But it is disappointing that there was no more than a faint indication of a desire to take positive steps to reduce this burden. It is here—and not, *pace* the Chancellor, in further reductions in interest rates—that any hope of substantial tax reliefs can be found. The Chancellor is still waiting for a fall in world food prices—and no doubt he will have his reward in due course. But it is most unlikely that any fall in world food prices will be enough by itself to wipe out these subsidies, which are keeping the prices of foodstuffs at a level appropriate to a value of money quite different from any that the post-war world is ever likely to see. The subsidies will either be removed catastrophically and with disturbance or gradually and smoothly, and it is in no way too early to make a start if the latter alternative is preferred.

Again, if his heart were in a disinflationary policy, the Chancellor might have made an attempt to demonstrate that his cheaper money campaign was not being run in an inflationary way. This passage of his speech fell well below the level of cogency of the rest. He detailed, at great length, the advantages of cheap money to the borrower—which nobody would dispute. He asked whether there is "really a British citizen who is either too avaricious or too frightened of the future to lend money to his country at 2½ per cent on long term?" But that argument applies equally to 2 per cent, or to 1½ per cent. Mr Dalton said nothing whatever to establish his claim that, of all the possible points at which the taxpayer's desire for low rates of interest might exactly balance his desire, as citizen, to avoid the inflationary consequences of pushing them too low, exactly 2½ per cent is immutably the one. He said nothing to defend himself against the charge of having pursued his policy at the cost of a large-scale creation of liquid credit, contrary to the debt-funding tactics that are appropriate to a disinflationary policy.

Nevertheless, though there are these might-have-beens, it

would be wrong to cavil at the meagreness of the tribute that Mr Dalton paid to the principles of sound finance. The real point is that he paid any tribute at all. It is reassuring to hear a Socialist Chancellor of the Exchequer saying that "this is a good year for a good surplus," and even though it is only in a very qualified sense that he can be said to have been as good as his word, he deserves credit for his restraint in tax relief.

The rearrangements of taxation that the Chancellor proposed, within his policy of fortifying rather than of weakening the revenue, are also, on the whole, well chosen. Within the structure of the income tax, the earned income and family allowances were clearly at the top of the priority list. The doubling of many existing stamp duties charged on the transfer of property is hardly welcome, but it cannot be said to be out of line with the general weight of taxation. The new stamp duty on bonus issues is a surprise. There is a case for some taxation on bonus issues, many of which are undeniably devices for evading surtax. But there are some objections to the present proposal; the rate of 10 per cent is, for a capital transaction, very heavy; and since it is levied by reference to the market value of the shares after the bonus issue has been made, it also offends against the canon that every tax should be capable of being calculated in advance of the action that attracts it.

The two changes in taxation that will attract the most attention are the steep rise in the tobacco duty and the new tax on dividends. The increase in the tobacco duty is a sound decision as well as a politically brave one. There is no room for doubt that the level of consumption of tobacco must be reduced. The only alternatives to a stiff rate of duty are a cut in supplies, which would merely lead to queues and black-marketing, or a rationing scheme, which would have great administrative difficulties.

The dividend tax, on the other hand, is a thoroughly bad one. If a case can be made out for widening the differential of taxation between incomes from work and incomes from property, then the fairest way to do it is by death duties or by combining a higher standard rate of income tax with a much larger earned income allowance. But Mr Dalton did not attempt to argue the case for heavier taxation on property incomes. He did not attempt to argue any case at all, he merely asserted that he was "not satisfied with the large increases in distributed profits and the higher dividends which have been paid out in so very many cases in the last twelve months." It is almost certain that the increase since 1938 in the sums paid out in dividends has been less, proportionately, than that of any other constituent of the national income save only rents. But even if the case were made out for stopping excessive or increased dividends, how does that justify a differential tax on all dividends, excessive or meagre, increased or reduced? There is still another objection to a profits tax that falls on the company, and therefore exclusively on the equity shareholder. The point was put very clearly some years ago by an authority on public finance, writing of the Corporation Profits Tax that was levied for a few years after the first war. This tax, he said

was a bad tax. . . . For it discriminated against a particular class of property-owners, namely, the ordinary shareholders in joint stock companies, as compared with all other classes, including debenture-holders and the holders of gilt-edged securities. It was, therefore, in effect, a tax on risk-bearing, and tended to divert the flow of capital from risky to comparatively safe investments. But, in view of the need that risks should be taken and the reluctance of many investors to take them, this was a harmful diversion.

The quotation is from "The Principles of Public Finance," by H. Dalton, M.A., D.Sc. (Econ.). Thus does politics corrupt learning. The Opposition will be well advised to put their confidence in Dr Dalton rather than in the Chancellor of the Exchequer and to give notice that they will repeal this piece of class malice at the earliest opportunity they are given.

The New Statesman

MR HENRY WALLACE has come to Europe in search of progressives, and according to him a progressive is a "person who believes the future is more important than the past." If he sticks to this definition he will not need to look very far; in that sense we are all progressives now. But other things he has said, in the course of two broadcasts and three public meetings—all under progressive auspices—suggest that his definition is incomplete. The progressives he is looking for are the people who turn their backs on the present and occasionally take a short and painful look at it from between their legs. Most politicians and public men reaching middle-age find the posture increasingly uncomfortable, and end by turning their backs on the future; but not Mr Wallace. After fourteen years of politics he remains supple, hopeful, indignant, and broad of vision. Perhaps because he is also a farmer and a scientist, because he wants power but could at a pinch live without it—in other words because he is the imperfect politician.

The risk created by his present visit is that many people in Europe—progressives and others—will overestimate his power in their admiration for his quality. They may repeat the error they made—with more excuse—with Wilson thirty years ago, and mistake the idealist American for American idealism. They may be tempted to see in Mr Wallace a candidate for leadership of the Democratic Party, who hopes to return to the United States and feels himself propelled to power by the ardent breath of progressives outside his own country. Then—they may think—he would reverse present American foreign policy, seek to bring Russia into international partnership for the reconstruction of Europe, and repel Communism everywhere by a united effort to raise world standards of living. This is no unfair simplification of what Mr Wallace is describing as his "international new deal." And if he is not serious, if he does not intend to organise power behind the idea, why has he come to Europe to spread it? Not, surely, just to blow on the embers of the Socialist revolt against Mr Bevin's foreign policy, or on the feeble flames of European opposition to Mr Truman's anti-Communist doctrine—or to study the art of editing a progressive periodical.

Mr Wallace's speeches are clearly intended to be read in America. They are intended to shake American—and European—confidence in Mr Truman's challenge to Communist conspiracy against governments outside the Soviet sphere of influence. It is important that the countries next visited by Mr Wallace should understand not only this, but also that the editor of the *New Republic* and the successful experimenter with Rhode Island Reds does not represent a body of American

opinion either massive or organised. As the last hope of the New Dealers—or, more accurately, of one section of the New Dealers—he represents the vague aspirations of many Americans for peace and security and friendliness in the world, but nothing more. It is good that he does, for such voices should always be heard in this country with respect, and have always been so heard, so long as the facts were not overwhelmingly against them.

But the facts of the moment are overwhelmingly against Mr Wallace's practical proposals. This can easily be seen from one or two he has propounded during the last ten days. To begin with the most actual problem of all, the Moscow Conference—how would Mr Wallace deal with this indecisive debate about Germany? He would make it succeed, he said in London last week, "by starting an overall programme for the reconstruction of Europe." An excellent idea; but is it not precisely because the Russians want to use German industry for their own reconstruction before it is used for European reconstruction that the conference is failing? Nine months ago, before the Moscow Conference was thought of, they refused to attend the London conference of the United Nations Sub-Committee on Devastated Areas. This modest body was engaged in nothing more harmful than a survey of what reconstruction there was to be done in Europe. Out of it emerged much useful information and the fruitful suggestion of an Economic Commission for Europe. It received hearty American and British support; the Czech and Polish observers could have told Moscow how hearty it was and how easily the Commission might be an inducement to American loans and gifts to Europe. What happened? The Soviet delegate in the Social and Economic Council fought the proposal tooth and nail until his colleagues from eastern Europe convinced him of the dangers of doing so. Then he withdrew opposition, but refused to vote on the Commission's terms of reference. The example is chosen because it shows Russian intransigence at a low, working level of international cooperation, where diplomatic risks were few.

Much the same has happened over other attempts to make a common approach to the joint effort that Mr Wallace advocates: the conference on a world trade organisation, the allocation of European coal supplies, the world food conferences. And the Russian refusal to take part in them dates back to a time when Mr Byrnes was still being accused of trying to secure an agreement with Russia even, if need be, at British expense, when Mr Wallace was denouncing from New York the imperialism he saw in London, and when Britain was taking alone all the knocks in Indonesia and Greece. That was fifteen months

before the Truman Doctrine was announced to the world. Obviously nothing could be more welcome, nothing more likely to pacify Europe, than a joint effort of the Great Powers to carry through its reconstruction. And an American loan to Russia is the only quick device that might divert the Russians both from their insistence on reparations in goods from Germany and from their plans to mobilise the resources of eastern Europe to help the Five Year Plan. But one does not get loans by shaking the lender's faith in the borrower; and this is what Mr Molotov has been doing these months past. Indeed he and his colleagues have done more; they have created the suspicion that Moscow regards the economic recovery of Europe west of the Elbe as against Russia's interest.

Let us take another of Mr Wallace's specifics. He says that the way to overcome the present crisis in Russian relations with the West is for the United States to return to the principles of the United Nations. This means, he said in London, "an agreement on world control of atomic energy, and other weapons of war destruction, the internationalisation of strategic areas, including the Dardanelles, Suez Canal and Panama Canal." How, precisely, would he overcome Mr Gromyko's defence of national sovereignty in the debates on atomic control? What would he do if he satisfied himself that Mr Gromyko's instructions are to play for time? As for the Dardanelles, whose fault is it that nothing has come of the proposal made to the Russians two years ago that the Powers should meet with Turkey and revise the Montreux Convention? Was it not Moscow that pressed on the Turks in private negotiations last year the idea that the security of the Dardanelles should be guaranteed by the Black Sea Powers only—that is to say, by Russia, Turkey, and the satellite governments of Rumania and Bulgaria? What has this to do with internationalisation and the United Nations?

*

Then—to take a matter that seems trivial against the background of strategic thinking and power politics that Mr Wallace detests—what would he say about the matter of the fifteen Russian women who are not allowed to leave their country and join their husbands in England? A progressive can nowadays look over and beyond such things to the wider horizons and the overall blue-prints; there was a time when he would not have dared remain silent about such a piece of petty tyranny and heartlessness. It is the kind of symptom of national behaviour that ordinary men and women pick out of a BBC news bulletin containing far more momentous news. How would Mr Wallace handle this problem? Would he try to drive a bargain on such a matter of principle?

There is a good deal in Mr Wallace's vocabulary and argumentation which recalls the worst days of the thirties in this country, when jargon, sentimentalism and wishful thinking ran riot. Typical is the argument that Communism "can only be ended when poverty and exploitation are no longer a part of democracy." It is the argument Communists use in the company of liberals. No one will deny that Communism thrives where there is poverty and social injustice; but it is equally true that Communism thrives on men's love of power, excitement and conspiracy. With his faith in the potentialities of all men, Mr Wallace overlooks, or deliberately ignores, what Hobbes four hundred years ago placed first among the factors to be reckoned with in politics: "a perpetual and restless desire of power after power, that ceaseth only in death." This is the human characteristic which makes Communists conspire so efficiently; for the prize they aim at is complete—not shared—power. Surely Mr Wallace's hosts can explain to him that no one expects the Communists everywhere to give way to the Socialists and Radicals just because the latter promise "an international new deal." And while Mr Wallace's deal is being

prepared, who is to prevent the internal collapse of the countries in which Communists aim at complete power, whether for themselves alone or for Russian foreign policy?

If Mr Wallace's arguments are unacceptable, so is his flattery. He suggests that the world is agog to see how Britain will reconcile planning and freedom. It is quite obviously not true; in Europe Britain is living on the prestige won during the war and the curiosity there is about our prospects of remaining strong though socialised. As for Mr Wallace's advice that Britain should take up a position somewhere half-way between the United States and Russia, that comes of bad observation and loose thinking. The British position is different from the American on many issues. But it cannot be half-way to the Russian. There are too many political, legal, economic and social principles on which the American and British people agree for such a manoeuvre to be performed by the British without sacrifice of faith and tradition—and interest too.

*

It is very unfortunate for Mr Wallace that the draft Russian suggestions for the revision of the treaty of alliance with Britain should have become known during his visit. He has come here with the curious purpose of pushing Mr Attlee's Britain away from Mr Truman's America. That is precisely what Mr Molotov would like to do too. But Mr Molotov is not a progressive; he is intensely interested in the present and very sore about the past. He believes in the United Nations only in fits and starts, and in international new deals not at all. When Mr Marshall suggested the other day that the products of the territories transferred from Germany to Poland should be used in the interests of Europe as a whole, Mr Molotov turned the idea down flat. The strategic thinking which Mr Wallace deplures, Mr Molotov takes for granted. While Mr Wallace is impatient for the new deal in his time, Mr Molotov waits with massive patience for his opponents to fall out among themselves.

Mr Wallace's visit may do much harm. He will rally all those who think with their emotions. He will encourage all those on the Left—and they are many—who do not think about foreign affairs at all, but merely wait to observe what the Right think, and then shout the opposite. In wider circles of the general public, the charm and impressiveness of his manner, the striking resemblance of his radio technique to that of Mr J. B. Priestley—king of progressive broadcasters—and his past association with President Roosevelt and the social engineering of the New Deal will gain new supporters for the critics of Mr Bevin. The Foreign Secretary very honestly makes foreign policy sound difficult; Mr Wallace makes it sound easy, although he must know, from his own experience of affairs, that it is not easy. To pretend otherwise is to make a fool of the common man for whom he speaks. The people of France and of the other countries that he is visiting will be less ready to applaud uncritically the vision offered by this new world statesman. There they have longer memories, sharper eyes for the present, and cautious habits of thinking about the future; the editor of the *New Republic* focuses exclusively on the horizon.

There is one point—and one point only—at which it is possible to reconcile Mr Wallace's views and British interests. That is where he emphasises the urgent need for eventual American understanding with the Russians. That must be the objective of British, as well as of American, policy. But there is no evidence that the Russians will come half-way towards such an understanding until they are convinced that Mr Marshall—and Mr Bevin—are standing absolutely firm. That they cannot do without the support of Congress and the House of Commons. In trying to undermine this support Mr Wallace is doing a disservice to all three governments.

“The House”

A HUNDRED years ago, a scandal at the Andover workhouse, where the inmates fought each other for the gristle on bones, overthrew the Poor Law Commissioners and led to the establishment of a Poor Law Board with direct Ministerial responsibility to Parliament. In the succeeding years, the harshest regulations for the administration of the workhouses were gradually dropped, but the workhouse test remained—the relief of the able-bodied poor in workhouses had to be given under conditions inferior to those of the worst paid labourer outside. It was not until this century that major reforms took place.

It so happens that two committees, one official and one unofficial, have recently thrown some light on conditions in the workhouses today, seventeen years after they were made the responsibility of the county and county borough councils and renamed public assistance institutions. Neither committee was concerned with the administration of the workhouses as such. One, the Curtis Committee, was investigating the care of children deprived of a normal home life, many of whom, at least in the first instance, are placed in institutions. The other, the Rowntree Committee, was appointed by the Nuffield Foundation to investigate the provision made for the care and comfort of old people, and in many places old people who cannot live independent lives in their own homes are entirely dependent on the local workhouse—by whatever name it is called.

From the reports of these two committees it is possible to obtain a good picture of “The House” as it exists today, for their comments and criticisms are very similar. The architecture, for the most part, is that of a hundred years ago, sometimes imposing from the outside, sometimes gaunt and forbidding, but inside bare, dark and cheerless, with chocolate and buff paint predominating. The wards are long and narrow and may contain as many as a hundred beds, separated only by two feet or less. In the dayrooms, the wooden armchairs are placed along the wall in rows. There is no garden, only an asphalt courtyard. In this building may be housed “a motley collection”—an expression found in both reports—of the destitute: the aged, including the senile, the mentally defective, the epileptic, the blind, and the young—babies, with or without their mothers, and children up to fifteen years. “One Nursery,” reported the Curtis Committee,

which was structurally linked to the Public Assistance institution, had sunk to the lowest level of child care which has come under our notice. There were 32 children on the register, eight of whom were sick children. These were being nursed in a small ward adjacent to the infirmary adult sick ward. . . . The smell in this room was dreadful. . . . The healthy children were housed in the ground floor corrugated hutment which had been once the old union casual ward. The day-room was large and bare and empty of all toys. The children . . . slept in another corrugated hutment in old broken black iron cots. . . . The children wore ankle length calico or flannelette frocks and petticoats and had no knickers. . . . Most of them had lost their shoes; those who possessed shoes had either taken them off to play with or were wearing them tied to their feet with dirty string. . . .

The Rowntree Committee described the profound apathy that is to be found among the old inmates of an institution, who are usually to be found sitting along the wall “waiting for the next meal or for bedtime.” In a few institutions they are required to wear a distinctive uniform; in many more they are not allowed to retain those personal belongings to which old people cling almost as though they made up for lost friends and relatives. The matron of one institution defended this restriction by the

fact that if the old people were allowed to have private possessions, these would be stolen by the mentally deficient girls who shared the accommodation with them. In a great many institutions, the regulations are often unnecessary and often harsh. Visiting is restricted. In one case, there was even a rule forbidding the aged male and female residents to be in the garden together—a relic perhaps of the poor law principles of 1834 which laid down that man and wife must be separated in order to prevent the breeding of more paupers to become a burden on the rates.

It should be strongly emphasised that the worst conditions revealed in the Curtis and Rowntree reports are not typical of the workhouse today. There are some cases where even the old building has been scrapped, and others where an enlightened master and matron have achieved wonders in the most unpromising surroundings. But the fact that such bad conditions can exist at all and that the average conditions are below what public opinion to-day considers desirable is enough to explain the unpopularity of “The House” throughout the country and the great dread of old people lest they should be compelled to end their days in it.

*

Approaching their investigations from the viewpoint of what they considered desirable for the old and the young respectively, the Rowntree and Curtis Committees came to the conclusion that the main reason for the conditions they found was that the institution housed so many different classes of people. On behalf of old people, therefore, the Rowntree Committee asked for more classification and the transfer of all normal old people to small homes and hostels. This policy has already been adopted by many local authorities, but until there are enough homes to accommodate all who need them, the Rowntree Committee recommended highly classified institutions of medium size—to accommodate up to 200 aged residents instead of the thousand or more that are sometimes found at present—in which the restrictions and institutional atmosphere would be at a minimum. But it recognised that some old people are unsuitable for life in small homes or even in classified institutions, and considered that there should still be some all-purpose institutions which would house the difficult unsocialised old person who would not fit easily into the community life envisaged for the normal aged.

If the Curtis Committee's recommendations are carried out, there should be no children in the institutions at all, except young babies with their mothers. But the future of “The House” will be further influenced, and to an unpredictable extent, when the new social security measures come into force and in particular when the remnants of the poor law are transformed into national assistance and transferred to the Assistance Board. In the eyes of the public, it is the poor law authorities who are to blame for the lumping together under one roof of the destitute child, the mentally defective child and the old and the senile. As poor law administrators are for ever pointing out, however, this position arises because of the failures of the other social services. The children over the age of three whom the Curtis Committee found to have been in some institutions for several months were there against the law, which only allows them to be retained in an institution as an emergency measure and for a period limited to six weeks. That they were kept longer was as likely to be the fault of the local education authority as of those in charge of the workhouse. Similarly, the mentally defective children were there because of a failure on the part of the mental deficiency authorities. The senile are

there, and the chronic sick, because the public health departments refuse to accept them into their hospitals. How can the poor law authorities make conditions in their institutions inviting to the infirm old, who make up far the greater part of the inmates, when they are constantly having to shelter what they call the "residuals" of the other social services?

As the master of a London institution recently pointed out, if the social services which in the course of the last fifty years have been carved out of the poor law had functioned efficiently, there would be no residuals inside or outside institutions. As it is, the poor law has become more and more the residuary legatee of the other services, and it is this fact, the fact that so many of its cases have been rejected by them because they do not exactly qualify for their help, that has made the poor law so universally unpopular. Yet are the number of residuals likely to diminish next year when the new social security is in full operation? Will the regional hospital authorities be able to provide accommodation for all the destitute lunatics now found in workhouses? Will the Assistance Board find shelter for the evicted and for the discharged prisoner?

The conclusion seems inescapable that other social services will continue to need, at least in the foreseeable future, what the master quoted above aptly described as "the statutory roof" provided under the poor law. Crippled children will be

brought up in special schools. What will happen to them, if they cannot live at home, when they leave the scope of the education authority? The unmarried mother and her baby will for a brief time be accommodated by the hospital authority. What will happen to them after that? It is high time that the public realised just what is meant by the statutory obligation to shelter the destitute which is imposed on the poor law authorities and which was well summarised in last year's report of the executive committee of the National Association of Administrators of Local Government Establishments:

Even in 1946 nothing but our establishments, apparently, can deal with emergency destitution or the new social problems arising from overcrowding. Our institutions—called upon to service as EMS Hospitals, Rest Centres, Emergency Feeding Centres and to house vast stores, and yet to continue to meet their normal obligations, during the war—now switch in peace to housing refugees and displaced persons, foreign servants, the homeless of all races, creeds and ages, our own ex-Service men, and still to gather up the loose ends of other services, the while caring for tens of thousands of chronic sick and the aged; for while other doors are closed ours must remain open.

Before the poor law is abolished, in name if not in fact, the full force of that phrase—"our doors must remain open"—should be appreciated, and recognition given to those who, for all the evils revealed in the Curtis and Rowntree reports, have provided the only truly comprehensive service that exists.

The Conflict in China

ON April 16th, President Chiang Kai-shek's old friend, General Chang Chun, received appointment as Prime Minister of the Chinese Government. Two months and a half have passed since the United States Ambassador to China gave notice that his Government had decided to end its connection with the Committee of Three, of which General Marshall had been chairman, and which had been set up for the purpose of bringing about a settlement of China's internal conflict. That notice was immediately followed by two closely related events: the replacement of Dr T. V. Soong as Prime Minister by Chiang Kai-shek himself and the launching of regular warfare against the Communists, who were declared to be in a state of "open rebellion" against the Government.

The military leaders in Nanking had for some time been urging that the deadlock in the negotiations between the Kuomintang and the Communists could only be resolved by force, that American mediation was merely tying the Government's hands, and that the American loan dangled before the Government's eyes as a reward for a peaceful settlement would be obtained at too high a price if it involved a renunciation of the legal Government's right to suppress armed revolt. They felt, moreover, that their political position had been greatly strengthened by the promulgation of a fairly liberal Constitution to replace tutelage by the Kuomintang party, and by the deals recently done with the Young China and Social Democrat minority parties; economically, they already held large stocks of military supplies turned over to China from American war-time accumulations, even without the projected conditional credits, and they could reasonably expect that, if they were successful in forcible unification of most of the country—or alternatively if they were in danger of defeat—the credits would in the end be forthcoming. These views appear to have been shared by the Generalissimo himself, who was anxious to be rid both of the restraint of American mediation and of the humiliating reputation of being dependent on American support for his survival.

With the bothersome American peace-makers out of the way, the Nanking generals have their chance of achieving decisive military victory over the Communist armies. Their difficulty is to obtain any result which can be called decisive in warfare with

a supple and elusive guerilla power in a country of scanty communications, where there is widespread popular sympathy for the rebels. They hope, nevertheless, to force the Communists out of certain areas where they seriously embarrass the Government's authority in China as a whole, and to confine them in other areas, where they will be relatively harmless. The war is in fact going on in two separate regions—in Manchuria and in North China, especially in the coastal province of Shantung. The two regions are separated by a zone of Government control on the line Tientsin-Peking-Kalgan-Tatung, though there is some Communist intercommunication across this zone. The regions also differ in their relation to the geographical framework of the Government's authority. The latter is centred on the Lower Yangtse and is also established in the Peking-Tientsin area, in other important cities of North China, and in South Manchuria. The Communist-controlled area of North Manchuria is at the northern extremity of China, far from Nanking, and does not interrupt any communications, as the Government holds nothing beyond it. The Communist forces in Shantung, on the other hand, intercept the vitally important railway which links Peking and Tientsin with Nanking and also the lines running into the interior from the ports of Tsingtao and Haichow; in addition, they are dangerously near to the capital and to the economic metropolis of Shanghai. For the Government, therefore, success in Shantung is much more important than success in Manchuria. The Communists appear to take the same view of the supreme strategic importance of Shantung, for they have not only infiltrated reinforcements by sea from Manchuria into Shantung in fishing boats and other small craft, but they seem to have depleted their forces in Shensi and Shansi to concentrate them in Shantung; a consequence of this strategy has been the loss of their famous "capital," Yen-an, which was abandoned to Government troops early in March without serious resistance.

Fighting has been going on in Manchuria as well as in North China, but it has been of an inconclusive character, and there is some ground for believing that it has been complicated by political considerations which are not purely domestic. Nanking claims to have repelled a Communist offensive against Changchun, but although the best-equipped Government divisions are

supposed to be engaged on this front, there does not seem to have been much energy in pressing the much advertised advance on Harbin. There have been rumours of secret Nanking-Soviet talks about North Manchuria. This region, which forms a huge salient projecting northward into Siberia and through which runs the railway from Chita to Vladivostok, is the part of China in which Russia has long been, and is today, most interested, the region where the Soviet Government is least willing to see either full control by a non-Communist Chinese central government or the penetration of American capital associated with it. The Soviet Union, as a result of the secret treaty concluded at Yalta with Britain and the United States and subsequently imposed on China, has control (in nominal partnership with China) of the principal Manchuria railways, but no rights of military occupation, without which the railways are always liable to seizure. The next best thing to military occupation being a "friendly" government, the Russians after the Japanese surrender gave a helping hand to the Communists in Manchuria. This was nearly effective in closing the whole territory to the Nanking forces, but when the latter, with the aid of American transport, forced their way in, they were allowed to advance north as far as Changchun without Russian intervention. It has been a matter for doubt, however, whether Russian restraint would stand the further advance of Chinese Government troops to Harbin, and it may be that,

even if the Chinese Communists are defeated in North China—which is not yet by any means a foregone conclusion—a refuge for them will still be maintained under Soviet protection in North Manchuria. Without abandoning ultimate claims to full sovereignty up to its northern frontiers, the Nanking Government would probably be well content for the time being if it could but remove Communist armed power from near the heart to the periphery of China.

President Chiang and some of his close associates—though not all of them—are aware that the success of their policy is not only a matter of military operations. Apart from factors of international diplomacy and public opinion abroad, the Government has to fight for political support within China and this means something more than a paper Constitution or grandiose paper plans for future economic construction. There have recently been some signs of a real effort to check official corruption and to put an end to the fantastic regime of carpet-baggers which overwhelmed the liberated provinces after the collapse of Japan. There has been some cleansing of the Augean stables, even if only with muddy Yangtse water. Poor Dr Tsiang, former Director-General of the Chinese National Relief and Rehabilitation Administration (CNRA), has been made a scapegoat for the sins of more exalted persons, and is

leaving for the United States to become a Professor of modern Chinese history, from which exile he will no doubt in time be restored to favour, if the history he teaches is not too indiscreet. An Economic Supervisory Committee, acting under direct instructions from President Chiang, has made some spectacular moves against the illegal currency speculation which recently brought about a panic in business circles in Shanghai. A committee of the People's Political Council investigating recent accidents on Chinese air lines has reported that the State-controlled civil aviation companies are "improperly equipped and badly managed and riddled with corruption and delinquency."

This reforming zeal which now manifests itself—still, to be sure, within strict limits—may have been due in part to the desire to make a better showing in anticipation of American credits, in part to the desperate need of the Government to obtain some sort of financial stability after China's prolonged orgy of inflation, but probably in part also to a purpose of strengthening the ties of the Kuomintang with the sounder part of the commercial and industrial bourgeoisie. The Kuomintang was in its origin the party of the rising capitalist class which sought both protection against foreign "imperialist" capital and an end to disorderly, inefficient and restrictive "feudal" rule in China. But the Japanese invasion, overrunning all the most important urban centres of China, eclipsed the new bourgeoisie, and the Kuomintang in exile in the interior under war conditions fell under the domination of landowners and civil and military officials who raked profit from monopoly trading. Since the end of the war, however, the bourgeois element has revived in Shanghai and elsewhere, and has shown a lively discontent with official maladministration and racketeering, which have even been compared unfavourably with the conditions for private business in the Communist areas.

Anti-Communism without the support of the capitalists is obviously a poor proposition, even in China, and there have been signs that the Kuomintang is seeking once more to base its policy on the bourgeoisie rather than on the landed gentry. Such an orientation would make it easier to carry out the minimum of agrarian reform necessary to enable the Kuomintang to appease peasant antagonism. The Government recently decreed that in areas recovered from the Communists owners may reclaim confiscated lands, but only if they can produce the proper title deeds, and that rents may not exceed one third of the crop—whereas rents of more than half are not uncommon in China. If the provision about title-deeds is strictly enforced, many owners may fail to regain their properties, though the principle of restitution will not be affected.

Perhaps the Government's strongest card, however, is a firm foreign policy. The Kuomintang flies the banner of nationalism and it comes nearest to rallying the Chinese nation under its leadership when it stands up for the dignity of China in the international field. The withdrawal of American marines and mediators has delivered the Government from a too obvious foreign patronage and it has certainly had the support of all politically conscious Chinese except the most fanatical Communists in its uncompromising protest against discussion of Chinese internal affairs by the Council of Foreign Ministers.

A strong line has also been taken about measures of the Philippine Government discriminating against the Chinese community and, in Indonesia, where a number of Chinese residents have been victims of disorder, China has demanded special safety zones to be policed by an armed Chinese militia; the Dutch authorities are reported to have conceded this in principle. Such energy in protection of the "Overseas Chinese" is evidence that civil war has not paralysed China as an international factor where important national interests are concerned.

NOTES OF THE WEEK

Last Lap in Moscow

A successful meeting between Mr Marshall and Mr Stalin has long looked like the one way of ending the Moscow deadlock. It has now taken place, but one looks in vain for signs that it has done good. The Foreign Ministers are indeed reported to have smiled on occasions, but only when their detailed arguments verged on absurdity, as they often do. Mr Molotov certainly did not smile at the American proposal for a four-Power pact to keep the Gerthans disarmed for twenty years or more; in fact he grimly offered a re-draft of the pact which would make it guarantee almost everything the Russians want in the German peace settlement. This is scant courtesy to a very bold proposal to keep an American stake in Germany for a generation, which has been on offer for nearly a year. Perhaps Mr Molotov would rather see American influence out of Europe altogether.

If that is the case, it would explain reports that the British Government are being asked by the Soviet Government to accept in the revised treaty of alliance a clause which, in certain circumstances, could be used to detach British from American policy. The present treaty of 1942 by its seventh clause binds both parties "not to conclude any alliance and not to take part in any coalition directed against the other." To rewrite this in a form which takes account of the inevitable—and desirable—association of British and American interests almost all over the world will clearly tax the ingenuity of Mr Vishinsky and Sir Maurice Peterson. If they cannot succeed, it would be better to postpone revision of the treaty until efforts have been made to reach a broader understanding between the Russians on the one hand, and the Americans and the British on the other—just as the Dunkirk pact would have been a more real document had Mr Bevin and M. Bidault agreed on the principles of their German and Western European policies beforehand.

There is still a chance that some progress can be made on Austria. The Foreign Ministers have started working on their deputies' report clause by clause, and if their deep differences over the Yugoslav territorial claims and the Russian claims to "German assets" in eastern Austria can be in any way modified, there would be some chance of having a peace treaty ready for their next meeting. This looks like taking place in London later in the summer.

As for German economic unity, agreement is as far off as ever. The Russians are reported to be interested in Mr Marshall's tentative suggestion that if to concede a higher level of industry to the Germans means reducing the amount of capital equipment that goes to the Russians from the west, they should receive compensation from current production. In a conference that was intended from the first by all parties to be "tough" this is a dangerous sacrifice of principle; it can only be made at British—as well as American—expense and Mr Bevin should have nothing to do with it. The choice is quite clearly between a European and a selfish approach to the control of the German economy; so long as the Russians show no interest in the former there can be no profit in discussing the latter.

* * *

Mr Molotov Misses a Trick

It is difficult not to believe that secret diplomacy would have made a better job than public diplomacy of the differences that have arisen in Moscow over the western frontier of Poland. Mr Marshall's proposals of April 9th, if studied in detail, reveal an opportunity for a deal which might have given to the Russians much of what they want in the Ruhr and to the Poles a settlement which future generations of Englishmen and Americans would have been prepared to defend with clear consciences against German agitation. M. Modzelewski, the Polish Foreign Minister, says that Mr Marshall demanded the revision of the provisional frontier drawn at Potsdam. He did not. He asked that the revision of the pre-war frontier should be studied by an international boundary commission with two objects in view: to give the Poles fair compensation for the territories in the east ceded to the Soviet Union and to ensure that such raw materials and heavy industry in the ceded territories "as are vital to the European economy shall fairly serve that need, including particularly the need of Poland." Mr Marshall asked for a settlement that "should be in the interest of Europe as a whole"; new frontiers must not be barriers to the "healthful and accustomed flow of trade and commerce and human intercourse."

Mr Molotov's rejection of the proposal was flat; yet a few minutes earlier he had objected to the French proposals for separating the Rhineland and the Ruhr from Germany on the grounds that it would be "a policy of dismembering Germany and abolishing her as an independent state," which would play into the hands of "German irredentists." He could surely have avoided such crass inconsistency and left the door open for some arrangement based on Mr Bevin's often repeated offer to discuss a special régime for the Ruhr if a similar régime is considered for Upper Silesia.

The Poles appear to admit that the "final delimitation of the frontier" is a task for the peace conference, but to argue that the process will be formal and perfunctory. The rate at which their people have resettled "the recovered territories" is given as an argument for the justice of the rough line drawn at Potsdam. They add that they have already invested \$600 million in the area; that the Germans could increase agricultural production to make good the loss of its food; and that Mr Bevin said at Potsdam that when the British give something they give it for ever.

On simple moral grounds the settlement is indefensible, as the Poles may one day find to their cost. It is also bad politics. As no one has seriously suggested depriving them of the territories in dispute, they would do well to cease the outcry against their wartime ally and consider whether in the years to come they cannot do something to guarantee to Germany some of the food supplies it will need. They are already claiming that they will have food for export in 1949.

* * *

A Fancy Coal Target

Response to pressure seems to be the watchword of the Government at present. A fortnight ago it was on conscription: this time it is on coal. Mr Shinwell has now revised his coal target from 200 million to 220 million tons for the current year, and this revision, given in two speeches last Saturday, comes so pat after the Trades Union Congress's criticism of the White Paper's coal target that it is impossible to avoid connecting the two.

If Mr Shinwell really believes that the extra 20 million tons can be produced, no news could be more welcome, for that "submerged tenth," if it could be brought to the surface, could transform the whole face of the country's economy. The trouble is that Mr Shinwell gave no adequate reason for altering the target figure, and since its original publication the course of the fuel crisis and statements by Sir Stafford Cripps indicate that the 200 million tons is an outside rather than a minimum target. There is, indeed, no harm in exhorting the miners to greater efforts. And it is possible that the extra 20 million tons could be forthcoming if the miners on their side were all prepared to work the full five-day week and to co-operate wholeheartedly in any changes and reorganisation necessary to increase output, and if the Coal Board were itself ready to put these changes into effect. But these are two big "ifs," whose fulfilment is unlikely. In any case Mr Shinwell, from his Ministry, cannot do more than exhort, for he is not managing the industry.

It is, however, nearly time for the Coal Board to provide the public with more information about its plans for increasing output. Until it works out an efficient system for planning its development work and evaluating the effects of both the short and long-term plans it is, presumably, making, future estimates of output can only be based on past performance, and on this basis there is little prospect of achieving even the 200 million target. No one can yet predict the effects of the five-day week, but certain reliable forecasts should soon be possible if the Board is setting about its work properly: if mining machinery and supplies are being efficiently ordered and allocated, their effects should be predictable; if there are plans for closing inefficient pits and transferring labour to adjacent ones where costs of production are lower, certain results must be expected; since new recruitment can have little effect on production for six months ahead, and output cannot therefore be expected to rise immediately, it is no use implying, as Mr Shinwell did, that the results of the intake will have substantial results this year.

The Coal Board is very new, and it would be unfair to expect prodigies of planning at once. But no estimates of future output can ignore these factors, and if the target is to be revised, it should be done as the result of reliable statistics and forecasts of this kind and not of Ministerial face-saving or fancy.

Dockyard Politics

The apparently successful restriction of a possibly devastating national dock strike to its point of origin is a feather in the cap of the Transport and General Workers Union. But until the Glasgow stoppage is cleared up, one cannot feel altogether easy. At the back of this stoppage lies an economic point of some interest: the dispute is not over hours, wages or conditions, but over planning and is between the planners—represented by the Workers' Joint Council Fact Finding Committee—and the non-planners, the members of the Scottish TGWU. Some eight months ago this Fact Finding Committee, after examining the position at the port of Glasgow, unanimously agreed that the current labour force was too big and should, in order to ensure de-casualisation, be reduced by some 500 men. The Scottish Union disagreed, insisting that the entire force be retained on strength. After several months of fruitless discussions, the port authorities acted without union concurrence and dismissed 500 men. The dockers then struck. Such are the bare facts.

The principles at stake are curiously intermingled. There is the relationship, never very cordial, between the TGWU and its Scottish affiliate; the flaws in this relationship have in this instance stultified the activities of the National Joint Council; from this the lesson should perhaps be drawn that the Council is both insufficiently joint and inadequately national. The relation between unions and their constituents is important in every type of dispute, but in this particular dispute it raises an unusual issue—the question of who, in any given undertaking, shall decide on labour intake and outgo. Traditionally, the employer's right to hire and fire has been limited only by apprenticeship regulations and provisions against victimisation; but in a deliberate once-for-all move to squeeze the surplus out of an immemorably overmanned labour force, even the most intransigent economic royalist could hardly deny organised labour a say. But it is one thing to have a say, quite another to insist on dictation—a motion that the country is bound to carry.

To say this is not to claim that the Glasgow Port Authorities have acted, in their selection of the 500 redundant men, with perfect justice and complete economic justification. There was plenty of room for union co-operation and championship of their members' interests. On what principle were "the redundants" to be chosen? What, if anything, was done for them in the way of resettlement? As to the first point, the only dispute is whether there was perfect adherence to a cut and dried seniority rule—a principle even more idiotic economically in the docks industry than elsewhere; as to the second, no information whatever is forthcoming. The Scottish TGWU would have been better occupied in dealing constructively with these questions, particularly the latter, than in a blank refusal to face the ascertained facts of de-casualisation. As it is, they have allowed the workers' case to go by default.

* * *

Tourist Trade

A heated debate rages round the tourist trade. The Automobile Association reports that foreign visitors are being explicitly warned off because of the lack of any special provision of petrol for tourists, and draws distressing pictures of the British holiday-maker crowded out of his seaside lodgings by the influx of foreigners; while the Caterers Association, alleging a fatal shortage of crockery, napery and food, prophesies that any visitors who do come will retreat disgusted, never return, warn their friends against this island and remain its life-long ill-wishers.

Optimism, for contrast, offers golden prospects: 150,000 tourists, more than half of them from the hardest of hard currency areas, bring, on a conservative estimate, between \$800 and \$900 apiece to restore the sagging balance of payments—a sum of which not more than 10 per cent need be ranked as a re-export of imported commodities. Is it possible to strike a balance?

Warnings or no warnings, Great Britain will get this year as many visitors as the passenger fleet plying to her shores can carry. Whether those visitors stay or flounce disgusted off is another question. That they should stay is, with all due respect to the needs of the British holiday-makers, eminently desirable. They will not further crowd out Blackpool or Mr Butlin's—have they not got Coney Island? They are far more likely to go where comparatively few British families go—round historic Britain, comparatively few British families go—round historic Britain, looking at the face of the land. The hopelessly insular American holiday-maker, who is the soul mate of the traditional British tourist with his insistence on the precise ritual for afternoon tea, will stay at home; his own continent offers abundant playgrounds

complete with Coca-Cola and fifty kinds of sandwich. Those with a normal endowment of imagination and willingness to experiment will, as Mr Tom Johnston pointed out: "Come here prepared to find less of comfort though more of interest than at home." It is to smoothing and making pleasant their travel that public and private efforts should be directed, rather than to vain attempts to compete with either Palm Beach or the Bois de Boulogne.

The alternatives to luxury and obsequiousness need not be squalor and bad manners. Certainly the pinch-penny refusal to make extra petrol available to tourists has nothing to commend it, unless one is to admit the implied solicitude for the feelings of the native and unprivileged motorist. Beyond this, far more effective than an extra shilling on the permissible price of meals or toleration of the continental-style Black Market, would be an extension of such work as is being carried on by the British Travel Association with its attractively presented information and its constant pressure to raise the standard of hospitality. An intelligently run tourist information centre in every town with a substantial tourist trade would be more valued than fresh upholstery in railway carriages; a nation-wide hotel-clearing system enabling every traveller to find out quickly where accommodation was available would be worth as much as half-a-dozen new hotels. Success in inducing the Ministry of Labour so far to relax its muscle-bound xenophobia as to allow a few competent European chefs in to succour the tourist industry in its hour of trial would probably be equivalent to a 10 per cent increase in the ration. However uncongenial the idea may seem to the Caterers Association, it is intelligence and imagination, rather than impossible aspirations to luxury, which are most needed in the tourist trade to-day.

* * *

Prospects of Trade with Russia

The breakdown of the political negotiations in Moscow is apparently being followed by an attempt to improve trade between Russia and the western countries. Next week a British Trade Mission is going to Moscow; and Mr Marshall is reported to have discussed with Mr Stalin the settlement of Lend-Lease accounts and trade between Russia and the United States. *Mutatis mutandis*, the situation is somewhat similar to that which prevailed in the early twenties, when the western countries and Russia began resuming business links across a chasm created by ideological antagonism. At a recent press conference, Mr Vyshinsky stated that "the success of the Soviet plan for reconstruction of their devastated areas within six or seven years depended on their receiving goods from current production." So, logically, the disagreement over reparations from Germany ought perhaps to impel the Soviet Government to devote more attention than hitherto to the development of foreign trade. But the present atmosphere of mutual suspicion and rising hostility that is making agreement on the German economy so difficult as to seem almost impossible, may not be very conducive to trade either.

Mr Vyshinsky's statement on the need for Russia to draw on foreign resources for its own reconstruction reflects what is perhaps the central dilemma of Soviet economic policy after the war. The pre-war Five-Year Plans, especially the second and the third, were based on the principle of complete self-sufficiency. In the thirties, Russia's share in world trade was below 1 per cent. The force of circumstances has tended to compel the planners of Soviet economy to depart from that policy: self-sufficiency now would spell grievous delays in reconstruction and prolong destitution over vast areas. In the last two years that departure has taken the form of a "mobilisation" for Russian reconstruction of the resources of eastern Europe, including eastern Germany. Quite apart from reparations, the compensatory trade between Russia and eastern Europe has raised Russia's share in a reduced volume of world trade to much above the pre-war level.

Trade with the countries of eastern Europe alone, however advantageous in many respects, is not enough for Russia's needs, since her most pressing need is for capital goods and mechanical equipment, which are not produced by them. Until quite recently this fact was masked by the flow of dismantled industrial equipment to Russia; but its meaning becomes doubly important now. Moreover, the countries of eastern Europe cannot easily sever their old links with world economy and adjust themselves to a scheme of regional autarky for Russia and themselves. Czechoslovakia and Poland, for instance, are in different degrees dependent on trade with the west; and to the extent to which they must export

their goods to western countries their resources are denied to Russia.

The two years during which Russia was able to draw on the resources of eastern Europe have helped her to tide over a very difficult period, in which the chances of her trade with the western countries were in any case practically nil. In the sellers' market of these years Russia would have been able to appear only as a buyer, with no commercial bargaining power whatsoever. Reports on the state of the western markets and forecasts of trends in the near future must now be eagerly studied in the Soviet Ministry of Foreign Trade. Is the sellers' market beginning to shrink? Is the buyers' market beginning to cast its shadow ahead? These are the questions that are probably uppermost in the minds of those in charge of Soviet trade policy. They are probably anxious to time their appearance on western markets just for the moment when the tide of trade will be turning. If this guess is correct, then the forthcoming trade negotiations will not yield any quick and spectacular results; they will rather be used by the Soviet negotiators for testing the temper of the western business world.

Italians for Reconstruction

The first Italian foundry workers for Britain left Milan on Tuesday. These swallows do not make a summer, for less than 1,000 are likely to arrive this year. France, Belgium and Argentina have been doing things on a much bolder scale. The Italian agreement with Belgium of last June provides for the emigration of 50,000 workers (as far as possible miners) in yearly or two-yearly contracts, and the Italian Government will receive badly needed coal at the rate of 3,000 tons a month for every 1,000 Italian miners at work in Belgium. Over 20,000 are already at work.

The French agreement signed on March 21st is intended to bring 200,000 Italians across the frontier before the end of 1947; they should arrive at the rate of 17,000 a month and should provide 30,000 for training as miners, 70,000 for the countryside, and the rest for building, heavy industry and other essential occupations. For each working day of an Italian miner his government will receive from France 150 kg. (nearly 3 cwt.) of coal. The Argentine Government are thinking in terms of 60,000 immigrants a year for five years; they will pay the passages of immigrants, give each a two-year contract and give them the same protection as their own workers.

The terms offered in each case are generous. The Italians in Belgium, for example, receive the same wages and social assistance benefits as Belgian workers, as well as normal family allowances. They may remit to Italy as much of their savings as they wish. Argentina has also agreed to unrestricted remittances back to Italy, where these contributions from emigrants used—in the late 'twenties—to produce some 2,000 million lire a year towards a healthy Italian balance of payments.

Italy has many emigrants to spare, for the old problem of over-population has reappeared. The African colonies provide no outlet now; agriculture has absorbed all the labour it can, and the revival of industrial employment is restricted by shortages of raw materials. Last year the number of unemployed had risen to over 2,000,000. It still seems that the British Government could take more advantage of this situation; there are good political as well as economic reasons for overcoming the opposition of the trade unions.

Platform for Propaganda

In December, 1944, on the initiative of the Foreign Office, an interdepartmental commission was created under the chairmanship of Lord Scarbrough "to examine the facilities offered by universities and other educational institutions in Great Britain for the study of Oriental, Slavonic, East European and African languages and culture, to consider what advantage is being taken of these facilities and to formulate recommendations for their improvement." The various sub-committees of the commission heard a great deal of evidence from all interested quarters and the final report which has just been published is a most interesting and stimulating document. It recognises that our foreign trade and diplomacy are in the post-war era more than ever dependent on sound knowledge and information, that "a significant part of our contribution to world peace is to understand and know our neighbours both near and distant," and that a firm

basis of academic study is indispensable not only for these ends but for the prestige abroad which accrues from distinguished scholarship.

In making practical recommendations the report takes note of the fact that in the past very little regular provision has been made in higher education in this country for the studies under review and that they have been left for the most part to amateurs with private means or to consuls, civil servants or missionaries to pursue in their spare time. The report considers that this haphazard private enterprise is no longer sufficient for contemporary needs and proposes a scheme for government subsidies and at the same time a certain division of labour between different universities and institutes whereby specialisation will be regulated. This is an innovation in the Government's attitude in such matters, at least in the field of the humanities, as it has hitherto been the practice of the University Grants Committee to allot funds in response to initiatives from the universities; here funds are recommended for a detailed plan which the Government—or at least Whitehall—wishes to see carried out by academic bodies.

The most striking merit of the Report is that, in spite of its concern with practical affairs, it does not concentrate its attention on short language courses, but is anxious to promote serious literary, historical and sociological studies over the whole field. This official respect for intellectual standards makes it all the more deplorable that one of the institutions of which most is expected in the Report should be at the moment in the public eye, not as a place of learning, but as a platform for a piece of highly fraudulent political propaganda. The exhibition of Poland's western territories being held at the School of Slavonic Studies, and opened by a member of its Council, is part of an official Polish attempt to deny the plain fact that the Oder-Neisse frontier was given to Poland only as a compensation for the Soviet annexation of the eastern provinces and to put across entirely untenable ethnic claims. The Polish Government has the right to conduct any publicity it pleases in this country through its own agencies, but it is extremely undesirable that academic institutions here should be identified with this kind of propaganda, which can only serve to discredit them as homes of serious and disinterested study.

The Right to Arrest

The decision of the Court of Appeal in the case of *Leachinsky v. Christie and Others*, noted in *The Economist* on January 19, 1946, has now been affirmed by the House of Lords. The substance of the case was a claim for false imprisonment made by a Liverpool merchant against two police constables of the Liverpool Police Force, and the main allegation against the police officers was that they arrested the plaintiff on a charge under a local Act which did not give them an actual right to arrest without a magistrate's warrant. The case is of considerable constitutional importance, in that it embodies a full consideration of what are the rights of the police, and of private persons, to make arrests without a magistrate's warrant, and conversely what are the limitations on the right of every man to go unimpeded where no magistrate has ordered his arrest. In the House of Lords Viscount Simon epitomised the existing law in the form of certain propositions, of which the most important are: if a policeman arrests a man without a warrant he must in ordinary circumstances inform the man arrested of the true grounds of his arrest; he is not entitled to keep the reasons to himself or to give untrue ones; if he fails in this duty then, save for certain exceptions, the arrested man has the right to sue for false imprisonment; technical or formal language is not necessary when saying why the arrest was made, nor is it necessary to inform the arrested man if in fact he knows from other circumstances the nature of the charge against him; finally, the requirement of telling the arrested man is waived if he, the arrested man, puts it out of the power of the policeman to tell him, for example, by resisting.

The complexity of the general body of laws required to be known by a police officer may sometimes strike a spark of sympathy from the lay breast, but the importance of the right of arrest without warrant—and of its converse, the right to be free—are so important that they should form part of the basic training of every police officer. It may be easier for a policeman to remember the exact permitted dimensions of a public service vehicle. It is far more important to the public that he should know when and how he can subject, at his own discretion, a citizen to temporary imprisonment and when and how he cannot.

Petition from Bermuda

Uneasiness has long been felt over conditions in Bermuda, which was outside the scope of the West India Royal Commission of 1938-39. Bermuda boasts a centuries-old constitution which gives it representative government. But whom does its parliament represent? Last November, a petition was presented to the Secretary of State from the Bermuda Workers' Association, which draws attention to the extremely narrow parliamentary franchise and to the property qualifications required for membership of the House of Assembly. As a result of this oligarchy, the petitioners claim, the general body of the people remain depressed and poverty-stricken. The social services pass them by. Trade union activities have only recently been legalised and the trade union legislation is still far below what is recognised as desirable elsewhere.

The Governor's comments on the petition are very unfortunate. He is, presumably, right in declaring that it is not backed by the people of Bermuda, and that he has never seen a coloured population "so well dressed, well fed or well housed as it is in Bermuda"—in view of conditions elsewhere, that does not mean very much. But the tone of the despatch reveals, if not a reactionary attitude, at least one that seems far from realising the currents that are moving in dependent territories to-day. The Governor defends the constitution as "a system which has withstood the test of time and has brought prosperity and, by and large, contentment to the Colony as a whole." The franchise should be extended, but only gradually in accordance with "the growth of political mindedness of the masses" which "can only develop if the people are carefully educated in their responsibilities as citizens"—and he later defends the present educational system which does not even give free primary education. He is in favour of the introduction of direct taxation—at present, the great bulk of the colony's revenue comes from customs duties, a system which bears very severely on the less wealthy section of the population—but dare not guess what the fate of the income tax Bill, at present before the House of Assembly, will be. If it is turned down, it will surely not be a good advertisement for the present system of government.

The Secretary of State's reply to this despatch (all of which is included in a White Paper (Cmd. 7093)) is an implied rebuke to the Governor. He does not agree, yet, to the Royal Commission requested by the petitioners. But he makes it very clear that he considers that they have a good case, and he asks the Bermuda legislature to give special attention to their grievances, in particular to the labour legislation, the franchise and the fiscal system. If its deliberations do not produce far-reaching reforms, there is a strong hint that a Royal Commission will be appointed.

Who Controls in the Air?

A statement issued by the Air Ministry on April 13th announced that pending the establishment of a world-wide air traffic control organisation, an air traffic control service had been established within the framework of the RAF Commands at home and overseas for all aircraft on British routes. In this way a beginning would be made in creating the single unified national control organisation which the international system envisaged by the International Civil Aviation Organisation presupposes. At the same time, "air traffic control procedures for both civil and military aircraft will become standardised, as far as possible, on all Imperial routes."

The statement is far from clear. It seems to imply that for a transitional period at any rate the RAF will be responsible for controlling aircraft on British routes. If so, it is to be hoped that the Control Officer will be given more responsibility and more equipment for proper control than disquieting reports now indicate he has. What exactly are the defects in the present system which have led to its modification it is difficult to say. But the inadequate powers of the Control Officer must surely be one of the gravest. That one of the main wartime lessons of the RAF should be disregarded is surprising. It may be due to the provision of inadequate facilities—but this should not affect the principle. Radar, for example, is hardly used in civilian flying either in the aircraft or on the ground. And the efficacy of control at any local range depends largely on the navigator's dead reckoning and estimated times of arrival and departure. This method, of course, works quite well. But there are better methods, and it is to be hoped that the "standardisation of air traffic control procedures" will lead to their adoption.

Film Quiz

The Granada circuit of cinemas, an independent circuit of which Mr Sidney Bernstein is head, has at intervals since 1927 obtained from its patrons replies to a questionnaire designed to extract their views on cinemas, films, stars and producers. In December last, after a break of nine years, the practice was resumed and the results are now available. As well as facts of only transitory interest they also contain considerable material for those concerned with how the public use their leisure and the influences that make them prefer one amusement agency to another.

As might have been expected, the popular opinion of British films has risen considerably. Ninety-six per cent of those replying thought that British films had improved since 1939; only 26 per cent thought that American films had done so. The results will be a disappointment to those who thought that the general public were gradually coming to like the shorter educational film. About half the replies said that they liked cartoons and news magazines "very much." Only 10 per cent disliked cartoons very much. On the other hand only 18 per cent liked films on "social developments" very much, and 37 per cent disliked them equally strongly. Short films on animal life exceed in popularity those on science, and the justifiable comment of the report is that the dislike for science and social development topics is comparable with the dislike felt for horror films in the main feature class (perhaps social development suffers from an association of ideas?). Short Government films, such as those on food or health, generally leave a feeling of indifference.

On reasons for going to the cinema at all, 21 per cent go to the cinema only to see a particular film, 15 per cent go to a particular cinema whatever the film, and the middle group, 49 per cent, go to cinemas regularly but exercise such choice in films as is possible locally. Finally, of those who go regularly to a particular cinema, 31 per cent go because it is the most comfortable. Perhaps the best conclusions to draw from the report are that the commercial cinema is still a branch of the entertainment industry, not of the educational world, and that the wise proprietor should never forget that one in three of his regular customers will still pay to come in and sleep rather than stay outside.

Bisected Korea

The 38th parallel of latitude does not correspond to any geographical or ethnic division in the "Land of the Morning Calm," as Korea used to be known for literary purposes. This mystical number which now dominates the lives of the Koreans was merely adopted by the United States and Soviet Governments for a line of demarcation between their respective armies which were to liberate Korea from the Japanese. But the line has now become a frontier dividing Korea into two parts and virtually preventing all contact or communication between them. North of the line the Russians have set up a Communist-controlled administration with its own social and economic policy; in the south the Americans have been trying to create a democratic régime in accordance with their own ideas of what is politically right. By the Moscow agreement of December, 1945, Korea was to be placed under Four-Power trusteeship for five years in preparation for full independence and a Provisional Government was to be set up with participation of Korean "democratic parties." But an American-Soviet Commission created in March, 1946, to arrange for the formation of the Provisional Government was deadlocked by Soviet insistence on a formula for defining "democratic parties" which would have excluded all parties except the Communists and their close associates. The consequence is that there is still no common administration for the whole of Korea, and meanwhile the economy of the country is disrupted, for the bulk of the agricultural population is in the south, whereas the coal and hydro-electric resources are located in the north.

Mr Marshall in a recent letter to Mr Molotov has asked for a fresh start in negotiations, but the prospects of agreement do not appear bright at the moment. The most serious feature of the situation is the allegation of the American authorities in Korea that a Communist-led Korean army is being recruited and trained in the Russian zone. If this is so, and if no armed forces are raised in the American zone, the effect of withdrawal of Allied forces at the end of the trusteeship period can only be a conquest of the defenceless south by the militarised north; if, on the other hand, armies are built up in both zones, then the stage is set for civil war as soon as the Allied troops go—a civil war in which both the Great Powers will have interest and prestige at stake. A basic difficulty is that Korea is not an enemy, but a liberated country, and therefore not subject to disarmament; moreover, the long subjection of the Koreans to Japanese rule and their

lack of political, administrative or business experience would be adverse to the stability of an emerging independent state even if their mighty sponsors were co-operating instead of opposing each other.

Finland seeks a Government

The resignation of Mr Pekkala's Cabinet in Finland on April 11th is no occasion for surprise. Its position had seriously deteriorated in recent weeks. New Year hopes that some political tranquillity would be maintained as a result of such measures as the partial reduction of taxes rapidly dwindled. A series of strikes for higher wages stimulated the fissiparous tendencies of an increasingly uneasy coalition and progressively undermined the country's confidence in its competence. On March 29th the Social Democrats, now regaining strength after their internal dissensions last summer, proposed to the Communists and the Agrarians that their three Parties should co-operate in forming a new Government to cope with what was now termed "the economic crisis." On April 1st the important Economic Council recommended to the Council of State that a comprehensive economic programme should be adopted with the prime aim of stabilisation and that, as a first step, all strikes should be prohibited during April.

The political implications of more vigorous measures than Mr Pekkala had been willing or able to adopt heightened the political tension. The Communists and their companions in the Demo-

cratic League approved more vigorous measures, but thought that a prohibition on strikes should be balanced by the blocking of prices. Conservative opinion held that the real cause of the crisis was the inability of the Left to rise above party interests and co-operate in sound economic measures. The Social Democrats, encouraged by the similarity of the Economic Council's recommendations to their own economic proposals, worked steadily for a new Government. But it was the Right-wing Agrarians who, when their proposals for strong measures were rejected, withdrew their four Ministers and brought the Government down.

Unlike many political moves in Finland in recent months, this change of Government was due to entirely internal issues. The Communists played a small part, and that more critical than hostile; while the Russians, to judge from Mr Zhdanov's public expression of satisfaction with the Pekkala Government during his visit to Helsinki in February, probably prolonged its life. Yet these very factors make more difficult the formation of a new Government that has a better chance of carrying out the more vigorous measures which conflict with party policies. The balance of strength in the Diet, where the Social Democrats have 50 seats, the Democratic League 49, the Agrarians 49 and the Conservatives 28 out of a total of 200, makes some sort of coalition inevitable. Yet the action of the Agrarians means they are unlikely to join it. A coalition between the Democratic League and the Social Democrats is feasible. The choice of Mr Tuomioja, a Liberal banker, to form a new Government, however, indicates that the main parties will not now commit themselves.

Letters to the Editor

Development or Welfare?

SIR,—Your leading article of March 15th rightly underlines the fact that the impetus behind the East African Groundnut Scheme comes from *our* needs not from those of the colonies concerned. If, as you assert, this is indeed the sort of economic planning that is needed to change the face of the colonial empire, the full implications of this and other aspects of the scheme must be faced.

First as to the contribution the scheme may make in the immediate future to "development and welfare." Though it will no doubt increase the total productivity of the territories concerned, it is difficult to see how it can increase the productivity of the great mass of African farmers, except through its contributions to revenue; and these can be made effective only through development and welfare projects that have nothing to do with the scheme. It no doubt represents a revolution in agricultural technique in East Africa—but not for the East African. Is not one of its most emphasised merits that it will not "interfere with the flow of labour to existing essential production"? It cannot therefore add to the absorptive capacity of East Africa in proportion to its scale and to the capital resources engaged.

Nor does it seem likely that the scheme can, in its technical and financial aspects, serve as a model for the future development of African agriculture. To turn an unpopulated wilderness into a gigantic mechanised estate may be a relatively straightforward problem of applied science and technology. But this approach will not work in a Kikuyu reserve—the sort of area in which an agricultural revolution is most desperately needed. In fact the availability of these vast unpeopled lands is a *sine qua non* for the plan. Perhaps this underlies some of the enthusiasm that has greeted it. For once it is possible to carry through a huge agricultural development scheme without the risk of obstructions rooted in the existing structure of a native economy. It would be interesting to learn how this sort of economic planning would be applied to Northern Nigeria, for example, where groundnuts are already a staple export crop.

Nor are the expectations, so sanguinely held, of the wider effects of the welfare services, etc., connected with the plan, very convincing. Is it anticipated that the "model centres" will be copied by Native Authorities or the colonial governments? That is not how social services spread in Africa—least of all when they are expensive and form part of what, to the mass of the people, must appear as artificial and relatively isolated organisations.

The groundnut plan is primarily a large business enterprise albeit State financed and controlled. Let it be accepted on its obvious merits as such, and as a demonstration of what applied science and technology can do, given favourable conditions and

appropriate organisation. It is fallacious to think that it can directly influence native farming either in techniques or in social structure, unless, of course, the groundnut scheme gradually swallows the whole economy. It does not therefore materially alter the basic problems of policy in regard to development and welfare planning, if by this is meant immediate measures for raising the standard of life of the people of East Africa.—Yours faithfully,

M. FORTES

Imperial Preference

SIR,—The review of Mr Ronald S. Russell's book "Imperial Preference," appearing in your issue of April 12th, calls for one or two comments. Your reviewer makes the curious statement that the year of the greatest expansion of Empire trade, as far as the United Kingdom was concerned, was 1931 to 1932 and attributes this expansion mainly to the creation of the sterling bloc.

<i>Hicks</i> : Public Finance ...	10/6

No one, of course, will deny that our departure from the gold standard had its effect, but the expansion to which your reviewer refers, while it might have been due to this cause, was not in fact of any substantial magnitude. The fourth quarter of 1931 compared with the first quarter showed £67 million in imports from the Empire, an increase of less than £5 million, and this figure was not reached again until the end of 1933. Exports to British countries declined throughout 1931, and continued to decline until the second quarter of 1932, finishing up the year £5,000,000 lower than at the end of 1931. Even 1933 did not show a rise until the third quarter. The main improvement during 1931, in the matter of imports, accrued to foreign countries which showed a rise of about 19 per cent, but this disappeared very rapidly. Exports from foreign countries also showed a decline.

The real improvement in trade between the United Kingdom and the Empire did not take place until between 1933-34, when the Import Duties Act and the Ottawa Agreements Act had had time to take effect. That period showed an increase of £22 million in imports, and the subsequent years £13, £48 and £73 million respectively. Similarly, exports to the Empire in 1934 showed an increase of £22 million over 1933, and the years that followed £19, £12 and £35 million respectively. Surely this dispels the contention that the establishment of the sterling area was the main factor in Empire trade expansion. Incidentally, it might be added that no responsible person nowadays would dream of assuming that the Empire could become a completely self-contained economic unit, or wishes it. It is, however, upon the basis of Empire trade that the United Kingdom at least, and probably every single unit in the Empire, must build its foreign trade.

I was much interested in your reviewer's reference to the grant by Canada of unilateral preference to British goods. This step, of course, was based upon sound economic calculations, but if your reviewer had been, as I was, living in Canada in 1911 he would have realised that altruism and sentiment both played their part, and a part too large to be ignored. In that year the Canadian Government went to the country on the issue of what was known as "Reciprocity" which meant that they proposed to swing Canadian trade in the direction of the United States and away from Great Britain. The party suggesting it was swept out of office. That was no economic decision.—Yours faithfully,

W. A. WELLS

Empire Trade Association, 9 Victoria Street, S.W.1

[It is inadvisable, when discussing the effects of imperial preference on Empire trade, to use absolute figures. To show that British trade with Empire countries increased by so many million pounds sterling each year is no argument in favour of imperial preference. These absolute increases may have been due, as indeed they were, to the general improvement in world economic conditions. The important guide is the proportionate share of Empire countries. In 1931 the Empire supplied 28.7 per cent of British imports; in 1932 this had risen to 35.3 per cent. This was the largest single proportionate increase recorded in the period 1927-1938.—EDITOR.]

Census of Production

SIR,—Surely Dr Barna is rather naïve if he accepts without question the statement of the Government's statistical needs as set out in Chapter 6 of Cmd. 6527. After all, on April 1st this year they were convinced that the period of National Service must be 18 months; but by April 3rd they had changed their minds. Governments are not infallible; nor are White Papers.

I agree with Dr Barna that more statistical information is desirable. My difference with him is that I do not think that we can, at this moment, afford the necessary manpower to compile and analyse further records. I suppose we must agree to differ.

Our paramount need to-day is for more production. Filling in Census forms is not producing. I suggest that most people would prefer an incomplete picture of our economy and more goods than a complete picture and fewer goods.

There is a further advantage in postponing the Census in that neither 1947 or 1948 are likely to be "normal" years, owing to fuel shortages. Any figures obtained would be distorted; and interpretations of them would lose much of their value.—Yours faithfully,

K. C. STUART

Corodale, 9 Elm Road, Sidcup, Kent

Correspondents are asked to keep their letters as short as possible, and, in spite of paper shortage, to write on one side only.

Jewish Camps in Cyprus

SIR,—I have read with much interest the report in your issue of April 5th. Throughout this report the word "immigrants" appears many times; but not even once is it hinted that most of these so-called "immigrants" are refugees, the desperate survivors of Hitler's concentration camps.

Can it be said that these people are no longer refugees, no longer homeless and destitute, and therefore can be classed as ordinary immigrants?—Yours faithfully,

J. PODHORIZER

26 Little Moor Hill, Smethwick, Staffordshire

Planners and Politicians

SIR,—I quote the following from your article on "Planners and Politicians" in the March 29th issue of *The Economist*:

"Will the Treasury, for example, concede anything of its monopoly of decision on financial matters. To do so would be a revolution in British methods of Government."

Would this, in matter of fact, be such a revolution?

During the time, before and after the Munich Crisis in 1938, I was Director of Aeronautical Production in the Air Ministry. Before the crisis we had to get prior Treasury approval for all plans for increasing production, whether these entailed building and equipping new factories; the supplying of machine tools to existing factories or the placing of educational orders for munitions. After the crisis, however, when it was quite obvious to many that war was inevitable, the position was altered and our powers to put plans for increased production into operation were greatly increased by delegated sanctions.

In my experience the Treasury continued, after the crisis, to require detailed information, but they were entirely reasonable in their outlook and I cannot recall a single instance where they refused financial approval of plans.—Yours faithfully,

H. A. P. DISNEY, Lieut.-Col.

Uphanger, Chorley Wood, Herts

From *The Economist* of 1847

April 17, 1847

We see the progress of knowledge in our own country, or in the whole of Europe, gradually knocking off the shackles of slavery—gradually overturning feudal tyranny and shaking off debasing superstition—gradually setting commerce free, and extending it over many lands—gradually extinguishing Church tests and State cruelties—gradually abolishing intolerance and sanguinary laws—gradually increasing mutual services and mutual kindness, by an ever increasing dependence of man on man, as division of labour extends—we see it gradually inventing new arts, and gradually increasing the power of man over the material world, till he comes, as in the case of the newly discovered application of ether, almost to extinguish physical pain . . . That kind of progress we see everywhere, and perhaps at all times. Education, or the sedulously drilling of men into a fast adherence to the knowledge already acquired—the training them up to conform to the views or serve the purpose of the educators, we see in Paraguay. Education is, in such cases, all darkness and destruction—the progress of knowledge is all light, life, and happiness. But these two different and opposite things, when they approach each other, and education is directed to diffuse some little part of the knowledge continually gathered, are by many people confounded and regarded as one . . .

*

The cost of the Great Western, making it, as the author says, a gentleman's railway, has been so great that the directors cannot afford to attend to the wants of the working man. Hence it happens, notwithstanding the vast speed of its express trains, that the average speed of all its trains is less than on any other road.

On an average of all the trains between London and Southampton the rate is 25.29 miles per hour; and on the London and North-Western, between London and Birmingham, 24.27 miles per hour; the Great Western, between London and Bristol only attains 23.97 miles per hour. Between London and Wolverton the average is 27.77 miles per hour; while from London to Swindon the rate is only 24.97, being a difference of nearly three miles an hour in favour of the narrow gauge of line. The secret of this undeniable conclusion . . . lies in the trains at 12.9 miles an hour, which are provided by the Great Western managers in compensating economy for those at 42 miles an hour.

Books and Publications

Unorthodox Colonial Views

"On Governing Colonies." By W. R. Crocker. Allen and Unwin. (1947.) 152 pages. Illustrated. 10s. 6d.

COLONEL CROCKER is Chief of the African Section of the Trusteeship Department of Uno. For this reason alone his views on colonial affairs are of significance. Though his book is concerned with the West African dependencies of Britain, France and Belgium, a wide and varied experience of colonial territories lies behind it. The result is a somewhat unorthodox critique of colonial government as it actually works. The interest of the book lies in the point of view. The facts used are mostly matters of common knowledge, given a new slant by their juxtaposition here.

In considering colonial affairs the fundamental problem is that of introducing European civilisation to primitive peoples. The results depend on two sets of factors: the material, social and moral condition of the contemporary African peoples, on the one hand; and the national temperament, the political and economic structure, and the traditional ideals of the governing powers on the other. African conditions may make what appear to be diametrically opposed British or French policies come to the same thing in practice, as, for example, in the "bush" areas; and national temperament may make apparently identical policies work out differently in practice, as, for instance, "Indirect Rule" in British and Belgian territories. Comparison of the policies and achievements of the three Powers shows that all have made positive contributions, but that in every case some cherished beliefs do not stand close scrutiny. For example, the much-vaunted belief that there is less of a barrier between the French and their African subjects than between the British and theirs is shown to be false.

On balance, Colonel Crocker appears to conclude that the British approach holds out most hope for the future, though the Belgian has come out best on past performance. The Nigerian "autonomists" may be aspiring beyond their present capacities and moral qualities, but the goal of self-government, to be attained by building up from "Indirect Rule" on lines implied in the new Nigerian constitution, is the only worthwhile one. In the long run the French policy of frenchification and centralisation will reap only hatred and revolt.

There is some plain speaking on subjects that are often discreetly overlooked, though widely known in West Africa. Such are the unscrupulous activities of some missionaries in British territories, and the ruthless coercion practised by the French in their war-time production drives. Colonel Crocker also pays a tribute to the West African Press, which, in spite of immaturity and uncritical partisanship, has a decisive part to play in the social and political scene. The chief significance of Colonel Crocker's book lies in the fact that, though not orthodox, it is also not just a personal expression of opinion. It is a persuasive statement of the case for a policy advocated by a small but influential group of officials and business men in West Africa.

Patents

"Inventions, Patents and Monopoly." By Peter Meinhardt. With a Foreword by James Mould. Stevens and Sons. (1946.) 352 pages. 25s.

It is a long way from the Statute of Monopolies of 1623 to the Second Interim Report of the Kenneth R. Swan Committee on the Patents and Designs Acts, published in April, 1946. The Patent Acts have been amended from time to time, but Mr Meinhardt asserts that fundamental changes in the scientific, technical and economic field have not in every respect been followed by corresponding changes in patent law. The author expects important legal reforms to take place soon, and it is to these that he devotes much painstaking work in this latest contribution to the problem.

After explaining in a short introductory chapter the functions and general characteristics of inventors and inventions, he analyses in detail the British patent law and practice, the possible abuses of patent monopoly and the suggestions for patent law reform. One of the most interesting of his own recommendations is the suggestion that under a future Patent Act an application for the reconversion of a "full patent" into a "licence patent" should be heard and decided by the Patent Court. If the future Patent Act does not distinguish between "full patents" and

"licence patents" an application for a compulsory licence under an ordinary patent should from the start be heard, not by the Comptroller of the Patent Office, but by the Patent Court, which in the view of the author should emerge from its present separate jurisdiction and should form part of the High Court of Justice. "The decision should . . . be entrusted to an independent judge and not be left in the hands of an executive official, such as the Comptroller, who is acting 'under the superintendence and direction of the Board of Trade.'"

Administrative, legal and judicial problems of this kind are dealt with by the author with authority and objectivity. But this cannot be said of the parts which deal with the purely economic and social aspects of the matter. The author has in no way attempted to give a comprehensive picture of the monopolistic effects of patent legislation, and blindly adopts the claim of patent agents that cases of wrongful suppression of patented inventions are rare, if not almost non-existent. He evades the issue by saying that "we have not got the means of checking up whether and to what extent allegations brought forward from time to time in America about the wrongful suppression of inventions" are true. He does not tell his readers about the research done on this subject by J. Borkin and Charles A. Welsh in "Germany's Master Plan" or by Gunter Reimann in "Patents for Hitler," who have carefully analysed official American documents; he does not mention the contributions of such outstanding authorities as Thurman Arnold or Wendell Berger. After a careful study of his book one is left with the sorry conclusion that a treatise on the economics of patents is more needed than ever.

Soviet Trade

"Soviet Foreign Trade." Alexander Baykov. Princeton University Press. London: Geoffrey Cumberlege. 100 pages and tables. 11s. 6d.

DR. BAYKOV's position is unassailable. He knows his facts better than any reviewer; and it is impossible to criticise his views on policy, because he carefully avoids discussing them. Even his factual discussion reaches only to the point at which awkward questions begin to arise.

Just how, for example, are the political and economic factors which he enumerates weighed up together in the Ministry of Foreign Trade, and how do the results differ from those which might have been reached by free marketing plus the pressure of interests in a system like the British? Would not a more gradual adjustment of foreign trade in the late 'twenties and early 'thirties—that is, an adjustment brought about by mainly economic forces and not by political planning—have been of more service to the Soviet Union than the policy actually pursued? Was separate bargaining by different Soviet agencies in the same foreign markets in the early days of Soviet trade policy the disaster to Russian interests which it is now officially assumed to have been? What is the evidence for believing, as Dr Baykov apparently does, that the USSR will presently abandon its politically inspired insistence that what can be made at home within reasonable time-limits ought to be made there, irrespective of cost? Was the allegedly legendary dumping by the Soviet Union in the late 'twenties and early 'thirties not in fact, on Dr Baykov's evidence, a case of appalling commercial incompetence and of unwillingness to adapt a political plan to the facts of the commercial situation? And was the inconvenience caused to other countries not almost as blame-worthy as if it had been due to deliberate malice? Was discrimination against the Soviet Union in credits and similar matters in the early days entirely the fault of the reactionary West? And does recent experience in Eastern Europe suggest that the political and economic influence of the Soviet foreign trade monopoly on other countries will remain as small or innocuous as Dr Baykov suggests?

The reader must answer these questions for himself; what he will get from Dr Baykov is little more than a bare recital of facts—useful facts, certainly, especially for the historian, but facts whose barrenness destroys a regrettably large part of their value.

Correction.—In the review of "Industrialisation of Latin America" last week the figure of \$4,000,000 should have read \$4 billion.

TI

back their beliefs

TI, with confidence in Britain's future, have staked six million pounds of their own resources on the belief that the country's great reserves of technical skill and 'know-how' offer an effective answer to the difficulties ahead.

The finest skill demands the best equipment, the most efficient processes. That is why TI Companies are now tearing out and replacing old plant, reorganising production methods, acquiring new works, turning to account the lessons of the war.

This wide programme of reconstruction has been planned as a coherent whole, each part fitting, jigsaw-like, into one picture. Its realisation will mean more TI products for the world markets, of TI standard, but at prices to meet overseas competition on equal terms.

Their plans are being pushed ahead with all energy in readiness for Britain's second D-Day, the passing of the Seller's Market—which TI expect sooner than later.

TI is a team of engineering industries which serve in more ways than may be realised. The component companies have made their own reputations in the fields of precision tubes, bicycles, electrical appliances and cables, wrought light alloys, pressure vessels, metal furniture and paints—the whole is TI.

AMERICAN SURVEY

Spring Strikes

(From Our US Editorial Staff)

NOW that April's here, the question of recent months—another round of strikes?—has changed its form to: "How big and how long will this round be?" For another round of stoppages is certainly under way, and the total of stoppages and threats of stoppage is already large.

The most conspicuous walkout is that of the telephone workers, which is reported to cover more than two-thirds of a work-force of 600,000, and constitutes the first nationwide strike by this group—though one was barely averted last year. The basic issue is more pay, accompanied by a number of other points, including industry-wide bargaining. In this case, unlike earlier controversies in other industries, there is no question of excessive earnings by the employer, for the Bell system has paid the same dividend to its stockholders for 25 years and for a number of recent years has only barely, or not quite, earned the dividend. Telephone service has not been significantly impaired in areas served by automatic telephones (the dial system), usually the central parts of large cities, though there is much question how long this complex mechanism will continue to perform without repair. Service in suburban and small town areas, along with inter-city or toll service, was largely shut off. However, emergency calls were usually put through by company executives or union personnel. The telegraph companies, of course, did an enormous business.

Scarcely less conspicuous was the work stoppage that Mr John L. Lewis contrived to bring about in the soft coal mines in his ill-tempered and vindictive struggle with both operators and government. Barred by the recent court action from threatening or calling his usual April 1st walkout, he found a subterfuge in the Illinois coal disaster which killed 111 miners. First, a week of mourning was called, then the union chief declared virtually all mines unsafe, or possibly so. The action is clearly a subterfuge, and the courts recognised it as such, refusing to release the partial refund of the union's fine until compliance with the Supreme Court's decision is sincere. By mid-April a considerable proportion of the miners were back to work as Mr. Lewis suddenly discovered many of the mines were not so unsafe as he thought a few days earlier. But the future status is very unclear, with another crisis probable not later than July 1st, when the government expects to return the mines to their owners.

While these two major stoppages were in progress, other large strikes appeared to be near. The deadline for negotiations in the steel industry is April 30th, and the press reports that a strike now seems somewhat more likely than not. The companies refuse to negotiate on wages until Congress determines the size of their contingent liability on "portal-to-portal pay." Negotiations are under way in the automobile industry, which may bring a halt in one or more of the large companies at any time. Workers—or at least the union leaders—are restive on the railroads and in other industries. Even the recent rubber contract, greeted as evidence of constructive moderation, will

almost certainly be revised if other unions set a sharper pace. The major immediate cause for the present troubles and unrest is the increase in prices resulting from the spurt in quotations in the first quarter of the year. Labour was already disturbed by the rises following the end of price control during the latter half of 1946, but then a plateau seemed to be reached. But the 7 per cent rise in wholesale prices in the early months of this year is touching off trouble again. (The cost of living index, which is heavily weighted by such items as the cost of utilities and rent, and is laggard in movement, has remained quite stable and is therefore brushed aside in current discussion.)

The preponderant part of the price increase has, of course, been in foods and farm products, for which industrial employers are not responsible and from which they do not profit. But this is much too reasonable an objection to receive attention other than from a few economists, and so does not enter the controversy. However, 1946 corporate earnings reports indicated profits at a level which in many cases was regarded, even as far to the right as Wall Street, as thoroughly indefensible. Though return on net worth in the aggregate was still below that received in 1928 and 1929, it exceeded the returns of 1941, and in at least one line of business, distilling, reached the fantastic figure of 42 per cent.

Repercussions set off by the stoppages and the price rise are numerous. Labour legislation was brought to the forefront again in Congress, and the probability of greater severity enhanced. The state legislature of New Jersey passed, in just four hours, a vicious law providing fines and imprisonment for strikers in public service industries—which the striking telephone workers defied. Operators in Virginia and Indiana, which have similar but less drastic laws, remained on the job, but prefaced calls with announcements that the laws were unconstitutional.

Prices received major attention from the government. Following the President's recent request for lower prices "to make free enterprise work"—significantly not aimed at farm prices where the bulk of the rise has occurred—a cabinet meeting was held at which prices were discussed with the Council of Economic Advisers. At his press conference the following day the President placed the responsibility for price reduction squarely on business, repeatedly hoisting business interests on their own statements made when they demanded the end of price control last fall. He stated flatly that wages will have to be increased if prices go higher. While he said nothing about the fiscal and monetary policies so greatly contributing to inflation, the monetary authorities too, apparently, are re-examining their position.

The real problem with which the United States is struggling, and which all public figures apparently feel, with Herodotus, that it is not fit for men to speak of, is allocation of resources. Domestic and foreign claims for goods and services are larger than the supply which can be produced. This might be true even if production were not impaired by the numerous obstructions including work stoppages, and even if the demand were not accentuated by devotion to slogans of high purchasing power and low interest rates which serve only to aggravate inflation in a condition of boom. Until this disequilibrium is recognised and corrected, either by forthright rationing or the traditional rationing of the price system, the end of unrest is not in sight. And the gentlemen in Washington have a profound disinclination to tackle either approach to the problem.

American Notes

An Innocent Abroad

When, as Secretary of Commerce, Mr Wallace attacked the foreign policies of Mr Byrnes, the chief victim was Mr Wallace himself, and the second the party with which he is nominally aligned. In his tour of Britain as a private citizen Mr Wallace has exercised to the full the right of free speech he gained by being kicked out of the Truman Cabinet, with very similar results. Nothing in his speeches added materially to what was already known of Mr Wallace's views; to have expressed them at home would have caused hardly a ripple. It is only the fact that they were expressed in a foreign country that has stirred up a hornets' nest. From as far left as Senator Hill to the extreme right of the Republican Party there has been a surge of indignation at the spectacle of a former vice-president of the United States attacking the policies of his country while abroad. Mr Wallace, for his own sake, and the sake of the policies he believes in, might have done well to reflect on the sad fate in the past of American Ambassadors to Britain suspected of nothing more heinous than a sympathy for the British way of life. What is particularly irritating in Washington is the suspicion that, in foreign countries, Mr Wallace is given credit for representing a much more substantial section of American opinion than in fact is the case.

For President Truman and his advisers the spectacle of Mr Wallace once more kicking over the traces is a source of additional political embarrassment. In the current effort to recondition and streamline the Democratic machine for 1948, Mr Truman, only a few days before Mr Wallace's first utterance, expressed the cordial belief that both Senator Pepper and Mr Wallace, the mavericks of the party, would support the party in its coming campaign. It now looks as though Mr Wallace's support would be a liability to the new model far outweighing any votes he may be able to control. It is significant that on the subject of the Truman doctrine, Senator Pepper, who is closer than any Democrat on Capitol Hill to Mr Wallace, has expressed his intention of supporting the President, and has repudiated any suggestion that he might abandon his "ancestral home" in the Democratic Party. Mr Wallace becomes more and more isolated by his energetic attempts to saw off the branch on which he is precariously perched.

One of the most piquant things about Mr Wallace's visit is that this is the first time a prominent American politician has sought to gain sympathy in Britain for a policy he has been agitating for in his own country. The friendship between Mr Wallace and the Labour rebels is an entangling alliance indeed. The emulation of other politicians opens up the possibility of Congressman Cox coming over to share the plaudits of the Orpington diehards with Sir Waldron Smithers, and Senator Fulbright beaming from the platform of the next Liberal Assembly, standing arm in arm with Lord Samuel and Lady Violet Bonham-Carter, as the fraternal delegate from Arkansas.

The Price Spiral—

Continuance of industrial activity at a level far beyond all previous peace-time peaks has so far failed to shake the very widespread impression that a substantial setback is still to be expected at some time in 1947. Earlier predictions have been falsified by events. In the autumn of 1945, for example, it was generally held that reconversion and transition problems would bring severe unemployment by the early summer of 1946. And when the Price Control Act became impotent last summer, there was again the general view that the inevitable boost in prices could not last for more than a few months, and that this spring would bring the end of the boom. On many occasions in recent weeks, as the upward trend again got under way, Federal Departments have warned industry of the lack of balance in the price structure. And though the Council of Economic Advisers has made no formal proclamation since the January report to the President, they are known to be of the opinion that the price spiral has now reached very dangerous proportions.

Not many days ago, therefore, the President repeated his earlier warnings on the dangers of a business slump, this time reinforced with the declaration that control of the price structure was entirely in the hands of industry, and that the absence of downward price revisions must enforce labour's claim to a greater share in current profits. In other words, the President went on record as declaring that labour would enjoy at least the moral support of the Govern-

ment in pressing further wage claims if industry is unwilling to revise present price-lists.

Within the general terms of their diagnosis, the President and the Council of Economic Advisers do not differ greatly from spokesmen for industry. Private gross capital formation has shown a tremendous increase since 1945, the annual rate then being below \$7 billion, while that in the fourth quarter of 1946 was not so very far below \$40 billion. Over that time, private constructional expenditures enjoyed a fourfold expansion, while business expenditures for machinery and equipment rose by 150 per cent. Moreover, inventory and export surpluses have made a very substantial contribution to activity. On the other hand, the output of consumer goods has also been rising, and while wage rates have risen quite sharply since the end of the war, there can be no doubt that consumer incomes have for some time past lagged badly in terms of living costs. The Council of Economic Advisers thus holds that a potential "deflationary gap" to the tune of perhaps as much as \$10 billion at annual rates is beginning to show itself (initial evidence cited is the disappointing trend of retail sales in some centres, plus a certain amount of slowing-down in the accumulation of business stocks) and may well develop rapidly from this point onwards. For the President and the C.E.A., a reduction in business profits, or present prices with a fresh boost in wage rates, are seen as alternative means of stretching consumer incomes, and thus preserving activity near current levels without an inflationary spiral.

* * *

—Industry's Views.

Beyond diagnosis, however, industry, or certainly a very large section of industry, is not willing to meet the President. Industrial profits, admittedly, are now relatively large—an inevitable feature in a free economy which has for some time past hovered around the point where effective demand is stretching the available labour force, and has in very many commodities outpaced producers' capacity for some way ahead. Gross business income for 1946 more than doubled the 1939 level at \$45.5 billion, while the net balance showed a threefold expansion at \$12 billion. But, even making allowance for a substantial advance on the 1946 rate, and due adjustment for the changed price structure, there is not a tremendous scope for wage adjustments at the expense of profits with a national wage and salary list that totalled \$106 billion in that year. A few manufacturers have been bold enough to announce general price revisions. But in general, the hesitation to follow this line probably follows as much from prevailing uncertainty concerning the length of the present boom, and still more strongly from fears of a fresh turn to the spiral through wage demands, as it does from the undoubted inclination in many quarters to get whatever can be made from current prices.

The bald fact seems to be that in the present situation, the direct influence of such moral suasion as the President is now trying, is not likely to be very great. And while Mr Truman and the CEA may be perfectly correct in their assumption that only an increased propensity to consume can, in the longer run, serve to sustain present business levels, it seems far more likely that, immediately, they may give a fresh hoist to the price spiral, if only because their support for organised labour stands the chance of being far more effective than the rod reserved for industry. If government could afford to ignore the claims of the unions at this point it might easily witness the return of conditions sufficiently competitive to restrain any undue profits at no very distant date.

Quite obviously, however, there can be no certainty that peak price levels have yet been reached. A turn might conceivably follow from a fresh outburst of labour unrest, or again, sentiment might be affected sharply later in the year by a continuance of bumper crop advances and a substantial downturn in the prospective farm cash income. It has, in fact, been said with a great deal of justice that the 1947 boom "follows Chicago and not Wall Street." Certainly the rise in farm incomes from an annual rate of \$8.7 billion to probably \$28 billion at current levels is an experience which might well be envied by the financial com-

munity in New York. And this month has brought further evidence of the investment community's entire unwillingness to discount prosperity, with Wall Street values still a long way below pre-war peaks despite the rise in business profits, and the sustained reduction in interest rates over the war period. Preliminary figures of the Commerce Department show a new peak annual rate of \$15 billion for net corporate profits over the first quarter of 1947.

*

In the meantime, decisive action by the Administration does not seem to be in prospect. There have been suggestions that the Commerce Department would revive the wartime organisation of industrial committees in an endeavour to ease the price structure industry by industry, but no responsible agency seems to have been converted to this theory. In fact, the direct powers of government in this context are now quite negligible, and the Presidential statement on prices was itself accompanied by rumours that the Cabinet is sharply divided on the issue of how far it is safe to "knock" business at this juncture without bringing down a deluge. Another fact of very considerable significance is that no step has yet been taken to "de-frost" the structure of short-term money rates. Though of minor importance in terms of inflationary pressure, such a step might now have some value as an indicator of the government's concern over the continuing price spiral. And in no official quarter is there any suggestion that the Reserve Board Governors have modified their earlier opposition to any wider revision of interest rates.

* * *

Cuts in Federal Departments

(From our US Editorial Staff).—Congressional aspirations towards economy in the operation of the Federal Government have been translated into actual figures. As a result, lights burn long these nights in the executive departments, and faces are still longer.

Ever since the Republicans' post-election statements on how they would reduce government spending, the departments had anticipated cuts. But as time went on those whose Congressional fences had been kept well mended had forecast that reductions would be

of manageable proportions, and mitigated by supplemental appropriations after a face-saving budget had been passed. The inaccuracy of predictions is illustrated by the present not-too-exceptional plight of the Department of Labour. Like a number of Federal departments, Labour's budget consists of funds for its own operations, plus much larger funds for transmission to the states for co-operatively administered activities. The department's total funds for the current fiscal year amount to \$113.7 million. The requested budget for 1948 was \$103.6 million. (The drop was due to the recent transfer, on Congressional order, of the US Employment Service back to the states.) The Bill brought out by the House Appropriations Committee provided \$90.9 million. Of this, \$71.7 would go to the states (which is where Congressmen come from). Only \$19.1 million remained for Washington operations, 40 per cent below both the budget request and actual appropriations for 1947.

The Bill required a cut of 20 per cent in the office of the Secretary of Labour; 30 per cent in the office of the solicitor. In the Conciliation Service, whose head has become a controversial figure in the current swing to the right, it is specified that the posts of the director, his 7 regional directors and their assistants, and certain other top personnel, be eliminated. (This phrasing avoids the appearance of a Bill of attainder, but leaves the pyramid to operate on its base alone.)

Under the Bill as brought from committee the Bureau of Labour Statistics was to receive \$3,373,000. But a further million-dollar cut was inserted on the House floor. The Bureau's budget is now 60 per cent down. Unless a considerable part of these funds are restored, most of the indices which the BLS compiles will be issued only on a quarterly or annual and national basis, instead of the present weekly or monthly and city, state or regional basis. Yet up to date, local figures are the ones of most use in present circumstances: during the 1930's national averages were important in connection with the preparation of basic legislation like the Fair Labour Standards Act; but to-day, the figures most wanted are specific findings, localised by occupation and by place, as criteria for specific wage negotiations. These facts are being discreetly brought to the attention of the public by the BLS. The response is considerable, in editorials and in representations to Congress by interested firms. What the House has taken away, the Senate may in some degree restore. It is an odd game, and most departments are now intently playing it.

THE WORLD OVERSEAS

Preliminaries in Geneva

(From Our Special Correspondent)

THE second session of the Preparatory Committee on Trade and Employment has now passed the stage of inaugural speeches. This is normally a somewhat barren period in international conferences, for the delegates are talking less to each other than to their own public at home and to the press of the world. But on this occasion the inaugural speeches have been significant and important. Every delegate who has hitherto mounted the steps of the rostrum in the magnificent assembly hall of the Palais des Nations has been concerned as much with reservations to the proposed charter of the International Trade Organisation as with his basic agreement with the wider objectives which this conference is to serve. The Australian delegate, Dr Coombs, pleaded his familiar theme that any code of commercial behaviour must be subservient to the objective of maintaining high and stable levels of demand and employment in the world. Dr Coombs, however, was prepared to admit that, in present economic conditions, full employment policies had lost some of their links with the forces that had given them birth. For many years there could be no question of lack of effective demand leading to depression and unemployment. Just because for some time to come there might be an excess of demand over supply of goods, Dr Coombs saw in the present conjuncture a favourable opportunity for reducing tariffs.

Sir Stafford Cripps drew special attention to the importance of maintaining imperial preference in some form, pointing out that these preferences were merely the expression of an economic fact—namely, the interdependence of the economies of the United Kingdom and the other members of the Commonwealth. He made it quite clear in the course of a press conference that even if the United States went to the inconceivable length of cutting tariffs by fifty per cent, which is the present legal limit of their concessions, this would be regarded by the British Government as an insufficient consideration for the complete elimination of imperial preferences. But on Wednesday Mr Winthrop Brown told his press conference that, on the basis of 1943 figures, American tariff cuts might work out as high as 75 per cent. The maintenance of imperial preferences was even more forcibly demanded by Mr. Walter Nash, the head of the New Zealand Delegation. The South African, Mr J. E. Holloway, spoke of the secondary industries which the Union is erecting behind the protection of substantial tariff walls and expressed his determination that the development of such industries should make further headway. The French delegate spoke of the shattering of his country's economy as a result of the war and argued that, if bilateral agreements made possible the piecing together of any two of the fragments, then bilateralism would be justified. And so the tale went on, one speaker after another, preaching to the text that all instruments of commercial policy must be judged by their effects and not in accordance with a rigid philosophy of international trade.

The Test Ahead

The test, however, is only likely to come at a much later stage in the discussions. The inaugural speeches having been delivered the eighteen nations represented here are now trying to begin with the Americans negotiations on reductions of tariffs and preferences. It is only after these have been largely completed that the conference will enter upon its second important task. This will be the completion of the ITO charter, and the negotiation of preliminary agreement, by which the eighteen countries will hold themselves bound by this charter.

The tariff and preference negotiations began in fact some weeks ago when a number of the countries represented here compiled lists of goods in the export of which they are interested and for which they ask reductions of tariffs from the other countries. Some of the eighteen have not yet presented their schedules of demands, but the most important, namely those of the United States and Great Britain, have been drawn up. These highly confidential documents provide the material on which negotiations can begin. Each country is also compiling a schedule of tariff

and preference concessions which it is prepared to make. These schedules of demands and offers will be the basic documents for the tariff negotiations. In the first instance, the negotiations will be as between pairs of countries. When bilateral agreement has been reached in each case, the concessions exchanged will then be "multilateralised" and extended to other countries through the agency of the most-favoured-nation clause.

Never before have multilateral tariff negotiations of this kind been attempted and the complexity of the procedure in generalising what might be 153 bilateral agreements (half of 18 multiplied by 17) can readily be imagined. The task will be simplified by concentrating the bilateral negotiations between pairs of countries between which a substantial volume of trade is done. In effect this will mean that most of the discussions will in the first instance be as between the United States, on the one hand, and the other seventeen countries on the other. The mutual concessions which can be obtained from these seventeen bilateral sets of negotiations should set the pattern for the whole range of agreements that will be reached at the Geneva meeting.

Britain's Special Case

Although the tariff negotiations will stand apart from the final drafting of the charter, which will mainly occupy the second part of the conference, the two stages will inevitably become intermingled. It will be necessary to interpret and clarify certain passages of the draft charter before tariff and preference negotiations can make much headway. One case in point is the provision in the draft charter that "negotiated reductions in most-favoured-nation tariffs should operate automatically to reduce or eliminate margins of preference." The report of the first session of the Preparatory Committee pointed out that "three delegates thought that the rule should not apply automatically," and this difference of opinion will have to be composed before real progress can be made in the crucial negotiations between the United States and the countries of the British Commonwealth. That the latter provided the three dissentients is as certain as that the United States were the authors of the demand for "automaticity." If the Americans have their way, preferential rates must remain unchanged until the corresponding general tariff rates have come down to their level. The British and Dominion delegates, on the contrary, are opposed to this clause, which might well eliminate certain preference margins which it is desired to maintain, even in attenuated form. The Commonwealth representatives will certainly demand freedom to negotiate reductions in preference rates as well as in general tariff rates. There must, therefore, be some clarification of this point at a very early stage of the tariff negotiations.

Just as the charter discussions may impinge on the tariff talks in the first stage of the negotiations, so it may well be that the tariff talks will be carried over into the second stage of the conference. It would be the height of optimism to assume that general agreement on tariff and preference reductions will have been reached at the end of the four weeks provisionally allotted to the first stage of the discussions. When the second stage is reached, however, the main emphasis will be on charter discussions. It is already evident that the main issue will be the question of non-discrimination. It will probably be the main concern of the British delegation to obtain some liberalisation of Article 28 of the report of the first session of the Preparatory Committee, which deals with exceptions from the rule of non-discrimination. In particular it should be the endeavour of the British delegation to except from the rule transactions which, though of discriminatory character, can be shown to contribute to the quantum of world trade and to increase it beyond the level at which it would have stood had the rules of non-discrimination applied. If success can be achieved in this respect, and if the resultant clauses of the ITO charter can be substituted for Article 9 of the Anglo-American Agreement, which provides for non-discrimination against American goods, the most glaring and damaging defect of that agreement will have been remedied.

Inflation in Austria

[FROM A CORRESPONDENT IN VIENNA]

IN Austria to-day the word "inflation" is rarely heard. Yet dangerous inflation clearly exists, although it has not yet assumed that uncontrolled form which it possessed in 1922. Seven years of Nazi exploitation followed by a senseless vandalism in the days of escape, the effects of bombing and fighting in the most industrialised areas, and the confusion of the first post-war days caused so much destruction and dislocation that to-day more than half the industrial establishments work at less than half of their peace-time capacity. In addition, the currency circulation increased about six-fold in the war period, from a monthly average of 849 million S. in 1937 to about 5,000 million S. in 1945.

The Austrian Government thus inherited a situation charged with an explosive inflationary potential which had been kept in check only by the severely enforced price and wage-stops and general economic controls of the Nazi period. The obvious task was to prevent an explosion by keeping the controls and at the same time reducing the inflationary potential through stimulants to production and reductions in the volume of currency in circulation. This has indeed been the declared policy of the government, but only half-hearted measures have been taken.

The fuel crisis of the past winter has made the situation worse. Production, which had steadily recovered during 1946, suffered a sharp set-back. In January, 2,280 firms employing 90,000 workers were closed altogether, while many others were only working short-time or on maintenance. Even now, when the thaw has improved the situation in the hydro-electric works and firms can start production again, it is still to be expected that the loss of production in the winter months will lead to numerous hold-ups in the whole production machine through lack of raw materials and spare parts.

While the volume of production has not sufficiently increased to reduce the inflationary gap, and has actually decreased during the winter months, the currency circulation has continued its upward trend.

CURRENCY CIRCULATION
(Million Schillings)

		Increase
1937 (Monthly average)	849	...
1946 September	5133	...
October	5149	16
November	5282	133
December	5561	279
1947 January	5652	91

The decline in the rate of increase in January is misleading, because it occurs in a month which normally shows seasonal decline in the currency circulation. Things have been made worse by the fact that, in order to improve the liquidity of the banks, the National Bank have set free some of their accounts which had been frozen in the course of earlier currency measures.

This growing inflationary pressure could not be held in check by a government which was not prepared to maintain a very strict enforcement of controls. So, at first prices and then wages have risen considerably during the past year. Taking August, 1945, as 100, official food prices had risen to 157.6 in December, 1946, and prices for tobacco, beer, etc. to 366.1. But even these increases were by no means sufficient to absorb the greatly increased currency circulation. With controls as weak as they were, a black market developed and now flourishes practically in the open. In fact, prices in the black market have actually fallen. Again, taking August, 1945, as 100, black market food prices were down to 27.5 in December, 1946, and those of semi-luxuries to 15.2. Even at this lower level, black market food prices are still about fifty times the official price.

This fall in black market prices is probably due to a number of causes. Partly it is just a consequence of its more open working, which has reduced the risk and "know-where" premium. Then domestic agricultural production has recovered much more quickly than industrial production—last year's wine harvest was a bumper one—and this has led to increased supplies for the black market. And, finally, large numbers of workers and employees, whose current wages are far too small to allow them to buy in the black market, have exhausted their savings and can no longer afford to supplement their meagre rations.

In a world "full of shortages" reconstruction in Austria would be difficult in any circumstances. The currency chaos makes it worse. The erratic prices and the consequent opportunities for profit in the black market attract an undue number of people into this sector of the economy. The lack of an adequately controlled distribution of the scarce essentials means that almost

everybody has to spend much time and energy hunting for this or for that.

A currency reform would have to bring the volume of currency into some relation to present output possibilities. This would necessarily hit somebody's savings, probably those who made the biggest profits in the Nazi period or in the black market. Yet the government are still hesitating to take this step. The neighbouring government of Hungary have shown that even an occupied country can carry out a successful currency reform. If Austria hesitates much longer, its industrial structure, trading position, and reconstruction effort will suffer distortions which it will take a long time to repair.

The British Zone as Partner

[FROM A CORRESPONDENT IN STUTTGART]

THREE months have passed since the fusion of the British and American Zones of Occupation in Germany took place. In both zones it was welcomed as a bold and necessary step towards greater economic unity and strength. Balancing one zone against the other, it looked at first as if the greater agricultural potential of the American Zone and the greater industrial and power-producing capacity of the British Zone would supplement one another with their respective surpluses. The fusion seemed to offer a provisional solution of German economic problems, with great possibilities of spreading assets and liabilities.

In this first quarter of fusion the emphasis in all matters has been on administration and organisation. The creation of *Länder* in the British Zone brought its administrative methods more into line with those of the American Zone. The setting up of new bi-zonal administrative offices for economics, transport, communications, finance and food raised entirely new political and functional questions, which could not be solved in a day or two and needed the intervention of the Military Government authorities.

The situation which led to fusion was largely determined by economic problems, and the newly-created Administrative Council for Economic Affairs set up in Minden occupies a key position and can decide the success or failure of fusion. It was in this office that the first co-ordination of administrative and party political objectives was carried out. As a result of the elections in the *Länder* of both zones the economic ministries were in the hands of the SPD, and it followed that the Social Democrats demanded the leading position at the head of the bi-zonal machinery. It was given to the chief economic expert of the party, Dr Viktor Agartz, who had already been head of the central economic department for the British Zone. The former Economics Minister of Greater Hesse, Dr Mueller, who had come to Minden with many matured plans and practical targets, had to leave. This change was regretted, especially in the American Zone.

Suspicious of the South

The creation of the new bi-zonal bodies must involve a decline in the importance of the councils of the *Länder* in the American Zone, which have seen some of their tasks taken from them. The question then arose whether the bi-zonal bodies would carry out legislative functions while executive functions were left to the *Länder*; the question was answered, at least provisionally, when at the end of March legislative decisions were reserved to Military Government. This has raised the further question whether the German departments have made the best use of their opportunities. Obviously the bi-zonal departments have a very imperfect basis in law, but it is probable that the growing political individualism of the South German *Länder* prevented them from making the best use of the possibilities they had. In both zones opportunities for shaping the economic future have fallen to the bi-zonal Economic Council. If even more powers of legislation and regulation were transferred to it, the control of bi-zonal planning might be so concentrated that an economic policy dominated by the views of the "Government Party" of the British Zone might involve the danger of a kind of economic dictatorship. There is no question, of course, of administrative dictatorship, and it may be that the distrust which is shown in the American Zone springs not only from old economic and social contrasts between North and South Germany, but also from reluctance to tie the relatively seaworthy ship of the American Zone too closely to the more battered and helpless British Zone.

The two zones reacted very differently to the ordeals of the past winter. In Germany the catastrophe of the last few months was not the result of irresistible natural forces, but the direct consequence of economic and social helplessness. The crisis began at the same moment as zonal fusion, and this accounts

partly for the critical view which is taken in the American Zone of its new partner in distress. In spite of the greater industrial power of the British half, it is now regarded more and more as economically more static and helpless. The economic task of the bi-zonal councils is increasingly regarded as the spreading of the one surplus which both zones can offer—namely scarcity. The earlier hopes of a quicker and wider development of industrial production based on increased coal production are already being abandoned, and with them expectations of any considerable improvement in the supply of Ruhr industrial products to the American Zone. But the industrial north is still hoping for increased food deliveries from the South.

Prospects for Production

What increase in production can fairly be expected? From May 1st next distribution of Ruhr coal will be managed by the Germans themselves. With a yearly output of 70-75 million tons (excluding consumption in the pits) and after deducting exports, the needs of the Occupation Authorities and deliveries to other zones, there will remain for industrial production in both zones only sufficient coal to achieve a production level ten per cent below that of October, 1946. The relevant estimates are given below:

ESTIMATED DISTRIBUTION OF RUHR COAL—1947	
	Mill. tons
Exports and occupation needs	22.8
Russian and French Zones	6.0
Transport	10.0
Hospitals and official buildings	1.7
Food, agricultural and fertiliser industries	9.0
Basic industries (iron and steel)	6.7
Manufactures and domestic coal	14.8
	71.0

Last month in the American Zone industry reached its highest production since the end of the war with about 50 per cent of the output of March, 1938. It can hardly be claimed that zonal fusion yet shows any economic results beyond the general encouragement which it gave at the beginning of the year. It is probably too early to expect such results, as the effects of the winter catastrophe have not yet been exhausted.

It is well known that the British Zone is even less able than the American Zone to feed itself. The creation of a bi-zonal food department can admittedly help to solve the food problems of the north, but not decisively. Imports must go on. But long-term planning to cut out periodic crises must provide for much closer, franker and more continuous co-operation between the occupying authorities and the German officials than has been allowed so far. The recent food crises in the Ruhr can be regarded as the direct result of the bi-zonal officials having no knowledge of the overall plan of organisation. This defect has often been pointed out by the Germans, but they have only met with an optimistic Micawber attitude.

Lack of Raw Materials

One cannot see yet in the British Zone a starting-point for the free development of individual or collective enterprise. The integration of the key products and semi-finished goods of the British Zone with the production of finished goods in the American Zone, has not yet been sufficiently stimulated to make possible the general expansion of production in both zones which is being aimed at. The efforts to export—which at first received lavish publicity in the American Zone—are carried on in the British Zone behind a curtain of hints, guesses, organisations and rumours. One even hears the old rumour of cases of German butter being sold in British shops.

The success of German efforts to export depends not only on production in the British Zone but also on the size of the available stocks of non-ferrous metals. These stocks, left over from past years, will soon be used up. The question of when they will be increased by imports is the second most vital one for the export industries of both zones. It was the main topic of a conference in the first week of April between German foreign trade exports of the two zones held in Stuttgart.

The way the British zonal partner has fared so far has disappointed many hopes. The futility of many efforts made, the numerous imponderables which weigh on everyone, the lack of continuity in the contacts between Occupation Authorities and German departments is creating in the British Zone an atmosphere more like that of the Russian Zone than that of the American.

VIKINGS TO EUROPE

From April 21 BEA Vikings, Britain's most famous twin-engined airliners, will speed the regular services between London and Copenhagen, Gibraltar, Madrid, Oslo, Prague and Stockholm. Sister aircraft to those chosen to form the 'King's Flight,' they will reduce flying times while adding immeasurably to flying comfort. Month by month, more Vikings will be coming into service until all BEA routes between London and the continent are Viking routes

The Budget Accounts

THE wider aspects of Mr Dalton's Budget are discussed in the leading article on page 569. This article examines the Budget in greater detail, is concerned with fact rather than policy, and is mainly "for the record"—for the benefit of the Arthur Bryants of the future. As usually happens, the Budget in detail proves to be less satisfactory than it is in the round, and its accounting has this year become more curious than ever. On his own accounting principles, Mr Dalton was confronted, on the existing basis of taxation, with a prospective "ordinary" surplus of nearly £248 million in 1947-48. But, "this being a good year for a good surplus," he proposed tax changes which, on balance, were expected to provide £22 million of additional revenue. Ostensibly, therefore, he is budgeting for a surplus of almost £270 million, as the accompanying table shows.

The Surplus Examined

In global terms, the estimates of normal items of revenue upon which this calculation is based differ little from those given in these columns recently, though there are appreciable divergences in detail. Both the estimated expansion in Customs and Excise and the estimated fall in EPT and Profits Tax are rather larger than had been generally expected. Purchase tax, on the existing tax basis, was put at £260 million (up £79 million) and tobacco at £450 million (against £446 million). Customs and Excise as a whole were expected to produce £116 million more. On the other hand, the yield from EPT and Profits Tax was put at only £200 million—a decline of £157½ million.

The dislocation caused by the fuel crisis is not expected to affect revenue significantly this year, but will affect revenue next year, through its impact upon industrial profits. In the current year, the buoyancy of the national income is expected roughly to offset the effects upon income tax of the concessions granted in earlier Budgets.

Big Windfalls

The unexpectedly large surplus, on the Chancellor's reckoning, thus arises entirely from heavy non-recurring receipts.

Sales of surplus war stores and surpluses from Government trading operations, which together produced £215 million in 1946-47, are expected to fall by only £65 million this year, to £150 million. In addition, Mr. Dalton expects to secure no less than £250 million more from miscellaneous receipts than he budgeted for a year ago. These windfalls will come principally from sums voted in previous years but not expended—£112 million "from paymasters and quartermasters all over the world," £23 million from the UKCC, now being wound up; £18 million from surplus appropriations-in-aid, and £10½ million from NAAFI. Hence Mr Dalton's estimated surplus of £269.6 million is neatly balanced by £270 million of miscellaneous revenue mainly comprising the return to the Exchequer of monies previously issued and now lying idle.

Below-Line Expenditure

In no sense, therefore, can the balance on the account be regarded as the "real" surplus which Mr Dalton claimed. Indeed, if the receipts from surplus stores and trading are excluded, on the grounds that they are non-recurring revenue, there would be a deficit of £150 million. In addition, the whole programme of expenditure inevitably includes further heavy outlays "below-the-line." War damage payments during the year are expected to require £330 million—£60 million under the Business and Chattels schemes, £170 million for "value" payments (including the increases recently conceded, and accrued interest) and £100 million for cost-of-works payments. EPT Refunds will require £60 million, and this will virtually complete the payments now outstanding. Release of the remaining post-war credits due to elderly folk will cost £70 million. In addition, at least £200 million will be borrowed by the Treasury for housing and other capital schemes of local authorities financed through the Local Loans Fund, and £90 million will be borrowed for temporary housing. Some £50 million will be advanced to the National Coal Board; but

REVENUE (£'000's)				
	Budget Estimate 1946-47	Actual Receipts 1946-47	Estimates for 1947-48

the other public boards, such as Air Transport and Electricity, will in due course finance themselves by issues of their own Treasury-guaranteed stock. It should perhaps be added—though Mr Dalton did not mention it—that part of the direct tax revenue upon which he counts has in fact been already received, in that there will certainly be a further repayment of Tax Reserve Certificates in the current year.

Small Savings

The expected contribution from small savers is again "written into" the overall Budget, but this item (as a Note on page 600 records) is at last put on a realistic basis. The Chancellor counts—somewhat optimistically—upon small savings of £366 million, compared with £330 million in 1946/47. On the other hand, £160 million of 3 per cent Defence Bonds will fall due for repayment.

The Chancellor claimed that his budgeted surplus, together with net small savings, would "much more than cover" such "below-line" expenditure as is not incurred for the creation of new capital assets. It may indeed be true that "all further internal Government borrowing this year will be either for replacement of maturing debt or for definitely new capital development," and "none of it will be merely to bridge a gap between current income and expenditure"; but it is important to realise that this position is no measure of the extent to which the Budget is anti-inflationary in its effect. To assess that, it is necessary to bring into the reckoning the extent of relief afforded by the deficit on the external balance of payments, and then to relate the resultant Exchequer position to the demand for finance for priority capital outlays, in the national economy as a whole, which are not met directly or indirectly from the Exchequer.

Incentive Reliefs

Given this shape of the overall Budget, and given, too, the curious accounting which Mr Dalton chose to adopt, it would indeed have been rash not to budget for a surplus. But it ought to be pointed out that a real surplus of this magnitude could not have been achieved without recourse to a deflationary policy of the kind which Mr Dalton so deplored. As it is, all he has done is to bring into the reckoning purely nominal revenues which even he in effect recognised had no relevance to policy. The scope for the necessary "incentive" measures of relief was therefore relatively small. That being the case, it was inevitably confined to income tax, which the Chancellor rightly regarded as the most eligible candidate in the eyes of the public. To have reduced the standard rate would not only have absorbed a larger sum than could readily be financed by increases in other taxation, but would have spread the relief over a wider range—including unearned incomes—than was desirable for the purpose of achieving the maximum incentive effect from limited outlay. The proportion of earned income allowable as a deduction before computing tax, which was raised last year from the wartime fraction of one-tenth to one-eighth, is now to be one-sixth, which compares with one-fifth before the war. The limit to the income deduction is also restored to its 1940 level, rising from £150 to £250. The two concessions combined will cost £54½ million this year and £62 million next. In addition, the income tax allowance for each child is raised from £50 to its pre-war level of £60, at a cost of £13 million (£15 million next year), and the income limit for the purposes of the dependent relative allowance is also raised, at a cost of £8½ million this year (£10 million next).

Customs and Excise Concessions

The remaining concessions are not incentive measures at all. In fulfilment of an earlier pledge, the import duty on heavy fuel oil and gas oil is removed, together with that on any other

hydro-carbon oils used in a refinery for heat, light or power, or for producing gas—concessions which cost £4 million this year (£4½ million next). The excise duty on home produced artificial silk is repealed at a cost of about £2 million. Purchase tax is reduced from 33½ per cent to 16½ per cent on a miscellaneous range of articles, the most important of which are linoleum and certain classes of sports gear. Certain types of domestic water filters are exempted from tax entirely. The purchase tax reliefs in all will cost £2 million (£2½ million next year).

Tobacco Duty

The total cost of tax concessions this year will thus be £84 million (£96 million in 1948-49), and almost the whole of this is expected to be provided by the raising of the tobacco duty by 50 per cent. The implications of this unexpectedly severe increase are discussed in detail in a separate article on page 594. On the assumption that consumption falls by not more than one-quarter, the Chancellor expects to obtain an additional revenue of £75 million.

Purchase Tax Increases

As expected, Mr Dalton has re-imposed the purchase tax on domestic cooking and heating appliances, and has raised the rate from 33½ per cent to 66½ per cent on other domestic apparatus suitable for operation from electric or gas mains. These increases in tax are expected to provide £13 million in 1947-48 (£18 million next year).

Profits Tax

Profits Tax is to be left at its present level of 5 per cent on undistributed profits, but the rate will be increased to 12½ per cent on "distributed profits." The net incidence of the full rate, allowing for income tax, is 1s. 4½d. in the £. The Chancellor justified the tax on the ground that too much had been distributed from profits during the past twelve months, and too little ploughed back into the business, and he argued that "these increased dividends are the clearest case, anywhere in our national economy, of an inflationary element"—a broad statement which seems open to disproof first by Table 7 in the National Income White Paper, and secondly by the following computation of industrial profits and their distribution, before tax, between interest, preference dividends, ordinary dividends, free reserves, and other allocations:—

INDUSTRIAL PROFITS BEFORE TAX 2,040 COMPANIES (£'000's)				
	1945	%	1946	%
All Interest	20,998	6.5	20,616	5.9
Preference dividends	57,321	17.9	58,595	16.8
Equity dividends	170,647	53.5	186,152	53.2
Free reserve	59,694	18.7	72,016	20.6
Other allocations	10,908	3.4	12,316	3.5
Total profits	319,568	100.0	349,695	100.0

Presumably the term "distributed profits" would include profits paid out in preference dividends. Mr Dalton's estimate of the net revenue from the increase after allowing for loss of income tax is £20 million in a full year (but a mere £1 million this year). On the figures shown in the representative sample of companies above, the net revenue in respect of preference and ordinary dividends would amount to roughly £17 million. If these companies decided to carry this charge, it would entail a cut of nearly one quarter in their free reserves, before charging income tax. If, on the other hand, they decided to maintain the allocation to free reserves, the consequence would be a reduction in ordinary dividends from £186.2 million to approximately £170 million, since the full burden of tax on

both preference and ordinary capital would fall on the equity shareholder. This would entail a reduction in the average rate of ordinary dividend from 12.4 per cent last year to about 11.3 per cent.

These are the limits within which directorial policy will be free to operate. The incidence of the increased dividend tax will plainly fall with greatest severity on highly geared ordinary shares, either by way of a cut in their dividend, or by reducing the amount of profits which can be ploughed back. It may not, therefore, work unequivocally in favour of ploughing back earnings into the business.

Taxing Bonus Issues

Mr Dalton's second thoughts on bonus issues have enabled him to be "a little more forthcoming in permitting bonus issues" on condition that the public takes a reasonable participation "in these somewhat debatable operations." He proposes, therefore, to impose an "additional" 10 per cent Stamp Duty on the value of all bonus issues which obtain the approval of the Capital Issues Committee, which is to be given an extended discretion with regard to bonus issues. The new Stamp Duty will be levied on the excess of the market value of the bonus share over the amount, if any, which the shareholder pays for it. In other words, it will apply to capital bonuses and also to issues on bonus terms. The market value will be taken "as the Stock Exchange valuation for the shares after the issue."

The estimated yield from the tax on bonus issues is £5 million both this year and next.

Increased Stamp Duties

The possibility of a tax upon Stock Exchange transactions had been discussed as a probable political *quid pro quo* for a

betting tax. But, while the betting tax has been rejected because of its administrative complexity and the difficulty of working it equitably, all duties pertaining to stocks and shares are doubled—mainly, it appears, for revenue reasons, but probably also because the Chancellor holds that stockbrokers have "done very well under this Government." In fact, the duties on contract notes, transfers, bearer securities, debentures and letters of allotment are all doubled, with the existing graduation retained. As it is, therefore, Mr Dalton will get a modest revenue at the cost of significantly reducing the freedom and flexibility of the market, without reaching those whom he presumably really wished to penalise.

Duties on conveyances of land and property, and on leases and mortgages are also doubled, except for transfers below £1,500 and tenancy agreements at rents below £100 p.a., the duties for which are unchanged.

The increased stamp duties take effect on August 1st, and are expected to yield £12 million this year and £20 million next.

Legacy Duty Doubled

The Legacy and Succession duty, the yield from which is small by comparison with the main death duty—the Estate Duty—has been remodelled on lines parallel to the changes made in Estate Duty last year. The rates of charge, which vary with the degree of consanguinity, have been doubled and now range from 2 per cent to 20 per cent, except that bequests to charity still bear only 10 per cent. Exemption limits have been raised in nearly all cases. These changes will produce no revenue this year, but the yield for 1948-49 is put at £9 million. The limit upon the value of estates for eligibility for the minimum Probate fee has been raised.

The National Income

THE annual White Paper containing the official estimates of the National Income* provides, every year, such a feast for the statistician, with so many fascinating byways to explore with the slide rule, that there is a certain temptation for comment upon it to consist solely of playing with the figures.

Many of the stories it tells are, indeed, of great interest and importance; they are, or should be, the subject-matter of economic policy. Every year the official statisticians provide fresh evidence of their ingenuity—the principal novelty this year is a more detailed estimate of the balance of payments than has hitherto been publicly available. But despite all these grounds for gratitude, it would be a pity if the official estimates were accepted uncritically, or without any attempt to relate them to other available indications of the state of the nation's economic health. This year in particular, when the estimates relate to the first full year of peace, there are certain searching questions to be asked, for not all of which the White Paper provides an answer.

The totals of the national income, in the two definitions that are in most common use, for 1938 and for the last three years, are as follows (all figures in this article are millions of pounds; the figures in brackets, which cannot be deduced from this year's White Paper, are partly constructed from last

year's estimates):

	1938	1944	1945	1946
Net National Income at national cost	4,671	8,366	8,340	7,974
Gross National Product at market price	5,741	(10,181)	(10,100)	9,827

Of these two versions, the former is that favoured by the British estimators, the latter is commonly used by the American experts of the Department of Commerce. The differences between them are two: gross national product includes, as income, allocations made for the depreciation of existing capital, which are deducted before arriving at net national income; secondly, "national cost" excludes, while "market price" includes, the inflating effect of indirect taxes (less subsidies).

It will be observed that the estimate for 1946 is below that for 1945—4.4 per cent lower, as the figures stand. Some falling off in national income as the efforts of wartime relaxed was only to be expected.

The totals can be re-arranged and analysed in a number of interesting ways. Perhaps the most illuminating is to show (on a gross basis, at market prices) the total resources available to the British people, where they came from and how they were used (the figures in brackets are those that have required some interpolation or estimation by *The Economist*):—

	1938	1944	1945	1946
Gross output of United Kingdom	5,566	(10,081)	(10,000)	9,747
Net receipts of interest, etc., from overseas	175	(100)	(100)	80
Gross National Product	5,741	(10,181)	(10,100)	9,827
Overseas borrowings or drafts on overseas capital	70	659	875	400
Gross Available Resources	5,811	(10,840)	(10,975)	10,227
Personal Consumption*	4,252	5,474	5,884	6,584
Government Expenditure—Defence	(336)	(4,687)	4,450	2,329
Other	(453)	(562)	(641)	1,314
Gross Capital Expenditure	770	(117)	(641)	1,314
Total Gross Expenditure	5,811	(10,840)	(10,975)	10,227

* "National Income and Expenditure of the United Kingdom, 1938 to 1946." Cmd. 7099. 1s. net. The tables in the White Paper will be printed in next week's issue of the *Records and Statistics Supplement* to *The Economist*.

All these figures, of course, are affected by the change in the value of money; but some interesting comparisons can, nevertheless be drawn. In 1938, if gross home output be taken as 100, the net income from British foreign investments added 3 and overseas disinvestment 1, so that the total of available resources was 104 per cent of home output. In 1945, the additions were 1 and 8½, so that available resources were as much as 109½ per cent of home output (even without counting lend-lease receipts). Even in 1946, the drawings on the American loan (and other overseas disinvestment), together with the shrunken remnant of overseas investment income, enabled the British people to spend nearly 5 per cent more than they produced. Of total gross expenditure, personal consumption made up 73 per cent in 1938; it fell to just over 50 per cent in 1944 and had recovered to 64 per cent in 1946. Capital expenditure—which, it should be remembered, includes all expenditure for the maintenance and replacement of existing capital—was 13 per cent of total expenditure in 1938, fell to 1 per cent in 1944 and in 1946 had already recovered to about the pre-war proportion.

Another interesting analysis of the figures shows the total of private incomes before and after the payment of direct taxes:

	1938	1944	1945	Increase 1938-45 %
Income from work and property:—				
Wages	1,735	2,780	3,020	74
Salaries	1,110	1,530	1,675	51
Pay and allowances of the Armed Forces	78	1,255	523	571
Rents	380	385	386	2
Profits and interest*	1,534	2,810	2,840	85
Total private income from work and property	4,837	8,760	8,444	75
Social Security benefits and other transfer incomes	270	455	737	173
Total private income before tax	5,107	9,215	9,181	80
Less: Direct taxes	-516	-1,894	-1,876	
Private income after tax	4,591	7,321	7,305	59

* Including farmers' profits, professional earnings and National Debt interest.

Reckoned before the payment of tax, both wages and property income (including, however farmers' profits and professional incomes) have both gained proportionately more than salaries. But after the payment of direct taxes, wages (including the appropriate part of the pay and allowances of the forces) have risen from 39 to 44 per cent of the total, while property incomes have fallen from 37 to 33 per cent. Salaries show little change in their proportion.

This is one measure of the redistribution of real net income that has been produced by the economics of war and by heavy direct taxation. The same effect can be differently measured by the effects of taxation on private incomes of different sizes. In 1938 there were 105,000 incomes over the surtax limit of £2,000. These incomes had 10.3 per cent of the total of private income before tax and 7.2 per cent after tax. In 1945, the number of incomes in the surtax range had risen to 132,000; but they had only 6.5 per cent of the total of private income before tax and as little as 3.3 per cent after tax. The very rich, with gross incomes of £10,000 or over, who in 1938 were left, after paying taxation, with 1.8 per cent of total net incomes, now have left a bare 0.35 per cent. In 1938-39, there were 19,000 persons with net incomes of over £4,000; in 1945-46 there were 885.

From private incomes to the total of consumption expenditure is an obvious step. In 1938, 83 per cent of private income was spent and 7 per cent saved, the balance going to direct taxation. The proportion consumed fell as low as 60 per cent and savings rose to 21 per cent in 1943, but the figures were back last year to 72 per cent and 8 per cent. The total amount of money spent on consumers' goods and services at market prices rose from £4,252 million in 1938 to £6,584 million in 1946. These money figures, however, are meaningless until they are corrected for changes in prices, and fortunately this is the one part of the field in which the White Paper re-calculates

the figures on a constant price basis, as follows:—

	1938	1939	1940	1941	1942	1943	1944	1945	1946
Personal expenditure on consumers' goods and services at current market prices (£ million)	4,252	4,379	4,627	4,828	5,133	5,218	5,474	5,884	6,584
Do, revalued at 1938 prices (£ mn.)	4,252	4,277	3,891	3,718	3,697	3,641	3,738	3,938	4,296
Consumption expenditure as index number (1938=100)	100	100½	91½	87½	87	85½	88	92½	101
Indicated index number of prices of consumption goods and services (1938=100)*	100	102½	118½	129½	138½	143½	146½	149½	153½

It is at this point that it is necessary to stop and consider what the figures say. If the second line of figures is to be believed it says that the total volume of consumption in 1946, after allowing for price changes, was slightly in excess of 1938. That is to say, the reader of the White Paper is invited to believe that the average real standard of living of the British people in 1946 was back to the pre-war level—in fact, slightly in excess of it.

Is this credible? The first instinct is to say that of course it is not, and that if the figures make such an assertion, so much the worse for the figures. But perhaps the matter is not quite so simple. In the first place, it is very difficult for anybody in the middle or professional classes—as most manufacturers and consumers of statistics are—to make sufficient allowance for the undoubted rise in the average standard of living of many, if not of all, wage-earners. The total of wages, of social security benefits and of the appropriate portion of the pay and allowances of the Armed Forces, after the payment of direct taxes, rose from something like £2,000 million in 1938 to something like £3,850 million in 1946. If the latter figure is corrected for a 53 per cent rise in prices, it still stands at £2,500 million—that is, the real net income of the wage-earning class has apparently risen by about a quarter.

Secondly, some light can be shed on the trend of consumption by observing what has happened in the various categories:—

PERSONAL EXPENDITURE ON CONSUMERS GOODS AND SERVICES AT 1938 PRICES

	1938	1946	Change
Increases:—			%
Alcoholic beverages	285	320	+ 12
Tobacco	177	236	+ 33
Rent, rates and water	491	514	+ 5
Fuel and light	195	215	+ 10
Books, newspapers and magazines	64	88	+ 37½
Travel	160	226	+ 41
Communication services	29	42	+ 45
Entertainments	64	102	+ 59
Income in kind of the Armed Forces	17	81	+ 376
Decreases:—			%
Food	1,258	1,232	- 2
Durable household goods	234	148	- 37
Other household goods	54	43	- 20
Clothing	446	330	- 26
Private motoring	127	71	- 44
Miscellaneous services	481	424	- 12
Miscellaneous goods	177	152	- 14

This gives a rather different picture. The increases shown in the first half of the table, instead of contradicting ordinary observation—as the blunt statement that the standard of living is back to pre-war apparently does—are in accordance with what can be seen on every hand. It is wholly apparent that much more is being spent on drink, tobacco, fuel and light, books, railway journeys, theatres and cinemas and the like. On the other hand, the statisticians were not, after all, trying to assert that the level of consumption of the big staple items—food, clothing and furniture—had returned to pre-war. So re-defined, the figures become much more credible. They say that the total volume of consumption has returned to the pre-war level but that it is still badly distorted and that the people are spending their money on things they would not want if they could get larger quantities of the necessities of life. The quantity of consumption has recovered, but not its quality.

There is an additional point to be made concerning quality. It is quite impossible to allow, in any price index, for the

deterioration in quality that has occurred in many—indeed, in most—consumers' goods and services. If allowance could be made for such changes in quality, then not even in a statistical sense could it be said that the standard of consumption had returned to the pre-war level. Even so, however, the shortfall would be far less than might be imagined, on the basis of their personal observations, by middle-class observers thinking of the staple necessities of life.

This question of the proper allowance to make for the changed value of money has a wider importance. The White Paper has never attempted to correct its figures, other than those of consumption, for price changes. Year by year, however, *The Economist* has made the attempt, though it has never been pretended that the results are other than indications of probable order of magnitude. These calculations are carried forward to cover the year 1946 in the following table:—

	1938	1944	1945	1946
1. Gross output of the U.K.	5,566	7,153	6,933	6,504
2. Net overseas interest, etc.	175	71	70	54
3. Gross National Product	5,741	7,224	7,003	6,558
4. Overseas borrowings or drafts on Overseas capital	70	471	612	272
5. Gross Available Resources	5,811	(7,695)	(7,615)	6,830
6. Personal Consumption	4,252	3,738	3,938	4,296
7. Government Expenditure	789	3,888	3,236	1,640
8. Gross Capital Expenditure	770	69	441	894
9. Total Gross Expenditure	5,811	(7,695)	(7,615)	6,830

Item 6 is as given in the White Paper. For correcting items 2, 4 and 8, an index of "national cost," derived from last year's White Paper, has been used. For item 7 an index of prices of goods and services entering into Government expenditure has been assumed. For 1946, the index of market prices of consumption goods and services is 153 (1938: 100), the "national cost" index is 147 and the "Government expenditure" index is 142½. It should be emphasised that the two latter indices, especially the last-named, are conjectural.

The method of arriving at these figures is explained in the footnote. It is based on the assumption that prices of consumers' goods and services, which have been raised more by indirect taxes than they have been lowered by subsidies, have probably risen more than the prices of the things on which the Government spends its money or which enter into capital expenditure.

Tobacco Shares Now

THE Chancellor of the Exchequer has grasped the political nettle by increasing the tobacco duty by 50 per cent so that 20 cigarettes will cost 3s. 4d. instead of 2s. 4d. and a popular brand of pipe tobacco is increased from 2s. 10½d. to 4s. 0½d. an ounce. This week's increase in the duty, unlike the succession of increases since 1938, is designed not specifically for revenue purposes, but to secure a reduction of home consumption of tobacco by 25 per cent and a saving in its dollar cost of \$30 million. It is therefore quite different in character from the moderate increase that Mr Dalton was expected to make. His estimates—they are naturally rather tentative—suggest that the limits of exploiting the inelastic demand for tobacco have practically been reached. Very roughly, he estimates that consumers' outlay on tobacco, including the higher duty, will further increase by about 7½ per cent during the current financial year; he has increased the selling price of cigarettes by 43 per cent and is aiming at a reduction in consumption of no more than 25 per cent. This guess can only be confirmed by the practical test of the market. The National income estimates show that personal expenditure on tobacco rose without any semblance of check from £177 million in 1938 to £603 million last year, while home consumption of tobacco increased from 190 million lbs. in 1938 to 250 million lbs. in 1946.

A cut of a quarter in home tobacco consumption would reduce the total from 250 million lbs. to say 190 million lbs.—

If the rise in consumption prices is known—and it is given in the White Paper—the other price indices used cannot be very badly wrong and the resulting figures must be broadly right. This—and the great assistance that it is to have some notion of the real size of the national income—has been the justification, year after year, for publishing them.

But it should again be observed what these figures purport to show. They indicate that the gross output of the United Kingdom, adjusted for price changes, rose in 1944 to 28½ per cent above the pre-war level and that in 1946 it was still 17 per cent above pre-war. Moreover, it would be possible to show, by a little simple arithmetic, that the Government's plans, as outlined in the recent "Economic Survey," envisage an increase in 1947 to a still higher figure.

Again one must ask, is this credible? Is there any sense corresponding to reality in which it can be said that the real output of the British economy is to-day greater by one-sixth or more than it was before the war? Is it really justifiable to use price indices showing increases of only 42½ to 53 per cent when the fact is on record that the average price of British export goods has increased by over 100 per cent? If this latter figure were taken as more truly representative of what has really happened to the value of money, then the national output, instead of being 17 per cent higher than in 1938 would be at least 10 per cent lower. Many people would say that this corresponds more closely to the truth. And yet many of the other indicators contradict this view. More freight is moving on the railways, more steel is being produced, much more electricity is being consumed, no less coal is being burnt, than in 1938; many more people are at work. Is the national output inadequate in volume? Or merely distorted in its composition?

This puzzling question cannot be answered from the statistics of national income. And yet it is the question on which, above all others, such exercises in statistical ingenuity ought to shed light. The experts of the Central Statistical Office, who have already put all students of public affairs heavily in their debt, have yet to crown their labours.

exactly the same figure as in 1938. Table I puts Mr Dalton's target in perspective against the tobacco supplies for the United Kingdom. Total imports of tobacco last year amounted to 433.4 million lbs. of which (as Table II shows) the United States provided 365.8 million lbs. of nearly 85 per cent of the whole. Imports from Empire sources (including Canada, though this is in the hard currency area) totalled 63 million lbs. Thus home consumption last year absorbed less than 60 per cent of total imports; stocks were increased by no less than 100 million lbs. to 380.3 million lbs. The 1946 import figures included a large proportion of the 1945 crop, which was directly purchased by the Government and imported in 1946, and also a considerable part of the 1946 tobacco crop bought and paid for in that year under the resumed private purchasing arrangements.

Purchases of tobacco last year from the United States and Canada (as distinct from imports) absorbed about £47 million in dollars, of which £9½ million should be offset by re-exports—though these are mainly to soft currency areas, they should serve to stimulate the production of commodities to be sold against dollars—and £3½ million for addition to stocks. Taking home consumption alone, therefore, the current rate in the past financial year would probably have cost about £32 million in dollars, and not £56½ million. The former figure is closely related to the estimated dollar saving of \$30 million to which Mr Dalton referred on Tuesday on the assumption of a 25 per

cent cut in tobacco consumption. The dollar cost of tobacco for home consumption will be less than 10 per cent of the first year's drawings on the loans—a very different ratio from the usual idea that one-third of them have been spent on tobacco. The decision last August to permit manufacturers to draw from bond 120 per cent of their basic quotas for use in the home market suggested that the Government was fully prepared to meet the dollar cost of a higher rate of tobacco consumption in the interests both of morale and of the Exchequer. Faced now with the alternative of rationing or a swingeing increase in the duty, the Government has rightly preferred the second course. Tobacco would be a difficult article to ration, and it would provide a welcome opening for new enterprise in the black market.

The figures in Table II show that tobacco supplies from the United States could not be readily replaced by Empire and Oriental tobaccos. An increased proportion of Empire and

TABLE I—U.K. TOBACCO SUPPLIES 1938-1946
in million lbs.

	1938	1945	1946
Total Imports	346.1	369.1	433.4

H.M. Forces, Ships' Stores, etc.	23.0	48.8	19.2
Bonded Stock and year (a)	583.1	278.1	380.3

(a) Almost wholly manufactured.

Oriental tobaccos could be blended with American leaf without unduly offending the British palate (which has come to regard Virginian tobacco almost as its exclusive taste), but that policy would require more machinery and a radical improvement in the supplies of oriental leaf. As for Empire tobaccos, Rhodesia might be capable of increasing its output by 50 per cent during the next few years; its ultimate ambition of producing 100 million lb. is impossible for several years to come because of shortage of labour alone. An increase in the consumption of Empire tobacco may now be more difficult to encourage because the price differential (reflecting the preferential duty) between Empire and American manufactured tobaccos is now so narrow as to be scarcely effective.

What does the higher duty imply for tobacco shares and dividends? So far, the leading companies have been able to absorb increased costs of raw tobacco, holding of stocks and increased charges for almost every raw material and grade of labour, because their total turnover has been steadily increasing. If

TABLE II—PRINCIPAL SUPPLIERS
(million lbs.)

	Average 1935-39	Average 1940-44	1945	1946
United States	200.8	168.0	309.9	365.8
S. Rhodesia	15.7	20.2	20.6	23.2
Nyasaland	12.3	13.2	11.6	10.9
British India	19.6	17.8	10.2	17.7
Canada	14.3	7.9	12.1	9.4
Total Empire	63.6	61.6	66.0	63.0
Total all countries	269.3	240.8	369.1	433.4

Mr Dalton's rough estimate of a reduction in consumption by as much as 25 per cent proves to be anywhere near the mark, the profits of even the best tobacco companies might present a rather sorry picture in a year's time. Perhaps a reduction of as much as 25 per cent may not in fact occur but it is improbable that the amount of tobacco consumed will be maintained. Even if demand settles down at some intermediate point, the reduction in turnover is likely to have a significant effect upon tobacco profits if retail prices remain unchanged. The companies can anticipate little relief from the smart rise in the price of both American and Empire leaf tobacco since 1938. A cut in the British demand might have an unsettling effect on American prices but the relief would not be seen in

tobacco costs for some time, owing to the companies' policy of equalising the costs of their leaf supplies.

For tobacco shareholders, therefore, recent prices of raw tobacco are still highly relevant. Empire producers have been receiving 75 per cent to 200 per cent more than their pre-war prices. Canadian flue-cured cigarette tobacco has been costing 35 cents a lb. compared with 20 cents before the war; in Southern Rhodesia, cigarette tobacco has risen from 10d. to 32½d., while in the United States farmers' prices for flue-cured tobaccos have advanced from an average of 23 cents for the years 1934-38 to about 50 cents in 1946.

Ever since the end of the war, the high prosperity of the tobacco industry has been accepted with a certain scepticism by the far-sighted investor. At first the tobacco companies were regarded as enjoying an evanescent boom which might be rudely checked as soon as consumption goods generally were in freer supply. That has not happened on a sufficient scale to make any material difference to tobacco consumption. On the demand side, until late on Tuesday afternoon, it seemed that the industry was as well secured as ever. That assumption has now become fallible. Some fall in consumption seems inevitable, even though it may not reach Mr Dalton's 25 per cent target. On the supply side, the end of the rising cost trend is not yet in sight; the strain of financing the higher cost of stocks, part of which will now carry a 50 per cent increase in duty, will be further increased. This strain has been vividly illustrated in the recent attempt of the Imperial Tobacco company to adjust its ordinary share capital and to replace the short term financial

commitments which the company has undertaken for financing of stocks. Looking further ahead, it is well to remember that taxes have a habit of sticking well beyond the period to which they are appropriate. A tobacco tax at the existing rate when consumption goods were in freer supply or food prices dearer, or employment less full, might well have a devastating effect on demand.

It is hardly surprising therefore that tobacco shares should have been hit so severely by the Budget. Table III shows some representative share prices and yields. Even before the Budget the latter were well in excess of the average return of industrial equities—4.39 per cent at the last calculation of the Actuaries' index. Now there are even deeper uncertainties about future earning power, which may be mitigated by recovery in demand later this year when consumers have become hardened to higher prices and could only be avoided altogether if the companies decided to pass on increased costs to the consumer of cigarettes as they have recently done for pipe tobacco. An increase sufficient to cover the whole of the rising costs of the manufacturers would be a very modest affair indeed compared with Mr Dalton's new impost. It might therefore be prudent not to take too tragic a view of the present position of tobacco shares. The dangers are obvious. Indeed, the greatest danger of all is perhaps the possibility that consumption will not fall sufficiently to satisfy Mr Dalton; if that happened the Government might in a year or two's time be disposed to take even more drastic action to reduce the dollar expenditure on tobacco.

Business Notes

Budget Reactions

In principle, Mr Dalton's third Budget was designed to assist the gilt-edged market and to damp enthusiasm for equities, in practice, the reverse has happened. Gilt-edged failed to benefit from the negative stimuli of the Chancellor's reiterated case for cheaper money and from his increases in the profits tax and in stamp duties, which are aimed very largely at ordinary shares. But equities found Mr Dalton's new burdens less arduous than had been expected, and they were quickly counting the blessings of tax increases which Mr Dalton might have made, but did not. Since the Chancellor confined his new indirect taxation to tobacco, there was a sigh of relief for brewery and cinema shares; since his attack on speculative profits was confined, by implication, to the Stock Exchange and left betting untouched, dog racing shares rebounded; and even tobacco shares, after a sharp fall, rallied appreciably.

These, of course, were impact adjustments to the removal of fear; more refined calculations will be necessary before it is safely established that restrictions of output—and of dog racing—will justify the present levels of many ordinary shares. In its first reaction the market was inclined to argue that the increased profits tax was a good "swap" against the removal of EPT, and was busy on its calculations about the position of companies with a heavy liability for EPT and a moderate capital gearing, for which the new profits tax would leave the greatest margin "to go for." But it is doubtful if such nice calculations at the margin will have very much significance, in terms of prices. After all, the removal of EPT is far from being a new market factor, and the present tendency in some quarters to begin publicising it all over again merely reflects the wish to make the best of the imposition of a new tax and not the unexpected withdrawal of an old one. It would indeed be surprising if the market had not long since capitalised all of the good in the withdrawal of EPT. Its present task is something much bigger than the adjustment of prices to measure the differential effects of two taxes; it is to make some estimate of the consequences, in terms of profits and earning power, of the fuel crisis, which, as Mr Dalton emphasised on Tuesday, will fall with particular severity upon earnings in the fiscal year 1947-48.

The new tax on the "bonus element," with its dubious moral principle of permitting, on payment of a fee to the pardoner, what the Chancellor has always maintained is indefensible, is a matter of general condemnation in the City. Here, certainly, is all the evidence of Bourbonism, which never forgets and never learns. There are many issues which would not, in the ordinary commerce of the market, be regarded as bonus issues, but which are made at a price somewhat below the market price; at the other extreme lies the 100 per cent capital bonus. The cost and complexity of raising new capital, even where the so-called bonus element is moderate, will be greatly increased, and for the "free bonus" the effect will be so punitive that they will be entirely out of court.

* * *

Rallying the Patriots

As for the cool aloofness of the gilt-edged market, that was hardly needed to point the general verdict on the Chancellor's disquisitions on cheap money. The much-trumpeted defence disappointed even the critics. It is not that there is any real disagreement with the general tenor of Mr Dalton's arguments. But he wholly missed the point of the recent criticisms, which in these columns as in other responsible quarters have been based exclusively on wide grounds of economic policy and not at all upon sectional or political grounds. It would be easier to give the Chancellor the benefit of the doubt, and assume that his evasive omission was accidental, if he had not also tried to shift this purely economic issue to a moral plane, with characteristic histrionics. But the question whether a given rate of interest is economically—even socially—advantageous cannot be burked by rallying cries for "patriots." "Is there really a British citizen," boomed Mr Dalton, "who is either too avaricious or too frightened of the future to lend money to his country at 2½ per cent on long-term?" Again, "the faction of whom I speak would enshrine the usurer over all, trample the common man in the dust, and consolidate catastrophe in our national life." Resounding phrases, these; but is this really a British Chancellor in the middle of the twentieth century—or an ecclesiastic in the Middle Ages?

It is small wonder that the City was unimpressed, and interpreted these noisy phrases simply as signs of weakness. But it is a pity, none the less, that the Chancellor declines to recognise that hardly anyone—and none of the serious journalistic critics whom he so regularly attacks—has advocated dear or even dearer money. They object simply to the recent accentuation of cheap money in conditions of inflationary dangers, and particularly to the speed with which the Chancellor has pressed towards his objectives. Their objections are based, not upon any tenderness for the rentier as such, but upon the fillip which such tactics have recklessly given to inflation, with resultant wastage of scarce national resources. Obviously, a low rate of interest at long-term is imperative if the huge burden of debt is to be supportable; but that is not an argument for pushing aggressively to still lower levels, against the natural trend, in conditions of post-war scarcity at a time when the wartime defences against inflation—the physical controls—were perforce being relaxed.

* * *

Real Savings in Interest?

The short-run saving to the Exchequer is in any case small—far smaller than the Chancellor's figures imply. His calculations were of course made on a gross basis, before allowing for loss of income-tax (not to mention sur-tax), but even the reduction in net payments would not measure the true saving to the Exchequer. Without raising afresh the controversial question of the extent to which the "departments" have had to absorb large quantities of long-term securities themselves because the public has been reluctant to accept the Chancellor's terms, it is at least clear that one major consequence of the tactics of the past eighteen months has been to enable the banks to exchange from low-yielding to high-yielding assets. Since August 1945, the month before the cheaper money drive was launched, their investment portfolios have expanded by £329 million while their holdings of Treasury deposit receipts have dropped by £676 million. In effect, upon £329 million of the £635 million of "true" deposits which have been created during the period, the Treasury is paying, say, 2½ per cent instead of the 1½ per cent which would have been paid before, and the ½ per cent which has been payable since, the cut in short money rates in October 1945. The resultant gross loss almost equals the £6½ million gross saving which Mr Dalton claimed on his long-term operations.

But, whether the saving is real or nominal, the policy is to be "resolutely" followed—though what precisely the policy is now is no clearer than it was after the economic policy debate. The public "is to be gradually conditioned to the idea of 2½ per cent as the maximum rate of interest on long-term loans to the British Government"; but the impression that this rate is at present intended to apply to dated stocks such as 2½ per cent Savings Bonds rather than to irredeemables is somewhat stronger than it was. In the circumstances, it is hardly surprising that the gilt-edged jobbers, whom Mr Dalton blamed for the crisis set-back, have so far apparently disappointed his hope that they "would feel stronger to-morrow." At least they cannot be blamed for that.

* * *

Increased Coal Allocation

Revised allocation arrangements were announced last week, after *The Economist* had gone to press, of the extra 100,000 tons of coal to be made available to industry each week from April, 13th to the end of May. Basic allocations to industry will be raised from 33½ to 50 per cent and in addition the Regional Fuel Allocation Committees will continue to make supplementary allocations from their pools. In the North-West Region it has already been announced that all sections of the cotton trade are to receive 75 per cent of their November quota, which gives the industry the same coal ration as steel. This region hopes to make supplementary allocations available to other industries when the new summer coal programme is introduced in June.

The method of allocation, granted the increased supply figure of 100,000 tons, is hardly a matter for controversy. First, all industry must be assured of sufficient supplies to restore the flow of components and semi-finished products through the industrial system. It would be a hopeless and invidious task to attempt to apply a priority allocation system for individual concerns.

Second, the adjustment of quotas between different sections of localised industries is best left to be worked out by the regional committees. There are, however, other key industries for which it is necessary to fix a national quota. Steel and public utilities have been in such a position from the start. The present 75 per cent quota for steel may seem "fair" by comparison with other industries, but unless it is increased the current shortage of steel will become even more acute. The new allocation system will be in operation for a mere seven weeks, for at the beginning of June the summer programme is to be introduced. The first full month of the summer coal production period and the five-day week will then have passed, and some closer budgeting of summer coal production ought to be possible. But the restoration of coal supplies to industry is a painfully slow process, involving delay and diseconomy in production of all kinds. Industry at the end of the third week in April still has no clear idea of the total supplies of coal which it may receive before winter sets in. Realistic budgeting for coal in the summer months and the prompt allocation of supplies are urgently needed if arrears of production are to be overtaken this summer.

* * *

Britain's External Account

Despite the detailed analysis presented in the *Economic Survey*, the latest National Income White Paper gives much fuller information about Britain's balance of payments than has ever previously been made officially available. It also revises the provisional figures of the *Survey*, and reduces the estimate for the overall deficit on current account in 1946 from £450 million to £400 million. This difference is explained by revisions which add £20 million to the adverse visible balance and £70 million to the net invisible income. Whereas the *Economic Survey* showed invisible items, other than Governmental payments, under two net headings only, the new analysis gives the four main categories—shipping; interest profits and dividends; tourist payments; film remittances and other items—separately, and shows the first two on both sides of the account. Interest profits and dividends for 1946 are now put at £80 million, instead of the £60 million in the *Survey*, while the remaining items, which previously were reckoned to require a net payment of £10 million, are now estimated to yield a net credit of £40 million. The revised figures are as follows:

	(£ Mn.)	Receipts	Payments	Net	Receipts
Shipping	150	140	10		
Films	...	...	17		
Tourism	...	25	25		
Miscellaneous	...	...	72		
			40		
Interest, profits and dividends .	150	70	80		

There is also an analysis of the £300 million of net Governmental expenditure abroad, from which it appears that the net cost of Germany was a good deal less than has been generally supposed—only £38 million.

The White Paper continues the analysis of external liabilities of the United Kingdom first given in the Statistical White Paper which accompanied the Anglo-American Loan Agreement; it also presents for the first time a detailed analysis of the capital elements in the balance of payments, showing how the £400 million deficit was financed.

BALANCE OF PAYMENTS			
Capital Account*			
	1945	1946	
Gold and U.S. dollar reserves	— 3	61	
U.S. and Canadian lines of credit	...	—279	
U.S. Govt. Loan (Lend-Lease, etc., settlement) ...	—161	...	
Other loans to H.M. Govt.	— 48	38	
Net sterling, etc., liabilities	—445	—148	
External capital assets*	—110†	—70†	
Subscriptions under Bretton Woods Agreement Act, 1945	...	33

Total external investment (equal to balance on current account)

* Increases in assets and decreases in liabilities are shown as positive, and decreases in assets and increases in liabilities as negative items.

† So far as ascertained.

‡ Including an allowance for errors and omissions on capital account.

Britain's gross holding of gold and dollar reserves rose by a further £13 million in the last quarter of 1946 to £642 million—

an increase of £61 million during the year. On the other hand, total external liabilities rose from £3,825 million to £4,214 million, of which £2,920 million (against £2,971 million) represented indebtedness to the sterling area. The amount due to North and South America, including drafts on the dollar credits, was £847 million and that due to European countries and their dependencies was £356 million.

* * *

The Problem of India's Balances

It was reported from Calcutta this week, and confirmed in London, that negotiations on the future of India's accumulated sterling balances are to be resumed—probably around the end of next month. The talks in New Delhi in February were exploratory and conducted at the official level; the new discussions will take place in London, and will be on a ministerial level. There is, unfortunately, little reason to suppose that the past few weeks will have significantly narrowed the wide difference between the points of view of the two parties which was plainly revealed in February. But at least the Indians now recognise the extent of the difference and probably well understand the position in which Britain is placed. The hard facts of Britain's balance of payments problem make it virtually impossible for the present arrangements to endure beyond July 15th, when currently accruing sterling becomes freely "expendable" in conformity with the Anglo-American Loan Agreement.

In the earlier talks, the British delegation obviously impressed upon India the imperative need for economy in dollar expenditure, and one apparent by-product of this was the Indian embargo upon imports of bullion. But, although India may be showing a sense of responsibility in its import policy, there is little doubt that it is making net demands upon the dollar pool. In addition, at present India's spendings from accumulated sterling balances are limited only by its capacity to secure deliveries of goods ordered in Britain or elsewhere in the sterling area. Hence, as is well known, a substantial block of British exports has for some time served only the purpose of redeeming accumulated debt to India. After July 15th, however, any accumulated sterling which is available for current expenditure at all, must be equally available for such expenditure in the dollar area. If, therefore, India thereafter retained the present freedom to spend accumulated sterling, it would be able—subject

Records and Statistics

In addition to the short "Statistical Summary" which appears weekly in *The Economist*, a full service of statistical and factual information appears weekly in

Records and Statistics

Supplement to *The Economist*

Records and Statistics is a separate, self-contained weekly publication of from 16 to 24 pages. It includes not only many statistical tables but also factual records of public affairs, including Parliamentary activities and digests of state papers, and industrial and commercial reports from home and overseas. It is believed to be the most comprehensive statistical and factual report appearing weekly anywhere in the world.

The *Records and Statistics* Supplement to *The Economist* is available by postal subscription only. The subscription, which may be sent direct to this office or through a newsagent, is 30s. per annum. For those who are already direct postal subscribers to *The Economist*, the economy of posting both publications together makes it possible to quote a combined subscription of £4. Subscribers to *The Economist* who wish to receive *Records and Statistics* should notify this office as soon as possible, but are asked not to send any money until an account is rendered. It is regretted that it is no longer possible to supply back numbers of *Records and Statistics* or to date subscriptions back.

Paper shortage also makes it impossible to supply sample copies. For a limited time, however, subscribers to *Records and Statistics* will be allowed, if they wish, to cancel any unexpired portion of a subscription.

THE ECONOMIST, BRETTENHAM HOUSE, LANCASTER PLACE, LONDON, W.C.2

only to "moral" and purely voluntary restraints—to utilise the accumulated balances to place large orders in the United States in addition to the orders in the United Kingdom.

Even the existing strain is greater than Britain's balance of payments can reasonably be expected to bear, and the pressure would become intolerable if the drain upon British exports were augmented by a specific drain upon dollar reserves. Britain, for its part, naturally hopes that it will be possible amicably to reach a comprehensive settlement—possibly for a limited term of years, as in the case of the Argentine Agreement—before, or at least shortly after, July 15th. But if these hopes are disappointed, it is hard to see how the British authorities can avoid imposing some restrictions upon the use of the accumulated balances. Such a step, if taken, would not be a sanction intended to force India into an agreement; it would provide, inexorably, the only means of saving Britain's dollar resources and export potential from an intolerably rapid rate of dissipation. As the Chancellor said in his Budget speech, "unrequited" exports are a "luxury of which we can afford very little for many years to come."

* * *

Liverpool on Shipping

Liverpool shipowners are renowned for their independence, and the annual report of the Liverpool Steam Ship Owners' Association reflects a good deal of the cautious detachment of the North. The report reproduces some calculations and comparisons of the volume of UK exports, which show that by the end of 1946 the volume of 1938 had been surpassed. It goes on to point out, however, that the year 1938 "was itself anything but satisfactory"; that the volume of exports other than coal fell short of 1938 as a whole; that in 1946 exporters were enjoying a sellers' market; and that "there is little ground, therefore, for self-satisfaction in the progress so far made." Examination of the statistics shows two important facts. First, a much larger proportion of cargoes than before the war is being carried in British ships; secondly, the amount of cargo carried per 100 tons net of shipping exceeded that of 1938 by 41 per cent in the case of imports and more than double in the case of exports. This gives an idea of the extent to which economy in the use of tonnage has offset the shortage imposed by war losses, but it must be remembered, as the report points out, that the degree of concentration of British ships on UK trades has been at the sacrifice of participation in the foreign-to-foreign trades which contribute so much in the way of invisible exports. Foreign tonnage, meanwhile, has been able to seek more remunerative employment in trades from which British ships have been temporarily withdrawn.

The Association expresses doubts about the future earning power of British ships. In the first place, there is the inevitable gap between the cost of replacements at current prices and the money made available by depreciation, plus compensation, based on pre-war building prices. Whether in the long run the earning power of a new ship will cover that gap is questionable, in Liverpool's view. A ship's earnings are necessarily depleted by delays in port, and in this connection ship-repairing delays and costs, a favourite target of Liverpool shipowners, are singled out for special attack. A liner to-day, it is claimed, takes not less than 20 per cent longer on a round voyage than before the war, while dry-dock repairs take twice as long and cost 2½ times as much. This is attributed mainly to "failure to give a full and fair day's work"; but little or no allowance is made in the report for the shortages of materials such as timber, steel and paint, the increase in their cost (as much as tenfold in the case of paint and threefold for timber), the demands of reconditioning and re-conversion work as well as postponed overhauls, and the introduction of the five-day week. Nevertheless, whatever their causes, increased building and operating costs, apart from port delays in all parts of the world, are bound to have an adverse effect on a ship's earning power, and the long-term prospects of shipping earnings do not warrant undue optimism.

* * *

World Tin Conspectus

The first meeting of the Tin Study Group opened in Brussels last Tuesday. The Study Group was set up on the recommendation of the Tin Conference which met in London last October, when representatives of eight major tin-producing and consuming countries attended. Its function is to survey the long-term supply and demand position of tin. As with the recent inaugural meeting of the Wool Study Group, only four days were allotted for the Tin Study Group's first meeting and momentous decisions are

hardly expected to emerge within that time. Output of the major producers in 1946 is unlikely to have reached 60 per cent of the pre-war (1936-39) average. Production in Bolivia, Belgian Congo and Nigeria has increased considerably, but only small quantities are yet available from Malaya and the Netherlands East Indies. Rehabilitation in these two countries has been much slower than was expected, owing mainly to shortages of coal and new equipment. Reports from Singapore suggest that plans are in operation for a large-scale change-over from coal to oil in Malaya for both power stations and dredges. But this measure can bring little improvement for some time. The agreement between Siam, the United States and the United Kingdom, whereby 16,000 tons of tin which accumulated in Siam during the war years were released for export, has been renewed for a further three months, and much of the tin has yet to be shipped. When tin output in the Far East does reach pre-war levels and if capacity in both Africa and South America is maintained at current figures, the question of a restriction scheme may be raised. In some quarters it is held that the world shortage of tin will have largely disappeared by the end of 1947. This is indeed optimistic; unless conditions in the Far East improve at remarkable speed, stringency is likely to last well beyond 1947.

One question which merits examination is that of smelter capacity. The operation of the Texas smelter, which was built during the war and is believed to be capable of producing between 50,000 and 100,000 tons annually, dependent on the grade of ore, is an important factor in the world tin situation, particularly if it is intended to run it permanently in peacetime at an optimum throughput. It has also been reported that Argentina intends to increase its smelting capacity from its present low level of 850 tons of metal a year to 2,600 tons. But Argentina has recently concluded an agreement with Bolivia for the annual purchase of 8,000 tons of tin concentrates for a period of five years. If Argentine smelting capacity is not increased beyond the 2,600 tons level, a large stock of concentrates will have been built up by the end of the contract period. Perhaps Argentina also has in mind the creation of a strategic reserve. The main problem for study, however, is the extent to which smelter output will be conditioned by market forces and how far it will be arbitrarily determined by governmental policy. It is estimated that consumption in the United States would be substantially higher if the American Government's allocation of tin supplies between domestic users were lifted. The American motor industry is reported to be using only 2-3 lb. of tin per vehicle compared with 7 lb. before the war. In the United Kingdom home consumption of tin metal in 1946 was 17 per cent greater than the 1935-38 average.

The deliberations of the Study Group are likely to be formal, and most of its time will be taken up in estimating current and prospective production and consumption and perhaps in devising future procedure. It is known that the Belgian Congo producers are in favour of some form of international regulating scheme, and since there will be insufficient time to discuss this policy question in detail, perhaps it will be delegated to a sub-committee. An issue of this importance, however, cannot be taken very far by a Study Group; it is, after all, a question involving the executive authority of governments—to say nothing of the right of the consumers to obtain a full hearing.

* * *

Bank Advances Analysed

The value of the new classification of bank advances grows steadily as each new quarterly return appears, and the latest statement, relating to February last, has the particular merit that it presents the comparative figures for February, 1946, which were, rather inexplicably, suppressed when the first return appeared last November. For the first time, therefore, it is possible to trace the post-war movement of bank advances in detail without the considerable distortion produced by seasonal influences. In view of the extent to which industry accumulated liquid reserves during the war, and of the fact that its borrowings since the war must have been strongly influenced by Governmental disbursements such as EPT refunds as well as the re-opening of the new capital market for essential purposes, the bank advances' figures might not have been expected to afford a very reliable index to the underlying course of business. But, in fact, the pattern which emerges from a comparison over the past twelve months conforms quite closely to that presented by the *Economic Survey* and the industrial scene as a whole.

It is questionable whether the acute phase of the fuel crisis had as marked an effect upon bank advances as had been expected, but in any case the February return was completed before this influence could have made itself felt. The figures—given with full comparisons in the *Records and Statistics* supplement this

week—yet reflect the difficulties produced by shortage of fuel and labour at the points of worst bottle-neck; thus, apart from entertainment, the only groups to show a net reduction in borrowings over the year are cotton, which has declined from £7.1 million to £4.8 million; coalmining, down from £8.9 million to £8.5 million; and iron and steel, down from £15.4 million to £14.6 million. On the other hand, the biggest relative growth during the year is shown by public utilities, up from £7.3 million to £13.5 million, and transport and communications, up from £9.6 million to £13.0 million—both of which movements suggest the resumption of re-equipment work. The large proportional increase in wool (from £4.3 million to £9.5 million) reflects an increase in privately-held stocks and advancing prices.

In the total increase in advances during the year, by £178.7 million to £1,027 million, the largest single element was naturally the expansion of the personal and professional group, which has risen by £55.7 million and accounts for 28.7 per cent of the total. Excluding this group, the largest increases have occurred in retail trade, one evident effect of the bigger flow of consumers' goods; "other" financial (i.e., excluding stockbrokers in their professional capacity); agriculture and fishing; and builders and contractors. These four groups, with a further £15 million for "unclassifiable" industry and trade, account for £73 million of the year's growth. Other important groups, though still rising, have in general absorbed a smaller share of the total. Thus the engineering group, which has expanded from £66.6 million to £72.7 million, now represents 7.1 per cent of the total compared with 7.8 per cent twelve months ago. Even so, it has apparently a larger share than before the war, which probably reflects the slower rate of turnover of working capital owing to the dislocations caused by shortages of materials and components. Similarly, the food, drink and tobacco group has expanded by £7 million, but the proportion has dropped from 6.8 per cent to 6.3 per cent. Advances to local government authorities are virtually unchanged over the year, though somewhat higher on the quarter, but the proportion has dropped from 9.3 per cent twelve months ago to 7.7 per cent.

* * *

Savings Statistics Rationalised

The National Savings Committee has started the new financial year with a reform of its weekly series of statistics which is none the less welcome for being so long delayed. Throughout the wartime campaign, as is well known, the Committee regularly published only gross figures (except, necessarily, for savings bank deposits), despite the fact that since about 1944 encashments of savings certificates and bonds have risen steeply, with the result that the gross figures became almost meaningless. The new form of return, which shows gross receipts and repayments separately under each of the three headings, meets all—or nearly all—the recent criticisms. It is worth noting that the new table itself still does not measure the exact net cash contribution from small savers because it excludes the interest portion of the amounts paid out on encashment of savings certificates. The interest disbursement is, however, shown as a footnote. Similarly, the repayments column—which would be better described as "encashments"—excludes redemptions of securities at maturity. Interest accrued on the outstanding total of savings certificates and deposits is separately noted and is not included in the week's gross savings. As formerly, the weekly figures will exclude credits to, and withdrawals from, Service Release Benefit accounts. It would be a valuable improvement of this more realistic statement if comparative figures could be given for the previous year; and a marginal note of the Benefit Accounts would also be appreciated by many statisticians.

The return for the first week, to April 12th, is reproduced in its official form below, from which it will be seen that net savings totalled £14,071,000. To this total, gross sales of new savings certificates contributed £13½ million, a relatively high figure, which suggests that the raising of the limit above the amount for each individual holding, which took effect when the rate of interest was reduced at the beginning of the month, has already produced the expected response from "large" savers. The net cash received during the week, allowing for the interest portion of savings certificates repayments, was £13,791,000.

	Receipts	Repayments
Savings Certificates.....	£13,250,000	£1,400,000
Reference Bonds.....	2,000,000	601,000
Post Office and Trustee Savings Banks.....	16,738,000	15,916,000
	31,988,000	17,917,000

The Committee has found it impracticable to change the established practice of fixing gross targets for the purpose of its local campaigns, but the national target for the current year will be a net figure, of £366 million—a million a day in leap year—as Mr Dalton disclosed on Tuesday, and thus has been framed after an estimated allowance for withdrawals. This is indeed a welcome step towards realism. It is to be hoped that the additional publicity which will now be given to encashments can be turned by suitable propaganda into an incentive for additional saving, instead of being, as the Committee apparently feared in the past, a source of discouragement to local workers. But the new target, which excludes the interest portion of savings certificate encashments, as well as specific redemptions of Defence Bonds of maturity, is £35 million above the comparable figure for 1946-47, and will be very hard to attain except by adventitious aids of the kind so widely sought in the past year.

* * *

Reduced Steel Output

Figures issued this week by the British Iron and Steel Federation show a fall in the average weekly production of pig iron and steel ingots and castings in March for the second month in succession. Average weekly output of pig iron was 123,100 tons, compared with 126,200 tons in February and 147,300 tons in March, 1946. Compared with a year ago, the annual rate of production was reduced from 7,660,000 to 6,400,000 tons, a decline of over 16 per cent. Steel ingots and castings production in March was reduced to an annual rate of 10,190,000 tons, compared with 13,295,000 tons in March, 1946. Weekly average production at 196,000 tons compared with 206,300 tons in February and 255,700 tons in March, 1946.

These results reflect the full rigours of the fuel crisis early in March. Heavy calls were made on pig iron stocks last year, and these would have to be made good if steel output is to be brought into better balance. Oil firing at steel furnaces has already shown its advantages, for without its assistance the steel output figures would have suffered even more than they did in the fuel crisis. The figures certainly suggest that since the industry was receiving on paper in March 75 per cent of its November fuel allocation and could produce only at the annual rate of 10,190,000 tons, there is little hope of regaining the 1946 level of production in the remainder of this year unless the coal allocation is increased well beyond 75 per cent. In addition, supplies of refractory bricks for furnace linings are running short. The hope expressed in the *Economic Survey* that "output for the year will not be far below the 1946 level" seems doomed to disappointment.

* * *

Cotton Amalgamation Moves

A date has at last been fixed after which Government approval may be formally given to amalgamation schemes in the Lancashire spinning industry. From May 1st, five months after the announcement of the "Cripps offer" to assist in re-equipment of the mills, amalgamation schemes may be submitted for official approval to qualify for the grant of 25 per cent of the cost of re-equipment. It is understood that both the master spinners and the operatives have accepted a formula produced by Sir Stafford Cripps which meets their reservations to the re-equipment scheme, and the Master Spinners' Federation has expressed its willingness to assist the Cotton Board in carrying out amalgamation schemes. One or two new mill groupings have been reported this week, and these, together with the large spinning combines which already qualify for assistance under the scheme since they own over 500,000 spindles, will be eligible for the grant.

Some time ago the Master Spinners' Federation suggested to the Board of Trade that where, on amalgamation, machinery and plant may be sold for more than its written down value, the proceeds should be free of tax. The Chancellor went half way to meet this proposal on Tuesday when he intimated that only half the standard rate of income tax would be levied on such transactions—a concession which would cost £2½ million over a period of three years. One more inducement has thus been added to what is freely admitted in Lancashire to be a generous offer. The stage has now been set for the industry to show that it intends to take serious advantage of the scheme.

* * *

Raw Materials for Paints

The paint industry is suffering from the lack of raw materials. Some materials can be partially replaced by substitutes, but production can still be held up through the shortage of a vital

though quantitatively small constituent. Until quite recently, linseed oil has always been considered an essential component for paint, but persistent research has developed a material, styrene co-polymer, which can be substituted for linseed oil to the extent of 50 per cent and gives it a greater retention of gloss and quicker drying properties. This material is being developed as a new ingredient and not merely as a temporary substitute for linseed oil. At the moment, however, styrene has to be imported from America, but it is hoped that production will start in this country next year.

Linseed oil is not the only scarce constituent. Glycerine, which is used as a medium in paint, has as yet no satisfactory synthetic substitute, although work is progressing on the development of a material obtained from soya beans. In 1946, 6,000 tons of glycerine were exported from the United Kingdom compared with 2,300 tons in 1945 and 5,300 tons in 1938. Moreover, only negligible quantities have been imported in the last two years, whereas the pre-war quantity amounted to over 2,000 tons. Synthetic resins are another paint material with a large export, totalling nearly 13,000 tons last year against 3,700 tons in 1945 and 2,700 tons in 1938. Titanium is rapidly replacing lead in paint manufacture. Imports of the ores, which come mainly from Norway and India, totalled 38,000 tons last year, more than double the pre-war quantity. These materials do not exhaust the list, but they illustrate the current position of shortage. Paint is not merely a decorative medium; it is also a preservative. Property in Britain has suffered and is still suffering serious deterioration through the lack of paint. The restriction on the amount used on new houses, affords only short-term relief, as either re-painting will be necessary within eighteen months or the structures must be allowed to deteriorate. If the export of paint materials is necessary on the recent scale to achieve the industry's export target, their cost should include not merely the labour and materials involved, but also the capital cost for deterioration of unpainted property in Britain. And is there not a good case for exporting the finished product rather than the raw materials?

* * *

Petroleum Equipment Exports

Several missions have recently published reports on the prospects for British sales to export markets. The report of the technical mission to the Caribbean, organised by certain members of the Council of British Manufacturers of Petroleum Equipment, is a valuable addition to the series. Apart from its shrewd observations on certain technical problems in supplying petroleum equipment, the report is of wider interest for its emphasis on the need for manufacturers to study overseas customers' requirements.

The Caribbean mission found widespread approval for the quality of British craftsmanship, though criticisms were voiced to the mission on the over-elaborate design of some equipment and tardiness in delivery. Two important gaps in British exporters' contacts with overseas markets were discovered. The first was the failure of manufacturers to maintain permanent technical representation in the area; the second, following from the first, was a certain failure to appreciate the conditions under which equipment has to be transported and assembled and operated in tropical areas. To meet competition from American firms a combination of local technical representatives, attractive sales catalogues and an efficient equipment maintenance service were found to be essential if customers are to be attracted and retained. In this connection, the report of the mission emphasises the need for standardisation, not only among British firms but also to enable British companies

to compete for replacement and renewals orders from firms which have installed American equipment. The primitive state of the transport system in some areas and the fact that much equipment has to be installed and operated by semi-skilled labour are further arguments for simplicity of design and mechanism, robustness of structure, detailed attention to the stamping of small parts and careful instructions about assembly and operation.

The mission's report does not break new ground in export policy. But it underlines certain points for the attention of manufacturers which still call for emphasis. Exports of capital equipment do not "sell themselves"; they need imaginative handling and a keen insight into the problems of the overseas buyer. Such exports in 1947 and after will have to be the spearhead of the export drive.

* * *

America's Demand for Copper

Reports from the United States indicate that the Senate Finance Committee has reported favourably on a Bill suspending certain import taxes on copper, but with an amendment excluding from suspension the tax on all forms of copper sulphate. Although no definite action has yet been taken so far as is known, American industry remains highly optimistic that the 4 cents a lb. duty on copper metal will in fact be lifted. Indeed, it has been reported that American purchasers are placing orders for foreign copper for forward delivery on the basis of slightly less than 23 cents a lb. New York for electrolytic types, approximately equivalent to £127 a ton.

The removal of the US import duty, however, has wider implications falling beyond the American market. Although less scarce than some other base metals—notably lead—copper is nevertheless in short supply. Increased American demand for foreign supplies will certainly tend to increase world prices because American buyers are able and willing to pay, and because their dollars are in great demand. The influence on Britain, however, will be restricted partly by long-term British contracts for domestic supplies or because Britain is the natural market for "sterling" copper. Thus it is unlikely that any large quantities from Rhodesia will find their way directly across the Atlantic, while 75 per cent of the Canadian exportable surplus for the current year has already been purchased by the United Kingdom. This leaves America four possible sources of supply: Chile, the Belgian Congo, Mexico and Peru. Most of the Congo output is naturally earmarked for Belgium, but it may be willing to sell part of it in return for dollars, just as it has been willing to sell for sterling. Chilean production in 1946 amounted to 352,000 tons, and in the current year it is expected to reach about 400,000 tons. Moreover, it is possible that 75,000-100,000 tons will be obtained from Mexico and Peru. Since current American consumption is estimated at over 1 million tons and prospective domestic production at 600,000 tons, it would seem that the US copper account for the current year can be balanced, but not very comfortably.

Even if the majority of British supplies are secured for 1947, contract prices are not firmly fixed, but tend to move in sympathy with the "world" price. Current indications suggest that this price is more likely to move upwards than downwards. The crucial factor in the equation is the continuance of a high level of industrial activity in the United States this year. If this is maintained, the world shortage of copper and other essential materials will be even more marked in 1948.

Shortage of Containers

One legacy of the fuel crisis has been the growing shortage of containers and wrappers of all kinds, and especially of fibre-board casings. Even before the crisis, manufacturers had been forced to reduce their output to well below normal, a state of affairs indicated early in the year by the acute shortage of kraft paper bags for the cement industry. For some time before February, packers had been almost entirely dependent on current deliveries. Supplies of cartons, paper bags and wrappers were in a poor position, owing to the general wood pulp shortage for all types of paper and cardboard production.

When the fuel crisis came some of the largest users of containers, such as the food manufacturers and distributors, were allowed to carry on without power cuts. But while food production was maintained, food container production was treated as a non-priority industry, and thus deliveries to the foodstuffs and other key industries were further reduced. Electric power has been restored for several weeks, but the limitation of coal allocations to 50 per cent of the November level will prevent packing-case producers from catching up with food production although supplies of pulp and other raw materials are sufficient to increase the output of cases beyond the current rates. Other priority users of packing-cases, such as cigarette manufacturers, producers of medical stores and War Office contractors will also be affected by the shortage.

Since essential foods and supplies must be delivered, materials must be available for packing them. Timber, which is in shorter supply than almost any other material, would have been a possible substitute. But since no relief can be expected from that source, the only solution is to release sufficient coal to enable container manufacturers to meet at least the minimum demands of a schedule of the priority classes—though this is in all conscience far below the output which is required for essential trade. The danger seems to be that the inevitable decision will be delayed long enough to exacerbate the present distribution problem out of all proportion to the saving in coal.

* * *

Retail Sales in 1946

The main feature of retail sales in 1946 was the higher turnover and larger stocks in the shops compared with 1945. A selection of the Bank of England retail sales figures for these two years is given in this week's *Records and Statistics* supplement, but an indication of the increased supplies handled by retailers can be obtained from the indices of sales per selling day given in the next column. Over the year, sales increased by about 18 per cent. The increased turnover in food and perishables was much less spectacular than in other categories. An advance of 12 per cent on the year was dwarfed by the 75 per cent jump in furnishings and 60 per cent in hardware sales.

INDICES OF SALES PER SELLING DAY
(Average Daily Sales in 1942=100)

	1941	1945	1946
Household piece goods	79	86	115
Dress materials	119	125	140
Women's wear	104	117	140
Men's and Boys' wear	102	110	131
Hats and shoes	95	95	111
Furnishings	82	112	196
Hardware	94	125	200

For the year as a whole, daily sales increases ranged from 13 to 17 per cent. The two London areas showed larger advances in turnover, but the divergence between London and the provinces was less marked than in 1945. The continued flow of population back to London in 1946, however, was still sufficient to give the department stores group a larger increase in turnover (30.3 per cent up on the trading year 1945-46) compared with the co-operative societies and multiple shops, which recorded increases of 12.3 and 17.3 per cent respectively. Over the twelve months, stocks of non-food merchandise rose by about the same percentage as sales.

SALES PER SELLING DAY IN 1946-7 COMPARED WITH 1945-6:

(By Areas)§

	1st Quarter	2nd Quarter	3rd Quarter	4th Quarter
Scotland	+ 6.2	+17.1	+17.4	+18.9
North East	+ 7.6	+16.6	+16.7	+17.3
North West	+ 7.5	+18.7	+19.0	+17.8
Midlands and South Wales	+ 5.0	+15.2	+15.1	+18.1
South of England	+ 9.6	+19.6	+19.9	+19.8
London (Central and West End)	+32.1	+41.4	+34.1	+31.0
London (Suburban)	+18.4	+24.1	+17.7	+18.9
Unallocated	+ 7.8	+19.8	+21.4	+21.9

§ Trade years February to January in each case.

Changes are to come into operation in the presentation of the Bank of England retail statistics which will go some way to meet criticisms of the old figures. Sales per selling week will be given instead of sales per selling day, a change which will obviate the rather wide and misleading movements in sales per selling day in months which cover public holidays. It is also hoped to increase the size of the sample and there are important improvements in the classifications of both foodstuffs and other merchandise. These changes, which will incidentally make the figures more strictly comparable with the Board of Trade's returns from independent retailers, will be welcomed by those in the retail trade who use the figures and by the statistician. The statistical value of these new and more ambitious classifications, however, will be dependent on enlarging the size of the sample in many cases.

COMPANY MEETINGS

GENERAL REFRACTORIES, LIMITED

RECORD RESULTS

The forty-seventh annual general meeting of General Refractories, Limited, was held on the 14th instant, at Sheffield.

Sir Ronald W. Matthews, the chairman, said that last year he had given a comprehensive account of the activities of the company and its many subsidiaries at home and abroad and had informed shareholders of the heavy demand for the company's products in the home market and of the highly satisfactory expansion in their business from all parts of the world.

The problems which had confronted the management in their efforts to take full advantage of that favourable position had not arisen from any terminal difficulties on the change-over from war to peace-time production as they were manufacturing exactly the same classes of goods. The main difficulty was the shortage of skilled and unskilled labour at those works which produced the goods in greatest demand, such as silica and basic bricks for the steel industry and silica bricks for the carbonising industry. It was obvious to the board from the experience of the early periods of 1946 that shortage of man power was likely to persist and in consequence it had been decided to carry out further schemes of mechanisation at the works concerned in order to overcome that "bottleneck." He was pleased to inform them that as the year progressed and the various schemes came into operation output had steadily increased and the results for the year for all works of the group were highly satisfactory.

IMPORTANCE OF RESEARCH

They were building a new laboratory at their Worksop works which, when com-

pleted and equipped, would be second to none in the industry. The work of the research and technical departments was of great significance, enabling the company to offer to the many industries which they served not only a constantly increasing range of new and improved products but also a highly developed technical service to ensure that from those products the best possible results were obtained. There was no doubt that the day of using rule-of-thumb methods in ordering refractories had gone for good and it was essential that all users should avail themselves of the great store of technical knowledge possessed by the industry.

The total turnover of the group for 1946 was a record for the group as consolidated in 1939, both in home sales and export business. All departments and subsidiaries had played their part in that very satisfactory achievement. As the largest producers of refractories in the country, the company rendered a vital service to the major industries of the country and, although the general public still only had a vague idea of what refractories were, it was no exaggeration to say that without refractory materials the steel, gas, chemical and cement industries would find it impossible to carry on their business. It would therefore be appreciated that it was essential, if success was to attend the far-reaching schemes of reconstruction and expansion in those industries, that no obstacles should be placed in the way of refractories manufacturers in maintaining production at the highest possible level.

The trading profit of the group for 1946 amounted to £283,723, a record in their history. The directors recommended a dividend of 10 per cent, less tax. The company was in a sound financial position and every opportunity was being taken to modernise and develop their productive capacity. The reputation of their various products stood higher than ever.

The report was adopted.

CAMP BIRD, LIMITED

SATISFACTORY YEAR

The forty-fifth annual general meeting of Camp Bird, Limited, was held, on the 17th instant, in London, Mr F. W. Baker, the chairman, presiding.

The following is an extract from his circulated statement:

The profit and loss account for the year to December 31, 1946, shows that dividends and sundry revenue received at £36,127 were £12,389 higher than in the previous year and that profit on realisation of investments increased by £57,899 to £152,334. The profit earned by the Camp Bird mine was also considerably higher at £11,020, compared with £1,923. The net profit earned, namely, £186,428, was £74,884 higher than for 1945.

Your directors recommend the payment of a dividend of 10 per cent, less tax at 9s. in the pound, which will absorb net £59,782 and leave £32,635 to be carried forward to the current year, compared with £15,304 brought in. The break-up value of the company's shares at December 31st last was 19s. a share, which compares with 17s. 3d. a year ago. The Camp Bird mine and other of our dollar interests, in particular the Fresnillo Company, not only help to swell the company's revenue, but in a small way add to our country's dollar resources.

Since the year-end an interest has been acquired in Motapa Gold Mining Company, Limited, a company formed in Southern Rhodesia under the aegis of the Gold Fields Rhodesian Development Company, Limited, to work the B. & S. and Fossicker properties situated at Bubi, north of Bulawayo.

Your company is in a sound liquid position and is able to take advantage of any promising opportunities which may present themselves.

The report was adopted.

Shorter Notes

Since last Monday, the new Stock Exchange Daily Official List has been published. This combines the old Daily List of Officially Quoted Securities and the Daily Supplementary List of Securities Not Officially Quoted. Under the new conditions, a quotation is granted at the same time as permission to deal. This ends a practice which marked an interesting tradition but had become increasingly irrelevant to present-day market conditions. New companies will appear in italics until they have been able to make certain statutory declarations necessary under the Companies' Acts. Some relatively inactive stocks will continue to appear in the Monthly Supplement. The layout of the new list has been changed to show information about recent dividends.

The Vauxhall Motors report for 1946, which is dealt with among the Company Notes in this week's *Records and Statistics* Supplement, is noteworthy for the clarity in the presentation of the accounts and the informative content and the broad approach to shareholders and workpeople alike, of the directors' report. The latter includes an analysis of the year's total income into the shares attributable to the different factors of production. Only 0.9 per cent of income went to shareholders, while materials and services took 68.9 per cent and wages and salaries 20.4 per cent. A cautious optimism on output estimates for 1947, the success of the 5-day week and the value of good relations with the workers are among the features of the directors' statement.

The Brussels trade talks between British, Belgian and Luxembourg representatives ended last week. The delegations agreed upon measures to increase exports to the United Kingdom, and discussed the question of imports from Britain and foreign exchange problems. British iron and steel imports from Belgium declined from 219,890 tons in 1938 to 48,581 tons in 1946, and flax imports from 19,611 tons to 9,496 tons. It is hoped that the imports of steel will total 92,000 tons in the twelve months to

March 31, 1948; that flax imports will exceed the 1938 total in 1947, and that other goods, including foodstuffs, will be increased.

It has been reported from the Netherlands East Indies that Java is unlikely to export large quantities of tea at least before 1948. Only four of the 350 tea producing estates and factories in Java and Sumatra are at present working under Dutch control. Many others are, however, operating under the administration of the Indonesian Republic, but no information is available about production or stocks for export.

The 20 per cent war-time discount on private car and cycle policy premiums in the United Kingdom and Northern Ireland will be discontinued from July 1, 1947, in cases of new insurances and renewals. This decision has been necessary owing to the increased volume of traffic and road accidents.

The output of main copper and copper alloy products in the United Kingdom amounted to 29,395 tons in February, the copper content of which was 23,047 tons. This compares with the January output of 64,700 tons having a copper content 50,600 tons. Consumption of virgin copper, which totalled some 33,500 tons in January, declined to 13,000 tons in February, while the use of copper and alloy scrap fell in the same period from 17,200 tons to 10,100 tons.

The Rand gold output for March was 815,157 ounces against 572,720 ounces in February, when dislocation due to the unofficial white labour strike was at its height.

Two new working parties have been set up by the Board of Trade. The first will inquire into the Light Clothing industry and the second into the Rubber Proofed Garment industry.

SECURITY PRICES AND YIELDS

A fuller list containing 370 securities appears weekly in the *Records and Statistics* Supplement. Notes on the following company reports also appear in the Supplement: Vauxhall; International Nickel; Canadian Pacific; Associated Electric.

HONGKONG AND SHANGHAI BANKING CORPORATION

PROGRESS IN THE COLONY

MR A. MORSE'S SURVEY

The ordinary general meeting of shareholders of this Bank was held, on the 28th ultimo, in Hong Kong.

The chairman, the Honourable Mr A. Morse, C.B.E., in the course of his speech said: Gentlemen,—I want to start my speech to-day with a word of sympathy for our people at home in Great Britain. It is indeed hard that after their toil and privations during the war the promising early progress achieved by strenuous efforts in 1946 should be retarded first by adverse conditions which marred the harvest and then by one of the severest winters within living memory. I feel confident, however, that the setback is but temporary and that with the vigorous measures now being adopted and the traditional courage, grit and energy of the British people, the wheels of industry will soon again be revolving with full vigour, with a consequent increasing flow of exports overseas.

The balance-sheet submitted to you this year is on the same lines as before the outbreak of the war with Japan, and I am sure it is a source of satisfaction to you as it is to me that once again we are in a position to produce what may be termed a clean statement of account.

The profit arising from current transactions during the year, after making certain transfers to provisions for contingencies, amounts to H.K.\$9,602,703. I would remind you that last year I stated in effect that until such time as our war losses could be ascertained with reasonable accuracy, no dividend would be paid. I am glad to say that your directors feel that the present position justifies a payment to shareholders, and it is proposed to pay a dividend of £3 per share, which at 1s. 2½d. amounts to H.K.\$7,760,842 and leaves the sum of H.K.\$1,841,861 to be carried forward to next year.

You will be interested to know that we now have 39 offices, including agencies, in operation, while we have recovered possession of two more which have not yet been opened. Seven pre-war offices are still closed. I must confess that it is difficult to understand why we should still, 18 months after the end of hostilities, be refused facilities even to send our men to Japan to try to clear up our books or to take possession of our properties. My feeling is that the importance of this matter is much under-estimated by British official circles both in Tokyo and London.

EXCELLENT TRADE RETURNS

As in past years has been the custom, I will now say a few words about conditions in the areas where we operate. In Hong Kong we can, I think, be well satisfied with the progress made in 1946 as shown in the excellent trade returns, which aggregated close upon H.K.\$1,700 million, namely \$933½ million of imports and \$765½ million of exports. In terms of volume, however, foreign trade is still well below the pre-war mark.

Our relations with China remain of supreme importance, and we have watched with anxiety the trend of developments there during the past year. We welcomed the visit of the governor of the Central Bank of China last December and some very useful discussions then took place. I hope that the exchange of such visits will become a regular practice in the future.

JAPANESE OCCUPATION CURRENCY

At the annual meeting in July last year I said that it was a matter of urgency that His Majesty's Government should take early action to remove the moratorium both in

Hong Kong and Malaya, and to clarify the effects of enemy occupation on the relations between debtors and creditors. It now appears from an announcement made on February 27th in the House of Commons by the Secretary of State for the Colonies that the enactment of legislation is shortly to take place to deal with the value to be accorded to payments in Japanese occupation currency in respect of debts contracted before occupation. This is a serious matter, and, speaking for the bank, I must formally protest against any legislation which would have the effect of adjusting debtor-creditor relationships by the arbitrary validation to any extent of payments made in occupation currency to the so-called liquidators. If I understand the present proposal correctly, it is without justification either in law or in equity in its wider sense. Moreover, the bank has discharged all its obligations to depositors and other creditors, but it has been precluded by the moratorium from collecting the debts owing to it before the war.

PROGRESS IN MALAYA

In Malaya the period of reoccupation has ended and trade and industry are progressing rapidly towards normality, but materials required for the rehabilitation of factories, for the tin-mining industry and for many industrial undertakings are slow in arriving. There is also a shortage of coal and labour troubles have been a serious problem. The rubber industry has recovered steadily. Tin has made less progress, owing to the serious damage to dredges, shortages of fuel and strikes. It looks as if the international control of tin will remain in force until world supplies have increased, but there is a widespread desire for a reversion to an open market with the normal and speedy adjustment of prices to supply and demand. As in Hong Kong, so also in Malaya a settlement of questions affecting debtor-creditor relationships, the moratorium and war damage claims is long overdue.

N. E. I., PHILIPPINES AND INDIA

The political situation in the Netherlands East Indies at present prevents normal trading, but, looking ahead, I am by no means pessimistic about the future prospects of trade in these rich islands.

I must take this opportunity to extend our good wishes to President Roxas and to the Philippine Islands on the establishment of the Republic on July 4, 1946. In spite of many difficulties, the primary products of the islands are recovering and the world demand for Philippines sugar, hemp, coconut and mining output remains vigorous. Our branch in Manila has taken an active part in financing foreign trade in this territory and prospects remain satisfactory.

As regards India, the year 1946 will long be notable on account of the discussions regarding the transfer of political power, which were followed by the establishment of the Interim Government in August. Last month a further momentous announcement was made by the Prime Minister when he stated His Majesty's Government's intention to transfer power into responsible Indian hands not later than June, 1948. Notwithstanding the political uncertainty, Indian trade has been good during 1946 and I am well satisfied with the business done by our offices at Bombay and Calcutta.

Turning to the political situation in China, we must face the fact that in spite of all hopes internal developments during the past year have been a great disappointment.

The report was adopted.

HADFIELDS, LIMITED

OVERFLOWING ORDER BOOK

LORD DUDLEY GORDON'S SPEECH

The 59th ordinary general meeting of Hadfields, Limited, was held, on the 14th instant, at Sheffield.

Lord Dudley G. Gordon, D.S.O. (the chairman), in the course of his speech, said: The directors' report circulated with the balance-sheet and accounts refers to the change-over from armament to commercial products, and the development and modernisation which have been taking place since the last general meeting. Last year I referred to the cessation of production orders for armour-piercing projectiles. Prior to and during the war we were asked to install some Government-owned plant in other sections of our works in order to expand our capacity for further armament work. From the moment that hostilities ceased we have been in touch with the authorities concerned with a view to ascertaining what demands might be made on us in the future.

As regards armour-piercing projectiles, the negotiations have reached an advanced stage, and it is expected that an agreement concerning the maintenance of a nucleus will shortly be concluded. In the case of the Government-owned plant, certain groups have now been removed from our works, but other important sections are still here, and we lack an indication of the Government's policy as regards their future use, which interferes with the completion of the final details of our reorganisation schemes.

MAJOR DEVELOPMENT SCHEMES

The directors' report refers to several major development schemes. The most urgent of these is a modern forging shop in a new position, to be equipped with the latest and most efficient plant. The space so released will provide badly needed extensions for the Millspaugh section of the works. Development in the foundry is well advanced, and certain tests are at present being made which will help to decide the alteration necessary to our steel melting plant. We have also ordered a number of new machine tools, some of them of large size and involving considerable expenditure. Thus we have to contemplate an expenditure of over £1,500,000 spread over the next five years.

We continue to receive a satisfactory volume of orders for our specialities of hardened steel rolls, crushers, equipment for dredgers, tramway trackwork and coal mine equipment. Export trade continues to expand satisfactorily, though in certain directions there are already signs of increased activities by overseas competitors. We are on the point of completing one of the largest orders for dredger spares ever received in the history of the company, whilst other notable orders for dredger parts have been secured, for shipment abroad.

The visits which have already been paid to America will be followed within the next few days by a visit which is to be paid by our deputy-chairman and managing director, Mr Thomas, who will be accompanied by Mr Leetch. This visit will enable Mr Thomas to renew our many valuable contacts in the United States, and also to investigate the possibility of acquiring further manufacturing licences which are under consideration.

THE ACCOUNTS

I draw attention to certain figures in the accounts. In the profit and loss account, the figure of £143,000 for taxation provides for our liability to the date of the balance-sheet and not merely for the fiscal year. We propose to provide in future for the full period. It is specially to be noted that there is no provision for E.P.T. This is due to the fact that though profits in excess of the pre-war standard were earned in the early period of the tax, deficiencies in later years extinguished this liability and we became liable instead to

National Defence Contribution and later on profits tax. Having made no excess profits, we have no claim to the return of 20 per cent. for the period when the tax stood at 100 per cent., and no fund is available from this source to contribute towards our reconstruction expenditure.

The net profit at £158,852 is £47,544 higher than 1945, while the trading profit at £149,053 is £45,710 lower. The balance-sheet shows a surplus of current assets over current liabilities of £1,919,886. This surplus of current assets is based on book values. If market values were taken the surplus would exceed £2,000,000. The reduction in Government securities represents the repayment of debentures. The figure of £140,839 under advances to subsidiaries represents the major part of our investment in Millspaugh, Limited.

The dislocation caused by the coal crisis and the severe weather resulted in a loss of steel production of 10,000 tons. The bulk of our production is special steels which pass on for further fabrication within our works, so this loss is more serious than if we were suppliers of bulk steel. By careful attention to fuel economy and maintenance of the efficiency of plant we hope to make good the greater part of this loss.

MANAGING DIRECTOR'S VIEWS

Mr J. B. Thomas, F.C.A. (Deputy-Chairman and Managing Director), in the course of his remarks, said: The accounts show an increase of profit of £47,544 over 1945, which, however, includes the sum of £224,367 in respect of a claim against the prices fund of the British Iron and Steel Federation for 1945, which after allowing for taxation leaves £112,183. Charged against the profits of 1946 is the sum of £40,205 for the balance of A.R.P. expenditure, most of which would have been recovered if the company had been liable to E.P.T. over the whole period of the tax. After allowing for these items, the profit for 1946 is therefore £86,874 as against £111,308 for 1945.

The following information gives some interesting details of the 1946 results:—

Dividend.—It is again suggested that to calculate the dividend of 17½ per cent. on the issued ordinary stock is misleading. If the capital employed in the business belonging to the ordinary stockholders be taken, then the figure of 17½ per cent. comes down to 5½ per cent., both of course less tax. It must not be forgotten that a considerable portion of our reserves is represented by capital profits, which had nothing to do with our trading.

STEEL BARONS

"Steel Barons."—This and similar terms have been used against the iron and steel industry. The holders in our company are: 66 per cent. with £100 or less, 95½ per cent. with £500 or less, and 98.2 per cent. with £1,000 or less, with an average holding of £124. The balance of 1.8 per cent. is owned by trustees and investment companies. What applies in our case applies to similar companies. Where then are these "Steel Barons"?

General.—This country is facing what is probably one of the greatest crises in its history, which, if not surmounted, will inevitably result in financial chaos from which will ensue wholesale unemployment. A country like our own, which depends for its very existence upon its export trade, cannot maintain its present high level of wages, together with improved social services, against the competition from other countries whose peoples have lesser benefits than our own, unless we produce far more than we are doing to-day. The remedy is in the hands of each one of us, and a nation whose people withstood the perils of the last war can undoubtedly overcome the dangers that lie ahead of us, providing we all work with the same will as we did in 1940 and 1941.

The report was adopted.

UNITED KINGDOM PROVIDENT INSTITUTION

LOSS ON NATIONALISATION

SIR ERNEST BENN'S STATEMENT

The annual general meeting of the United Kingdom Temperance and General Provident Institution will be held on the 23rd instant, at the head office, 33, Gracechurch Street, London, E.C.

The following is extracted from the statement by the chairman, Sir Ernest J. P. Benn, Bt., circulated with the report and accounts:—

THE DIRECTORATE

Two changes have occurred on the board of directors of the Institution. Failing health has impelled the Earl of Strathmore to relinquish the position he has held throughout the whole of the war.

We welcome a new director, the Hon. T. Money-Coutts, whose election is now submitted for confirmation by the general body of members. With a life-long interest in banking and a wide experience in matters of investment, Mr Money-Coutts strengthens our capacity to face the problems of the future.

THE DEMAND FOR LIFE ASSURANCE

The year 1946, covered by the accounts now presented, was a period of exceptional difficulties, enhanced by the general sense of disappointment at the absence of reliefs expected to come from the ending of the war. Our figures continue, on paper, the story of our uninterrupted progress, and as our obligation is to deliver benefits, when due, in pounds sterling the technical position of the institution is stronger than ever. So far as it is humanly possible to foresee, there is not the slightest chance of any first-class life office failing to honour the letter of its contracts. In our case policies effected only 20 years ago now stand at 40 per cent. above their original face value. In addition to the provision of cover for all those years, a U.K. policy has thus proved to be a gilt-edged investment yielding compound interest at the rate of 4 per cent. per annum. Such results, of themselves, are sufficient to explain the demand by the discriminating public for increasing sums in life assurance policies.

The present-day difficulties in finding investments are also stimulating the market, and it is evident that people prefer to employ expert agencies such as the U.K. Provident to take care of their money. With more than a century of experience, and equipped with highly skilled departments in the management of investments and estates, we should do somewhat better than the individual with small resources.

We cannot, for the time being, offer the prospect of such spectacular bonuses as have been our fortune in the past, but we hope to maintain the lead, as indeed we have done even in the course of the war. Our compound system of bonus, coupled with low premium rates, still provides the best obtainable return.

LOSS ON NATIONALISATION

The institution has yet to experience the full effects of the nationalisation policy now actively engaging the attention of Parliament and the Government. We hold between three and four millions of stocks which have been, or are due to be, compulsorily exchanged into what are called gilt-edged securities. In some cases, as for instance coal, it will take time before the loss of income caused by the exchange can be accurately measured. In others, such as railways, it is possible to make close estimates on the assumption that the schemes now before Parliament reach the final stages

without amendment. With gas and electricity we still await the detailed proposals, but when all these risks are added together the loss of income to be suffered by the institution may well be in the neighbourhood of £100,000 per annum. The nationalisation of further industries would, of course, enlarge the loss: £100,000 is 7½ per cent. of our total income from all our investments, including mortgage interest and rents; if quoted Stock Exchange securities are the basis of the calculation, then 15 per cent. is the nearer measure of loss of income with which we are threatened.

The accumulated funds of the institution amount in round figures to £30,000,000, and the sums assured by our policies total £65,000,000. The interest on our funds, added to our premium income, has therefore to provide rather more than half of the total benefits which our members look to receive as and when their policies qualify for claims. It follows that if interest rates fall, rates of premium must rise. The shallow impression that cheap money is only a matter of concern to the wealthy should be corrected by a wider knowledge of the affairs of provident trusts such as ours. The average value of our policies on maturity is £700 and the average personal share in our total funds is seen to be, at the present cash value, a little over £300. The loss of £100,000 a year interest may be thought to be of minor importance to a great life office whose financial position is impregnable, but if that loss is considered as a new tax of a pound a year upon all those thrifty people who in their careful way have accumulated a capital sum of £300, one of the results of the nationalisation of industry becomes easier to understand.

Cheap money, against which I have always protested, has provided us with very considerable enhancement or inflation of capital values but the calculations on which insurance contracts are based are concerned almost entirely with income. A low rate of premium assumes a high rate of interest and vice-versa; a good bonus is contingent upon a good income earning capacity.

BONUS YEAR

This is the last year of another valuation period, and at the end of it the board will review the financial position of the institution and decide what surplus funds may properly be given to the members as bonus additions to the sums assured by their policies. So far as can be seen at the present time, and should 1947 prove equal to 1945 and 1946, the distribution of a good bonus for the three years 1945-47 is assured. Our mortality experience has again been favourable, and by judicious management of the funds the interest yield has been slightly increased. In accordance with our established practice, new policies completed during 1947 will participate in any bonus that may be declared.

FIRE AND ACCIDENT COMPANY

Our subsidiary, the United Kingdom Fire and Accident Company, is growing both in volume of business and in profits. Full advantage has been taken of the removal of the limitations imposed during the war, and our members are becoming increasingly aware of the benefits of using their own office. The convenience of dealing with all insurance matters at one and the same time is appreciated, and experts in fire and general business have been appointed to all our branches.

NATIONAL BANK OF INDIA LIMITED

Bankers to the Government in Kenya Colony and Uganda.
Head Office: 26 BISHOPSGATE, LONDON, E.C.2.

BRANCHES:				
Aden and Aden Point (S. India)	Cochin (S. India)	Madras Mandalay	Kisumu Mombasa	Kenya Colony

ASSETS EXCEED	£92,000,000
CLAIMS PAID EXCEED	£173,000,000

(1945 Accounts)

CRAWLEY DEVELOPMENT CORPORATION

The Development Corporation recently appointed for the establishment of a new town at Crawley invite applications for the under-mentioned posts.

The officers will be responsible heads of departments, and will be expected to work as a team under the direction of the Chief Executive Officer. The task is of a pioneering kind and calls for imagination, initiative, resource and proved organising ability of a high order. Applicants should show themselves possessed of this combination of qualities as well as of a recognised professional status.

Chief Engineer (Ref. H.D.100)

Applicants should be corporate members of the Institution of Civil Engineers and/or the Institute of Municipal and County Engineers, and should have had executive experience of large-scale civil engineering works. The successful applicant will be required to take charge of the civil engineering projects to be carried out on behalf of the Development Corporation.

Chief Architect (Ref. H.D.101)

Applicants should be Fellows or Associates of the Royal Institute of British Architects and should, in addition, have had experience of town planning work. The successful applicant will be required to co-ordinate the design and planning work in connection with the development of the town.

Estate Officer (Ref. H.D.102)

Applicants should be Fellows or Associates of the Royal Institution of Chartered Surveyors or of the Auctioneers and Estate Agents Institute, and should have had experience of the management of large urban estates. The successful applicant will be required to supervise the leasing of land, to manage the Corporation's own property, and to advise on all matters of estate development and on the promotion of industry and commerce.

Legal and Administrative Officer (Ref. H.D.103)

Applicants should be Barristers or admitted Solicitors and should preferably have had experience in a Local Authority or Public Utility Undertaking. The successful applicant will be required to act as Secretary of the Corporation and to take charge of the administration and personnel services as well as of all legal questions.

Chief Finance Officer (Ref. H.D.104)

Applicants should be Chartered or Incorporated Accountants or certified Corporate Accountants and/or hold high municipal or other accounting qualifications, with a wide and varied experience in important financial and commercial affairs. It will be of advantage to have been in some branch of public service. The successful applicant will be required to take charge of all aspects of the Corporation's finances.

Applications, in writing, must quote the appropriate reference given above and should be submitted to the Crawley Development Corporation, 11, Grosvenor Square, London, W.1, by the 24th May, 1947, together with copies of three testimonials. Date of birth should be given, as well as particulars of education, qualifications, appointments in chronological order, present salary and salary now required.

THE CUNARD STEAM-SHIP COMPANY, LIMITED

NOTICE IS HEREBY GIVEN that the Seventieth Ordinary General Meeting of THE CUNARD STEAM-SHIP COMPANY LIMITED will be held at Cunard Building, in the City of Liverpool, on Wednesday, the 30th April, 1947, at eleven o'clock a.m.

1. To receive and consider the Statement of Accounts and Balance Sheet to the 31st December, 1946, with the Reports of the Directors and Auditors.
2. To sanction the declaration of final dividend for the year 1946.
3. To elect Directors and Auditors in place of those retiring, but who being eligible offer themselves for re-election.

By Order of the Board.

H. J. FLEWITT, Secretary.

Offices: Cunard Building, Liverpool. 17th April, 1947.

SUDAN GOVERNMENT

Sudan Railways require a Qualified Accountant for service in the Sudan for general accountancy and costing. Candidate should possess a recognised professional accountancy qualification and have a good practical experience with a business firm. Knowledge of modern costing procedure and of punched-card accounting would be advantage. Age 25-35 years.

Appointment on Short Term Contract (initially for two years) at a starting salary of not less than £E400 per annum, according to age, experience and qualifications. Cost of living allowance at the rate of 3s per cent of salary, subject to a maximum of £E15 per month, is now payable. Outfit allowance at the rate of £E40 is payable when contract is signed, provided appointment is at a salary not exceeding £E300 per annum (£E1=£1 0s. 6d.). Free passage on appointment. Strict medical examination. There is no income tax in the Sudan at present. Papers containing fuller information, and application forms, obtainable from Sudan Agent in London, Wellington House, Buckingham Gate, London, S.W.1. Please mark envelopes "Railway Accountant."

NATIONAL FARMERS' UNION requires **ECONOMIST**. Sound knowledge of economics and statistics and ability to write essential. Salary according to qualifications, but not less than £500 per annum. Applications should reach the General Secretary, 45, Bedford Square, W.C.1, not later than 10th May, 1947.

AN important national institution requires the services of a Senior Executive. He should have a first-hand knowledge of industry, administrative and some sales experience, and wide cultural interests. The work is interesting and offers considerable scope. The headquarters are in London, and the salary is on a range of £1,000 to £1,300 with a pension scheme. Particulars should be sent to Box 437.

A BUSINESS man of proved ability, courage and initiative, with a successful record in war and peace, seeks a permanent progressive post where good brain-work receives scope and appreciation. Educated at Winchester and Oxford. Lately Lt.-Col. and Assistant Director, Ministry of Supply. Up-to-date knowledge of management, marketing, research, control.—Box 480.

The Battle of Minden

WHATEVER minor agreements may be contrived by the Foreign Ministers at the eleventh hour of their meeting in Moscow, it is clear that a comprehensive agreed plan, either for the present administration or for the future settlement of Germany, will not be forthcoming. The American and British Governments have never made any bones about the alternative course they would have to pursue in the event of just such a failure to agree. They would then regard the fusion of their two zones of occupation, not as a provisional expedient in advance of a fusion of all four zones, but as a more permanent policy. Failure at Moscow ought to mean a more vigorous pursuit of agreed Anglo-American policies in the fused zones. Yet the fact is that the alternative two-power policy is not in very much better shape than the four-power policy that is now breaking down. The project of fusion has reached a point from which something approaching disaster can be seen lying ahead, unless a new path is followed. Failure at Moscow may assist matters, since it will re-direct attention to the problems of fusion and make it urgent to take steps to resolve them. But no good can come of their being taken in a fog of illusion in this country or in America about "progress" being made in Western Germany.

Why, it may be asked, should the position be so serious now, seven months after Mr Bevin and Mr Byrnes agreed on the principles of a merger of the British and American Zones, and three months after the agreement was implemented by measures designed to make the combined area financially self-supporting within three years? To all parties the agreement seemed to promise the revival of German economy—at least in half the country. To the British, it guaranteed that the United States and the largely agricultural American Zone would share the responsibility for feeding the industrial British Zone, and would provide credits for priming the export trade. The price paid by the British was high; it meant a temporary increase in the financial outlay, an agreement to bear half of the German trade deficit over three years and to provide the British share of the cost, if required, in dollars—but no other way could be seen of eventually stopping the drain of British "reparations" to Germany. The merger has not, strictly speaking, failed. More accurately, it has never really taken place. The reason is chiefly to be found in the divergence between the British conception of a Federal Germany, and the American conception of a German Confederation—one with a centralised, planned economy, and the other with a decentralised control in the hands of virtually independent States. Roughly, the divergent trends have also come to be represented by the North German Social-Democrats, and the South German Conservatives, by the Ruhr and Bavaria.

In practice, the merger has resulted in making the structure of government more complex rather than more simple. In each zone, before the fusion, there was the Military Government of the occupying power, acting partly on its own authority and partly on that of the four-power Control Commission in Berlin, and also various German administrations. Both the British and the American zones are divided

into three *Länder* or States and one city (in the British zone, North Rhine-Westphalia, Lower Saxony, Schleswig-Holstein and Hamburg; in the American zone, Bavaria, Württemberg-Baden, Hesse and Bremen). The problem of fusion was to evolve new joint organs, both on the Allied and on the German side.

On the side of the Military Government, the fusion has not brought about such a close integration of British and American authority as was achieved by SHAEF, with an officer of either nationality exercising functions for both. What it has meant has been the appointment of two officers, one British and one American, to every office. It is a happy fact that these officials are working together with the greatest smoothness. Both sides respect the other's ability; both are working for a common ultimate aim. Despite its complexity, this side of the fusion is not a failure; and there is much comfort for the future in that fact. Nor can it be said that the relationship of the Allied Military Governments to the German bizonal executive committees is unsound in its structure, although complications are introduced by the fact that the five committees are situated in four different cities.

The fundamental fault which has led to the present deadlock is to be found in the relations of these German executive committees, set up for the two zones together, to the German administrations of the eight *Länder* or States. This is the point at which the issue of regional autonomy *versus* central planning and control is being fought. The basic question which still remains unanswered is the degree of authority that the German bizonal agencies are to have. The Anglo-American Preliminary Agreement of last September, which decided upon their establishment, implied that they would have legislative powers valid for the combined zones. It was laid down, in particular, that the bizonal Executive Committee for Economics (ECE) would have authority over the principles of German economic law (including penalties for infringements); over economic planning and the control of production and consumption; and over price policy and price control. As a concession to the States, however, they were given the right to veto any act of legislation by the committees, the final decision resting with the Military Government. Before the fusion, the powers granted to the bizonal committees had already been exercised in the British Zone by the German Central Office of Economics. The provisions of the September Agreement, therefore, appeared to mean that principles hitherto followed in the British Zone were to be applied to the two zones.

But this appearance of things was very quickly disturbed by the emergence of a point of constitutional law of the kind in which Americans, in their own country, take so much delight, and by which—or so it seems to the foreigner—they seem to be so often content to allow their own good intentions to be frustrated. What legal authority, it was asked, did the German committees have to legislate? From whom did they derive authority? The Ministers of Justice in the three South German States in the American Zone declared some months ago that none existed; any such authority presupposed, they said, the existence of a legal entity superior to the States, and there was no such entity. Dr. Agartz, now head of the Executive Committee for Economics, on the other hand, maintains that the German Reich still exists, its sovereignty being only temporarily taken over by the Allied Control Council; according to him, the rights which the ECE was originally intended to exercise were withdrawn from the States pending the establishment of a Central Government.

Confusion on this point has led, first, to a fatal division of responsibility and, more recently, to a definite decision that the ECE had no power to legislate. The ECE and the other German bizonal agencies were formed by bringing together the respective Ministers from each of the German State Governments, under an independent chairman. There are thus eight ministers of economics in the ECE, eight ministers

of food in the Bizonal Food Committee, and so forth. As a body, the committees are responsible to the Allied Military Government; but each Minister is also responsible to his own State Government. And in the State Governments, it is local party politics that swing decisions. No Minister in Germany today cares to take an unpopular decision, though the times call for the sternest measures.

The way the land lay was shown at the beginning of this year, when the Executive Committee for Economics issued a decree on a uniform scheme for the control of goods and prices, and it was vetoed by Bavaria. Up to the present, neither this nor any other piece of legislation valid for the two zones together has been promulgated.

Democratic legality and separatism won last month a major victory over centralised planning and control. The highest British and American authorities then issued a decision to the effect that no authority exists in the German executive committees which can issue a law binding in both zones; that they may recommend, but not enact or require the enactment of legislation; that their recommendations must be submitted to the Military Government; and that, if they are accepted, "each Military Government will proceed according to its methods to secure promulgation." The last phrase means that the British will promulgate the law direct, but that the American Military Government will pass it down again to the individual German State Governments in their zone, who can, if they choose, then hand it back to their own *Länderrat*, or Council of States. At the same time, the American Military Government issued a proclamation expressly stating that the State Governments in their zone had full legislative powers in all matters except international treaties, legislation by the Allied Control Council for the whole of Germany, and powers for executing such fundamental policies of the occupation as demilitarisation, the breaking-up of cartels and the like. Only in these fields do the Americans retain their powers of law-making.

It is small wonder that after this blow Dr Agartz, a sick and almost despairing man, bitterly declares that the Anglo-American Bizonal Agreement, instead of reducing two zones to one, has created eight out of two. The forces of German separatism, particularly in Bavaria, indeed seem to be too strong. They find allies in those conservative and liberal circles all over the combined zones who see a menace in the ECE, consisting as it does entirely of Social-Democrats, with strong ideas on socialisation and centralised control. Political prejudices are behind a propaganda campaign which is in progress in South Germany at this moment, directed against the whole fusion agreement and the Anglo-American export plan in particular. It depicts the failure of the agreement as due to the British and the "Government Party," that is, the Social-Democrats, and is indignant at the idea that South Germany should deliver its food surplus to the Ruhr when coal deliveries to the South have not come up to the promised level. Yet one basic cause of the sudden drop in coal production, apart from the appalling winter, was the failure of Bavaria to deliver food to the Ruhr.

The demand for control of the German economy, with centralised pooling and distribution of resources, is no more due to doctrinaire Socialist dislike of free enterprise than were the war-time controls in Britain. It is the hard fact of the extreme scarcity of almost all commodities which makes it imperative. What lack of power at the centre means can be seen from the example of coal. When the Coal Control came under the ECE, the system of allocation was changed; instead of being on a "State" basis, it was put on an industrial basis, the most vital industries being given priority. But since no bizonal control of distribution exists, each individual State authority can allocate the coal to any firm it pleases within the industry—or even to different industries. When the crying need is to stop waste by closing down all but a few of the most effi-

cient producers, permits are being issued right and left, in order to keep everyone pleased with the local authority and his party. Permits are even being granted to new firms to start up, when existing efficient industries are only running to a fraction of capacity. The right to issue such permits in the British Zone was one which was formerly in the hands of the Trade and Industry Division of the Control Commission; now it is decentralised into the hands of the State Economic Ministries, instead of being firmly in the hands of a body which is executing a coherent policy.

The greater proportion of general output—perhaps even as much as 60 per cent of it—is completely outside control. Several conditions make it inevitable that a large proportion of output should tend to go direct from the factory to some form of black market. The first is the low level of production in comparison with capacity; this means that enterprises work at a loss, which can only be made good by selling—or more often, bartering—some of their output in the black market. The second is the artificially low controlled prices, which are coupled with an extremely high rate of taxation, based partly on unreal "assets." The controlled rates of wages are also artificially low, which makes it necessary for the employer to supplement them in kind. The absence of any currency reform, coupled with the knowledge that a proportion of the existing note circulation will sooner or later be cancelled, makes for a plentiful supply of money in the black market. And finally, lack of food drives works managers to barter part of their production in exchange for canteen supplies. In view of this situation, it is small wonder that the German economy and the control authorities are working on parallel lines which never meet.

Democracy or Salvation

Unless some drastic changes are made, the British and American plan to make their "combined" Zones pay their way by the end of 1948 will fail. Already it is clear that there is almost no possibility of reaching the 1947 export target. The export plan suffers from faults of its own. The German economic authorities and the Joint Export-Import Agency form another set of never-meeting parallel lines. The British and Americans, through the Agency, control the foreign trade of the combined zones, but not their internal economy. The position is somewhat that of a board of directors with no control over the management—an arrangement which might work if the interests of the two were identical. In Germany, however, they are largely conflicting. And behind these economic difficulties there lies a similar conflict over political principles. Some form of political fusion of the two Zones is being discussed, and there also traditional American principles, somewhat academically applied, are allied with South German separatism in favour of a very loose confederation of states. Bavarian separatist feeling is, at the moment, undeniably strong and the Americans can justly argue that their policy is strictly democratic, since the German people's will, expressed in elections and constitutions, is being followed. They can also argue that, if there is not a strong Government of Germany, there can hardly be a revival of militarism and aggressive foreign policy, and this argument also, taken by itself, is a valid one. But the fact remains that if, in the realm of economic policy, there is to be no central and coherent policy, but a selfish determination to keep food in the home larders, then Germany—whether it be the whole of Germany or Western Germany by itself—will never climb out of its present sterile chaos or cease to be a burden on the occupying powers. If States' rights, in the United States itself, did not extend to the economics of war, then they cannot be applied with any hope of success to the far more stringent shortages of Germany today.

A new start is now to be made, and a central government of some kind for the two zones—or for three zones, if the French can be persuaded to join in—will now be set up, as a

sequel to the failure in Moscow. Much depends upon whether it has a federal and not a confederate structure. If the new parliament merely reproduces on a larger scale the *Länderrat*, or Council of States, of the American Zone, which is simply a conference of State Governments, with vague powers and a rule of unanimity, then the prospect is bleak. It is not a comfortable position to be urging British views, with a Socialist tinge, on Americans, with their federalist traditions and free-enterprise principles. If it were possible to avoid such a direct clash of national viewpoints, it would be a great advantage, and the British authorities in Germany have made, and are still making, every effort—without very much advance from the American side—to avoid it. But the pressure of inexorable facts is too great. The issue cannot be further deferred, and it becomes the first task of Lord Pakenham, as he takes over Mr Hynd's office, to give the Americans solemn warning that the British Zone will collapse unless there is a coherent and

effective economic policy which is enforced all over the combined zones—and that, with an industrial collapse, the comparative self-sufficiency in food of Southern Germany will not avail it very much or very long. Perhaps the issue can most effectively be stated to the Americans in terms of their own history. Do they really think that the United States could have prospered under the Articles of Confederation of 1777 and without the stronger financial and economic powers that were conferred on the Federal Government by the Constitution of 1787? The whole of American history and law gives the answer. And if some central powers were needed in eighteenth century America, are they not far more necessary in twentieth century Germany? It would be a pity—more than a pity, a disaster—if a temporary and accidental alliance between American academic idealism and Bavarian selfishness were to undermine the only policy that the Western Powers have to set up as an alternative to agreement with Mr Molotov on Mr Molotov's own terms.

The Tory Alternative

AT regular intervals since the General Election, the British Institute of Public Opinion, the local branch of the "Gallup Poll," has been asking the public whether it is satisfied or dissatisfied with the Government's record to date. Last week, for the first time, the results showed a majority of dissatisfied voters. On simple, general political issues like this—questions that the man in the street can understand and on which he has at least a partly-formed opinion before he is asked—the record of the Gallup Poll for accuracy has in the past been very impressive, both in this country and in its native land. The public was not asked whether it preferred the Tories, and if it were, the adverse majority might be much larger. The vote was also taken in the shadow of the fuel crisis and the Labour Government may have a return to favour. But the probability, it must be said, is in the other direction; there is more economic trouble coming; the Government are in no fit state to meet it; and their popularity will suffer as a result. It would be very rash indeed to bet on another lease of power to the Labour Party at the next General Election.

These things are not here stated with any glee. *The Economist* is not a party organ and the opinion is not now stated for the first time that a transfer of power at this moment from the Labour Government to a Conservative Government, or even to a coalition of both parties, would be no improvement and might well be a disaster. The Socialists, whatever may be their defects, have a lot of energy and a few ideas, while the Tories are tired political agnostics. If, at the next General Election, the electors give the Tories a majority, not for the positive reason that there is a Tory policy to believe in but for the negative reason that they are tired of the Socialists, then the country will drift in a political vacuum for another Parliament. If this is the direction in which the political tide is flowing, it is not a cause for any gratification. What would cheer the spirits of even the most neutral onlooker would be if there were any sign that the basic issues of the time were being identified, expounded to the people and put to them for their decision. If that were the prospect for the next General Election, one could look forward to it as an act of history instead of as a choice of evils.

A statement of Conservative economic policy is said to be impending, and it would be unfair to prejudge its contents. It may answer some of the questions that are being asked. Have the Tories, equally with the Socialists, a policy on which they are united, in which they believe, which they would embody in statutes or administrative actions in the first two years after they were returned to power? Can it be stated in unequivocal terms? Is it of a nature to secure the positive assent of the floating middle vote that decides elections?

One preliminary test to apply to the document will be to observe whether it manages to detach itself from the issue of public or private ownership of industry. Very few members of the decisive middle sector of opinion would be willing nowadays to condemn all public ownership as sweepingly as Mr Churchill does. This is an issue on which the Tories would be well advised to be very "progressive." They would do well to confess—what everybody knows—that they will not attempt to unscramble all the present Parliament's nationalisation Acts, or perhaps even any of them. They might even go further and suggest a few more public-ownership projects of their own, and if they can discover one or two that the Labour Party has not yet hit upon—and for which a sound case can be made—they will have proved the sincerity of their claim to be open-minded on this issue.

It is not over the existence of a field for public ownership

that the fight needs to be joined, but over what sort of policy is to be pursued outside that field. The real issue is not whether some industries are to be wholly red, but whether all are to be pink; not whether the state is to have responsibility and control in some trades, but whether it is to interfere without responsibility or purpose in all; not whether there is to be a public sector and a private sector, but whether there is to be any real difference between them, whether the Coal Board and the whelk stall are to be different economic species or merely two branches of the same economic bureaucracy.

To these questions, when they are posed in general terms, every Tory will give a decided answer. But it is much more doubtful whether he realises what his answer means. It is of little use to inveigh against the stultifying effects of trade union dictatorship unless the condemnation is equally extended to the rings and cartels of the employers; neither the one nor the other is the mark of free private enterprise. No one will pay much heed to condemnations of nationalised industries as monopolistic bureaucracies so long as the Tory Party defends its own bureaucratic monopolies. It is no good prating of the need for industrial efficiency without denouncing the agreements, with which industry is riddled, to keep inefficient firms in existence. It will not carry much conviction to demand the end of the price controls if what is meant is that the control of prices should be returned to the capitalists.

The fact is that British industrialists, under the deliberate leadership of the Tory Party in its Baldwin-Chamberlain era, have become distinguishable from British Socialists only by the fact that they still believe in private profits. Both believe in "organising" industry; both believe in protecting it, when organised, against any competition, either from foreigners or from native newcomers; both believe in standard prices for what they sell; both unite in condemning competition, the one as "wasteful," the other as "destructive." If free, competitive, private-enterprise capitalism is to continue to exist, not throughout the national economy, but in any part of it, then it needs rescuing from the capitalists fully as much as from the Socialists.

Here is a task for the Conservative Party if it wants to present a real alternative to Labour Socialism. The real issue of today is not between Capital and Labour, who on so many matters are on the same side of the fence, but between the carrot-and-stick economy and the sugar-candy economy, between the treadmill and the feather-bed, between the principle of "equal rations for all" and the principle of "let the best man win." A vigorous democracy will not exist in this country until the opposing principles are set up for the public to choose between them. At present, because half the Tory Party is debauched by Big Business and the other half is so anxious to be "progressive," one side of the argument goes by default, save for the gallant voice of the Liberals.

If the Tories, after being as progressive as they choose about the public sector of industry, will be wholly immoderate and unprogressive about the need for enterprise in the private sector, and if they will prove their sincerity by a frontal assault on the restrictive practices of their own industrialists, they may lose some of their present paymasters. But they will gain a positive purpose which will some day give them both a majority and something to do with it. If they prefer, on the other hand, to hawk what is merely a bastard brand of Socialism, the public will prefer the legitimate practitioners and the Tory Party will be, for many years, what the Labour Party was between the wars, or what it was itself for a whole generation a century ago, the permanent minority party, coming into transient and embarrassed office only while the majority party takes a rest.

Local Government's Future

THE annual reports of boundary commissions are not as a rule exciting documents. The first annual report, covering the year 1946, of the Local Government Boundary Commission (HMSO, 4d.) is, however, something of an exception. It may prove to be the first step in the creation of a new order of local government. The report itself says nothing very startling, nor has the Commission yet reached a single decision on the numerous claims for changes of local government areas and status that are before it. What is encouraging and significant is the wholehearted spirit in which the Commissioners are approaching their task

to make, so far as is practicable, all local government authorities, both individually and collectively, effective and convenient units.

Although the Commission has fairly extensive legal powers to change the areas and functions of all local authorities, the Government has given it no clear line of action to follow, and its major decisions, those relating to counties and county boroughs, require Parliamentary confirmation. In addition, Mr Bevan has laid it down that no county borough of over 60,000 population or county of over 100,000 population should normally be abolished, amalgamated, or changed in status. The terms of its mandate are such as to deter the Commission from undertaking any surgical operation on the body of local government.

What the Commission can do is to find out the best way of remoulding the local government structure and then ask the Government for a clear mandate to implement its proposals; and this is the course that it appears to be taking. The Commissioners are postponing all important decisions until they have made up their minds on what ought to be the general shape of local government in the future. It will be surprising if their conclusions do not lead them to ask Whitehall to authorise reforms of a far more drastic character than it has so far contemplated.

The present structure of local government is highly unsatisfactory; and the symptom of this—although not necessarily the cure—lies in the numerous claims for the extension of county boroughs and for the conferment of county borough status that are at present before the Commission. In England, nearly every county borough wants to extend its borders, and there are also claims that 33 new county boroughs should be created; by contrast, most of the English counties want nothing of substance except to be left in peace without further dismemberment through the loss of territory to county boroughs. The Commission lists three alternative methods of tackling this issue, without committing itself as yet to any of them. These are to concede these claims in part and permit limited extensions of county boroughs; to concede them in substance and permit

large extensions of county boroughs; or to adopt a third device, described as the creation of new county areas.

The county borough line of argument has much to support it. Many county boroughs consist of overcrowded towns which have long since overspilt their administrative borders so that, as things are, they must rehouse a large surplus population outside their own areas—a very unsatisfactory arrangement. For reasons of planning too, each town or in some cases each "conurbation" of towns, should be developed as a unit. Moreover, it can plausibly be argued that, of all existing administrative units in local government, the all-purpose county borough is the most efficient. Why then should the advantages of county borough status be denied to large municipal boroughs like Luton, or to urban agglomerations that are at present partitioned among minor authorities?

One of the main objections to conceding the county boroughs' case is the resulting effect on the counties. Were the proposals before the Boundary Commission to be accepted in whole, the area controlled by county boroughs would be almost quadrupled and their total population would be increased by about 50 per cent; conversely, the counties would be stripped of about a quarter of their population and rateable value, while Lancashire, for instance, which is the largest of the counties and the plum of local government service, would be shrunk to a shadow of its present self. Clearly, in these circumstances, many—perhaps the majority—of existing counties could no longer function as efficient units. The only way to get over this would be drastically to reduce the number of counties and completely to rearrange their areas. This is no impossible aspiration—the chief bar to it is perhaps the historical and sentimental pull of the present counties, connected with county cricket and the like. But this arrangement would also make the counties far more exclusively rural than they are at present, with baleful effects.

The only alternative to extending a county borough system of government that has so far been considered by the Boundary Commission is one that is intended to solve the special problems of the large conurbations. This proposal has originated from a large urban area in Southern Lancashire which centres on Manchester and contains eleven county boroughs. The idea would be to deprive of their status all the county boroughs within the selected area and thus to establish throughout it a two-tier system. As top tier, there would then be brought into existence a new populous urban county, somewhat similar to Middlesex, capable of providing a unitary control over the whole conurbation. This proposal moves in the opposite direction to the county borough proposals, for it would extend

Bonus Distribution

TRIENNIAL VALUATION 1944-46

Reversionary bonuses on With-Profit policies have now been allotted at rates per annum ranging from £1. 10s. to over £2. 10s. per £100 of sum assured—and, 10/-% on all existing bonus additions.

instead of diminishing the area in the country for which a two-tier system of local government operates. Its advantage would be to establish, in those areas where they are most needed, much larger units of local government than could be evolved from any expansion of county boroughs. Its disadvantage would be to create an awkward problem over the division of functions between the new top and bottom tiers. What, for instance, would happen to Manchester? Would it be relegated to the position of an outsize municipal borough, would some special status have to be found for it, or would it be best to split it up into several smaller authorities?

The Boundary Commission has got to make its choice among these three alternatives. Merely to permit some modest extension of county boroughs would satisfy nobody—neither county boroughs nor counties—and would do little to solve the present dilemma. It might, however, be possible and also desirable to combine—for all their apparent contradiction—the two more drastic remedies that have been outlined. This is so because, while the old local distinction between urban and rural areas is now hopelessly obsolete, there is need of a new distinction, at the national level, between major areas of the country. For a few of the largest conurbations, the idea of abolishing county boroughs and creating a single large urban county along "Middlesex" lines may well be the right one, in spite of the many tricky points of detail falling to be settled. For smaller or straggling conurbations, such perhaps as Plymouth in the first instance or the industrial area of Yorkshire in the second, a considerable extension of the county borough principle so as to get both larger county boroughs and in some cases more of them might prove a more satisfactory solution. In the rest of England—outside the conurbations—the number of counties will certainly have to be reduced, but in addition, if the counties are to be made efficient units, there is a case for reducing rather than increasing the number of county boroughs, although a policy of this kind need not necessarily prejudice the claims of such county boroughs as are left to extend their areas. Counties

and county boroughs alike should be fewer and larger.

These are highly tentative suggestions given merely to demonstrate that a satisfactory reform of local government, so as to increase the average size of the major units, bring into being better planning areas, and improve the balance between town and countryside, is by no means impossible. The Boundary Commission, by suspending judgment until it has held very full informal discussions with most of the local authorities in the country, is pursuing the right course. But it has also had to make it clear that its decisions, some of which must be given very soon as a matter of urgency, are no more than provisional. No major decision, such as the grant or withdrawal of county borough status, will be made for the time being. The most that can be done is to authorise some enlargements of a number of "blitzed" or overcrowded county boroughs such as Plymouth, whose claims have rightly been given first attention, and also perhaps a suitable reorganisation of the counties in two large rural areas, Wales and East Anglia, which the Commission has singled out for early attention on its own initiative on the grounds that they each contain several counties of less than 100,000 population.

On minor matters of principle, the Commission is already formulating its views. It believes that the distinction between rural and urban districts should be abolished and their functions approximated, that the parish should be kept and its underlying idea perhaps extended to urban areas through the creation of neighbourhood units or the like, and that compensation should cease to be payable from one authority to another consequent upon a rearrangement of areas. However, little real progress can be made until the Commission comes to some conclusions on the major issues of policy that are before it. The sooner this is done, the earlier can Parliament be asked for the fresh mandate which alone can enable the Commission to get to work in real earnest. To prod the Government into an acceptance of the need for drastic reform will be hard enough in any event.

Italy Next

MR BEVIN would be hardly human if he returned from Moscow without the feeling that he must at once turn his hand to a piece of constructive diplomacy. He would not be a good politician if he did not look for some opportunity to meet half-way the critics who have had their hearts warmed and their tongues sharpened by the private and public addresses of Mr Henry Wallace. He must expect the taunt that the tough line won nothing out of the Russians, that he was a mere second in the American corner, and that he would have done better to act as referee and force Mr Marshall and Mr Molotov to break their prolonged clinch. Mr Bevin can produce a good answer—and some bruises—but he will be wise none the less to use an opportunity in which he can negotiate without knocks.

The opportunity will be provided by the visit to London next month of Count Sforza, the Italian Foreign Minister. Unless economic and political planning have in this case got separated—as happens less and less in the reconstructed Foreign Office—the way has already been made easier for him. Last week Italians read in their newspapers substantial evidence of British goodwill. The financial and monetary agreements signed at the Palazzo Chigi on April 17th were notably generous documents. The last British claims to reparations were given up entirely in return for Italian payment of pre-war debts; the account of over £100 million between the two Governments, covering wartime supplies and surplus stores received by the Italians, was settled with a final payment of £8,000,000 to Britain; and all Italian sterling credits—future as well as present—will be transferable to other currency areas

for current spending, save for £10 million to be left on deposit. So Mr Bevin has kept the promise of discussing "hardships" arising out of the peace treaty which he gave to the House of Commons in his last survey of foreign affairs on February 26th. And Count Sforza, after signing the agreements, took the opportunity to say that "free England recognises that free Italy is a factor necessary for the new united life of Europe and is acting accordingly."

Foreign Ministers of the old school like Count Sforza weigh their public utterances carefully, and it is fair to guess that "free" and "united" are the significant words in this comment. A free Italy cannot be dependent on either American or Russian favour; which means that it must be run by a party, or coalition of parties, that can assert itself against extremists of either Right or Left. It has to produce and work the new constitution of a "democratic republic founded on work," plan and carry through economic and administrative reconstruction, and develop a large exchange of goods with other countries. In other words, it has a problem like that of France and so far Rome seems to have tackled its tasks at least as well as Paris. Italian industry is working at 75 per cent of capacity. Italian Communists and Socialists work together better than their French counterparts. A threatening religious quarrel has been stopped by the Vatican's recognition of the Republic and by the Assembly's acceptance of an article in the Constitution regulating the state's relations with the Holy See.

So far, very good. But a government in the stage of development that has been reached by Signor de Gasperi's Cabinet

needs more spectacular results. Once the constitution has been worked out elections will be held and, if Signor de Gasperi is to retain power, he and his party and their allies will have to show the electors wider achievements. It is unfortunate, but inevitable, that the obvious next step towards these achievements is the one most likely to cause divisions and resentment in the Italian people. The peace treaty has to be ratified by their representatives—and by the Allies—before Allied troops leave the country and before Italy can take her place in the United Nations. The temptation must be strong to procrastinate in the hope of first getting some clauses of the treaty modified. The British and Americans, with whom the initiative would lie for revision, must seem vulnerable to such tactics; the Italian Communists must hope that some support might come from the Russians, particularly over their former North African colonies; the French must seem cordial, though they have little to offer save M. Bidault's vote. Situated at such a key strategic position in the Mediterranean, even a defeated nation must feel the urge to bargain.

Here then lies Mr Bevin's first problem: what political and economic concessions can he offer to Count Sforza which will strengthen moderate and frustrate extremist counsels in Italy? The Italian Foreign Minister represents a group of the Left Centre which is dwindling, but which is still the essence of the Republican regime. His visit to London will be closely watched by the Right, which is pro-American and stubbornly opposed to social change, and by the Left, which becomes more pro-Soviet as it becomes less moderate. If he returns empty-handed, intransigent revisionists might oust him and his colleagues from power, which would mean that Italian revisionism might in time become a threat to European peace. In such circumstances Trieste would have all the makings of another Danzig. Mr Bevin has also to bear in mind something that Count Sforza may be loth to tell him: that the British, once the heroes of the day, have become extremely unpopular in Italy. Many leading anti-Fascists have humiliating memories of their treatment by British officers after the liberation; and former Fascists contribute for obvious reasons to the general dislike.

Politically there is little that the country on its own can offer. The future of the North African colonies is for the four Foreign Ministers to settle in the next twelve months. But it should be possible for the British Military Administration there to turn over a new leaf. The atmosphere which has been created in Tripolitania was certainly never desired by the Foreign Office, whatever may be the intentions of the War Office. Too much scope has been given to officials—described by correspondents who have seen them in action as "pseudo-British"—who have gone out of their way to humiliate the Italian population. Count Sforza should receive an assurance that it is not British policy to drive out the Italian colonists in the months of British control that are left. It should also be possible—with French support—to arrange for the Italians to play some part in the future running of their pre-Fascist colonies. Such a generous and reasonable approach would cut the ground from under the feet of the Fascists who are saying that Britain is seeking to make good in Libya the loss of strategic positions in Egypt and India.

Possibilities of giving Italy economic help are of course limited. If only Mr Bevin had his forty million tons of coal to juggle with! So desperate is Italian industry's need for coal that even France—itself short—is paying three hundred-weight of coal for each day's work done by Italian immigrant miners. Much might be done to restore Italian trade with Germany and exchange its coal for Italian food products, hides and non-ferrous metals which are needed there. Credits could be found for purchase of raw materials. And, above all, it should be not impossible for Mr Bevin to persuade his col-

leagues, both in the British and in the Dominion Cabinets, to make some openings for the host of emigrants pressing to leave Italy. With 2½ million unemployed and a heavy birth rate, emigration is a matter of major policy for Count Sforza, and much has been done to improve relations with France and Belgium by the plans to despatch industrial and agricultural workers which were described in *The Economist* last week.

For some time to come Italian foreign policy must concentrate on meeting such economic needs. But already a complex and dangerous political problem faces it in the new Trieste. Count Sforza has realised from the first that the settlement worked out by the Foreign Ministers will break down unless his government's relations with Yugoslavia are kept at an even temperature. In seeking to conciliate Marshal Tito, now and in the future, he is liable to rouse nationalist excitement of the kind which the revisionists have been mobilising. And if—as is always possible in view of his public denunciations of the Trieste settlement—Marshal Tito does not come half-way to meet Count Sforza, the latter will need the constant support of a firm and tactful British policy. But this is all the small change of diplomatic transactions. There is nothing here with which the Italian Government could hope to capture the enthusiasm of their people and give them a sense of security and international respectability. One must return to Count Sforza's references last week to a united Europe.

★

Sooner or later Mr Bevin will have to examine more closely and expound to his colleagues the various ideas under this title which recur in conversation all over Europe. Many Frenchmen advocate closer association with their neighbours; the planners have long talked of "integrating" French with British—and German—industrial planning. The Belgians and the Dutch have it in mind as, with Luxemburg, they work out their customs union. It is often discussed in western Germany by men who seek an ideal. Mr Bevin's Socialist critics in the House of Commons favour a European economic and political group which—they say—could hold the balance of power between the United States and the Soviet Union. Mr Attlee has said that Europe must federate or perish. Now an Italian voice joins the chorus. The British Cabinet should forget the association of these ideas with Mr Churchill and examine them on their merits. Certain risks have to be run. Any such scheme will be attacked as either anti-American or anti-Russian; in a sense it is bound to be both. For by next year Europe will probably have arrived at a turning point in its affairs. By then it should be known, not only whether a third attempt to settle the economic future of Germany with the Russians has failed, but also whether the Americans have been able to offer at Geneva sufficient inducements to bring the great trading nations into line with their commercial policy. Both efforts may fail. Mr Bevin and Sir Stafford Cripps should therefore have alternative policies ready; just as Mr Bevin last year prepared the economic fusion of the British and American zones of Germany in case economic unity of all four zones should prove unattainable.

The economic future of Europe has been more than once on the agenda of the Cabinet; British persistence and loyalty have contributed a lot to the success of the existing European economic agencies. What is needed, to provide Mr Bevin with his alternatives, is not a revolution in thinking, but some solid research and painstaking diplomatic inquiry. The lull between Moscow and the next Foreign Ministers' meeting is an obvious time to begin. And Count Sforza's visit will be an excellent opportunity for finding out what an experienced European statesman of the Left Centre means when he aspires to a place for Italy in the "new united life of Europe." What Mr Bevin—also of the Left Centre—says in reply might be momentous for the future.

NOTES OF THE WEEK

Life of Service

"The use of the Princess in a dignified capacity is incalculable"—so would Walter Bagehot have commented on the celebration of Princess Elizabeth's twenty-first birthday in Capetown last Monday. A piece of pageantry and symbolic family business of the strongest interest to the British people was reserved for the men and women of the youngest Dominion. For Princess Elizabeth sincere congratulations have to be mingled with sympathy. She faces a full life of strenuous, boring and testing routine, of which she has been given a foretaste during the last three years. She has to keep herself informed—as a future monarch—of every aspect of public affairs, which have never been more complex, more technical and more contentious. She has to prepare for headship of a society which, for the most part unconsciously, assumes in the successor to the throne, virtues, habits and religious views which it has long ceased to impose on its own recruits.

It is curious, and quite uncharacteristic of the age, that there are no republicans in this country, that there is no seriously argued criticism of the monarchy or of its place in the constitution and public life. No one is surprised to read that Mr Attlee signs a birthday message to Princess Elizabeth "your humble and obedient servant"; no one would be indignant to learn that the King had exercised his right to disagree with his Prime Minister's choice of colleagues. The planners have not yet thought of an overall scheme to cover the monarchy. To quote Bagehot once again:

When there is a select committee on the Queen, the charm of royalty will be gone. Its mystery is its life. We must not let in the daylight upon magic.

Princess Elizabeth seems to enjoy her public rôle; she certainly plays it with charm. May the magic long go on working.

* * *

Cabinet Changes

Once again, Mr Attlee has carried out a minor reshuffle of his Government instead of the thorough reconstruction that is periodically rumoured. The changes announced at the end of last week are mainly confined to Labour peers, and will, in fact, hardly alter the composition of the Front Bench in the House of Commons. Lord Pethick-Lawrence resigns the office of Secretary of State for India and Burma on the grounds of age—he is 75. One cannot, however, feel confident that the advantage possessed by his successor, Lord Listowel, in the matter of years will make up for the loss of Lord Pethick-Lawrence's experience. The transfer of power in India and Burma will call for outstanding statesmanship, but Mr Attlee seems to have subordinated India's needs to his personal inclination to promote the faithful.

The promotion of Lord Pakenham, Under-Secretary of State for War, to be Chancellor of the Duchy of Lancaster is better merited, for recognition of his qualities has for some time made him one of the chief Government spokesmen in the House of Lords. He will now take over from Mr Hynd the duty of administering the British zones in Germany and Austria, but the final responsibility will remain elsewhere. Hitherto, it has rested with the Secretary of State for War; it is now to be transferred to the Foreign Office, a logical step since conditions in Germany are largely dependent on foreign policy, but it adds to the heavy burdens Mr Bevin already carries.

It is presumably because the main work of government is carried on so few shoulders that Mr Attlee has added to the number of non-departmental Ministers by appointing Lord Inman Lord Privy Seal and a member of the Cabinet. Lord Inman was given his peerage last year for political and public services, and the conventional phrase sums him up pretty well. But as a policy-maker he is an unknown quantity. Mr Greenwood, formerly Lord Privy Seal, becomes Minister without Portfolio, a change of name but not of responsibilities or function. Other changes in the House of Commons, consequent upon the shuffle in the Lords, are the appointment of Mr Hynd to be Minister of Pensions and of Mr Paling, hitherto Minister of Pensions, to be Postmaster-General in succession to Lord Listowel. The Government Front Bench will also, in the near future, be strengthened by the return of Mr Morrison, whose robust personality has been greatly missed.

No Smoking

At one time it seemed likely that the new tobacco tax would involve the Government in the same sort of trouble with its own back-benchers as it has run into over conscription. But although there is undoubtedly considerable grumbling in the country among Labour supporters because the heavy increase will hit "the masses" more severely than "the few"—grumbling which was voiced by Labour speakers in Monday's debate on the Budget resolutions—it looks as if the political storm that was brewing has subsided.

There are probably two reasons for this. The first is the merits of Mr Dalton's case, which are probably grasped by Labour MPs even if his arguments are lost on their constituents. The increase in the tobacco tax is intended to achieve two mutually conflicting aims: to reduce dollar expenditure and to act as an anti-inflationary measure. The more successful it is in the first aim the less successful it will be in the second, for the purchasing power saved on tobacco will be diverted elsewhere. If, instead of increasing the tax, Mr Dalton had placed physical restrictions on tobacco consumption, through a reduction in imports or through rationing, as he was urged to do by the Opposition and some Labour members, he would have ensured the saving in dollars he wants, but at the expense of his anti-inflationary policy—apart from the undesirable administrative and social consequences that would have arisen in the shape of queues and a black market. As it is, he can still hope for a reduction in tobacco consumption of 25 per cent, which would save \$30 million, and to net an extra £75 million for the Exchequer. But, in addition to his arguments in justification of the increased tax, Mr Dalton turned away much wrath in Monday's debate by his promise to consider the case of old age pensioners, that strong political force in the Labour lobby. The difficulties are considerable, for probably at least half of the four million or so of old age pensioners do not smoke, that is, the great majority of old women. To whom would the concession to grandmothers be passed on?

The second reason why the threatened storm subsided was, however, probably more decisive, and that was the attitude of the Conservatives. By declaring their opposition to the increased tax, and by championing the cause of the working-man smoker and the little man tobaccoist, the Conservatives undoubtedly prevented the Labour discontent from becoming an embarrassment to the Government. It remains to be seen whether their reported decision to oppose the National Service Bill, now that the period of conscription is to be reduced from eighteen months to twelve, will have the similar effect of rescuing the Government from what might have been an awkward political corner.

Return from Moscow

Two days ago the visiting Foreign Ministers in Moscow sent for their trains and their planes. Three long closed sessions had taken them no nearer agreement either on Germany or on Austria. Mr Marshall has begun to talk of referring the Austrian question to the United Nations, which shows how hopeless the outlook must seem. Nobody yet knows what are the Russians' exact claims to German assets in their zone of Austria, which makes the dispute about defining them a little unreal. But every Austrian is convinced that the real battle is over the future control of the Zistersdorf oil fields, free use of which by Austria would tremendously enhance its importance as a trader and an ally. Further delay in restoring the country's economic unity and in removing the troops of occupation will have serious economic consequences; if there is no sign of progress towards a treaty by the time the Foreign Ministers meet again—perhaps in July in London—then Mr Bevin will obviously have to consider fusing the three western zones and making the best of a bad job.

Neither on Germany nor on Austria has the Moscow conference been a complete failure. The chief and deepest differences existed before the conference started; they were unlikely to be overcome unless Soviet relations either with the British or the Americans took a new and more cordial turn. This did not happen—indeed, the eruption of the Truman doctrine after the first week of the conference made it impossible that it should happen. If there was fundamental confidence between the three Foreign Ministers at any point, but particularly about the future economic organisation of Europe (including Germany and Russia), most of the Moscow differences would quickly disappear. A tremendous

amount of hard committee work by deputies and delegations has brought order into the differences and the agreements and into the instructions to be given to the Control Council in Berlin.

Diplomatically the most curious feature of the conferences has been the part played by M. Bidault. He came to Moscow with the Dunkirk Pact in his pocket. He had a strong case on coal, to be argued with the British and Americans at will, and a strong case on the Ruhr and the political future of Germany—both matters on which the French must always be listened to. Mr Molotov should have seen that the French Foreign Minister was in a good position to play an independent game. But, once Mr Stalin had given his private audience to M. Bidault, Mr Molotov seemed to go out of his way to push the French statesman into the "Anglo-Saxon" camp. If M. Bidault is assailed by the French Communists for returning to Paris with nothing more than the agreement on the distribution of German coal, all he needs to do is to publish a selection of Mr Molotov's criticisms of French points of view.

* * *

Ruhr Hopes and Fears

To ensure that M. Bidault should not return to Paris from Moscow empty-handed, the British and Americans have indulged in the dangerous game of counting their coal before it is hacked. They have fixed with the French the proportion of all coal produced in their three zones of Germany which is to be available for export to other European countries—or rather for allocation to them by the European Coal Organisation. A sliding scale of exports as percentages of production covers the months July-December, 1947.

When daily output for the Ruhr-Aachen and Saar mines reaches 280,000 tons a day the proportion allocated to export goes up to 21 per cent. How far off is this figure? At the moment production from the Saar is 33,500 tons a day; from the Ruhr, during the week ended last Saturday, average daily production was 222,800 tons. In other words, production has to be increased by 26,000 tons a day before exports can be increased. In the Saar they reckon they can put on 6,500 tons a day; in the Ruhr they should be able to reach 20,000 tons a day more by July. So the chances of France and other countries receiving increasing proportions of German coal are quite good.

But there is the threat of further protests and disorders hanging over the Ruhr. For reasons that are described this week both in a leading article and in a special despatch from Düsseldorf, the food situation offers no hope of improvement and there exists in the fused zones a first-rate administrative and political crisis. If the miners strike again—and so far they have shown remarkable restraint—they may take more trouble to make their action effective. Already they have given a headache to those who drew up the estimates of coal production for the first half of this year. From the peak daily production figure of 237,065 tons reached in the third week of March, there has been a decline to a daily average of 206,000 tons in the first week of April, followed by a rise to 217,495 tons in the second week, and to 222,800 tons last week. It will take six or seven weeks to recover from a bad drop in output caused by discontent and demonstrations.

It is curious to think that the Ruhr miner bears on his shoulders one of the main planks of Anglo-French and US-French understanding. Handled properly he might become one of Mr Bevin's main foreign assets; badly handled he can do irreparable harm. Lord Pakenham, the new Chancellor of the Duchy of Lancaster, should get to know him.

* * *

Madagascar Shakes M. Ramadier

It is becoming clear that the revolt which began on March 29th in Madagascar is—or was, for it is all but subdued—neither so well organised nor so costly to France as its counterpart in Indo-China. It amounted to an effort by the former feudal ruling class (now calling itself the Malagasy Renovation Party) to forget its one-time readiness to join the French Union, to exploit some local economic discontents, and to strike for full independence at a moment when France was embarrassed elsewhere. But next week, when the topic reaches the French Assembly, it seems more likely even than the Indo-Chinese affair to upset M. Ramadier's shaky coalition. Coming second in time, it may prove the more potent threat to his cabinet's "solidarity." For that cabinet is fundamentally split on the question of how best to handle a recalcitrant empire. On the issue of whether or no to send troops to Indo-China, the Communists temporised—the ministers voting one way with their cabinet colleagues, the party voting the other. Can

they, and do they want to, do the same again next week? They will then be called upon to decide whether or no it was constitutional to arrest the Malagasy deputies to the French Parliament for complicity in the revolt. For this is what the Governor-General of Madagascar has done. The delicate constitutional issue he has raised is that deputies are immune from arrest without the consent of the Assembly unless caught in the act of committing a crime, and that unless flagrant acts can be cited, consent will, in the case of four out of the five Malagasies concerned, have to be retrospective.

The cabinet, less the Communist ministers, has approved the arrests. The Communists walked out of the meeting which gave this approval, but have not otherwise commented on its decision. Broadly, the problem before the cabinet majority is: for how long

is it compatible with the dignity of government to continue to work with ministers whose party is openly working against cabinet decisions? This behaviour, which obviously plays into the hands of General de Gaulle and all other enemies of Communism, is causing much impatience among the MRP. But the Communist leaders too are in a dilemma. How long can they afford to go on acquiescing in the majority decisions of a cabinet which practises what they have always been taught to call naked imperialism?

Over Indo-China, both groups hesitated to plunge the country into a cabinet crisis because to do so while the Moscow conference was sitting was to impair M. Bidault's bargaining power. That deterrent has now ceased to exist. In place of it there is General de Gaulle's renaissance, which is prompting all good parliamentarians to pause before upsetting the Government or shaking the constitution. It is still an open question, therefore, whether the push, if it comes next week, will be given by the MRP or by the Communists.

Prospects in India

Indian affairs have faded out from the British political scene since the debate on the Government's last public declaration of policy; the initiative now lies with the new Viceroy in New Delhi. Since his arrival he has been working hard at his task of mediation between the two Indian points of view which still appear irreconcilable. Most of the negotiation is naturally going on in private, and it would be unfair to be too impatient for results. But while the talk drags on, time does not stand still in those parts of India afflicted by communal rioting, and there is no sign of a cessation of these disturbances, even since the joint Gandhi-Jinnah appeal for a communal truce. Every communal outburst produces appetites for revenge and thus leads on to more bloodshed of the same kind unless order is at once strongly and impartially restored. From the beginning of the year to the middle of April at least 2,400 persons are known to have been killed in communal riots, the great majority of these in the Punjab. Fear

of the future is widespread, and many Indians have been migrating, even at serious economic cost to themselves, from areas where their community is weak to places where they feel safer.

It is against this background that Mr Nehru's Gwalior speech must be judged. This speech has been hailed in some quarters as a constructive contribution and a conciliatory approach to the Moslem League, because he spoke of "facing realities," declared that no part of India would be compelled to join the Union against its wishes, and that the Punjab and Bengal would have to be divided. On the other hand, he took up a threatening attitude towards the States by saying that any of them which did not join the Constituent Assembly would be "regarded as hostile States and would have to bear the consequences of being so regarded"; he also said that the Constituent Assembly would go on with its work whether the Moslem League came in or not.

But how is the framing of a Constitution for all India by the Constituent Assembly compatible with the promise that no part of India is to be brought into the Union against its wishes? There is as yet no sign of any understanding between Congress and the Moslem League on basic issues, and without such an understanding attempts to divide the Punjab and Bengal territorially on communal lines are more likely to intensify the present bitterness of feeling than to allay it.

* * *

Imperial Migration

The debate on emigration in the House of Lords on April 17th was one of those occasions which justifies the Second Chamber in its claim to take the long view and to rise, on topics of great moment, superior to party. Lord Tweedsmuir's memorable speech, appealing for an imaginative and far-sighted policy towards migrants both inward and outward from the British Isles, was matched by an equally statesmanlike pronouncement by Lord Addison, the Secretary of State for Dominion Affairs. On the face of it, of course, there is something paradoxical in the encouragement of emigration—and a highly selective emigration at that—in the face of a hampering manpower shortage at home. But the manpower shortage is relative, and a very slight downswing in the world-wide inflationary boom would do away with it overnight; whereas the Commonwealth and its needs and its relationship with the mother country constitute an enduring fact, of paramount importance on any long-term historical view. To have recognised this is the merit of all the participants in the Lords debate.

Possibly, however, a stronger appeal might have been made to the Dominions to take a share of the displaced persons now eagerly looking to the Anglo-Saxon world for a new start in life. With all due respect to the Huguenots, the Flemish weavers, and other past contributors to the genial and fortunate mongrelism of the British people, it is possible to overtax the digestive and absorptive capacity of any national society. That of a new country is, as America has shown, particularly strong; and it should not be impossible for the Dominions to absorb, along with the British migrants whom they are eager to receive, a proportion of new citizens from other sources. Great Britain should not become, ethnologically speaking, the Empire's milch cow and wastepaper basket combined, sending overseas the cream of each generation and receiving and retaining on humanitarian grounds whatever European flotsam the Dominions may reject on grounds of economics or prejudice. This might still be possible were the British birthrate to return to what it was at the time of those great outward migratory tides to which Lord Tweedsmuir referred—that is to say around twice the average of the last ten years. But that is unlikely. It could hardly be claimed as yet that Great Britain has done too much towards absorbing refugees; in its own interests it could do more; but it could do far more yet if seconded by the Commonwealth to whose long-run advantage it is so willingly subordinating its own immediate needs.

Fruit Imports Anomaly

The protest addressed to the Ministry of Food by the fruit and vegetable importers' organisation draws attention to a very nice instance of control without planning. The protest is concerned less with prices—though the importers believe that the removal of the remaining controls would raise prices, if at all, only slightly and temporarily—than with the compulsory channelling of trade through an unnecessarily elaborate and uneconomic sequence of middlemen. The "first-hand salesman"—generally the *alter ego* of a wholesaler—formed during the war part of a pool which handled regional allocations to the wholesale trade. His function, in the importers' view, is obsolete; but controls maintain him in

being. Anyone can now import fruit and vegetables—except for bananas, citruses and apples—without licence or restriction. But having imported them he is legally bound to sell them, not to a freely chosen wholesaler, not to a retailer, not (unless he is a Breton onion boy) to the public, but at a fixed price to a privileged intermediary, the first-hand salesman. The latter sells at a fixed margin to the wholesaler, the wholesaler to the retailer, and the retailer at last to the public.

Were the first-hand salesman a genuinely independent link, this curious sequence would merely represent a certain wastage of manpower and a tax on final consumption. There would be no impediment to free competition among importers, and the field would be genuinely open, as it legally appears to be, to all comers. But he is not independent; he is, as often as not, part of an importing-cum-wholesaling concern which, nominally open to competition as an importer, is sheltered as a wholesaler by the impenetrable armour of licensing regulations. And this composite concern can draw on the three profit margins to which it is entitled to outbid the "pure" importer on the foreign market. The "pure" importer may or may not be correct in claiming that foreign sellers would lower their prices if the "composite" importers were able to bid no more than the "pure"; such market judgments are fallible. What is quite obvious is that neither efficiency in the public interest nor equity within the trade is served by this survival under government protection of a mechanism which has outlived its wartime usefulness. And a Government which has just sealed the doom of the well-tried and highly competitive Liverpool Cotton Exchange can hardly defend in principle the maintenance of superfluous distributive machinery.

* * *

UN Secretariat under Fire

American newspapers have recently given voice to complaints about the integrity of certain members of the United Nations Secretariat, with reflections even on the impartiality of the Secretary-General himself. It is alleged that the work of the Commission sent by the Security Council to investigate conditions on the northern frontier of Greece has been hampered by the partisan activity of persons in the Secretariat who have been representing the official attitudes of their countries of origin instead of performing their proper function as servants of an international organisation. It is difficult to discover how much, if any, truth there is in the particular charges which have been made, but the fact that they are made at all raises questions about the steps which have been taken to secure for the United Nations the services of a competent body of permanent officials detached from national loyalties.

It cannot be said that the present position is satisfactory. The Secretariat is that part of Uno which is supposed to be genuinely international as distinct from inter-governmental; the delegates to the Assembly and Security Council are, of course, political representatives of their Governments from whom they take instructions; but the members of the Secretariat are not nominees of Governments, and in theory devote themselves to the service of Uno alone as international civil servants. On appointment they take an oath of allegiance to Uno, and bind themselves not to "seek or accept instructions" from any national Government. But something more than such a promise is required if Uno officials are really to be detached from national Governments, and an impartial *esprit de corps* is to be formed. The Secretariat has to be recruited from ordinary human beings who have to make provision for their future; they cannot be free from hopes and fears about employment in their own countries unless they have a high degree of security of tenure. So far a job with Uno has offered no such security. The longest contracts for a very few of the highest officials have been for five years, but the vast majority of the staff have been working on monthly contracts. Under these conditions it is impossible to expect men and women, especially those who come from countries where any dissidence from official policy or publicity is liable to be regarded as treason, to be indifferent to the possible consequences of getting on the wrong side of their national Governments. If Uno is to render the world the services which it can render within the limits of its Charter, an increased security of tenure for its Secretariat staff is one of the first essentials.

The State of Denmark

By the death of King Christian X Denmark has lost a sovereign whose sagacity, high sense of duty, and ease of manner

endeared him to his subjects. The Crown Prince becomes King Frederik IX, and once again a Frederik succeeds a Christian. On a comparison of the state of Denmark with the state of the world at large—or more particularly with the plight of Greece where his kinsman, Paul, has similarly just succeeded to the Throne—the new king has little cause for dissatisfaction with his inheritance. The present Danish Government of Mr Knud Kristensen, which appears to be losing ground slightly, has surmounted a series of crises since its formation in October, 1945. As it is a minority régime of right-wing Liberals (*Venstre*) with only 38 seats in a Parliament of 148 members, it is likely to be faced with more. Although outnumbered by the Social Democrats with 48 seats, and their allies the Communists with 18, it has when in difficulties the support of the 26 Conservatives and 11 Radicals.

At the General Election in 1945 and the municipal elections last Spring, the Social Democrats, who had for long held power, had considerable losses. Some of their more radical supporters went over to the Communists. Other supporters, doubtless seeing the resemblance between their nationalisation plans and German control, swung to the Right and voted for the Liberals' "return to economic freedom" and, though perhaps to a lesser extent, their proposed revision of the Danish-German frontiers. But these policies have lately begun to look more difficult or more unreal, and there has consequently been a slight, though significant increase in the strength of the Social Democrats. At the end of 1946 it was estimated that the party membership had increased during the year by 11,000, giving a total of 260,000 out of a population of 3,500,000. The voting earlier this month for the elections of one-half of the elected three-quarters of the Upper House confirmed this estimate. Although the Government vote increased, so did that of the Social Democrats who seem now to be emerging from their eclipse.

The constitution of the Upper House makes it impossible for this tendency to have any direct quick results. The Prime Minister, however, announced as soon as the results of the poll were known, that he expected the Social Democrats, encouraged by the shift in the electorate's mood, to intensify their efforts to force a new election to the Lower House. This would normally not take place until the end of 1949. As long as the Conservatives and Radicals go on rallying to the Government in its difficulties, it is unlikely that the Social Democrats will be able to advance that date, even if their prospects of returning to power improve.

* * *

The Domestic Profession

The opening of the National Institute of Houseworkers, headquarters of the Government's domestic training scheme, may or may not herald a new era for housewives and their helpers; probably not. The minimum wages suggested for adults (£2 1s. 6d. resident, £3 11s. 6d. non-resident) are too low compared with those for juveniles (£1 11s. and £2 13s. 6d. respectively) to make domestic service appear a "skilled" trade, let alone a profession. And the stipulated 48-hour week bears no relation to the nature of household activities and to their spread through the day. They range from the heavy manual labour of floor-scrubbing through the concentrated artistry of cooking to sitting in an armchair replacing buttons, with one ear open for the baby; and while 48 hours of the first category is too much for anyone but an Amazon, 48 hours of the last is not a working week at all. What the Institute's 48 hours will mean in practice will depend on the one hand on the housewife's ingenuity and ruthlessness in concentrating within its compass all the most skilled and strenuous labour, and on the other on the employee's *ca' canny*. For the tiny minority employing several domestics and so able to arrange shifts, no difficulty arises. But to those who most need help—the elderly or invalid with an old-fashioned house, the mothers of young children, and that total misfit in the social system the professional woman with a family—the diploma-ed and clockwatching product of the Institute will be about as useful as an odd shoe to a barefoot traveller.

The truth is that no practicable improvement in pay or hours is likely to make resident domestic service attractive, as a lifetime profession, to any normally alert, sociable and ambitious young woman. On the other hand it is, more than any other occupation, an education in the basic technique of what is still most women's vocation—that of home-making; and thus an admirable way of spending some part of the seven or eight years between school leaving and marriage. Similarly, full-time non-resident work—cycling or tram-riding from job to job, finding everywhere an accumulation of the grimmest floors and the grasiest dishes, and with one's own housework to do before or after—hardly looks as attractive as work in shop, office or factory; but to the childless wife or woman whose children have grown up it offers, as more

organised occupations do not, a handy part-time source of income. Altogether, the Institute, by recruiting a few more to a much under-staffed field, will help matters, even if they go, as, owing to the provision about hours, they mostly will, where they are least needed. Any real solution to the domestic problem, which is part of the problem of the family in society, must come through something both more far-reaching and less definite; a change in public opinion, a change in private personal standards. Possibly the greatest value of the National Institute of Houseworkers will lie in its indirect effect on these.

* * *

Believe: Obey: Work

To the official mind, it would seem that there is something inherently shocking in the public receiving any item of information from official sources otherwise than through the recognised channels; even then the information should be released sparingly. Social surveys of various kinds are conducted by various bodies, from the Ministry of Food's own survey on food consumption to the BBC's continuous investigation into the preferences of the listener. The information so collected may have come from public sources; it certainly concerns public activities and is paid for with public money. The natural official reaction is at once to mark it "confidential." Information released is dangerous. It can be misused, distorted and misunderstood. It may even suggest further questions that may be put to embarrass hard-working officials. There is a lot to be said for a poster campaign. The amount of information which you need give varies inversely with the size of the sheet you use to disseminate it.

Accusations made in Parliament last week have illustrated the advantages and disadvantages of this attitude of mind. Clearly there would be little to recommend in the giving of advance information of a budgetary nature to a selected few, to enable those few to profit by a rise in the prices of Courtaulds or British Celanese shares. On the other hand, it is clear that a more open approach to the release of information might have avoided the suggestion that parliamentary journalists are compelled to haunt the bars of the Palace of Westminster in the hopes of finding some MPs in their cups. It is, of course, only fair to add that the Central Statistical Office strides happily on down the middle of the road, handing each month to those who can understand them (and to those who cannot) the basic data from which a true picture of the country and its activities can be constructed.

Yet, even where information is given, can it be said that it is given in a form that translates it into concrete images in the mind of the man in the street? The Government has now launched a new publicity campaign for output—"a campaign of explanation and fact-giving, not of exhortation." But even this, much more desirable, method of publicity is not likely to get home unless it is successful in awakening interest. If the man in the street is to absorb any facts at all, he must first be made interested in the subject to which they relate, and so receptive to facts concerning that subject. It may be that interest in the indiscretions of a bibulous MP is not the best form in which concern for public affairs can reveal itself, but, then, have MPs any conception of how dull some of them can be when they are sober?

* * *

The Arab League and French North Africa

The Arabic equivalent of "coo-ee" is ringing along North Africa. Last week the Sultan of Morocco, on a visit to Tangier, spoke of his "ardent desire to acquire full rights" and of his "firm ties with the eastern Arab countries." At once, Azzam Pasha, the Egyptian Secretary-General of the Arab League, replied by telegram that the Sultan could count on full League support in his demands for independence. The League has for some months been sponsoring better organisation of the North African Nationalist parties. These hope to entrust the independent Arab states with the task of appealing on their behalf to the United Nations. How do these new developments affect the League and the Quai d'Orsay?

Arab League statesmen are delighted. Not being at one on all internal Middle Eastern issues—for instance, on Egypt's wish to question Sudanese rights before Uno—they seize with satisfaction upon a diversionary and non-controversial topic. The liberation of fellow Moslems from western tutelage is a situation with which they are familiar and which they know to bind them in unity and harmony. They are unlikely to let the subject drop.

Frenchmen see the matter differently. They encourage their protégé the Sultan to pay Tangier his first visit, because the greater his influence in the two non-French zones of his domain, the better it suits the principal protecting Power, which is France. But they did not expect him to speak as he did. Indeed, it was—to say the least—unfair to the quality and quantity of France's contribution to his prosperity that he should make no mention of ties with her and should speak of the future as if it lay exclusively on an east-west, or Arab, axis. He knows, and admits, that he must rely on his French friends for defence purposes. The French have also, in thirty years, brought under the control of the Maghzen or central government, turbulent Berber areas which it would have had no hope of controlling without their support. They have poured, and are still pouring, money into the country. They are proud, and with reason, of their effort. They have just embarked on a programme of political and social reform. Is a ruler who owes most of his power to them to be able to cut the painter just because he wants to keep abreast of an independence party, and now thinks that France rules too directly?

Were North Africa developing in a vacuum (as, indeed Algeria developed in its day) Frenchmen of all parties could and would no doubt work to induce all three territories to see the economic value and the security of accepting the place that France desires them to occupy in the French Union. But, swept as the area is by outside influences, its future is unlikely to develop so simply. For if Morocco binds itself to the Arab League, Tunisia—always more malleable and more open to Egyptian influences—is bound to move in the same direction. Only Algeria, where at least half the educated Moslems wish to retain a link with French culture and French politics, may hesitate to follow suit. A pointer to the future will be obtainable when the new Algerian constitution, now in draft, comes before the French Parliament. There, fifteen Algerian Moslem deputies, duly elected by Moslem electors, will have their chance to speak out. And of the fifteen, eight are assimilationists wanting closer union with France.

The Geneva Negotiations

The meeting of the Preparatory Committee on Trade and Employment at Geneva has got to grips with its first essential task, the negotiation of tariff and preference reductions, rather more quickly than at first seemed possible. The early start of these negotiations appeared to be threatened on two counts. First, it was found that considerable differences separated the British and American views on the procedure to be followed in the negotiations. The Americans, fearing that the other countries at Geneva might tend to line up against them, suggested that the negotiations be kept multilateral throughout, and that all countries represented should have access to information about the course of each set of bilateral deals. The British and Commonwealth view was that to follow this course would be to give away considerable bargaining advantages to other countries who would be given a pre-view of others' potential concessions before they made their own offers. This issue appears to have been decided against the United States, and every delegation has been left free to decide whether or not to pass on to third parties information about its negotiations with the various countries represented. The second threat of delay came from the fact that a number of the member countries were not prepared to begin negotiations immediately. They pleaded lack of adequate warning, but beneath this excuse could be seen a wish to "test the market" and see what other countries were prepared to do before they themselves made their own offers and bids.

In spite of these difficulties a real start has been made with the actual task of tariff negotiations. The most crucial of these negotiations, that between Great Britain and the United States, began on Wednesday, when representatives of the two countries exchanged lists offering tariff concessions. Lists of their respective demands had already been exchanged some time ago. Tariff talks have also begun between the United States on the one hand and Canada, Czechoslovakia and France on the other. France has also set in train negotiations with China, Canada and South Africa. Of the 120 scheduled bilateral tariff negotiations, dates for starting them have been provisionally fixed for as many as 96. Of these, 24 will have been set in motion by the end of April, 48 in the first half of May and 24 in the second half of May. The United States, with their considerable command of manpower, have negotiating teams available to meet every country represented at Geneva, and are providing the principal stimulus to rapid progress. The prevailing feeling in Geneva is that the negotiations now begun will appear to stall for a considerable time, but that progress, when it begins, will be fairly rapid. It is,

however, regarded as unlikely that the log jam will break much before the end of May, and the hopes that this part of the task of the Preparatory Committee might be finished before the end of next month appear to be doomed to disappointment. This does not mean that discussion of the charter will have to be postponed, but that the closing stages of the tariff negotiations will certainly impinge considerably on the second part of the Geneva discussions.

Prison Labour

In 1933, a Departmental Committee on the Employment of Prisoners summed up its findings with the words "prisoners became adept at wasting time unobtrusively." During the war, however, as the two reports, recently published, of the Prison Commissioners revealed, their work was very different. The demand for prison labour, from the Services and elsewhere, introduced an entirely new outlook, and the prisoners' output proved to be remarkably satisfactory. In the Young Prisoners' Centres and Borstal Institutions where the prisoners were working on sub-contracts, there was "a marked improvement in industry and discipline," and the farmers who employed prison labour, working under only nominal supervision, generally found it the best emergency labour they had.

Is there now to be a return to the pre-war position, when prison employment merely meant that prisoners became confirmed in the habit of half-hearted work? In the past, prisoners were only allowed to work for the prison service or for Government departments. The prison authorities, therefore, dared not speed up the work in case the contracts would not last out. With the extension of the Government's activities, it should be possible to increase and vary the contracts without infringing this principle. But is the principle itself really justifiable? After all, the effect on industry and the labour market as a whole is the same whether prison labour is employed on making mail bags for the Post Office or sacking for industrial firms. The important thing is that there should be no under-cutting, a principle which was maintained during the war when contractors paid the Prison Commissioners for the work done on the same basis as applied to their own factories.

No doubt, the increased output during the war was partly due to a genuine patriotism. If another stimulus is needed in peacetime, it could be provided by an extension of the earnings scheme. The paltry sums the prisoners can earn at present, never more than 11d. a week and often only 4d., cannot have any effect on their work or outlook. From the prisoners' viewpoint, the increased cost of living is almost entirely a matter of the increased cost of tobacco, and, even before this year's Budget, he could only earn about one cigarette a day.

It is impossible to read the Prison Commissioners' reports without realising that a genuine effort is being made to ensure that a prison sentence should educate and reform the offender. In their 1942-44 report, they admit that it was perhaps the first time that the section on employment was appropriately included under the heading of training. Nothing could be more likely to undo the efforts that are being made than a return to the pre-war system of discharging men and women who have not learnt to do a proper day's work.

The Regent's Park Terraces

The Gorell Committee, set up to consider the future of the Nash Terraces surrounding Regent's Park, has reported* in favour of preserving all or a majority of the terraces with their original façade and as residential units; with this conclusion the Government declares itself "in sympathy." There are, however, serious practical difficulties. The houses are now in a very poor condition with dry-rot almost universal. The Committee in effect censures the Commissioners of Crown Lands for having left the work of repair to their tenants and the Government for taking so few steps to prevent the recent deterioration of the many derelict or bomb-shattered houses. Moreover, 212 out of the 374 terrace houses have already been taken over by the Ministry of Works for temporary use as government offices, an arrangement made in secret immediately before the Committee's appointment and one which it finds undesirable. The superficial repairs now being carried out by the Ministry will be of little assistance towards the proper rehabilitation of the terraces, which will in any event be an uneconomic proposition; by contrast, complete demolition and rebuilding on modern lines should be a profitable commercial investment. Finally, the length of life of the rehabilitated terraces might not be long—perhaps no more than fifty years.

* Report of the Committee on the Regent's Park Terraces. Cmd. 7094. H.M.S.O. 1s.

Despite these difficulties, the Committee are certainly right. These terraces are one of London's greatest architectural glories, and it would be stupid as well as tragic to destroy them at a time when the nation has decided to foster the art of town-planning and when a satisfactory new school of British architecture is still very much in the making. On a purely commercial basis, their value as examples to students and as attractions to tourists are considerable. Rather should the present opportunity be used to improve the access to the park from surrounding areas and to replace some unsatisfactory buildings with the Music Centre and the hostel for university students which have been suggested. Accommodation for students, which is badly needed and would be ideally sited in this area, might be best provided by an interior conversion of one of the terraces.

The estimated cost of rehabilitation, at existing prices, would be high, but not unduly so. It would vary from £1,350,000 to £4,250,000, according to whether the houses were simply restored or were partly reconverted into flats. An Exchequer subsidy would be unavoidable, but there seems no good reason why—as the Committee recommend—differential rents should be fixed to enable some poorer tenants to live there. The tenants would be subsidised in any event, and the taxpayer should not be asked for more than is needed to let the houses in good condition to those who attach special value to living on this site. If the terraces are not to go to rack and ruin, it is now up to the Government to display greater understanding and energy than it has done to date and to make wise use of its own temporary tenancy.

Shorter Notes

In a Note on "Further Education" in *The Economist* of March 29th, page 449, the statement was made that the Education Act of 1944 demanded that "compulsory part-time education should come into being three years after the raising of the school-

leaving age." Actually, the position is more complicated. Within these three years local education authorities become liable for the duty of establishing and maintaining county colleges. An Order-in-Council was recently made placing the responsibility upon them, and a circular has been issued directing them to prepare schemes for county colleges. But the circular states that the Order-in-Council has no reference to a possible date for the completion of the provision for county colleges nor to the date on which compulsory attendance at them is likely to be imposed.

After a wartime period of stability, the inevitable increase of rates is now getting into its stride. The average rate in county boroughs rose by only 1s. between 1939-40 and 1945-46; it was increased by 1s. 5d. for the year just ended and for the coming year it has been put up by 1s. 8d. The new average level of 18s. 7d. compares with a pre-war average of 14s. 6d., an increase that is still very modest when contrasted with the fall in the value of money; but the increased outlay on some services, in particular on education, that is now beginning to be felt will make increasing demands on rate income in the coming years.

The demands made by the swollen Civil Service on accommodation in the London area are illustrated by a parliamentary answer given on Monday, when it was disclosed that Government departments hold on requisition in the London civil defence region no less than 40 hotels, 854 large houses, 409 small houses and 1,479 flats. Another answer on the same day stated that in the present year permanent and temporary office space will be built for Government departments in London to the extent of 190,000 square feet and 428,000 square feet respectively (plus 70,000 and 2,380,000 square feet elsewhere than in London).

Letters to the Editor

The National Income

SIR,—In the first two tables in the article on the National Income White Paper in your issue on April 19th you give certain figures in brackets which you state "cannot be deduced from this year's White Paper" and "have required some interpolation or estimation by *The Economist*." Unless I have interpreted the figures in the National Income White Paper incorrectly, all the categories which you give in brackets except those for "net receipts of interest, etc., from overseas" and consequently for the "gross output of the United Kingdom," can in fact be obtained from the figures in this year's White Paper as follows:—(The main numbers refer to those used in the Main Tables of the White Paper itself, i.e., Tables 15, 16, 17 and 18.)

	£ million	1944	1945
Gross Available Resources	10,820	10,965	
(Item 7+8+9+56)			
Gross National Product	10,161	10,090	
(Gross Available Resources less item 10)			
Gross Capital Expenditure at Home	97	631	
(Item 9+56 or Item 60)			

These figures are slightly different from those given in your article.—Yours faithfully,
ELY DEVONS
Department of Economics, University of Manchester
[Mr Devons is quite right. We had failed to notice one item.—EDITOR.]

The Budget

SIR,—It seems a great pity that the Chancellor of the Exchequer has once again missed the opportunity to offer effective inducement under PAYE.

Voluntary absenteeism arises mainly because the standard rate of tax, even after allowing for earned income allowance, is too high to offer inducement to work. And indeed anything over, say, 6s. should not be charged until high levels about the sur-tax level are reached. There is no doubt that the present high level cannot be continued indefinitely.

Something, however, could have been done. In 1945-46 the effective standard rate of 10s. less one-tenth, that is 9s., was not reached until £272 had been earned by a single man. It was the young single men who chiefly absented themselves. £272 is one-tenth earned income relief plus £80 plus £165, and represents £5 5s. a week.

In 1946-47 the standard rate of 7s. 10½d. (9s. less one-eighth) was reached at £269 (one-eighth earned income relief plus £110 plus £50 at 3s. plus £75 at 6s.), which equals £5 3s. 6d. a week.

Now it is to be the standard rate at £282 (one-sixth earned income relief plus £50 plus £125), which equals £5 8s. 6d. a week, the standard rate being 7s. 6d. (9s. less one-sixth).

This will not encourage extra work. If a workman is earning 25s. a day, he reaches full rate after working four days a week, and the concession now given will not make an extra day's difference.

Had Mr Dalton restored the reduced rate to £165 at 6s. (if he could not afford to give £50 at 3s. and £115 at 6s.) the standard rate would not be reached till £330 had been earned, which is £6 7s. a week. £330 is arrived at by taking earned income relief one-sixth plus £110 plus £165.

Is it too late to amend this?—Yours faithfully, H. H. BARKER

Saxby, Southbourne, Bournemouth

The Eastern Frontier

SIR,—I agree fully with the author of your note on "The Eastern Frontier" in your issue of April 12, 1947, that Russia has robbed a territory which was "more Polish than Russian," and I would like to add that of the 12,012,000 people who lived in this territory in 1931 there were 4,794,000 Poles but only 120,600 Russians.

I cannot, however, agree with the statement that in compensation the Poles now want to rob a "still weaker" neighbour—the Germans.

First of all, the territory claimed by the Poles was once Polish. In the eleventh century the rivers Oder and Neisse were Polish

frontiers and west of them lived not Germans, but Slavs. For centuries this territory was robbed—to use the author's own expression—by the Germans who applied the same methods as those which roused the indignation of all the civilised world during this last war; and, if a great part of the British—and even more the American—public agree with the historical claims of the Jews to a country which they left, flying from persecution, 2,000 years ago, why not admit Polish claims which are more than twice as recent?

Then, one must not forget that this “weaker neighbour” attacked Poland deliberately, killed 5,500,000 people, destroyed at least 50 per cent of the total national property and more than 75 per cent of all Polish cultural works. Is it immoral to claim indemnities for such damages and should one wonder that the retribution has been as great as the harm inflicted? The territory conceded to the Poles has to be big enough to permit them not only to increase their population, in 30 to 40 years, by the 5,500,000 they lost during the war, but also to the level which they would have reached in this time if there had been no war—and the Polish birthrate was much higher than the German. If this were not done, the Germans would attain their principal war aim—to prevent the pacific development of the Polish nation. Would it be moral?

And—last, but not least—it is necessary to remember that in consequence of the Yalta and Potsdam agreements, in which the Poles were never even consulted, the new Polish territory is to-day inhabited by 5,000,000 Poles and less than 500,000 Germans. Of this Polish population 80 to 90 per cent are people forcibly expelled by the Russians from their homes in eastern Poland under the most inhuman conditions one can imagine, or persons who, cruelly displaced by the Germans for slave labour in Germany, could not return home, but were compelled by the Russian-dominated Warsaw government to settle down in this new country. All these unhappy men, persecuted without reason during seven years of war, deprived of all their property, separated from most of their relatives, were thrust into a devastated land without any other help than their own hands and their will to work. And now, after they have rebuilt this land amidst such hardships and by superhuman labour, hoping to find one spot under the sun at least where they could live in peace, why should they be displaced again? Would it be moral, would it be human?—Yours faithfully, **TADEUSZ FELSZTYN**

Foxley Canadian Camp, near Hereford

Czechoslovakia's Trade

SIR,—In your Prague correspondent's report on Czechoslovakia's export trade (April 12th) he referred in a paragraph (which you headed “No Place for the Middleman”) to a plan adopted by the Government of that country to develop a system of direct sales from factory to retailer.

Trading in that country has always suffered from a lack of the services provided by the bona-fide stock-carrying wholesaler. When making a special survey for my members in 1936 I found that there were practically no wholesale textile houses such as we have in Britain.

It is perhaps interesting, therefore, in view of the additional emphasis Czechoslovakia now proposes to place on direct sales, to quote some of the points I noted at that time.

There was a very definite body of opinion among the business community which believed that a system of wholesale distribution would prove beneficial to the country. There was a high percentage of retail failures, inevitable when the trader is deprived of “wholesale protection.” Large numbers of manufacturers' travellers forced big orders on retailers when they did not know their seasonal requirements. There was no “buffer” range of stocks between supply and demand as in Britain. Representation of their products cost manufacturers an uneconomical sum because each could only show his own limited range. According to Czechoslovakian calculations shown to me, English manufacturers dealing through their wholesale distributors had an advantage of 3 per cent over the Czechoslovakian producers who had to freeze their capital in providing extended credit facilities for retailers instead of investing it in bulk quantities of raw materials.

In view of all this it will be interesting to see how Czechoslovak trading economy fares now that the present Socialist administration is still further carried away by the “no middleman” fallacy.—Yours faithfully,

W. T. CAVES,

Secretary, The Wholesale Textile Association

75 Cannon Street, E.C.4

Jewish Camps in Cyprus

SIR,—In the letter you published in your issue of April 19th, on the subject of Jewish camps in Cyprus, the writer, Mr Podhorzer, seems to forget or to ignore the following points.

(1) The persons concerned were caught while attempting illegally to enter Palestine.

(2) The traffic in illegal immigrants is on a vast scale and highly organised by Zionists whose activities are either condoned or actively assisted by the various authorities in control of the areas of Europe whence these immigrants are recruited.

(3) The appalling conditions in the refugee ships is thus the responsibility of the organisers alone.

(4) The conditions in the camps are the result of the behaviour of the immigrants themselves. The camps are equipped on a scale of lavishness undreamt of by the British soldier serving in the Middle East, and yet within a few days after occupation by these immigrants, partly by deliberate sabotage and partly by complete indifference to or ignorance of the elementary rules of hygiene, these camps are reduced to a filthy shambles.

(5) All reports concur in saying that most of the immigrants are young and active persons of both sexes. While it might be possible to make a case out for relaxing the immigration regulations in respect of the aged and infirm, there is no reason why the young, strong and healthy should not be able to find full employment and ample opportunities in Europe to-day.

I submit, therefore, it is nonsense to refer to such illegal immigrants as “the desperate survivors of Hitler's concentration camps.”—Yours faithfully,

PATRICK COGHILL

Bengeo Hall, Hertford

ON THE TEN HOURS' BILL
To the Editor of THE ECONOMIST

SIR,—You are probably aware that it is the opinion of some persons that an equal quantity of work will be accomplished in eleven or ten hours per day as has been effected in twelve hours per day. If so, the Ten Hours' Bill will be of undoubted advantage to the factory occupiers, as it will secure a considerable saving in light, fuel, etc.

I need not inform you that the effect of the Ten Hours' Bill will be to limit the labour of adults to ten hours a day, although this point is not distinctly stated in the Bill; for everyone acquainted with the factory system will know that the moving power will cease when young persons and children are driven away by Act of Parliament, as machinery cannot be longer profitably continued running, either for the owner or the operative.

Allow me to state what I believe to be an almost invariable principle, that the interest of the employer is identical with that of the employed; that is, we cannot have prosperity and full employment, and the operatives not partake of the benefit. Neither can the labouring classes suffer through want of employment and consequent low wages and, at the same time, the factory owners and occupiers enjoy the benefit of prosperity. Neither is it in the power of one party or the other to regulate wages. Wages will at all times vary with the variations of supply and demand. Therefore the inference is that the employer is no more praiseworthy for giving high wages during a season of large demand and under supply than he is blameable for giving low wages during the season of small demand and comparative large supply.

The Ten Hours' Bill, when it comes into operation, will at once reduce the hours of labour in all those factories fully employed. There will, therefore, be an immediate loss to the employers or employed, or both. If it fall on the workman, it operates as a tax on his only property—that is, his labour. If the employer gives more wages for work done, he must, of necessity, lay the additional cost on the goods manufactured. But there is another description of cost which he cannot avoid, viz., the rent, interest of outlay, insurance, watchmen, overlookers' and clerks' salaries, with nearly the same amount of dilapidations, which remain the same, whether subject to Ten or Twelve Hours' Bill. Then there is the waste of water-power . . . of one-sixth, or equal to two months' use during the year. All these losses will materially enhance the cost of goods, rendering the competition of foreign manufactures successful, to the ultimate loss of a considerable part of our foreign trade. . . .

I remain, Sir, your obedient servant,

A CONSTANT READER

Huddersfield, April 20, 1847

Books and Publications

A Liberal Super-Squib

“The Little Less. An Essay in the Political Economy of Restrictionism.” By A. S. J. Baster. Methuen. 161 pages. 7s. 6d.

THIS is a lovely little book; Mr Baster's deadly and economical assault suggests a skilled matador confronted with—let us say, stall-fed oxen. He must have enjoyed writing it, and his enjoyment is infectious. With meticulous attention to chapter and verse, restrained indignation, and an elegant but irreverent style, he analyses the economics of the Lunatic Years between the wars; the grand structure of private and public devices for producing less, growing less, working less, transporting less, and trading less. Not Professor Hayek himself could make more comprehensive hay of his victims; but the emphasis here is decidedly different from that of “The Road to Serfdom.” Mr Baster objects far less to Socialism, though he regards it as a poor and possibly dangerous second-best, than to the restrictionists' arthritic and emasculated capitalism.

His own alternative is a militant liberalism designed to restore—or rather to bring about for the first time—the necessary conditions of a really free price economy. Redistributive taxation, particularly on inheritance; expanded statistical and technical information services, designed to give producers and consumers something like the knowledge assumed by textbook definitions of competition; an educational war on gullibility; the root-and-branch abolition of the private power to “create” credit, and the setting-up of a Government “pool” of standard commodities to stabilise cyclical fluctuations—these are the chief items in his programme. Interests now vested in the unreal economic values evolved under the policy of the “little less” should be assigned a fair cash value and then be extinguished over a term of years—the restrictive practices concerned ceasing immediately.

While applauding Mr Baster's general onslaught, one feels that he sometimes proves too much. If food subsidies wrongfully interfere with consumers' free choice, what about the education services? Is there absolutely no room for restrictionism in remedying the discrepancies between individual and public time-horizons, nor in short-circuiting a mutually destructive competitive struggle? (This latter argument has been used in support of some far from competitively minded transactions, but misuse alone should not invalidate it.) Nor is one altogether convinced that his commodity buffer stocks, especially on a merely national basis, would really suffice to tame the cycle. But over-comprehensive attack and over-summarised remedy are natural, almost inevitable, ingredients of the pamphleteer's work; and it is as an extended pamphlet rather than as a cut-down treatise that “The Little Less” should be read. One is the sorrier to note from internal evidence that it took some sixteen months to go through the press. Possibly a compositor, dutifully “going slow” during last winter's semi-strike, noted the chapter on Working Less and vowed that the trade union movement should, in this case at least, have the last word.

Job Security

“The Guarantee of Work and Wages.” By Joseph L. Snider. Harvard Business School. 191 pages. \$2.75.

JUDGING by the comparative output of books on the subject, the American public is more interested than the British in the problems and techniques of industrial management; a fact which may partly explain the acknowledged superiority of American managerial methods. Dr Snider's “The Guarantee of Work and Wages” is a typically American recipe-book of job stabilisation, addressed primarily to business men and trade unionists. Typical, too, is the insistence that the demand of American workers for security must be met in the first instance and for the most part by private industry, with Government action as a residual remedy only. Dr Snider does indeed touch in his later chapters on Government trade cycle policy, but his treatment is perfunctory. The real core of his work lies in the private sector, the action taken by different firms (Hormel, Nunn-Bush and others) to give security of status and annual earnings to their employees.

He offers no single scheme as a model; but certain standards

of success do emerge. A scheme must be actuarially sound; a guarantee offering more security than is indicated by the firm's record and reasonable prospects means bankruptcy for the firm or default on the guarantee. It must, on the other hand, offer a real increase on existing security, or it will be meaningless. It should have a specific reserve fund to tide it over lean periods. Above all, it must be worked in a spirit of thoroughgoing co-operation by both sides. Indeed, the impression left both by Dr Snider's studies of individual schemes and by his general conclusions is that the benefits of the guaranteed wage are chiefly indirect and psychological. Management, faced with a certain target of stability, moves heaven and earth to spread peak loads, find off-season work, make special deals with suppliers and customers, dovetail the activities of different departments, and choose workers for their versatility; all highly profitable improvements, but no less so if undertaken independently of a guarantee scheme. Workers, no longer fearing dismissal or short-time, refrain from job-spreading, recognise their community of interest with management, improve the quality of their work, and so increase both earnings and profits; again, an improvement which intelligent self-interest could make independently. However, any device, even a mere incantation, which sets management and labour thinking constructively and jointly about a difficult and often disruptive problem of their relations is well worth while.

The London haulage strike showed how important is a clear understanding, on both sides, of what the guaranteed work week entails. Dr Snider throws little light on such difficulties of interpretation in America; he touches on them here and there, but only in terms so diplomatically general as to be meaningless. This over-delicate diplomacy, and a certain haziness of theory surprising in a specialist on industrial fluctuations, are the weak points of a book whose interest to all concerned in industrial relations is certainly not limited by the Atlantic.

Quick Disillusionment

“The Covenant and the Charter.” Henry Sedgwick Memorial Lecture. By J. L. Brierly. Cambridge University Press. 1s. 6d.

IN the lecture now printed as a pamphlet Professor Brierly, who holds the Chair of International Law at Oxford, has made a comparison of the League of Nations Covenant and the United Nations Charter which is severely to the disadvantage of the latter. He points out that the League Covenant sought to “create a system of co-operation between states, which were to retain their sovereignty but to agree to do and not to do certain things in the exercise of their sovereign rights”; the League was always “they” and not “it.” The United Nations Charter, on the other hand, has tried to move from a co-operative to a corporate system, towards what the American Constitution calls “a more perfect union.” The United Nations “confer on the Security Council primary responsibility for the maintenance of international peace and security.” The trouble is, of course, that the Great Power veto prevents the Security Council from discharging this responsibility, and as the Member States have hardly any definite obligations apart from the decisions of the Council, there is even less “collective security” than there was under the League.

Professor Brierly exposes the basic contradiction between the Charter's professed purpose “to take effective collective measures for the prevention and removal of threats to the peace and for the suppression of acts of aggression” and its admission of a veto right which “has made it impossible that enforcement measures should ever be taken against a Great Power.” This contradiction is so obvious that one can but marvel how such a system came to be solemnly accepted by the world. Never was so much humbug sold to so many by so few. That it was successfully put across was due to the intensity of the hope of mankind for a real international order, a hope which was ready to gulp down any patent medicine. But disillusionment has come quickly this time and, as Professor Brierly remarks, “it is something that we should face the future, as I think we now do, with a fairly general realisation of where we stand.”

AMERICAN SURVEY

Emergent Policy

(From Our US Editorial Staff)

PUBLIC concentration on the combative aspects of what Mr Baruch calls the "cold war" now in progress should not obscure the fact that behind the Marshall "tough line" is a new phenomenon. Contrary to American habit, a foreign policy seems to be emerging which has both shape and direction.

The action which implements the policy may seem at times both over-brusque and over-eager, but those are novice's faults. At least it has got past the stage of timid fumbling. When Mr Truman asked for the repeal of that vestigial skin of isolationism, the Neutrality Act of 1939, he sought not only to get rid of detritus, but also to recommend new legislation more in keeping with present circumstances. When Mr Vandenberg pinned verbal orchids on the 57th birthday of the Pan-American Union he talked to the whole hemisphere, and not merely to that portion of it lying below the 49th parallel. The inverse effect of Mr Wallace's criticisms on the Greek-Turkish aid bill, the State Department announcement that negotiations of the American-Soviet Joint Commission in Korea had broken down and that the United States would therefore act independently, the current trade activity in Geneva, the attempts to find a basis for dealing with Mr Perón which shall satisfy Argentina and mollify those American critics who remember his history—all these point, as do Mr Marshall's daily disagreements in Moscow, to a congruent line of action wherever American interests are deemed to lie.

That policy is driven by three motors—impatience with the lack of progress in peace negotiations among former allies (and in particular with what looks to some people like intentional non-progress), distrust of the effects of exported Communism, determination to strengthen the United States against real or fancied aggression by putting into effect a modern version of that recipe for victory ascribed to a general in the war between the States—"to get there fustest with mostest men." That in some instances it is literally men while in others it is money, machinery, the loan of industrial and scientific "know-how" is in accord with modern strategic practice. The attitude of the military mind toward long-term planning is very different from anything which comes to the mind of an economist or a politician when he hears that word. Its influence on American foreign affairs in the present administration is far from being a figment of the imagination, and cannot be usefully discounted by any reliance on the previous American habit of preferring to go diplomatically in flannels.

During a single week the policy has led the United States into plans for action north, south, west and east, as well as at home. Mr Truman's request for the repeal of the Neutrality Act of 1939 was made on the ground that the ammunition control sections of that law were "particularly ineffective in dealing with current problems." He did not state which problems he had in mind. In asking for a new and different control law to take its place he said—and no surer measure

of the difference between 1939 and 1947 exists—"We have committed ourselves to international cooperation through the United Nations. If this participation is to be fully effective, this Government must have control over traffic in weapons which will permit us to act in accordance with our position in the United Nations and will be adaptable to international conditions." It was not until the end of the next paragraph that he brought in "the security interests of the United States," and not until the end of the Message that he paid his respects to the bogey which had done so much to inspire the original Act, the international arms brokers.

Mr Vandenberg's gesture northward in inviting Canada to take her seat in the chair which has been waiting for her since the Pan-American Union building was erected in 1910 might be shrugged aside on the ground that his language was birthday oratory. Yet observers noted that only a month earlier the Canadian Deputy Minister for External Affairs, Mr Pearson, had made a speech in New York City in which he supported Pan-Americanism within the framework of the United Nations. At least one division in the State Department is said to be working on studies designed to relate the Pan-American Union closely to the United Nations, and there are those who believe that a formal invitation to join the Union may be extended to Canada at the coming Bogotá Conference.

Southward, the policy apparently calls for eating a rather tough crow. If ways can be found, without too great indigestion, for disposing of the policy towards Argentina which Mr Braden initiated in 1945, and if at the same time Argentina can be persuaded to comply with the promises she made at Chapultepec and has been disregarding ever since, the Bogotá Pan-American Conference may usher in a new and broader version of the hemisphere co-operation which Mr Roosevelt made so important and which Mr Truman has left to wither to such dangerous unimportance. On the result of the Bogotá Conference will depend the much-postponed Rio Conference on hemisphere defence. Whether negotiations will proceed to the point where military equipment and experts will be sent south no matter what the political colour of the recipient is a question which is being watched with rather bitter interest by those who do not trust Mr Perón as much as Ambassador Messersmith might like.

Moving west, across the international date line the policy stiffens. To free Korea has been a declared American intent since 1943; to free it in the American way became difficult when Japanese forces in the north surrendered to the Russians and split the country in two. In 1946 a Joint US-Soviet Commission was appointed to set up a provisional Korean democratic government, but it bogged down in arguments over what "democratic" meant in terms of Korean politics. Mr Marshall now informs Mr Molotov that "the United States, mindful of its obligations under the Moscow Agreement, sees no alternative to taking without further delay, such steps as will advance the purposes of that agreement."

Mr Wallace's speeches on the eastern side of the Atlantic are affecting the new policy, though not in the direction which Mr Wallace would prefer. Not only do they raise the blood pressure of his enemies in both political parties; this week they stirred those enemies into a positive enthusiasm for the Bill to extend aid to Greece and Turkey. The inverse galvanic effect of the Wallace crusade was a decisive Senate vote for the President's policy.

Ironical though this action may seem, the Wallace evangel

cannot be taken too lightly. Whatever his offence against political etiquette—an offence shared by Messrs Churchill and Laski—Mr Wallace still holds the key to the conscience of the American liberal. That he has not always used it wisely does not save them from a sense of sin when he chooses to stalk and talk as a prophet. Many of them believe that the policy of amity which he is preaching has been tried and has failed, but that he should continue to advocate it makes them newly aware of the dangers to an irritated world that lie in the policy of hard realism which has taken its place. Whether he can capitalize on this sensitivity for his own political advantage is more dubious; but the discomfort he is causing his friends may make them look more closely into the potential perils of the course he is attacking.

Meanwhile the costs, at home and abroad, of the emergent policy of expansive defence are beginning to attract analysis. Representative Herter of Massachusetts has introduced into the House a Bill calling for a committee on foreign aid to consider relating the foreign expenditure of the United States to its resources and objectives. Exclusive of the Bill for aid to Greece and Turkey, which calls for \$400 million, there has already been allocated, in goods or money, \$16,788 million for foreign spending, a figure which is eloquent even in the United States. Food prices have already risen in reply, cartoonists see the scrawny curs of inflation sniffing in the national dooryard, economists discuss the reallocation of resources which will be necessary if American wealth is to be spread so far and

hence so thin. And Mr Baruch, dedicating his own portrait in the South Carolina legislature, calls on the nation to work harder and for longer hours "if we are to regain our heritage; if we are again to be the missionaries of hope and to be rewarded for our effort . . . Until we straighten out and solve our own problems of production, and have internal stability, there is no basis on which the world can renew itself."

The cost of the new policy abroad, in terms of influence and durable friendliness within the United Nations and with individual governments, remains to be assayed. Indications that the policy is any more successful in persuading Russia to co-operate than was the less militant policy it replaced are hard to find, but there is no indication that the converse is true. Russia stirs her great bulk only after the last card has been played, and that moment has not come. As for Britain, the problem is more complex, and whether the Labour government will choose to regard the nascent military republic as bulwark or competitor in Western Europe is a vital choice that is yet to be announced.

Meanwhile the power of the motor force presently at work may be gauged from a sentence in the report which Mr Marshall (then General Marshall) made to the President in 1945 in his capacity of Chief of Staff. "We may again elect to depend on others and the whim and error of potential enemies, but if we do we will be carrying the freedom and treasure of this great nation in a paper bag." The work of providing luggage which shall be less vulnerable is now under way.

The Vanishing Chinook

(From a Correspondent in Oregon)

PACIFIC salmon are born on clean gravel in the clear waters of mountain brooks. Early in life the baby fish get into the current and slide backwards to the sea. They remain in salt water until maturity, four years later, when they return to the place of their birth, spawn, and die. Later their rotting bodies serve as food for their own offspring *en route* to the sea. The salmon one buys in tins were adult fish caught in fresh water on their way to the spawning beds. So long as some salmon are permitted to escape and spawn, the runs usually continue year after year unabated, for most salmon eggs in the natural course of things serve as food for trout and other enemies; when the egg crop declines, they decline.

Most tinned salmon comes from Alaska. But the choicest of the five Pacific salmon tribes is the royal chinook, which runs in commercial numbers chiefly in the Columbia River, and the life cycle of the chinook is being disrupted. It has been argued by fishermen that the decline in the run is due to construction of dams, but this contention cannot be proved with present evidence. A minor fraction of the run was probably lost with the building of Grand Coulee dam, 550 feet high. But few salmon ever went as far inland as that. At Bonneville, only 150 miles from the Columbia's mouth, fish ladders were built beside the dam.

The ladders are a 60-foot climb at low water. They are narrow at the top, so that all fish coming up can be counted. During the first season 271,799 chinook went up. Next year the number was 286,217. But since spawning salmon are four or five years old, it could not be known until the fourth year whether sufficient salmon were getting up past the dam, and sufficient fingerlings coming down unhurt, to maintain the run. In the fourth year, 1941, the count was 461,548. In the fifth year 401,998. In 1945 the run was 445,718.

The commercial season usually opens in April and runs to November, with a brief summer closure and weekend closures throughout the season. The greatest run comes in September. The runs are erratic. In one three-day period 149,661 fish passed Bonneville, more than a third of the total 1942 run. It is a sight for tourists—salmon, weighing from 20 to 50 pounds, crowding up the ladders. Sometimes these peaks occur during

closures. Millions of chinook are caught. For instance, over 16 millions were caught on the Oregon side of the Columbia in 1941. The catch in other streams ran the total to well over 20 millions.

Clearly Bonneville dam is no bar either way. And yet the catch of fish is declining. In the past, the commercial pack, the only available yardstick, has been as high as 400,000 cases. The largest pack in recent years was 328,000 cases, and in 1945 it was down to 132,000. Nor is this due to any lack of demand. Commercial fishermen, using gillnets, catch as many as they can, and most of the fishing is done below Bonneville because fish are fattest when taken nearest the river's mouth—mature chinook never eat after entering fresh water.

Why is the run declining? Choked brook mouths and covering of eggs by silt due to logging are factors. The escapement of fingerlings into irrigation ditches is another. Stream pollution takes its toll. These can be combined into one word—industrialization. Can the chinook salmon survive civilization? The deleterious factors mentioned are being corrected, for the chinook salmon is worth a minimum of \$10,000,000 annually to the state of Oregon. But no student of the problem believes these measures will restore the runs. Whether hatcheries will reverse the trend remains to be seen. Hatcheries currently release more than 20 million chinook annually. Many fingerlings have been tagged when released, and few tagged fish caught. But this proves very little. Last year, experiments were started in clipping fins in different ways, with the fingerlings released in batches at different times. Answers are sought to the questions: Are the fingerlings held in the hatchery too long, or not long enough? Are fingerlings reared in a hatchery on a diet of animal viscera under ideal conditions sufficiently rugged to survive the journey to the sea, there to grow and eventually to return?

Many people believe that if healthy fingerlings can be got to the sea, the problem will be solved, for adult fish always return to the stream of their birth. But will it? About the time the decline became alarming, albacore tuna appeared in great numbers off the Oregon coast, saving many a fisherman from

"AMERICAN SURVEY" is drawn from three sources. Articles described as "From Our US Editorial Staff" are the work of a small group of regular correspondents, resident in the United States. Everything printed without attribution is prepared in London.

bankruptcy. That tuna live on young salmon is unproven. And that the stupid tuna could drive the fighting chinook from their mysterious pastures in the sea is doubted by every man who has ever hooked—or failed to hook—a chinook.

Is it then just civilization? The chinook is a primitive creature, refusing the tastiest of baits, yet striking furiously at a bit of flashing metal in the water; a creature that will fight with the last ounce of strength to reach a particular spawning bed, making unbelievable leaps up swift rapids on the way. Yet big chinook will swim for hours in the top pool of the fish ladders at Bonneville before crossing the two-foot white painted submerged board at the counting station. They approach the board, turn away, seek a less exposed passage, come back to the board, turn away again. They take the ladders in their stride, but shrink from that split second exposure on the flash board. Dead fish which have not spawned, found later below the ladders, indicate that some prefer death to this exposure. Or was the climb up the ladders too much? Nobody knows.

American Notes

Pilgrims' Progress

By the decisive vote of 67 to 23 the Senate on Tuesday approved the \$400 million Bill for aid to Greece and Turkey. The measure now goes to the House, where every indication suggests that approval will be given by an equally substantial majority vote.

It is noteworthy that in the Senate the Republican Party gave a more than two-to-one vote for the President's policy—35 for and 16 against. Thirty-two Democrats supported the majority and seven voted against the Administration. A number of Senators, however, made reservations in expressing their decision to vote this time with Mr Truman. Senator Taft, for example, said that national prestige alone compelled his assent. To Senator Vandenberg was left the task of dealing with Senator Johnson, Democrat from Colorado, whose sustained and vigorous opposition to the Bill was based on the allegation that such a step was equivalent to a declaration of war. Senator Vandenberg declared that Congress was asked to support the independence, and not the monarchy, of Greece; that without support both Greece and Turkey might become "totalitarian satellites"; that the United States could not afford to be isolated by possible "chain reactions" from the loss of these countries as independent units, and that, finally, the United Nations could no, at present, give the necessary lead.

The very substantial Congressional majority, however, does not conceal the fact that many Congressmen are profoundly uneasy—and altogether perplexed. A major criticism is that President Truman made an abrupt reversal of tactic by failing to consult fully with Senator Vandenberg and thus reinforcing opposition by the omission, for example, of Mr Vandenberg's clause covering Uno authority over US policy. As on earlier occasions, it does seem to be quite true that Mr Henry Wallace has succeeded only in giving reinforcement to the policy which he is now opposing. Far beyond Mr Wallace, however, is the plain and unescapable fact that Moscow regards every possible attempt to pave the way for European reconstruction as no more than "dollar diplomacy." The threat to freedom has become so plain that only a modest minority in Congress believes that there is any practical alternative to the "Truman doctrine."

* * *

Congress Looks at Geneva

In his efforts to secure a successful outcome to the Geneva discussions on world trade policies, Mr Clayton enjoys the general support of the commercial press, and unquestionably of a wide

section of industry. In general, official statements by such spokesmen as Mr Clayton and Mr Clair Wilcox, who took the lead as head of the US delegation in the opening discussions, assume that within the terms of their authority there is ample room for agreement and for decisive concessions in the interests of trade freedom.

Congress, however, seems still to be in a far more suspicious mood. Mr Daniel Reed, as acting chairman of the House Ways and Means Committee, has complained that an air of secrecy surrounds the Geneva discussions, and he has called upon the President to supply his Committee with a daily progress report covering all commitments made. In general, Republican Party spokesmen seem to hold the view that President Truman "gave nothing away" in his recent Executive Order which guaranteed the provision of "escape clauses" in new trade agreements, and that effective control of the machinery will rest, as has been true since 1934, with the State Department.

So far from being willing to witness further concessions, a majority on the Ways and Means Committee, in fact, holds that tariff cuts under the Hull programme have already exceeded reasonable limits. So soon as budget and labour legislation are completed, the Committee plans to issue a "declaration to foreign nations" that any agreement at Geneva "will be subject to Congressional scrutiny in 1948." In the Senate the Republican chairman of the Finance Committee, Senator Milliken, plans to submit to the Geneva delegates a general Congressional review of tariff and trade plans in order to forestall "unalterable commitments."

Even those Republicans who are most vociferous in their attacks on the Geneva Conference concede that the present Congress would almost certainly not override a Presidential veto on any attempt to upset existing tariff agreements. But they believe that a general process of bludgeoning inside and outside of Congress will put severe limits on the scope of new concessions. It cannot be said that the State Department is showing any particular concern over Republican opposition. Probably officials recall that the Republican Party, despite its overwhelming votes against the grant of authority in tariff matters to the State Department under the 1934 Act, was in 1944 obliged to give that Act a conditional approval in its election programme, and they are fully aware that the majority party is by no means united on this issue. But in the light of electoral prospects for 1948 smaller nations must find considerable room for discouragement in President Truman's failure to bridge the gulf between the parties on foreign trade policy. The *New York Journal of Commerce*, which declared recently that Mr Truman's Executive Order on tariffs went beyond Republican demands "in curbing the powers of the State Department," now declares that full employment at home and uncertainty concerning the fate of the Trade Agreements Act are "two solid reasons for rushing negotiations." The *Journal of Commerce* has consistently supported the cause of trade freedom, but this statement, however well-intentioned, will scarcely reassure the weaker nations that Mr Clayton's commendable zeal reflects a permanent American policy.

* * *

Wage Agreements

Industry has given, in the main, a generally favourable reception to news of the wage agreement between the United States Steel Corporation and the United Steel Workers. This is a key month for wage negotiations, and the steel contract is always regarded as a pointer to probable results in other major industries. The full advance, estimated at 15 cents an hour, is certainly as high as US Steel wanted to go, but the contract averts the threat of a lengthy strike at a time when operations are at a very high rate, and when profit margins are certainly substantial. A statement on behalf of US Steel declared that the corporation "hoped" to absorb this wage advance without adjusting prices. An encouraging feature of the contract is that the union has agreed to cancel the so-called "portal" wage claims. Despite the discouragement given to such claims both by Congress and the courts, industry is only too willing to secure formal cancellation.

The removal of any threat to steel supplies is a good pointer for a number of major industries, some of which have still to settle wage claims. The recent settlement between General Motors and the electrical workers provided for an increase on about the same scale as that secured for the steel workers, when allowance is made for other benefits received, and there now seems to be a general belief that this key automobile company will accept a similar award for other workers. The United Automobile Workers have been perhaps the most aggressive union body in their persistent claim for a wage advance of 23½ cents an hour. Last week, General Motors made a formal offer of 11½ cents

for UAW men; on this basis, 15 cents is perhaps the right level for a bargain. Following General Motors, Ford and Chrysler contracts must be settled, but industry is now taking a definitely hopeful view.

The situation, however, is not precisely unclouded. The railroad "brotherhoods" are known to be seeking considerable wage concessions, plus new "feather-bedding" rules that could bring a damaging rise in operating costs. They are financially strong, and are well-organised. Additionally, they are known to resent deeply the emergency action by which President Truman defeated their claims rather more than a year ago. Beyond the railroad stands Mr John L. Lewis, and the continuing, though still muffled, threat of a new stoppage in the bituminous coal mines.

Organised labour, of course, is still keeping a very wary eye on Congress and the progress of labour legislation. The House of Representatives seems to have been infected by the foreign policy of the White House with belief in the virtues of a "tough line." At the close of last week, it passed by an overwhelming majority—308 votes to 107—the Hartley Bill which would impose bans on industry-wide bargaining, the closed shop, and welfare funds, and would permit court injunctions where strikes involved "national paralysis." It seeks also to limit union fees, and to "outlaw" mass picketing, "feather-bedding" and jurisdictional strikes. On this vote, the House could quite clearly override a Presidential veto. The Senate, however, is fortunately holding to the more responsible mood which defeated President Truman's hasty demand for emergency treatment in 1946, although it is also demanding a ban on the closed shop, and new authority for the injunction process. Here, the dispute has opened a bad breach in the Republican Party, with Senator Taft in furious opposition to a coalition majority on the Labour Committee. His main grudge is the absence of any ban on industry-wide bargaining in the Senate version of the labour bill, though he is demanding a much wider revision of the measure.

* * *

Commodity Exchange Controls

The recent burst of speculative trading in commodity markets has brought widespread demands for revision of the existing controls. These demands now have the formal backing of Mr Clinton P. Anderson, the Secretary of Agriculture, who declared

last month that speculation had been "talking loudly in the Chicago grain market," and that the time had come to curb further excesses by corrective action. It can scarcely be said that the Administration has acted vigorously, since the panic liquidation that developed in the cotton markets last autumn (and enforced the closure of the New York, New Orleans and Chicago markets for several days) was followed by an investigation that showed all too clearly the fragile nature of the resources behind the move to "drive cotton to 40 cents."

At no time during the last decade has there been any general revision of the regulations for the Commodity Exchange Administration. Its nominal controls cover all main commodity exchanges, and the regulation of future trading and speculation. It has authority to register brokers and merchants, to limit "speculative transactions" and open commitments, to prevent manipulation, and to "eliminate fraud, deceit and issuance of false information to influence prices."

Under recent pressure, however, CEA has found a certain lack of weight in its authority as thus defined. The re-emergence of three-dollar wheat during March, for example, brought down upon the Chicago grain market a CEA request for minimum margin requirements of 25 per cent in grains, and produced some impressive evidence of abnormal trading on the part of small operators. But CEA held no authority to enforce these margin requirements, and the Chicago market authorities did not meet the full CEA demand, though margin rates were raised quite substantially from the entirely nominal levels prevailing at the beginning of the month. CEA now wants direct Federal authority for margin rates.

In cotton, CEA did move to limit speculative commitments following the October break. Apart from hedging operations, a limit of 30,000 bales was put on speculative holdings of future positions. Operators, however, could then cover to this limit on seven future positions, and in three separate exchanges. From the beginning of the month the 30,000 bale limit applies to all future positions in any one market. New regulations may, of course, go beyond due curbs on speculative excesses and impair the flexibility of the commodity exchanges. Traders are already voicing such fears. But with the security markets so rigidly confined, and with the present weight of money seeking appropriate outlets, the time has come to review the scanty authority possessed by CEA.

THE WORLD OVERSEAS

Northland of Canada—I

New Elements in Strategy

(From Our Ottawa Correspondent)

IN the past quarter of a century, the attitude of Canadians to their sub-arctic and arctic areas has profoundly changed. Between 1920 and 1939 the underlying cause of the new interest was mainly economic: since 1939 a still more compelling interest has arisen from strategic reasons. The discovery of oil, gold and uranium ore within the north-west territories, the rapid evolution of transportation and warfare by aircraft, the invention of rocket and guided robot missiles, the Japanese success at Pearl Harbour, and the subsequent occupation of Kiska and Attu in the Aleutians, the possibility in 1940 that the Nazis might hop from northern Norway to Iceland and to Greenland—these happenings have transformed Canadian thinking about this vast, largely barren, area, which stretches between the inhabited areas of the Dominion to within a few hundred miles of the North Pole.

Before 1920 Canada's Northland was chiefly interesting because of the romantic names connected with its exploration—such as Samuel Hearne, Alexander Mackenzie and the ill-fated Sir John Franklin—and because of the valuable fur trade, which yielded several million dollars' worth of fine pelts every year. The population of the north-west territories in 1921, including whites, half-breeds, Indians and Eskimos, was just under 8,000. The area (excluding the Yukon) as given in official Canadian publications is 1,309,682 square miles, which is well over one-third of the total area of Canada.

Oil and Uranium

The new economic era began in 1920 with the discovery of oil on the banks of the Mackenzie River. In 1930 came the spectacular discovery—to which the successful fission of the uranium atom in 1939 gave vastly increased value—of pitchblende-silver ores at Great Bear Lake. The Yellowknife gold field was located in 1934-35; a major gold rush resulted in the development of six producing mines by 1941, before the increasing gravity of the second world war discouraged further development. When hostilities were over prospectors and promoters surged back into that territory. During the past two years there has been a wide extension of the search for gold. Also, with a minimum of publicity, a broad programme of prospecting for additional uranium ores and other strategic metals and minerals has been under way.

This new activity in Canada's Northland has caused auxiliary developments in air, water and road transport, and in the supply of power, fuel and food. To provide hydro-electric power for the new settlement at Yellowknife, the Canadian Government have undertaken a development on Snare River, about 80 miles north-west of the settlement, which will provide about 8,000 h.p. Surveys for additional power sites are in progress. A road link between the railway system of Alberta and the water transportation of the north-west territories is being created jointly by the governments of Alberta and the Dominion in the form of a 307-mile all-weather highway between Grimshaw, Alberta, terminus of a line of the Northern Alberta Railways, and Hay River settlement on Great Slave Lake. Navigation conditions along the Mackenzie River are being improved. Improved landing fields equipped with weather stations have been constructed at a number of the larger settlements in the Mackenzie district.

During the war a number of military or semi-military aids to transport were established by the Canadian and US Governments which will continue to serve economic development, though most of them lie on the west or north-west margin of the area in which most of the new economic activity is apparent. Early in the war the Canadian Government built a line of airports linking Edmonton with the Yukon (the North-west Staging Route). Japan's attack on the United States, which offered a threat to Alaska and Canada's north-west coastline, was followed by the rapid construction of the Alaska military highway from the end of the railway at Dawson Creek, British Columbia, to Fairbanks, Alaska. The Canol Project linked a valuable source of oil at Norman Wells with the Pacific seaboard. Landing fields between Edmonton and Norman Wells were built, and a number of winter roads constructed. Some of these projects have little post-war value: but the airfields and the Alaska highway, as well as the winter roads, have served to open up a large new area for commercial exploitation.

Exercise Musk-Ox

A series of Canadian and American military exercises in the past two years have added to the topographical and climatic data about the new Northland. These included "Exercise Lem-

ming" of March, 1945, from Fort Churchill into the barren lands north of the timber line as far as Eskimo Point and inland to the native settlement of Padlei, using American Weasels, American M-7s (half-tracks with skis) and Canadian-built snowmobiles; "Exercise Musk-Ox," which was "Exercise Lemming" on a much grander scale; the US Operation "Frostbite"; the US Army's midwinter tests this past winter in Alaska and in the Aleutians; exercises "Eskimo" and "Polar Bear," the first a "dry-cold" and the second a "wet-cold" test of men and equipment, the former into north central Saskatchewan and the latter in the Cariboo and coastal ranges of northern British Columbia.

The new strategic importance of the far north affects the defence of the United States. On February 12, 1947, Ottawa and Washington simultaneously announced "an honourable partnership" in security plans for that area. It was described as a "limited collaboration" and a practical working arrangement, which either country could terminate at any time, since no treaty, executive agreement or contractual obligation had been entered into. The Canadian Prime

Minister, Mr Mackenzie King, used the opportunity to deny that the United States had asked for bases in the Canadian North. Talk of Maginot Lines or large-scale defence projects were, he said, all unwarranted, and much of the talk was "fantastic." Canada's new interest was expressed by the Prime Minister in the following language:

It is apparent to anyone who has reflected even casually on the technological advances of recent years that new geographic factors have been brought into play. The polar regions assume new importance as the shortest routes between North America and the principal centres of population of the world. In consequence, we must think and learn more about those regions. When we think of the defence of Canada, we must, in addition to looking east and west as in the past, take the north into consideration as well. Our defence forces must, of course, have experience of conditions in these regions; but it is clear that most of the things that should be done are required apart altogether from considerations of defence. We must know more about such fundamental facts as topography and weather. We must improve facilities for flying. We must develop better means of communication . . . our primary objective should be to expand our knowledge of the north and of the conditions necessary for life and work there, with the object of developing its resources.

The statement was made, in part, to allay international concern. A further step of this nature was taken a few days later when the Canadian Minister of Defence (Mr Brooke Claxton) invited the military attachés of ten countries to go to Churchill on Hudson Bay, to see what truth there was in charges made in Moscow and elsewhere that large numbers of US troops were stationed in Canada's northern outposts and that experiments were being carried on with jet-propelled aircraft. The invitation was extended to, and accepted by, the Soviet military attaché.

Early last month the Canadian Government announced that within the next three years nine new weather stations for long-range weather forecasting will be built above the Arctic Circle. They will be operated by Canadians, but the United States will pay a portion of the cost of establishing them. A few days later the Secretary of State for External Affairs (Mr St. Laurent) disclosed some details of a US-Canadian agreement to set up a chain of long-range navigation stations (Loran) to serve Alaska and the Canadian Western Arctic. The first chain will be located at Port Brabant, the Arctic outpost of the Mackenzie River system, at Cambridge Bay on Victoria Island, 600 miles or so east, and Point Barrow, Alaska, several hundred miles west.

(To be concluded)

German Votes and Grievances

[FROM A SPECIAL CORRESPONDENT IN DUSSELDORF]

EACH of the three *Länder* of the British Zone elected its parliament, or *Landtag* last Sunday and 8½ million Germans went to the polls. Any satisfaction the average German may have felt inside him at this first opportunity for years to vote freely to a German parliament was more than outweighed by the gnawing anxiety about where he would get his next meal. In the prevailing atmosphere of deprivation, despair and disillusionment it is remarkable that the British Zone has returned a strong anti-Marxist majority; Socialists and Communists together can be outvoted by the Christian Democrats, provided the latter get the support of the three smaller, middle parties which polled 18 per cent of the votes cast. They almost certainly will.

The Social Democrat Party, generally regarded by Germans as the British Government party, may feel some satisfaction at the results, if the three *Länder*—North Rhine-Westphalia, Lower Saxony and Schleswig-Holstein—are taken together. The Social Democrats polled 3.1 million votes against the CDU's 2.7 million; the Communist vote was nearly 900,000, the Centre Party vote nearly 600,000, and that of the Free Democratic Party nearly 570,000. In the free cities of Hamburg and Bremen, where elections were held last year, there are already Social Democrat majorities.

The Centre Holds the Balance

The situation in the industrial *Land* of North Rhine-Westphalia is naturally the most interesting. Here the Communists increased their strength considerably—their vote rose to 14 per cent. The CDU remains the strongest single party with 91 seats. None the less their proportion of the votes—37.6 per cent—shows a fall on the 46 per cent they won in the *Kreis* elections last year.

Of the smaller parties in the middle, the Centre Party has 20 seats against 12 in the previous *Landtag* and the Free Democratic Party has 12 against eight previously. So the outcome in this key *Land* is that Social Democrats and Communists together command a majority over the CDU alone, but not over the CDU plus the Free Democratic Party which has hitherto thrown in its weight on the side of private enterprise and against socialisation. The Free Democrats are definitely conservative in economic and social matters although radical on cultural matters; the Centre Party, on the other hand—once predominantly Catholic but now without definite religious affiliations—will vote with the Left on economic issues but tends to be conservative in cultural affairs. So in this *Landtag* the Centre Party literally holds the balance between Right and Left. There is a similar situation in the *Land* of Lower Saxony, where the Social Democrats and Communists combined have a clear majority over the Christian Democrats only if the latter are not supported by the Lower Saxony Party which, surprisingly, polled as many votes as they did.

It is difficult to say yet whether the election results will much affect the present alignment of forces in North Rhine-Westphalia. But there may well be a change in the *Landtag* attitude towards socialisation. The Social Democrats had urged full socialisation of heavy industries and had proposed a referendum on the question, to be held at the same time as the elections. The Christian Democrats and the Free Democratic Party combined to defeat this proposal, the former proposing instead that heavy industries should be run by private and public ownership in co-operation. Now that the Christian Democrats can be outvoted by the Social Democrats with the help of the Centre, the socialisation question will arise in urgent form.

Explosive Mood in the Ruhr

This and other issues raised in the election programmes have aroused little interest in the ordinary voter. Food is all that matters to him, and no party can promise more than any other a remedy to a situation which is still getting worse. But the poll was higher than was expected—an average of two-thirds over the three *Länder*—and would be very creditable even in an adequately fed country with a longer democratic tradition. If only the theoretical daily calory level of 1,550 for basic consumers could be maintained and honoured, then the miseries of cellar life and overcrowding and shortage of goods would matter much less. Only half this level is being met at the moment, and for the four weeks ahead the bread ration will be cut by two-fifths, from 92 ounces to 55. As nearly half the bread grain to be received in the next two months consists of maize—which makes a heavy and indigestible loaf—and as most families living in the towns can eat hardly anything but bread, there is great hardship ahead. To honour the official bread ration, 5,000 tons of grain daily must be imported, and the deliveries planned for May fall far short of this figure.

As for the rest of the diet, the fat ration nominally stands at seven ounces every four weeks; in fact, only two or three ounces were received on the last ration. Because of shortage of meat, fish and sugar have been substituted for two-thirds of the current meat ration. Families who were not lucky enough to lay in stocks of potatoes last autumn are now completely without them; even in the miners' canteens, which receive special issues, potatoes are often short. In these conditions it is not surprising that the mood of the people since the recent demonstrations has been explosive. A further strike of the miners to protest against the shortages is expected soon. If it comes, the effect on German exports and industry will be very serious. The recent one-day strike cost about 300,000 tons of coal, but the long-term effects on daily production are still being felt.

It is well known among the population here that their troubles are partly due to the bad working of the fusion arrangements between the British and American zones. For example, in March Bavaria should have delivered 2,387 tons of meat instead of the 330 tons actually sent. Bavarian fat deliveries are also below quota. Feeling generally against the farmers who will not deliver their harvest quotas and hold back their livestock is very strong. In North Rhine-Westphalia new schemes are being introduced for punishing and encouraging farmers. After July 1st, farmers who reach or exceed their quotas will be rewarded with coupons giving them priority in the purchase of agricultural machinery, implements and fertilisers which are in short supply. Farmers who fail to meet their quotas may have implements, livestock, even farms, taken away. But there is no confidence that stern measures taken in this province, where the town population is politically strongest, will be copied in other *Länder*.

Ten Year Plan for Northern Rhodesia

[FROM A CORRESPONDENT IN LIVINGSTONE]

ONE of the most important effects of the 1940 Colonial Development and Welfare Act, which provided for grants to the Colonial Empire totalling £120 million over ten years, was the way in which it forced colonial governments to prepare some kind of centrally co-ordinated development plan. Production of such a plan was, in effect, a condition of eligibility for grant. In Northern Rhodesia the response was what has been described in the colony's recently approved Ten-Year Development Plan as "the first major effort at long-range planning." In February, 1943, the Government called for the preparation of provincial and district plans of development throughout the colony. This led to the collection of a mass of ideas and information. The next step was the appointment of a development adviser. In late 1944 and early 1945 Mr G. F. Clay, the joint Northern Rhodesia-Nyasaland development adviser, carried out investigations. His report was accepted by the Government as giving the general principles on which planning was to be based, and the heads of the social and economic departments were then asked to draw up plans for the minimum necessary expansion over the next ten years.

When it was announced in November, 1945, that Northern Rhodesia's share of the London fund (subject to Colonial Office approval of individual schemes) was to be £2,500,000 plus a share in the £1,000,000 allocated jointly to Northern Rhodesia and Nyasaland, it was clear that the departmental plans had overestimated the amount of assistance to be expected. The programmes were reconsidered, reduced and eventually submitted as a whole to the Legislative Council.

The revised allocations of expenditure for the ten-year period are as follows:—

1. Social Services (Health, Education)	£ 3,384,000
2. Economic Services (Agriculture, Forestry, Livestock, Game, Fish)	2,108,000
3. Rural development	1,500,000
4. Communications	1,820,000
5. Water development	970,000
6. Economic development (agricultural, marketing, secondary industries)	500,000
7. African housing	1,000,000
8. General building and public works	1,300,000
9. Loans to local authorities	250,000
10. Unallocated balance	168,000
	£13,000,000

This expenditure is to be financed as follows:

Colonial development and welfare allocation	£ 2,500,000
Loan	5,000,000
Surplus funds approved in Legislative Council ...	3,000,000
Surplus balances, 1945-49	2,500,000

The plans for economic services were left almost intact. The reductions in the original plans were achieved by drastically cutting the allocations for social services and rural development. The Health Department's plan was reduced to about 81 per cent of its original, the African Education Department's plan to about 64 per cent and the rural development plans to about 70 per cent. The total saving from these cuts was in the region of £1,909,500. It might be deduced from the healthy state of the colony's balances that the cuts were unnecessary and that this sum could have been financed from revenue. The 1947 estimates expect a surplus balance of £6,332,168 at the end of the year. The balances in 1945 and 1946 (latest estimates) totalled £1,149,000. Yet the total allocation from balances for the period 1945-49 is only £2,500,000. The 1945 surplus, however, was partly due to a shortfall in expenditure arising out of the shortages of staff and materials—and only partly to unexpected revenue from increased industrial prosperity. The 1946 surplus was almost entirely due to an underestimate of revenue prospects, which is unlikely to recur. On the assumption that the full programme of normal expenditure estimated for 1947 is achieved, and that copper prospects continue unchanged, there is no reason to expect an appreciable revenue surplus this year. Similar considerations apply for 1948 and 1949. Hence from a total surplus of perhaps £6,332,000, the development plan draws £5,500,000.

It might be argued that the cuts were made in services which could ill afford them. This is certainly true of the health plan, for the original represented "the minimum at which to aim if the health services of the territory are to be considered satisfactory." The reduction in the African education plans, while proportionately heavier, is not such a disaster. It is true that a provision after ten years, for 120,000 children to Standard II, 17,000 to Standard IV, 3,750 to Standard VI, and only 600 to receive any government secondary education at all, is pathetically limited for a total school population in the region of 314,000. But no one who knows the incredibly low standards of the education at present provided can doubt that the Director's insistence on "the need for consolidating and improving existing facilities for elementary education before embarking on any large schemes for further expansion" is fully justified. Similar arguments could be used to justify a temporary reduction in the plans for rural development. There is a real case for proceeding cautiously and for not committing too large a proportion of the colony's resources to projects which might prove unworkable.

Development Centres

As originally explained by Mr Clay in his memorandum, the idea was that basic development plans, instead of emanating from Lusaka and spreading thinly over the territory, should be concentrated at a few focal points, or development centres, from which they could be gradually extended over wider areas. The objective was an attempt "to give the Africans of Northern Rhodesia reasonable health, education and agricultural (including veterinary) facilities, all within reasonable distance of their villages." But there is a great deal more implied in the proposals. The main function of a centre will be to train subordinate European and African staff for development work in the districts to which they will be posted; but the high-grade European staff of the centre will also be engaged in planning basic development for the zone surrounding the centre in conjunction with the provincial team of the province concerned. Each centre is to be equipped with a hospital, a community centre, lecture rooms, chapels, and full provision for research and demonstration, on local problems, such as farm land, livestock, etc. Each will turn out a succession of trained African teams consisting each of a teacher, a dispensary assistant, a sanitary assistant, and a rural assistant, who will carry forward the centre's work of "permeating the rural areas and acting as the main agents in rural reconstruction."

The unofficial section of Northern Rhodesia's Legislative Council received the original development centres plan with some scepticism. One centre needs a staff of 16 European officers, many of them senior high-grade officials and most of them technical experts in short supply, plus an auxiliary African staff. It involves an initial capital expenditure of £80,000. To set up five of these centres, as originally proposed, without any initial trial, might involve a considerable wastage of trained staff and valuable equipment. The final plan establishes one centre in the first instance and a second if that proves successful.

The more cautious approach has much to be said for it. The success of development centres must depend largely on the enthusiasm of the participants—both Africans and Europeans. It is probably fair to say that no one, as yet, knows exactly what the centres can achieve, and how they are to set about their work. There will be much initial fumbling. On balance, therefore, except in respect of the health department's plans, Northern Rhodesia's development programme does not seem to have suffered irreparable harm by this enforced austerity.

So little is known as yet of the actual potentialities and needs of the colony that it is premature to plan for a period of ten years ahead in any but the most tentative fashion. Indeed, even the total population is unknown, and the lack of information on technical problems shows up throughout the report. In all spheres there is an urgent need for more research, and one of the first tasks of those engaged in putting into effect the development programme should be to consider and report on the most profitable and urgent avenues of research. It is already clear, however, that unless the financial position of the Northern Rhodesian Government improves, either through increased industrial prosperity or through increased taxation, the present allocation of £2,500,000 is not enough to provide for a satisfactory programme of development for the next ten years. It does provide a fair start for an imaginative but cautious series of experiments in colonial development planning.

IT was in the North of Essex that Courtaulds' business was founded. In 1816 at Panfield Lane, Bocking, Samuel Courtauld set up his first premises midway between the great silk centres of Norwich and London. Nine years later his two brothers joined him in partnership as silk throwsters, and soon they were making crape on an extensive scale with factories at Bocking, Braintree and Halstead.

At these mills from 1906 onwards Courtaulds' earliest viscose rayon yarn was woven, dyed and finished into dress and furnishing fabrics, linings and shirtings. Local men and women, whose ancestors had made the ancient bays cloth of the Essex yeomen, applied their traditional weaving skill to creating new techniques for using a revolutionary textile fibre.

These mills have long since used more rayon than any other material, yet during the war their experience of silk saved lives; they produced many millions of yards of silk and nylon parachute cloth and helped others to do the same.

Today at Braintree mill, rayon is processed, woven and knitted; there, the new British knitting machine, fastest in the world, has recently proved itself. At Bocking, fabrics are dyed and finished, and furnishing and other fabrics are woven at Halstead.

Out of a total of over 20,000 people employed by Courtaulds in the United Kingdom, the Company's Essex mills employ 1,600 local people in regular work—approximately half as many more women as men.

There is an urgent need for many more employees than this if these three mills in North Essex are to fulfil their share of the world demand for British rayons.

The purpose of this series of statements is to inform the public of some part of the contribution made by Courtaulds' industrial enterprise to economic well-being in various districts of the United Kingdom.

HOW DEEP IS A HEART-THROB?

THREE-DIMENSIONAL films are not new; the problem of their successful commercial use has yet to be solved. Iodine is helping to make this possible.

Iodine has unlimited applications. Few elements serve mankind in such a variety of ways. It is used in heat-sensitive and germicidal paints, X-ray analysis, dyes, insecticides, infra-red photography, bactericidal deter-

gents, paper, glass and textile technology. A vast store of technical data on the uses and potentialities of iodine in Medicine, Agriculture and Industry has accumulated during the last 135 years. This information is recorded, collated and kept up-to-date by the Iodine Educational Bureau, whose qualified consultant staff is ready to assist with professional, research and development problems. There is no charge.

BALKAN SOBRANIE CIGARETTES & TOBACCO

THIS ENGLAND . . . *Number Seven*

OUR English weather is never as summery or as wintry as it used to be. Our Springs are perfect in January, and our Autumn rains are hailed sardonically as the last dose of Summer. No wonder we breed philosophers . . . those who, lighting a pipe as they shelter from a midsummer hurricane or a quiet cigarette as they bask in a midwinter Spring, find that in the smoke clouds of *Balkan Sobranie* they can weather any weather and enjoy an atmosphere so delightfully and so exclusively their own.

SOBRANIE LTD. LONDON, E.C.1.

How much do YOU know about British films?

A survey on British films was recently carried out by Research Services Ltd. among top-ranking business and professional executives. (Some idea of the type of person approached will be gained by the fact that the principal papers read by them are *The Times*, *The Observer*, *The Economist*, *The New Statesman and Nation*, *The Spectator* and *Tribune*.) The survey revealed that many of these people were by no means accurately informed about the nature and activities of the J. Arthur Rank Organisation. For example, 21% of the informants said that the Rank Organisation did NOT produce feature films.

In fact, the following feature films are among the many made in recent years by producing companies associated with the Rank Organisation:

HENRY V • BRIEF ENCOUNTER
ODD MAN OUT • THE SEVENTH VEIL
GREAT EXPECTATIONS
IN WHICH WE SERVE
A MATTER OF LIFE AND DEATH
THE WAY TO THE STARS
THEIRS IS THE GLORY
CÆSAR AND CLEOPATRA
THE RAKE'S PROGRESS • THE OVERLANDERS
I KNOW WHERE I'M GOING
THE CAPTIVE HEART
MEN OF TWO WORLDS
SCHOOL FOR SECRETS
THE WICKED LADY • THE WAY AHEAD
THE LIFE AND DEATH OF COLONEL BLIMP
HUE AND CRY

J. ARTHUR RANK ORGANISATION LIMITED

THE BUSINESS WORLD

The Capital Budget

CAPITAL budgeting, so widely advocated before the war, has assumed a new importance in these post-war days of full employment, large Government expenditures, and inflationary pressure. In pre-war years, the idea of the capital budget was, in essence, a device for making deficit expenditure acceptable; it was a means for making good any deficiency in investment activity in the "private sector" (that is, on the part of industry and private individuals) by appropriate expenditure from the Exchequer. To-day, the emphasis on the capital budget has changed its direction, but none of its importance. Capital budgeting has become an essential adjunct to the "ordinary budget" because the latter, being merely a device of Treasury tradition and accounting expediency, provides no measure of the impact of the total effect of state expenditure on the behaviour of the economy as a whole. The state claims the right and duty, through its own programme of investment expenditure, to command an increasing volume of physical resources and services for public "capital formation." It should be the function of a capital budget to relate these claims to those of the "private sector," and by combining them, to show the amount, or the proportion, of the national income which is to be devoted to the creation of new assets. This when added to the amount used by the Government and the public for current consumption, minus any borrowing from abroad which may be needed to meet an excess of consumption and capital formation, will equal the national income.

There is nothing formidable in these ideas of the compensating balance between consumption expenditure and investment expenditure. But the technique of applying them has not yet advanced very far. There is no capital budget, in any formal sense, and official opinion seems to be hardening against one. Yet the policy implicit in capital budgeting was reflected in several passages of Mr Dalton's Budget Speech last week—in its explanation of "below the line" expenditure items, and in his recognition of the dangers of an inflationary break-through overwhelming the physical and financial controls. Information about the rate at which physical capital and stocks are rebuilt is not needed merely to measure whether there is to be open inflation or not: it is needed quite as much to measure the progress of British industry towards a higher level of efficiency. There is little doubt that industry was investing before the war too small a proportion of the national income year by year to expand and improve its equipment. There is no doubt whatever that the making good of arrears of new investment and maintenance which accumulated during the war would absorb the energies of the British economy for many years to come.

This is a field in which accurate information is scanty. "It is not possible," declares the National Income White Paper, "to provide an exhaustive analysis of net capital formation at home." A few weeks earlier the "Economic Survey for 1947" had pointed out that statistics are not yet sufficiently comprehensive to enable the investment expenditure to be estimated with great precision, and it resorted to the general statement that the scale of the programme at which the Government is aiming in 1947 (apart from housing) should be at least 15 per cent higher than for a normal pre-war year. It further

suggested that in 1947 capital equipment and maintenance would absorb 20 per cent of the gross national income, towards which 7 per cent would be contributed by depreciation funds set aside from current income. Perhaps the more convenient way of looking at these figures is to say that 13 per cent of the net national income is put forward as this year's capital investment target. A capital budget, therefore, is still largely a matter of hopeful guesswork. The following table shows its movement in 1938, 1945 and 1946:—

COMBINED PUBLIC AND PRIVATE CAPITAL ACCOUNT

£ mn.	1938	1945	1946
Private saving	323	1,528	877
Less Excess of accruing tax liabilities over payments	+ 16	— 91	— 156
Public authorities' dissaving	— 89	— 2358	— 705
Provision for depreciation and maintenance	450	510	600
War Damage payments	...	167	131
E.P.T. refunds	...	...	167
Gross Savings	700	— 244	914
Gross capital formation at home	770	631	1314
Debit: Net borrowing abroad	70	875	400
Gross capital formation	700	— 244	914

Source: Cmd. 7099, Table 18, with minor changes.

This table is expanded by a lengthy note in the National Income White Paper. The gross capital formation at home (£1,314 million in 1946) is composed of total expenditure on fixed capital works, together with changes in the value of stocks and work in progress. But it is based originally on a figure, shown in the main table on the national income, for net capital formation at home, which itself is arrived at by difference and depends on the accuracy of six other estimates. To this net figure (£714 million) has been added the estimated sum set aside for depreciation and maintenance (£600 million); these provisions are known to have increased sharply last year owing in part to the introduction of the Income Tax Act of 1945. If the figure of £600 million for depreciation is considerably out, however, it would mean that the gross capital formation figures would be correspondingly out too. If the figures are taken as they stand, they show that the private sector saved £1,477 million gross, of which £156 million represented taxes paid by drafts on accumulated tax provisions and £407 million (net, after the receipt of £298 million in War Damage payments and EPT refunds) for financing the dis-saving of public authorities. This left a figure of £914 million for net saving. But gross capital formation at home exceeded savings by £400 million, which was made good by overseas borrowing.

To estimate the pattern for 1947, and thus to resolve the question whether the Chancellor's financial policy as a whole is inflationary or not, is an uncommonly hazardous task. But some indications of the total claims of the Government sector were given by Mr Dalton last week. Expenditure on roads is put at £10 million. EPT refunds this year will require £60 million, and the total estimate for war damage payments is £330 million. Some part of these two items will be saved

by the recipients, if only because physical plant and resources will not this year be available to meet them; nor perhaps will the total of £70 million for the further paying off of post-war credits to older people be wholly spent. Direct capital expenditure will be involved by the advances of £50 million to the National Coal Board, £200 million from the Local Loans Fund to local authorities for housing and other capital schemes and £90 million for temporary housing. In addition the Exchequer will, in effect, have to re-borrow the amount of tax reserve certificates surrendered in payment of taxes. This item absorbed £118 million net last year, and might be put at, say, £150 million this year. These items give a gross figure of £960 million for the Government's financial requirements, of which perhaps £160 million might result in additional private savings (£30 million from post-war credits, £100 million from war damage value payments and £30 million from EPT refunds) leaving a net total of £800 million. Against this, the Government might expect to obtain £70 million from the growth of the unemployment and national health funds. The question, therefore, is whether, and if so how, the net financial requirements of the Government for capital or "below the line" items, are to be matched by savings and balanced against the capital requirements of industry.

In the "Economic Survey," the proportion of the national income to be set aside for capital equipment and maintenance in 1947 was put at 20 per cent gross, of which 7 per cent would be provided from depreciation reserves. The corresponding proportions in 1946 were 16½ per cent and 7½ per cent of a national income estimated at £8,000 million. In 1947, the national income may fall—by how much it is impossible to guess, but possibly within the range of 5 to 10 per cent. If the middle figure of 7½ per cent is taken and a national income in 1947 of £7,400 million is assumed, the capital targets set in the "Economic Survey" would involve £1,500 million or rather less for new equipment and maintenance, and a total depreciation provision of £525 million, leaving a net capital formation estimate of say £975 million. Perhaps the national income estimate of £7,400 million in 1947 errs on the low side, but even if its money value were the same in 1947 as in 1946, the net capital figure would not exceed £1,050 million. Against this sum of £975 million, the requirements of the Government and the local authorities will claim approximately £725 million, on the estimates of the preceding paragraph, and leaving industry with £250 million, in addition, of course, to its depreciation provision. Industry's net share would be largely met from undistributed profits, which were put last year at £210 million.

Thus, there is a rough symmetry between the Government

and the private sector in the 1947 capital budget. Industry should cover its apparent share—roughly £775 million gross—by using £525 million from depreciation provisions and £250 million from undistributed profits. This estimate, however, makes no allowance for the urgently needed rebuilding of stocks, which could easily absorb another £200 million or more. On the Government side, the £725 million would be offset by £366 million net from small savings, plus overseas borrowing. The "Economic Survey" declared that it would be unsafe to borrow more than £350 million net this year. But last week Mr Dalton showed that the overseas deficit might be "a good deal higher" than last year's total of £400 million unless vigorous action was taken to reduce it. The hard currency deficit, in particular, is likely to be substantially higher than it was in 1946. The conclusion, provisional though it must be, suggests that if the capital expenditure programme in 1947 is non-inflationary, it will be so only by increased reliance on overseas borrowing, coupled with close restriction of new capital activity in the private sector and an almost total abstinence from rebuilding the stocks of industrial raw materials, which are now run down to the very limit.

Obviously, there are plenty of "ifs and buts" in estimates of this sort. Nevertheless, they raise the important longer-term issue of the future relationship between consumption and saving, and the speed at which the British economy can hope to make good the depredations of war, given its limited resources, and given the fact that accumulated small savings equivalent to nearly one year's personal consumption could, in the absence of restraint, be used for current purchases. Mr F. W. Paish, in a recent bulletin of the London and Cambridge Economic Service, has sketched the cost of the possible reconstruction commitments during the post-war decade, on the assumption that war-time losses are made good that three million houses are built, and that industry as a whole, including nationalised concerns, meets its capital requirements from undistributed profits. These are, in some respects, draconian conditions; but they demand, on Mr Paish's estimates, that savings should be more than doubled and probably nearly quadrupled. The country, if it is to restore its losses and undertake its hopeful construction targets for the next ten years, will have to save £300-£700 million a year more than it wants to save at present. In the event, a good deal of the programme may have to be pruned. But the essential minimum will still be large enough to call for a greatly increased national income, of which a higher proportion is saved either by personal savers or by the Government acting on their behalf. The alternative is progressive austerity and industrial enfeeblement. It is here that a long-term capital budget could set out the facts and make the challenge.

Power and Planning

THE annual report of the Central Electricity Board is always an informative grand inquest of electrical progress. This year, unfortunately, there is a corpse for post-mortem examination, for the Board, whose pre-war planning was directed to the provision of abundant and cheaper electricity at wholesale, has been forced by shortage of generating capacity and coal to cut supplies to the retail consumer. It has become, through no fault of its own, the instrument for planned shortage, instead of planned plenty. The 142 selected generating stations which it controls were, on 54 occasions last year, unable to meet the load. On December 16th, it had to shed 10.4 per cent of the load on its system, and on that day 16 per cent of the plant was out of commission, owing to breakdown, overhaul, or unsuitable fuel, compared with an average of about 6 per cent before the war. The total installed capacity at the end of the

year amounted to 11.6 million kilowatts; the estimated peak demand on December 16th (since exceeded in January by a million kilowatts) was 10.1 million kilowatts; on last December's figures alone, the gap between available capacity and peak load was as much as 1.2 million kilowatts. The legacy of the war years, during which no new generating capacity was installed, could hardly be more graphically recorded.

The Board has recently made no secret of the fact that electricity supplies during the next year or two will still be below potential demand. Last year, the projected programme of new generating plant was 992,600 kilowatts; in the event, only 221,500 kilowatts were brought into service, together with 83,500 kilowatts under the 1944 programme. But withdrawal of old plant reduced the net addition to capacity to 272,375 kilowatts, and the programme for 1946 in arrear amounted to

over three quarters of a million kilowatts. The plant programme can be summarised thus:—

GENERATING PLANT PROGRAMME 1947-50		
Submitted in	For Completion in	Kilowatts
1944	1946	771,100
1944	1947	1,040,100
1944	1948	1,155,000
1945	1949	1,394,000
1946	1950	1,532,500
Total		5,892,700

At the end of last year, work was in progress on the plant included in the 1946-48 programme and on part of that for 1949, while arrangements had been completed with authorised undertakers for two-thirds of the 1950 programme. Clearly, no charge of lack of anticipation could be brought against the Board, but equally there may be further delay before these developments are in operation. In addition, the Board having given preliminary consideration to the 1951 programme, began negotiation for a new station, only to find that owing to "the uncertainties surrounding the future of the industry"—a delicate reference to nationalisation, indeed—the authorised undertaker in the area was unwilling to proceed, and the Board have therefore decided to construct the station themselves. This is a new and significant development.

The report clearly holds out little hope for a balance between capacity and demand during the next few years. But lack of plant is not the only handicap under which the Board labours. The comments on the coal situation are coldly factual, but they have a sharp sting. For several years past, the Board have drawn attention to the grave position of coal supplies at the generating stations. In pre-war days, they used to aim at autumn stocks equivalent to 10 to 12 weeks' winter consumption. But the stations last autumn had succeeded in building up their stocks to little more than three weeks' supply, despite the warnings which had been given to the Ministry of Fuel and Power that widespread interference with supplies was likely to occur as a result of coal shortage. Nor was shortage the only factor. The flat rate increases in the price of coal which have occurred during the war—and have raised the average delivered cost from 20s. 3d. per ton in 1938 to 45s. 3d. per ton last year—"have led to the anomalous situation that the pithead price per unit of heat supplied to the generating stations now increases with the increasing ash content of the coal." In 1944, the freight and handling charges involved in

A. Average cost of production at steam stations operating under the Board. B. Fuel. C. Fuel handling, salaries, wages, maintenance, etc. D. Management, rates and capital charges.

hauling this incombustible matter from pit to station cost over £2 million, and in the two succeeding years the burden was undoubtedly greater. Moreover, bad coal means poor boiler efficiency, and at times during 1946 the loss of output capacity from this cause rose to as much as 380,000 kilowatts. "A heavy proportion of the coal allocation is unsuitable"; it follows that the improvement in thermal efficiency of electric plants which was so marked before the war is being retarded. Waste of transport, waste of coal, and waste of generating capacity have resulted from the failure to deliver coal of the right quality at the right price.

Equally shrewd are the Board's comments on the place which electricity must be given in any effective system of planning. It is no secret that the Board has failed to secure the approval of the Ministry of Town and Country Planning to several of its projects, and it points to the serious consequences which result from the withholding of consent to develop a site when one is found with difficulty. Power stations are large, but not necessarily ugly, buildings, but they generate heat as well as light—as this week's outburst over the proposed Bankside station has shown. On this occasion, Mr Silkin has so far resisted the critics, and has underlined, perhaps, the Board's comment that "during the year the departmental planning procedure has been revised."

At many points, the story of the Central Electricity Board last year is the same story of strangulation and frustration which has affected so many parts of the British economy after the great efforts of war and the precipitate demands of peace. Too much is being demanded of electricity in too short a time. It continues to use outworn plant because it cannot be replaced by new—cannot even be taken out of service for necessary repair. Because old station sites cannot gradually be made over for modern stations, the Board has had to concentrate largely on finding new sites, and has met immense difficulties in doing so. It has had its share of shortages, resulting in the steady growth of arrears of new transmission lines and sub-stations. But it would seem, from data published from other sources, that the electricity industry last year was well supported by the equipment manufacturing industry, for the latter produced generating plant with a capacity of 810,000

A. Total units generated by authorised undertakers. B. Units used at stations in transmission and in distribution (less purchases from non-statutory sources). C. Total sales to consumers. D. Sales to industrial consumers. E. Sales to shops, offices, public buildings, etc. F. Sales to domestic and farm consumers. G. Sales to traction and public lighting authorities.

kilowatts, of which 540,000 kilowatts were delivered to power stations (many of them, of course, outside the Board's domain) while the balance was exported. The electrical engineering industry has top priority for steel supplies required for public generating plants, and there is little need for any panic diversion of output from export to home use. Much has already been done in the direction of standardising boilers and generating machinery, and a considerable increase in output could be obtained from the producers of generating plant if they had more labour and more materials. An annual output of, say, $1\frac{1}{2}$ million kilowatts of capacity would meet the requirements of the programme for the next five years and still leave a valuable margin for export.

In its nineteen years of operation, the Board has shown great accuracy in anticipating the growth of demand for electricity. To be sure, the steady secular trend of growth in the load made such estimation easier than some other types of economic forecasting. But the character of demand in recent years, illustrated in the second chart, shows that the major part of the growth in sales is now arising from the continued expansion of domestic and farm demand, whereas last year sales to industry increased by no more than $1\frac{1}{2}$ per cent. This suggests that the major part of industrial electrification has already taken place. In 1935, the largest industrial consumers of electricity were the mines, steel, engineering and shipbuilding, chemicals, paper making, electricity undertakings themselves, and building materials. All these industries, with the single exception of paper making, have priorities for fuel and materials; but full employment for them may not mean any great increase in their electricity load. Looking ahead, beyond the time of immediate shortage, however, it seems likely that the pattern of demand for electricity is likely to be more complex than in the past. The present demand for electricity is, in some part, an inflationary phenomenon. Power is cheap and

convenient. But the rising trend of coal costs and the inflated capital expenditure now needed for new capacity must find their reflection, sooner or later, in electricity tariffs. The "Grid's" own tariff takes this increased capital cost into account, by making provision for a satisfactory surplus in the next year or two in anticipation of higher costs to follow. The reaction of increased prices on demand might have significant consequences for the future trend of sales. In the present quinquennium, it is unlikely that the programme, if completed to time (which is perhaps improbable) will run ahead of demand, for the 5.9 million kilowatts to be installed represent the gross addition to capacity, without deduction for plant which should be taken out of service as soon as possible.

The Board's assumptions in estimating demand presume that transition to a full peace-time economy will not be completed until 1950, that rationing and controls will continue until that time, that solid fuel supplies for non-essential industry will be maintained, and that industrial production will steadily expand. But there are no assumptions about monetary policy, which might exert a significant influence on domestic demand. Nor are the other assumptions in any respect certainties. The Board has shown in the past that it knows its business, and there is no reason to suppose that its estimates of future demand on the domestic side are likely to be wide of the mark. But at least it can be said that, after two awkward winters, capacity should be restored somewhere nearer total demand. It follows that the diversion of capacity for the manufacture of generating plant exclusively to home needs, as some critics have demanded, would be a fatal error—fatal certainly for the export trade, and fatal in all probability for the smooth expansion of the electricity industry at home. The Board has made out a sound case for the 1946-50 programme, and it should be possible to satisfy it without any stampede diversion of manufacturing plant from export to home orders.

Business Notes

The Borrowing Programme

Twelve months ago the Chancellor declared that he would not need, in 1946-47, to borrow "from the City of London and the money market, any very large sums of new money." This year, he is both more cautious and more specific: "all further internal Government borrowing will be either for replacement of maturing debt, which is always occurring, of course, or for definitely new capital development." It is rather questionable, however, whether even this more cautious forecast will be fulfilled—except, perhaps, in a purely book-keeping sense. Consider first, the position of the ordinary budget. Not only has Mr Dalton's £270 million surplus no real significance in the context of inflation, but it will not even correspondingly relieve his effective borrowings. The "clawing back" of the proceeds of unspent votes will, indeed, produce a reduction in nominal debt, but as most of the funds must certainly be already lent to the Exchequer in the form of book credits or holdings of internal floating debt, their recapture will have no real effect. It is only to the extent to which they are at present held outside the Exchequer, in banks at home or abroad, that the operation can provide any finance for the Treasury's current outgoings, and the amount so held is presumably small.

On the other hand, a significant portion of the actual tax revenue included in the estimates has already been received by the Exchequer in the form of subscriptions to Tax Reserve Certificates, of which £118 million on balance were repaid in 1946-47, and a substantially larger sum (of the £529 million still outstanding), will certainly have to be redeemed this year. It may well be, therefore, that the ordinary budget, so far from providing, as Mr Dalton contended, a sum of £270 million towards the financing of other expenditure, will, in fact, require a borrowing of some £150 million in order to achieve a mere balance.

Below-line expenditure, as a leading article this week shows, will, of course, require much larger sums; and from the point of view of the borrowing programme, considered in relation to the gilt-edged market, it is a matter of indifference whether the expenditure does or does not create capital assets. Below-line expendi-

ture detailed by Mr Dalton, totalled £800 million, including war damage, EPT refunds, post-war credits, housing outlays, and advances to the National Coal Board. Further sums, perhaps of the order of £50 million, are likely to be required for maintenance and extension of Government-owned assets. Finally, some provision needs to be made for borrowing through the Civil Contingencies Fund, which last year absorbed £64 million gross. It is true that £55 million of these borrowings was repaid by the Exchequer at the end of the financial year, but it appears that most of the "repayment" resulted simply from the charging of the corresponding expenditure to supplementary votes for supply services. In a sense, therefore, allowance now for expenditure through the Civil Contingencies Fund is really an advance provision for supplementary votes. On these bases, the total borrowings for purposes other than the repayment of debt may be put at about £900 million, plus £150 million for redemption of Tax Reserve Certificates.

Finding the Finance

To meet these requirements, Mr Dalton will be able to count upon three sources of finance before needing to borrow on the capital market or from the banks. First, and most important, is the finance made available through the deficit on the external balance of payments. The way in which this contributes to the financing of the internal Exchequer deficit is most clearly seen in the drafts on the United States and Canadian dollar credits, but the contribution is by no means necessarily limited to such specific borrowings. As, however, Mr Dalton envisages a hard currency deficit "substantially higher" than the £400 million of 1946, it is, perhaps, reasonable to expect that there will, in the aggregate, be a net repayment of sums due to other overseas creditors. Secondly, there are the borrowings from small savers—rather optimistically estimated at £366 million net. This excludes, moreover, the interest portion of the repayment of National Savings Certifi-

cates, which last year absorbed £23 million, probably a rather larger sum than was provided for in the fixed debt charge "above-the-line." Finally, there will be certain extra-budgetary receipts (chiefly from the Unemployment Fund), which, in 1946, provided £88 million; the contribution from this source in the current year will evidently be smaller.

Altogether, therefore, the Chancellor can, from these sources, count upon, say, £830 million towards the £1,050 million he will need to raise, leaving at least £200 million or so to be borrowed on the market or through the banking system. In addition, there will be debt maturities during the year totalling £465 million. Of this, £300 million comprises the 3 per cent Conversion Loan which becomes optionally redeemable on March 1st next; but, provided that the cheap money policy is not pursued in the aggressive fashion of 1946, it may be possible to deal with this without involving the Exchequer in any significant volume of new cash borrowing. It would be unwise, however, to make any similar assumption about the remaining obligations, £160 million of which represents an early series of 3 per cent Defence Bonds which mature during the year. Obviously, the longer such "small" savings securities are held, the more they tend to be regarded by their owners as "crystallised" capital, but it would surely be imprudent to assume, at this stage in the post-war transition, that small savers will readily re-invest the bulk of their redemption proceeds. In the absence of new commitments, the aggregate net cash demands for the year may, therefore, be put at around £300 million. This is a more substantial borrowing than the Chancellor implied; but, if he avoids over-ambitious tactics, it ought to be possible to carry it through without undue pressure on the gilt-edged market and without any further large creation of bank credit.

Disagreement on Wheat Prices

The International Wheat Conference has ended its arduous and at times difficult five weeks' sitting by agreeing to place the draft agreement before the International Wheat Council—which means, in effect, failing to agree. International wheat conferences have been taking place for the last 15 years, and no complete international agreement has ever been achieved. The aims of producer and consumer are diametrically opposed. Delegates may utter generally acceptable phrases such as "purchasing at prices which are detrimental to neither producer nor consumer," but how can such prices be achieved? Certainly not by international conferences nor even, it would seem, by resort to complicated statistical formulae. The easiest method is by reverting, as soon as possible, to a free market, where in times of scarcity consumers starve or in periods of plenty producers go bankrupt.

The draft agreement is well-intentioned. Both export and import countries are to have "guaranteed quantities" which must be bought and sold at prices within an upper and lower limit. These limits act as guarantees to both consumer and producer. The actual price at which the transaction takes place is conditioned by market forces within these two limits. It is indeed a scheme which permits a large amount of trade freedom, at the same time fixing "wheat points" so as to damp down undue price fluctuations. Inevitably, it tends to favour producers more than consumers, because the former could hold off the market and force the consumer to buy at the upper limit. If the consumer tried to retaliate by forcing the exporters to sell at the lower limit, he would, in present circumstances, starve in the attempt.

The point of disagreement, which the United Kingdom has taken is the proposed range of prices. The basic minimum and maximum prices for the duration of the agreement are understood to be \$1.00 and \$1.80, Canadian currency, per bushel for No. 1 Manitoba Northern wheat in store Fort William-Port Arthur; the parity of the Canadian dollar being taken as on April 1, 1947. The British Government is of the opinion that prices for the next and subsequent seasons should show substantial reductions on the present level. It does not wish to purchase at prices which would give the farmers little or no return, but it must, after all, consider its dollar position as well as its domestic food subsidies. Given the security to producers which the Wheat Agreement affords, their level of return should be lower than under conditions of severe market fluctuations. And given the interest of Britain in lower import prices, the British delegation has very properly declined to sign.

That agreement has been reached in principle on the scheme, is no doubt an achievement, although it cannot be implemented until agreement has been reached over prices. The United States fear a fall in the world wheat market during the coming season; for that reason it wishes to fix prices now at current levels. Great Britain, on the other hand, is hoping for such a fall—it is, indeed, an essential requirement for British economic recovery—and therefore prefers to defer long-term commitments.

Recovery in Coal

Provisional figures of coal production for the third week of April show an inevitable improvement after the reduced level during the Easter holiday; it is much more important that they continued to show improvement on the March figures. Output for the third week of April was 3,971,700 tons, compared with 2,998,400 tons for the previous week (which included the Easter holidays) and an average weekly production of 3,844,000 tons in March.

The recruitment figures for March are also encouraging. New recruits numbered 12,680 compared with 7,750 in February. Making an allowance for the fact that March was a five-week month, recruitment averaged 2,500 a week compared with just under 2,000 the month before. After wastage has been deducted, the net increase in March was 8,200—4,700 more than February. Most of the increase is due, significantly, to the transfer of ex-miners from other industries. Numbers effectively employed increased from 631,800 to 647,600, and the numbers on colliery books stood at 703,400. But by the week ending April 19th this figure had increased to 709,300.

Voluntary absenteeism at the coal face was down slightly on the month from 11.12 to 10.98 per cent and for workers as a whole it fell from 9.14 to 8.71 per cent. But these figures are still higher than a year ago. On the eve of the introduction of the five-day week, the trend of shifts worked per man is of particular interest. In March, output per worker at the coal face was 2.8 tons. This was a slight improvement on February and also on March, 1946, and reflected a corresponding increase in the number of shifts worked from 4.60 to 4.64. If workers at the coal face were to achieve a full five-shift week with the same rate of output as at the end of March they could cut and haul another ton a man per week, which would give a weekly average production of well over four million tons a week with the present labour force. The May output figures will invite close examination, following the introduction of the five-day week; its effect is still an open question, but some present consolation can be derived from the trend of recruitment.

Welsh Steel Development

The Government's decisions on the projected scheme for developing and modernising the South Wales tin-plate and sheet-steel industry were given, in part, by the Minister of Supply last Monday. The original scheme, as submitted to the Iron and Steel Board by the companies concerned, was discussed in a Business Note on page 256 of *The Economist* of February 8th.

The scheme falls into two parts. The first, which is the less controversial from a political point of view, has now received Government approval. Under it, the Steel Company of Wales will take over the Port Talbot and Margam works of Guest Keen Baldwins Iron and Steel Company. The works will become the nucleus of a new continuous hot strip mill with coke ovens, blast furnaces and ancillary equipment. Part two of the scheme is still being considered by the Government in the light of the Iron and Steel Board's recommendations. This section of the scheme is concerned with the erection of three cold reduction plants. The Government do not question the need for new finishing plant for tin-plate and sheet-steel, but they have postponed a decision on the Board's recommendation for their location owing to "the sociological factors involved." There has not been any serious hesitation so far about the best location for two out of the three cold reduction plants. These will probably go to Swansea and Llanelli. Opinions have differed on whether the third one should go to Margam (Port Talbot) or to Newport. There are reports that technical advice favours the former. A Government decision on whether the third mill shall go to the workers—which is the essential philosophy of Development Area planning—or whether workers go to the mill, must not be deferred. Key equipment will have to come from the United States and must be ordered while American firms have capacity available to fulfil the order.

This whole scheme will cost about £50 million. Once the decision on part two has been given, the question of finance will arise. When the formation of the Steel Company of Wales was announced in February it was hinted that the Finance Corporation for Industry might be approached for some of the money. Finding the money, however, is likely to be less problematical than finding the plant in time to be in operation by the scheduled time in three or four years from now. The decision on the South Wales scheme has been given with exemplary speed. An official decision is still awaited on the recently announced Stewarts and Lloyds programme at Corby.

Bretton Woods Changes

The early formative period in the lives of the International Monetary Fund and the International Bank for Reconstruction and Development is proving creditably eventful—"creditably" because the pace at which changes are being made is a token of the adaptability of these two new institutions. Both of them were launched on the basis of meticulously detailed blue-prints, and there is always the danger that ambitious schemes begun in this way and not in an empirical build-as-you-go method may become excessively rigid and unadjustable. In the case of the Bretton Woods institutions that danger seems to have been successfully circumvented. The blue-prints, as they appeared in the final acts of the Bretton Woods Conference, are of course intact; but much of the interpretation given to that agreement at the inaugural meeting of Governors in Savannah has already gone to the scrap-heap. The most visible evidence of that change is apparent in changes of personnel, and in particular of the dominant American personnel. From the Bank the first President and the first US Executive Director have gone, and have been replaced by nominees of Wall Street. Even more significant perhaps is the recent resignation of Mr Harry White from the position of US Executive Director. Mr White remains as an "honorary advisor without pay," but his disappearance from the board of executive directors can only be regarded as a further mark of the shift of power and influence in these two institutions from the politicians and the civil service in Washington to the bankers of New York.

At the International Bank preparations are said to be well in hand for the first loan, which may well go to France. If necessary a start may be made with lending by using the resources which the Bank has already accumulated by capital subscriptions from member countries. Some progress is, however, being made in preparing the market in the United States for bonds to be issued by the Bank. The President of the Bank has recently stated that the Bank's bonds would ultimately be listed on the New York Stock Exchange. A recently appointed officer, the Bank's "Director of Marketing," has suggested that the bonds would have a maturity of 10 to 25 years, and that since they would be protected by paid-up and uncalled capital of \$7.7 billion, of which over \$3 billion would be US dollars, the bonds should virtually have the standing of US Government obligations.

Scope for Rationalisation

There appears to have been a suggestion of controversy about the proposal of certain members of the Board of the International Bank to proceed to the election of a thirteenth executive member. According to the resolutions of the Savannah inaugural meeting, an additional executive director was to be elected if one or more countries were admitted to membership and if countries not represented on the Board had votes totalling 4,000. That position has been reached with the admission to membership of Syria, Lebanon, Turkey, Italy and Norway. The American and Chinese directors wish, therefore, to proceed immediately to an election. Others, including the British, have suggested that the election be postponed until September, when the next meeting of Governors will take place in London. This issue is complicated because Australia is now going through the formalities of election to membership. Hence if a thirteenth Director is appointed now, it may be a very long time before Australia has any say in the elections to the Board of Executive Directors.

Other reports from the two institutions suggest that M. Gutt, managing director of the Fund, is in favour of a merger of the Fund and the Bank. It is not the first time such a proposal has been made. There is much to be said for it, especially that it would prune the swollen budgets of these two as yet largely non-earning concerns. But the two institutions are so contrasted and have such diverse though complementary rôles to play, that their continued legal and administrative separation appears to be desirable. What could be achieved to secure greater efficiency and a measure of economy would be to merge certain common services such as statistical and economic research, and public relations, which now not only duplicate a good deal of the work they perform, but do so in contiguous rooms. Another contribution both to economy and administrative efficiency would be to hasten the process of converting full-time to part-time executive directors and cut the directors' remuneration accordingly.

Financial Aid for Italy

Full details, released late last week, of the financial settlements between the British and Italian Governments reveal that Britain has dealt very generously with its former enemy and

eventual co-belligerent. Earlier reports from Rome, which implied that as a result of the payments agreement, Italy would emerge with a large balance of immediately convertible sterling, were, of course, quite incorrect, as a Note in *The Economist* of April 5th pointed out. It is in the inter-governmental financial settlements, rather than the payments arrangements, that the generosity is evident. The payments agreement follows the lines indicated in the earlier note, and is modelled on the familiar pattern. The Italian Exchange authorities agree to hold a minimum balance of £10 million in sterling, any surplus above this amount being freely expendable on the principles applicable to the recently created category of "transferable" sterling. That is to say, at present such sterling may be used for current transactions, not only within the sterling area, but with the dollar area, Canada, Argentina and the Belgian, Dutch and Portuguese monetary areas. It is expected that the scope for transfer will shortly be extended to the French area, Brazil and Uruguay. This liberal range of expendability, instituted in conformity with the American Loan agreement, will not, however, mean that the whole of Italian sterling holdings in excess of the reserve balance of £10 million will be immediately converted. A further sum of up to £10 million will need to be held in reserve to finance imports already projected from the sterling area, and a further £8,000,000 is due to the British Government. Italy's free surplus at the moment, after these deductions, is not likely to exceed £6,000,000.

The inter-governmental settlements cover cross-claims arising from the post-liberation military occupation, Italian assets in the United Kingdom and pre-war debts. Britain had already announced that it would waive its claim (valued at about £25 million) for payment for supplies distributed to the Italian civil population. It is now, in effect, waiving almost £100 million of net claims on military account. Surplus United Kingdom stores, military surpluses and other supplies delivered to the Italian Government or expended on maintenance of Italians totalled £132 million, against which £26½ million was due by Britain to Italy for pay and maintenance of troops. Against the net balance of £106 million, Italy is to pay £8,000,000 in final settlement—an arrangement which Britain regards as her contribution to Italian reconstruction during the difficult year in which Unrra aid is no longer available. Finally, having already agreed to waive any claims to reparations from Italy, the British Government now similarly waives its rights under the Italian Peace Treaty to seize Italian property, valued at about £11 million, in the United Kingdom. The Italian Government, for its part, undertakes to secure early repayment of some £7,000,000 of Italian pre-war debts due to the United Kingdom.

Anglo-Soviet Trade Possibilities

The desire for a restoration of Anglo-Soviet trade has led to a number of approaches from the British side since the arrival of a Soviet trade delegation in this country last summer. These culminated in a conversation between Mr Bevin and Mr Stalin in Moscow last month. Last December, lists of British import requirements were drawn up and submitted to the Soviet delegation for comment; simultaneously an invitation was extended to the Russians to state their needs. The offer made by Mr Wilson, the recently appointed Secretary for Overseas Trade, to go to Moscow, has been accepted and discussions are taking place with the Soviet Minister for Foreign Trade.

The need to re-open trade relations with Russia has become more important through the incorporation of the Baltic countries in the Soviet Union. Before the war the Baltic countries were an important source of dairy produce and timber for Britain. In 1938 total imports by the United Kingdom from Russia alone amounted to £19½ million and exports to £17½ million, of which £11 million represented re-exports. In 1946 imports from the Soviet Union amounted to only £4.9 million, since Russia urgently required for its own reconstruction programme food and materials which had previously been exported. British exports, which consisted mainly of machinery, increased to £9.1 million, while re-exports dwindled to only £1.3 million owing to the world shortage of commodities, although Russia has recently started to purchase wool in the United Kingdom on a fair scale. An interesting new item among Russian goods imported into this country is medium staple cotton and cotton waste, the value of which totalled just over £1 million last month. The Soviet Union is not only shipping less timber than in the pre-war period, but it has also acquired from Finland the good timber lands of Karelia which is particularly productive of housing timbers, besides drawing off a part of Finland's exportable surplus for reparations. This

Is Australia your market?

Do the people of Australia buy your products? Or do you buy theirs? Whichever is the case, the Commonwealth Bank of Australia is able to give you considerable assistance. Guaranteed by the Commonwealth Government, the Bank has 330 branches throughout Australia and New Guinea; it has an unrivalled first-hand knowledge of Australian produce and Australian requirements; it is, therefore, unusually well equipped to facilitate trade between this country and the Commonwealth. The Managers of the London branches welcome enquiries from those whose interests lie in the Australian market.

Atlantic Banking

The *Mauretania* sails on her first post-war

voyage as a passenger liner with three offices

of the Midland Bank in operation on board.

Similar facilities are available on the *Queen*

Elizabeth. More than a quarter of a century

ago the Bank inaugurated Atlantic branches in

the great Cunarders and, until the outbreak of war, provided banking services for all passengers.

The branches on board are still on Britain's territory, thus continuing this Bank's policy of confining branch representation to Great Britain.

We are proud to provide this unique service for the convenience of those who voyage on the high seas.

Midland Bank

LIMITED

The Union of South Africa produces large quantities of gold, wool and diamonds, and it is with these commodities that the prosperity of the country is generally associated. There are, however, many other valuable industries, although in some instances their relative importance in the economy of the Union underwent considerable change during the war years. The export of sugar, for example, declined sharply until 1942 when an upward trend developed. Coal exports also rose steeply, as did the export value of wines and spirits, while maize and fruit showed a marked decrease in comparison with the 1939 figures.

As conditions return to normal throughout the world, fresh demands may well cause changes in the relative importance of the industries of the Union. Full and up-to-date information, backed by an intimate knowledge of the country, is available to merchants and manufacturers interested in trade with the Union of South Africa.

BARCLAYS BANK

But what about Imports?

There is an urgent necessity to re-establish our export trade, and the private Banking House of Glyn, Mills & Co. offer their financial services to undertakings extending their export business. But as the economic situation improves, so should the natural balance be restored, and the national import trade grow once more. Business houses anxious to develop their import trade will find invaluable this private bank's international contacts and intimate knowledge of foreign conditions.

† Exports from Baltic countries.

Even with a favourable political wind, trade development is likely to be slow, for Russian domestic demands for materials will no doubt have priority over exports, except in return for the most urgently needed capital equipment. The machinery and other industrial equipment which Russia requires is not in free supply either in Britain or elsewhere. But there is a basis for discussion to effect a gradual expansion of trade and if both sides are willing to make concessions, a mutually favourable agreement could be concluded.

Report on Linoleum

The Linoleum and Felt Base Working Party Report has been published this week.* Although the Party did not reach entire agreement on all questions, this has not crystallised into any memorandum of dissent and the report's recommendations are unanimous. A selection of the statistics is given in this week's *Records and Statistics Supplement*.

In contrast to earlier working party reports, no recommendation is made for a new central organisation for the linoleum industry. The present organisations on both sides of the industry are considered sufficient, with assistance from Government departments, to implement the report's suggestions. Apart from this one departure from precedent, many of the recommendations are on "standard" working party lines. These include suggestions for improving the recruitment and training of workers and managers, the introduction of a uniform costing system and the setting up of a Central Statistical Organisation. There is also a recommendation for the exchange of information on costs to facilitate the fixing of minimum prices, which have long been a feature of the linoleum industry. A design centre is suggested and closer co-operation with the paint manufacturing industry is recommended in order to extend the field of useful research. The eventual export target should be higher than the 75 per cent set by the Government for industry as a whole.

Attention is drawn to the grave long-term consequences to the industry of the protracted shortage of linseed oil. Present allocations are at the rate of 10,140 tons a year, compared with the pre-war consumption level of 33,800 tons and estimated requirements in 1947 and 1948 of 35,000 tons and 44,000 tons respectively. Vigorous research into substitutes is recommended, and is coupled with the plea to the Government departments concerned to keep the industry informed on the short and long-term prospects of the industry. The Government's attention is also drawn to the industry's requirements of machinery. Linoleum manufacturers like other industries in need of equipment, are being held up by slow delivery. The working party has been impressed by such evidence as they have had time to collect of the apparently higher output per worker in the United States compared with this country, and they recommend that the industry should examine the reasons for this disparity.

Price Fixing and Efficiency

At some points the linoleum report is a rather complacent document. The working party have been impressed by "the general state of efficiency exhibited in the industry," and they consider "that it would appear that the Price Agreement has not been used to bolster up inefficient manufacturers." The Linoleum and Floorcloth Manufacturers' Association established

* Board of Trade Working Party Reports: Linoleum and Felt Base. H.M. Stationery Office. Price 1s. 6d.

this price agreement, in a revised form, in 1934. The Association contains eight firms, including all but two of the medium or large linoleum producers, but does not include felt base manufacturers. Minimum wholesale prices were fixed prior to the war (before statutory price-fixing came in) by bargaining among members. But no manufacturer could be obliged to sell at more than 20 per cent above cost—cost being struck after depreciation but before debenture interest. No agreements exist for limiting production or the division of sales and markets. An international agreement also existed before the war by which the Continental Linoleum Union and the British Linoleum Association agreed to maintain uniform prices in certain markets. The CLU kept out of British home and empire market, while the BLA did not compete in Germany and Italy. In the Working Party's view, the British linoleum industry gained considerably from the international agreement.

The advantages to both sides of the industry of such arrangements to limit price competition are set out in the report. The manufacturers argue the merits of competition based on quality and service; the trade unionists are attracted to a system which gives some stability to wages. The Working Party are unanimous in the view that the agreement has been worked "in a spirit of reasonable moderation." The position of the consumer, so far as it is considered, is rather that of a poor second cousin. The Working Party do indeed go so far as to say that "cost plus 20 per cent" is an insufficient safeguard to the linoleum purchaser, and recommend that so long as minimum price-fixing continues cost data should be available for scrutiny by the Board of Trade. There the matter rests.

Though the data available in the report suggest that the linoleum industry is efficient and progressive, it is doubtful if the price-fixing agreement should be unanimously hallowed by a Working Party on such evidence as the limited range of cost, price and export statistics which are presented. Nor is it necessarily convincing proof of effective competition that three of the smaller members of the Association have had to go out of business since it was formed. On the other hand, there is also *prima facie* evidence that output per worker in the United States industry was from 50 to 100 per cent greater than in Britain in 1939. On this score there is no ground for complacency. As the recommendations in the report stand, there appears to be no provision for an independent probe into these matters, nor is there any effective assurance that the linoleum consumers' point of view will receive regular and adequate hearing.

Check to Shipbuilding

Merchant tonnage under construction in Great Britain and Ireland at the end of March showed an increase of 94,653 tons gross over the previous quarter, according to the latest returns issued by *Lloyd's Register*. The British total of 2,031,715 tons gross amounts to 54.3 per cent of the world total of 3,743,315 tons gross (excluding Danzig, Germany, Japan, Poland and Russia). Of the leading British competitors, the United States has dropped to third place during the quarter, work on hand having decreased from 326,753 to 214,923 tons gross. Sweden now leads foreign yards with 244,205 (compared with 248,205) tons gross, while France follows closely with 232,949 tons gross. Returns for France, however, are still incomplete and this figure does not yet indicate the full measure of the recovery of French shipbuilding activity. During the quarter work was begun on 294,902 tons in British yards and 270,543 tons were launched, compared with 339,060 and 267,760 tons respectively in the previous quarter. The launching figures are below the average for 1946, but not unduly low for the season. There is considerable doubt in the shipbuilding districts, however, whether the leeway will be made up in the summer, in view of the 30 per cent cut in the allocation of steel to the shipyards, coupled with the introduction of the 5-day week.

The proportion of shipbuilding for foreign account continues to show encouraging progress, having increased from 478,000 to 513,000 tons gross during the quarter and from 24.7 to 25.3 per cent of the total. Norway and France continue to be the biggest customers, followed by the Dominions and Portugal. There is for the moment no lack of foreign orders awaiting their turn for berths, according to returns published by the *Shipping World*. These show a total of 3,149,693 tons gross in hand or on order in British yards, of which the foreign share is 901,345 tons gross, or more than 28 per cent of the total orders. About one-third of the total foreign orders are from Norway, with a value estimated at more than £20 million. British owners are showing signs of hesitation in ordering further tonnage, being deterred

by the prospects of yet higher costs. In Norway, however, the greatest concern at the moment appears to be delivery time. In view of the export value of Norwegian orders, and the fact that Norway has further contracts to place, the absence of priority for shipbuilding steel has serious consequence.

Restoration of British Shipping

Almost two years after the end of the European War it is possible to make a rough estimate of the progress made in replacing the wartime losses of British shipping. Official statistics are not calculated to impart any information of great value, but the *Shipping World* has carried out an analysis of British shipping on the United Kingdom register in private ownership according to all sources available up to March 31st. This analysis embraces 6,236,869 tons gross of ocean-going liners, 2,414,558 tons of ocean-going tramp ships, 2,518,519 tons gross of tankers, and 1,397,176 tons of vessels between 500 and 3,000 tons gross. This gives a total of 12,567,122 tons gross in private ownership, excluding all tonnage operated by or on behalf of the Ministry of Transport. The extent of Ministry commitments has not been revealed, but more than 1,000,000 tons gross have been chartered to British owners. Its latest offer to British owners is the purchase or hire of five "heavy-lift" ships at some £300,000 apiece, while its latest acquisition is 30 ships of "handy" type from the United States, totalling 52,111 tons gross. The Chamber of Shipping is now considering ways and means of transferring to private ownership the 100-odd Liberty ships expected within the next 12 months in accordance with the recent agreement. This transfer, with the Victory ships for which offers by private owners await approval, will add some 1,300,000 tons gross to private British ownership, which also has 1,500,000 tons under construction and a further 1,000,000 tons on order. When all these transactions have been completed the quantity of British shipping will have been restored approximately to pre-war level, at a cost to the industry estimated by the president of the Chamber of Shipping at about £230 million.

As to the quality of the post-war fleet, the *Shipping World* analysis provides some indications. Of the current totals, one-third of the liners are more than 20 years old, and almost another third was built before the Second World War. Nearly half the tramp tonnage is of wartime construction and over half is of wartime standard size, about 7,000 tons gross. The acquisition of further warbuilt ships, whether of British or American Government origin, will further emphasise the preponderance of this group and the deficiency of the handier tramp sizes. This analysis gives a clearer picture of the composition of the British Mercantile Marine than any statistics so far published since the war.

March Trade

The export figures for March (which are given in fuller detail in this week's *Records and Statistics* supplement), which amounted to £82.6 million, showed the impact effects of the coal crisis. Total exports for the first quarter of the year were just under £250 million. Last month's figures are slightly inflated by March having 31 days. Recalculation of the last three months of 1946 and the first three of 1947 on the basis of 26 working days as a normal working month gives the following figures (actual value exports are also shown for comparison):

U. K. EXPORTS.			
Actual		26 Working Days	
£ mn.		£ mn.	
Oct., 1946 ..	91	87½	Jan., 1947... 91
Nov., 1946 ..	92	92	Feb., 1947 .. 76
Dec., 1946... 83	90		Mar., 1947... 83

The stability of the February and March figures is striking. In both months the transport and shipment of goods for export was hindered by bad weather, while the closing down of industrial establishments during the fuel crisis will project its effects for some months to come. The volume of exports for March has been provisionally estimated at 99 per cent of the 1938 volume. This compares with 93 per cent for February, 112 per cent for January, making the first quarter of 1947 approximately 101 per cent, as against 111 per cent for the last quarter of 1946. There is much ground to be covered to meet the end-of-year export target of 140 per cent of the 1938 volume. Exports of vehicles, which totalled only £9.7 million in March, were the lowest since June, 1946, but this was the only major reduction in exports during the month.

Shipments of machinery reached the record figure of £13.9 million, almost one-fifth of the total exports of manufactured goods. By weight, this item was 48 per cent above the monthly average for 1938 and by value 190 per cent above.

Imports during March totalled £130 millions. This represents a sharp increase to a total higher than in any month since December, 1925. On a daily average basis imports were 7 per cent higher than in February and 11 per cent above the January level. The value of retained imports during the month (£123.6 millions) was the highest recorded figure since October, 1943. Larger imports of raw materials included increased arrivals of raw cotton, in particular some 10.5 million lbs. of medium staple (under 1½ in. and over ¾ in.) from the Soviet Union, and rubber. Not only has industry a lot of leeway to make up, if the export target is to be reached by the end of the year, but, unless exports expand very materially, it will be impossible to maintain the current rate of imports which is in fact still sub-normal. In any event, the import programme set out in the "Economic Survey" is apparently under review in order to secure further reductions.

Railway Pool Deficit

Estimates were given in *The Economist* of February 1st of the probable deficit of Railway and London Transport earnings last year, amounting to £12 million short of the fixed annual sum payable to the undertakings of £43,469,000. A White Paper issued this week closely confirms this estimate. It shows that the gross receipts of the controlled undertakings last year amounted to £360.7 million, while gross expenditure amounted to £325.2 million. Net receipts consequently amounted to £35.5 million and after including other net receipts and expenditure from ancillary undertakings, the net revenue of the pool as a whole is estimated to have amounted to £32.2 million.

The following table summarises the pool figures and gives a comparison with earlier years under control:—

RAILWAYS AND LONDON TRANSPORT POOL REVENUES (£ million)						
	1941	1942	1943	1944	1945	1946
Receipts:						
Passenger.....	132.1	163.5	186.3	194.6	210.6	202.2
Freight.....	158.8	176.7	190.9	196.1	169.7	155.1
Miscellaneous.....	2.9	3.3	4.5	3.7	3.6	3.4
Total.....	293.8	343.5	381.7	394.4	383.9	360.7
Expenditure.....	226.6	251.7	272.2	301.2	317.0	325.2
Net receipts.....	67.2	91.8	109.4	93.2	66.9	35.5
Other expenditure (net)...	2.1	2.6	3.9	2.9	4.4	3.3
Net revenue of Pool.....	65.1	89.1	105.5	90.3	62.5	32.2
Operating ratio.....	77.1	73.3	71.3	76.4	82.5	90.2

Meanwhile, the question of railway charges during the current year still awaits a decision. The Minister of Transport published the conclusions of the Charges Consultative Committee in February, but deferred the consideration of increased railway charges until the end of March. The lapse of time may have been due partly to his preoccupations with the Committee stage of the Transport Bill. Alternatively, he may be considering the desirability of keeping rates stable for the remainder of this year at the cost of meeting an increased deficit on the pool account from the Exchequer.

Aggregate of traffic receipts from the four main companies for the first 16 weeks of this year show a fall of £3.8 million for passengers, £6.2 million merchandise and an increase of £1.1 million for coal and coke. The total fall in traffic receipts is thus £9.1 million, equivalent to 12 per cent so far this year. On the costs side, some economies in the running expenses should result from cuts in services, but the general level of railway costs appears still to be rising, and there is a large wages claim under discussion. Evidently the optimistic forecasts of this year's traffics, which the Charges Committee heard with interest last autumn, are unlikely to materialise; hence the total prospective deficit for the Controlled Undertakings, in the absence of any adjustment of charges, may well involve a heavy subvention from the Exchequer to meet the fixed sum for 1947.

More Bill Market Capital

The important series of capital expansions which began in the discount market early last year has been rounded off this week by the news of the refinancing operation by Seacombe, Marshall and Campion. To facilitate this operation, the business is being con-

verted from a partnership into a private limited company with a capital of £500,000 divided into £300,000 4 per cent redeemable-preference shares, £199,900 £1 ordinary shares and £100 in management shares. The capitalisation of this house has never previously been disclosed, but it is a fair presumption that the preference shares now created are the measure of the additional finance that has been provided, though it is believed that the issue is being made at a premium. It is understood that a large proportion of these shares is being subscribed by the staff provident fund of one of the large banks. Obviously, such an arrangement could not give the bank concerned any influence over the policy of the discount house—from the provident fund's point of view, it is clearly a perfectly normal investment transaction. But, in view of Seacombe, Marshall and Campion's special connection with the authorities—this house has long acted as market agent for the Bank of England—the operation is a little unexpected. It must be admitted, however, that a long-term investment by a strictly impersonal provident fund is really a particularly appropriate means of finance in the special circumstances. These same special circumstances no doubt also explain why this house is the last member of the discount market to complete its post-war capital arrangements. Its financing now brings the total expansion in discount market resources, since the beginning of 1946, up to approximately £11 million. The aggregate true resources of the twelve houses are now about £34 million.

Argentine Railway Panel

The Economist was among those who argued at the beginning of March that the apportionment of the purchase price of £150 million, payable by the Argentine Government to the British-owned Argentine Railways, between the various companies and their even more varied classes of capital should be submitted for independent confirmation by an expert tribunal. The British Argentine Railway Council has given general satisfaction this week by its announcement that the boards of the railway companies have decided that the scheme embodying the terms of the allocation of the proceeds of sale among holders of the different categories of loan and share capital ought, in the best interests of the holders, to be referred before publication to an independent panel of three. This panel will consist of Sir Andrew Duncan, MP, who will act as chairman, Sir David Maxwell Fyfe, KC, MP, and Mr Gilbert D. Shepherd, president of the Institute of Chartered Accountants.

The decision to appoint the panel is as welcome as its composition is felicitous. The tangle of legal claims, inter-company complications and the nuisance value of the junior stocks mean that some stockholders are bound to be disappointed in the share-out. The panel will provide a balance of business, legal and accounting expertise, which will give the best independent assurance that fairness will be done all round.

SECURITY PRICES AND YIELDS

A fuller list containing 370 securities appears weekly in the *Records and Statistics* Supplement. Notes on the following company reports also appear in the Supplement: Cunard; Enfield Cables; Thos. Firth and John Brown.

Details of the scheme have yet to be completed, but it is expected that the proposals will be put before the panel at an early date. Then as soon as the panel has considered them, the figures showing the allocation of the purchase price, which they regard as fair and equitable, will be published. The next stage will be an application to the High Court for summoning the necessary meetings to approve the scheme, and thereafter the full text will be issued as soon as possible. It is evident that, in the apportionment of a legal sum of this order of magnitude between such a wide variety of claims, the door would be wide open to controversy unless some independent body had previously expressed its opinion upon the division. There is, of course, no necessary guarantee at this stage that the panel will be able to satisfy all claimants to their complete satisfaction—to do so they will have to show the joint wisdom of Daniel and Solomon—but their assessment of the scheme which the railway companies put forward will be wise, impartial, and will be received with respect.

Tin Supplies and American Demand

The Tin Study Group, which concluded its work last week in Brussels, fulfilled expectations by accomplishing little more than estimating production and consumption of tin for the current and subsequent years and establishing a secretariat. The world tin position is apparently worse than had been foreseen at the International Conference last October. Output for 1947 has been revised downwards to 117,000 tons, for 1948 to 163,000 tons, and for 1949 to 201,000 tons. These figures compare with a 1939 world total of 183,300 tons and a peak production in 1941 of 241,700 tons. World consumption during the current year is expected to amount to 140-150,000 tons, in 1948 to 184,000 tons and in 1949 to 190,000 tons. On this assumption, from 1949 onwards output will apparently exceed demand. Statistics showing the current world tin position are given in the *Records and Statistics* Supplement to this issue.

The creation of a centrally organised statistical office by the Study Group supplying reliable and timely information will be of great benefit to consumers and producers. In such matters a Study Group can afford valuable assistance. But international marketing bristles with ticklish problems which often can only be solved on a governmental level. Whether the study-group method will be able to help in these matters has yet to be seen. The powers of the representatives are certain to be restricted, so that no major policy decision is likely to be taken by the Group itself. But much useful spade work could be done in clearing ground for the formulation of policy by the governments concerned.

The tin position in the United States is particularly important in relation to the world situation. The Civilian Production Administration recommended the continuance of controls during the current year on the ground that in the absence of a radical

(a) Interim. (b) Final. (c) Whole year. (d) Int. paid half-yearly. (e) Also a capital bonus of 2½ per cent free of income tax; yield worked on 15 per cent basis. † Free of Tax.

improvement in the supply position, Government stocks, excluding those held for strategic purposes, would be exhausted before the end of 1947. Supplies of pig tin available in the United States are unlikely to exceed 69,000 tons, inclusive of substantial withdrawals from Government stocks. Stocks of tin in the United States amounted to only 77,925 tons at the end of 1946, showing a decline of some 13,700 tons on the year; of this total, 54,979 tons were held on Government account. The level of stocks, however, was considerably higher than before the war, even after excluding the 12,140 tons of Treasury and Navy Reserve stocks which are not available for distribution. On the basis of 1946 consumption, the net stock figure represents almost 10 months' supply.

Of the 38,100 tons of concentrates imported during last year, some 28,600 tons came from Bolivia, 7,200 tons from the Belgian Congo and 2,200 tons from the Netherlands East Indies. Most of the shipments of tin metal came from the United Kingdom. Consumption in 1946 amounted to 80,400 tons compared with 84,500 tons in 1945—a reduction due in part to the cancellation of war contracts. Tin and tern plates absorbed over a third of the total or some 27,100 tons and almost maintained the previous year's level, while brass and bronze showed a decline of 4,500 tons on 1945 to 22,300 tons.

* * *

Rhodesia Railways Purchase

The Southern Rhodesia Parliament now has before it the proposal to purchase the £500,000 share capital of the Rhodesia Railways, Ltd., from Rhodesia Railways Trust at an agreed price of £3,150,000, with effect from March 31st, 1947. Interest will be payable at 2½ per cent until completion of the sale. The price is equivalent to 25 times the maximum dividend of £125,000.

The Southern Rhodesia Government is expected to give notice to repay the £20,346,706 4½ per cent debenture of the Railway Company on October 1st at par and to arrange to raise funds to cover the purchase of the equity, the refunding and the provision of new money, amounting perhaps to £10 million, a figure suggested by the Railways Trust as necessary for new equipment. When these operations are complete a joint statutory commission will probably be established to take over and operate the railways. This commission would include representatives from the Governments of Southern Rhodesia, Northern Rhodesia and Bechuanaland; the financial responsibility of the Governments being 75, 20 and 5 respectively. A transport authority and a body to replace the existing rate fixing transport commission are also fore-shadowed.

The Rhodesia Railways Trust has a capital of £2,005,767 in £1 shares, of which 1,611,401 were held by the British South Africa Company at September 30, 1945. If the Shabani Railway, which serves the south-east of Southern Rhodesia, is also purchased the *raison d'être* of the Trust would disappear; reinvestment of the funds to produce an over-all 4 per cent might be difficult. The approximate break-up value of the Trust shares, which last year received 10 per cent, is 45s. This valuation is equivalent to about 8s. on each 15s. share in "Chartered," which are currently quoted at 47s. 6d. cum the 1s. 9d. gross dividend for 1945-46.

Aluminium Supplies and Scrap

The Ministry of Supply have announced this week that, in agreement with the Board of Trade, they will in future permit the import of aluminium scrap and aluminium alloy scrap, under individual licences. The metal trade is thus permitted to search the world for scrap, the most likely areas being Western Europe, the Mediterranean and West Africa where battle scrap may still be obtainable. At the moment there is no shortage of aluminium in this country; but there may be a shortage of scrap suitable for castings in the near future. Present recovery is almost entirely dependent on crashed aircraft and the production of secondary ingot from this source is expensive, firstly because the amount of aluminium obtained is approximately 33-40 per cent of the weight of the aircraft and secondly because the recovered aluminium is not suitable for castings without re-treatment.

It is apparently because of this prospective dearth of scrap that the ban on its import has been lifted. But this can hardly be the sole reason, for neither the Ministry of Supply nor the trade can yet be certain where suitable casting scrap is to be found and in what quantities. The policy of individual licensing, however, will enable merchants to search and to make or renew trade contacts—and that alone would be a valuable preliminary

to decontrol. Perhaps, therefore, it may not be too optimistic to interpret the lifting of the ban on scrap imports as the first sign of freer trading conditions in aluminium generally.

Consumption of aluminium in the United Kingdom has been maintained at a very high level since the end of the war. Metal furniture has been another important new use and aluminium has also been substituted for iron in corrugated roofs, drainpipes and housing components. This demand, however, is unlikely to be sustained beyond the period of immediate shortage, for it arises mainly because of the scarcity of other materials. When the emergency housing programme is eventually finished—it has been much delayed—a large element in the recent demand for sheet aluminium will have been satisfied. When good timber is in adequate supply metal furniture may be relegated to the novelty class. The demand for aluminium will then depend largely on the hollow-ware, aircraft and motor vehicle industries. The post-war level of consumption is certain to be higher than in pre-war years, but it is extremely doubtful if war-time and immediate post-war figures will be maintained.

Scrap aluminium has assumed importance because a large part of British requirements of virgin metal has to be satisfied from Canada, which involves the spending of dollars. At the end of the war, the United Kingdom had large supplies of scrap. Much of this has been absorbed into domestic consumption. But it would also appear that since the export of scrap was forbidden—although the United States was offering high prices for it—there were fairly large shipments overseas of secondary ingot which in the past year have been estimated at over 50,000 cwt. It is, however, impossible to check this from any published data, but if it is true it would at least account for a large element in the relative shortage of scrap aluminium at the moment.

Central London Assented

Glyn Mills and Company, the trustees for Central London Assented 4 per cent stock, of which £2,811,839 is outstanding, have been informed by the Minister of Transport that the underlying security, which at present consists of £2,605,698. London Passenger Transport "C" stock, will be exchanged for British Transport stock worth, at the time of issue, £1,750,703. The trustees understand that the Transport Commission will continue to guarantee, in place of the LPTB the full 4 per cent interest, until such time as redemption of the British Transport stock takes place. On this point, all that is known is that the British Transport stock will be redeemable "within this century." On the assumption that Transport stock is issued at par, the holders of Central London Assented would receive, on its redemption, £62 5s. in cash per £100 Central London Assented. On the face of it, this would involve a significant capital loss to existing holders, though it is a contingent liability which can only occur at some as yet indeterminate date. Under existing conditions, Central London Assented stockholders are entitled to their well-secured 4 per cent payment at least until June 30, 1956, when Transport "C" stock becomes optionally repayable and thereafter until it was actually repaid. On that event they were entitled to receive £92 13s. 4d. in cash per £100 of Central London Assented. Thus they may be faced with a loss of about one-third of their capital expectation. The hardship is not a present one, for the income continues for an unpredictable period, so that Central London Assented stockholders are to that extent better off than holders of senior railway securities. But a relatively high rate of interest—to which the holders are legally entitled—will provide no adequate margin after tax from which to write off the heavy capital loss which holders must expect one day to suffer.

Shorter Notes

As a result of a poll of debenture holders of the Peruvian Corporation, the five nominees of the board all secured election to the debenture holders committee by comfortable margins over the representatives of those who opposed last year's reconstruction scheme.

*

The Chancellor of the Exchequer, showing a proper concern for the fair treatment of British investors with overseas interests, has characterised the original offer of 64 per cent including arrears to holders of the Union Company of Oslo bonds as inadequate. This offer was withdrawn by the Norwegian Government. The bonds now carry some 38 points of gross arrears, and a new purchase offer is awaited.

R.O.Y.G.B.I.V.

Red, orange, yellow, green, blue, indigo, violet; these are the colours of the rainbow which Newton flashed from the bevelled edge of a mirror when he made his famous researches on light. Since then, the study of colour has travelled a long road. It has become a methodical and precise branch of physics which the chemist is exploiting. It demands instruments of precision, such as the absorptiometer illustrated above. This is employed to measure with exactitude the intensity of the colour of a solution. For example, it may be desired to follow closely the rate at which a fabric is being dyed under given conditions. This can be done by withdrawing samples of the dyeing liquor at suitable intervals of time and measuring the intensity of their colour. The absorptiometer is admirable for the purpose. In the centre, a source of light throws out beams on either side. These pass through adjustable apertures and strike photo-electric cells. A sample of the dye liquor is placed in front of one cell and the aperture in front of the other cell is adjusted until the two cells give exactly equal readings. The sample is then removed and the readings of the two cells are again brought to equality by adjusting the aperture on the first cell. The degree of adjustment that must be made on this aperture is a measure of the intensity of the colour of the sample of dye liquor, and from this the rate of dyeing can be estimated. Just as British chemists discovered synthetic dyes, so they are today taking the lead in developments in the physical measurement of colour.

"A young man
of real promise —
exactly the fellow
we needed out there..."

"We thought we were wonderfully lucky in finding him — but of course it was system, not luck. I've found, since, that the Appointments Offices take enormous trouble to 'screen' and classify applicants. In fact, they can give you a choice of excellent candidates in less time than it generally takes you, nowadays, to get an advertisement printed!"

"What's more, all the Regional Appointments Offices are linked by teleprinter — it means that wherever the right man is registered, you hear of him. It helps him and the employer. In fact, if we had the time, we'd do just what they do for us — interview chaps all over the country, sort out their aptitudes and abilities, and end with a really good 'short list' to choose from. They use the latest interviewing techniques for assessing men and matching them with jobs."

"I'd recommend any employer who's looking for a high-grade man (or a dozen!) to notify his nearest Appointments Office first, wherever else he looks. There's the machinery, waiting to serve him at no cost — and it's doing a grand job..."

Hundreds of employers have commended the prompt and efficient service given by the fourteen Regional Appointments Offices. They are today's logical starting-point in the recruitment of high-grade staff, whether the need is for men and women already experienced and qualified for responsible posts, or for promising younger candidates to train.

Your nearest Appointments Office "matches men with jobs" in the executive, managerial, and administrative field. If you do not know the address, any local office of the Ministry of Labour will put you in touch at once.

But for highly qualified technical and scientific personnel — engineers, scientists, architects, etc. — appointments are dealt with centrally, in London, by the specialist staff of the Technical and Scientific Register, York House, Kingsway, W.C.2.

Since VE-day, the Appointments Department has successfully filled over 47,000 responsible posts. If you have a staffing problem, your Regional Appointments Office is ready to help.

14 linked Regional Offices cover the Nation's potential executive manpower

UNION CORPORATION LIMITED

(Incorporated in the Union of South Africa.)

ABRIDGED REPORT OF THE DIRECTORS FOR YEAR 1946.

The Accounts are drawn up in Union of South Africa currency, United Kingdom currency being taken at par.

The profit is £635,615, plus £128,345 brought forward, making a total of £763,960. The Directors have placed £50,000 to the credit of Exploration Reserve Account; have provided £25,000 for Staff Pension Fund Contingencies and have written off £14,755 new issue expenses. A final dividend of 4s. 6d. U.K. currency per share free of U.K. Income Tax was declared, absorbing £325,500, making with the interim dividend of 2s. 6d. per share a total distribution of 6s. 6d. per share free of U.K. Income Tax or £488,400 for the year, leaving £185,560 to be carried forward.

The dividend is declared in compliance with Section 52 of the U.K. Finance (No. 2) Act, 1945, and the gross amount which is the equivalent of this Dividend for Income Tax purposes is ascertainable by reference to the full standard rate of Income Tax. Double taxation relief allowable to the Corporation amounting to 3s. 9d. in the £, has been taken into account in arriving at the provision for taxation shown in the Profit and Loss Account. Holdings of Shares, Debentures and other securities have been taken into the Accounts at cost or under, but in no case above the market price of December 31st last, or, where no market price exists, above the Directors' valuation. At present market prices, these holdings show a very substantial surplus over the amount at which they stand in the Balance Sheet. The Directors, as on other occasions, have thought it expedient to provide for contingencies by reducing the book cost of certain holdings both below cost and below market price.

During the year the nominal capital of the Corporation was increased from £1,000,000 to £1,100,000 by the creation of 100,000 new shares of 12s. 6d. each. Including the 50,000 shares already held in reserve, 220,000 shares became available for issue, and 98,000 shares were offered to shareholders at £10 per share in the ratio of two new shares for every thirty-five held on April 24th, 1946. The issue realised a gross sum of £880,000 of which £55,000 constitutes an addition to the issued capital of the Corporation. The balance of £825,000 placed to Share Premium Account was transferred to Reserve Account, raising it to £2,825,000.

GOLD INTERESTS.—Summary of the operating results for the past year of the companies operating in the Witwatersrand in which the Corporation is largely concerned is given in the Report.

ORANGE FREE STATE.—The Corporation holds the mineral rights over 4,025 morgen adjoining Western Reefs Exploration and Development Company, Limited, and 1,140 morgen further to the east. It continues to hold under option certain areas in the Thunissen and Brandfont districts.

ST. HELENA GOLD MINES.—Good progress was made by this Company in preparations for exploiting its area south of Odendaalsrus in the Orange Free State. Shaft sinking was commenced with temporary equipment on No. 3 incline shaft.

BAY HALL TRUST.—The net profit for 1946 was £71,436 and a dividend of 6% free of tax was declared. The Trust's investments at December 31st showed an appreciation of £1,298,708 over the book cost of £2,089,195.

BRITISH ENKA.—In May last the issued Capital was reduced by £312,500, eliminating the debit of £282,849 on Profit and Loss Account, the balance of £49,651 being transferred to Capital Reserve Account. The creation of 1,250,000 new shares of 5s. each, which were offered to shareholders at 6s. per share under the guarantee of the Corporation, restored the capital to £1,250,000.

SAN FRANCISCO MINES OF MEXICO.—Operations were interrupted by a workmen's strike early in 1946. The price of metals produced rose substantially during the year. Underground development continued to give favourable results.

SOUTH AFRICAN PULP AND PAPER INDUSTRIES.—After providing for taxation and depreciation the net profit amounted to £100,862 and a dividend of 1s. per share has been declared.

Copies of the full Report and Accounts can be obtained on application at the London Office, Princess House, 75, Gresham Street, E.C.2.

THE SPIRIT OF ENQUIRY

Fifty centuries ago...

... a meteor flashed to earth

From this heaven-sent nickel-bearing iron the warriors of ancient China fashioned their "invincible swords." Fifty centuries were to pass before men learned to isolate nickel: the story of its refining is largely the story of the Mond Nickel Company. Without its background of research and enquiry you would not to-day enjoy the many contributions which nickel makes to your car, and to the manufacture of your food, your shoes and scores of other things you use every day.

SHOPPING THROUGH THE AGES

One Shopping Day a Year!

The great yearly fairs of the Middle Ages were originally organised by the monasteries. Since travel was then so difficult, such occasions were often the sole opportunity of shopping. It was not unusual for a year's purchases to be made on the same day, but travelling to and from the fair could last days, or weeks, even.

No longer an occasional event, shopping is now much more pleasant and convenient. In fact, to those familiar with the inviting and friendly atmosphere of W. H. Smith & Son's bookshops, it can be as leisurely as one likes to make it. And today, this is well worth considering.

In addition there is a signal staff of 750, who maintain 2,020 automatic and 2,860 semi-automatic signals, as well as 1,330 pairs of points, along 350 miles of Underground track. Their efficiency enables as many as 40 trains an hour to use a single track.

COMPANY MEETINGS

MANGANESE BRONZE AND BRASS COMPANY, LIMITED

LARGER PROFIT AND DIVIDEND

MR J. C. COLQUHOUN'S STATEMENT

The forty-eighth ordinary general meeting of the Manganese Bronze and Brass Company, Limited, was held, on the 23rd instant, at 63 Grosvenor Street, London, W., Mr J. C. Colquhoun, M.B.E., the chairman and managing director, presiding.

The secretary (Mr W. K. Gibb) read the notice convening the meeting and the report of the auditors.

The following is the chairman's statement circulated with the report and accounts:—

The board has again decided to circulate this statement with the directors report and accounts, and no doubt many shareholders will favour a continuation of this procedure, which was adopted for your convenience during the war. Since our last meeting Mr A. T. Thorne has resigned from his position as joint managing director, but we continue to have his able assistance as a member of the board.

DIVIDEND OF 30 PER CENT

The profit for the year, before providing for taxation, is £127,977, compared with £81,407 for the previous year. Your directors recommend a final dividend on the ordinary shares of 2½ per cent., making 30 per cent. for the year. After providing for all dividends and for taxation there remains a surplus for the year of £34,766, compared with £15,765 for the previous year.

Referring to the balance-sheet, you will see that net current assets amount to £203,243. The additions to and withdrawals from our liquid resources in 1946 can be shown in the following manner:—

Net current assets December 31, 1945	£ 172,785
Add—	
Surplus for year 1946	34,766
Depreciation for year 1946	21,218
E.P.T. Post-War Refund	33,000
	261,769

Less—	
Capital expenditure 1946 (net) ...	58,526

Net current assets December 31, 1946	203,243
--	---------

Depreciation charge for the year is somewhat above the more liberal rate which Inland Revenue now allow for wear and tear. The item of £33,000, representing the net amount of excess profits tax post-war refund, is shown as a separate item in the balance-sheet, at least for the time being, as this refund can only be used for development and re-equipment. Capital expenditure includes the leasehold cost of the new London office. There are no other items in the balance-sheet calling for special comment except trade investments, which I will deal with later.

Before leaving the accounts I might say in reference to the ordinary share capital, which has been heavily written down in the past, that a dividend of 30 per cent. to-day gives a return of about 2 per cent. on the original capital of the company. Some members still hold shares giving this low yield.

WORKING TO CAPACITY

The marine propeller side of your business has been fully booked with work throughout the year and, indeed, has a well-filled order book running well into 1948. We have recently completed a licence agreement with Messrs Escher Wyss, of Switzerland, under which we will manufacture controllable pitch propellers in co-operation with them. In this we have the advantage of a design based on practical experience and research work carried out at the Escher Wyss cavitation tunnel in Zurich. At your Ipswich works the volume of trade is extruded; rolled and forged products kept this part of the business working to capacity during the year, as was also the case in the production of Oilite self-lubricating bearings and other parts made from metal powders. Here, again, there is no indication of any falling off in the demand for our products up to this date.

In regard to the outlook, I believe the requirements of our customers at home and abroad will absorb all we can produce in the current year. It is regrettable, therefore, that the fuel crisis in February brought production to a standstill for three weeks. One further week's output was lost at your Ipswich works as a result of floods, and I would like here to make special mention of the splendid efforts which achieved such a quick resumption of production.

TRADE INVESTMENTS

Trade investments in the balance-sheet show no change at December 31, 1946, but we have since sold our interest in Rubber Bonders, Limited, for £10,200. I said last year, in regard to this engineering investment that we anticipated losses for a period, but regarded the more distant future hopefully. So far as the business goes that still stands, but economies became necessary, and urgently necessary, when the fuel and power crisis started. The only way these economies could be made without jeopardising the future of the business was by amalgamation with the adjacent rubber factory of H. G. Miles, Limited, which had mothered the bonding business as partners of ours in the years of quick growth during the war. As we did not wish to remain with a minority shareholding in what now becomes largely a rubber business, we have, with regret, relinquished our interest in the reconstructed company.

In conclusion, I would like to express our appreciation and thanks to the staff and all employees for their loyalty and excellent co-operation in producing the satisfactory results which you have before you.

The report and accounts were unanimously adopted.

The retiring directors, Mr A. T. Thorne and Mr W. Mure, C.B.E., were re-elected and the auditors, Messrs Lever, Honeyman and Company, were reappointed.

A vote of thanks to the chairman, directors, staff and employees terminated the proceedings.

JOHN WRIGHT AND SONS (VENEERS), LIMITED

MR. LESLIE C. W. JENKINS' REVIEW

The eleventh ordinary general meeting of John Wright & Sons (Veneers), Limited, was held, in London, on the 23rd instant.

Mr L. C. W. Jenkins, F.C.S. (chairman and managing director) said the raw material supplies still caused anxiety, for during the year the stock of peeler logs had been exhausted, but at the moment, however, they had on hand sufficient to last for some time. The company's manufacture might be divided into two classes, the cutting of veneers for the manufacture of plywood, and the cutting of decorative veneers. There was an insatiable demand for plywood, but there was also a general reluctance on the part of the countries that had raw material available to export logs, particularly those with veneer and plywood plants, which preferred to retain the benefit of manufacture. From this country's point of view, however, it was most important that logs should come forward in order to save the sterling represented by the difference between the cost of the logs and the veneer for disbursement by way of wages, overheads, etc.

Once again he emphasised the strategic value of the veneer and plywood industry to the country. Since the war the company had cut many millions of feet of veneer for the utility furniture programme and had been actively engaged in renewing pre-war overseas contacts and finding new markets for decorative veneer. In addition to the direct export of veneers a valuable contribution had been made to the export trade by the supply of veneers to the makers of radios, sewing machines, etc.

In April, 1946, it was decided to eliminate Saturday work and reduce the standard 49-hour week to 45 hours. The change-over had been a great success, for output had been maintained at a figure equal to over 98 per cent of that achieved in the previous period.

The increase in the value of plant and machinery after depreciation as shown by the balance sheet, represented orders placed during the year for up-to-date equipment to replace machines many of which had, since Munich, worked round the clock. He paid tribute to the staff and workpeople who had again worked willingly and well, and thanked his co-directors for their support.

LARGER TURNOVER AND DISTRIBUTION

The result of the eleventh year's working showed a profit of £69,115, which compared with £42,221 in 1945. He was pleased to report an increase in turnover of nearly 13 per cent., as compared with 1945. It was considered that the return on the ordinary stock for the year should be increased and a final dividend of 2½ per cent., making 10 per cent. for the year and a bonus of 5 per cent., were recommended.

The current assets of £349,283 exceeded the current liabilities, and provisions of £175,161 by £174,122. The excess compared with £141,984 at the end of 1945, and should be taken as the surplus of liquid assets after payment of the recommended dividend and bonus on the ordinary stock.

The report and accounts were adopted, and a vote of thanks to the chairman, proposed by Mr Harold M. Moore, F.C.A., was carried with acclamation.

NATIONAL BANK OF EGYPT

ALY SHAMSY PASHA'S REVIEW

The forty-seventh annual general meeting of the National Bank of Egypt was held at the head office of the bank in Cairo on the 26th ultimo.

Aly Shamsy Pasha (the president) was in the chair.

THE PRESIDENT'S ADDRESS

The following is an extract from the President's address:—

If, generally speaking, we notice a certain shrinking in business activity in Egypt due partly to the withdrawal of the Allied armies, there are still numerous signs of prosperity. Nevertheless, in every sector of general economy—agriculture, industry, foreign trade, public and private finance—certain post-war problems have to be faced, the study of which is not lacking in interest.

The main characteristic of our general economy is the lack of balance between the available goods in Egypt and the volume of purchasing media. In other words, there is

an inflationary situation due to an excess of the means of payment, but it is far from comparable with that which prevails in certain countries which have had to finance their expenditure by the issue of banknotes issued during the war is offset by solid reserves: the sterling balances resulting from the expenditure of the Allied armies. This expenditure has gradually decreased, however, and it is estimated that in 1946 it amounted only to about a third of the figure for 1945.

AGRICULTURE AND INDUSTRY

A noticeable improvement in the statistical position of cotton took place during 1946, whereas at the beginning of the year it appeared quite alarming. A cotton policy must be established as we cannot always rely on the intervention of the Government; even they might find themselves, sooner or later, grappling with a situation which could have been avoided if the contingencies of production, consumption and world prices were considered with the foresight necessary to any country whose economic stability rests mainly on agriculture.

Industry has benefited, in general, from a fairly favourable situation and financial results have been appreciably the same as in the previous year. The establishment of a constructive industrial policy is necessary if the development of our industry during the war is to be assured of solid foundations in peacetime. Another factor which would contribute to the development of industry and also to other sectors of our economy would be the re-establishment of the capital market on sound foundations.

Our foreign trade has clearly improved during 1946, both in volume and in value. The prospects of our foreign trade are closely linked to the question of foreign currencies and sterling balances.

FOREIGN CURRENCIES

One of the economic consequences of the war has been to diminish considerably the foreign exchange resources of most countries. This shortage has led to the imposition of a series of monetary and exchange restrictions and their suppression seems still remote, since for almost all countries it is a question of utilising their scanty reserves of foreign currency for the import of commodities essential to the revival of their economic life. Some slight alleviation of these measures is already being felt, but it will not be substantial until the lack of balance in production and in public finances has been corrected.

Speaking of foreign currencies, Egypt is in a different position compared with some other countries which took part in the war, since she holds large reserves in sterling. A preliminary exchange of views took place early this month between the British financial delegation and the Egyptian delegation, together with experts.

Our net profits are £E2,539 higher than last year and amount to £E506,171. This enables us to pay the same dividend as last year—namely, 17 per cent., which will absorb £E497,250, and to add £E8,921 to the carry-forward, which will thus amount to £E282,226. We have continued our policy of strengthening further our internal reserves, which we consider essential in order to be prepared to meet any eventualities which may arise.

Copies of the chairman's address in full will be available at the National Bank of Egypt, 6 and 7 King William Street, London, E.C.4.

ASSOCIATED ELECTRICAL INDUSTRIES, LIMITED

RECORD ORDERS

The forty-seventh annual general meeting of Associated Electrical Industries, Limited, was held, on the 23rd instant, in London.

The Rt. Hon. Oliver Lyttelton, D.S.O., M.C., M.P., the chairman, said that the gross trading profits of the group were approximately the same as those for the year ended December 31, 1945. Non-recurring profits amounted to £119,000. The gross profits of the holding company were £2,282,000, compared with £2,084,000. Some of the group factories had been unaffected by the switch-off of electrical power in February. In some others they had been able to maintain at work a high percentage of their total numbers; others, however, had been shut down completely. It was impossible to compute indirect losses, but the direct losses caused by payment of wages to those who could not be employed amounted to about £200,000 gross.

FINANCIAL STRENGTH

For the group as a whole the orders on the books were considerably higher than last year and, in fact, were the largest ever recorded in the history of the company. The directors recommended a final dividend of 7½ per cent. on the ordinary stock (following an interim dividend of 5 per cent.) and a bonus at the rate of 2½ per cent., both less tax. The financial strength of the company was one which it would be difficult to match anywhere in a company of their size. The manufacturing floor space occupied by their factories was now 9,000,000 square feet, an increase of 60 per cent. since 1939. That fact would give stockholders an idea not only of the progressive policy which was being pursued, but also of the wider responsibilities which they had assumed. During the year they had continued to attempt, where practicable, to bring the work to the workers, and they were trying to make their contribution to a balanced industry in all parts of the United Kingdom.

A large number of important orders and projects were now being handled by the group. If the Government wished to accelerate the building of power stations, they would have to attack the problem on a wide front. First of all, they must set up some clearing house or improved administrative machinery to clear the projects through the eight different public authorities concerned. At present it took nearly a year to get the site and project approved.

PRODUCTION PROBLEMS

He would conclude by reiterating that their problems were those of production, and that they saw in front of them some years of high activity. They were glad to learn that the Government was now taking steps to prevent the worst effects of a shortage of materials and notably electrical steel. That by itself would not be enough, because the capacity of their companies and of others engaged in the electrical equipment business was not being fully utilised, owing to a shortage of labour, particularly skilled labour. Out of the 6,000 men who were serving with the Forces, nearly 2,000 were skilled men.

They were well placed to take advantage of the great developments which might be expected in the electrical industry and could confidently rely on their technical and manufacturing departments to be in the forefront of electrical developments. They based their confidence very largely upon the fact that they had been and intended to remain in the van of research and development into the generation and application of electrical power in all its features.

The report was adopted.

"BANK INSURANCE GROUP" OF TRUSTS

MR. BRUCE OTTLEY'S REVIEW

Mr. Bruce Ottley, the chairman, presiding at the twelfth annual general meeting of the Bank Insurance Trust Corporation Limited, held at 30, Cornhill, London, E.C., on the 24th instant, said:—Though I have a long experience of the business of Investment Trust Companies, it is only within the past year that I have been brought into close contact with Unit Trusts. It may be of interest then to place on record certain features that have impressed me.

First, the buyer purchases his Units at a price based upon the current Stock Exchange quotations of the investments held in the Trust Fund. Similarly, he is able to sell his holding, however large it may be, for not less than the realisable or realised value of his proportion of the whole Trust Fund. Secondly, he has the advantage of highly experienced management at a very low cost. This is due mainly to the economy of large scale operations—the Trust Funds of your Group exceed £20,000,000: and the revenue which the managers may derive from helping to make a free market in Units. Any profit obtained by the managers from the difference between the buying and selling price becomes part of their revenue. If the dealing in Units were to be done by a third party, that party would retain any revenue accrued, and the managers would be bound to increase their management charges, to the disadvantage of Unit investors. Moreover, Units differ from other types of security in that both the offer and bid prices are fixed within narrow limits by the trust deeds and the Board of Trade requirements. Since the Treasury prohibited the issue of new units (except for £50,000 per trust per annum, plus the re-issue of any cancelled units) the managers' function of helping to maintain a free market in the units has become even more advantageous to investors in units because it is far more economical to buy back units when holders wish to sell, to hold them, and later to re-sell them, than it would be to liquidate repurchased units by selling the underlying securities and then, when the demand for units increased again, buy the underlying securities to create more units.

Unit holders benefit from the daily supervision of their investment by expert managers. The units of the "Bank Insurance Group" are restricted to quite a small number of securities, and these are subjected to daily scrutiny by a well-trained statistical staff, under the guidance of our managing director, Mr. Faber. The closest contact is maintained with the dealers on the Stock Exchange, and the managers are able to take advantage of market anomalies in share prices. The profits resulting from what might almost be termed arbitrage operations in gilt-edged equities accrue to the unit holders and are reflected in the capital value of the units.

1946 CONSOLIDATED ACCOUNTS

Copies of the directors' report, of the consolidated balance sheet and the consolidated statement of profit and loss of the management company and of its wholly owned subsidiary companies and of the unit accounts of the trusts are in your possession, and are being sent to all unit holders. The usual auditors' reports and certificates of our official stockbrokers in London and Edinburgh are attached to the accounts.

1946 was a highly satisfactory year for holders of Units in the "Bank-Insurance Group." All our units appreciated by an average of about 17 per cent. in 1946, except Cornhill debentures and "geared" deferred units, which latter rose by 35 per cent. The gross distributions on all units, shown in the table in the directors' report, again exceeded those for the previous year. The

outlook for the current year is favourable in both these respects.

The value of units sold during the year amounted to £460,854, an increase of 42 per cent over 1945, which itself showed an increase of 15.8 per cent. over 1944. The value of units liquidated was approximately 3½ times larger than in 1945. That the interests of the unit holders are carefully looked after is shown by the fact that the result of repurchasing and realising £532,435 worth of units was the very small profit to the managers of £1,496 or 0.28 per cent. In addition, we made a holding profit of £991 or 0.18 per cent.

The managers' gross dealing profit (excluding Cornhill units which being highly "geared" are not comparable) from selling and repurchasing, i.e., in making a free market in a total of £1,291,154 worth of units was £6,452 or ½ of 1 per cent.; in addition they made a holding profit of £835 or 0.07 per cent. From the creation and sale of £69,871 worth of new units the profit was £1,000 or 1.43 per cent. plus a holding profit of £661 or 0.95 per cent. The aggregate net balance carried to consolidated profit and loss account from the unit dealing accounts, after crediting the semi-annual service charge and deducting expenses, amounted to £4,002 16s. 9d., or 0.19 per cent. on the total turnover of £2,152,340.

CLOSE DEALING PRICES

We have as usual maintained close prices. In our three largest trusts, the difference between our bid and offer prices, after allowing for Stock Exchange commissions and stamp duties has been, in Stock Exchange parlance, a 2½-4½d. price, or, when markets have been firm, even closer, in quantities up to 5,000 units either way. We have maintained these terms throughout the day to all comers without changing our quotations. Similar dealing terms have ruled for our other units, though the demand for Cornhill Debentures, Investment-Trust Units and "Scotbills" has generally exceeded immediate supply, so that we have not always been able to accept orders for them. We have, however, always been willing buyers.

STAMP DUTIES

Since the 1st August, 1946, Unit Trusts have been subject to additional stamp duties. In certain cases these duties are onerous and might amount to an additional 1 per cent. on the value of the unit. So far we have avoided passing on these extra charges to buyers and sellers of units and, where they have been incurred, we have ourselves borne them; we shall do our best to continue this practice, but the doubling of stamp duties in this year's Budget will create fresh difficulties.

CONSOLIDATED PROFIT AND LOSS ACCOUNT

The managers' profit (before tax) for the year from all sources amounted to £18,829 (£17,818 in 1945) or a modest 7½ per cent. gross (7½ per cent. last year) on our capital and reserves of £242,000. We have re-named our "Investment Reserve" "General Reserve," and transferred to it an additional sum of £6,000, bringing it up to £48,000.

PROGRESS IN 1947

Since the close of our financial year there has been a considerable increase in the demand for our Units. Sales of Units during the first half of this year already largely exceeded those for the whole of the previous year. Had it not been for the continuation of the Treasury restrictions on the issue of

new units our sales would have been still larger. The case for the removal of these restrictions is now too well known to require repetition.

STAFF

To the staff go out our grateful thanks for all the good work they have put in during the past year. Things are not yet back to normal and quite a lot of somewhat tedious work has been necessary to bring us wholly up to date. Shareholders will be glad to know that we have been able to inaugurate a pension and assurance scheme to include all members of the staff.

Our members will, I am sure, wish me to convey, through Mr. George Faber, our indefatigable managing director, their appreciation to Mr. Hooker, our Secretary, and his admirable staff for their efforts during 1946.

BOOKER BROTHERS, McCONNELL AND COMPANY, LIMITED

A SATISFACTORY PROFIT

The annual general meeting of Booker Bros., McConnell and Company, Limited, was held, on the 27th ultimo, in London, Major A. F. V. McConnell (the chairman) presiding.

The following is an extract from his circulated statement:

The net profit for the year ended June 30, 1946, of £116,562 is some £8,000 higher than in the previous year, and this result must be regarded as satisfactory in a year when we felt more of the effect of the Georgetown fire and suffered increasingly from the continuation of restrictions on supplies of goods of almost every kind. The reduction of the burden of war-time taxation should enable the company to make up some of the leeway in building up the reserves which was the inevitable result of that taxation. It is proposed that a final dividend of 5 per cent., plus a bonus of 4 per cent., free of tax, be paid on the ordinary shares (following an interim dividend at the rate of 5 per cent., less tax). Apart from the rehabilitation of our sugar estates, we are faced with considerable expenditure.

In recent years shareholders will have observed indications of an increase in the number of our activities. We have two companies trading in Africa. Their operations include the marketing of leaf tobacco and ground-nuts. Turning to sugar, which forms the foundations of our business, the agreement with the Ministry of Food for the purchase of our export sugar has been extended to the end of 1949, and negotiations are proceeding with the Ministry for fixing the price of export sugar for the 1947 crops on a new basis, the main object of which is to reserve part of the increase in price, first, against future periods of difficult adjustment and, secondly, to assist in defraying the cost of factory rehabilitation and thus to counter any tendency to local inflation.

Meantime, plans for the rehabilitation of our sugar factories and estates are making what must in present circumstances be regarded as reasonably satisfactory progress, though we fear that those concerned are suffering from a sense of frustration by reason of repeated delays in delivery of the plant and equipment ordered. However, these estates have made a very good recovery from the low level to which, owing to war-time difficulties, production fell in 1944.

SCOTTISH POWER COMPANY, LIMITED

THE NATIONALISATION PROPOSALS

MR WILLIAM SHEARER ON CONFISCATION

The thirty-seventh ordinary general meeting of the Scottish Power Company, Limited, was held, on the 18th instant, at the North British Station Hotel, Princes Street, Edinburgh.

Mr William Shearer, the chairman, said, in the course of his remarks:—

The prospective legislation for the nationalisation of the electricity supply industry concern the consumer, the stockholder and the employee.

"How will I benefit from all this upheaval?" is a question which many consumers must be asking themselves. The answer is in the words of the Minister of Fuel. "There can be no guarantee," he said, speaking on the Committee stage of the Electricity Bill on February 25th last, "that every potential consumer in the country will be supplied with either a cheap or an abundant supply. To impose on the central authority the duty of providing a cheap and abundant supply, irrespective of the circumstances, is to do far more than is desirable." Yet at the last Party Conference on June 11, 1946, that is, before the presentation of the Bill to Parliament, and when the public mind was being prepared for it, the Minister stated that "the objective as regards the nationalisation of electricity is twofold. It is to make electricity available to every person in the country who desires it and to every industry which needs it, to bring it within the reach of the rural areas, and, over and above all, to cheapen it."

GLIB PROMISES

This remarkable volte face indicates the facility with which glib promises can be made by certain gentlemen during an election campaign, and the somewhat timid and evasive approach when the realities of the situation emerge.

The Minister has also made it clear that he will look with disfavour on what he terms "unhealthy" competition between electricity and gas when both are nationalised. There can be no doubt that competition between these industries in the past has brought great benefits to the consumer; but these, also, are apparently to go by the board.

The only tangible promise in the Bill, so far as the consumer is concerned, is that there will be another swollen bureaucracy to be paid for by taxation. No wonder that there can be no guarantee in the Bill of cheap or abundant electricity. The price of this experiment in nationalisation, like all others, must be met out of the public pocket except to the extent that possibly, in the initial stages of the bureaucratic control, substantial reserves which were built up as the result of free enterprise may be utilised to conceal the true financial results. But that could only be a very temporary face-saving expedient.

HOLDINGS TO BE EXPROPRIATED

I should now like to refer to the position of stockholders under the Bill, with particular reference to the price at which their holdings are to be expropriated, and their dividend rights. The pledge of the Labour Party prior to the last Election, that there would be just and proper compensation for any industry that was nationalised, has, in my view, been completely discarded in the basis of expro-

priation adopted in the Electricity Bill. The country will know precisely what value to attach to Socialist election pledges in the future. As recently as his Budget speech this week, the Chancellor of the Exchequer reaffirmed that the "Labour Party stood, most of all, for justice," but electricity stockholders will search in vain for this commodity in the compensation terms.

Stock Exchange quotations are not a true measure of the value of the assets of an undertaking and their earning potential. Market dealings and markings are sensitive to many factors, such as the volume of buying and selling; yield and extraneous influences—political, economic and international. Quotations are no guarantee of possible dealings and are quite inappropriate as the basis of purchase of an entire undertaking as a going concern. I have no hesitation in expressing the view that the terms of acquisition amount to confiscation.

PRUDENT ADMINISTRATION PENALISED

Under the method adopted prudent administration is penalised and profligacy in financial operations rewarded. In his Budget speech, the Chancellor underlined once again the importance he attaches to industries ploughing back profits into the business. Yet it is precisely those companies who have carried out this policy in the electricity industry who will suffer most under the compensation terms of the nationalisation scheme. Could inconsistency be more inconsistent?

I wonder whether our Government, which so often claims a monopoly of political wisdom, has taken fully into account the repercussions on other Governments of this un-British treatment of British stockholders.

What if the Indian Government should decide to apply the Dalton-Shinwell standard of financial probity? What answer it is reasonable to ask, would British negotiators have to the argument that what was good enough for the British stockholders at home was certainly adequate abroad?

ASSETS GREATER THAN COMPENSATION

Our assets represent a very much greater value than the compensation proposed under the Bill. From whatever standpoint the expropriation terms are regarded, their inequity is evident, particularly when we reflect that most of our undertakings have perpetual franchises under Statute.

So far as can be ascertained, the take-over prices at which our stocks will be expropriated will be as follows: Ordinary stock 46s. 1d. for each £1; 6 per cent. preference stock 31s. 4d. for each £1; 4 per cent. preference stock 2s. 4d. for each £1. If the new electricity stock carries interest at 2½ per cent., the income of stockholders will suffer a percentage reduction as follows: Ordinary stockholders by 36 per cent.; 6 per cent. preference stockholders by 34.7 per cent.; 4 per cent. preference stockholders by 30.2 per cent.

The net results of these frenzied endeavours will be detrimental to the nation as a whole, no matter how gratifying they may appear to the political sponsors of the scheme. The truth is—and it is high time it was stated frankly—that nationalisation of this and other industries is a political ramp which has little or nothing to do with the general well-being of the country.

The accounts were adopted and a final dividend of 5 per cent. (making 8 per cent. for the year), together with a bonus of 1 per cent. on the ordinary stock, was declared.

J. H. VAVASSEUR AND COMPANY, LIMITED

(East India Merchants)

RECORD PROFITS AND DISTRIBUTION

The forty-third annual general meeting of J. H. Vavasseur & Co., Ltd., was held, on the 22nd instant, in London.

Mr E. Mackenzie Hay, the chairman, who presided, said that the profit of £194,319 earned in 1946, which compared with £106,667 in 1945, was the highest in the company's history. The considerable increase was owing to the greater measure of freedom to trade, both in this country and abroad, particularly in commodities and produce which had been unobtainable by many countries since before the war and for which, in consequence, there was keen competition at a high level of prices. After the provision of £90,000 for taxation there was a disposable profit and loss balance of £110,081, out of which the preference dividend and an interim dividend of 5 per cent. on the ordinary capital had already been paid and from which the directors now recommended the payment of a final dividend of 20 per cent on the existing ordinary stock, leaving £20,081 to be carried forward against £5,761 brought in. The company had also made an additional profit of £59,049 from the sale of investments, out of which it was proposed to make a special distribution of 2½ per cent. tax free to the ordinary stockholders, involving £8,750, and to carry the balance of £50,299 to the capital reserve account.

A STRONG BALANCE SHEET

The principal changes in the balance sheet were the very considerable strengthening of the reserves through the augmentation of the capital reserve to £63,340, and the creation of the share premium reserve of £98,259 arising from the recent new issue. With the general reserve of £140,000 and the dividend reserve of £60,000, the total free reserves now amounted to £361,599. On the other side there was a large expansion in the items of advances to subsidiary companies, stocks on hand and sundry debtors, reflecting the more active trading conditions experienced. The consolidated balance sheet showed an addition in 1946 to the surplus of net assets over all liabilities belonging to the company of £267,544, bringing the total surplus of net assets to the impressive figure of £1,230,033, against an issued preference and ordinary stock capital of £450,000.

PROSPECTS PROMISING

The prospects for the company as well as for its subsidiaries during the current year were promising. As in the case of most business enterprise, their efforts and results would be largely governed by the overriding economic developments, of which, in view of this country's present financial position internationally, the predominant factor was likely to be the Government's import policy. Happily, the commodities in which the company was almost exclusively concerned were essential commodities deriving from the Sterling area, with many of which it could earn hard currencies for this country, thus assisting the solution of its balance of payments problem.

With regard to commodities generally, though there had lately been a welcome tendency for some raw material prices to become more stabilized, the general trend remained adverse to buyers, the situation in respect of fats and oils, particularly, being one of acute scarcity. It was questionable whether the best interests of this country were being served in many cases by continued adherence to the war-time technique of bulk buying, which had encouraged the post-war technique of bulk selling.

The report and accounts were unanimously adopted.

KEMSLEY NEWSPAPERS, LIMITED

VISCOUNT KEMSLEY'S REVIEW

The twenty-third ordinary general meeting of Kemsley Newspapers, Ltd., was held on the 17th instant at Kemsley House, London.

Viscount Kemsley (chairman) who presided said: Ladies and gentlemen, I propose to follow the usual course and, with your permission, to treat the report and accounts before you as read.

The accounts with which you have been presented show that the trading profits, combined with the income from subsidiary companies and other investments, reach a total of £1,875,501, an increase of £389,513, and after deduction of directors' fees, Debenture interest and the provision for taxation, and adding the amount carried forward from last year, there remains a disposable balance of £1,150,055. It is proposed to deal with this, as is our custom, in a conservative manner. It should gladden the heart of Mr. Dalton that our first concern is materially to improve the capital position of the company. Nevertheless, we think it right in addition to provide a modest increase in the return on the Ordinary shares.

One hundred and fifty thousand pounds is to be allocated to the general reserve, to make a total of £3,150,000.

INCREASED ORDINARY DIVIDEND

Provision must then be made for the dividends on the 6½ per cent. and 8 per cent. Preference stock and the interim dividend of 5 per cent., less tax, on the Ordinary stock, and from the residue a final dividend is recommended on the Ordinary stock of 7 per cent., less tax, making 12 per cent. less tax, for the year, compared with 11 per cent., less tax for 1945.

If these proposals are approved, there will remain a balance to be carried forward of £264,055, compared with £260,139 brought in.

"Excess Profits Tax Post-War Refund Suspense Account—£105,160," is the amount received from the Government to date in respect of excess profits refund due to the company and is a reserve available for development and re-equipment.

Turning to the assets side, the increase of £300,752 in "Advances to Subsidiary Companies" is accounted for by the increase in dividends receivable from subsidiary companies. The increase in "Stock in Trade" from £213,066 last year to £323,785 this year is due mainly to additional stocks of newsprint held and its increase in price.

DEBENTURE REORGANISATION

I should now refer to the redemption since our year ended of the outstanding amount of £3,112,175 4 per cent. 1st Mortgage Debenture stock and its replacement by £3,500,000 1st Mortgage Debenture stock carrying interest at the rate of 3 per cent. per annum. The expenses of this reorganisation included the redemption of the old Debentures at a premium of 8 per cent., the costs, stamp duties, and so forth. The total is approximately £300,000 and it is, I feel sure you will agree, most satisfactory that this sum has been provided wholly out of the annual profits of the year under review.

This reorganisation has provided your company with rather more than £60,000 additional capital and has effected a direct saving of £52,500 a year in interest and sinking fund. If, however, taxation at present rates is taken into account the saving is substantially more, in that previously trading profits of £240,680 per annum were required to meet the interest and sinking fund of the old stock, whereas in the case of the new stock the comparable figure would be £168,636 per annum, a difference of £72,044, but on the other hand the new 3 per cent. stock will not be re-

deemed until 1994, whereas the old 4 per cent. stock would all have been redeemed by 1975.

EDITORIAL POLICY

Let me restate our editorial policy. Editorially a newspaper has three functions, equally important, which need to be clearly separated.

A newspaper must present the news, both local and national, with the highest degree of accuracy both in presentation and balance.

It must provide instruction and entertainment for its readers in accordance with their tastes.

Finally, it must make comment and express opinion on the events of the day, whether they be of local or of national interest, and this duty, performed as fearlessly as it is performed honestly, endows a newspaper with its character and individuality. In this matter of opinion, quite different considerations arise. Free and fearless statement of opinion is the very essence of democracy.

Our national daily the *Daily Graphic* is a newspaper which combines news, pictures and features of universal interest, while at the same time retaining an individuality which marks out for it a distinctive position as an organ of opinion.

With characteristic enterprise the *Daily Graphic*, alone among British newspapers, has at the present time its own photographers both accompanying the Royal Family in South Africa, and attending the Foreign Ministers meeting in Moscow.

THE "SUNDAY TIMES"

The *Sunday Times*, whose circulation has again risen substantially since I spoke to you last year, is indispensable to all who wish to follow the course of public affairs with the closest accuracy. After the publication of a leading article entitled: "The Twilight of Freedom," from all parts of the country came an insistent demand that the *Sunday Times* should put itself at the head of a new movement to resist further encroachments on the liberty of the individual and to regain those liberties we have lost. Such a movement must be essentially political in character, and to lead it is no part of the true function of a newspaper. The temptation was therefore resisted. Moreover such a movement is the stronger if it springs spontaneously from local sentiment. The *Sunday Times* undertook to maintain a link between the various bodies so brought into being, and to be a clearing house for information. You will be interested to know that 200 such Freedom Unions have already been formed and that from week to week these associations of liberty loving citizens grow in number and in importance. The response to the appeal of the *Sunday Times* reveals the extent to which the newspaper represents and expresses the feelings and desires of a large and influential section of the thinking people of this country.

This year, as in the past, your company has been assisted by the valuable services rendered by newsgagents throughout the country, and I should like to record my appreciation of their efforts.

I now beg to propose the following resolution: That the report of the directors and statement of accounts for the year 1946 be received and adopted, and that the reserves, appropriations and dividend recommended therein be and are hereby adopted.

The Honourable Lionel Berry, deputy chairman, seconded the resolution, which was carried unanimously.

The retiring directors, the Hon. Lionel Berry, Mr W. M. Teasdale, Mr H. J. Staines, Mr William Veitch, and Mr W. W. Hadley were re-elected, and the election to the board of the Rt. Hon. William Mabane was confirmed.

DERBYSHIRE STONE, LIMITED

EXPANSION OF ACTIVITIES

The annual general meeting of Derbyshire Stone, Limited, was held, on the 21st instant, at 28, Victoria Street, London, S.W., Mr J. Hadfield, M.Sc., A.R.I.C. (chairman and managing director), presiding.

The chairman, in the course of his speech, said:

The consolidated balance sheet shows a total for capital, reserves and undistributed profits of £798,812 and, with £109,265 received in January 1947, in respect of the final call on the Preference shares, there is now a total of £908,077. In the opinion of your directors the company now has ample financial resources for the projects contemplated.

The consolidated profit and loss account reveals more fully the increased activities of the group in 1946 compared with earlier years. The combined trading profit of the company and of its subsidiaries amounted to £106,758 in 1946, compared with £67,221 in 1945. The same dividend, £1,625, was received from our associated company. Excess profits tax recoverable was £2,619 in 1946, compared with £24,669 in 1945. On the other side of the accounts you will see that £24,500 has been provided for depreciation in 1946, compared with £16,136 in 1945. During the war it has been the endeavour of the directors to maintain the company's plant and properties in good repair so far as possible, but inevitably certain work had to be deferred.

I have already referred to the satisfactory position of the company as regards capital and reserves. You will notice from the consolidated balance sheet that current assets amount to £476,039, which figure was increased to £585,304 early in January, 1947, when the remaining calls on the Preference shares were received. This figure compares with current liabilities of £171,720 and provision for future liabilities of £47,125, and you will agree, I am sure, that this position is very satisfactory.

FOUNDATION FOR FUTURE SUCCESS

Your company was able to spend on capital items approximately £70,000 in 1946, and the expenditure of the proceeds of the Four and a-quarter per Cent. Preference share issue on mechanisation, expansion, etc., will be proceeded with during 1947 and 1948 as effectively as the position relating to the supply of plant and equipment permits.

Nineteen forty-six was one of the most important years in the history of the company, and the foundations were laid for what the directors hope will be sources of added profit, quite apart from the results to be obtained from the mechanisation programme.

To forecast the future is not easy, particularly in so far as 1947 is concerned, but your directors can say that if the company had enjoyed throughout 1946 its present plant and production facilities, profits would have been higher. The demands for our products for the numerous purposes for which we supply them are high. On the reverse side it must be said that the abnormal weather of February and March, 1947, has been costly to the company, but every effort will be made over the remaining nine months of the year to minimise these early setbacks. The effects of shortages of coal and electric power are factors which must be considered in surveying the prospects for the year, but we are hopeful that any difficulties arising from these two sources will not be unduly onerous during the summer and autumn months, when our activities are usually at their maximum.

The report and accounts were unanimously adopted, and a dividend of 12½ per cent., less income tax, was declared on the Ordinary stock.

THE MIDLAND EMPLOYERS' MUTUAL ASSURANCE, LIMITED

CHAIRMAN'S REVIEW

ANOTHER YEAR OF EXPANSION

The forty-eighth annual general meeting of the Midland Employers' Mutual Assurance, Limited, was held on the 22nd instant, at 16 Waterloo Street, Birmingham. Lieut.-Colonel J. Beaumont Neilson, C.M.G., D.S.O., C.A., presided. Extracts from the Chairman's speech, which had been circulated with the report and accounts, were as follows:—

BALANCE SHEET AND ACCOUNTS

The Premium Income for the year 1946 at £3,146,805 showed an increase of over £46,000 on the previous year's figures, despite a reduction in Employers' Liability Premium Income as the result of the nationalisation of coal mines previously insured with the company. As your company has been transacting fire and general accident business since June, 1945, separate revenue accounts have been prepared for the employers' liability, fire, personal accident and general accident departments. The individual departmental premium incomes, less re-insurances, are as follows:—

Employers' Liability	£2,884,750
Fire	£16,574
Personal Accident	£10,182
General Accident	£235,299

LOW COST OF ADMINISTRATION

The expenses of management amount to £314,857, or 10 per cent. of the premium income. This compares with 8.76 per cent. in 1945. The increase is due to a general advance in salaries, the return from active service of a large number of pre-war staff and the continued increase in cost of all types of office equipment and supplies. Few companies, however, are able to conduct a business of the magnitude of this with such low costs of administration.

Commission at £181,081 (5.8 per cent.) is in substantially the same ratio as last year.

INCREASING COST OF CLAIMS

The expenditure on claims amounted to £2,275,057, an increase of £233,365, and the claims reserves at £4,977,679 have been increased by £353,772.

Of the new departments, all have contributed a satisfactory profit with the exception of Motor. This is a department which has caused, and is still causing, considerable concern to underwriters, and it is obvious that with the increasing cost of third party and "Own Damage" claims, rates will have to be drastically revised by all insurers. Your company has taken the initiative in abolishing the war-time discount, which is no longer warranted, and other steps have been taken to place the department on a satisfactory basis. It will be observed that the profit of £2,854 in the fire department has been left in the fund.

The reserve for unexpired risks is maintained at 45 per cent. and amounts to £1,416,062.

The assets of the company as at December 31, 1946, totalled £7,341,612, which compares with £6,796,647 at the end of 1945.

The company's holdings of British Government securities increased by £528,700.

NEW LEGISLATION AND EMPLOYERS' FUTURE LIABILITY

I have on previous occasions referred to pending Government legislation regarding Workmen's Compensation. If the recommendations of the committee presided over

by Sir Walter Monkton, K.C., are accepted it will still be necessary when the new Act becomes effective for employers of labour to continue to ensure their liabilities to employees at Common Law which as I have mentioned earlier are increasing year by year.

FIRE AND ACCIDENT DEPARTMENTS EXPANDING

NEW LIFE DEPARTMENT

I am pleased to say that during the year the company has continued to receive, not only from its old assured but from new connections, increasing support in the new fire and general accident departments. As from January 1, 1947, the company opened its own life department, and the business completed to date, which has exceeded our expectations, augurs well for the future. In addition to all the usual forms of life assurance and annuity business, the company will specialise in group pensions and life assurance schemes, and this department should be of considerable assistance and interest to our assured, particularly those who are large employers of labour.

DIRECTORS

You will observe from the report that Sir Andrew Agnew, C.B.E., tendered his resignation as a director. I should like to place on record my personal appreciation of the valuable services he rendered to the company during the period he was a member of the board. To fill the two vacancies on the board, Mr. Leonard P. Lord, Chairman and Managing Director of the Austin Motor Company, Limited, and Mr. Alan S. Barnfield, O.B.E., our general manager, have been appointed, and their experience will be of great assistance to the company.

The accounts having been unanimously adopted, the meeting closed with a vote of thanks to the chairman.

TELEGRAPH CONSTRUCTION AND MAINTENANCE COMPANY, LIMITED

SATISFACTORY ORDER BOOK

The 83rd ordinary general meeting of this Company was held, on the 22nd instant, in London.

The Rt. Hon. Lord Colgrain, the chairman, said that the balance of the trading account was £160,736, compared with £162,938 last year. In view of the difficult period at the commencement of the year, that was a satisfactory figure. The board recommended a final dividend of 5 per cent., making 10 per cent. for the year, leaving £68,709 to be carried forward, a substantial figure decided upon in view of the position which had arisen consequent on the fuel crisis.

The year 1946 had presented many problems to industry and especially to a company like theirs, which during the war had been almost entirely employed on Government work. When in 1945 peace was declared somewhat suddenly and contracts amounting to over £1,500,000 in value were cancelled, they had been left for a time with ample resources, inflated staff but little or no work. For the first 6 months of the year it had not been possible to do more than cover expenses. After July things had begun to improve; they had developed new lines of manufacture in plastics and certain high grade magnetic metals and had rebuilt their order book, which was now most satisfactory in every branch.

Their policy was one of steady development and they were making good progress in several directions, but great care had to be taken. Mass production had never been the aim of this company. It was upon the quality of their goods that their reputation was based.

The report was adopted.

JOHN BARKER AND COMPANY, LIMITED

RECORD FIGURES

The fifty-fourth annual general meeting of John Barker and Company, Limited, was held on the 10th instant, at Kensington.

Mr Trevor A. Bowen, chairman and managing director, said that he thought it would be agreed that the report and accounts showed a healthy state of affairs. The net profit amounted to £1,187,829 subject to taxation, an improvement of approximately 23½ per cent. The year under review had been marked by what they called a "sellers' market." Their turnover and gross profit both constituted record figures, and, in his opinion, went to show that their organisation was now so arranged and controlled as to enable them to deal with any volume of trade that it might be their good fortune to secure.

As regarded the future, crisis followed crisis and almost every day brought its own internal re-arrangement of plans to meet changing conditions and the increasing restrictions on trade and all supplies, but their strong financial position enabled them by prompt cash payments to take immediate advantage of any merchandise that was offered and to pass the benefit on to their customers and finally to their shareholders by way of dividend. Official restrictions and difficulties continued to multiply.

Their turnover today was conditioned wholly and solely by the number of coupons available to the purchaser. Cash was of secondary consideration. Until the Board of Trade saw fit to release merchandise from couponage, business could not be expected to function with the smoothness and ease of the years prior to 1939.

The report was adopted.

B. MORRIS AND SONS, LIMITED

PROFIT NEARLY DOUBLED

The annual general meeting of B. Morris and Sons, Limited, was held, on the 23rd instant, in London.

Mr A. J. May, the chairman and managing director, in the course of his speech said: It is pleasing to be able to tell you that we had a large increase in the sales of our varied products last year, and, although the extra cost of leaf and labour had to be met, we were able to keep to our usual high standard of quality, and should help to maintain our business in the future. The profit for the year, £21,504, compares favourably with 1945, being almost doubled. The increase in our stock figure to £92,415 is due to the fact that we are very much better placed with regard to raw material than we were last year. The financial position of the company is very strong and it is due to this fact that we have been able to finance the extra duties and trade without the slightest strain on our resources.

With regard to 1947, during the fuel crisis we were able to run our plant on Diesel engines, and we can be, if necessary, independent of electricity for power purposes. I mention this because any future electricity crisis will not affect the working of the company's factories. Our trade has already shown a large increase in the first three months of this year, and although the Chancellor of the Exchequer has seen fit to increase the already heavy tobacco duty, we will, I hope, produce another good and better result next year. We are sending dividend warrants out on May 16th.

The report was adopted and the proposed dividend of 10 per cent. less tax, was approved.

GOVERNMENT RETURNS

For the week ended April 19, 1947, total ordinary revenue was £54,721,863 against ordinary expenditure of £47,254,674 and issues to sinking funds, £130,000. Thus, including sinking fund allocations of £239,015, the deficit accrued since April 1st is £19,153,552 against £98,297,000 for the corresponding period a year ago.

THE STEVENAGE DEVELOPMENT CORPORATION invites
applications for the undermentioned posts. The officers appointed
will be responsible Heads of Departments of the Development Corpora-
tion and will be expected to work as a team under the direction of the
Chief Executive Officer. The task is of a pioneering type and calls for
imagination, initiative, resource and proved organizing ability of a high
order, and applicants should show themselves possessed of this com-
bination of qualities as well as of a recognised professional status. In
determining salaries, account will be taken of the range of qualifications
and experience of the individual applicant, and applicants are asked to
state salaries required.

Applications should be made in writing, stating date of birth, and
the post in respect of which the application is made, together with full
details of qualifications and experience (including a list in chronological
order of appointments held), and should be received by the Stevenage
Development Corporation, Aston House, near Stevenage, Herts, not later
than May 3, 1947.

Legal and Administrative Officer.

Applicants should be Barristers or admitted solicitors, and should
preferably have had experience in a local authority or public utility
undertaking. The successful applicant will be required to take charge
of the administration and personnel services as well as of all legal
matters, and to act as secretary to the Corporation.

Chief Finance Officer.

Applicants should be Chartered or Incorporated Accountants or certi-
fied Corporate Accountants and/or hold high municipal or other account-
ing qualifications, with a wide and varied experience in important
financial and commercial affairs. To have had experience of the public
service would be an advantage. The Chief Finance Officer will be
required to take charge of all aspects of the Corporation's finances.

Social Development Officer.

This officer will be responsible for directing and co-ordinating the
development of the New Town into a balanced and self-contained
community. He will be responsible for the direction of research into
the social and economic problems encountered in the course of the town's
development; he will be expected to interpret the needs and wishes of
the community to the Corporation and to be responsible for explaining
the policy of the Development Corporation, both to the people living in
the town and to the general public. The important qualifications will
include a wide knowledge of contemporary social and economic problems
and of techniques for the assessment of human needs. Experience of
large-scale public relations work is also desirable, but not essential.

CANADIAN PACIFIC RAILWAY COMPANY (Incorporated in Canada
with limited liability).—ONTARIO AND QUEBEC RAILWAY COM-
PANY FIVE PER CENT. DEBENTURE STOCK. SIX PER CENT.
COMMON STOCK.—In preparation for the payment of the half-yearly
interest payable on the 2nd June next, the Debenture Stock Transfer
Books will be closed on 1st May and will be reopened on 3rd June.
The half-yearly interest on the Common Stock will be paid on 2nd June
to holders of record on 1st May.—R. F. TREMAYNE, Deputy Secretary,
8, Waterloo Place, Pall Mall, London, S.W. 1. 15th April, 1947.

SWISS LADY (31), of good family, visiting England early Spring.
Desires interesting employment. Speaks French, Italian, German
and a little English; good appearance, socially experienced. Willing
act as hostess, receptionist, or consider anything offering scope for tact
and initiative.—Box 435.

CAMBRIDGE GRADUATE, History Tripos, 27; old-fashioned enough
to believe that hard work and initiative are still surest way to
success, seeks appointment where he can escape from deadening effect
of present Civil Service routine at Temporary Principal's level. Any
offers?—Box 464.

THE UNION BANK OF AUSTRALIA LIMITED

ESTABLISHED 1837.

With a network of branches throughout every important pastoral, agricultural,
commercial and industrial area in

AUSTRALIA and NEW ZEALAND

and with Agents in the principal cities throughout the world, The Union Bank
of Australia, Limited, is able to offer the facilities of a most comprehensive
banking service.

Head Office:

71, CORNHILL, LONDON, E.C.3.

West End Agency:

15, CARLOS PLACE, LONDON, W.1.

REFUGE ASSURANCE COMPANY LTD.

Chief Office: OXFORD STREET, MANCHESTER, 1

ANNUAL INCOME EXCEEDS £16,300,000

ASSETS EXCEED £97,000,000

CLAIMS PAID EXCEED £181,000,000

(1946 Accounts)

UNIVERSITY OF LONDON

A course of three lectures will be given on "Additive stochastic
processes" by Professor Paul Lévy (Ecole Polytechnique, Paris), at
Imperial College of Science and Technology (Department of Mathe-
matics), Huxley Building (opposite Science Museum), Exhibition Road,
S.W.7, on May 8th, 12th and 13th, at 5.15 p.m. At the first lecture the
chair will be taken by Professor H. Levy (Professor of Mathematics
in the University of London).

ADMISSION FREE, WITHOUT TICKET.

JAMES HENDERSON, Academic Registrar.

UNIVERSITY OF BIRMINGHAM

FACULTY OF COMMERCE AND SOCIAL SCIENCE.

Applications are invited for the following appointment:—
ASSISTANT LECTURER or GRADE 11b or 11c LECTURER in
PUBLIC ADMINISTRATION.

The person appointed will be given salary and grade, according to
qualifications and experience.

Salary Scale: Assistant Lecturer—£400-£500 per annum.

Lecturer, Grade 11c—£550-£600 per annum.

Lecturer, Grade 11b—£600-£750 per annum.

The post is open equally to men and women applicants.
Further particulars may be obtained from the undersigned, to whom
three copies of applications, together with copies of not more than three
testimonials, and the names of two referees, should be sent not later
than May 24th, 1947. There is no special application form.

The University, C. G. BURTON, Secretary.

Edmund Street,
Birmingham, 3. April, 1947.

UNIVERSITY OF LEEDS

DEPARTMENT OF ECONOMICS AND COMMERCE.

Applications are invited for the post of Lecturer in Accountancy on
the salary scale, £550-£25-£900, together with membership of the
Federated Superannuation System for Universities. An appointment may
be made in the upper part of the scale (£750-£900), the initial salary
to be determined in relation to the experience and qualifications of
the selected candidate. Applicants should possess a recognised
accountancy qualification, have had practical accountancy and preferably
teaching experience, and be able to undertake research in accountancy.
Applications should reach The Registrar, The University, Leeds, 2
(from whom further particulars may be obtained), not later than May
31, 1947.

BUCKS COUNTY EDUCATION COMMITTEE

Required immediately, MAN TEACHER of COMMERCIAL SUBJECTS.
Applicants, who should possess a Degree in Commerce, or equivalent
qualifications, will be required primarily to undertake duties in con-
nection with General Business Courses (Ministry of Labour and Ministry
of Education) for selected ex-Servicemen, with in addition some teach-
ing in the Slough Evening Institute and/or Day Continuation School.
Experience in industry and qualifications in Law and Accountancy will
be additional recommendations.

Salary: Burnham Scale for Teachers in Technical Colleges.

Applications (no forms issued) with copies of testimonials should be
sent immediately to D. R. Barraclough, M.A., Technical School, William
Street, Slough, Bucks.

D. E. COOKE, M.A., Chief Education Officer.

THE JOHN LEWIS PARTNERSHIP is considering the appointment
of a DEPUTY for Sir Metford Watkins, their Financial Adviser.
Applicants should possess an appreciation of financial problems that
would be expected of a first-rate Chartered Accountant, but the qualifica-
tion is not essential. The post calls for a real critical ability combined
with a sympathetic outlook towards the experiments necessary for the
rapid expansion of a business with now a capital of £12 million and with
a total of 11,000 employees. Initial salary up to £2,500. Substantial
further prospects. Age 30-40. Non-contributory pension at 60.—Applica-
tions in writing should be addressed to the Financial Adviser, John
Lewis and Company, Ltd., Oxford Street, W.1, to be received by
23rd May. Letters will not be acknowledged before that date.

Mr Marshall's Round

MR WALLACE having done his best to obscure the differences
between appeasement and compromise as methods of American
foreign policy, Mr Marshall has lifted them back into the clear air.
The long and carefully phrased broadcast in which he addressed the
American people last Monday night was a judicious, moderate, but
perfectly frank summing up against Mr Molotov; but it contained, as
it were, a recommendation to mercy. Mr Marshall asked that Americans
"should sincerely try to understand the point of view of those with
whom we differ" and mentioned the belief expressed by Mr Stalin in
their private talk that "compromises were possible on all the main
questions, including demilitarisation, the political structure of Germany,
reparations and economic unity." Even if allowance is made for Mr
Stalin's wish to make a further meeting of the Foreign Ministers this
year seem worth while, his statement is notable; for it came after the
public declaration of the Truman Doctrine in provocative and flamboyant
terms and followed closely upon outspoken speeches in the tough strain
by both the British and the American Foreign Ministers.

The tough line has so far had no visibly harmful results. The Soviet
delegates may, indeed, have found the inconclusive conference a very
useful internal stimulant. Their press covered the proceedings very
fully; a number of Mr Molotov's and Mr Vishinsky's speeches were
clearly aimed at the Russian, as well as the German, public; and the
Western delegates were at their most outspoken and obdurate when
criticising the Soviet claim to \$10 billion worth of reparations from
German production. To the Russian people, who must be assumed
to believe all they read and to trust their statesmen, the course of the
conference must have confirmed everything they have been told recently
about the west; they have learnt that the industry of western Germany
will not be used to help repair the devastated towns and fields of western
Russia; that the Ruhr is to remain under British control; that the
denazification and democratisation of Germany are still incomplete; that
Mr Bevin gives higher priority to the feeding of Germans than to the
rehabilitation of the Ukraine; that the Americans want to have a weak
German government in Berlin and strong governments in Munich,
Stuttgart and Frankfurt, and so on. The picture is, of course, unfair;
but it is not devoid of truth, either in its presentation of the issues or
in its imputation of motives. Should the Foreign Ministers fail again
to agree and should American-Soviet relations get worse, Mr Molotov
will be able to count on the Russian people to accept willingly the
sacrifices which autarky and isolation from Europe might demand. There
will be no Russian Wallace to disturb their consciences.

None of the other Foreign Ministers can claim to have got as much
as he hoped out of Moscow. Mr Bevin, who has stuck closely to his
brief, asks us to be patient and speaks only of the advantage of having all
points of difference between the Powers clearly revealed. Mr Marshall
has established a reputation for firmness and clear-principled argument.
He shares Lincoln's dislike of "pernicious abstractions" and has declared
his determination not to "achieve agreement for agreement's sake"

by "compromise on great principles." Thereby another hard knock has been given to the lately fashionable doctrine of the new realists, who maintain that principles and—if necessary—ways of life should be sacrificed to the one objective of getting the great Powers working together. M. Bidault must return to Paris gravely disappointed, but with a clear conscience. He was uncompromising only on coal; having failed to get agreement to his demand that the peace treaty should bind Germany to fixed deliveries of coal to France, he was offered—outside the conference—and accepted a sliding scale of deliveries to France relating them to increased production from the Ruhr and the Saar. To the French wish to incorporate the Saar into their own economy, Mr Molotov would give no clear answer; he rejected suggestions for special regimes in the Ruhr and the Rhineland; and he demanded more power for a central German government than the French would concede for many years to come. How M. Bidault will settle all this with the French Communists remains to be seen.

Obviously, the main task now for all three western Foreign Ministers is to take some action in Germany and Europe that will avert economic disaster and promote European unity, but not bar the way to agreement with the Russians next November. The door has been held open so long for hopes of German political and economic unity that, as *The Times* points out, the resulting draught has very nearly blighted all hopes of German recovery. Action now presents different problems at different levels. At the highest level is the question of the form that economic association of the European nations might eventually take, a question in which the Czechs and the Poles would be as interested as the Belgians and the Swiss. If some clear and practical ideas can be worked out here, British and American plans for the future of western Germany would be less open to suspicious questioning by Germany's neighbours. For the coal and steel of the Ruhr must be the basis of any continuous economic recovery in the west, from which, sooner or later, eastern Europe will want the equipment and tools to repair its industry and bring it up to date. At the next level there is the problem of associating the French zone with the British and American zones of Germany. The resistance to the idea in France will be strong, not only because the French like to run Germans in their own way, but because they see in a merger at present only the prospects of sharing British and American expenses and losses.

So everything depends—at the next level—on the more efficient organisation of the British and American fused zones. Matters have been allowed to come to a crisis and Mr Bevin and his new Minister for Germany, Lord Pakenham, have had to have emergency consultations at a Berlin station. Anglo-American disagreement is quite serious, although it would be

less bitter if General Clay were a less obstinate man. In the direction of German industry the British preference—not wholly derived from Socialist doctrines—for strict controls, big units, and planning at the centre is confronted by American individualist liking for light controls, chances for the small man and as much power as possible left with the State governments. The "Battle of Minden" may yet need the intervention of Mr Attlee and Mr Truman, for it is merely the reflection of differences in fundamental British and American policies. Federalism and its faults are in fact on trial, and since federalism of one kind or another is the only method by which any closer association of the western European countries could be brought about, much more than German issues hang upon the decision.

Thus the technical problem of making Western Germany work becomes the key to the whole of European policy. The plans that are now laid must not forget the Germans, who, if they are not to sink into sullen sabotage, must have some hope of working their way back to collaboration with the rest of Europe; if they cannot do it through a united Germany, then they will want to do it through western German states, associated with their neighbours to the north, west and south. There is no reason why the preparation of a British policy on these lines—alternative to the more fundamental policies of agreement with Russia on a unified Germany and agreement with America on terms of multilateral trade—should provoke more suspicion in Moscow than exists there already, or make more difficult the agreement of the Foreign Ministers next November. It is indeed the one major constructive line along which British policy can for the moment work in Europe.

As for Soviet relations in general with the "Anglo-Saxon Powers," there are many lines along which they can be discussed which do not run through Germany. Some of them are already open: the Russians begin discussing shortly in Washington the settlement of Lend-Lease balances; discussions in Moscow for revising the Anglo-Soviet Treaty of Alliance are continuing; there will be opportunities in the Security Council and the General Assembly to watch for conciliatory signs; and there are peace treaties to ratify and Allied troops to be withdrawn. Mr Stalin told Mr Marshall in Moscow that he regarded the past conference on Germany as "only the first skirmishes and brushes of reconnaissance forces"; true to the Russian tradition, the main forces will not make their effort until General Winter is available. Mr Marshall should make it clear to the Americans and the Russians that he is not simply working for a general Russian retreat, but for an understanding about vital interests along a firmly-drawn line through Europe and Asia. The tough line has had its effect; Mr Marshall can now put the gloves on again.

and grievances. The latter is the better way to start, and credit is due to the Liberal Party for the gesture—at the present moment it can be no more—of introducing into the Lords a private measure, entitled the Preservation of the Rights of the Subject Bill, which sets out a variety of remedial devices for protecting the citizen against the abuse or misuse of power. The Liberals are at pains to point out that undesirable powers were taken by the Executive prior to the recent war and were sanctioned by Conservative as well as by Labour Governments; indeed, many of the new Bill's clauses embody the unanimous recommendations of the Committee on Ministers' Powers, which reported as long ago as 1932.

It is interesting that there are only two specific controls at present possessed by the Government which the Bill seeks to modify. One is the vague and wide powers of search, intro-

duced during wartime and continued under the Supplies and Services Act, 1945, under which some 10,000 officials possess authority to enter unspecified buildings at any time they think fit. Powers of search are indispensable for the enforcement of economic regulations and rationing, but it is unnecessary and politically dangerous to draft them so widely, and it would be safer to require the production of a specific warrant for each building that an official wants to enter. The other undesirable control is the authority to suspend newspapers, that is supposed by the Government to reside in the same Act. Whether it does so or not, the Liberals suggest that temptation should be removed from Ministers by an outright enactment that the suppression or suspension of any publication is illegal.

But apart from these two objectionable powers—of which one, indeed, may be no more than a figment of Mr Shinwell's imagination on a cold night—it is not the numerous powers now held by the Government, but the lack of safeguards against their misuse, to which the Liberals take objection. Here, indeed, in the latitude conceded to Ministers through the growth of delegated legislation, which is now multiplying itself in geometrical progression, lies the greater threat to the liberties of the citizen. The traditional safeguards against this danger reside in the twofold supervision over the administrative acts of the Executive that is exercised respectively by Parliament and by the judiciary.

It is on restoring and strengthening these safeguards that the Liberals have bent their attention. This is valuable repair work, although it may require much supplementing by more novel methods. It is alarming to realise that two vital principles, relating to the judiciary, have still to be established. These are that no Minister should be allowed to set himself above the law that Parliament has enacted, and that public authorities should not be given a preferential advantage over private individuals in courts of law. Some of the points at issue are covered in the new Proceedings Against the Crown Bill, but by no means all. There should be an end of the exceptional provisions in some Acts, which permit Ministers to repeal or amend statutes at their own discretion or which prevent points of law from being raised in the courts; and there should also be an end of the grave unfairness of having a much shorter time-limit for taking proceedings against public authorities than against private individuals, even though this has been a feature of the English legal system for a considerable time.

The prerogatives of the judiciary need jealous guarding. But it is important to realise that the law courts are no more competent than anyone else to judge the goodness or badness of an administrative act, and it is this that most needs watching to-day. The powers of Ministers are now drawn so widely that the most monstrously unfair acts can be perpetrated without calling into question any points of law. Moreover, where provision is made for objectors to have recourse to a public inquiry, there is little chance of upsetting the Minister's decision in the courts so long as he goes through the outward motions of considering the matter in good faith. It is only when a Minister exercises insufficient care or speaks out of turn, as Mr Silkin did on the subject of Stevenage, that he is likely to find himself involved in litigation. This is not to suggest that any Minister at any time acts under any other conviction than that he is serving the public interest. The point is that his department, rendered insensitive by too much power, too much introversion and too much absorption with administrative convenience, will make decisions of perfect legality that are in violation of elementary canons of common sense and even dealing.

The remedy for such maladministration lies not in the courts but in the force of public opinion, whose main outlet is and always must be Parliament. Especially when fed by a vigilant public, Parliament is still a highly efficient sounding-board for complaints, grievances and suggestions. Question time and

debates on the adjournment are the cause of frequent and salutary shake-ups in the departments, while Parliament will still find time to right the wrongs of an individual citizen. But for every grievance that is ventilated, many now go by default. Parliament's watching brief can no longer encompass the deeds of so vast an administration.

The crying need, therefore, is to reinforce the sanctions of public opinion. A first step is to put a greater onus of explanation and justification on the Executive itself. Public inquiries are valuable; but, as the Liberals urge, they would be far more use if the Minister was obliged to publish his inspector's report together with the reasons for his own subsequent decision; without this, criticism is blindfold and fruitless and all the more irritable on that account. What reason in any case can there be, other than a mole-like obscurantism, for withholding the arguments for building a new town at Crawley or a reservoir at Ennerdale? The Liberals' Bill also suggests that Parliament's hand should be strengthened by the power to amend, as well as to annul, a statutory order or other instrument. This is again a perfectly valid request, although the difficulty would be to find the time for debating such amendments.

It is because Parliament has become so overburdened that other devices against maladministration need to be sought. It is interesting that both the Agriculture Bill and the Town and Country Planning Bill that are now under examination contain powers to set up independent tribunals, whose main function is to consider the fairness and reasonableness of administrative acts. If a way can be found to man such tribunals with ordinary citizens of good sense and judgment, this idea should be extended far more widely, giving a right of appeal not so much to the judge as to the jury. Another expedient might be to enlarge Parliament itself. But, when all the possibilities have been canvassed, it remains true that the best way to prevent Ministerial excesses is the old-fashioned one of conceding only those powers that the Government can clearly show to be necessary for an approved purpose. The Labour practice of legislating first, and thinking out policy afterwards, is more destructive than anything else of Parliamentary control and, by extension, of the liberties of the subject.

It may readily be conceded then that the growing powers of the Executive bring serious danger of ineptness and maladministration, against which new safeguards are necessary. But it by no means follows that basic rights or liberties are being destroyed or even threatened. Unesco is taking upon itself the difficult task of drawing up a charter of human rights; and the striking thing about its first tentative list is that nearly every item is either still taken for granted in this country or else constitutes an ideal goal, such as "freedom from want," for which Britain is actively striving at the moment.

In no other nation are the personal and political freedoms—the freedom of conscience, of religion, of speech, of opinion, of assembly, of voting—so firmly respected. A police force and judiciary that are as nearly impeccable as has so far been devised guarantee the individual's right to justice. Moreover, toleration extends to the group equally with the individual and discrimination against political, racial or religious groups is absent to an extent that should shame, for instance, the witch-hunters of Communism in the United States. There is no occasion for smugness on this score; but in an age in which ordinary respectable Germans have treated the killing of millions of humans as being all in the day's work if only they belonged to a different race or creed, it is as well that Britain should make clear beyond any doubt its continuing belief in the intrinsic respect due to every individual person.

The growing powers of the British Executive are not due to any tyrannical aspirations, but are instrumental to the greatest effort in history to translate the ideal of human equality into concrete fact. The enormous apparatus of social services, the direction of industry, the rationing of scarce supplies, the sub-

A Statute of Liberty?

OF recent years, and especially since the advent of the Labour Government, a great deal has been heard of the growing infringement of the rights and liberties of the British citizen consequent upon the widening authority and discretion of the Executive. Most of the talk has taken place in the heated and incoherent atmosphere of party strife, and has not for that reason been very instructive. The subject is of such importance that it is high time to try to view in some sort of perspective, hard as this is to focus in a period such as this of double transition from war to peace and from unplanned to planned economy. Moreover, in both cases the transition is gradual, which may prove no bad thing in the long run. There is also confusion because the argument about citizens' rights and liberties can be carried on at an exalted plane of philosophical theorising or at a more mundane level of listing claims

sidising of basic needs—all these and many more are done in order to try to provide work for all, food for all, health for all, a minimum income for all, and equal educational opportunity. Perhaps the ideal is being pursued too hastily and too thoughtlessly. The apparatus of economic regulation, the whittling down of economic incentive, that is involved in carving the national cake into shares may cause a shrinkage in the size of the cake itself. In addition, egalitarianism is not free from the shackles of envy and mediocrity. The greatest danger to the individual's freedom of action to-day comes not from the Government but from the efforts of certain trade unions to

force each worker to march at the pace of the slowest. The pernicious "closed shop" principle, with its damaging effect on initiative and ability, cannot be overthrown by Government edict alone; but, as the Liberals' Bill suggests, it would at least be a good step to put public authorities in the position that they are legally prevented from compelling their employees to join a union. But in general the pursuit of equality has so far been responsible rather for inefficiency than for loss of liberty. The only question is whether, in trying to add this new group of human rights to his long list, the Englishman runs any danger of bursting the bag.

The Birth Rate

LAST week-end, the Registrar-General's weekly return showed that the number of live births registered in the first quarter of this year was 241,421. This birth rate, 22.8 per thousand of the population, was the highest for any quarter since the June quarter of 1921 and compares with an average rate of 16.1 per thousand for the March quarters in the years 1941-45. Thus, the high birth rate registered in 1946 appears to be continuing, and inevitably the question arises: does this mean anything? Is it merely a short-term check to the steady decline in the birth rate from the beginning of this century onwards, or is it the beginning of a change in the long-term trend? Does it mean that before the Royal Commission on Population, appointed in March, 1944, issues its report, as it is expected to do in a few months' time, the population problem will have solved itself?

The social and economic causes of the declining birth rate have often been discussed. So, too, have the consequences. They will, presumably, be given weighty and authoritative examination in the Royal Commission's report. This article will, therefore, not be concerned with causes and consequences. Its sole aim is to place the rise in the birth rate in the last few years in a long-term setting and to give a simple—possibly over simple—picture of the statistical background.

The first chart shows the trend of the birth rate from 1900. It gives five-yearly averages of births from 1900 to 1935, and the actual number of live births registered in each year from 1936 to 1946. It will be seen that the average of the last five years is well above the low level of the late twenties and the thirties. It is, in fact, almost back to the average of the five-year period 1915-1919, and the figure for 1946 alone is the highest for any single year since 1921.

Although this article is not concerned with causes, the fact of the social upheaval resulting from the war cannot be ignored, and the second chart compares the birth rate during the first war and post-war period with the rate from 1936 to 1946. It will be seen that the rate fell steadily and at times sharply all through the years 1914-1918. In 1919, there was a slight rise followed by a steep increase in 1920, after which the rate resumed its downward trend. It is clear that the boom in births in the immediate post-war period was merely compensation for the abnormally large fall during the war. It had no effect on the long-term trend.

Is the same thing happening now? It is not possible to give a strict comparison between the two war periods because, for one thing, of the difference in their duration. But it is worth noting, first, that the rate never fell so steeply from the pre-war level as was the case in 1914-18 and, secondly, that the rise began well before the war ended. Other factors which have to be taken into account in a comparison of the two periods are that, in the first war, the absence of the potential fathers from home was greater and more prolonged than in 1939-45 and that demobilisation was much more rapid. The most that can be deduced, however, from the comparison is that the

experience of the birthrate in the two war periods has been different. In the first, it fell sharply, rose sharply and then continued its steady downward progress. In the second, the post-war boom is superimposed on what appears to be an upward trend.

Is this upward trend apparent or real? It is possible to examine one or two other factors that have a bearing on the birthrate. The next chart shows the number of marriages from 1925 to 1936. It will be seen that there was a big jump upwards in 1939 and 1940, that the number of marriages fell back to about the pre-war average in 1942 and well below it in 1943 and 1944, but that it has jumped up again in 1945 and 1946. The annual average for the eight years 1939-46 was about 16 per cent greater than in the eight preceding years. This rise in the marriage rate may perhaps have reflected the fact that men and women who, but for the war, would have remained single were getting married—that is, a real decline in celibacy. If so, the births that resulted could be reckoned to be a net addition. On the other hand, the rise in marriages may merely have meant that people who would in any case have got married did so earlier because of the war. Ordinary observation—un-supported by any statistics—would suggest that, though there were some marriages of the first sort in the war years, the great majority of the addition must have been of the second variety. If the marriages took place earlier than they would otherwise have done, so presumably did the ensuing births. But unless these war brides, by marrying earlier, are also starting to have larger families than was the rule before the war, the babies they have had in the last seven years have merely been, so to speak, "borrowed" from future years.

In the last analysis, therefore, the number of births depends on the number of potential mothers in the population and on the average size of the family. The crude birth rate, it is now generally recognised, is an inadequate measure of whether a population is maintaining itself or not. To determine this it is necessary to know whether each generation of mothers is reproducing itself; in other words, whether the women of reproductive age in the population are giving birth to enough female babies to maintain the supply of mothers when they themselves reach the reproductive age. To calculate the net reproduction rate, as it is called, in any given year, the number of female babies born is first ascertained and allowance made for the fact that not all of them will survive to the reproductive age. The rates at which the women of reproductive age bore female babies in that year are then applied to the survivors, and the result shows whether the number of female babies born was enough to maintain the supply of mothers or not.

The reproduction rate is very crudely illustrated in Chart IV, in which the number of girl babies born in 1900-25 is compared with the number born from 1925-46. Two quite unwarranted assumptions are made: first, that all the girl babies born survived to become mothers; and, secondly, that they reproduced themselves at the exact age of 25. But for those whose

minds boggle at the intricacies of the net reproduction rate the chart—of what might be called the gross reproduction rate (simplified)—may serve as an illustration of its underlying concept. The space between the two lines shows, roughly, the deficiency of potential mothers. From 1925 until 1942, not enough female babies were being born to maintain the supply of mothers in the population. But since then the position has improved, and the numbers born in 1946 were well in excess of those born twenty-five years previously.

The Registrar General has not published figures of the actual net reproduction rate further back than for 1933. But except in 1943 and 1944, when the actual rate was just below unity, instead of just over unity as shown in the chart, the picture presented by the net reproduction rate since 1933 accords fairly well with that shown in the chart. In the thirties, the net reproduction rate was roughly 25 per cent below unity, below, that is the full replacement level. In 1946, it is provisionally estimated at 1.102, that is, 10 per cent above the replacement level, and the Registrar General has announced that it is the first time the replacement level has been reached since 1921.

If, therefore, births continue at the rate of 1946, there is no population problem—or, at least, none of any seriousness. Is this likely? This cannot be answered by any statistics that have yet been published. The answer would involve knowing whether 1946 was a year typical of those that will follow, or

whether, for some reason, the births that occurred last year were "borrowed" from other years, which will therefore show correspondingly low totals. One fact, which must be known to the authorities, both from the returns under the Population (Statistics) Act and from the applications for family allowances, is whether the number of third, fourth and fifth births is increasing. Mr Dalton said in his Budget speech that there had been 200,000 applications more than the actuaries had allowed for, and all of these must have been at least second children, since family allowances are not given for the first child. It does not necessarily follow that they were all children who were not expected to be born at all, since they also may be "borrowed" from future years. But at least these 200,000 unexpected claimants establish a presumption that the size of family is rising.

But there are some reasons on the other side for anticipating a fall in the number of births in the next few years. First, the high marriage rate of the war years must have been in part at least merely anticipation, and will therefore be followed by a marriage slump. Secondly, while the present generation of mothers is a big one, for it comprises the large number of girl babies born after the first world war, the new entrants will be much fewer, reflecting the slump in births in the later 1920s and early 1930s. Thirdly, commonsense would indicate that the year after demobilisation would probably see a higher birth

rate than the average. The high birth rate of the last few years has been sustained over too long a period for the figures for 1946 to be solely attributable to a post-war boom. Nevertheless 1946—or perhaps 1946 and 1947 together—will probably stand out on the curve much as 1920 did.

Some of the essential data are still missing, at least to the public. Some only time can supply. But the provisional con-

clusion is that though the population problem may not be so acute in the late 1940s as it was in the early 1930s, it is by no means solved. The British people may not be failing to reproduce themselves by quite so wide a margin as earlier appeared, but over, say, the next two decades the years when the net reproduction rate reaches unity will probably be very few.

1157 — and all that

WHEN Mr Marshall recently raised in Moscow the question of Poland's western frontier and referred to the "compensation" to be given to Poland for the loss of its pre-war eastern territories, Mr Molotov indignantly repudiated the idea that the Poles were getting their new lands as compensation; they were merely, he said, having the homeland of their nation rightfully restored to them. The Polish Government has also been carrying on a propaganda campaign to sustain this argument, and the crowning proof given in a pamphlet published by the Polish Embassy in Washington is taken from a good German source; in the year 1157 the Emperor Frederick Barbarossa wrote: "With our entire army we crossed the river Oder which, like a wall, surrounds that State (Poland) and, sweeping through the bishoprics of Breslau and Poznan, laid waste the whole country with fire and sword."

The controversy over the Oder-Neisse frontier has arisen from the fact that by 1939 the overwhelming majority of the inhabitants of the territories "regained" by Poland were German by speech and sentiment and that the territorial transfer has involved the expulsion of these Germans (or the prohibition of return to those who had already fled before the advance of the Russian armies) into the remainder of Germany. The addition of these masses of homeless and propertyless exiles to the population of Germany west of the Oder-Neisse line combined with the loss to Germany of the resources, especially in foodstuffs, of the territory to the east of it, has been a principal factor in the economic collapse which has involved Britain and the United States in heavy expenditure to meet the minimum needs of the Western zones; and this fact goes far to account for the sharpness of current American criticism of the frontier—which is the more resentful because other related parts of the Potsdam settlement, the Russian undertaking on German economic unity and the Polish promise of free elections, have not been fulfilled. The British and American Governments have also become increasingly aware that the new eastern frontier is a cause of extremely bitter feeling among nearly all Germans who now have any thoughts beyond the day's food and that the spreading of the millions of refugees over Germany is likely to be in the future the strongest factor favouring a revival of militant German nationalism. Hence the belated appeal for a compromise between the 1939 and "Potsdam" frontiers—an appeal which, though it may have served a tactical bargaining purpose in Moscow, also reflected a genuine opinion on the rights of the question.

The reason why the Polish Government has been unwilling to take its stand on the "compensation" agreement among the Big Three by which the Oder-Neisse line was fixed is to be found in the recent political history of Poland. In 1939 the Soviet Union, by agreement with Germany, but without recognition from any non-Axis countries, annexed over half of the territory of pre-war Poland. But when in 1941 Germany invaded Russia, the Soviet Government signed an agreement with the Polish Government-in-exile cancelling the German-Soviet partition, though leaving the door open for future negotiations for revision of the pre-war boundary. In December,

1941, General Sikorski, then Polish Premier, visited Moscow and talked over the matter with Marshal Stalin; the latter's claims were at that time only for minor post-war cessions and did not include Vienna or Lvov. In the spring of 1942 Sikorski went to Washington and informed President Roosevelt of the demands Poland would make on German territory after an Allied victory. They comprised the Upper Silesian industrial area (claimed by Poland at the Peace Conference in 1919), East Prussia (except for a portion to be assigned to Lithuania), Danzig and a strip of north-eastern Pomerania. The case for depriving Germany of East Prussia was, as the campaign of 1939 had shown, that the pre-war Polish frontier was strategically untenable. The revisions proposed by Sikorski would have involved a considerable German population, but they were not wholly unreasonable on a combination of ethnic and strategic grounds and they would have left to Germany Breslau, Stettin and the greater part of the food-surplus area east of the Oder and Neisse.

*

After the battle of Stalingrad, however, the whole situation again changed. The Soviet territorial appetite was revived by military success and Russia again claimed approximately half of pre-war Poland; when the Polish Government in London resisted these demands, steps were taken to create in Poland a Communist-controlled Government which would grant them. At the same time, the "London" Poles began to put forward projects for annexations from Germany more far-reaching than any which had ever previously been advanced. Thus the idea of the Oder-Neisse frontier emerged, and in negotiations with Britain and the United States at the end of the war Russia insisted on it no less than on its own territorial claim against Poland. Both were finally approved by the Big Three, but whereas the Polish-Soviet frontier was definitely fixed by a Polish-Soviet treaty, the Oder-Neisse frontier remained provisional until the final conference for making the German peace treaty. The Polish Government is therefore uneasy about recent moves for revision. But it finds itself morally and politically in an awkward situation. If it claims the Oder-Neisse line as compensation for what Poland has ceded to the Soviet Union, it cannot avoid raising the question of Poland's rights in its former eastern territories. Compensation implies a legal or moral right to that for which compensatory payment is to be made; nobody thinks of compensating a burglar for the loss of the swag which is taken away from him when he is caught. But according to the Soviet view, duly accepted by Polish Communists, Poland had no right whatever to the eastern territories, which had been brutally seized from their rightful owners by Polish reactionaries and imperialists. How then has Poland a just claim to compensation for the loss of something to which it never had any right at all?

The present Polish Government's only way out of this dilemma is to discard the principle of compensation in the presentation of its case (or at least, to bring it in only as a supplementary argument) and to claim the Oder-Neisse line as rightfully Polish quite independently of the cessions to the Soviet

Union. That is why we are invited to study an historical atlas and go back to medieval times to assure ourselves that these lands were originally Polish and have therefore been merely "regained" by Poland. It is of course a fact that at one time Slav population spread westward not merely to the Oder, but to the Elbe, and the modern eastward extension of German nationality has been the result of a prolonged historical process of conquest and colonisation, involving countless brutalities and a tension which has been a principal cause of the German racist mania. But it is also a fact that the *Drang nach Osten* eventually produced a large German majority in the conquered lands. Polish official figures concede that of a pre-war population of 8½ million in the Regained Territories, 7 million were Germans. Of the Polish minority, moreover, more than three-quarters was concentrated in Upper Silesia. In other words, most of the territory concerned was ethnically German in 1939, whatever it may have been twenty generations ago.

*

An attempt has been made to render the ethnic claim more contemporary by quoting figures of German emigration from the "Prussian East" since the middle of the nineteenth century—an emigration which after 1919 made East German agricultural estates largely dependent on Polish seasonal labour from across the border. This emigration was an important economic and social fact and was greatly deplored by German nationalists. But the main cause of it was the growth of German industry and its attractions for a poverty-stricken peasantry. There has for generations been a somewhat similar movement from Scotland into England, especially from the high glens which had more population in the eighteenth century than they have now; but it would cause some surprise if this were to be regarded as a valid reason for expulsion of the Scots who have remained in Scotland. In any case the post-war restriction of German industry would have stopped the flight from the land in Germany and an increased dependence on home-grown food supplies combined with agrarian reform would have been favourable to the East German peasantry. It is not possible seriously to argue that the 7 million Germans east of the Oder and Neisse were a mere vanishing remnant of a population already on the move westwards.

We must rely then, after all, on the medieval ethnography for which forward-looking Marxists have developed so much enthusiasm. But it has its pitfalls for the unwary. The game of "Where were you in 1157?" is one at which the Big Three of Yalta and Potsdam, who are responsible for the new frontiers, really cannot afford to play. The Americans least of all, for they just were not anywhere in 1157; the sole occupants of their continent at that time were people who now survive under the Stars and Stripes only in what are called "reservations." Nor do the Russians come well out of the test. By far the greater part of the present territory, not only of the Soviet Union, but also of its nuclear component, the Russian FSSR, was in 1157

devoid of Slav settlement; the constitutional nationality boundaries within the Union have been based on twentieth-century ethnography and have taken no account of lands taken by Russian colonists from Tatars, Chuvashes, Bashkirs, Ostyaks, Kirghiz, Buryats and other fraternal peoples during the last few centuries. The English may appear at first sight to bear the investigation rather better; there was already an England in 1157 and it was mostly English. But, after all, if we are going to have historical justice, why stop at 1157? If one goes back a few centuries further, the English have not a leg to stand on. In the far off days

When Severn down to Buildwas ran
Crimson with the blood of man,

the English were merely a horde of brutal German invaders from Schleswig-Holstein and Lower Saxony, and they have added to all their other infamies by usurping the name "British," although they cannot speak a word of any Celtic language. It is clear that historic justice requires that England should be restored to the Welsh and that the English inhabitants should be deported to what is now the British zone of Germany, where, if anywhere, they belong.

It seems, therefore, that as the three Great Powers have so much reason to fear an enquiry into their ancient title-deeds, it is unwise of the Poles to lay so much stress on the principle of historic justice. There must be some statute of limitations applicable to claims arising out of past conquests and migrations; ethnographically, it is only the very recent past which can reasonably be taken into account. The Poles would be well advised in their own interest to drop the talk about old medieval Slav Szczecin (still Stettin to most English-speaking people) and rest their case, such as it is, on the deal which was actually made in political bargaining among the Great Powers in 1945, and which was as innocent of ethnography as it was of historic, or any other sort, of justice. It would be best of all if they would make some material concessions on the lines of Mr Marshall's proposals. But, if they will not do this, they should at least refrain from a nonsensical propaganda which in the long run can only recoil on their own heads. Whatever is decided in the peace settlement, it is essential that it should be such as to be still endorsed by public opinion in the Western democracies in ten years' time and that, therefore, whatever case is made for it should be of a kind to wear well. The case the Poles are now making will not wear well. It would be better if only they were not so scared of Moscow's displeasure, to state simply that they claim compensation for eastern territory of which they were deprived by force and that this compensation has been taken from Germany by right of the victor, in accordance with the promise of the major Allies. A bad ethnic argument is sure to be a boomerang for the Polish cause, for the Germans can easily refute it and thus unsettle the wide section of Western opinion which now thinks Poland does deserve compensation for the "Sixth Partition."

NOTES OF THE WEEK

Dollars

A Business Note on a later page discusses the ominous meaning to be drawn from the latest figures of drawings on the United States and Canadian credits. Until quite recently, the official view on the length of time for which the supply of dollars would last was one of qualified optimism. Since the New Year, there has been a sharp change and the gravest apprehension is now the order of the day. This is partly because of the harm that the fuel crisis has done to the prospects of earning dollars; partly because the time when supplies of foodstuffs and raw materials will be available from non-dollar sources seems to be receding rather than advancing; but mainly because dollar prices have been soaring and the real value of the credits has been so sharply diminished. Their total was cut very fine when they were negotiated, and it is now discovered both that the need is much greater, and that the value of the dollars is much less, than was then thought. The dollars look like running out well before the end of 1948.

It is still very imperfectly realised what a very serious plight the country will then be in. In the long run, the prospect of balancing the British international accounts is by no means hopeless. Given time, the export industries could develop their plans—given time, they may even have enough coal to make their exports. Given time also, the cost of necessary imports can be expected to come down with a run; the fantastic prices of to-day cannot possibly endure. But time is a commodity of which Britain is getting uncommonly short. It would be very fast going for the present universal seller's market to turn itself inside twelve months into the world-wide slump in the prices of primary products which will be Britain's salvation. There may, or may not, be a possibility in 1949 of borrowing some more dollars; but there is certainly very little possibility before the Tuesday after the first Monday in November, 1948, when Mr Truman's successor has to be elected. In the meantime, imports may have to be cut down—the process is already starting, and its impact is made the more severe by the rule of non-discrimination on which the Americans insist. Imports to-day consist overwhelmingly of essential raw materials and essential foods. Which shall be cut? To cut the former means unemployment (and still fewer dollars); to cut the latter means starvation. There is an unpleasant edge, in these circumstances, to the Keynesian epigram that in the long run we are all dead.

There is any amount of political dynamite in this dollar shortage. A serious cut in the rations and two million unemployed would drive any Government from office. Why, then, it may be asked in the Government's own interest, does it persist in playing its cards so close to its chest? Why is there so little informed and authoritative discussion? Why is it made so hard to discover the facts about the dollar supply, about what could be done and what could not? A first-class crisis is absolutely certain next year. Does the Government positively wish to be held solely responsible?

* * *

The Transport Bill

The Government's Bill to nationalise the whole transport industry of the country has now been railroaded through its report stage. Apart from a bout of generalised oratory on third reading, it is through the Commons. There has never been another such case of the brutal use of the guillotine. In Standing Committee, 37 clauses and 7 schedules were never even discussed, and for the three days of the report stage, no less than 376 amendments were on the order paper. Nor was this in any way due to obstruction by the Opposition. There were 245 Government amendments in Committee and a further 176 on report.

Even if the Bill were a comparatively simple one, the outlines of which had been thoroughly explained and discussed before it was introduced, this procedure would have been brutally summary. But the Bill is not a simple one, it is most complicated and far-reaching. Its outlines were not familiar; they had never been discussed in public and to this day they have never been explained. It was not well drafted, as the hundreds of Government amendments prove so clearly. Nobody yet knows what the Government propose to do with their gigantic transport monopoly; and accordingly nobody who is not so blinded by Socialist fanaticism as to believe in nationalisation for nationalisation's sake has been given any opportunity of making up his mind whether the scheme is a good one or a bad one.

There is no point in mincing words. The way the Government have rammed this Bill through the Commons is a scandal and an insult to the democratic process; it is a debasement of the Parliamentary currency that the Labour Party will not have to live long to regret.

*

The Bill now goes to the Lords. The Government have not concealed their desire that the Lords should deal with it, and the other Bills on the programme, by the end of July, so that the session can then be brought to an end. Their Lordships will hardly make so bold as to reject the Bill, or to carry wrecking amendments—unless, indeed, by the summer the Conservative Party is so sure of winning an election that it will challenge it on the dangerous ground of "the peers *versus* the people." But the Lords may be much readier to take their time over the Bill and to give it the careful examination that the Commons manifestly have not.

Hitherto, the Conservative majority in the Lords has not only bowed to the Government's wishes on the substance of legislation, but it has also been strangely willing to follow the Government's lead on the arrangement of its business. There is nothing to prevent the overwhelming Tory majority from refusing to accept a time-table. But up to the present it has always dutifully done so. There should be a paragraph in the constitutional treatises to explain the means that a Labour Government possesses to render a nominally hostile Upper House so docile in small matters as well as large. Perhaps the threat to move for sittings after dinner is one—their Lordships would like neither to work after dinner nor publicly to confess their unwillingness to do so for the country's good. The one real right they retain, the one service they can render, is to insist on enough time for issues to be properly examined before they are rushed into law. There will never be a better case than the Transport Bill.

* * *

Reconstruction in Europe

The British Government have paid the new-born Economic Commission for Europe the compliment of sending Mr Hector McNeil to bless its beginnings. With the Swedish Mr Myrdal in charge, remembered all over eastern Europe as a prominent figure in the Soviet-Swedish trade negotiations last year, this body may provide a useful and businesslike activity in which Europeans from west and east and the Americans can get down to brass tacks.

The session which has begun this week will be spent in deciding how to absorb such existing European organisations as the Coal Organisation and Inland Transport Organisation. A further organisational session is due in June, and then in July the affairs of the new Commission come before the Economic and Social Council in New York again. By the autumn the real work on particular problems should start, not with a large international bureaucracy, but with *ad hoc* committees of experts and a permanent secretary provided from a general staff of economists. This is the Swedish way of going to work, which is a good way provided the experts can be made available by the interested Governments. But Uno is rapidly creating a bottleneck in economic as well as diplomatic experts.

A hopeful omen is that some Soviet co-operation now seems certain; a disturbing one is that no one knows for certain how far this new body can concern itself with the problems of Germany.

Without access to German statistics and opportunities to influence Allied policies in Germany, the Economic Commission will be able to take only limited views; if it insists on interesting itself in Germany, it might quite easily lose its slender ties with the Soviet Government.

* * *

The ITO Charter Debate

Although tariff negotiations are likely to monopolise the attention of the eighteen delegations attending the Geneva trade discussions until at least the end of next month, some preliminary shots are already being fired in the battle for the International Trade Organisation charter—a battle which will thereafter hold the greater part of the delegates' interest. The charter, as it

emerged from the deliberations of the drafting committee which met in New York last January and February, was published soon after the Geneva meeting opened. It closely follows the draft charter issued at the close of the first session of the Preparatory Committee which met in London last October. Many controversial clauses are still left in alternative forms, some remain to be drafted, others still are annotated with reservations from one or more delegates whose carefully veiled identity often emerges quite clearly from the nature of the comment. The debate on the charter will, therefore, be a real one. This is not only because many important items of substance remain to be filled in, but because the crucial portions of this document, and in particular the chapter dealing with general commercial policy, will serve as the basis of an interim agreement to which all eighteen countries represented at Geneva will be asked to subscribe.

The first shot in the Geneva phase of the charter debate was fired by the International Chamber of Commerce which is one of the non-governmental organisations represented at the meeting. It has issued and circulated a detailed commentary on the draft charter in which that document is subjected to considerable, though always constructive, criticism. The main burden of that criticism is that the proposed charter falls between two stools in that its desire to serve the ultimate objectives of the ITO, namely the maximum dismantling of obstacles to the flow of international trade, is necessarily overshadowed by its concern with the special and temporary difficulties that have to be faced over the present period of transition. In the view of the ICC, therefore, the charter gives a disproportionate amount of its space and attention to exceptions and reservations and far too little to the rules themselves. This is valid criticism which the ICC follows up by supporting the suggestion that all exceptions relating to temporary emergency situations should be removed from the body of the charter and assembled in a separate protocol. That would probably make a better job both of the fundamental charter and of the exceptions. It would make it much more possible to bless the Charter for eventual application in a balanced world without in so doing accepting a commitment to apply it rigidly and at once.

*

The International Chamber of Commerce speaks for the international trader and, therefore, aligns itself unreservedly with the general philosophy of free and non-discriminatory trade which inspires the whole chronology of documents leading up to the ITO charter; it can hardly be blamed for not concerning itself overmuch with the problems of preserving equilibrium, internal and external, from which governments cannot escape as easily as individual traders. The ICC also makes some very telling points in its comments on the chapter of the charter dealing with industrial development. Of all the loopholes that riddle the charter, this is the biggest, since it would give countries desirous of industrialising themselves in order to diversify their resources almost unlimited freedom to transgress the ITO code. The ICC points out that industrial development can also be extremely uneconomic development and reminds the committee that many cases are known where the development behind high tariffs of high cost industries has tended to make the economic position of the developing countries more precarious and less stable than it would otherwise have been.

* * *

Industrial Delinquency

No better example of the priority given by the Government to legislation over administration could be found than its hasty rushing through of the Report stage of the Transport Bill while over 9,000 London stevedores and lightermen were out on strike in support of the Glasgow dockers. Mr Isaacs has condemned the strike; he has given an assurance that food supplies will be safeguarded. But it is a sorry reflection on the Government's administrative record that this major strike should have come about so soon after its presentation of the country's economic difficulties and its exhortations to harder work and greater output.

For the strike itself there is no justification whatsoever. The original Glasgow dispute was quite sufficiently silly. The six-weeks-old stoppage was launched in defence of the following principle: that the nation is bound to support, attached on full pay to whatever trade they may have chosen in the past, whatever deadweight of able-bodied industrial pensioners the rank and file of the union concerned may consider desirable. The most frankly restrictionist apprenticeship regulations, the most unrealistic demands about wages and hours, the most grasping and dog-in-the-manger-like demarcation stipulations, are nothing to this. It amounts not only to a veto on all economic progress, which is labour-saving or nothing, but to the complete negation of any

conscious planning of industrial priorities. Nothing could be more flatly contrary to the Socialist policy of publicly organised progress and wise allocation of resources in the community's interest. A much-misused word for once is apposite: this is anarchy.

It is possible—just barely possible—to make some allowance for the Glasgow workers themselves, whose economic destiny may have seemed to them to have been settled over their heads by negotiators in whom their confidence was less than complete. For the stevedores of London no allowance can be made. The only principle discernible in their action is the still wider and (if that were possible) still less defensible maxim that the last word in any industrial controversy shall lie not with duly elected negotiators or legally provided tribunals, but with the rank and file; and that that last word shall, regardless of public hardship and national necessity, consist in throwing tantrums like a roomful of badly brought up three-year-olds until their point is won. Coupled with contemporary rank-and-file claims to exercise a final power of veto over promotions, appointments, and the boss's right to unload his own materials, the latest news from the London waterfront seems to indicate a perilous spreading of dry rot at the base of the imposing edifice of organised labour.

* * *

The Domestic Fuel Scheme

Mr Shinwell's long-awaited statement on the restrictions to be imposed on the domestic consumption of fuel in the summer months was made on Thursday of last week. The restrictions fall into two parts. There is to be a statutory ban on the use of gas and electricity for space-heating from May 5th until the end of September. (This ban on space-heating is also to apply to industrial and commercial premises, in which case it extends to the end of October.) Secondly, all domestic consumers are asked to aim at saving 25 per cent of the gas and electricity they consumed during the comparable period of last year. This saving will be voluntary, and the 25 per cent asked for will include any saving made by the ban on the use of gas and electric fires. When these arrangements come into force, the existing ban on the use of electricity by domestic consumers during certain hours of the day will be revoked.

If the impossibility of a proper rationing scheme is accepted, a flat reduction of 25 per cent is probably the only alternative. It favours those who were extravagant last year and penalises those who economised; on the other hand, it is arguable that last year, when there was no patriotic urge to economise, but, on the contrary, a direct incentive to be extravagant in the shape of a flood of electrical appliances in the shops, the number of economisers was probably very small. But there are two big objections to the proposed restrictions. The first, and the more serious is the imposition of a statutory ban on space-heating. Not only will this detract from the appeals for voluntary economy in other respects; it is also unlikely to be observed whenever a cold spell of weather comes along. Does the Government really think that the present ban on the use of electricity in certain hours is strictly adhered to? Does it really think that people are not using their vacuum cleaners and electric irons in the mornings and afternoons, and that they solemnly turn off their refrigerators and water-heaters at 9 a.m. and 2 p.m. every day? But if there is one thing worse than a law that is not enforced, it is a law which people are officially told will not be enforced. The Ministry of Fuel says that the ban on space-heating is a token ban and that the police and inspectors will not be used to enforce it. Why, then, not make it part of the appeal for voluntary economy instead of inviting the social consequences of bringing the law into disrespect?

The second objection to the restrictions is that the ban on space-heating will be relaxed only on presentation of a medical certificate. Mr Shinwell even said that a possible relaxation in the case of households with babies would be based on a medical certificate. Why should doctors be asked to certify that a household contains a small child or an old-age pensioner? Why not ministers of religion, justices of the peace or trade union officials? Why should not the local fuel officials themselves grant the relaxation on the presentation of the relevant ration books? This shelling of responsibility on to doctors in the allocation of scarce supplies, whether of food or fuel, corsets or cookers, has gone far too far and should be stopped.

* * *

Fair Compensation for Land

The Government is to be congratulated on another late conversion from the wrong policy. It has abandoned the 1939 basis of compulsory acquisition for land and property. The 1939 basis

was already outdated when the 1944 Planning Act was passed. It both goes back to a pattern of land values that has become increasingly false and it also fails to take account of changes in the value of money. The attempt to right the injustice by permitting a supplement of up to 60 per cent to owner-occupiers was unfair to landowners as a class and underlined the growing artificiality of the calculation. The Town and Country Planning Bill, which is shortly to have its third reading, was the obvious and proper occasion for righting this anomaly, especially since one part of it provides that claims for loss of development value should be entered at their current market value on January 7th of this year. The Government has now recognised this fact and has tabled a series of amendments that remove the Bill's worst feature.

The effect will be that in future compensation will be based, broadly, on current market values. The same principle will hold for "converted" war damage payments. There is a necessary modification of this principle to prevent the payment of the inflated prices that can be demanded at present for some classes of site with early vacant possession. In all cases, of course, the compensation payable refers to the "existing use" value of the land, since its development or redevelopment value is to be cancelled and compensated for out of the £300 million compensation fund. This fact will considerably modify the cost to local authorities of carrying out this new policy of fair compensation.

Report on Greece

The eleven-power Commission appointed by the Security Council to report on Greek frontier incidents is taking longer to agree than it expected. The main points of controversy seem to be, first, what valuation to put upon the items of evidence it has painfully collected; secondly, to what degree fault lies with the internal Government of Greece; and, thirdly, whether it shall or shall not present Uno with recommendations. With these problems it is still at grips in Geneva after an itinerary running from Athens and Salonika to the frontier and on to Sofia and Belgrade. Athens, once in a twitter over what it would say, is now apathetic about the results to expect. Its enthusiasm for a United Nations solution waned as it observed the time the Commission spent on procedural matters, the tendency of members to hear evidence with their minds made up in advance, and the resultant disillusionment of the Commissioners themselves.

It looks likely that the only outcome of the report will be a fresh manifestation of the cleavage between East and West. But before writing off all Uno commissions as idle, it should be remembered that here was a peculiarly difficult topic on which to collect evidence. For the frontier under review is not only on the dividing line between Russia and the West; it is also an ancient source of bad blood. As is well known to any visitor to the area between the wars, it was always child's play to collect anti-Albanian or anti-Bulgarian evidence on one side of the frontier and anti-Greek evidence on the other, coupled with, at all times in Macedonia, the fruitier mixture of tales known as a *macédoine*. It is hardly to be wondered at if the Commission falls automatically into two halves. It did so physically during its farcical visit to the partisan leader "General Markos," since only the Soviet and Polish delegates were ready to wait upon his pleasure for longer than two days in a chilly mountain village. It has done so over what witnesses to call in Belgrade, over protests that the Greeks were impeding the movements of its Russian and Polish members, over alleged pro-Russian bias on the part of the Uno secretariat, and over whether or not to maintain a permanent team of investigators on the frontier itself.

This last proposal, made by the United States, has now been carried in spite of Russo-Polish opposition. Yet it should not be assumed that all the Commission's findings will be carried by nine votes to two. Its French and Chinese members have both shown signs of being impressed by the argument that any help reaching the partisans from the north is but matched by that reaching the Greek Government from the British and Americans.

*

Meantime inside Greece the spring thaw has brought classic "fighting weather" and the Government's mopping up operations against the partisans are well under way. Three Greek divisions are engaged and are issuing high command communiques. Only a handful of weedy fellows have responded to a leaflet appeal to surrender in return for fair treatment. It seems that the campaign may be long. Indeed, its length and its volume begin to look as unpredictable as were those of the war in Spain.

Black Summer for Palestine

The debate on Palestine in the United Nations Assembly has begun, and is producing the expected clash between the British and Americans—who want to proceed by appointing an international commission of enquiry—and the Arab States, backed by the Russians, who want forthwith to discuss the territory's claim to independence. This talk brings no hope of respite from the killings, explosions and threats that now dominate everyday life in the Holy Land itself. Following the execution of death sentences upon convicted terrorists, the *Irgun* is now boasting by radio that it will likewise execute any British soldier caught carrying arms, on grounds of "participation in murder." Onlookers had best face the gruesome fact that human lives, mainly British, will be regularly lost until the autumn Assembly.

Could this hateful and dangerous interim have been shortened? Surely yes, if the British Government, instead of going forward empty of constructive suggestions, had given newcomers to the subject something to bite upon in the shape of a recommendation based on twenty-five years' experience. The official explanation of its negative attitude—given to the Lords by Lord Hall—is that Uno must "be free to choose between the various plans." But this contention matches ill with his subsequent statement that Britain will not carry out alone any Assembly recommendation of which it does not approve. Obviously the British will in the end have to execute, or help to execute, the policy chosen. They should have said in advance what can and cannot be done. The explanation of the weak and costly course the British Government has chosen is that its members are divided on the best policy to recommend. Mr Bevin and Mr Creech Jones do not agree.

Other interested partners are equally at sixes and sevens. In New York, every lobby that is not cordoned off against terrorists rings with the sound of discordant Jewish views. These range from that of the American League for a Free Palestine (which aims to collect £2,000,000 for help to the terrorists), through the official Jewish Agency (more moderate because its future lies among Arabs as neighbours) to the American Council for Judaism (which does not want a Jewish state because its members do not want to be sent "home"). Only the Arabs are at one.

Pending decisions on the claims, sympathies ought to turn to the British servants, civil and military, whose unenviable job is to make the wheels of administration turn this summer. It is idle to hope that they will get much help from the Jewish Agency. This has instructed its defence force, the Hagana, to spy on terrorists and has initiated long-term plans for teaching school-boys that terrorism is a vice. But it will still not co-operate with the Government to stamp out a scourge that neither can eliminate single-handed.

Zionist Legends Made and Marred

Is it churlish to level one criticism at British forces who are carrying out a more than exacting task? They still seem to lack either the numbers or the ingenuity to defeat Jewish stratagems that are bound to inflame heated Jewish imaginations. Here a terrorist slips out of a prison lavatory inside which she has been afforded the time and chance to veil as an Arab; there the corpse of a wanted criminal is spirited from a mortuary; elsewhere two condemned men cheat the hangman by blowing themselves up with explosives smuggled into their cell in oranges. It is foolish to allow such ingenuity to become legendary. Perhaps the tide has turned now that 50 *Irgun* prisoners in Jerusalem central prison have been caught in a tunnel that they had dug to within eight feet of the street.

And new light is due to fall on other Zionist legends. During the Uno inquiry, new minds of several nationalities are likely to see through the fallacy—hitherto cherished by many including President Truman—that the Palestine problem is mainly one of housing Hitler's victims. Americans in particular are likely to find their opinions coloured by their new commitments in Greece and Turkey. The colour is likely to be heightened by Russia's backing of the Arabs against "western imperialism." Many American citizens who have hitherto seen the problem only from the angle of Zionist advertisements may discover that American interests include the retention of Arab friendship.

The Bankside Station

The Government has stirred up a hornets' nest by giving its consent to the erection of the large Bankside power station, on the south bank between Blackfriars and Southwark bridges and immediately opposite St. Paul's. It must indeed be a powerful cause

which brings the London County Council, Southwark metropolitan borough and the City to unite for once in a vehement chorus of protest. There are two objections to the power station from the point of view of planning. The first and more bruited is that its tall chimney or chimneys—it is not settled whether there will be one or more—will spoil the splendid dominance of St. Paul's over the surrounding City and river. This argument is overdone. There will be little impediment to the view of St. Paul's from most angles, and it is not clear that a well-designed power station need spoil the effect half as much as do some of the minor existing buildings in the neighbourhood.

The more serious argument is that the bold and fine scheme to rebuild the whole south bank from Westminster Bridge to London Bridge will be spoiled. This scheme envisages the removal of industry and obsolete housing, their replacement by offices, flats, shops, and cultural buildings, the creation of a riverside walk and gardens, and the opening up of Southwark Cathedral. The erection of the power station would cut the full scheme short at Blackfriars Bridge or earlier. It would remain an important and ambitious scheme of redevelopment—many would say as ambitious as this generation can afford. But the essence of town planning should be to look several generations ahead and, viewed in this light, there can be no doubt that the abandonment of the opportunity to build a wholly new and harmonious south bank is a disaster. After all, this is the best site for a demonstration of planning that the nation possesses.

To the long-term needs of good planning, the Government has preferred the advantage of the one or two years' speed in obtaining electricity which is expected to result from selecting this site in preference to the alternative site suggested by the LCC at Rotherhithe. The need for the quickest possible increase of generating capacity is undeniable, even although the gain in both time and volume to London's electricity supplies appears to be modest. The Government is certainly risking its posthumous reputation by seizing on the urgency of the short view.

War Damage to Defective Property

It had been generally hoped that the decision of the Court of Appeal in the case reported under the name *in re 36, 38, 40 and 42 Jamaica St., Stepney* would have cleared up definitely an important point in connection with war damage to buildings not in the best state of repair. However, the court has on this occasion refrained from, or been unable to lay down, any principle of general application. The facts of this case were that the front walls of these particular houses were damaged by bomb blast. The houses were old and the walls were in bad condition. The defects were so accentuated by the blast effect that the walls had to be rebuilt. The view of the War Damage Commission was that, as the walls were defective before the bomb fell, the Commission was liable only to pay a proportion of the cost of rebuilding. The courts, both the court of first instance and the Court of Appeal, decided against that contention. The decision of the Court of Appeal was based on the fact that the evidence in this case did not show that the pre-existing defects in the walls had made them unsound. Since there was no finding of fact that the walls would have fallen down within a measurable period of time, there was no reason why the Commission should escape their statutory liability to pay the whole cost of the rebuilding. In conclusion, the court expressly left open the question of whether, in a case in which the facts showed that a building was defective enough to have a limited life, the owners of such a building could only recover from the Commission a proportion of the cost of building a new and, of course, sound structure.

The general facts in this case must be frequent enough. Many buildings known to be defective suffered bomb damage. The Commission, who are by now relying upon public money for all the payments they make, are certainly entitled to argue that it is not for them to give the owner of a defective building a new one in replacement just because he was lucky enough to have his building damaged by enemy action. But they have not obtained from this decision a solid argument which they can use in these classes of case. The question of whether they can settle their liability by paying only a proportion of the full cost is as open as it was before *Jamaica Street, Stepney*, appeared in the law reports.
